Mention must be made of Babism, of which Behaism is the latest development. In the year 1844, Ali Mohammed, in Persia, announced himself as the *Bab*, or "gate," that is, "the source through which revelation comes." As the inaugurator of a new dispensation, he set about the reformation of men's lives. Many converts were made and the antagonism of their Moslem neighbors was aroused. Thousands of adherents to the new faith were slain, and in 1850 the Bab himself met this fate. As persecution continued many fled from Persia and finally settled at Akka. In this band of exiles was one upon whom the Bab had conferred the title of Bha Allah, that is, "the Glory of God." His declaration that he was the manifestation foretold by the Bab was accepted, and his followers have been styled Beha'is. At his death in 1892, his son, Abbas Effendi, succeeded him and is considered as the third of the divine messengers. The thousands of converts made by this new movement attest its importance. Its missionaries have made converts by thousands. Here, in the United States, its adherents are scattered throughout a few of the larger cities, and Professor Browne, the eminent English authority on Babism, speaking of its influence, states that the number and influence of the Babis in Persia is immensely greater than it was a few years ago. See BABISM; KORAN; MECCA; MEDINA; MOHAMMED; SHIITES; SUNNA; WAHABI; and consult works referred to under these articles.

**MOHAVE** (mō-hā'vā) **DESERT**, California, an arid basin chiefly in San Bernardino County, in the southeast, and also extending into Arizona, and forming part of the great Colorado Desert with which its name is frequently used synonymously. The Mohave River rising in the San Bernardino Mountains flows through it for some distance, finally disappearing in the Mohave Sink.

**MOHAVE, or MOJAVE, INDIANS**, an American tribe formerly the most populous and warlike of the Yuma family, residing in Arizona and California in the region of the Colorado River, between the Needles (the origin of their name) and the entrance to Black Canyon. They practised tattooing and cremated their dead. There are upward of 1,500 Mohaves remaining, most of whom live on the Colorado River Reservation in Arizona. They are an agricultural people, rank high physically and are expert makers of pottery and baskets.

**MOHAWK**, a river whose head-waters rise in Mohawk Hill in the southern part of Lewis County, N. Y. It flows south to Rome, where east by south, with many curves, it continues to the Hudson River, which it enters at Cohoes, nine miles above Albany. It is about 160 miles long, and is the largest tributary of the Hudson. In several places along the route there are rapids and falls, as at Little

Falls in Herkimer County, Oriskany in Oneida County, and several other places, all of which are noted for manufacturing. The falls of the Mohawk River (Cohoes Falls) 70 feet high are near Cohoes, where in a glacial pot hole the complete skeleton of a mastodon was discovered in 1883. The bed of the Mohawk River was once much wider than the present channel through which the water passes; in some places the distances between the old banks are from a mile to nearly three miles. The Mohawk Valley is noted for its beauty and the fertility of its soil. The Erie Canal (q.v.) is parallel with the river to Rome. Two railroads parallel the river to Rome, the New York Central and Hudson River and the West Shore. The manufacturing industries of the valley, which depend largely for motive power upon the water power of the Mohawk, are extensive. A number of pretty villages and thriving manufacturing towns are on its banks, chief of which from west to east are Rome and Utica in Oneida County; Ilion, Herkimer and Little Falls in Herkimer County; Fort Plain, Canajoharie, Fonda and Amsterdam in Montgomery County; Schenectady in Schenectady County and Mechanicville in Saratoga County.

In the "Settlement Period" of the United States, this valley was the main highway from the "East Colonies" to the Great Lakes. It was the home of the most warlike tribes of Indians, the headquarters of the Five Nations. The first missionaries and the first explorers who left the Hudson River in this part of the United States journeyed along the country through which flowed the Mohawk. In this valley, near the Mohawk, Goupil was killed by the Indians, and later Father Jogues (q.v.) was martyred at the place now called Auriesville, on the south side of the river a little east of Fonda. Sir William Johnson built two homes in this valley, one at Fort Johnson about one mile west of Amsterdam, now the railroad station of Akin, the other, Johnson Hall, near the present Johnstown in Fulton County. Much of the early history of the river and valley as related to the whites is connected with the rule of Sir William Johnson and his power over the Five Nations. The centre of wealth and power, in the valley before the war, was at Johnson's home. At the breaking out of the Revolutionary War, an effort was made by both parties to hold possession of the Mohawk. The death of Sir William Johnson, just at the beginning of the war, removed a strong power from the council. His sons and their friends lacked his humanity and wisdom. The union between the British and the Indians resulted in many terrible scenes, among others the massacres of Cherry Creek and Schoharie, the burning of homes and the taking of many lives in the valley. Burgoyne (q.v.) realized the value of having possession of this valley, and some of the important battles of the Revolution took place along the Mohawk. There were many Tories in the valley; but a large number of the settlers were always patriots. When the news of Concord and Lexington reached the inhabitants along the Mohawk, many of them loaded into wagons all the grain they could spare and sent the precious cargoes over the rough roads to Boston. When the British determined to end the war the Mohawk Valley, the gateway to the West, was the site chosen.

Here the Tories outnumbered the patriots, and the Indians were the allies of the British; but Saint Leger's defeat at Oriskany by men under Nicholas Herkimer filled Burgoyne with despair and fired the enthusiasm and enlivened the hope of the patriots.

**MOHAWKITE.** An arsenical ore of copper with minor amounts of nickel and cobalt, a variety of domeykite. Occurs in Mohawk copper mines, Houghton County, Mich.

**MOHAWKS,** a tribe of North American Indian, the easternmost of the Six Nations, named collectively by the French, the Iroquois. According to their own tradition, confirmed by those of other tribes, they were the eldest people in the confederacy of the Six Nations and styled themselves Kaniengehaga, "people of the place of the flint." They believed that they were liberated from subterranean confinement by Tareya-wagon, who guided them into the valley of the Mohawk; thence they passed to the Hudson and to the sea. The valley in which they at first established themselves was the seat of their power from the discovery of the country until the American Revolution. Their dominion extended from Lake Champlain to the head-waters of the Susquehanna and the Delaware. A warlike tribe, they inflicted great tortures on their prisoners and practised cannibalism. With the introduction of firearms by Dutch traders they became renowned above all the other nations for their skill as warriors, and carried terror wherever they went. Their forays extended as far as the Connecticut River, and their influence prevailed among the small independent tribes about the region of the present city of New York. During the French and Indian War they supported Sir William Johnson, following him in his most perilous expeditions and aiding him in the contests of Lake George and Niagara. After his death they transferred their attachment to his family, and were forced to flee from their ancestral home to Canada, where lands were assigned them on the Grand River and on the Bay of Quinté, near the east end of Lake Ontario, where over 1,200 still reside. See IROQUOIS LEAGUE; SIX NATIONS.

**MOHEGAN** (mō-hē'gan) or **MONHEGAN** (mōn-hē'gan) **INDIANS,** a tribe of North American Indians of the Algonquian family, who formerly lived on the Thames River in eastern Connecticut. They were at one time united with the Pequots and after the death of Sassacus, the Pequot leader, the remainder of the tribe came to the camp of the Mohegan chief. After the death of King Philip in 1676, the Mohegan tribe was the only important one in that region. They became scattered, some joining the Brotherton Indians in New York. The survivors of this race are so mixed with negro and white blood that they have practically lost their identity; about 100 of them continue to reside in the neighborhood of Mohegan or Norwich, Conn.

**MOHILEV,** mō-hō-léf', Russia, a western town and government. The town and capital of the government is on both banks of the Dnieper, 85 miles southwest of Smolensk. The town has spacious streets and a large octagonal square occupied by the principal buildings, among others the palace of the Greek archbishop and

the bazaar. It is surrounded by ramparts and is fortified by a citadel on a commanding height. The staple manufacture is tobacco; and the trade with Riga, Memel, Danzig, and Odessa, chiefly in leather, wax, honey, potash, oil and grain, is very extensive. Pop. 72,500, about half Jews. The government, bounded north by Vitebsk, east by Smolensk, southeast by Oreal, south by Czernigov, and west by Minsk, is about 210 miles long from north to south by 112 miles broad, and has an area of about 18,514 square miles. The surface, though in the line of watershed which divides Europe into two great basins, is generally flat, and sends its waters chiefly to the South Dwina, but partly also to the Dnieper. The soil is fertile, though very imperfectly cultivated, and the forests, chiefly of oak and fir, cover extensive tracts. The principal mineral is bog iron ore. Both trade and manufactures are limited. Pop. 2,551,400.

Another Mohilev in the government of Podolia on the left bank of the Dniester, 60 miles east-southeast of Kamenetz, has a population of 32,604, nearly half being Jews.

**MOHL,** mōl, **Julius von,** German orientalist: b. Stuttgart, 25 Oct. 1800; d. Paris, 3 Jan. 1876. He studied theology at Tübingen and England, and Oriental languages at Paris, becoming assistant professor of Oriental literature (1826) at Tübingen. After several years' research at Paris, London and Oxford, he was appointed by the French government to translate and publish 'Shāhnāme' by Firdosi, which appeared (Paris 1838-66) in six folio volumes de luxe. In 1847 he was appointed professor of Persian at the College de France and, in 1852, inspector of Oriental works in the Imperial printing bureau, becoming secretary and later president of the Asiatic Society at Paris. He published 'Lettres de Mr. Botta sur les découvertes a Khorsabad' (1845), concerning Botta's excavations at Nineveh. He wrote also 'Fragments relatifs à la religion de Zoroaster' (Paris 1829), in collaboration with Olshausen. His reports to the Asiatic Society were collectively published after his death by his widow (née Miss Mary Clark) under the title 'Vingt-sept ans d'histoire des études orientales' (1879-80). Consult Simpson, 'Julius and Mary Mohl; letters and recollections' (London 1887).

**MÖHLER,** mē'lēr, **Johann Adam,** German Roman Catholic theologian: b. Igersheim, Württemberg, 6 May 1796; d. Munich, 12 April 1838. He studied theology at Tübingen and became successively tutor (1822), extraordinary professor (1826), and ordinary professor (1828) at that university, and in 1835 was called to a chair in Munich. He was an able doctrinal disputant, distinguished alike intellectually and spiritually; and did much to arouse the German Roman Catholic Church to new vigor. He wrote 'Unity of the Church' (1825); 'Athanasius the Great' (1827); 'Symbolism, or Exposition of the Doctrinal Differences between Protestants and Catholics' (1832; English version by Robertson), and (a reply to the works of Baur and others against his 'Symbolism'), in 1834 'New Investigations on the Doctrinal Differences between Catholics and Protestants.' He was one of the great theologians of the century. Consult the biographies in German by Friedrich (1894) and Knöpfler (1896).

**MOHLER, John Frederick**, American physicist: b. Boiling Springs, Pa., 30 Oct. 1864. He studied at Dickinson College, Pa., receiving the degree A.M. (1890), and was given the degree Ph.D. (1897) at Johns Hopkins. He was appointed instructor of mathematics and science at the academies of Wilmington and Dover (1887-90), instructor of mathematics at Wilbraham, Mass. (1890-94), and professor of physics at Dickinson College since 1896. His research work extended to surface tension of water, electric arc effects on wave-length disturbance of light rays and on light spectra of magnesium. He wrote 'Practical Physics,' (1897) which has passed through three editions, as well as a number of scientific contributions to the periodicals.

**MOHN, mōn, Henrik**, Norwegian meteorologist: b. Bergen, 15 May 1835. He studied at Christiania and was appointed (1861) observer at the astronomical observatory of the university, becoming (1866) professor at the university, then director of the Meteorological Institute of Christiania, which was founded through his active work. He directed a scientific expedition (1876-78) in northern Norwegian waters, and the Bossekop meteorological station was erected (1882-83) under his direction as well as other stations in northern Europe. He wrote 'Grundzüge der Meteorologie' (Berlin 1875; 5th ed., 1898), a very important work; 'Température de la mer entre l'Irlande, l'Écosse et la Norvège' (Christiania 1870); 'Oversigt over Norges Klimatologi' (ib. 1870); 'The North Ocean, its depths, temperature and circulation' (1887); 'Meteorology: Report of the Second Norwegian Arctic Expedition in the *Fram*, 1898-1902' (1907). He has also edited, since 1867, the *Yearbook of the Norwegian Meteorological Institute*.

**MOHOCKS, mō-hōks, The**, a club in London, England, also known as the Mohawk Club, which had a scandalous existence in 1711-12. "The avowed design of their institution was mischief"; it was composed of young men of good families, and their conduct varied from horseplay to brutalities. Gay mentions in 'Trivia' that the Mohawks rolled women in hogsheads down Snow-hill, and Swift told Stella of a report that 80 of them had been put into prison; while Lady Wentworth, writing to her son, Lord Strafford, says, "I am very much frightened with the fyer, but much more with a gang of devils that call themselves Mohocks." A royal proclamation was issued against them 18 March 1712.

**MOHR, mōr, Charles Theodor**, American botanist: b. Esslingen, Germany, 28 Dec. 1824; d. Asheville, N. C., 1901. He was educated at the Polytechnic School in Stuttgart and in 1845 visited Dutch Guiana in the interest of botany. He removed to the United States in 1848 and in the following year went to California, where his health becoming impaired he returned to the East, engaging in the drug business in Louisville, Ky., and later in Mobile, Ala. He was employed in various botanical and forestry investigations under the State and United States governments. In 1884 he was appointed botanist of the Alabama Geological Survey and in 1889 became agent of the forestry division of

the United States Department of Agriculture. He was a member of numerous learned and scientific societies, a contributor to the *National Herbarium* and published 'The Timber Pines of Southern United States' (1896-97); 'Plant Life of Alabama' (1901), etc.

**MOHR**, one of the larger of the West African gazelles (*Gazella mohr*), notable especially as the source of the "mohr-stones," or bezoars, derived from these animals and highly esteemed by the Arabs of Morocco and Algeria.

**MOHS, Friedrich**, frēd'rīh mōs, German mineralogist: b. Gernrode 1773; d. Agardo, Lombardy, 29 Sept. 1839. He studied at Halle and the mining academy at Freiberg; in 1811, became professor of mineralogy at Grätz, and later held similar posts at Freiberg and Vienna. He is known as the inventor of a new system of classification for minerals, which regards, in the collecting of species into higher groups, only their external characteristics. He published 'Die Charaktere der Klassen, Ordnungen Geschlechter und Arten oder Charakteristik des naturhistorischen Mineralsystems' (1820); 'Grundriss der Mineralogie' (1822-24, in English 1825), etc.

**MOIDORE, moi'dōr** (from the Portuguese, *mōda d'ouro*, literally, coin of gold), a gold coin formerly used in Portugal (from 1690-1722), worth about \$6.50.

**MOIRE, mwār**, a French name for watered silks. Though made in the same way as ordinary silks, these are of double width and must be of a stout substantial make. They should also be folded in such a way that the air contained between the folds should not be able to escape easily. They are subjected to an enormous pressure, of from 60 to 100 tons, generally in a hydraulic machine, and the air, in trying to escape, drives before it the small quantity of moisture that is used, and hence is effected the permanent marking called watering, which is for the most part in curious waved lines. The finest kinds of watered silks are known as *moires antiques*. Woolen fabrics to which the same process has been applied are called *moreen*.

**MOISE, Penina**, American poet: b. Charleston, S. C., 23 April 1797; d. Charleston, 13 Sept. 1880. A personality of much charm, she was born of French parents of Hebrew extraction, who originally came from the island of Saint Eustatius. Her poetical gifts were early evidenced and her contributions to the press of her day were many, the chief of which appear in 'Fancy's Sketch-Book' (Charleston 1833.) Her hymn book, written for the Charleston Beth Elohin Congregation, is still utilized, and was a pioneer in its field. Despite blindness in her later years, she continued to write poems, and her home was a place of pilgrimage to a host of admirers.

**MOISSAN, Henri**, French chemist: b. Paris, 28 Sept. 1852; d. 20 Feb. 1907. He was educated at the Museum of Natural History in Paris and at the School of Pharmacy; taught in the Higher School of Pharmacy 1879-83, and then (1886) became its professor of toxicology. He isolated and liquefied fluorine, thus winning in 1887 the Lacaze prize from the Academy of Sciences; was transferred to the

chair of mineral chemistry in the School of Pharmacy in 1889 and to that of general chemistry in the Sorbonne in 1900. He won great fame by his important experiments and achievements with the electric furnace. In 1892 he made the manufacture of acetylene simple and commercially profitable by his discovery that if carbon and lime be fused in the electric furnace pure calcium will be formed, which makes the liberation of acetylene an easy matter. Much more spectacular was his formation of artificial diamonds in 1893; iron was melted in the electric furnace and saturated with carbon; the furnace at a temperature of more than 4000° C. (that is, more than 7200° F.) was plunged into cold water; the resulting ingot was attacked with hot aqua regia; the iron was thus dissolved and artificial diamonds were disclosed. In 1906 he received the Nobel prize in chemistry. Moissan wrote 'L'Isolement de fluor' (1886); 'Reproduction du diamant' (1893); 'Etude complète des carbonés amorphes et des graphites' (1898), and 'Classification des éléments' (1904).

**MOISTURE.** See RAIN.

**MOJI**, mō'jē, Japan, seaport town on the most northerly point of the Japanese island Kiu-shiu in the Strait of Shimonoseki and opposite the harbor of that name. It is important as the shipping point of the coal obtained from the neighboring mines. The total of exports and imports in 1913 had grown to a value of over \$19,500,000 and nearly \$10,500,000 respectively, more extensive, therefore, than those of Noigasaki. The exports, besides coal, consist of cotton thread and cotton goods, cement, rice, porcelain wares and wood. In imports the chief articles are raw cotton, beans, grain, flour, sugar, metal ware, machinery and petroleum. Pop. 55,682.

**MOKADDASI**, mōk'a-dā-sē, Arabian geographer: b. Jerusalem, 946. His name is derived from his birthplace and signifies merely "of Jerusalem." He was well educated, and after a pilgrimage to Mecca in 965 devoted himself to travel. His critical sense makes his work the most trustworthy by any Mohammedan geographer. Two editions of it were published in his lifetime; it was edited by De Goeje in 1877, and the part relating to Syria and Palestine appeared in an English version by Le Strange in 1886. Consult Le Strange, 'Palestine Under the Moslems' (1890).

**MOKANNA**, mō-kān'na, **AI** (**HAKIM-BEN-ALLAH**), styled the "Veiled Prophet," Mohammedan impostor of the 8th century. He hid his face under a veil, a proceeding which his followers ascribed to the splendor of his countenance. He attributed to himself divine powers, and is said, by means of his chemical and other knowledge, to have performed apparent wonders. He gained many followers, so that at last the Caliph Mahdi was compelled to send an armed force against him. He retired to a fortress in Transoxiana, where he first poisoned his soldiers and then burned himself. His followers continued to pay him divine honors after his death. He is the hero of Moore's 'Veiled Prophet of Khorassan' in the first part of 'Lalla Rookh' (1817).

**MOKI**, mō'kē, or **HOPI**, a Pueblo tribe of Shoshonean Indians inhabiting six pueblos on a reserve of 2,472,000 acres in northeast Arizona. They are mesa-dwellers, their seven villages, chief of which are Walpi and Oraibi, being situated upon three mesas difficult of access, several hundreds of feet above the desert lands around. The inhabitants of the small village of Hano are of Tanoan stock and speak a different language, being descendants of refugees from the Rio Grande who migrated in 1680 at the time of the Pueblo rebellion. They became first known to the whites (Spaniards) in 1540. The Moki are small in stature, but muscular and agile. They are of an industrious and provident nature, successful cultivators, keeping their granaries always well stocked with agricultural produce, and are devoting increased attention to pasturage; they are also noted for their manufactures of pottery, baskets and blankets and for their wood-carving. They numbered, in 1904, 1,878 persons, are monogamists, and are descendants of tribes who according to the evidence of the ruins scattered around have inhabited the region for several generations. They are ruled by a council of hereditary clan elders and the chief of the religious fraternities, and are rich in mythology and folklore.

**MOLA**, **Pietro Francesco**, Italian painter: b. Coldre, near Como, 1612; d. Rome, 13 May 1668. At an early age he went to Rome, where he studied painting under Prospero d'Orsi and Giuseppe Cavaliere d'Arpino. He afterward painted at Venice, Milan and Bologna, in which last city he adopted the style of the local painters, especially Albani. His landscapes are of special excellence. The English National Gallery possesses his 'St. John Preaching in the Wilderness' and 'The Repose of the Holy Family in the Flight into Egypt.' In the Ravenna chapel of the Church of Jesus at Rome is his 'Peter in Prison' and in fresco 'The Return of Peter to Rome.' He also painted the 'History of Joseph' in the Quirinal Palace. Others of his works are to be seen in the Louvre, the Pinakothek at Munich and the Dresden Gallery. He was one of the followers of Annibale Caracci, whose manner he reproduced with ease and dexterity, but he was lacking in imaginative depth, while his indebtedness to Albani and Guercino is too evident.

**MOLA DI BARI**, mō'la dē bār'ē, Italy, town in the province and district of Bari, on the Adriatic Sea and on the Bari-Brindisi Railway. It has a church of the Norman period, a gymnasium, harbor, oil-presses and tanneries. Pop. 14,911.

**MOLASSES.** See SUGAR.

**MOLASSES ACT.** See ACTS OF TRADE.

**MOLAY**, **Jacques Bernard de**, zhāk bār-nār de mō-lā, French knight-templar, last master of that order: b. Burgundy, about 1243; d. Paris, 11 March 1314. He entered the Order of the Templars in 1265 and became its grand master in 1298. In 1306, after the Templars had been driven from Palestine, and while he was in Cyprus busied about raising new troops against the Saracens, he was summoned to France by Pope Clement V, who was determined to end the feuds between the Templars

and the Knights of Saint John. Philip the Fair, fearing, it is alleged, the power of the order in France, seized Molay and all the knights then resident in France, after receiving them with the greatest kindness, charged the order with heresy, tried them before a packed court and found them guilty. Molay was imprisoned and terribly ill-used for more than five years, then, after recanting certain admissions of guilt he had made, was burned at the stake. The guilt of the Templars is still a disputed historical question. Consult Prutz, 'Entwicklung und Untergang des Tempelherrenordens' (1888), Lea, H. C., 'History of the Inquisition' (Vol. III).

**MOLDAU**, mól'dow, a river of Bohemia, which rises in the Schwarzberg, on the frontiers of Bavaria, flows first southeast to Rosenburg, where it turns almost due north, and continuing that direction, in a circuitous course, passes Budweis. After receiving several tributaries it traverses the town of Prague, and after turning due east, joins the Elbe on the left, 17 miles north of Prague. Its whole course is about 270 miles. It begins to be navigable at Rosenburg, where its north course commences, but at first only for shallow barges.

**MOLDAVIA**, mól'dá'ví-á, Rumania, a northern division of the kingdom since 1861 (area, 14,759 square miles; pop. about 2,145,464), when the union of the former principalities of Wallachia and Moldavia as the Principality of Rumania was proclaimed. See RUMANIA.

**MOLDENKE**, mól'dén'ké, Charles Edward, American Egyptologist: b. Lyck, East Prussia, 10 Oct. 1860. He was graduated from Columbia in 1879, and from the University of Strassburg in 1885. He was ordained to the Lutheran ministry in the latter year and held pastorates successively in Jersey City, N. J., 1885-90; New York, 1890-96; Mount Vernon, N. Y., 1897-1900. He has published 'The Egyptian Origin of Our Alphabet' (1886); 'The Trees of Ancient Egypt' (1886); 'The New York Obelisk' (1891); 'The Tale of the Two Brothers' (1898); 'Egyptian Classics' (1900).

**MOLÉ**, Louis Matthieu, loo-ē māt-tē-ē mō-lā, French statesman: b. Paris, 1584; d. there, 3 Jan. 1656. His integrity and fearlessness often resisted the arbitrary measures of the despotic Richelieu, and under the no less ambitious but less vigorous Mazarin, he acquired the esteem of all parties. In 1641 he was appointed first president of the Parlement through the influence of Richelieu, whom he had opposed in the process against the Marshal de Marillac. The disturbances of the Fronde soon after commenced. In this contest of factions Molé defended with equal prudence and sagacity the interests of justice and freedom, as well as those of the court, and when Paris became the theatre of tumults, conducted himself with so much firmness and dignity that his bitterest enemies could not withhold from him their approbation; and even Condé and Cardinal De Retz were forced to esteem him, although his unshaken rectitude and devotion to the welfare of the nation and the safety of the throne frequently frustrated their designs. He was more than once threatened with personal vio-

lence by the furious partisans of the Fronde, whom he overawed by his inflexible dignity. In the memoirs of De Retz and other records of the time of the regency of Anne of Austria and Mazarin, Molé's happy influence in the troubled state is everywhere perceptible. His 'Memoirs,' bearing on the stirring events in which he acted so great a part, were published in 1855.

**MOLE**, a small insectivorous mammal of the family *Talpidae*. They are related to the still smaller shrews (*Soricidae*), from which the typical species may be distinguished by having the external ears so short that they are completely concealed in the fur, the fore feet broad and shovel-like, the skull provided with an auditory bulla and a zygomatic arch and numerous other characters. The moderate number of species, belonging to 11 genera, are found only in the temperate portions of the northern hemisphere. Three species, the common mole (*Scalops aquaticus*), the hairy-tailed mole (*Parascalops breweri*) and the star-nosed mole (*Condylura cristata*) occur in the eastern United States. The fourth genus (*Scapanus*), with six species, is confined to the Pacific coast. The second is the smallest and is also distinguished by its densely hairy tail and numerous teeth. It is not common and is found chiefly in mountains and about evergreen forests. The star-nosed mole is known at once by the rosette of fleshy processes on the snout and its larger size; both it and the common mole are abundant in cultivated lands and pastures, the former preferring moist, the latter dry lands. Their habits differ only in details. Moles are eminently fossorial—a mode of life for which they are by structure peculiarly adapted. They construct underground nests lined with soft grasses, from which several passages run off in different directions, and by branching become finally divided into a network of burrows which daily enlarges as the animal searches for the earthworms and insects on which it almost exclusively feeds. They seldom come to the surface except just at noon—a habit which has been repeatedly observed but never explained. The young are born in the nest and some species raise two broods. Notwithstanding its scientific name the common mole shuns water while the star-nosed mole shows a decided predilection for its vicinity and is an expert swimmer. Consult Stone and Cram, 'American Animals' (1903).

**MOLE**, a long pier or breakwater built of masonry and extending into the sea, at times to a distance of a mile or more. In San Francisco Bay are two of these piers, the Oakland Mole and Alameda Mole. The railroad extends to the end of these moles and connects with a line of ferry-boats.

**MOLE**. See NÆVUS.

**MOLE CRICKET**. This insect (*Gryllotalpa vulgaris*) is most appropriately named, for it combines the characteristics of the crickets, to whose family it belongs, with some of the habits and special adaptations of the moles. The mole-crickets dig winding burrows in the loose soil on the borders of ponds and ditches, raising ridges like miniature mole-hills. In their subterranean wanderings they cut the roots of plants, upon which, as well as upon

earthworms and larvæ, they feed. A Porto Rican species (see CHANGA) does serious damage to crops. The European mole cricket lays several hundred eggs in an underground chamber where they are guarded by the female, though many of the young are later devoured by the male. The species occurring in the eastern United States are *Gryllotapa borealis* and *G. longipennis*. They may be recognized by their large brown bodies with a velvet-like covering of fine, close hair, short wing covers and fossorial front legs, not unlike the great paws of a mole. The ear of the mole cricket is situated on the front leg below the knee. Two pairs of wings are found, the tegmina or upper wings which are small, and the larger true wings which are long, delicate and flexible.

**MOLECH.** See MOLOCH.

**MOLECULAR THEORY**, in physics and chemistry, the theory which teaches that matter, however homogeneous it may appear to be, is in reality a heterogeneous aggregate of ultra-microscopic particles called "molecules." In a crude form this idea was entertained and defended, even before the Christian era, by certain of the philosophers of Greece and Rome, among whom Democritus and Lucretius may be specially mentioned. The writings of these ancient authorities are of great interest to the historian, and are highly creditable when allowance is made for the state of science at the time they were produced; but they are too nebulous to be of practical value to the modern physicist, who demands that every theory shall be tested by a critical comparison of its necessary consequences with the facts of observation.

The distinction between the atomic theory and the molecular theory, though still convenient for many purposes, is nevertheless an artificial one, which will doubtless disappear in time. The atomic theory relates to the view that the chemist takes with regard to the constitution of matter, while the molecular theory relates to the point of view of the physicist. The atom has been the ultimate unit in which the chemist has been interested, while the molecule has been, until the very recent past, the ultimate unit with which the physicist has concerned himself. The chemist has dealt mainly with the phenomena of chemical combination, as observed when two or more definite substances unite so as to produce one or more new substances, and to him it has not been essential to speculate with regard to the physical nature of the tiny particles that constitute his fundamental units, nor with regard to their behavior except as it concerns the chemical phenomena that he observes in his test-tubes and other apparatus. The physicist, on the other hand, has paid but little attention to the facts of chemical combination, but has confined his attention chiefly to the mechanical, thermal, electrical and magnetic phenomena that are observed in connection with definite substances whose chemical constitution remains unchanged, and to him the molecule has been a small, physical body, possessing mass and extension, mechanics. The modern corpuscular theory of treatment in accordance with the laws of mechanics. The modern corpuscular theory of matter, however, promises to do a great deal to bring the physical and chemical viewpoints far closer together, and perhaps even to bridge

wholly the gap between them. (See ELECTRON THEORY or CORPUSCULAR THEORY). There is much evidence, already, to indicate that the "affinity" that chemical substances have for one another is of an electrical character; and when the physicist has arrived at a more definite knowledge of the ultimate nature of electricity, it is possible (and even probable) that this knowledge will go far to clear up the mysteries of chemical affinity, and to consolidate chemistry and physics into a single science.

The molecular theory in its present form may be said to be a development of the 19th century; for although the celebrated Swiss mathematician, Daniel Bernouilli, had suggested, in the 17th century, that gases consist of little molecules moving freely about among themselves, and that gaseous pressure is due to the collisions of these molecules with the walls of the containing vessels, and although other thinkers had made analogous suggestions which helped to prepare the way for the modern theory, it was the work of John Dalton, in chemistry, which gave the first great impetus to the molecular theory, by making it, in some form or other, almost a necessity of thought. Dalton showed (1805) that when substances combine chemically, they do so in certain definite proportions; and he concluded that the facts of this sort which he amassed could be best explained by assuming that matter consists of exceedingly minute particles, or "atoms," each of which has a definite weight, and that when bodies combine chemically, their atoms come together in pairs, or in threes, or fours, or in other combinations involving only integral numbers, according to the compound formed. (See ATOMIC THEORY). It was shortly afterward observed that when gases combine they do so in accordance with certain simple volumetric laws. One volume of hydrogen, for example, combines with one volume of chlorine, to form two volumes of hydrochloric acid gas; and two volumes of hydrogen combine with one volume of oxygen to form approximately two volumes of steam-gas. To bring facts of this sort into harmony with Dalton's theory, it was suggested by Avogadro in 1811, and independently by Ampère in 1813, that all gases, when under the same conditions of temperature and pressure, contain the same number of molecules per unit of volume. With these tangible evidences of the molecular structure of matter as an incentive, physicists and chemists set themselves the task of testing, in all conceivable ways, the consequences of such a theory; and in the course of a century of experimental and mathematical study, no fact has been discovered which tends to controvert the fundamental doctrine that matter has a molecular structure. The molecular theory, in some form, is, therefore, confidently believed to be true by practically all physicists and chemists. The observations which have been made, and which must be harmonized and explained by the molecular theory, are so numerous and so varied, however, that no single set of mutually consistent hypotheses about the nature of molecules has yet been proposed, which completely and demonstrably explains everything that is known about matter.

It is quite probable that our progress in the development of the molecular theory has been seriously handicapped by our natural reluctance

to throw overboard, when dealing with ultramicroscopic bodies, conceptions at which we have arrived by studying larger bodies upon which we can experiment, or the behavior of which we can directly observe. Many indications of this are already apparent. For example, the principle of relativity (if further study proves it to be sound) will oblige us to substitute new mechanical axioms (or postulates) for those of Newton, in many lines of investigation; and we already recognize that when we have to deal with matter moving at extreme velocities (1) we can no longer assume mass to be constant, and (2) we have to distinguish between longitudinal and transverse mass, because the behavior of the body with respect to an impressed force is different, according as the force acts parallel to the velocity or at right angles thereto. (See ELECTRON THEORY). In dealing with molecular and sub-molecular bodies and magnitudes, there is no logical reason why we may not make any assumptions whatsoever that prove to be convenient,—provided these assumptions, when the bodies to which they are applied are large and tangible, harmonize with the facts of experience in the world that we can see; and when this fact is fully appreciated, and we have wholly abandoned the attempt to make the behavior of individual molecules and corpuscles harmonize with conceptions we have formed from a study of the larger facts of nature, our progress will doubtless be much more rapid. But until we have found out the precise set of assumptions that will best account for the ultramicroscopic phenomena of the universe, we shall perforce continue to treat the molecule as though it obeyed Newton's laws of motion, except in certain special cases or aspects, where we may know that it does not; and in the transitional stage that science is now entering, we shall be further vexed by having to deal with incompatible assumptions to a large extent, and to explain certain phenomena in accordance with our older conceptions, while at the same time we apply newer and broader conceptions to other closely related phenomena.

It has been abundantly proved that the "atom" of the chemist and the "molecule" of the physicist are (in general) different things, a molecule being a system formed by the union of a definite number of atoms, combined in a definite way. The molecules of a given substance are the smallest parts into which that substance can be conceived to be divided, without changing its chemical character; while the atoms are the proximate constituents through whose immediate combination the molecule is formed. (The word "proximate" is employed here, because the atoms themselves are now believed to be composed, wholly or in part, of still smaller corpuscles, as will be explained subsequently). The molecules of most of the substances that are considered in elementary inorganic chemistry are comparatively simple in structure. Hydrochloric acid gas, for example, is composed of molecules which each contain one atom of hydrogen combined with one atom of chlorine, as indicated by the formula  $\text{HCl}$ ; and water (at least in the form of steam-gas) is composed of molecules which each contain one atom of oxygen combined with two atoms of hydrogen, as indicated by the formula  $\text{H}_2\text{O}$ . In organic chemistry molecules

occur which apparently contain hundreds of constituent atoms, and the comparative stability of such systems is hard to understand, on any hypothesis.

One of the most fundamental assumptions of the molecular theory in its usual form is that the molecules of any one chemical substance are identically alike in all respects. This point was tested by Graham, in the case of hydrogen, by passing the gas through a series of porous partitions, and comparing the final hydrogen, as it issued from the last partition, with the original gas. No difference could be observed, and hence it was concluded that hydrogen, at least, is not a mixture of dissimilar particles; because it is known that a mixture of different gases, whose molecules are different in size, can be partially separated by a diffusion process of this kind. Stas, the great Belgian chemist, investigated this question by determining the atomic weight of a given element as prepared in different ways and from different sources; and he found that the results obtained under these varying conditions were indistinguishable from one another, even when his work was so accurate that a variation in the atomic weight of the hundredth part of 1 per cent could hardly escape detection. It cannot be considered to be proved, however, that the molecules of any one substance are alike in every way, in the sense that a hundred standard machine screws are alike, for the question has not yet been tested exhaustively enough. Graham's method and Stas' method furnish evidence to which proper weight should be given, but they cannot be said to be conclusive. Neither can we admit the evidence of the spectroscope to be conclusive, although it indicates that the internal vibrations of a molecule of hydrogen (for example) are performed with the same rapidity, whether the hydrogen is obtained from water, or from organic bodies, or from the gases that are occluded by meteorites and brought to us from the depths of space. The identity of molecules of the same substance is nevertheless a fundamental assumption of the usual molecular theory, and it will be assumed in the present article. In this connection the modern theory of isotopes should be considered. According to Soddy (who coined the word "isotope") it is possible, or perhaps probable, that many of the substances now considered to be homogeneous elements may prove to be heterogeneous when we know more about them. Each so-called element may consist of several different substances, which are inseparable and indistinguishable by any means we now have. Such substances are said to be "isotopic" with one another, and among the radio-active elements several such bodies have already been recognized. Ionium, thorium and radio-thorium are isotopes, for example. Consult A. W. Stewart, 'Recent Advances in Physical and Inorganic Chemistry.'

All matter may be classified, for present purposes, as (1) gaseous, (2) liquid or (3) solid. (See MATTER). According to the kinetic theory, a gas consists of molecules which are distributed through the space occupied by the gas in such a manner that the average distance from one molecule to the next one is large in comparison with the diameter of any one molecule. The molecules are all believed to be in rapid motion, so that from time to time they

encounter one another; and when an encounter occurs it is believed that the molecules that come together rebound again as if they were perfectly elastic bodies. They have motions of rotation as well as of translation, and the collisions affect both the rotative and the translatory velocities of the colliding molecules. A system composed of a practically infinite number of bodies of this sort will have certain properties which are considered in the article GASES, KINETIC THEORY OF, and shown to be in general agreement with the properties of the actual gases of nature.

It may be shown, by the methods of the kinetic theory of gases, that the speed with which the molecules of a gas are moving may be determined by means of the formula

$$\bar{v} = \sqrt{3PV}$$

where  $V$  is the volume, in cubic centimeters, of one gramme of the gas,  $P$  is the pressure exerted by the gas, in dynes per square centimeter, and  $\bar{v}$  is the square root of the average value of the squares of the velocities of the molecules, each expressed in centimeters per second. In the case of hydrogen at atmospheric pressure and the temperature of melting ice, we have  $V = 11,160$  and  $P = 1,012,000$ ; and therefore  $\bar{v}$ , for hydrogen molecules under the assumed conditions, is equal to 184,100 centimeters (or 1,841 meters) per second. The kinetic theory of gases shows that the true average (or arithmetic mean) of the velocities may be found by multiplying the so-called "mean-square velocity,"  $\bar{v}$  (as obtained above), by the constant 0.9213. Hence the average velocity of the molecules of hydrogen, under the conditions here assumed, is  $1,841 \times 0.9213 = 1,696$  meters (or 5,564 feet) per second. The mean (or average) velocity for any other gas, under these same conditions of temperature and pressure, may be found by dividing the velocity of the hydrogen molecules by the square root of the number that expresses the density of the other gas, when the density of hydrogen is taken as unity. Furthermore, the molecular velocity increases, in any given gas, in proportion to the square root of the absolute temperature.

The molecules of a gas undoubtedly attract one another under ordinary circumstances (except in the case of hydrogen, where the force appears to be repulsive at all distances); but it is assumed that they are so far apart during the greater part of the time that the attractive forces that exist do not have any great effect upon the motions of the system as a whole. The path of a molecule of gas, between two successive collisions, is called the "free path" of the molecule, and is believed to be sensibly straight, owing to the high velocity that the molecules have on the average, and the (assumed) fact that the attractive forces are unimportant at distances comparable in magnitude with the mean "free path." Maxwell showed that the average free path of the molecules of a gas may be calculated by means of the simple formula

$$L = \frac{3k}{SD}$$

where  $L$  is the average free path in centimeters,  $k$  is the coefficient of viscosity of the gas in absolute measure (see VISCOSITY),  $S$  is the

average speed with which the molecules are moving (in centimeters per second), and  $D$  is the mass of one cubic centimeter of the gas (in grammes). At atmospheric pressure and the temperature of melting ice, this formula gives values of  $L$  approximately as follows, where the unit, in each case, is the millionth part of a centimeter: Hydrogen, 17; nitrogen, 9.1; oxygen, 9.7; carbon dioxide, 6.4.

The length of the free path of a given gas is increased, when the density of the gas is diminished, in the exact inverse ratio of the change in density. In an exhausted tube containing hydrogen, for example, at a density one one-millionth of the density assumed above, the mean free path of the molecules would be a million times as great as the value given for hydrogen at the normal density—that is, the free path at this particular exhaustion would be 17 centimeters, so that the molecules would travel, on an average, over six inches between successive collisions. As the kinetic theory of gases assumes that the molecules collide with one another after traveling distances that are negligible in comparison with the dimensions of the whole mass of gas under consideration, its conclusions, when applied to gaseous masses in which this condition is not fulfilled, must be received with proper caution. Maxwell's formula, for example, is itself doubtful when applied to the extreme case in which the density of the hydrogen is only a millionth of the normal value. It is certain, however, that the free paths of gas molecules at such high exhaustions are to be measured in inches, and it is also certain that the pressure is not necessarily equal in all directions in vacua of this degree of perfection, since it is by means of the incessant collisions that this equality of pressure is brought about at ordinary densities. For these reasons (among others) Sir William Crookes considered that highly attenuated gases, in which the pressure is a millionth of an atmosphere or less, should be considered as constituting a "fourth state" of matter, essentially distinct in its properties from the three states that are commonly recognized. He also devised the radiometer and other instruments to show the reality of the difference of pressure that can exist in high vacua. In recent years it has become increasingly probable that in certain forms (at any rate) of the apparatus devised by Crookes,—in those forms, namely, in which "cathode rays" are generated by the action of powerfully excited electrodes,—the mechanical effects that are observed are not due directly to the motions of the gas molecules themselves, but rather to the motions of free electrical corpuscles given off by the gas molecules under the influence of the powerful electric discharge. Crookes himself appears to have held views not essentially different from this, though at the time they were stated they were clothed in language that was necessarily rather indefinite, since the corpuscular or electron hypothesis had not then taken form. See ELECTRON THEORY; RADIATION.

In liquids, the molecules are supposed to be so near together that the attractive forces that they exert upon one another are powerful at all times. The kinetic theory of liquids is imperfectly understood, but it is considered certain that collisions occur among the molecules just as they do in gases and that the

colliding molecules rebound from one another like perfectly elastic bodies. In liquids, however, there is nothing strictly analogous to the "free path" in gases; for the liquid molecules are always exposed to attractive forces of considerable magnitude and hence in the intervals between successive collisions they describe paths that are everywhere markedly curved. There is, doubtless, as great a variety of velocities among the molecules of a liquid as among those of a gas, but the law of distribution of velocities among liquid molecules has not yet been determined, on account of the mathematical difficulties that are involved and which have thus far proved insuperable. Admitting the fact that the velocities of the molecules are unequal, let us consider what would happen at a free surface of the liquid, assuming for the moment that above this free surface there is a boundless vacuum. A molecule that is well within the liquid is attracted, on the whole, equally in all directions. A molecule at the surface, however, is attracted only downward. Hence it is evident that when a molecule, in the course of its wanderings, comes to the surface, the possibility of its escape from the liquid depends upon the magnitude of the vertical component of its velocity. If this vertical component is sufficient to carry the molecule beyond the range of sensible attraction of the liquid, the molecule will pass away indefinitely into the space above. On the other hand, if the vertical component of its velocity is not sufficient to carry the molecule beyond the range of sensible attraction of the liquid, it will rise into the vacuous space only a short distance, its upward velocity growing less and less, under the influence of the downward attractive forces, until it vanishes altogether; after which the molecule will begin to fall back and it will finally plunge into the liquid again. From the slowness with which free evaporation takes place, we must conclude that by far the greater part of the molecules that start upward fall back into the liquid. Those that do escape by reason of their great velocities carry off more than their equable share of the kinetic energy of the molecules of the liquid and this causes the average kinetic energy of the liquid, per molecule, to grow continually less. In other words, free evaporation causes a reduction of the temperature of the mother liquid. When the liquid is enclosed in a containing vessel of finite volume, the phenomena are somewhat different, after the evaporation has proceeded for a time. If the space above the liquid is vacuous at the outset, the evaporation, at the first instant, takes place precisely as before. Of the molecules that come to the surface of the liquid, those that are moving most rapidly in a vertical direction fly off as in the case previously considered; but they can no longer pass away indefinitely into space. They are now retained in the vessel, in which they will accumulate, constituting a gas or vapor whose density will go on increasing until a certain limit is reached. The molecules composing this vapor will travel in every direction, precisely as they do in other gaseous bodies. Many of them, therefore, will plunge back into the liquid again and become an integral part of it once more. Now the number of molecules that leave the mother liquid in a given time will be quite independent of the density overhead; but the number that fly back into it again,

in a given time, will be greater, the greater the density of the vapor. At the beginning of the evaporation the vapor will be quite rare and the number of molecules that fly off in any given time will greatly exceed the number that return during that time. The density of the vapor will, therefore, increase. After a certain interval (short as measured by ordinary standards), the density of the vapor will become so great that the number of molecules plunging back into the liquid in a given time will become sensibly equal to the number that fly off from it in the same time. When this adjustment becomes perfect, the density of the vapor will no longer increase. It is then said to be "saturated," and its density will remain constant until the temperature of the system is altered. If the temperature be now raised, all the molecules will be accelerated and hence more molecules will plunge from the vapor into the liquid in a given time than before, and more molecules will also come to the surface of the liquid from the interior. Furthermore, of the increased number of molecules that emerge from the interior of the liquid, a larger proportion than before will have velocities exceeding the critical velocity that a molecule must have in order to escape from the attraction of its fellows. Hence, on the whole, the density of the vapor will increase, approaching a new limit at which the number of incoming and outgoing molecules will again become equal. It follows, therefore, that for any vapor in contact with its liquid there is a definite density corresponding to each temperature. The existence of a critical point (q.v.) may be explained in a similar manner, by considering the average kinetic energy that a molecule must have in order that it may be able to pass away from the attraction of other molecules in its immediate vicinity. A stone thrown upward by the hand does not proceed far before the attractive force of the earth annuls its velocity and causes it to fall back again. A rifle will project a ball far higher, but the ball will eventually fall back, just as the stone did. With a good modern cannon we can throw a projectile several miles into the air — and still it falls back. But we might conceivably project one with such a speed that it would leave the earth forever. It may be shown, in fact, that if the retarding action of the air is omitted from consideration, an initial vertical speed of 36,700 feet per second would be quite sufficient. With this much premised, conceive two molecules of a gas to be in contact, and let a sudden impulse be given to one of them, to drive it away from the other one. If the impulse is small enough, the disturbed molecule will only travel a short distance, and will then fall back to its original position; but we may give it such a speed that the attractive force of the fixed molecule will fail to bring it back, and in this case it will travel onward indefinitely. Now, just as in the case of the cannon-ball and the earth, there must be some intermediate initial speed that will be *just sufficient* to separate the two molecules under consideration. We may call this the "critical velocity," and we may say that if the molecules of a given gas are moving so that, on an average, when two of them collide they have a relative velocity greater than this critical value, the gas in question cannot be liquefied by pressure alone; for even if its molecules were forced almost into absolute contact with one

another, their velocities would be sufficient to separate them again indefinitely, as soon as the pressure was removed. From this, and from the relation between temperature and molecular velocity in gases (see GASES, KINETIC THEORY OF), it follows that for every gas there is a temperature above which the gas cannot be liquefied by any pressure whatever.

Very little is known about the molecular constitution of solid bodies. The most obvious property of a solid is, that it preserves its shape so long as it is not acted upon by external forces. Moreover, when such forces are applied, the solid indeed becomes deformed, but it eventually regains its original shape after the forces have been removed, provided they did not exceed a certain magnitude called the "elastic limit," which is peculiar to the solid under examination, and to the way in which the forces were applied. We are obliged to conclude, from these facts, that the molecules of a solid are not free to roam about, but that some or all of them have determinate mean positions about which they may oscillate and rotate, but from which they never permanently depart except when constrained to do so by an external force great enough to overcome the internal forces (whatever they may be) which normally determine the mean positions of the molecules. Some solids are brittle toward forces that are suddenly applied to them, although they yield slowly, and after the manner of a viscous fluid, to smaller forces that are applied continuously for a long time. A mass of cold pitch, for example, may be easily shattered by a blow, and yet when allowed to rest for a sufficient time upon an inclined plane, it yields gradually to the relatively insignificant force of gravity, loses its shape and slowly flows down the plane. It is evident that solids of this character must have exceedingly complicated structures. Maxwell suggested that they consist of two kinds of molecular groups, of which one is more stable than the other, and he supported his argument with considerable ingenuity. His views were purely speculative, however, and it appears to be fairly evident that the first advances that we make toward a good understanding of the molecular structure of solids must be based upon a study of bodies of crystalline nature, like quartz and iron.

It is certain that in crystals there is some definite regularity of orientation, either in the molecules themselves, or in their motions; and it may be fair to assume that this regularity is of such nature that any given molecule, in its vibratory excursions, never passes outside of a certain imaginary ellipsoid, which may be conceived to be described about the mean position of the molecule. Crystals may then be regarded as aggregates of such ellipsoids, piled up in such a way that the corresponding axes of all of them are either parallel throughout the mass, or at least arranged in accordance with some definite geometrical scheme. When a substance crystallizes, either from solution or from a state of fusion, the ellipsoids that bound the crystal molecules must necessarily arrange themselves so that the potential energy of the resulting solid is as small as it can be, consistently with the conditions under which the solidification takes place. For the sake of illustrating the application of the molecular theory to the explanation

of crystal structure, we may assume the ellipsoids to be simple spheres, and we may also assume that the potential energy of the system is least when the spheres are grouped together as closely as possible. The problem of crystal structure is then reduced, in its geometrical aspect, to the simple one of finding out how to pack the greatest number of equal spherical balls into a given space; and in order to properly comprehend the principles that are involved, a little patient experimentation with a liberal supply of buckshot or spherical bullets is desirable. It will be found that pyramids can be built with them, apparently in several ways; though the internal structure of the pile is really the same in all cases. The slant faces of these pyramids correspond to the plane faces of the actual crystal. When a crystal is forming (say by deposition from a solution) we are to conceive that a continuous series of exchanges is going on, all over its surface. Molecules of the dissolved substance are caught by the attraction of the growing crystals, but, on the other hand, molecules of the solidified crystal are continually passing into solution again; and the gradual increase in size of the crystal is due to the fact that in a unit time more molecules are caught by it than are lost again. Suppose, now, that the surface of a partially formed crystal is injured slightly, and let us represent the injury, in our shot pile, by removing a few of the shot from one of the faces of a pyramid. A molecule that happens to lodge in the injured place will be in contact with more of the other attracting spheres than it would touch if it were to collide with one of the uninjured parts of the crystal, and it will, therefore, be held more firmly in place. In the exchange of molecules between the crystal and the solution, a molecule thus embedded will be less likely to be torn away again; and this action tends to preserve the flatness of the faces of the growing crystals, and to cause the repair of damaged places to proceed with greater rapidity than the growth along normal, uninjured parts.

In the mathematical investigation of crystal-line structure it is usual to speak of crystals as possessing a "lattice-like" structure in space,—a space-lattice being defined as a numerous set of fixed points, arranged in such a way that the point-distribution is identically the same in every region. The points may be considered to be the mean positions about which the respective molecules oscillate. From the point of view of the investigator this conception has proved to be exceedingly useful, but for the purpose of giving a general conception of crystal structure the idea of piled spheres or ellipsoids is perhaps simpler and clearer.

It has been said, above, that the molecules of bodies attract one another. We do not know much, however, about the mechanism by which the attraction makes itself felt, nor even about the law in accordance with which the attraction falls off with increasing distance. It would be natural to assume it to vary as the inverse square of the distance, but it is usually held that there is good evidence that it falls off more rapidly than this, as the distance increases. Maxwell assumed, in certain of his writings, that the attraction varies as the inverse fifth power of the distance, but he apparently chose this law merely because it rendered certain of

his equations more manageable. William Sutherland has advanced reasons for believing that the inverse fourth power is more nearly correct for the distances that are commonest between the molecules of gases under ordinary conditions of density. We do not even know that the forces between molecules are "central,"—that is, we do know that the attractive force exerted by a molecule tends toward definite points within the substance of the molecules. Helmholtz showed, in a paper published in 1847, that if the universe consists of smooth spherical molecules, which attract one another only by forces that are directed toward their centres, the great fact of the conservation of energy is a necessary consequence (see *ENERGETICS*); but as we now have good reason for believing that molecules are not bodies of this sort, the principle of the conservation of energy must be regarded as a mere fact of observation. The distance at which the attractive force exerted by a molecule is still sensible is of course indefinite, depending as it does upon the delicacy of the means that are employed for the detection of the force. Maxwell showed that a soap-bubble would become unstable when its thickness is reduced until it is only equal to the radius of sensible molecular attractive power; and as Reinold and Rücker have shown that soap-films become unstable at a thickness of about one two-millionth of an inch, we may take this as a rough estimate of the limiting distance at which molecular attractive power ceases to be sensible.

The aggregate volume of all the molecules in a given mass of gas may be obtained, to a rough approximation, by several methods, among which we may mention the so-called "characteristic gas equation," which exhibits the relation between the pressure, density and temperature of a gas. Equations of this sort have been given by Van der Waals, Clausius and others, and in them a term occurs whose value depends upon the proportion that the bulk of the actual molecules bears to the total bulk of the gas that they constitute. The numerical magnitude of this term may be determined by experiments upon the variation of the pressure of a gas with temperature and density, and hence the aggregate bulk of all the molecules may be determined in a somewhat approximate manner. Roughly, it may be said that at ordinary densities, the actual total bulk of all of the molecules of a gas is from the thousandth to the ten-thousandth part of the bulk of the entire gas.

We are still far from being able to calculate the diameter of a molecule with any degree of precision, although we have no doubt advanced considerably beyond the point at which we stood when the first edition of the *Encyclopedia Americana* was published, for at that time asking how big a molecule is was much like asking "How big is a crowd?" The question could be answered only in an exceedingly crude way. We now know the individual *masses* of molecules with a considerable degree of precision, as will presently be shown; but we cannot hope to be able to determine the geometrical dimensions of molecules in more than a general way, until we attain to a clearer understanding of the physical constitution of these bodies. It is conventional, at the present time, to under-

stand, by the expression "diameter of a molecule" the diameter of the smallest sphere that can be imagined to be drawn around the molecule, consistently with the condition that nothing could collide with the molecule without penetrating this sphere. German writers have called this imaginary sphere the "Wirkungssphäre," and French writers call it the "sphère de choc" or "sphère de protection." Clausius and Maxwell showed that the diameter,  $d$ , of this collision-sphere may be calculated, in gaseous substances, by means of the expression

$$d = \frac{1}{\pi n L \sqrt{2}}$$

where  $d$  is the diameter in centimeters,  $L$  is the mean free path in centimeters and  $n$  is the number of molecules present in each cubic centimeter. The application of this formula to actual gases gives the following values of  $d$  (Perrin):

Helium .....	1.7x10 <sup>-8</sup> cm.
Argon .....	2.8x10 <sup>-8</sup> cm.
Mercury vapor .....	2.9x10 <sup>-8</sup> cm.
Hydrogen .....	2.7x10 <sup>-8</sup> cm.
Nitrogen .....	2.8x10 <sup>-8</sup> cm.
Chlorine .....	4.1x10 <sup>-8</sup> cm.

These values, although admittedly crude, are probably of the right general order of magnitude. See below for determination of  $n$ .

Considerable progress has been made in the last few years in the way of determining the masses of molecules, and the number of molecules that exist in a given quantity of matter. Some of the methods that have been proposed depend more or less directly upon a knowledge of the way in which the kinetic energy of a molecular aggregation is divided or partitioned among the constituent molecules. Our present knowledge with regard to molecular kinetic energy rests on a fairly sound basis in the case of gases, but it is still largely (though not wholly) conjectural in connection with liquids and solids. To facilitate the statement of the facts indicated by the kinetic theory of gases, let us assume that in any given mass of gas there are three intersecting and mutually perpendicular straight lines drawn in fixed positions in space, and let us call these lines the axes of X, Y and Z, respectively. The X-axis, for example, may extend in a north-and-south direction and the Y-axis in an east-and-west direction. The Z-axis will then be vertical. The individual molecules will be moving in every possible direction, and with the greatest imaginable variety of speeds, but we may simplify matters somewhat by conceiving the velocity of every one of them to be resolved into three components, each parallel to one of the three fixed axes we have drawn. Then, confining our attention for the moment to a gas containing molecules of only one kind, the kinetic theory tells us that one-third of the total kinetic energy that the molecules of the gas have, in virtue of their motions of translation, will be accounted for by the components that are parallel to each of the three fixed reference axes. Furthermore, if each molecule (so far as concerns the applicability to it, as a whole, of the accepted laws of mechanics) is assumed to be a rigid, elastic body in rotation, and if the rotation of every such molecule is resolved into component rotations about axes

passing through the centre of gravity of the molecule, and drawn parallel to the fixed axes of X, Y and Z, respectively, a similar statement may be made with regard to the rotational energy. Namely, one-third of the total kinetic energy represented by the rotations of the molecules will be accounted for by the component rotations about the axes that are parallel to the axis of X, and the remaining two-thirds will be accounted for by the component rotations about the axes that are parallel to the axes of Y and Z, respectively. Furthermore, the aggregate kinetic energy due to the translatory motion of the molecules in any one given direction is equal to the total kinetic energy due to the component rotations of the molecules about axes parallel to any one given direction. For the modifications to which this principle is subject when it is applied to molecules that have a number of degrees of freedom greater or less than six, reference should be made to GASES, KINETIC THEORY OF.

If the given gas contains molecules of several different kinds, then the kinetic theory teaches us (1) that the foregoing statements are true for each species of molecule, separately and independently of all the others; and (2) that the average kinetic energy of translation is identically the same in each of the several species of molecules that may be present; and furthermore, (3) that the average kinetic energy of translation, in any one set of molecules, is proportional to the absolute temperature of the gas as a whole.

The foregoing conclusions are based upon the researches of numerous mathematicians and physicists, beginning with Maxwell; but the principle of the equable partition of kinetic energy, as here described, was established, in its full generality, by Boltzmann, and is often called "Boltzmann's H theorem." (See, in addition, Watson, 'Kinetic Theory of Gases'). There has been considerable controversy as to the soundness of the proofs that have been given of it, yet the principle itself has been exceedingly fruitful, and it has played an important part in the development of the molecular theory in general. The consensus of opinion among physicists appear, to be, in fact, that the Boltzmann theorem, whether the proofs of it that we have are sound or not, constitutes a good general approximation to the real facts—provided we can regard molecules as behaving, in their excursions and encounters, substantially like solid and perfectly elastic bodies, which obey the same laws of mechanics that are followed by bodies large enough to be visible—and provided, furthermore, the molecules are not thrown into a state of internal vibration by reason of the shocks that they experience upon encountering one another.

It should be carefully noted, however, that even if we admit that Boltzmann's law of the partition of kinetic energy holds true in the case of a gas, it by no means follows that it is applicable to liquids and solids. In fact, certain of Boltzmann's fundamental assumptions are not fulfilled, even approximately, in liquids and solids; and hence his reasoning will not apply to such bodies, even though the conclusions at which he arrived may possibly still hold true. At first thought it appears highly improbable that molecular motions in solids

and liquids will be found to conform with the principles stated above, except that for any given substance the kinetic energy due to the translatory motions parallel to the three fixed axes will probably be equally divided, as before—though it is not obvious that even this would be true, in general, in crystals. Nevertheless, there is indirect evidence that tends to show that a distribution of kinetic energy similar in a general way to that established by Boltzmann for gases prevails also in liquids and solids. The numerous useful analogies that have been observed between gases and dilute solutions are strongly suggestive of a close relation in ultimate molecular behavior between liquids and gases, and the law of Dulong and Petit is similarly suggestive in connection with the solid state.

In physical chemistry it is often convenient to deal with the so-called "gramme-molecule" (or "gramme-atom"), a gramme-molecule (or gramme-atom) of any element or compound being defined as that quantity of it that has a weight in grammes equal to the molecular weight (or atomic weight, as the case may be) of the element or compound under consideration. The convenience of this unit depends mainly upon the fact that when we measure out any two definite chemical substances in quantities proportional to their respective molecular weights, we know that each sample then contains the same number of molecules. The actual determination of this number is a separate and special problem; but even if it proved to be forever impossible to enumerate the molecules, we should nevertheless find it useful, for many purposes, to know that the number of them is the same in two given cases. Assuming the atomic weight of magnesium to be 24.32 and that of platinum to be 195.2, to obtain a gramme-atom of each we weigh out 24.32 grammes of magnesium and 195.2 of platinum. Then we know, at all events, that we have taken the same number of atoms in both cases (except for slight errors in weighing and in determining the atomic weights). Now the specific heat of magnesium is 0.250 and that of platinum is 0.032. Hence  $24.32 \times 0.250 = 6.08$  calories of heat will be required to raise the temperature of the gramme-atom of magnesium by one Centigrade degree. Similarly,  $195.2 \times 0.032 = 6.25$  calories will be required to raise the temperature of the gramme-atom of platinum by the same amount. The point to be specially noted is that approximately the same amount of heat is required, *per atom*, to raise the temperature of either metal by one degree; and this appears to be the ultimate significance of the law of Dulong and Petit—which states that the product of the specific heat and atomic weight of a solid chemical element has an approximately constant value. It is true that there are apparent exceptions to this rule, but it is often found that there is a marked tendency to conform to the law when the temperature of the exceptional substance is raised. The law of Dulong and Petit has been the subject of many investigations, and it has been shown to be applicable to numerous compounds as well as to the elements. "This is the case even at the ordinary temperature," says Perrin, "for the fluorides, chlorides, bromides, iodides and sulphides of various metals, but not for oxygen-

ated compounds. A specimen of quartz weighing 60 grammes, composed of one gramme-atom of silicon and two of oxygen (or three in all), absorbs only 10 calories per degree of rise of temperature. But above  $400^{\circ}$  C. this same fragment uniformly absorbs 18 calories per degree, or precisely 6 for each gramme-atom,<sup>9</sup> which is substantially the same result as was obtained above, for magnesium and platinum at ordinary temperature.

The law of Dulong and Petit would be an immediate consequence, if we should assume (1) that the heat absorbed by the solid is all expended in accelerating the motions of translation and rotation of the molecules, (2) that the molecules of solid bodies all have the same number of degrees of freedom, (3) that the kinetic energy of translation of a molecule is the same (at any given temperature) whether the substance in which it exists is gaseous or solid, and (4) that the Boltzmann law of the partition of kinetic energy is fulfilled in solids. The first of these assumptions cannot be rigorously true either for solids or for liquids, and even in gases it is probably only closely approximate. The second assumption is also unlikely to be true of solid bodies in general, though solids may possibly be divisible into a small number of classes, in such a way that all the members of any one class will conform to it. When every reasonable allowance has been made for recognized uncertainties and sources of inaccuracy, the evidence that still remains is sufficient to suggest, as intimated above, that something akin to the Boltzmann law for gases holds true even in solids. Moreover, by making the assumption that a law of this general nature holds true in liquids, investigations have led to experimental results in good general agreement with those obtained by wholly different and totally independent methods.

Among the interesting and important results obtained by assuming that in liquids the kinetic energy of translation is distributed in accordance with the Boltzmann law those obtained by Perrin deserve conspicuous mention. (See BROWNIAN MOVEMENT). Perrin experimented with emulsions of various kinds, in which extremely small solid particles were suspended in liquids of a lesser specific gravity—extraordinary care being taken to have the particles uniform in size and as nearly spherical as possible. The most trustworthy results were obtained with gamboge or mastic, the gum being dissolved in alcohol and then precipitated by pouring the alcoholic solution into a large volume of water. Uniformity in size was assured by a careful fractional centrifugalization of the precipitated particles, while suspended in distilled water—a kilogramme of the original mastic furnishing, after several months, a fraction containing a few decigrammes of spherules of acceptable size and uniformity. The size and density of these spherules were then determined by several different methods, which gave concordant results. In the experiments that were considered by Perrin to be most reliable, the radii of the spherules were 0.367 of a micron—a micron being the thousandth part of a millimeter. Assuming that particles of this size, when suspended in a liquid, will comport themselves like molecules so far as the distribution of kinetic

energy is concerned, so that the average kinetic energy of translation of the gum particles will become equal, after a time, to the average kinetic energy of translation of the molecules of the liquid in which they are suspended, it is possible to obtain, from a study of the visible particles in an emulsion, definite information respecting the invisible molecules composing the liquid in which the emulsion is suspended. Perrin made use of no less than four different methods, in endeavoring, in this way, to ascertain the number of molecules in a gramme-molecule of matter, and he gives a general account of all four in his book on atoms. Surprisingly concordant results were obtained. In his simplest method, the emulsion was allowed to stand until the suspended particles in it had attained a permanent state of distribution—a condition which could be verified by making a microscopic examination of the emulsion, from time to time, at certain selected points. When the final state was reached, the number of solid particles per cubic millimeter of the fluid mass was greatest at the bottom of the containing vessel, and diminished in a regular manner with increasing height. A careful study was made, by means of the microscope, of the distribution of the solid particles at different heights, and by assuming that this distribution is determined by the same laws that hold in connection with gaseous molecules, it was found to be possible to determine the number of molecules in a gramme-molecule of matter of any kind. The idea upon which this work was based is exceedingly ingenious, and consists, as will be seen, in assuming that by working with fine-grained emulsions, where we have positive and definite knowledge of the mass, size, number, motions and distribution of particles that approach molecules closely enough to be presumably governed by similar laws, we can draw accurate conclusions as to the molecules themselves. From his most trustworthy series of experiments, Perrin concluded that Avogadro's number (that is, the number of molecules in a gramme-molecule of matter) is  $68.2 \times 10^{23}$ . If this number be accepted as correct, it follows that the mass of hydrogen atom is  $1.47 \times 10^{-24}$  grammes, from which we can easily obtain the mass of the atom or molecule of any other substance, the atomic or molecular weight of which is known.

Ingenious and important as Perrin's methods and results are, it is probable that future physicists will value them mainly for the light that they throw upon molecular behavior rather than because they afford us a means of determining Avogadro's number. In fact, we already have another and probably superior determination of the number of Avogadro, made by a totally different method, and based upon assumptions fewer in number and more likely to be generally admitted. Millikan, in his admirable and classic researches, found the value of the electron to be  $4.774 \times 10^{-30}$  absolute electrostatic units; and as the Faraday constant (or quantity of electricity required to liberate one gramme-atom of a monovalent element by electrolysis) is known to be 9,650 absolute electromagnetic units (or  $2,894 \times 10^{21}$  absolute electrostatic units), it follows that  $(2,894 \times 10^{21}) \div (4.774 \times 10^{-30}) = 60.62 \times 10^{23}$  separate and individual electrons are concerned

in the deposition of one gramme-atom of such an element. Hence we infer that  $60.62 \times 10^{23}$  is the value of Avogadro's number. This appears to be an unexceptional and exceedingly accurate method, provided we admit that one and only one electron is liberated or neutralized, for every atom of the monovalent element that is deposited,—an assumption which approaches closely to certainty, and which is far more likely to be true than are some of the assumptions that underlie other methods of determining Avogadro's number. Accepting Millikan's value of this number, it is easy to show that the mass of a hydrogen atom is  $1.662 \times 10^{-24}$  grammes, and that the number of molecules in one cubic centimeter of gas at  $0^\circ\text{C}$ . and 760 millimeters pressure, is 27,050,000,000,000,000,000. Millikan believes the probable error of his determination of the electron is only about the thousandth part of the concluded value as stated above, and if that estimate is justifiable, the values given above for Avogadro's number, for the mass of the hydrogen atom, and for the number of molecules in a cubic centimeter of gas, may be considered to be correct to the same degree of relative certainty,—that is, each may be considered subject to a probable error of the thousandth part of its own value.

Our knowledge of the constitution of the molecule, although still meagre, has been extraordinarily advanced in the last few years. In the earlier scientific treatment of the molecular theory, atoms and molecules were assumed to be hard, smooth, spherical and perfectly elastic. It is doubtful if any competent physicist really believed them to have these characteristics, but the difficulties involved in the mathematical treatment of the molecular theory were considered to be insuperable unless assumptions of the kind here indicated were made. It should be understood, however, that even although the actual molecules or atoms, if we could examine them individually and closely, might not resemble, in the least degree, the description of them thus given, yet they might behave collectively in much the same way as the spherical particles to which the mathematician found it necessary to confine his first investigations. Moreover, certain characteristics of the molecule may sometimes be accounted for by means of one set of assumptions, while certain other characteristics are best explained by the aid of an entirely different set. It is, therefore, wise to consider all the different constitutions that suggest themselves, in order to see what particular phenomena each one harmonizes with; for by doing this we may perhaps be aided in our approach to the final solution of the problem.

Rankine, following certain suggestions of Sir Humphrey Davy, developed a theory of molecular structure which he called the "hypothesis of molecular vortices" and which assumed that each fundamental atom consists of a nucleus or central point surrounded by an elastic atmosphere which is retained in position by attractive forces. He ascribed the elasticity of vapors to the centrifugal force developed in these atmospheres, which he assumed to be in a state of rapid revolution or oscillation about their central nuclei, and he believed that light is propagated through matter by means of the vibration of the central

atomic nuclei, which were assumed to exert attractive or repulsive forces upon one another. (To account for the propagation of light through free space he assumed a certain special constitution for the ether, with which we are not at present concerned). From this hypothesis of molecular vortices Rankine deduced a number of the known properties of bodies, being specially successful in connection with the pressure of saturated vapors; but subsequent mathematicians and physicists did not find the hypothesis attractive or promising and his theory still remains in the condition in which he left it, although it may yet be found to be a sort of crude forerunner of the modern corpuscular theory of molecular constitution.

Lord Kelvin made the interesting suggestion that atoms are merely definite portions of the ether of space, distinguished from the remainder of the ether by being endowed with a peculiar kind of motion called "vortex motion." The smoke rings that are sometimes seen over the stacks of locomotives afford familiar examples of vortex motion and the cyclone is another example on a grand scale. According to the principles of hydrodynamics it appears that a vortex ring, once set in motion in a frictionless fluid, would be indestructible and eternal. Moreover, it would possess certain elastic properties that are of special interest, inasmuch as perfect elasticity is one of the postulates that physicists have demanded for the atom or molecule from the very earliest times. It will be observed that the vortex theory of Kelvin does away with matter as distinct from the ether of space—the atom or molecule being distinguished from the remaining portion of the ether merely by reason of the special kind of motion with which it is endowed. Interesting as Kelvin's vortex theory is, it presents numerous difficulties that are almost insuperable as soon as we endeavor to develop it sufficiently to make it harmonize with the vast range of physical and chemical facts that we now possess.

Dr. C. V. Burton suggested, some years ago, that the atom may be simply a region in which the ether is subject to a permanent strain of some kind. This hypothesis may be capable of considerable further development, but it does not appear to harmonize with the direction in which present thought is tending. Dr. Burton's conception has the apparently unique merit of making it possible even to explain the origin of matter; for if the ether had long ago possessed motion of the most general kind, we might imagine its present condition to be due to the degeneration of that motion into a fine-grained turbulence, and if the constitution of the ether is such that strain-figures of the sort imagined by Burton are possible in it, then atoms may have resulted from time to time whenever the ether chanced to become stressed, locally, to such an extent as to take what would correspond in the world of familiar experience to a permanent set. In the vortex theory of Kelvin, an atom always consists of the same portion of ether, but in Burton's ether-strain theory it is only the strain that is propagated through the ether when the atom moves, the ether itself remaining motionless.

At the present time physicists strongly

favor the electrical theory of the constitution of matter. According to this view, an atom is a system composed largely or perhaps wholly of discrete charges of electricity, which maintain their individuality throughout all the changes that the atom undergoes. Much more is known about the negative charges than about the positive ones, because negative charges can easily be detached from atoms and molecules and subjected to study. The little charges or masses of electricity with which we are concerned in the investigation of molecular structure are commonly called "electrons," but some of the best modern authorities (following the original suggestion of J. J. Thomson) prefer to speak of them as "corpuscles" when considering them as physical bodies and to use the word "electron" as the name of a unit of electricity—the quantity of electricity, namely, that each corpuscle bears or of which it perhaps wholly consists. (See ELECTRON).

According to present views, all negative corpuscles are precisely alike, no matter from what source they come. The same is believed to be true of all positive corpuscles; but the positive corpuscle is believed to be differently constituted from the negative corpuscle—notably in respect to size and mass. There is also a marked tendency toward the belief that molecules contain nothing else in addition to these positive and negative corpuscles. If this conception be correct, we are to think of matter as being composed solely of electric corpuscles, the differences between the chemical elements being merely architectural—one differing from another only in the number and arrangement of the corpuscles of which the atoms consist.

We do not know the precise way in which the atom is put together, but certain fundamental facts in relation to its structure are becoming reasonably clear. In the early days of the electrical theory, Lord Kelvin suggested that the atom might consist of a spherical charge or mass of positive electricity of considerable magnitude, with many negative corpuscles oscillating or revolving within it. If the positive charge were distributed uniformly through the sphere, it would be easy to imagine a state of things in which the oscillations or revolutions of the negative corpuscles would be performed in certain definite periods and we might thereby hope to account for spectral lines that highly-heated substances show under suitable conditions. Later investigations have indicated, however, that this conception of the atom is hardly tenable. For example, it is now considered to be quite certain that the positive electricity in the atom is limited to an exceedingly small bulk, instead of occupying a considerable part of the total volume.

It is not possible to review all the theories of molecular structure that have been proposed and considered, nor would it be desirable to do so, because many of them that were regarded with considerable favor only a few years ago have now been definitely discarded on account of their demonstrated inadequacy. Something must be said, however, of the views that are at present in favor and which have been tested well enough to indicate that they are probably steps in the right direction.

It has long been known that the apparent mass of a body is larger when the body is

electrically charged than it is when there is no such charge present. The difference is too small to be observed in bodies of ordinary size, but the theory of electricity indicates that if the charge is concentrated in an exceedingly small volume, the apparent mass due to electrification may become very significant and important. Physicists now incline strongly to the view, in fact, that there is no such thing as "real mass" in the old sense of this expression, but that the mass of a body is due exclusively to the presence, within the molecules of the body, of the highly-concentrated electric charges that constitute the corpuscles of which these molecules are composed. (For discussion of electrical mass, see ELECTRON THEORY). The mass of a stationary or slowly-moving negative corpuscle has been shown to be equal to the one thousand eight hundred and forty-fifth part of the mass of a hydrogen atom. It was thought probable, a few years ago, that we should, therefore, have to assume that the hydrogen atom contains 1,845 of these corpuscles, if we are to explain its mass on the electrical basis. It is now believed, however, that the greater part of the mass of the atom is resident in the positive corpuscles that it contains, and if this be true it is no longer necessary to assume that the atom has the highly complicated structure that would be implied by the presence within it, in some form of stable arrangement, of nearly 2,000 negative corpuscles, even in the simplest case.

It appears probable, at the present time, that an atom consists of a certain number of centrally-located positive electrons, perhaps associated with an unknown number of negative corpuscles and certainly surrounded by other negative corpuscles which are in a state of rapid motion and which are related to the central nucleus in some such way as the planets of the solar system are related to the sun. Rutherford showed that the number of free positive electrons in a gold atom can be determined by observing the deflection experienced by alpha-particles (see RADIOACTIVITY) when these particles are passed through gold-foil of known thickness. The experiment was performed in Rutherford's laboratory (*Philosophical Magazine*, 1913, p. 604) and was repeated with foils composed of a number of other metals also, and it was found that, for the metals that were used, the number of free positive electrons in one atom was in each case approximately equal to half the atomic weight of the metal. This result harmonizes with the conclusions reached by Barkla from experiments of a wholly different kind; and Moseley, by his wonderful researches on the wave-lengths of X-rays, proved, beyond apparent question, that the number of free positive electrons in the nucleus of an atom is equal to the "atomic number" of the element to which the atom belongs—that is, to the number that the element bears when all the elements are arranged in accordance with the so-called periodic law. The results obtained by the methods of Rutherford and Barkla are only rough and approximate; but they substantiate Moseley's conclusions and as Moseley's results are absolutely definite and extraordinarily well founded, we may conclude that we now know, without much doubt, just how many free positive electrons the nucleus of every atom contains. The hydrogen

atom for example, contains 1; carbon atom, 6; chlorine atom, 17; iron atom, 26; gold atom, 79, and uranium, 92. We do not know how these central positive corpuscles are held together, but we infer that when an atom has no free electric charge, it contains, distributed through its outer regions, freely-moving negative corpuscles equal in number to the free positive electrons in the nucleus.

If these views be sound, then it follows that no very considerable part of the mass of the atom can be accounted for by the mass of the outer negative corpuscles, because they are too few in number. If, therefore, we adhere to the view that mass is wholly electrical, it is highly probable that the mass of the atom resides mainly in the central positive corpuscles of the nucleus. As we now know the number of these, we may obtain a general estimate of their size (in accordance with the principles explained under ELECTRON), in order that they may have the required mass. It is found, in this way, that the diameter of the positive corpuscle is only about one two-thousandth of the diameter of the negative corpuscle, and as the diameter of the negative corpuscle is only about the fifty-thousandth of that of the atom, it is evident that the positive corpuscle is minute beyond conception. If an atom were magnified up to the size of the earth, the negative corpuscle would have a diameter of about 850 feet and the positive corpuscle would have a diameter of only about five inches.

It will be evident, from the data here given, that an atom is far from being a solid, impenetrable body. It is more like the solar system in constitution—its bulk being mainly occupied by space, in which a few small corpuscles are circulating. This requires us to revise our old conception of the collision of atoms and molecules. They cannot often come together in actual physical contact, because the forces of attraction and repulsion that the component corpuscles exert are exceedingly great, and atoms or molecules, as they approach contact, must, therefore, be repelled apart with great violence by the mutual actions of their exterior negatively-electrified corpuscles; though it has not yet been made entirely clear how this tendency can be consistent with the facts of chemical combination. A particle possessing sufficient kinetic energy could penetrate an atom and pass through it without sensible perturbation, unless it happened to strike the small central nucleus; and we have photographic proof that the heavy, alpha-particles with which we have to deal in the study of radioactivity can pass through no less than half a million atoms in succession, before being stopped or sensibly deflected.

The electrical theory of the constitution of matter is still confronted by certain serious fundamental difficulties, notwithstanding its numerous successes. One of the most formidable of these difficulties is concerned with radiation. Electrical theory indicates, for example, that an electron must radiate energy whenever its motion is changed, either in speed or in direction. An electron revolving with uniform speed in a circular orbit would, therefore, radiate energy continuously. Unless we are prepared to abandon the principle of the conservation of energy or can show that atoms are continuously supplied with energy from

some external source, it is hard to escape from the conclusion that atoms are all "running down." In some cases, indeed, we have evidence that this is true. The radioactive elements, for example, are undergoing gradual spontaneous decomposition, but that is apparently due to the fact that the particular arrangements of electrons that prevail in their atoms are not altogether stable. It is no part of our present problem to consider whether this indicates that after a time the radioactive elements will disappear forever, or whether there is some unrecognized agency at work, renewing them, so that the supply will be maintained substantially as at present. It is important for us to note, however, that most of the matter with which we commonly have to deal is composed of elements that show radioactivity either very slightly or not at all; and hence we must recognize that the atoms of what may be called the "commonplace" elements are apparently stable, except as they are modified within certain limits by electrification, chemical combination or some other external influence.

In view of the difficulty just suggested, it has been assumed, by some of the leading physicists of the past few years, that the deduction that has been drawn from the theory of electricity, to the effect that an electron must radiate energy in consequence of a mere change in the *direction* of its motion, is (for some unknown reason) unsound and that radiation occurs only when the *speed* of the electron changes. A certain amount of indirect evidence in favor of this view is afforded by the phenomenon of permanent magnetism, which is not necessarily attended by the radiation of energy, although it is convenient to consider the magnetization to be due to the orientation of the orbits of some (or all) of the outer negative corpuscles in the atoms of the magnet. Apparently we here have a case in which the corpuscular revolutions continue indefinitely, without loss of energy by radiation.

Bohr has had marked success in accounting for radiation phenomena by assuming (1) there is no radiation from a corpuscle that is moving with uniform speed, even when the path it follows is curved; (2) that although the negative corpuscles in the outer parts of an atom normally revolve in circular orbits suggestive of those followed by the planets in the solar system, yet they may (and do) pass somewhat abruptly from one of these orbits to another; (3) that radiation from a corpuscle takes place only while the corpuscle is making a change of this kind in its orbit; and (4) that the possible stable orbits are not infinite in number, but that each stable orbit is characterized by the possession, by the corpuscle following it, of a quantity of kinetic energy expressed by  $\frac{1}{2} I h n$ , where  $I$  is any integer,  $h$  is Planck's constant (see RADIATION) and  $n$  is the number of orbital revolutions that the corpuscle makes per second. By means of his theory, Bohr is enabled to account for all the spectral lines of hydrogen with a wonderful degree of precision. The same high degree of precision is not obtained when the theory is applied to other elements, though the agreement is still close enough to be strongly suggestive. In fairness to Bohr's theory we should remember that it was originally proposed in

connection with the simple case in which the atom consists of a single negative corpuscle, revolving about a single free positive nucleus. That may very likely be the actual constitution of the hydrogen atom, and hence we should expect the most accurate correspondence with the facts in that case. When the atom contains a larger number of free positive and negative electrons, the fields of force that they produce will naturally overlap to a large extent and it is possible that some portion of the inaccuracy of the Bohr theory, when applied to elements other than hydrogen, may be due to this cause.

**MOLESKIN**, a fabric so called from its being soft like the skin of a mole. It is a strong twilled cotton fabric, cropped or shorn before dyeing. In the United States the word is also applied to the padded breeches worn by football players.

**MOLESWORTH**, mōlz'wërth, **SIR Guilford Lindsey**, English civil engineer: b. Milbrook, Hampshire, 3 May 1828. He studied at King's School, Canterbury, and at the Putney College of Civil Engineers; was apprentice to the chief engineer of the London and North-western Railway; was employed at Woolwich Arsenal during the Crimean War; went to Ceylon 1859, becoming director-general of railways there in 1867, and in 1871 was appointed consulting engineer to the government of India. He received decorations for his services in the Afghan and Burma wars and retired in 1889. He was president of the Institute of Civil Engineers 1904. He wrote a standard 'Pocket-Book of Engineering Formulæ,' various other works on technical subjects, 'Imperialism in India' (1885); 'Reason and Instinct in Ants' (1886); a prize essay, 'Silver and Gold' (1891); 'Our Empire under Protection and Free Trade'; 'Economic and Fiscal Facts and Fallacies' (1909).

**MOLESWORTH**, Mary Louisa Stewart, English writer of juvenile stories: b. Holland, 1842. In 1861 she was married to Major Molesworth of the Royal Dragoons. Her earlier writings were novels under the pen-name 'Ennis Graham'; she wrote her first children's stories about 1875 and gained an immediate success. Her most famous titles are 'Carrots' (1876); 'The Green Casket' (1890); 'Meg Langholme' (1897); 'The Laurel Walk' (1898); 'The Grim House' (1899); 'This and That'; 'The House that Grew' and 'Peterkin.' Among her later novels are 'Hather-

court Rectory'; 'The Red Grange' and 'Fairies Afield.'

**MOLESWORTH**, **SIR William**, English politician: b. London, England, 23 May 1810; d. there, 22 Oct. 1855. In 1823 he succeeded as 8th baronet; studied at Edinburgh and Cambridge, but was obliged to leave the latter because of his having challenged a tutor to a duel, and completed his education in Germany. He was a member of Parliament for East Cornwall 1832-37, for Leeds 1837-41 and for Southwark from 1845 till his death. In 1853 he became first commissioner of public works under the Earl of Aberdeen, and in 1855 was colonial secretary under Palmerston. The close friend of Bentham and James Mill, he was looked upon as the parliamentary exponent of the "philosophical Radicals." He founded the *London Review* in 1835 and the next year merged it in the *Westminster Review*. Consult Fawcett, M. G., 'Life of Sir William Molesworth' (London 1901).

**MOLFETTA**, mōl-fët'tä, Italy, a seaport city in the province of Bari, on the Adriatic, 15 miles northwest of the city of Bari. It has a magnificent Romanesque cathedral of the 12th century; several other churches; a college; manufactures of linen and saltpetre; a harbor, well-sheltered except on the north, and a considerable trade in corn, oil and fruit. Pop. 43,263.

**MOLIÈRE**, mō-lë-är (assumed name of **JEAN BAPTISTE POQUELIN**, zhōn bā-tëst pōk-ë-län), French dramatist: b. Paris, 15 Jan. 1622; d. there, 17 Feb. 1673. His father was *valet de chambre* and upholsterer to the king. When his father had become debilitated he had to discharge his office about the person of Louis XIII. In 1641 he accompanied the king to Narbonne. The French theatre had at that time begun to flourish through the talents of the great Corneille, and young Poquelin, who had imbibed a strong passion for the stage, now formed a company of young persons of similar tastes, exchanged his family name for that of *Molière*, and resigned the office of his father. His company soon became distinguished; and we find him at the head of a strolling troop, which acted 'L'Etourdi' at Lyons probably in 1653. This is the first comedy written in verse by Molière. The truth of the dialogue, the inexhaustible skill of a valet continually employed in rectifying the blunders of his master, the interest of the situations arising therefrom, have kept this piece on the stage notwithstanding the want of connection between the parts. Molière gained equal applause as a poet and an actor, and drew all the spectators from another company at Lyons. The art of representing character and manners on the comic stage was reserved for Molière. 'L'Etourdi' was acted with equal applause in Béziers. Here the Prince of Conti, who had known Molière at school, had just assembled the estates of Languedoc. He received the poet as a friend, and entrusted him with the charge of amusing the town and the assembly. 'Le dépit amoureux' (1656) and 'Les précieuses ridicules' (1659) were brought forward in the theatre of Béziers. In 'Le dépit amoureux' the incidents are better arranged than in 'L'Etourdi.' In the actions of the personages a genuine comic vein is exhibited, and their language displays much spirit and humor; but the plot is too com-

plicated, and the *dénouement* not sufficiently probable. The plot in the 'Précieuses ridicules' is more simple. A delicate satire on the prevailing affectation of the character of *bel esprit* and of a romantic style, on the pedantry of learned females, and affectation in language, thoughts and dress, is the object of this comedy. It produced a general reform after it was brought out in Paris. The spectators laughed, recognized themselves, and applauded. Louis XIV, well pleased with the performances of Molière's company, made it his own company, and gave its director a pension of 1,000 livres. 'Sganarelle' appeared in 1660. This piece also contains a fund of sportive humor, and keeps the spectators continually amused. Censure was not silent on its appearance, but was not listened to. 'Don Garcie de Navarre' (1661), in imitation of the Spanish, was criticized with more justice. It is a cold attempt at a more elevated style. 'L'Ecole des maris' (1661) the idea of which is drawn from the 'Adelphi' of Terence, contains a simple and entertaining plot and a natural *dénouement*. The theatre still resounded with the applause with which this piece was received, when 'Les fâcheux' (1661), projected, executed and committed to memory by the actors within a fortnight, was performed at Vaux at the residence of Fouquet, intendant of finances, in the presence of the king and court. This comedy is almost destitute of plot, but the intention was to interest the spectators by the multiplicity of characters, the truth of the portraits, and by the elegance of the language. It is said that the king, on going away from the first performance, happening to see the Count Soyecourt, a tiresome narrator of his exploits in the chase, said to Molière, "There is an original that you have not copied." In 24 hours the scene of the hunter was inserted; and as Molière was not acquainted with the terms of the chase, he requested Soyecourt himself to explain them to him. 'L'Ecole des femmes' (1662) met with critics, who, overlooking the art which prevails in the management of the inferior personages, and in the natural and quick transition from one surprise to another, animadverted upon some negligences of style. Molière answered them by his spirited 'Critique de l'école des femmes' (1663). The 'Impromptu de Versailles' was a reprisal occasioned by an attack of Boursault, who had written a piece against him, entitled 'Le portrait du peintre.' The court was much pleased in 1664 with 'La princesse d'elide,' a comic ballet, prepared for an entertainment given by the king. Another ballet, 'Le mariage forcé,' is drawn from Rabelais. 'Don Juan' (1664), excited much reprehension by the impiety of some of the expressions placed in the mouth of the profligate hero. Molière retrenched the objectionable parts in the second representation. 'L'Amour médecin' (1665) is one of the over-hasty works which are not to be strictly criticized. It was written, studied and represented within five days. In this Molière for the first time attacks the physicians. His great piece, 'Le misanthrope' (1666), was but moderately well received at first, but in the sequel was justly considered as one of the finest productions of modern comedy. It has been more admired in the closet than it has pleased on the stage—the reason Voltaire believes to be because the plot

is delicate and ingenious rather than lively and interesting; because the dialogue, with all its beauty, does not always seem necessary and therefore retards the action; and because the *dénouement*, though skilfully introduced, leaves the spectator unexcited. In 1665 appeared 'Le médecin malgré lui,' a farce full of humor. 'Le Sicilien' (1667) is a short piece which pleases by its grace and gallantry. But his reputation was carried to its highest summit when 'Le Tartufe' appeared. Three acts of the comedy had been performed in May 1664 before the king; but its pointed wit gave great offense to all the ecclesiastical authorities, and it was not until 1669 that permission was given for adequate unexpurgated representation. In this hypocrisy is fully unveiled, the characters are equally various and true, the dialogue is elegant and natural, the *dénouement* alone is unsatisfactory. An impious and obscene farce, entitled 'Scaramouche,' having been represented at court, the king said to the great Condé, as he was leaving the theatre in his company, "I should like to know why the people, who are so much scandalized at Molière, say nothing about 'Scaramouche.'" "The reason is," replied the prince, "that 'Scaramouche' ridicules only God and religion, about which these people care nothing, while Molière's piece ridicules themselves." In 1668 Molière published his 'Amphitryon,' a free imitation of Plautus. With the exception of a tedious scene between Jupiter and Alcmena, nothing can be more humorous. 'L'Avare' (the Miser), an imitation of the 'Aulularia' of Plautus, is, in the leading character, a little overdone; but the multitude is only to be struck by strong traits. 'George Dandin'; 'Monsieur de Pourceaugnac'; 'Les Fourberies de Scapin,' are rather amusing than instructive. 'Le Bourgeois Gentilhomme,' though mixed with some buffooneries, is full of power. Molière bestowed more care on his 'Femmes Savantes,' a witty satire on affected taste and pedantic learning, which at that time prevailed in the Hôtel de Rambouillet. The incidents are not all well connected; but the subject, dry as it may be in itself, is exhibited in a truly comic form. The development is admirable, and has been a hundred times imitated. The same is true of the 'Malade imaginaire,' in which the quackery and pedantry of the physicians of the times are fully delineated. With this piece the author concluded his career. He was indisposed when it was performed, and the exertion with which he played produced convulsions, followed by a hemorrhage, and he died after the lapse of a few hours. The archbishop of Paris at first refused him burial; but the king himself insisted on it, and he was interred in the cemetery behind the chapel of Saint Joseph, Rue Montmartre. In 1792 his remains were transferred to the Museum of French Monuments, whence in 1817 they were removed to Père Lachaise.

Molière is the true father of French comedy. His works may be considered as a history of the manners, fashions and tastes of his times, and as the most faithful pictures of human life. Born with an observing mind, skilful in catching the outward marks of the passions and emotions, he took men as they were, and, with singular felicity, exhibited the most sacred recesses of their hearts, and the tone, the action

and the language of their various feelings. Of all who have ever written, Molière is the one who has best observed men without seeming to do so. His knowledge of human character seems to have come by intuition. In his domestic relations Molière was not fully happy; he who made merry on the stage with the weaknesses of other men could not guard against his own weakness. A violent passion induced him to marry the daughter of the actress Béjart, and he thereby incurred the ridicule he had so often cast on husbands of a disproportioned age. As an actor Molière was not to be surpassed in high comic parts, such as Arnolphe, Orgon, Harpagon, etc. An edition of Molière published at Paris in 1838 gave the actors' names after the *dramatis personæ*, from which we learn that Molière always played the principal comic parts himself. Among the last and best editions are those of Monval (8 vols. 1882); A. France (7 vols., 1876-91); and Desfois and Mesnard (11 vols., 1873-93). See DON JUAN; LEARNED LADIES, THE; MISANTHROPE, THE; TARTUFFE. Consult biographies by Baluffe (1886); Chatfield-Taylor (1906); Desfeuilles (1900); Larramouet (1886); Lotheissen (1880); Mahrenholtz (1881); Brander Matthews (1910); Mesnard (1889); Moland (1886); Regal (1910); Schneegans (1901); Trollope (1905); Wolff (1910); also 'Lacroix, 'Bibliographie Molièresque' (1875); Loiseleur, 'Points obscurs de la Vie de la Molière' (1877); Livet, 'Lexique de la Langue de Molière (1895-97)'; Miles, 'Influence of Molière in the Restoration Comedy' (1910).

**MOLINA**, mō-lē'nā, Alonso de, Spanish missionary: b. Escalona (Toledo), Spain, about 1510; d. Mexico, 1584. He accompanied his parents to San Domingo, and in 1523 went to Mexico, where he learned the Aztec language and acted as interpreter to the Franciscan monks, whose order he subsequently joined and engaged in missionary work, in which he was very successful. He was superior of the province of Santo Evangelio, and his books are among the earliest printed in America. Among them are 'Diccionario de la lengua Castellana y Mexicana' (1555); 'Arte de la lengua Mexicana' (1578); and several works in the Aztec language.

**MOLINA**, Juan Ignacio, Chilean naturalist and historian: b. province of Talca, Chile, 24 June 1737; d. Bologna, Italy, 12 Sept. 1829. He was educated in the Jesuit College at Santiago, and entering the order after its expulsion from America in 1767, settled in Italy. After 1774 he lived at Bologna, teaching and writing. He published 'Compendium of Chilean History' (1776); 'Essay on Chilean Natural History' (1782); 'Essay on Chilean Civil History' (1787), the last-named being translated into several languages, including English, etc.

**MOLINA**, Luis, Spanish Jesuit: b. Cuenca, New Castile, 1535; d. Madrid, 12 Oct. 1600. He entered the Jesuit Order (1553), was appointed (1570) teacher of theology at Evora, but turned to literary work (1590) and died soon after being called to the chair of moral theology at Madrid. His most important work is 'Liberi arbitrii cum gratiae donis, etc., concordia' (Lisbon 1588), which made him famous and created a great controversy; the Domini-

cans contested his views as antithomistic, but many Jesuits (Molinisten) defended him with the consequence that a quarrel ensued that ended in the Jansenist dispute. Consult Schneemann, 'Die Entstehung der thomistische molinistischen Kontroverse' (Freiburg 1879-80); Régnon, Th. de, 'Bannésianisme et Molinisme' (Paris 1890); Gayraud, 'Thomisme et Molinisme' (Toulouse 1890-92).

**MOLINA**, Olegario, Mexican statesman: b. Bolonchenticul, Campeche, 1843. He was educated in the Seminary of San Ildefonso, Merida, where he subsequently became a professor. Later he founded in Merida a school of primary and secondary instruction, and still later a benevolent society known as "The Youth." During this period he established and conducted two journals, *La Guirnalda* and *Yucatan*; was elected to the Merida city council and later served one term in the national Congress. Returning to Yucatan he served as fiscal magistrate of the superior court of the state till in 1877 he took charge of the construction of the first railway in Yucatan, — the line which connects the cities of Merida and Progreso, — completing it in two years notwithstanding most discouraging conditions, and afterward and until 1881 operating it as manager. In the latter year he organized the present commission and banking house of O. Molina and Company. In 1902 he was elected governor of his state for the four years ending 1906, when he was re-elected. Owing to ill health he retired from the governorship at the end of the first year of his second term. In March 1907 he was appointed by President Diaz to the Cabinet position of Secretary of Fomento, colonization and industry. During his five years' service as governor Mr. Molina introduced and successfully carried through many important public improvements and reforms in the several departments of government, greatly advanced the cause of education, stamped out yellow fever at Merida and built a fine general hospital and an asylum for the insane.

**MOLINA**, Tirso de. See TÉLLEZ, GABRIEL.

**MOLINARI**, mō-lē-nā-rē, Gustave de, Belgian political economist: b. Liège, Belgium, 3 March 1819; d. 1911. He studied medicine and became a homœopathic physician in Brussels, but upon removing to Paris he entered journalism. His reputation as a radical compelled him to return to Belgium upon the accession of Napoleon III and he was appointed to the chair of political economy in the Musée Royal d'Industrie Belge. In 1881 he returned to Paris and edited the *Journal des Economistes* and later founded the journals *L'Economiste Belge* and *La Bourse du Travail*. Among his books are 'Etudes économiques' (1846); 'Cours d'Economie politique' (1861); 'L'Evolution économique' (1880); 'Comment se resoudra la question sociale' (1896), etc.

**MOLINE**, mō-lēn', Ill., city in Rock Island County, on the Mississippi River, and on the Chicago, Rock Island and Pacific, the Chicago, Burlington and Quincy and the Chicago, Milwaukee and Saint Paul railroads, adjoining Rock Island on the west, nearly opposite Dav-  
enport, Iowa, about 181 miles west of Chi-

ago. In the part of the river between Moline and Davenport is an island from which to the shore have been built dams to secure water-power. Moline has good water-power which is utilized in developing the manufacturing industries. The extensive coal fields in the near vicinity contribute to the industrial development of the city. The chief manufactures are wagons, carriages, automobiles, tractors, furniture, agricultural machinery, steel, foundry and machine-shop products, steam engines, saw- and planing-mill products, pumps, paper, flour and dairy products. Some of the prominent buildings are a library building, which cost (1903) \$50,000, a city hospital, several fine church and school buildings. The city library was founded in 1892 and contains over 16,000 volumes. There is a good library connected with the high school. The city owns and operates the waterworks. Pop. 24,199.

**MOLINO DEL REY**, mō-lē'nō dēl rā, Battle of, in the Mexican War (q.v.). Having captured Vera Cruz (q.v.) in March, Gen. Winfield Scott (q.v.) continued on toward his objective point—Mexico City—and on the way fought and defeated the Mexicans in the battles of Cerro Gordo, Contreras and Churubusco (qq.v.). In order not to hinder the peace negotiations then under way, Scott, on 24 Aug. 1847, arranged an armistice with the Mexican general, Antonio Lopez de Santa Anna (q.v.) but Scott soon learned that, in spite of his pledge to the contrary, Santa Anna was strengthening his fortifications, casting cannon from old church bells, and in other ways preparing for a resumption of hostilities. On 6 September Scott ordered such activities to cease on pain of suspending the armistice and proceeding with his attacks. The next day Santa Anna replied accepting the latter alternative whereupon, on the night of the 7th, Scott drew up his troops preparatory to storming the Mexican works. Scott's troops were divided as follows: those under Gen. John A. Quitman (q.v.) at San Augustin; those under Gen. David E. Twiggs (q.v.) at San Angel; those under Gen. Gideon J. Pillow (q.v.) at Mexico, and those under Gen. William J. Worth (q.v.) at Tacubaya, where Scott himself had his headquarters. A mile or so away was a cluster of stone buildings known as El Molino del Rey, which had been used a foundry and which formed the west end of an enclosure surrounding the hill and castle of Chapultepec. A short distance west of Molino was La Casa Mata, a strong stone building defended by an earthwork, between the two lying Mexican batteries and infantry; west of Casa Mata was the Hacienda de los Morales, where another body of Mexicans was lodged. At about 4 o'clock on the morning of 8 September Worth's division began the assault on the Mexican centre and left. The artillery thundered against the walls of Molino del Rey and the advanced batteries which, despite a desperate rally of the Mexicans, were captured; and the Mexicans on the left were driven from their position under the protecting guns of Chapultepec. The Casa Mata proved to be a stumbling block, since being surrounded with bastioned intrenchments and deep ditches, it afforded excellent protection against an assaulting column. The first American assault was repulsed, but after the

Molino had been captured, all the American guns were brought to bear on Casa Mata. As the garrison was cut off from all support and exposed to a most destructive fire, the place was evacuated; two attempts were made to recover the lost position but nothing could face the terrific artillery fire of the Americans, so that by 9 o'clock in the morning the battle was over. The Casa Mata was then blown up and the troops were marched to Tacubaya to prepare for the final assault on Chapultepec (q.v.). The Americans engaged numbered less than 3,500 of whom 787 were killed or wounded; the Mexicans numbered at least 10,000 and lost 3,000 dead, wounded and prisoners, among the dead being two generals. Consult Ladd, H. O., 'The Mexican War' (pp. 244-48); Scott's 'Memoirs' (Vol. II); Wright, M. J., 'Life of Scott' (pp. 218-22); Wilcox, C. M., 'History of the Mexican War'; Wiley and Rines, 'The United States' (Vol. VII, pp. 242-45).

**MOLINOS, Miguel de**, mē-gēl' dā mō-lē'nōs, Spanish mystic, founder of the Quietists: b. near Saragossa, 21 Dec. 1640; d. Rome, 29 Dec. 1696. He studied at Pamplona and Coimbra, took holy orders, went to Rome in 1669, and there published in 1675 his 'Guida spirituale,' which urged the immediate presence of God and pure love toward God as the only way to salvation and peace, which cannot be attained until the soul is free from all that is material. His opponents, notably the Jesuits, held that this meant the indifference of the individual to the external world. In 1685 he was summoned before the Inquisition; two years later was found guilty of spreading dangerous doctrines. He publicly recanted all his teachings and was imprisoned until his death. Even Pope Innocent XI, a friend of Molinos, was examined by the Inquisition—but not as Pope, merely as Odescalchi, an individual. The 'Spiritual Guide' has been translated into the languages of Europe. See QUIETISM. Consult Bigelow, 'Molinos the Quietist' (New York 1882).

**MOLLAH**, mōl'a, or **MULLAH**, mül'a, a Turkish title, originally meaning simply "lord," or "sir," in its narrower usage a judicial rank. In Turkey there are three classes of mollahs, with jurisdiction over divisions of various importance; those in control of small towns constitute the lowest grade; they, like the second grade, hold office only for a month at a time; the first grade is made up of those having legal authority over pashaliks. The mollah ranks below the kahiaskar and mufti, but is superior to the cadi. He is versed in both ecclesiastical and civil lore. Hence and because of its original meaning, the word is often used more loosely of Mohammedan dignitaries or scholars in Africa. See MAD MULLAH.

**MOLLAT**, mōl'lät, **Guillaume Marie Charles Henri**, French clergyman and historian: b. Nantes, France, 1 Feb. 1877. He received his education at the Ecole des Hautes Etudes, Seminary of S. Sulpice, Paris, the French Seminary, Gregorian University and Vatican Palæographic School, Rome. In 1900 he was ordained to the Catholic priesthood; was chaplain of the church of Saint Louis of the French, Rome, 1902-05, chaplain of the

Basilica of Montmartre, Paris, 1905-08, and since 1914 assistant at the church of Our Lady of Mercy, Passy. He has written 'Mesures fiscales exercées en Bretagne par les papes d'Avignon à l'époque du Grand Schisme d'Occident' (1903); 'Etudes et documents sur l'histoire de Bretagne' (1907); 'Les papes d'Avignon' (1912); 'Etude critique sur les Vitæ Papparum Avenionensium d'Etienne Baluze' (1917). He collaborated in 'Dictionnaire Apologétique de la Foi Catholique'; 'Dictionnaire d'histoire et de géographie ecclésiastiques,' and is a contributor to 'The Catholic Encyclopedia,' the *Revue de l'Art Chrétien*, etc.

**MOLLENDO**, mól-lán'dó, Peru, a seaport on the Pacific Coast, in the department of Arequipa, near the mouth of the river Tambo, seven miles south of Islay. A railway connects it with Puno on Lake Titicaca. It is the port through which the bulk of the imports and exports of southern Peru and Bolivia pass. The principal exports are alpaca, wool, quinine, tin, silver and copper ores to an average annual value of \$5,520,000; imports average \$2,600,000. Pop. 4,000.

**MÖLLHAUSEN**, mël'how'zën, Baldwin, German traveler and novelist: b. Bonn, 27 Jan. 1825; d. Berlin, 28 May 1905. He studied agriculture in Pommerania, then went (1850) to North America, joining (1851) Duke Paul of Württemberg and his party in the Rocky Mountains. He was wounded by Indians but, after five months, navigated the Mississippi to New Orleans. He became topographer and draughtsman, at the instigation of Alexander von Humboldt, for an American scientific expedition to the Far West, returning (1854), via San Francisco and the Isthmus of Panama, to Germany, where he was appointed custodian of libraries in Potsdam. He made another trip (1857-58) to North America exploring central Colorado. He wrote 'Tagebuch einer Reise vom Mississippi nach den Küsten der Südsee' (Leipzig 1858) and 'Reisen in die Felsengebirge Nordamerikas' (ib. 1861). Of his novels most relate to adventure in America. Noteworthy are 'Die Halbindianer' (1861); 'Der Flüchtling' (1862); 'Der Mayordomo' (1863); 'Das Mormonenmädchen' (1864; 3d ed., 1871); 'Reliquien' (1865); 'Die bieder Jachten' (1891); 'Der Spion' (1893); 'Das Fegefeuer in Frappes Wigwam' (1900), etc. A collection of his works was published (1906-13), under title of 'Illustrierte Romane, Reisen und Abenteuer.'

**MOLLOY**, Joseph Fitzgerald, Irish author: b. New Ross, County of Wexford, 19 March 1858; d. London, 19 March 1908. Among his numerous works may be cited 'Court Life Below Stairs, or London under the First Georges' (1882); 'Court Life Below Stairs, or London under the Last Georges' (1883); 'Life and Adventures of Peg Woffington' (1884); 'Life and Adventures of Edmond Kean' (1888); 'The Most Gorgeous Lady Blessington' (1896); 'Historical and Biographical Studies' (1897); 'The Queen's Comrade' (1901), etc.

**MOLLUSCA**, one of the great divisions or phyla of the animal kingdom, containing the oysters, clams, snails, slugs, squid and cuttlefish. The group is sharply marked off from all others

and is characterized by the following features: The body is primarily bilaterally symmetrical with the mouth and anus at the two ends of the body, the alimentary tract traversing it as an axis, but this bilateral symmetry frequently becomes obscured by secondary changes, often of a torsional nature. On the lower surface of the body is developed a muscular outgrowth, the foot; while on either side a fold of skin arises near the back and hangs down enclosing a space between it and the body and foot. The fold is the *pallium* or mantle, and the cavity is called the mantle or branchial chamber, from the fact that the true gills (*ctenidia*) arise in the angle between mantle and body and project into the space. The dorsal surface of the body usually has the power of secreting a protective shell, ordinarily strengthened by carbonate of lime. The heart, which always contains arterial blood, lies in a chamber (the *pericardium*) dorsal to the intestines, while the excretory organs, which are true nephridia, connect the pericardium with the outer world. The nervous system consists of a series of paired ganglia connected by nerve-trunks. Of these ganglia the most constant are (1) the cerebral, at the anterior end, above the œsophagus; (2) the pedal in the foot; (3) the parietal on the sides of the body; and (4) the visceral near the hind end of the body ventral to the intestine. All of the 10,000 species of living mollusks are built upon this plan.

**Details of Structure.**—*Mantle and Foot.*—Typically the mantle is a paired structure, but in most groups the two halves unite in front and behind. This has its effect upon the shell, since where the lobes are separate, there are two halves or valves to the shell, but where united there is but a single (univalve) shell. Sometimes this univalve shell is a straight cone, but, while conical, it is usually coiled in a spiral, a part of the body extending toward the apex of the cone. As the animal increases in size the shells also increase in thickness and extent, the successive additions being usually recognizable on the external surface by lines of growth which run parallel to the free edge of the shell. When the edge of the mantle is provided with projections, lobes, etc., these cause ridges or protuberances on the surface of the shell. When the mantle is colored (striped or spotted), the color-pattern is reproduced in the shell, since pigment from the mantle is deposited along with the carbonate of lime. There is also a structure to the shell which needs mention. On the outside is usually a thin organic cuticle and beneath this two layers of carbonate of lime. Sometimes the inner of these layers consists of thin lamellæ parallel to the surface, the free edges of which produce diffraction spectra and thus give the inside of the shell an iridescent appearance—mother-of-pearl. See PEARL.

In the bivalve shell (see BIVALVES) an elastic hinge ligament connects the two valves and causes them to open. The valves are closed by muscles (adductors), one or two in number, which extend across the body, from valve to valve. In the univalves there is always a muscle attached to the inside of the spiral, by the contraction of which the animal is retracted into the shell, the foot being the last part to disappear. In many groups the posterior dorsal part of the foot bears a horny or calcareous plate, the *operculum*, which closes the aperture

of the shell like a door when the animal is retracted. On the other hand the shell is frequently greatly reduced and may become internal, as in the slugs and squid; or it may be entirely absent in the adult, as in the so-called naked mollusks (nudibranchs) although it is formed in the young and later lost.

*Foot.*—The foot, which projects from the mid-ventral surface of the body, shows great modifications, but is rarely lacking. Usually it forms a broad creeping disc on which the animal glides about, but in the *Scaphopoda*, as in most *Pelecypoda*, it is flattened from side to side and forms an efficient digging organ. In the cephalopods it becomes developed in part into the tube (siphon) connecting the mantle-cavity with the exterior; in part into the tentacles surrounding the head.

*Digestive Organs.*—The alimentary canal is typically a straight tube, but in most forms it becomes convoluted to increase the amount of digestive surface, while not infrequently it is so flexed on itself that mouth and vent, instead of being at opposite ends of the body, are in close proximity to each other. In all except the *Pelecypoda* the region of the mouth contains a peculiar structure, variously known as the lingual ribbon, radula or odontophore. This consists of a strong band, having upon its upper surface numbers of rows of hard horny teeth—in fact, a flexible file; and of muscles adapted to draw it back and forth over any object to which the mouth may be applied. In this way the snails rasp away vegetation, or, as in the case of shells of other mollusks, are perforated in order that the soft parts may be reached and devoured. In the cone-shells a poison-gland is connected with the lingual ribbon. Wear at one end of the ribbon is made good by constant growth at the other end. Behind the gullet is a large sacular stomach, and closely connected with it are the ducts of the voluminous liver. The intestine is long, without enlargements, and in many acephala is remarkable for passing through the heart.

*Circulation.*—The heart lies dorsal to the digestive tract enclosed in a special sac, the pericardium, which is to be regarded as the sole representative of the true body-cavity or cœlom. (See EMBRYOLOGY.) In the heart two parts are always to be distinguished, a muscular ventricle which forces the blood through the arteries to all parts of the body, and one or two auricles which receive the blood as it comes from the gills and force it into the ventricle. As will be seen, the heart thus receives only oxidized or arterial blood. With the loss of the gill of one side the corresponding auricle disappears. When four gills are present as in the nautilus, there are four auricles. In the cephalopods branchial hearts, which force the blood through the gills, occur. At one time it was thought that some of the blood-vessels opened to the exterior, but this has been shown to be a mistake. The blood is usually yellowish or colorless, but occasionally is red, the color being due to the plasma and not to the contained corpuscles which resemble the leucocytes of the blood of man.

*Gills.*—As was mentioned above, there may be two kinds of gills, the ctenidia and the secondary or adaptive gills, the latter occurring only in the gasteropoda. The ctenidia, which always occur in the angle between mantle and

body-wall, consist, typically, of a series of filaments with blood-vessels in the interior, the filaments and the ridge from which they spring resembling somewhat the teeth and back of a comb, whence the name (Greek κτενός comb). The ctenidia are typically paired, but in the nautilus there are two pairs, while in many gasteropods one ctenidium (that of the left side) is lost. The adaptive gills occur on various parts of the body, usually upon the back. In most land snails (*Pulmonata*) the gills entirely disappear and an air-breathing organ, the lung, is developed on the walls of the mantle cavity, the opening to it being usually on the right side of the body.

*Nerves.*—The nervous system was described above. It is only necessary to say that the ganglia may coalesce into a smaller number. There are usually present three pairs of sense organs, a pair of eyes connected with the cerebrum, a pair of so-called ears (really organs of equilibrium) connected with the pedal ganglia, and a pair of organs of smell (osphradia) with the visceral ganglia. Of these the eyes are the least constant. In some cases they are replaced by numerous other eyes developed upon the back or upon the edges of the mantle.

*Viscera.*—The excretory organs are true nephridia, that is, coiled tubes opening at one end into the cœlom (pericardium), and at the other to the external world. They are also known as the organs of Bojanus. The reproductive organs are large. Usually the sexes are separate, but some, like the land-snails, are hermaphroditic. In no case is an asexual reproduction (fission, budding, etc.) known. A few bring forth living young. In many species a metamorphosis occurs during the development. In these a peculiar larva, known as the veliger, hatches from the egg, a larva which develops from a "trochosphere" form like that of the annelids, a resemblance which points to a relationship between the two groups. The veliger receives its name from the "velum," a circle of cilia upon the dorsal side of the head above and in front of the mouth, by means of which the larva swims.

*Classification.*—The mollusks are divided into five classes, *Amphineura*, *Pelecypoda* or *Acephala*, *Scaphopoda*, *Gastropoda* and *Cephalopoda*.

*Amphineura.*—This, the most primitive group of mollusks, contains the chitons (*Placophora*) and the *Solenogastres*, in both of which the body is markedly bilaterally symmetrical, while the nervous system is of a very low type. The chitons (q.v.) are flattened and covered with eight transverse plates of shell. The *Solenogastres* are worm-like shell-less forms of the deeper seas.

*Pelecypoda* or *Acephala.*—These are the mollusks which have the shell in two parts or "valves," no head, and the filaments of the gills more or less completely united into a couple of leaves (lamellæ) on either side of the body. See BIVALVES.

*Scaphopoda.*—This class includes a few marine forms of small size known as tooth-shells, from having shells shaped somewhat like an elephant's tusk, and open at both ends. See DENTALIUM.

*Gastropoda.*—In these, the so-called snails, the foot is usually a broad creeping disc and the head is well developed. See GASTROPODA.

1. Picea Sibirica (Lam.) (C. D. C.). 2. Pinus Armandi (Lam.) (C. D. C.). 3. Pinus koraiensis (Lam.) (C. D. C.). 4. Pinus massoniana (Lam.) (C. D. C.). 5. Pinus koraiensis (Lam.) (C. D. C.). (S. W. Ross, U. S. Forest Service).

the mantle cavity, and the gills are situated in the mantle cavity. The gills are usually of the ctenid type, but in some species they are of the lamellar type. The mantle cavity is usually large and is often divided into two or three parts. The mantle cavity is usually large and is often divided into two or three parts.

In the next part of the book we shall discuss the anatomy of the mollusk in more detail. We shall see that the mollusk has a very complex anatomy, and that it is able to adapt to a wide variety of environments. We shall also see that the mollusk has a very interesting life history, and that it is able to reproduce in a variety of ways.

MOLLUSCA

1. Pond Snail (*Limnea stagnalis*). 2. Slug (*Arion empiricum*). 3. Green Sea-Slug (*Elysia viridis*). 4. Pteropod (*Hyalea tridentata*). 5. Cone-shell (*Conus textile*). 6. Achatina (*Achatina mauritanica*). 7. Tun-shell (*Dolium galea*). 8. Wormshell (*Vermetus gigas*).

*Cephalopoda*.—In these the head is well marked off from the body, and the mantles of the two sides are united so that a single mantle cavity results, which is open to the exterior in front. See CEPHALOPODA.

Formerly two other orders of mollusks were recognized, the *Heteropoda* and the *Pteropoda*, but the heteropods are now known to be prosobranchs, the pteropods to be opisthobranchs, both being modified for a life on the surface of the sea.

**Bibliography.**—Hescheler, in Lang's 'Comparative Anatomy' (2d ed., 1896); Woodward, 'Manual of the Mollusca' (4th ed., 1880); Cooke, 'The Mollusca' (in Cambridge Natural History, Vol. III, 1895); Kingsley, 'Standard Natural History' (Vol. I, 1885); part V of 'A Treatise on Zoology,' edited by E. Ray Lankester, by Paul Pelseneer (London 1906); Tryon and Pilsbury began in 1896 a work in which they proposed to describe and figure every known species of mollusk. For mollusks of the United States consult writings of Gould, Binney, Morse, Tryon, Dall, Verrill, Bush, Stearns, etc.

**MOLLUSCOIDA**, a group of animals formerly recognized by some naturalists, which included the *Brachiopoda*, the *Polyzoa*, and the *Tunicata* (qq.v.). On account of misinterpretations of structure these were once included in the *Mollusca*, and when removed from that group the name Molluscoida was given. Next the *Tunicata* were removed to the *Chordata*, and later the group *Molluscoida* was abandoned.

**MOLLUSCS**, Eggs of. See EGG.

**MOLLWITZ**, mōl-vits, Prussia, a village of Silesia, 25 miles southeast of Breslau, which gives its name to the battle fought to the east of the village 10 April 1741 between the Prussians under Frederick the Great and the Austrians under Marshal Neipperg. About 20,000 troops were engaged on each side, and the Austrians gained the first advantage in putting the Prussian cavalry to flight. The Prussian infantry, however, commanded by Marshal Schwerin, stood their ground for five hours and won the battle. The Prussians lost 5,500 men and the Austrians 5,340. The victory led to an alliance between France and Prussia, and to Austria ceding the province of Silesia to Frederick the following year, to dissolve the alliance.

**MOLLY MAGUIRES**, an Irish secret society formed in 1843 at Farney, County Monaghan, to intimidate bailiffs or process-servers distraining for rent, or others impounding the cattle of those who were unable or unwilling to pay rent. A similar society called by the same name, existed 1854 to 1877 in the mining districts of Pennsylvania. The members disguised in 'Molly Maguire' or women's dresses, sought to effect their purpose by intimidation, and in some cases by murder. Under perilous detective work, several at length were arrested, tried and executed, and the society finally disbanded.

**MOLLYMAUK**, a bird. See FULMAR.

**MOLMENTI**, mōl-mān'tē, Pompeo Gherardo, Italian author: b. Venice, Italy, 1852. He studied law and practised in Venice, but abandoned it to become professor of Italian litera-

ture at the Liceo Marco Foscarini. His literary work comprises critical essays, history of literature and art and also fiction, among which are 'Impressioni litterarie' (1873); 'Studi e ricerche di storia e d'arte' (1892); 'Antonio Fogazzaro' (1900). His greatest work is 'Storia di Venezia nella vita privata' (Bergamo 1908-09; Eng. trans. by Brown, New York 1908) for which he was elevated to the rank of Senator of the Kingdom.

**MOLOCH**, mō'lōk, or **MOLECH** (Heb. *mōlekh*, king), called in Scripture (I Kings 11, 7) an idol of the Ammonites, the fire-god of Phœnicia, also identified as the Carthaginian god, Kronos or Saturn. The image was an iron statue, with a human body, the head of an ox, and extended arms. The statue is said to have been heated by a fire placed in the lower part, and children were placed as offerings in the arms. The cult was introduced into Judah, and Solomon built a temple to Moloch on the Mount of Olives.

**MOLOCH**, a small Australian desert-lizard (the *moloch horridus*) of the family *Agamidae*, whose skin is covered with irregular plates bearing thorny pointed tubercles, spines and prickles all over the body, but especially well developed behind the head. Altogether its appearance is alarming, reminding one of a miniature of some armored saurian of the Mesozoic era. It is, however, quite harmless, subsists mainly on ants, and its repulsive aspect, as in the case of the similar horned toad (q.v.), is wholly defensive in two ways—first as a real defense against being too readily seized and swallowed by enemies, especially serpents; and second, by exposing a very large and highly absorbent surface to whatever moisture the air may contain. Consult Saville-Kent, 'Naturalist in Australia' (1897).

**MOLOKAI**, mō'lō-ki, Hawaii, an island of the group about 40 miles long and seven to nine miles broad. It is noted for the government settlement for lepers where Father Damien spent his noble life of self-sacrifice. See HAWAII; LEPROSY.

**MOLOKANI**, mō'lō-kā'nē, or **MALAKANES**, a Russian sect. It derives its name through its custom of living on milk (*moloko* or *malako*) on fast days. Istineeye Christiane (true Christians) is the name they give themselves, also "Gospellers." The sect arose in the middle of the 18th century in the government of Tambof. About 3,000 of them colonized, early in the 19th century, in the Crimea. Their claim is that the Bible is their sole foundation and they repudiate ceremonial, veneration of icons, priesthood, etc. They abstain from pork. They pay their devotions in prayer, hymn-singing and Bible-reading, besides religious conversations. The meetings are held in private houses conducted by a presbyter and two assistants. They stand high in morals and brotherly benevolence. In theory they are against rulers and taxes or military service, yet are loyal, peaceful subjects in practice. Consult New Schaff-Herzog (New York 1911).

**MOLTING**, the change of skin, or of such cutaneous or partially cutaneous appendages as hair or feathers, which occurs annually or periodically in animals of many sorts, such as

arthropods, birds, reptiles, amphibians, etc. It is a process often perilous to the animal, being not infrequently attended by loss of life. In mammals it may be gradual, as when the pelage or hair is changed. Examples of analogous processes are the annual shedding of the antlers of deer in spring, or the autumnal dropping of the horns of the pronghorn antelope.

**Molting in Amphibia and Reptiles.**—Here the entire skin is cast. The newt in early spring sheds its skin by detaching it from around the jaws, then pulling it back over the head and the limbs. The toad in molting causes the old skin to split along the back, it then pulls it off as one would a coat by working the muscles of the back; it is detached by movements of the head from around the lips, face, eyes and mouth; the skin is more readily pulled off from the legs to the tips of the toes. The skin, as in salamanders, is a thin film, and it comes off in four pieces. Immediately after molting the creature is shy and active. Sharp describes the molting of the common striped snake (*Eutania sirtalis*). One came out of the water in a vivarium, gliding on to the grassy sod; it then shrugged itself for a moment, when the skin parted at the jaws. The skin on the head, however, remained fixed, so that when the creature crawled out the old skin was inside out. The operation took less than one minute. The rattle of the rattlesnake (q.v.) consists of those parts of the successive molts which are retained by a long knob made by the coalescence of the last few caudal vertebrae.

**Molting in Birds.**—The feathers may all be cast or only a part of them. Young birds molt several times before adult age. The passerine birds undergo a complete ecdysis after the breeding season is over (post-nuptial), when the worn-out plumage is restored; and they may also before the breeding time pass through an incomplete molt, when their wedding dress is put on. The process is so gradual as a rule that few birds, except the ducks, etc., are unable to fly, or go unprotected. The height of the molting season is in August, though the feathers drop out in nearly every month of the year. The complete molt is undergone in from a month to six weeks' time. Besides their feathers the pelican sheds a horny projection on the ridge of the bill, and the puffin and certain allied species shed the horny sheath of the bill, etc. For further information see PLUMAGE.

**Molting in Arthropods.**—In most arthropods the various developmental stages become indicated in the external appearance of the animal by means of the successive molts, for no modification of form is possible without the removal of the rigid exoskeleton. The Arachnid *Limulus*, the common horsefoot crab (q.v.), frequently sheds, its skin opening around the edge of the head; this is also the case with the fresh-water crustacean *Apus*. In the crayfish and lobster the skin splits open between the thorax and abdomen, and the animal draws itself out of the transverse rent thus formed. The skin is cast entire, while the chitinous lining of the mouth, throat, fore stomach and of the rectum is also shed. The process of exuviation in the crayfish has long been known to be aided by the outgrowth of little delicate papillae called casting-hairs; these serve to loosen the old integument; recently

Packard has discovered similar papillae on the new or under-skin (hypodermis) of the lobster, and similar undergrowths aid the serpent in shedding its scaly epidermis.

In insects molting is frequent, especially in the larva stage, most caterpillars molting four or five times. The body moves convulsively and splits along the back, at the same time, casting hairs being usually absent, a molting fluid is poured out which serves to detach the old skin. The head is molted separately, the shell falling off by itself, then the body-skin is shuffled off, being pulled back toward the tail, and with the outer integuments all the lining of the digestive canal is shed (except that of the stomach and beginning of the intestine), and the lining of the spiracles, as well as the cuticle of all the hairs, and the spines.

Consult Dwight, 'The Sequence of Plumage and Molts of the Passerine Birds' (Annals New York Academy of Sciences, Vol. XIII, 1900); Mivart, St. J., 'The Elements of Ornithology' (London 1892); Newton, 'Dictionary of Birds' (1893-96); Packard, 'Text-book of Entomology' (1898). Further details will be found in the articles in this encyclopedia on specific groups of animals and the authorities mentioned therein.

**MOLTKE, Helmuth Karl Bernhard, hël'-moot kār'l bĕrn'hārt mōlt'kĕ**, COUNT VON, German soldier: b. Parchim, Mecklenburg-Schwerin, 26 Oct. 1800; d. Berlin, 24 April 1891. In 1805 his father removed to Lubeck, where young Moltke shortly afterward saw his home looted and burned during the French invasion and his family reduced to poverty. In 1812 he was admitted as a cadet of the Royal Military Academy, Copenhagen. In 1818 he was appointed one of the pages of the king of Denmark and passed his examination for a commission as first of the candidates. Seeing little prospect of advancement, he entered the Prussian service in 1822, becoming 2d lieutenant. He then studied three years at the staff college, Berlin; in 1832 was appointed to the general staff; in 1833 became lieutenant, and in 1835 captain. He had already visited Italy, and he now went to Turkey, where he became military adviser of the sultan Mahmud. He took part in the Turkish expedition against Ibrahim Pasha in 1839, but his advice was disregarded, and he returned to Constantinople, and on Mahmud's death to Berlin, where he was again employed on the general staff. His experiences in Turkey led him to publish two valuable works 'The Russo-Turkish Campaign of 1828-29 in European Turkey' (1835), and 'Letters on Affairs in Turkey in the Years 1835-39' (1841). After rising through the various army grades he was placed permanently at the head of the general staff of the army in 1859 with the rank of lieutenant-general. His labors in reorganizing the Prussian army were of immense value to Prussia and to Germany, and had a great influence on the general history of Europe. The defeat of Denmark in 1864 was largely owing to his genius for military operations, and the result of the greater war of 1866 against Austria is equally to be attributed to him. Then followed the Franco-German War of 1870, for which Moltke was entirely prepared, having foreseen for some years what was likely to happen, and having

immediately after the Austrian War prepared for a campaign against France. The brilliant success which followed was in very large measure a personal triumph for Moltke. He passed his 70th birthday at Versailles, and was raised by the king of Prussia to the rank of count on receipt of news of the capitulation of Metz. On his return to Berlin he was made a field-marshal, received from Parliament a grant of \$225,000, was appointed for life a member of the Prussian upper house, and other honors were conferred upon him. He held the post of chief of the staff till after the accession of Emperor William II in 1888, when he resigned on account of advanced age, but was made president of national defense. His 90th birthday was made the occasion of public demonstrations in his honor all over Germany. He was a man of great modesty and simplicity, kind and considerate to subordinates, and devoted, above all things, to duty. His military genius was compounded of boldness in design with minute care in execution. From his reticence it was wittily said that he was silent in seven languages. Besides the works already mentioned, Moltke wrote 'Letters' (1892), and the works of the general staff on the Italian War of 1866, and the Franco-German War of 1870-71 are largely from his pen. Consult the 'Essays, Speeches and Memoirs' (2 vols., London 1893); also Bigge, W., 'Feldmarschall Graf Moltke' (2 vols., Munich 1901); Dressler, F. A., 'Moltke in his Home' translated by Barrett-Lennard (London 1907); Müller, W., 'Moltke' translated by Pinkerton (London 1879; 3d ed., Stuttgart 1889).

**MOLTKE, Helmuth von**, German general: b. 1848; d. 18 June 1916. A nephew of the famous strategist, he was appointed chief of the general staff in 1906, an event which occasioned considerable speculation in Germany. The general impression was that von Moltke had been chosen by the Kaiser as a convenient figure-head, and that the War Lord really intended to be his own chief of the general staff. Von Moltke did not originate, but rather identified himself with, the standing plan of campaign to be adopted in a war on two fronts, namely, the rapid invasion of Belgium and lightning descent upon France during the period of Russian mobilization. The breakdown of that plan led to serious differences between the Kaiser and von Moltke; the latter had not displayed the military genius of his uncle, and was dismissed from his post early in December 1914, to be succeeded by the Kaiser's favorite, General von Falkenhayn. See WAR, EUROPEAN—WESTERN FRONT.

**MOLUCCAS**, mō-lūk'az, or **SPICE ISLANDS**, East Indies, three groups of islands in the Malayan or Indian Archipelago (q.v.), between Celebes and New Guinea, and the Philippines and Timor Archipelago. (1) The Ternate Islands, or Moluccas proper, consisting of Ternate, Gilolo, Batschian, Obi, Morti Islands and numerous islets. (2) The Amboyna Islands, including, besides Amboyna, which is the chief seat of government for the whole Moluccas, the islands of Ceram, Booroo and other smaller islands. (3) The Banda Islands. They are nearly all mountainous, and some of them have peaks rising to a height of 7,000 feet or 8,000 feet, mostly volcanic; there are still

several active volcanoes in the group, and earthquakes are of frequent occurrence. Their aggregate area is estimated at 195,650 square miles; population 361,000. Cloves, nutmegs, mace and sago are exported to Europe; and birds'-nests, trepang, and shark-fins to China. The Moluccas, discovered in 1512, were alternately in the possession of the Spaniards, Portuguese and Dutch. They were taken from the latter by the British in 1796, and in 1810, but in 1814 again given up to Holland, in whose possession they still remain. The general language on the coast is the Malay.

**MOLY**, magic herb of the ancient Greeks that Homer says Hermes gave to Odysseus as a talisman against the enchantments of Circe. The plant is described as having milk-white flowers, and has been identified by different scientists under different herbs of the *Liliaceæ* family, as the white water-lily, also as the garlics. *Allium magicum* L., or *Allium Moly* L. were claimed by Italian Renaissance botanists, but these kinds have yellowish-red to red bloom instead of white, causing some to claim *Allium nigrum* L. or black hellebore, as more probable. See ALLIUM; GARLIC.

**MOLYBDENITE**, mō-līb'dē-nīte, a native sulphid of molybdenum crystallizing in tabular or hexagonal forms. It commonly occurs in granite, gneiss and other crystalline rocks. In the United States it is found in the New England States, and in New York, Pennsylvania, Colorado and California. It also occurs in Canada, in Pontiac County, Quebec, in Renfrew County, Ontario, and in other parts of the world. It is the chief of the commercial ores yielding the important metal molybdenum (q.v.), among which also are wulfenite, molybdate and other minerals, described as follows:

Molybdenite or molybdenum disulphide, MoS<sub>2</sub>, contains about 60 per cent molybdenum and 40 per cent sulphur. It is a soft, opaque mineral, with a lead-gray color, sometimes bluish or brownish, and with metallic lustre. When crystallized it is found in tabular or short prismatic, hexagonal crystals. It has a perfect cleavage, and yields flakes which are flexible but not elastic. It is sectile and feels slightly greasy. Its hardness is 1 to 1.5, and its specific gravity is 4.7 to 4.8. Its streak is lead-gray metallic, bluish-gray on paper, and greenish on glazed porcelain. It occurs in fine granular or foliated masses or scales scattered through or imbedded in many crystalline rocks, including granite, gneiss, zircon syenite and granular limestone. Its appearance is similar to that of graphite, for which it is frequently mistaken by the prospector. *Wulfenite* is a molybdate of lead, PbMoO<sub>4</sub>, and contains about 26.2 per cent molybdenum and 56.4 per cent lead. Its color is bright red to orange or wax-yellow; sometimes brown, grayish-white, or nearly colorless; occasionally yellowish-gray to pale green. Its lustre is resinous to adamantine. When crystalline it is translucent and occurs commonly in thin, square, tabular, tetragonal crystals. Sometimes octahedral and prismatic forms are found. It occurs also as crystal crusts and in massive granular forms. It is always found with other lead minerals, especially pyromorphite and vanadinite. It has one good pyramidal cleavage, and two less distinct. It is brittle and its fracture is subconchoidal.

Its hardness is 2.75 to 3, and its specific gravity is 6.7 to 7. Its streak is white. *Molybdite*, or molybdic ochre, is a hydrous ferric molybdate,  $\text{Fe}_2\text{O}_3 \cdot 3\text{MoO}_3 \cdot 7\frac{1}{2}\text{H}_2\text{O}$ , and contains 39.6 per cent molybdenum. It occurs as an earthy, yellow powder, or in hair-like crystals of pale yellow color, usually associated with molybdenite, of which it is an alteration product. Alone, it is not an important ore of molybdenum. It has a dull lustre, a straw yellow streak, a hardness of 1 to 2, and a specific gravity of 4.5. *Powellite* is calcium molybdate,  $\text{CaMoO}_4$ , and contains 48 per cent molybdenum. Sometimes tungsten replaces part of the molybdenum. It is greenish-yellow to dull gray in color, subtransparent, resinous, without cleavage, has an uneven fracture, a hardness of 3.5, and a specific gravity of 4.52. *Ilsemanite* is an oxide of molybdenum,  $\text{MoO}_3 \cdot 4\text{MoO}_3$ , and contains about 68 per cent molybdenum. It is a blue-black to black cryptocrystalline mineral, associated with barite and wulfenite. It is soluble in water, giving a deep blue solution which on evaporation yields dark blue crystals. Rare. *Belonesite* is magnesium molybdate,  $\text{MgMoO}_4$ , and contains 52 per cent molybdenum. It is a white transparent mineral, occurring in minute tetragonal crystals. It occurs in rock fragments enveloped in Vesuvian lava. Rare. *Pateraitite* is cobalt molybdate,  $\text{CoMoO}_4$ , and contains 43.8 per cent molybdenum, or it is molybdate of cobalt and iron,  $\text{FeCoMo}_2\text{O}_8$ , and contains 44.1 per cent molybdenum. It is an impure massive black mineral associated with uranium minerals. Rare. *Achrematite* is lead arsenate, chloride and molybdate,  $3(\text{Pb}_2\text{As}_2\text{O}_7 \cdot \text{PbCl}_2) \cdot 4(\text{Pb}_2\text{MoO}_6)$ , and contains 3.4 per cent molybdenum. It is a massive, cryptocrystalline mineral with an uneven to subconchoidal fracture, is brittle, has a hardness of 3 to 4, and a specific gravity of about 6. Its color is sulphur-yellow to orange and red, but in mass is liver-brown, owing to admixture of limonite. Its streak is pale cinnamon brown. Its lustre is resinous to adamantine, and fragments are translucent on thin edges. *Eosite* is a vanado-molybdate of lead,  $\text{Pb}_2\text{V}_2\text{MoO}_{16}$ , and contains 8.9 per cent molybdenum. Its color is deep Aurora-red. It has a brownish, orange-yellow streak. Its hardness is 3 to 4. It occurs in minute octahedral crystals of the tetragonal system which are found on pyromorphite and cerrusite. *Molybdurane* is molybdate of uranium,  $\text{UO}_2 \cdot \text{UO}_3 \cdot 2\text{MoO}_3$ . *Molybdoferrite* is molybdate of iron,  $\text{FeMoO}_4$ .

**MOLYBDENUM**, mō-līb'dē-nūm, a pure white metal, softer than steel, malleable and capable of being forged and welded. It can be filed and polished and may be drawn into ribbons and fine wire. Metallic molybdenum is used in various electrical contact making and breaking devices, in X-ray tubes, in voltage rectifiers, in the form of wire for filament supports in incandescent electric lamps, for winding electric resistance furnaces and in dentistry. It is also employed in the manufacture of chemical reagents, dyes, glazes and disinfectants. The principal use of molybdenum is in the manufacture of special alloy steels, usually in conjunction with chromium, manganese, nickel, cobalt, tungsten or vanadium. These steels are used for self-hardening and high-speed machine tools, for crank-shaft and pro-

PELLER-SHAFT forgings, high-pressure boiler plate, armor-piercing projectiles, permanent magnets and wire. During the World War the main uses were for gun-linings, armor plates, projectiles and in the motor industry, especially in the crank-shafts and connecting-rods of Liberty motors. The purest molybdenum is produced from wulfenite, but practically the whole of the world's supply of the metal and its compounds is obtained from molybdenite (q.v.). Molybdenite resembles galena in some respects and owes its name to this fact, the word "molybdenite" being based upon the Latin name for galena. It was first clearly distinguished from galena by Scheele in 1778, and in 1782 Hjelms obtained the element molybdenum in the metallic form. Molybdenum may be prepared by reducing the oxide by hydrogen, carbon or potassium cyanide, as well as by various other methods. It has a specific gravity of about 8.6 and a specific heat of about 0.0659. Its melting point is higher than that of platinum. Molybdenum is not affected by air or moisture at ordinary temperatures, but oxidizes slowly when heated in air, and at high temperatures it burns, whether heated in air or in steam. Chemically, molybdenum behaves both as a metal and as a non-metal. It has the chemical symbol Mo and an atomic weight of 96 if  $\text{O} = 16$ , or 95.3 if  $\text{H} = 1$ . It forms several oxides, of which the trioxide,  $\text{MoO}_3$ , is the most important. This is the oxide that is formed when the metal is burned in air, and it may also be prepared by roasting the native sulphide in air. The trioxide occurs native in small quantities, as "molybdenum ochre," or "molybdite." Metallic molybdenum combines directly with chlorine to form  $\text{MoCl}_4$ , and with bromine to form  $\text{MoBr}_4$ ; but it does not combine directly with iodine. Unlike the other metals, molybdenum does not readily replace the hydrogen of acids to form definite salts, but its oxides dissolve in acids with the formation of compounds which have, as yet, been but little studied. The trioxide combines with water to form substances of the nature of acids, and which are, in fact, called "molybdic acids." These further combine with metallic bases to form an extensive series of compounds known as "molybdates." Ammonium molybdate is used in the laboratory as a reagent for the detection of phosphoric acid, a yellow precipitate being thrown down when a nitric acid solution of ammonium molybdate is added to a solution containing a phosphate. Consult Wolf, H. J., 'Molybdenum' (Golden, Colo., 1918); Wilson, A. W. G., "Molybdenum" in 'The Mineral Industry during 1916,' Vol. XXV.

**MOLYNEUX**, mōl'i-nooks, William, Irish philosopher: b. Dublin, 17 April 1656; d. there, 11 Oct. 1698. He was graduated from Trinity College, Dublin, entered the Middle Temple, London, became a student of applied mathematics and philosophy, and a friend of Locke; was elected F. R. S. in 1685 and was elected to Parliament for Dublin University in 1692 and 1695. Besides his 'Dioptica nova' (1692) on optics and philosophy, he wrote 'The Case of Ireland's Being Bound by Acts of Parliament in England' (1698), a work on the legislative independence of Ireland, which created a considerable sensation.

**MOMBASA**, möm-bā'sā, Africa, an island and town on the east coast, the town, capital of the Seyidie province, the chief seaport and the seat of administration of British East Africa, being on the north side of the island, which is three miles long by two and one-half miles wide, close to the coast, 150 miles north of Zanzibar, lat.  $4^{\circ} 3' S$ . Here are an old Portuguese fort, a new European hospital and the offices and workshops of the British East Africa Company. A short railway connects Mombasa with Kilindini, the naval coaling depot, on the other side of the island, where is the residence of the chief administrator of the company. Mombasa is also the terminus of a railway connecting with the Victoria Nyanza. Trade in (imports) piece-goods, brass and iron wire, beads, rice; and in (exports) ivory, gum, copal, copra, ochella weed, maize and grain; carried on by natives of British India. Pop. about 30,000. Island and port are mentioned as early as 1331. It was visited by Vasco de Gama in 1497, held by the Portuguese from 1529 to 1698 and by the British from 1824 to 1826, but the British refused to accept cession of it. Soon after the sultan of Muscat obtained possession of the town, which at his death fell to his son, the sultan of Zanzibar. In 1888 the Imperial British East Africa Company received governing rights over it from the sultan of Zanzibar, since when it has passed definitely over to the possession of Britain, along with the huge territory on the mainland allotted to that country.

**MOMENT** of a dynamical quantity is the importance of that quantity in regard to its dynamical effect relatively to a given point or axis. The moment of a force about a point is the product of its amount into its perpendicular distance from the point. The tendency of the action of such a force is to cause rotation about an axis perpendicular to the plane passing through the point and containing the force. Thus, in the case of a pendulum, the effectiveness of the force in causing rotation is measured by the moment  $Wl$ , where  $W$  is the weight of the pendulum, and  $l$  is the distance of the line of action of the force  $W$  from the centre of rotation  $C$ , or the distance of the centre of mass  $G$  from the vertical line through  $C$ .

The term moment enters into several other phrases, all of which relate either directly or indirectly to rotation. Thus, there is the moment of momentum, or angular momentum, whose rate of change is the measure of the moment of the force producing the change. To obtain it for any given body rotating with angular speed  $\omega$  about an axis, we first imagine the body broken up into a great many small portions of masses  $m_1, m_2, m_3$ , etc., at distances  $r_1, r_2, r_3$ , etc., from the axis, multiply the momentum ( $m_1\omega$ ) of each mass by its distance, and then take the sum of all these products. The angular speed  $\omega$  being the same in every expression, the moment of momentum takes the form  $\omega(m_1r_1^2 + m_2r_2^2 + \dots)$ , which it is usual to write in the symbolic form  $\omega\Sigma mr^2$ . The quantity  $\Sigma mr^2$ , which is the sum of the products of each mass into the square of its distance from the axis, is called the moment of inertia about that axis. It is the factor in the moment of momentum which depends upon the distribution of matter in the body. It enters

into all questions of mechanics in which rotation is involved, from the spinning of a top or the action of an engine governor to the stability of a ship. By an obvious extension, the word moment is also used in such combinations as moment of a velocity and moment of an acceleration. Such phrases correspond to nothing truly dynamic, unless we regard velocity as meaning the momentum of unit mass and acceleration as the rate of change of that momentum.

If the mass of every small portion of matter in a body be multiplied by the square of its perpendicular distance from a straight line, the sum of all such products is called the moment of inertia of the body about the line regarded as an axis. The radius of gyration of the body is the distance from the axis at which all the matter of the body might be concentrated without altering the moment of inertia. Thus, if  $I$  is the moment of inertia of the body,  $M$  its whole mass and  $k$  its radius of gyration,  $I = Mk^2$ . We see that the moment of inertia of a body about a line is found by adding a great number of products of small masses and squares of distances; if the body can be defined mathematically as to shape, size and density, finding its moment of inertia is a problem of the integral calculus.

**MOMENT OF INERTIA.** See MECHANICS.

**MOMENTUM**, in mechanics and physics, the product of the mass and velocity of a body. Like velocity, momentum is usually regarded as having a definite direction, as well as a definite numerical magnitude. The momentum generated by a constant force acting upon a material particle for a definite length of time is numerically equal to the product of the force by the time during which it acts, and has the same direction as the force. See MECHANICS.

**MOMIERS**, mō'my'ā', from the French term for mummers. It was a nickname given in derision to the followers in Switzerland (1814) of the Baroness von Krüdener (q.v.), who charged the State Church with apostacy, held great conventicles and lived as æsthetics. They were led by the Geneva clergyman, H. L. Empeytaz, César Malan, L. Gaussen, Merle d'Aubigny and F. Monod. From this sect arose the Evangelical Society at Geneva (1832), the Free Evangelical Church (Eglise libre) of 1848 that, in 1883, divided and went into even severer directions. Consult Goltz, von der, 'Die reformierte Kirche Genfs in 19 ten Jahrhundert' (Basle 1864).

**MOMMSEN**, möm'z'en (Christian Matthias) Theodor, German epigraphist and historian: b. Garding, Schleswig, 30 Nov. 1817; d. Charlottenburg, near Berlin, Prussia, 1 Nov. 1903. He was a student of jurisprudence and philology at the University of Kiel; took his Ph.D. in 1842; published with his brother Tycho and his friend Storm a volume of verse which was scathingly condemned by the reviewers (1843); began more successfully his career as historian with the treatise 'De Collegiis et Sodalitiis Romanorum' (1843), commended for its thoroughness and a clarity of style new to German works of this kind; and in 1844-47 was in France and Italy under commission of

the Berlin Academy, collating manuscripts and inscriptions. On his return he edited for a short while the *Schleswig-Holsteinische Zeitung*, and in 1848 became professor of Roman law at Leipzig. He entered politics as an advocate of constitutional progress, was arrested for inciting to revolt, and though acquitted by the courts was deprived of his professorship. From that time he was an eager if not invariably judicious disputant in many political controversies. He was appointed to the professorship of Roman law at Zürich in 1852, at Breslau in 1854; and from 1858 until his death was professor of ancient history in the University of Berlin. In 1873 he was elected perpetual secretary of the Berlin Academy; but this post he resigned in 1895. For 10 years (1873-82) he was a Liberal member of the lower house of the Prussian parliament, where he bitterly attacked Bismarck's domestic policy. In an election speech at Charlottenburg in 1882 he characterized the Iron Chancellor's tariff measures as a "Politik von Schwindel." Such boldness could not go unrebuked, and Mommsen was brought to trial for slander. His acquittal by both a lower and an appeals court was one of his great triumphs. He sternly advised the Teuton element in Austria in the struggle with the Czechs; made some caustic observations in a *North American Review* article on British treatment of minor nations; to the last was quite as belligerent as ever.

But he was only incidentally the politician. He was pre-eminently what Freeman called "the greatest scholar of our times, well nigh the greatest scholar of all times" ('Methods of Historical Study'). He was distinguished as an epigraphist, historian, jurist, numismatist and philologist. None in the 19th century, which he almost spanned, has, as Freeman goes on to say, "taken in so wide a range of subjects, all brought with the happiest effect to bear upon and to support one another." To the educated reader at large he will probably continue to be best known for his 'Römische Geschichte' (3 vols., 1854-56; 8th ed., 1889), to the battle of Thapsus; together with Vol. V on the provinces from Cæsar to Diocletian (1885). Volume IV, on Imperial Rome, was unfinished at his death. There are English renderings by W. P. Dickson (Vols. I-III 1862-66; Vol. V 1886). This work opened a new epoch in historiography. Though written with great spontaneity, without even references to original sources, it was based on unrivaled knowledge, and presented its material with extraordinary clearness and at times with brilliancy. It is of course somewhat dogmatic, is certainly unfair to Cicero, and has been blamed, by Freeman among several, for undue glorification of mere power and success. To scholars Mommsen is above all the editor of the great 'Corpus Inscriptionum Latinarum' (1863 et seq.; Vols. I, III, VIII, IX, by himself; others under his immediate supervision). Every inscription of this monumental collection was taken down from the original. The errors and falsities of predecessors were cleared away, and a scientific foundation was supplied for the study of Roman antiquities. Mommsen's preface to the series is said to be thought by critics one of the finest specimens of Latin prose written in modern times. For a complete list of his writings, Zangemeister's 'Mommsen als Schriftsteller' (Heidelberg

1887; new edition by Jacobs, with additions, 1905) should be consulted. Mention may be made of 'Römisches Münzwesen' (1850), 'Römische Chronologie' (1859) and 'Römisches Staatsrecht' (1871-88). All are standard, but the last, particularly, by the breadth and completeness of his exposition of the Roman constitution, places Mommsen among the foremost of constitutional writers. He also edited the 'Res Gestæ Divi Augusti ex Monumentis Ancyrano et Apolliniensi' (1865; new ed. 1883); the 'Digesta' in Vol. I of the 'Corpus Juris Civilis' (6th ed., 1893), and many other publications. His library, when partially burned in 1880, was replenished by gifts from foreign scholars. In 1902 he was awarded the Nobel prize in literature. Consult Hirschfeld, O., 'Gedächtnisrede auf Theodor Mommsen' (1904); Sandys, J. E., 'A History of Classical Scholarship' (Vol. III, Cambridge 1908); Wachsmuth, C., 'Worte zum Gedächtniss an Theodor Mommsen' (Leipzig 1904).

**MOMORDICA**, a genus of plants of the gourd family, remarkable for their strangely marked seeds. Two or three species are cultivated in the United States as ornamental plants, one of which (*M. charantia*) produces a food for the Chinese in the pulp about the sculptured seeds; another Oriental food, the golkokra of India, is the fruit of *M. cochinchinensis*; and the balsam-apple (*M. balsamina*) furnishes a healing principle which is infused in oil to form a liniment highly esteemed in the Levant.

**MOMOTOMBO**, mō-mō-tōm'bō, Nicaragua, an active volcano rising 4,250 feet from the northwestern shore of Lake Managua. Eruptions took place in 1852, 1902 and 1905. The nearby village of Momotombo is connected by rail with Chinandega.

**MOMPOS**, mōm-pōs', Colombia, a town of the province of Bolivar on an island formed by the Rio Magdalena about 180 miles south of the deltaic mouth. The streets, which extend parallel to the river, are well laid out, but the houses are badly built. Mompos is a depot of foreign goods destined for consumption in the valley of the Magdalena; but the changes in the river's course rendering it unnavigable have seriously injured its prosperity. Pop. 11,000.

**MOMUS**, in Greek mythology, the god of satire and mirth. He is generally represented raising a mask from his face and holding a small figure in his hand. His mother was Nyx, the goddess of night. As a mocking censor and carping critic Jupiter cast him out of heaven.

**MONA**, mō'nā (1) a West Indian islet belonging to the United States since 1898. It lies 42 miles east of Porto Rico, in the middle of Mona Passage, to which it gives its name; seven miles long by two miles broad, its area is nearly 10,000 acres. It is of coral formation, with a general level about 60 feet above the sea. A range of hills on the east side of the island runs from north to south, the highest peak of which is 175 feet above the water. The island is well watered and well drained, has a luxuriant vegetation and all kinds of tropical fruits grow in profusion. It is the

**MONACO**

**THE HARBOR OF MONACO**  
Showing the New Oceanographic Museum at the Tip of the Mainland

nesting place of thousands of green turtles, and the surrounding waters teem with the finest varieties of fish. The only residents belong to the lighthouse establishment; off the northwest point is Monita islet; (2) the ancient name mentioned by Tacitus for the island of Anglesey (q.v.), Wales, also applied by other ancient writers to the Isle of Man.

**MONA**, a West African monkey (*Cercopithecus mona*), remarkable for its brilliant coloration, the head being olive-yellow, with a black stripe on the forehead; yellowish whiskers and a purple face. The back is chestnut-brown, the undersurface is white and there is a white spot on each side near the root of the tail, which is black. It is constantly seen in menageries.

**MONACO**, mōn'ā-kō, the smallest independent European principality, bordering on the Mediterranean, nine miles east of Nice, and enclosed on its land borders by the French department Alpes-Maritimes. It had an area of 53 square miles until 1861 when the Prince of Monaco ceded Mentone and Roccabruna to France for 4,000,000 francs. The principality has since been confined to the towns of Monaco, Condamine and Monte Carlo with the surrounding districts, having an area of about eight square miles, and a population of about 23,000. The expenses of government, municipal and other, are defrayed by a joint-stock company, which carries on the famous gaming establishment at Monte Carlo (q.v.), and which also pays a handsome yearly sum to the Prince for the concession. The capital, Monaco (pop. 2,247), situated on a lofty promontory overlooking the sea, in the midst of olive, orange and lemon groves, is a renowned watering-place. Here are the palace and cathedral. There are numerous hotels and an English church at Monaco. In the 10th century the Emperor Otho I conferred Monaco on a prince of the house of Grimaldi, a scion of which (through a female branch) still continues to rule.

**MONAD**, in biology. See INFUSORIA.

**MONADNOCK**, mō-nād'nōk, New Hampshire, an isolated mountain of a typical erosion character, near the southwest corner of the State, in Cheshire County, 10 miles southeast of Keene. The base covers an area of five miles by three, and the altitude is 3,186 feet above the level of the sea; it is composed of slate, talc and mica. The summit commands a fine view, and it is a conspicuous landmark, visible even from the dome of the state house at Boston.

**MONADNOCK**. See PENEPLAIN.

**MONAGAS**, mōn-ā-gās, José Tadeo, Venezuelan soldier: b. Maturin, Venezuela, 28 Oct. 1784; d. El Valle, Venezuela, 18 Nov. 1868. He served in the War of 1813-21 under Bolivar and rose to the rank of brigadier-general and was afterward engaged in various military measures until 1830 when he became a member of Congress. Bolivar's death occurring in 1831 Monagas retired but was soon called to the command of the Orient. In 1835 he supported a revolution but made his peace with the government a few months later and in 1847 was elected President. His administration was at first marked by liberal measures, but his policy

becoming arbitrary he was deserted by his party, whereupon he abolished Congress and assumed a dictatorship. He defeated Paez who led a revolutionary movement against him and disregarding his treaty, imprisoned him, and in 1851 took command of the army, the presidency being held by his brother. In 1855 he was re-elected, but a revolution followed and he was compelled to leave the country in 1858, after resigning the presidency. He returned in 1864 and in 1868 headed a successful revolution and was elected President by Congress, but died before being installed in the office.

**MONAGHAN**, mōn'ā-han, John James, American Roman Catholic prelate: b. Sumter, S. C., 23 May 1856. He was educated at Saint Charles College, Md., pursued a theological course at Saint Mary's Seminary, Baltimore, and was ordained to the priesthood in 1880. He held several pastorates in Charleston, S. C., and elsewhere, was chancellor of the diocese 1887-88, and assistant to the vicar-general at Saint Patrick's, Charleston, 1888-97. In May of the last-named year he was consecrated bishop of Wilmington.

**MONAL**, or **MONAUL**, a name among Anglo-Indian sportsmen for any of several Himalayan pheasants, especially the gorgeous species of the crested genus *Lophopterus*. See IMPEYAN PHEASANT.

**MONAMINE**, in chemistry, an amine that is derived by replacing one or more of the hydrogen atoms of a single molecule of ammonia by an equal number of monovalent organic radicals. Amines that are derived by joining two, three or four molecules of ammonia, through the partial replacement of their hydrogen by a single polyvalent radical, are called ditri-, and tetra- amines respectively; and the monamines are known as primary, secondary or tertiary, according as one, two or three of the hydrogen atoms of the ammonia molecule have been replaced. See AMINE; AMIDE.

**MONARCH BUTTERFLY**. See DANAIIS; MILKWEED BUTTERFLY.

**MONARCHIANS**, a sect in the early Church who asserted the oneness and singleness of the divine person, as at variance with the orthodox doctrine of the Trinity, three Persons and one God. The supremacy of God the Father, they maintained, was impugned by those who said that the Son was coeternal. If there was but one God, they taught, and Jesus Christ was God incarnate, then the Father must have suffered and died. Hence they were called Patripassians (q.v.). Christ was therefore merely one form or mode of the Father's manifestation; and the Father might also manifest himself through the Holy Spirit. This theory was called Modalism or Monarchical Modalism and its teachers Modalists. Praxeas (q.v.), a Christian of Asia, brought this doctrine to Carthage in the 2d century and was controverted by Tertullian (q.v.). The most noted of Patripassians was Sabellius (q.v.), and Modalism was widely known as Sabellianism in both the Eastern and Western Churches. There were other Monarchians called Dynamic Monarchians who taught that Christ became Son of God dynamically, by having certain powers bestowed upon him in his adoption by

baptism. Pope Victor I in the 2d century excommunicated Theodotus the Tanner who professed this theory, and an Asiatic synod (268) condemned and anathematized the view as taught by the noted Paul of Samosata (q.v.), the minister of Zenobia (q.v.), queen of Palmyra. Monarchianism was revived in the 16th century by Socinus, and is in some form or other the essential basis of certain Unitarian creeds. Consult Harnack, A., 'History of Dogma' (Vol. III, Boston 1897).

**MONARCHY** (Fr. *monarchie*, from Lat. *monarchia*, from Greek *μοναρχία*, rule of one, sole power). In the course of history, the word monarchy has been subjected to so many interpretations and has been applied to so many different kinds of governments that an exact definition or a classification of its main divisions is difficult. Strictly speaking, the word means undivided sovereignty or rule of a single person, and hence it has been used to describe states in which the sovereign or supreme authority is vested in a single individual, the monarch, who in his own right is the permanent head of the state. The king or chief magistrate of a state may properly be termed a monarch only when he possesses the entire ruling power, but the term monarchy has outlived this original meaning and in popular language is used somewhat loosely to designate that form of government in which the chief authority is exercised by a hereditary sovereign as distinguished from republics with elected presidents, or for the "monarchical principle" as opposed to the republican. Still more loosely the term is used to designate any government in which the political head is called king or prince, regardless of the authority he may exercise or the manner in which political power is distributed. The changes in the power exercised by the monarchs of Europe have necessitated the invention of new terms for general use in describing the various forms of government, but these terms in themselves are a contradiction of the true meaning of monarchy. We now have "limited" or "constitutional monarchy" as opposed to "absolute" or "autocratic monarchy," and a distinction is also made between "hereditary" and "elective monarchy," though the distinction is unimportant since these terms do not indicate the nature of the government.

As stated above, the absolute monarchy is the only real monarchy in the strictest interpretation of the word, since it is the only government in which the ruler is absolutely supreme. (See ABSOLUTISM). A mixed or limited monarchy is one in which the ruler, though still possessing the status and dignity of royalty, shares the supreme governmental powers either with a body of nobles, or with a popular representative body, or with both. A constitutional monarchy is one in which the power of the ruler is restrained by a constitution. Woolsey says: "Mixed monarchies are something more than limited ones. There may be a limited monarchy where king and people, the former restricted by a constitution, the latter organized and invested with certain means of preventing illegal government, are the only forces. This may be called mixed, perhaps, yet the term rather inclines to embrace only such states as have three or more political powers, as king, nobles and people, united in the government, or

the same powers with the clergy, as in many mediæval states. Thus all mixture contains limitations but all limited governments are not mixed." There are now no constitutional or limited monarchies wherein the sovereign possesses power to legislate by decree and in such a monarchy the democratic element is the only authority directly exercising any great degree of actual power. Monarchies are usually hereditary though they sometimes have been elective, but in the latter case they have generally been attended with disastrous feuds, and great confusion in the elections, as in Poland. Of the elective monarchies the most conspicuous were the papal states, the Pope being elected by the cardinals; but the states of the Netherlands were termed republics even though in some of them the office of stadtholder was hereditary. In Europe all monarchies were originally elective, within certain limits; and subsequent to the introduction of Christianity kinship with the reigning family did not count so much as the essential condition of the assumption of sovereign power as the "sacring" by the divine authority of the Church. Constitutional monarchs in their origin may be elective or they may combine both systems, as when one family is disinherited and the supreme power under certain conditions declared hereditary in another. The purely hereditary principle is of comparatively late origin, the outcome of obvious convenience which became a religious or quasi-religious dogma. The absolute monarchies of the present day are Abyssinia, Afghanistan and Siam; and the limited monarchies are Belgium, Great Britain, Denmark, Greece, Italy, Japan, Montenegro, The Netherlands, Norway, Persia, Rumania, Serbia, Spain and Sweden.

The conception of monarchy was derived through Christianity from the theocracy (q.v.) which was the earliest form of state and which was developed in Asia and northern Africa. The theocracy was ruled by a high priest or by a king or prince who represented within the limits of his dominions the monarchy of God over all things; hence religion was the bond of union and the idea culminated in the 17th century in the doctrine of divine right of kings. Therefore, when later transformed from a divinely ruled state into one with a human king, the distinguishing mark was despotism. But this barbarous form of monarchy was rejected by the people of Aryan origin who gave some recognition to individual and class rights apart from the rights of kings and princes. Though at first the monarchies were absolute, yet the absolute monarchs were not always tyrannical but in many cases ruled for the good of their subjects. Among monarchs of this class were Henry IV, Saint Louis, Canute, Charlemagne and others of the early centuries of European history and the "enlightened" or "benevolent" despots of the 18th century. The essential basis of the feudal monarchy (which followed the decline of Carolingian authority) was the bond of fealty between the king or supreme lord and his vassals, who derived from him their rank, power and property. The mediæval monarchy was followed by the modern absolute monarchy which first made its appearance in France, proclaiming the doctrine of divine right of kings and culminating in the absolutism of Louis XIV. The Stuarts of

England held this doctrine but the monarchical principle was shaken to its foundation by the execution of Charles I and the English revolution of 1688, and was completely shattered by the French revolution of 1789. Since that time the monarchies of western Europe have been transformed into constitutional or limited monarchies, the growth of democratic ideas having infringed upon and greatly reduced the former powers of the king or emperor. "Monarchists," strictly speaking, have long been a small and dwindling minority. See KING; ABSOLUTISM; SOVEREIGN; STATE; GOVERNMENT; THEOCRACY; REPUBLIC; FEUDAL SYSTEM; and the descriptions of the governments of the various nations. Consult Brougham, H. P., 'Political Philosophy,' Pt. I (London 1842); Bluntschli, J. K., 'The Theory of the State' (6th ed., trans., Oxford 1885); Woods, F. A., 'The Influence of Monarchs' (New York 1913); Woolsey, T. D., 'Political Science' (Vol. I, pp. 487-585, New York 1878); articles on divine rights in *The Outlook*, 10 Sept. 1910; *Living Age*, 26 July 1913; and *Current Literature*, October 1910; and articles on modern kings and rulers and their influence as listed in the guides to periodical literature.

**MONASTERY.** See MONASTICISM.

**MONASTERY, The,** a novel by Sir Walter Scott, published in 1820, the scene of which is in Scotland in the 16th century. In this tale Scott for the first time introduces a supernatural element, as in the mysterious appearances of the "White Lady of Arenal," and for this reason the book was never as popular with English readers as his other tales. Its sequel, 'The Abbot,' appeared the same year.

**MONASTIC ARCHITECTURE. East Indian.**—The Buddhist priests' monasteries, known as *vihāras*, either adjoined or were included in the *chaitya*-house (building surrounding the shrine). The most ancient (*Hinayāna*) erected monasteries are no longer in existence, but we know that the Jetavana monastery of Srāvastī in the 5th century A.D. had splendid buildings seven stories high. The existing ancient monasteries are those cut into the living rock. Of these perhaps the following are of greatest interest: Those on the hills of the Upper Godaverī River, at Nasik; the Gautamā-putra monastery ("Cave III"), belonging to the 2d century A.D. One of the grandest extant monastic structures is the Mahāyāna *chaitya* of Ajantā, but the magnificent *chaitya*-house at Kārḷī carved in the rocks of the Western Ghats, between Bombay and Poona, is considered to show the Hinayāna School in its best light. The Buddhist rock-cut *vihāra* at Bedsā, a 2d century B.C. work, has its cells round a *chaitya*-house, an apse around the *chaitya* and the usual barrel roof. The usual form of Indian monastery consisted of rows of cells ranged about the shrine, which was surmounted by its heavy mound (*stupa*). The architectural plan somewhat resembles the basilica with its interior lined with pillars and the shrine located in the domed extremity opposite the façade. The style of the Dravidian religious edifice, with its pyramid-crowned gateway (*gopura*), choultries, etc.,

belongs to the subject Architecture. See ARCHITECTURE—*Sasanian and Mohammedan*.

**Eastern Church.**—The early Basilian monks attempted no special style or application of architecture, using the Byzantine, Greek or Eastern plans as best suited for their allocations. From 306 to 322 the ascetics were withdrawing in bodies to the deserts, and under such leaders as Paul, Anthony and Pachomius, they established monasteries. To such belong those of Mount Athos (Rumelia), others in the Balkans, in Armenia, the Libyan Desert ("Coptic"). Many of these "Levantine" monasteries were devoid of all external architecture, rendered as inconspicuous as possible to avoid drawing the attention of the passing marauding bands of natives. They were usually surrounded by a high blank wall. The 4th and 5th century monasteries established under Pachomius rule in the Libyan Desert had small buildings, called *laura*, which contained separate cells, known in their combination as *canobia*, the dwellers thereby being called *Canobites*. They were governed by an *abbas* (father), *hegumenos* (leader), or *archimandrite* (superintendent).

**Western Church.**—*Benedictine Monasteries.*—Saint Benedict published his 'Rules' and established his monastery at Monte Casino about 520, but the first positive and complete information we have on monastic architecture of his Order is the plan (designed in 822) for the construction of the monastery of Saint Gall. The precept of Saint Benedict demanded that all the workers of the monastery should find their workshops inside the walls of the enclosure. In the Saint Gall plan the grounds form a long rectangle in which the church is about the centre. Annexed to the church are the dwellings of the monks, the chapter-house, cloister and refectory. In a wider circle are grouped the residence of the abbot, the school house, the lodgings for strangers, the stables, brewery, bakery, mill, workshops and barns. Behind the church are located the hospital with residence for physicians and a garden for cultivating medicinal herbs. Here are also an acolytes' school, cemetery, horticultural and vegetable gardens and a poultry yard. This ambitious plan was not carried out in its entirety and few of the buildings are now in existence.

*Cistercian Monasteries.*—While the Benedictines aimed at richness in architectural effect, especially in their church edifices, the Cistercians held to strict simplicity. Their mother monastery was at Clairvaux, but the abbey of Maulbronn, Württemberg, founded 1146 and finished in the 13th century, has come down to us in such a good state of preservation as to serve best for model. It is (according to periods of construction) in Late Romanesque, Transition and early Gothic. The cloister forms the central point connecting on the south with the church, on the east with the chapter-house and on the north with the men's refectory. To the west lies the lay refectory and, somewhat separate, we find the residence of the abbot and the farm buildings. When pressed for space the refectory served also as chapter-house, where the monks gathered daily to hear a chapter read from the 'Rules' and in which the more important affairs were discussed. The monks slept at first in a common

dormitory but later received separate cells. The dormitory was usually located in an upper story and the cell contained only a bedstead, table and stool and a window. The superiors, however, had more spacious and better furnished rooms.

*Premonstratensian and Grandmontine Monasteries.*—In these the central point of the enclosure is occupied by the cloisters, which include a separate court enclosed entirely by galleries under which the doors of the different apartments are located. In the centre of the court are a well and a cistern. The abbey church occupies one entire side of the square, either the north or south side. The western side of the cloisters is attached to the building which forms the exterior façade of the abbey and is composed of cells or stores of provisions surmounted by the dormitory of the menial servants. On the side of the square facing the church is the kitchen, communicating with the refectory by a wicket. The refectory has an elegantly carved chair for reading. On the east, following the refectory, come the workroom or several apartments serving as library, scriptorium, shops, etc. On the eastern side of the cloisters, between the working quarters and the church choir is a passage affording access to the gardens, then comes the chapter-hall, generally several steps downward from the cloisters with which it communicates by a great portal flanked by two richly adorned windows. It is generally vaulted and neatly decorated; the abbots were often interred under its pavement. The sacristy is usually located between the chapter-hall and the church, also the vestment room and chart room; sometimes a prison cell for delinquents. Above these compartments extends the dormitory of the monks, communicating by a staircase with the church choir. Opposite the stairway is the cell of the abbot overlooking his monks. The collection of buildings is closed in by a water-course or walls with an entrance on the east facing the façade of the abbey. The porter's lodge is located alongside. Within this enclosure are the lodgings for the laity; eastward are the apartments for ecclesiastical guests and the novitiate. The agricultural buildings (near a stream) and the mill and factories are scattered on the sides, the infirmary being carefully isolated.

The monastic housing plans of the Jesuits differed greatly from those of the mediæval monasteries. They rivaled one another in beautifying and enlarging their buildings and grounds. The church, of course, showed the chief magnificence, but the libraries and refectories boasted all the ornamentation the architectural periods afforded. They set aside special spaces for festivities and for the entertainment of distinguished guests, even furnishing (in Austria) a theatre, Imperial hall and ducal hall. Good examples exist at Otto-beuren, Salem, Ettal, Saint Florian near Linz, Melk (Lower Austria). The Carthusians adopted a plan differing in many respects from other Orders; the Knights Templar united military architecture with that of the monastery. The Franciscans and Dominicans of the 13th century dropped tradition in modifications, and by the 17th century followed no style entirely. The Cluniacs (from 912) developed the Roman-

esque style in their monasteries. The Cistercians (from 1098) adapted the Gothic to their needs, and the Trappists also utilized the Gothic style. In Italy the Renaissance period (of course) furnishes the finest specimens of monastic architecture. Of such perhaps the most prominent is the Certosa, near Pavia (Carthusian), built 1473, with its celebrated church façade, considered to be the most magnificent monument of the Italian early Renaissance. The Carthusian monastery, built by Michelangelo, which adjoins the Santa Maria degli Angeli church at Rome (now the Museo Nazionale delle Terme), is noted. The cloister of Santa Croce, Florence, contains the greatly admired portal of Brunelleschi. Consult Havell, E. B., 'Ancient and Mediæval Architecture of India' (London 1915); Jubainville, d'Arbois de, 'Essai de l'état intérieur des abbayes cisterciennes' (Troyes 1863); Lenoir, 'Architecture monastique' (Paris 1852-56). See ARCHITECTURE; BYZANTINE ART; CHRISTIAN ARCHITECTURE.

CLEMENT W. COUMBE.

**MONASTIC ART.** In its final analysis art is the visible, concrete proof of the development and stage of advance or decay of civilization. And the most prominent fact in connection with the history of art of the Christian era is that the holy flame of the spirit of artistic effort was kept burning for numerous centuries solely by the aid of the Catholic Church (Eastern and Western), while all outside of the monasteries was in a riot of barbarism, devastation, murder and rapine.

**Art in the Eastern Church.**—The basilicas (q.v.) of the early Christians, themselves designed on pagan lines but adapted to their needs, used for internal decoration the art of mosaics, which flourished in the 6th and 7th centuries. The monks produced manuscripts from the hands of their miniaturists, wonderful in their lovely illumination and calligraphy, beautiful creations in ivory, impressive examples of gold and silver-smithing, enamel work, embroidery, etc. These are in the style termed Byzantine. (See BYZANTINE ART). The conquering barbarians, with no native art of their own or knowledge of the antique, quickly absorbed the prevailing style, adopting it together with the religious influences of the Christian Church. With the fall of the Roman Empire workers in the arts were driven to the Orient for their existence and art flourished in the churches of Constantinople and Jerusalem. The Basilians, an order founded by Saint Basil (d. 380), had, among their "rules," the mandate that *work* was part of their monastic life; and art was one of the chief "works" done in producing the decorative elements of the churches. In this mediæval period we find the monastic life spreading from its centre (Constantinople) to Mount Athos (from 960). Greek monasteries were founded at Rome in the 6th and 7th centuries, the cult reaching to south Italy, Sicily and Calabria. From the monastic art standpoint of great importance is the fact that Basilian monachism spread into Russia, and, its art accompanying it, was absorbed by the Slavs (Kiev c. 1050). The Byzantine miniaturists were in the zenith of their fame up to the 11th century.

**Art in the Western Church.**—All the above art work was under Oriental (Mohammedan) influence. In the 11th century commences the true Christian monastic art of Europe, but we must go much further back for its inception. The early Christian art of the monasteries of the Irish and the Anglo-Saxons (about the 5th century) remains a source of bewilderment and mystery when we consider its marvelous (exquisite illuminated manuscripts, art jewels inlaid with enamels, etc.) execution and remember that the artist-monks had but just been converted to the Christian faith. And it was Winfred (683-755), an English priest who went as a missionary to Friesland and established successful monasteries and the adjunct art cult through North Germany, to be canonized as Saint Boniface after his martyrdom. From the 6th century the Benedictine Orders, starting from Monte Casino, Campania, carried on the entire culture of Europe for 500 years, the arts being a large and valuable part of the work. The "Rules" of Saint Benedict, disclosed in his 'Regula Monachorum' show the system required of the monks in their work. Cassiodore followed Saint Benedict soon with his monastery at Viviers in Calabria and its library, where in their cells (called *scriptoria*) the calligraphists and illuminators did their copying of manuscripts, illuminating and painting as well. And we now come to the great crowd of painters, sculptors and architects as well as calligraphers and illuminators that were trained by the orders to radiate their influence and example through all classes of society. And it is to these disciples that the world owes all it owned of art from the 7th to 12th centuries. Great centres of Benedictine work, besides Monte Casino (Italy), were the Alemannic domain of Saint Gall and Reichenau, later Hirsau and Fulda, in Germany. In France led the Cluniacs (from 912); in England York and Canterbury were great monastic art centres. In this interesting period we find hard manual labor, side by side with intellectual endeavor, done by monk and prelate alike. We find Abbot Herluin carrying sand and mortar during the building of the monastery at Bec in 1033; Canonius Hezelo, rich and distinguished, became a monk at Cluny so as to be able to work as *coementarius* (stone-mason) on the great abbey church founded by Hugo; Count Frederick at Verdun, as a monk at Saint Vanes, in 1000, dug the foundation to the dormitory with his own hands. The ranks of the monks of that day contained a remarkable number of versatile artists. Tutilo of Saint Gall (end of the 9th century), Ekkehard tells us, was painter, sculptor, poet and teacher; Abbot Mannius of Evesham, England, was noted as painter, musician, calligraphist and goldsmith; Fulco, the præcentor of Saint Hubert's monastery in the Ardennes, was architect and miniature painter, besides being mentioned as an efficient stone-mason and carpenter; the Alemannic chronicler Herman the Lame, at Reichenau, was a talented writer, poet, musician, while he was practised in astronomy and mechanics, at the same time being busy in making musical instruments and clocks. Bernard (b. 993, d. 1022), who rose from monk to bishop of Hildesheim, produced art work in metal and precious stones, some of which exist at the present day. He worked hard introduc-

ing the arts and crafts into Germany, and established schools and studios in his palace, sending pupils abroad to learn the different Byzantine arts, secrets and styles. Thiemon, monk at Altaich and later archbishop of Salzburg, was painter (as he himself claimed when suffering martyrdom in Palestine) as well as architect and goldsmith. And we come, in the 12th century, to the great monastic influences over the arts in France. The prelates of that period greatly enriched their churches (especially with goldsmithing work) with beautiful utensils for the cult. Of such monastic art patrons we find the name of Lambert, abbot of Saint Bertain at Saint Omer; of Gérard, bishop of Angoulême (d. 1136). But towering above all others would appear to have been Suger, who was abbot of Saint Denis (d. 1152), minister of Louis the Lusty and regent under Louis VII. Suger was censured by Saint Bernard for his rich beneficence to the artisans in embellishing his church. To his fine vessels in the precious metals he added furniture of great artistic refinement, also beautiful bronze doors with bas-reliefs of the Passion, etc. The episcopal and monastic schools of this century were producing more numerous and more beautifully illuminated manuscripts than in the preceding century, specimens of which are still extant. The abbey of Saint Denis created also lovely stained glass windows and mosaics. Some idea of the perfection of mechanical technique reached by the monks is afforded us by the work, 'Diversarum artium schedula' written by Theophilus, a monk or priest (10th or 11th century), in which he defines the manipulation and gives the formulæ used by the practitioners of the arts among the monks and lay coworkers. He gives perfect and practical information on painting on canvas, wood, vellum, glass, encaustic and fresco, mosaic work; goldsmithing, etc. While to the Rules of Saint Benedict and the assistance later of the Cistercians and Cluniacs in their establishments was due the propagation of art in the Middle Ages, the citizen class arising from the rapid growth in wealth of the civic communities together with the Crusades made a great change in the propagation of the arts. The clericals had not relinquished their efforts to aid the art movement, for they maintained the closest relationship with the arts at least till the Rococo period and practised the work extensively. But the civic lay element, from the 13th century, became stronger and more and more distinguished. Thus, while the monastic orders held supreme domain in the building of churches, the lay body took up the leadership of the plastic arts and painting in the persons of Niccoló of Pisa, Giotto, etc. And with Brunelleschi and Alberti on the scene we find the field of architecture also falling into the hands of civilians, displacing permanently the monastic talent. This was the Trecento period of the early Renaissance. Consult Labarte, J., 'Histoire des arts industriels au Moyen age et à l'époque de la Renaissance' (Paris 1864); Kraus, F. X., 'Geschichte der christlichen Kunst' (Freiburg im Breisgau 1896); Springer, A. H., 'Klosterleben und Klosterkunst' (Bonn 1886); Zouche, R. C., 'Visits to Monasteries of the Levant' (London 1916). CLEMENT W. COUMBE.

**MONASTIC ORDERS, Costume of.** See COSTUME, ECCLESIASTICAL.

**MONASTICISM, or MONACHISM,** is a state of life in retirement from the world adopted for motives of religion. It is not peculiar to Christianity, for in many religions, as that of Israel, and in those of India, China and Tibet, the same motive has led men to withdraw themselves wholly or in part from converse with worldly society and to seek in seclusion and retirement opportunity to lead a purer or higher life. The Nazarites, the Rechabites, the Essenes, the Therapeutæ were separatists from society in a greater or less degree, and in this respect were the precursors of the ascetæ of the earliest Christian age and of the hermits or anachoretæ and the cœnobites of the 3d and 4th centuries.

In the middle of the 3d century, during the persecution of the Christians by Decius, Paul of Thebes in Egypt (Saint Paul the first hermit), withdrew to a wilderness, and during the remainder of his long life lived in absolute solitude in a cavern of a mountain, deriving his food and his vesture from a neighboring grove of palm trees. Many others fleeing from persecution or from the contagion of a profoundly corrupt society, flocked to the wildernesses of the Nile country; among them was Antony (Saint Antony), who after many years of the strictly solitary life of an anchorite was in a manner compelled by circumstances to adopt the cœnobia rule. He was by choice an anchorite like Saint Paul the Hermit, but the fame of his virtues and his miracles brought to his cell in a remote wilderness many who desired to devote themselves to the service of God under such a master; and as he could not refuse their prayer he became, in fact if not in name, the Father or Abbot of a pretty numerous cœnobium; hence he is called the Father of Monachism, that is, of the life-in-common of those who retire from the world for reasons of religion; they retain the title of monk, *monachus* (a solitary), though since Saint Antony's day they are no longer solitary but cœnobites.

Antony's cœnobites occupied each a separate hut or a separate grotto; but Saint Pachomius, a contemporary of Antony, introduced a further development of the community life. The cells or huts were now to hold three brethren; meals were eaten in common; the labor of the monks was regulated; the brethren were graded according to their spiritual proficiency; the community was presided over by an abbot, with inferior officers; in addition to the primitive industries of petty agriculture, basket-making and mat-weaving, the monks practised the trade of the smith, of the tanner, etc.; there were daily assemblies of the community for prayer and conference. When Saint Pachomius died, about the middle of the 4th century, 7,000 monks were subject to his rule.

From Egypt monachism soon spread into Syria, Palestine, Mesopotamia, Asia Minor and Armenia.

The introduction of monachism in the Western countries of the Roman Empire dates from a little after the middle of the 4th century when a few small communities of monks, under the Pachomian rule, were founded at Rome and in Northern Italy. Later, when the rule of Saint Basil had been translated into Latin, communities of Basilian monks sprang up in Southern

Italy. Saints Jerome, Augustine and Ambrose were zealous promoters of monachism in Italy and Africa, Saint Martin of Tours in Gaul; when Saint Martin died (397) his body was followed to the tomb by 2,000 monks.

Whether under the Pachomian or the Basilian rule or under modifications of these, monastic establishments multiplied rapidly in the West. But the disorder which attended the decline of the Western Empire and the barbarian invasions, had its effects upon monachism, and the monastery exhibited the same anarchy as did civil society.

Early in the 6th century Benedict of Nursia, who had already led for three years the life of a strict recluse in a cave at Subiaco, about 40 miles distant from Rome, was chosen by the monks of a monastery in the same place as their abbot; but very soon, his new subjects having deposed him, he returned to his solitude and commenced that reform of Latin monachism which made his name illustrious. He gave to his monks a rule which, variously amended and modified, has been the law of the monastic life of Western Europe ever since. In its preamble Benedict recognizes two and only two legitimate classes of monks — cœnobites and anchorites — those who lead the life in common and those who live in solitude — usually now called hermits.

Two other classes he names, but only for condemnation, namely, sarabaites — professing monks who live two or three together without any superior or any fixed rule; and *gyrovagi* or *circulatores*, tramps, wandering beggars who wear the cloak of a religious profession. To do away with these scandals of the monastic life, Benedict's rule requires that the postulant for admission to a monastery shall take in addition to the usual monastic vows of poverty, chastity and obedience, a further vow that he will remain all his days in the community in which he makes his profession, and never be absent from the monastery save by leave of his superior.

Besides monasteries for men Benedict instituted also monasteries for women, and the first abbess of a community of Benedictine nuns was his sister Scholastica.

The Benedictine order was for a long time a powerful agency in the civilization and christianization of the barbarian nations of Europe. Wherever a Benedictine foundation was made there the face of the country was quickly changed: forests were cleared, marshes drained, the arts of husbandry developed, peace and civil order maintained, science and learning fostered, schools, hospitals and refuges established.

Monastic institutions founded in Britain, France, Switzerland, Italy and Germany by Celtic monks prior to Benedict's reform conformed to the Benedictine rule. The Carthusian order, founded in the end of the 11th century, was a reversion to the anachoretic type of monachism — the solitary or eremitical instead of the cœnobitic life. In the same century arose the order of the Camaldoli, another order of hermits.

The beginning of the 12th century saw the rise of that singular development of monachism, the knightly orders, the members of which besides the usual three vows of the monk took a fourth vow, of making war on the infidels for the defense of Christendom. The Knights Hos-

pitallers were originally a religious society bound by vow to harbor in health and in disease pilgrims visiting the holy places in Jerusalem; their house in the holy city was a "hospital" or guest-house. The full title of the Knights Templar is "pauperes commilitones Christi templique Salomonis"—poor knights-companions of Christ and of Solomon's temple. Another military order contemporary with these was the Teutonic order. History records the titles of over 90 military orders or of bodies styling themselves so.

The chronic state of war between Christendom and the Mohammedan power led to the institution of the order of Trinitarians and that of Our Lady of Mercy. The mission of these orders was the redemption out of slavery among the Mohammedans of Christian captives. Bearing the alms and gifts contributed by the charity of Europe, the members of those orders visited the Mohammedan countries on the Mediterranean and procured the liberation of the enslaved Christian captives and restored them to their native countries. The Trinitarians had at one time 250 houses; the Christians redeemed by them, from first to last, numbered over 30,000. The order of Mercy was at first a military order, but in 1218 it put off its military character, and devoted itself wholly to the charitable work of redeeming the captives.

There seemed to be now a sufficiency of religious orders to satisfy all needs. But at this very time, the beginning of the 13th century, two new orders were instituted—and that by Pope Innocent III. who in the Lateran Council had procured the enactment of a decree forbidding the creation of new monastic orders. The new institutes were the order of the Friars Minor (Franciscans) and that of the Friars Preachers (Dominicans); and to these very soon were added two more—the order of Austin Friars (Augustinians) and that of the Carmelites. These are the four mendicant orders, so called because by their rule they renounce all property and all endowments and subsist on the alms of the faithful.

The membership and the establishments of these mendicant orders increased with astonishing rapidity throughout the whole of Europe. Dominican and Franciscan friars were soon the great lights of the theological schools—Albertus Magnus, the Doctor Universalis, as he was styled by his contemporaries, and Thomas of Aquinum, the Angelic Doctor, being the foremost of the Dominican divines, and Duns Scotus, the Doctor Subtilis, and Roger Bacon holding the first rank among the Franciscans. The friars were also effective missionaries both among the poor and the rural populations at home and among the heathen and the infidels.

The Company of Jesus is the latest of the great religious orders; it was founded in 1534 and its mission was to resist the onward march of Protestantism, directly by combating the Protestant assault on the Catholic Church and by instructing the Catholic populations in the grounds of their religious faith and practice; indirectly by organizing a system of higher education for Catholic youth, and offering educational advantages superior to those afforded by Protestant universities and academies. The Company of Jesus took also as its special field of labor the evangelization of the heathen.

Nearly all the later religious orders and in-

stitutes have had for their object the Christian education of the young, the reformation of the fallen, or the relief of the poor and distressed; among the orders established for these ends are those of the Nuns of the Good Shepherd, the Sisters of Charity and of Mercy, the Brothers of the Christian Schools, and numerous other congregations.

The Reformation was hostile to monasticism, and in those countries where it obtained, the monasteries were suppressed and the monastic life disappeared. Henry VIII seized upon the monastic properties throughout his realm and applied them for his own religious or secular purposes. In Protestant Germany, Scandinavia and Switzerland, the monastic institution ceased to exist shortly after the triumph of the Reformation. In the 18th century a concertedly hostile movement against monasticism took shape in all the countries under Bourbon rule. The governments of Portugal, France, Spain, Sicily and some of the Italian principalities expelled the Jesuits and brought such political pressure to bear upon the Papacy that Clement XIV reluctantly signed the decree suppressing that famous Society in 1773. Pius VII restored the Society in 1814. During the latter half of the 19th century a recrudescence of hostility on the part of the governments of the Latin countries against the religious orders manifested itself. In Spain, France, Italy, Mexico and some of the South American republics expulsion for some orders and hampering restrictions upon freedom for others have contributed to retard their growth and development. The reasons usually alleged for these coercive measures by these governments are political and economic, the merits of which it would be out of place to discuss here. In the opening decade of the 20th century the French government aimed a deadly blow at monasticism in that country in its Associations Law. Germany admits all the religious orders except the Jesuits. In Great Britain full freedom is now given in the establishment and development of monastic institutions. In the United States, where there are absolutely no legislative restrictions upon the freedom of monastic life, the religious orders are in a flourishing condition. In this country there are 8,400 male and over 50,000 female members of religious orders.

In the Church of England within the last 50 years there has been a revival of the monastic idea with no inconsiderable results. Dr. John Mason Neale and Canon Carter promoted the establishment of sisterhoods (of Saint Margaret and of Saint John Baptist), in which life vows of poverty, chastity and obedience were taken, and a mother house of the Sisters of Saint John Baptist was founded in New York as a branch of the central house in England. There is also the Protestant Episcopal sisterhood of Saint Mary and many others in the United States. Among the male orders of Protestant monasticism must be mentioned the Cowley Fathers, founded by Dr. Benson, and in the United States the Order of the Holy Cross, a preaching order founded by J. O. Huntingdon, son of Bishop Huntingdon. An order of monks was also founded by Rev. Joseph Leicester Lyne in 1870 at Llanthony Abbey, Wales, and the strict rule of Saint Benedict was adopted. It is no exaggeration to say that the

monastic movement is now flourishing, both in the Church of England and in its daughter church, the Protestant Episcopal Church in the United States. For further details see the articles on the various orders, Benedictines, Cistercians, etc.

**MONASTIR**, mōn'ā-stēr, Africa, a seaport town on the east coast of Tunis on a peninsula in the Gulf of Hammamet. It is strongly fortified with surrounding walls surmounted by towers and has its Kasba (castle), 13 mosques, a high school for the natives and beautiful gardens in the vicinity. Its chief industries are soap-making and oil trade. The town is known locally as Mistir and is the ancient Ruspina. Its population is about 6,000, most of the Europeans being Italians and Maltese.

**MONASTIR**, or **BITOLIA**, bē-tō'li-ā, Turkey, a city and vilayet of Macedonia (q.v.). The city, 86 miles by rail northwest of Saloniki, is attractively built at the west edge of a plain, in a recess formed by two lofty mountains, and is intersected by a river, crossed by numerous bridges. The streets are wide and well-paved; the houses neat and clean; the mosques and minarets picturesque; and the bazars handsome. As an important central situation for all military operations relating to this part of Turkey, it was a scene of great activity during the Balkan Wars 1912-13 and after the outbreak of the European War in 1914. The majority of the inhabitants are Greeks and Bul-

garians, the Turkish residents being mostly soldiers or officials. It carries on a large trade with Constantinople, Saloniki, Vienna and Trieste. Pop. about 45,000. The vilayet has an area of 10,690 square miles. Pop. about 850,000.

**MONAZITE** (Greek, "solitary," in allusion to its rare occurrence), a native phosphate of the metals of the cerium group, often also containing more or less thorium silicate. It is reddish or brownish in color, with a resinous lustre, and crystallizes in the monoclinic system, though it also occurs in massive and granular forms. It is commonly translucent and brittle, with a hardness of from 5 to 5.5, and a specific gravity of about 5.0 to 5.2. It is found at Norwich, Conn., and also in the Ural district, as well as in Australia, Brazil and other parts of the world. The chief commercial supply, however, comes from North Carolina and from certain parts of Brazil. In these regions monazite is a constituent of the granitic rocks, and is obtained by washing the gravels and sand that have been formed by the disintegration of those rocks. The Brazilian output has been controlled by a German syndicate since 1902, and practically all of it now goes to Europe. The monazite produced in the United States comes chiefly from Burke and Cleveland counties, North Carolina. Monazite owes its industrial importance to the cerium and thorium that it contains, the former being utilized for the preparation of cerium oxalate, which is used in medicine and in the arts, while the thorium is employed in the manufacture of mantles for incandescent gas-lighting.

**MONBODDO**, James Burnett. See **BURNETT**.

**MONCHEUR**, mōn-shēr, Ludovic, BARON, Belgian diplomat: b. Brussels, 12 May 1857. He was educated at Louvain, entered the diplomatic corps, became attaché to the Belgian legation at The Hague in 1883; held posts in the legations to Vienna (1885), Berlin (1887), Rome (1892); became minister to Mexico in 1898; and in 1901 became minister to the United States. He has written on the geography of Mexico and is a member of the Antwerp Geographical Society.

**MONCLOVA**, mōn-klō'vā, Mexico, a town of Coahuila, the terminus of a branch line of the Mexican International Railroad to Cuatro Ciénegas, 100 miles northwest of Saltillo. Monclova dates from the 17th century and was formerly the capital of the dual state of Coahuila and Texas. It has railroad works, cotton factory, stock raising interests, and a trade in the agricultural produce of the region. Pop. 7,000.

**MONCRIEFF**, mōn-krēf', SIR Alexander, British ordnance expert, inventor of the disappearing gun system: b. Edinburgh, 17 April 1829; d. Bandirran, 3 Aug. 1906. He was educated at Edinburgh and Aberdeen; apprenticed to a civil engineer; served in the Scottish Royal Artillery; during the Crimean War planned the Moncrieff ordnance system, also called the protected barbette, or the disappearing system, for the invention of which he received \$50,000 from the British government. The important point in this system is that the recoil of the gun is utilized to drop it out of sight after firing and to raise it again when necessary, a contrivance

which did away with the cumbrous and expensive system of steel-plated forts. It substituted for them the simple, inexpensive Moncrieff pits, mere slight excavations for the masking of coast batteries. He received the honor of Knighthood in 1890.

**MONCTON**, mŭn'k'tŏn, Canada, a city and port of entry in Westmoreland County, New Brunswick, at the head of navigation of the Petitcodiac River, a tidal stream entering the Bay of Fundy; the Atlantic terminus of the National Transcontinental Railway, 86 miles northeast of Saint John, and 185 miles northwest of Halifax. It has a good harbor and an extensive trade in lumber and produce. The tide in the Petitcodiac estuary is one of the most remarkable in the world, coming in with a bore from four to six feet high and rising (in spring tides) to a maximum height of 60 feet. The offices and chief workshops of the Canadian government railways are here, employing 2,000 men. Enormous quantities of natural gas have been discovered in the vicinity, which are used for light, heating and power, the street railways being run by this means. Moncton was celebrated for its shipbuilding in the days of wooden vessels. Pop. 11,345.

**MOND**, mŏnd, Ludwig, English manufacturing chemist; b. Cassel, Germany, 7 March 1839; d. 11 Dec. 1909. He was of Jewish parentage, and educated at the Cassel Polytechnic and the universities of Marburg and Heidelberg; went to England in 1862, to enter the employ of the Leblanc soda works, where he introduced his method of recovering sulphur from alkali waste; in 1873 introduced the Solvay process of manufacturing ammonia soda, into England; and continually improved this process. His alkali works at Northwich are the largest in the world. He invented a means of manufacturing chlorine as a by-product of the ammonia soda process, and devised new gas-batteries, new processes for manufacturing nickel based upon his discovery of nickel carbonyl, and a new method of producing gas for power and heating, ammonia being a by-product. In 1896 Mond endowed the Davy-Faraday Research Laboratory at the Royal Institution. His remarkable collection of paintings, bequeathed mainly to the National Gallery, London, has been described by J. P. Richter in 'The Mond Collection' (London 1910).

**MONDAY** (*moon and day*; Saxon, *Monandag*; German, *Montag*; Latin, *lunæ dies*), the second day of the week, formerly sacred to the moon. See CALENDAR.

**MONDE (LE) OÙ L'ON S'ENNUIE**, lĕ mŏnd oo lŏn sŏn'nwĕ ('The Society that Bored' 1881), by Édouard Pailleron, is still, what after 15 years it seemed, "on the whole the most brilliant comedy of modern days" (*Athenæum*, 27 Jan. 1906). It is not only an extremely keen and witty satire on the modern Parisian blue-stocking, the counterpart for its day of Molière's 'Femmes savantes,' but its individual characters stand out so clean-cut that "keys" to it were once in vogue, and many thought to recognize unmistakably some at least of the originals. The outstanding characters are all types easily recognizable in modern counterparts of this society of literary, intellectual, political and social pretense. First is Bel-

lac, the complacent object of admiring adulations, such as the would-be intellectual *Parisienmes* were then bestowing on Professor Caro, who vapors of Platonic love, the better, in his own phrase, to "enjoy life and avoid marriage." Then there is the soldier-senator bore, General de Briais; the transcendental bore, Saint-Réault; the sentimental, yet shrewdly tart Duchess de Reville, who insists: "The older I grow the more I see that there is no happiness else in the world than love"; her niece, Madame de Cėran, the hostess, busybody of intrigue for reputation, and Lucy Watson, the may-pole Englishwoman, who translates Schopenhauer. The better to set these off and spice the whole come the recently-married, gaily sensible Paul and Jeanne Raymond and the delightfully ingenuous young girl Suzanne, vivacious yet tender, sensible yet *gamine*, whose hand one grudges a little to her guardian, the right-hearted but rather slow-witted Roger. Consult Claretie, 'Édouard Pailleron' (Paris 1883).

BENJAMIN W. WELLS.

**MONDOVI**, mŏn-dŏ-vĕ, Italy, an episcopal city in the province of Cuneo, 58 miles by rail south of Turin. Its chief building is the 15th century cathedral of San Donato crowning the steep height of the upper town. Silk, cloth, paper, pottery, machinery, etc., are among its manufactures, and it has a school of industrial arts and handicrafts. Near the city the Sardinians were totally defeated by Napoleon, 22 April 1796. Pop. 10,000; with suburbs, 19,300.

**MONER**, the simplest form of protozoan, regarded as the simplest known animal organism, and included among the rhizopods in the order *Lobosa*. One of the forms most frequently met is *Protamaba*. Consult Haeckel, E., 'History of Creation,' ed. by Lankester (4th ed. 1906).

**MONET**, mŏ'nĕ, Claude, French painter; b. Paris, 14 Nov. 1840. He opened a new road to landscape painting by his application of scientific principles deduced from the laws of light. His work, a magnificent verification of the optical discoveries made by Helmholtz and Chevreul, forms the very basis of the Impressionist movement with all its chromatic demonstrations of light and color. Suppression of local color and the study of reflections by means of complementary colors and division of tones by the process of pure, juxtaposed colors are the essential principles of Impression. Monet's first luminous studies date from about 1885. For years he remained unknown.

Light is the real subject of his pictures. He has treated one and the same site in a series of pictures painted from nature at all hours of the day. The most famous of this series are the 'Hay-ricks,' the 'Poplars,' the 'Cliffs of Etzetat,' the 'Golfe Juan,' the 'Coins of Rivière,' the 'Cathedrals,' the 'Water Lilies' and the 'Thames.' Monet paints this series from nature. He notes, for example, from 9 to 10 o'clock the most subtle effects of sunlight upon a hay-rick; at 10 o'clock he takes up another canvas; and so on from hour to hour, he follows step by step the modifications of the atmosphere. He finishes almost simultaneously the whole series. He has painted a hay-stack in a field 20 times over and the hay-stacks are all different; and when

this series is exhibited the beholder can follow, led by the magic of his brush, the history of light playing on one and the same object, a dazzling display of luminous atoms, a presentation of atmospheric vitality. The shadows, true to nature, are lights where certain tones—blue, purple, green or orange—predominate exactly as happens in optic science.

Usually his subjects or *motifs* are simple; a hay-rick, some slender trees, a cluster of shrubs or group of rocks. No one knows better than he how to place a rock amidst tumultuous waves, how to construct an enormous cliff or how to give the sensation of a group of pine-trees blown and bent by the wind. Most unexpected tones play in the foliage and on the ground. On close inspection the beholder sees the canvas striped with orange, red, blue and yellow touches of the brush, but seen from a distance the freshness of the green foliage appears as in nature. The eye of the beholder recomposes what the painter's brush has analyzed and *dissociated*. Monet is now considered one of the greatest of all landscape painters, ranking with Claude Lorrain and J. W. M. Turner. He understands and depicts with equal facility the true character of every soil and the true character of every kind of vegetation. Monet is also able to turn like all great artists from demonstrations of power to displays of tender charm. His studies of the austere rocks of *Belle-Isle en mer* where heavy waves and blinding spray dash with fury over the granite rocks are unparalleled, while his series of *Water-lilies* express the melancholy and quiet beauty of sequestered pools where the water is thick with tangled stems and sleepy blossoms. Monet has also painted the woods in autumn where the sunlight plays on tones of bronze and gold and red; chrysanthemums, dazzling sun-flowers, tulip-gardens in Holland; sailing boats on sunny rivers; and many portraits and other studies. The series called 'The Cathedrals' is famous. It consists of 17 studies of the west front of Rouen Cathedral, the towers of which fill the whole space of the picture. The gray stone, worn by time and blackened for centuries, is for 17 times made the theme for the painter's vision. Pale and rosy at sunrise and differently rosy and glowing at sunset, purple at midday, shrouded in mist or ethereal under the moonlight, the superb façade is reconstructed in the boldest way, yet producing the effect of its thousand details of architectural beauty and exhibiting the most dazzling and poetic atmospheric harmonies. Whatever subject he treats Monet creates an æsthetic emotion in the beholder. Consult Duret, 'Le peintre Claude Monet' (Paris 1878); Van Dyke, John C., 'Modern French Masters' (New York 1896).

**MONETA**, in Greek mythology, a name applied to Juno, known as the goddess of coin or money. A temple was dedicated to her in this capacity on the Capitoline Hill, in which the mint was located.

**MONETARY COMMISSION OF THE UNITED STATES CONGRESS**, a commission appointed in August 1876, by the 44th Congress, to inquire into the causes and economic effects of the decline in silver, the best means for resuming specie payments and other national monetary questions. The commission

consisted of three senators, three representatives and three monetary experts. Meetings were held in Washington and New York, during a period of six months. The results of these conferences were published by the government in monographs issued by the Treasury Department.

**MONETARY CONFERENCES, International.** In addition to the monetary conventions (q.v.) held among European nations, four great International Monetary Conferences have been held, three at Paris 1867, 1878 and 1881, and one at Brussels in 1892. Encouraged by the success of the Latin Union (q.v.), France invited all the powers to participate in a general conference for the purpose of relieving the problems of international exchange. The conference was attended by 18 European nations and the United States, and was presided over by the French Minister of Foreign Affairs. Eight sessions were held, the principal topics of discussion being the uniformity of coinage and the larger problems attendant upon such proposed uniformity. Two important decisions were reached: (1) that it would be more expedient and less expensive to the several nations to adopt as a uniform standard some already existing monetary system than to invent a new standard; and (2) that gold was the only standard which was adapted to international money. The standard of fineness was set at nine-tenths, and the five-franc piece was recommended as the common denominator. It was likewise agreed that all gold coins having this common denominator should have legal circulation in the states mutually bound by the conference. Since no treaties were contracted to bind the members of the conference to their decisions, little was really accomplished. The principal value of the first conference lay in the fact that it opened the way to further discussion.

The second conference was called by the United States by Act of Congress, 28 Feb. 1878, under which the President was directed to invite the nations of Europe to join in a "conference to adopt a common ratio between gold and silver for the purpose of establishing internationally the use of bi-metallic money, and securing fixity of relative value between those two metals." This determination was occasioned by the fact that the silver production of the United States had assumed immense proportions. Also Germany's use of the gold standard threatened the value of silver money, and it was deemed advisable to establish the ratio between gold and silver before serious depreciation of the value of silver might set in. Twelve countries participated, Germany alone of the great powers refusing to enter into the conference. The United States submitted two propositions, one covering the desirability of the unrestricted coinage of silver and its use as money of unlimited legal tender; and the second, advocating a double standard of gold and silver on the basis of the establishment of a fixed ratio between them. The European powers with the exception of Italy, after much discussion, made answer as follows: "That it is necessary to maintain in the world the monetary functions of silver as well as those of gold, but that the selection for use of one or the other of the two metals, or of both

simultaneously, should be governed by the special position of each state or group of states." They agreed also that bi-metallism must be determined by the discretion of the individual states chiefly in relation to the country's relation to the silver market; and that, in lieu of the fact that a mutual agreement on the question of ratio between the two metals could not be reached, the question had better be dropped for the time being. The conference therefore produced no effective results.

The French and United States governments joined in calling the third conference. The decline of gold production again brought up the problem of bi-metallism. England and France met with seriously diminished gold reserves, and the United States was forced to import gold, which upset the European market. Germany was unable to find a satisfactory means of disposing of her stock of silver. Nineteen countries attended the conference. It recommended the establishment of the 15½ to 1 ratio, and then adjourned for the purpose of giving the various nations time to consider the proposition, with the intention of reconvening on 12 April 1882. However, the conference was not reassembled on that date, and was therefore fruitless.

The fourth conference was called by the United States "for the purpose of conferring as to what measure, if any, can be taken to increase the use of silver as money in the currency system of nations." Twenty countries were represented. A delay was caused by the fear of a cholera epidemic, and in November 1892, the sessions were finally held. England and the United States were the most enthusiastic members of the group. Political factors began to play also on the interests of these two countries, and the discussion, though lengthy, was altogether unprofitable. Various schemes for a bi-metallic standard and for the wider circulation of silver through some co-operative system were brought forward. There was no unanimity and the conference finally adjourned; 30 May 1893, was the date set for its reconvention, but this never took place. (See MONEY). Consult the various official reports of the conferences; and also 'Coinage Laws of the United States' (1792-1894); Muhleman, M. L., 'Monetary Systems of The World' (New York 1895); and Russell, H. B., 'International Monetary Conferences' (New York 1898).

**MONETARY CONVENTIONS**, conferences between European nations, for the regulation of their coinage. Two of such conventions have been held, the "Latin Monetary Convention," and the "Scandinavian Monetary Convention." The former includes France, Belgium, Italy and Switzerland, the agreement having been made in December 1865, in virtue of which the coinages of those countries are of the same weight and fineness. Greece subsequently joined the convention, and assimilated her drachma to the franc. Spain, Austria and Hungary, Finland, Rumania, Serbia, Bulgaria and Monaco have also coined large amounts of either or both gold and silver money, of weight, fineness and value exactly proportionate to, or identical with, that of the countries included in the convention. Since 2 Aug. 1892, the gold standard has prevailed in Austria, and since 1 Oct. 1897, in Japan. The

"Scandinavian Monetary Convention" dates from 1873, and includes Norway, Sweden and Denmark. See LATIN UNION.

**MONETITE**, a native acid phosphate of calcium, CaHPO<sub>4</sub>, occurring massive and in small, triclinic crystals, in the islands of Moneta and Mona, in the West Indies. The mineral is found in limestone, beneath a deposit of guano. (Also spelled "monitite.")

**MONEY**, Walter, English author: b. Donnington, Berkshire, 21 Aug. 1836. He received his education in a private school and early began to study on historical and archæological subjects, and for a number of years was the local secretary of the Berkshire Society of Antiquarians, London, and of the British Archæological Association. From 1889-97 he was a member of the Berkshire County Council. Among his publications are 'The History of Newbury'; 'The History of Hungerford'; 'The History of Speen—the Roman Spinæ'; 'Church Goods in Berkshire'; 'The Two Battles of Newbury, 1643-44'; 'The Story of the Siege of Donnington Castle'; 'The Siege of Basing'; 'A Royal Purveyance in the Elizabethan Age'; 'A Popular History of Newbury and the Neighborhood' (1905); and many memoirs on historical and archæological subjects.

**MONEY**. Money is a term used to describe the standard of value and a very important part of the medium of exchange of a country. By a *standard of value* is meant any commodity, which is used to measure and express the ratios in which other commodities exchange for each other. For example suppose wheat has been traded for wood, cattle, sheep and plows on the following terms: 1 cord of wood for 5 bushels; 1 ox for 50 bushels; 1 sheep for 20 bushels; and 1 plow for 10 bushels. The figures 5, 50, 20 and 10 express the market values of these commodities and the ratios at which they should exchange for each other, and, since each refers to bushels of wheat, wheat may be called the standard of value.

**Standards of Value**.—In a community in which barter was the only method of exchange each person would trade the commodity he produced or the service he rendered for the other commodities and services he required, and would express their values in terms of the commodity or service thus bartered, no other method of expressing their values being available to him. Standards of value in such a community would therefore be individual and would be as numerous as the individual traders, and difficulty would be experienced in discussing values because each person would speak a language not intelligible to others or only intelligible after a mathematical calculation. For example, one man would express the value of a given commodity, say a horse, as so many bushels of wheat, another as so many cords of wood, another as so many yards of cloth, another as so many days of labor, etc. The only method of removing this difficulty would be the acquisition by each member of the community of the ability and the habit of quoting values in terms of the same commodity; that is, by the acquisition of a *community standard*.

Such community standards were early established in every trading group of which history furnishes any record, and, as trade developed

between different communities, standards common to wider and wider areas and to larger and larger groups appeared, until, with world-wide trade, we have standards common to many nations. Indeed, at the present time all the nations in which commerce has been highly developed use the same standard, gold, and only two standards, gold and silver, are used throughout the civilized world.

Only a commodity which possesses a high degree of utility for purposes of ordinary consumption can serve as a community standard since only for such a commodity would every person barter his commodities or services, and such barter, as we have seen, is a condition necessarily precedent to service as a community standard. Since several commodities in the same community and at the same time, however, may possess this essential quality of universal exchangeability, other qualities are also important in the determination of a community's standard. These are high value in proportion to bulk, divisibility, durability, fitness for coinage and steadiness or stability of value. The first four of these are important, because, as will appear later, it is desirable that the standard of value should serve as an element in the medium of exchange, and the fifth because of the relation between the standard of value and prices which will also be explained later. Among several commodities, therefore, for which every person has frequently bartered his commodities or services, the one which possesses these other qualities in the highest degree of perfection will become the community standard. This fact explains the almost universal use of gold and silver for this purpose, and the possession of the first of these qualities, relatively high value in proportion to bulk, and possibly the last one, steadiness and stability of value, in a higher degree than silver, account for the use of gold as a standard in the most important commercial nations of the world.

The numerical expression of the ratios in which goods exchange for the standard of value is called *prices*. Thus in the United States when we say that the price of a bushel of wheat is one dollar, we express the fact that wheat is exchanging on our markets for standard gold at the ratio of one bushel of the former for 25.8 grains of the latter, which amount of gold has been declared in our statutes to constitute a dollar. This being the case, the causes of changes in prices may be grouped under two heads, namely, those affecting the value of the standard commodity and those affecting the value of the commodity the price of which is under consideration, value in this connection meaning not ratio of exchange, but that quality of a commodity which is changed in magnitude by changes in the relations between its demand and supply. The price of wheat, for example, will change when the relation between its demand and supply changes, or when the relation between the demand and supply of gold changes, unless the change in the value of one commodity exactly offsets that in the value of the other.

The phrase standard of value, as used in the preceding sections, should be qualified by the adjective *primary*, in order to distinguish it from standards occasionally used which may be described as *secondary*. In the United States a secondary standard was in use from 1862 to

1879. In the former year the United States government, in order to assist in paying the expenses incident to the war then in progress, issued its notes promising payment to bearer in denominations suitable for circulation as money and made them legal tender in payments between individuals, i.e., decreed by law that the tender of these notes in the payment of financial obligations would constitute discharge of such obligations.

These notes speedily depreciated. That is to say, the people of the United States, and of other countries as well, did not consider them worth, and would not give for them on the open market, the amounts the payment of which was promised on their faces. As a result of this depreciation these notes took the place of coin in the circulating medium of the country, because people could melt down the coins and exchange the bullion for these notes at their depreciated value and with them meet a much greater volume of financial obligations than they could have met by tendering the coins directly. When everybody thus came to tender depreciated notes in the payment of all their obligations, prices were universally quoted in these notes instead of in gold, and they thus became the standard of value of the country.

The dependence of prices upon the value of gold was not, however, thereby in any way broken. What the government promised to pay in these notes was dollars, and dollars meant a certain amount of gold carefully specified in laws enacted by Congress. The value of the notes themselves, i.e., what people were willing to pay for them on the open market, was daily quoted in terms of the gold standard. The notes, therefore, were a *secondary* standard only, gold continuing to serve as the *primary* standard. Under these conditions prices fluctuated, not only because of changes in the relative value of gold and of commodities, but also because of changes in the degree of depreciation of these notes.

The phrase *medium of exchange* describes the go-between in exchanges now almost universally used in place of barter. Instead of exchanging the good or service we have directly for the one we want, we nowadays exchange it for a third thing which we in turn exchange for what we want and this third thing is called a *medium of exchange*. A farmer, for example, who comes to market with a load of grain and wants an overcoat does not search for a clothier who not only has for sale the coat he wants, but also wants the grain he has, but he exchanges his grain for coin, or government notes, or bank checks, and transfers these to the clothier in exchange for the coat.

**Medium of Exchange.**—The explanation of the almost universal practice of using a medium of exchange is found in the difficulties of barter. One of these is to find two persons each of whom has the thing which the other wants and wants the thing which the other has, and is willing to take the precise amount of the thing desired which the terms of the exchange agreed upon would bring him. There would be little commerce if this difficulty could not be overcome, and in overcoming it the medium of exchange has rendered a service essential to the progress of civilization.

In a state of barter also the process of saving is so difficult and expensive as to be practically

impossible as a general practice and on a large scale. It is that of hoarding surplus products. In such a state the farmer saves by storing his surplus grain and allowing his herds to grow and accumulate, the manufacturer by piling up goods in his warehouse, the wageworker, not being able to accumulate his services, could only save by exchanging them for such commodities as he might desire to consume in the future and hoarding these. In all these cases, however, the risk that the product hoarded would keep during the savings period, that it could be sold at the end of that period, and that the terms of the sale would be such as to render the sacrifice of saving worth while, would have to be assumed. In the vast majority of cases, these risks would be so great as to more than offset the inducement to save. The losses experienced by people who had attempted saving under these conditions would discourage others, and it is safe to say that few would ever make the attempt. A proper medium of exchange removes all these risks and thus renders saving possible and attractive.

A medium of exchange also promotes borrowing and lending. Without it a person with an unused surplus could aid another with a deficit only by transferring his surplus to him, but unless this happened to be in the precise form needed, which would rarely be the case, it would do the borrower little or no good. On the other hand, with a proper medium of exchange the lender can transfer to the borrower the means of purchasing at any time anything the market supplies, thus enabling him either to satisfy his own immediate wants or to purchase the means of producing wealth.

In order that exchanges may be accurately, conveniently and safely made under all conditions, that is, when the commodities to be exchanged differ widely in quality and value or when they differ very little, when the exchange is to be completed without delay or after a delay of days, weeks, months or years, when the persons between whom the exchange is to be made are face to face or separated widely in space or time, etc., the medium of exchange must represent every conceivable combination or amount of value; must be easily, cheaply and safely transportable from place to place; must be easily recognizable, durable, and certain in value; must be acceptable to all the parties involved in the trade, and must be automatically adjustable in volume to the fluctuating needs of commerce.

In the United States at the present time the medium of exchange must render it possible to make trades in values as low as one cent and as high as millions of dollars, and in every possible combination of amounts between those figures. It must be possible also to make up these amounts in a very short space of time, without long and difficult calculations and without danger of loss. The medium of exchange would be imperfect and quite incapable of meeting the public needs if it did not measure up to this requirement.

Since commerce takes place between people living far apart, in different cities, states and even nations, the medium of exchange must be of such a character that it can be sent through the mails and by express, over the railroads and on steamships, and be carried about in bags, pockets and purses, and it must be pos-

sible without danger of loss to transport in these ways all amounts large and small.

The importance of being easily recognized is well illustrated in a busy station where change must be made with great rapidity and where difficulty of distinguishing one element of the medium of exchange from another would render impossible the transaction of the necessary business.

Without elements of great durability a good medium of exchange would be impossible, because the wear and tear necessarily involved is great, and as an instrument of saving it frequently needs to be kept for long periods of time. Certainty of value is also absolutely essential. If there is any uncertainty regarding the value of any element of the medium of exchange, people will either refuse to accept it, in which case it will cease to be a medium, or they will protect themselves against possible loss by charging a higher price for the goods or services exchanged. In either case commerce is obstructed or made impossible.

In order that people may be willing to part with their commodities in return for the medium of exchange, they must be assured that it in turn will serve them in making desired purchases—that is, that the persons who have the goods they want will be willing to accept it in exchange for such goods. This requirement implies the possession of practically universal acceptability in some of the elements of the medium, of acceptability among wide circles in all of them, and of interchangeability between all, such interchangeability enabling the holder of any element which does not possess universal acceptability to exchange it for one which does.

The volume of exchanges in any community varies from time to time. In this and most other countries it varies with the seasons, being greatest in the spring and fall and least in midsummer and midwinter. The medium of exchange should adjust itself to these changes increasing automatically in volume as the volume of exchanges increases, and decreasing automatically under the opposite conditions.

The qualifications required in a good medium of exchange account for the composition of the currencies of modern nations and for the changes which have taken place in the past and which are still in progress. Every such currency consists of elements which from different points of view may be classified as follows: (1) hand-to-hand money, written or printed orders of one party to pay specified sums to another, and book accounts; (2) coin, government notes and bank currency, the latter sub-classified into bank notes and checking accounts; and (3) standard money and credit currency.

By hand-to-hand money is meant those elements of the medium of exchange which perform their service by mere transfer from hand to hand without endorsement or any other formality. In the United States at the present time it includes all our coins, several varieties of governmental notes and bank notes. Under the head of written or printed orders to pay specified sums to specified persons belong bank checks and drafts, postal money orders, express money orders and other similar devices. Some of these can be transferred between other than the original parties by the formality

of endorsement. Book accounts are widely used and constitute much the most important element of the medium of exchange of modern nations. Any book account serves as a medium of exchange if directly or indirectly it enables purchases and sales of commodities to be balanced against each other, for example, that of a grocer who credits farmers with the proceeds of eggs, butter, vegetables, and other produce purchased and debits them with their purchases from him, or that of the farmer himself who credits his hired man with the wages agreed to be paid for his services and debits him with house rent, milk, butter, eggs, potatoes, wood and other produce advanced him. Indirectly the checking accounts of commercial banks balance against each other on a large scale the purchases and sales of individuals, communities and nations, and thus constitute the largest element of the medium of exchange of all highly developed commercial nations.

The second of the above classifications is based in part upon the form and in part upon the source of the medium of exchange. The metallic element of the medium usually takes the form of coins, though bullion is also used. Government notes are those issued by the government and for the payment of which it is responsible, while bank currency originates with banks, which are responsible for meeting the obligations involved in its issue. The name *paper money* is frequently applied to government and bank notes to distinguish them from coins. Coins may be sub-classified on the basis of the metals employed in their manufacture into gold, silver, nickel, or amalgam and copper, and on the basis of their relation to each other, into standard and subsidiary.

The basis of the third classification is the presence or absence of the element of credit. Standard coins, that is, those made from the standard of value, are the only ones in which this element is entirely absent. All other coins, all paper elements of the currency and all book accounts which serve as a medium of exchange contain the element of credit in some degree. Our silver coins, for example, are actually worth as bullion much less than the amount stamped upon them and government and bank notes are in and of themselves worth practically nothing. People take them at the value indicated by the stamp upon them only because somebody in whom they have confidence is under obligation to make that value good, the government in some cases, banks in others, specified persons or corporations in others. The term *credit currency* is appropriately applied to all elements of the medium of exchange which circulate at a value greater than the market value of the substance of which they are made because the credit of some government or bank or person or corporation is an essential factor in such circulation.

The maintenance of a medium of exchange consisting of coins made of different substances and of paper elements issuing from different sources is only possible when complete elimination has been made of the interest of anybody and everybody to discriminate in favor of one element and against others. If such discrimination is for any reason profitable, those elements which alone can with profit be used as a medium of exchange will soon be

the only ones so used. The others will be devoted to other uses which are more profitable and on this account will disappear from circulation. This fact was observed in the 17th century by Sir Thomas Gresham, director of the English mint, and stated in the form of a law which has since borne his name. "Bad money," he said, "drives good money out of circulation."

This law has been brought into operation many times by the circulation in large quantities of worn and clipped coins. When the proportion of such coins becomes large, full weight coins will either be melted down and sold as bullion or clipped and sweated. It was cases of this kind which Sir Thomas Gresham had in mind when he used the adjectives *good* and *bad* in the statement of his law, *bad money* referring to worn and clipped coins and *good money* to full weight coins.

The operation of this law has also been frequently illustrated by the substitution of silver for gold coins and vice versa. In the early part of our history five silver dollars contained 15 times as many grains of silver as did a five-dollar gold piece grains of gold, 15 to 1 in 1793, at the time these coins were first minted, being about the relative values of the same weight of silver and gold. Subsequently the value of silver relatively to gold fell so that it required nearly 16 ounces of silver to sell upon the markets for as much as an ounce of gold. The result was that gold coins completely disappeared from circulation, because they were worth more as bullion than as coin. For the opposite reason, silver remained in circulation and silver bullion was taken to the mint and coined. Later still in our history, on account of a great fall in the value of gold relative to silver, gold coins took the place of silver, the latter being melted down or exported and sold as bullion.

The disappearance of coin as the result of the circulation of depreciated notes is another form in which the truth of Gresham's Law has been frequently demonstrated. During the war between our northern and southern States, both the Federal and the Confederate governments paid a portion of their bills in their own notes payable to bearer, made legal tender and issued in denominations suitable for circulation as money. They very soon depreciated and became a secondary standard of value, and coin of all kinds disappeared from circulation, since on the bullion market they could be sold for these notes at a good premium, and a five-dollar note would pay as many debts or buy as many things as five silver dollars or a five-dollar gold piece.

The terms in which Sir Thomas Gresham stated his law may be objectionable because the phrases *bad money* and *good money* are not accurate descriptions of the forces which crowd some of the elements of the medium of exchange out of circulation and hold others in, but the law itself is as certain in its operation as those of the Medes and Persians. It is really only one form of the expression of a law of much broader application, namely, that all men are prone to make the most of their possessions.

The device of making some coins *subsidiary* to others which are called *standard* and of making the paper elements of the currency redeemable in coin prevents the operation of

Gresham's law and has, therefore, been incorporated into the practice of all commercial nations. (See article CURRENCY). This practice renders it desirable that standard coins should constitute an element of the medium of exchange, since the stamps on the other coins and the paper elements of the medium refer to definite amounts of the standard of value, and their exchange on the markets, rapidly and conveniently at all times and places for precisely these amounts requires that this commodity should be put up in convenient sized and conveniently labeled packages and be widely spread throughout the commercial world. These ends can only be attained when the standard of value is put up in the form of coins and used as a medium of exchange.

The money of a country, which consists of its standard of value and of those elements of its medium of exchange which pass freely from hand to hand by mere act of transfer and without endorsement and which are accepted without question by everybody, is an historical product, and can, therefore, be explained only by reference to its history.

**The Monetary System of the United States.**—The foundation of the monetary system of the United States was laid in 1792 in which year Congress passed our first coinage act. That act provided for the manufacture of gold coins of the denomination 10, 5 and 2½ dollars, to contain respectively 247½, 123¾ and 61½ grains of pure gold; of silver coins of the denominations dollar, half-dollar, quarter-dollar, dime and half-dime, to contain, the dollars, 371¼ grains of pure metal, and the other proportionate amounts; and of copper coins of the denominations one cent and one-half cent. It further provided that the gold and silver coins authorized should be manufactured without charge by the United States mint for any persons who would supply gold and silver bullion of the requisite degree of fineness and that all such coins should "be a lawful tender in all payments whatsoever."

While the mint ratio of 15 to 1 between gold and silver coins established by this act closely corresponded to the bullion ratio between the two metals in 1792, it no longer did so in 1794 when the mint at Philadelphia was ready to begin operations. At that time the bullion ratio was about 15.37 to 1, and it never again fell to so low a point as 15 to 1. Gresham's law, therefore, operated almost from the beginning and the gold coin disappeared from circulation. Unfortunately the new silver coins did not circulate freely. Pending the construction of a mint and the manufacture of a sufficient quantity of new coin to supply the needs of the country, Congress had authorized the use of several kinds of foreign coins, including the Spanish milled dollars. Since these latter contained more silver than the new American dollars and since both the Spanish and the American dollars were accepted at their face value in both the United States and the Spanish West Indies, with which we were at the time carrying on an active trade, the merchants of Boston, New York, Philadelphia and Baltimore engaged in this trade discovered a source of profit in shipping American dollars to the West Indies and in bringing West Indian dollars home and transforming them into American dollars at the mint.

A remedy for this condition was not successfully applied until 1834, and in the meantime the currency of the country consisted chiefly of notes issued by the banks of which there were two varieties—state institutions and the United States banks—the first one operating in the period 1791–1811 and the second in the period 1816–36. The notes of many state banks were issued in small as well as large denominations, thus in part supplying the need for small change which the scarcity of coin frequently rendered urgent. In the interval between the first and the second United States banks, 1811–16, our second war with England was fought, and the conditions thus created, aggravated by the liquidation of the first United States Bank forced the state banks into a state of suspended specie payments. Their notes depreciated in consequence and coin of all kinds, foreign as well as domestic, disappeared from circulation. The remedy applied was the authorization of the second United States Bank which was charged with the task of securing a resumption of specie payments. President Jackson's war against this bank started during his first administration had reached a stage by 1834, which foreshadowed the certain end of that institution so soon as its charter should expire in 1836 and that fact, together with the discovery of gold in North Carolina and a recollection of the currency difficulties which succeeded the liquidation of the first United States Bank accounts for the passage in 1834 of another important coinage act.

That act lowered the weight of the gold coins by decreasing the amount of pure metal in the eagles from 247.5 to 232 grains, and that in the other gold coins proportionately thus changing the mint ratios between gold and silver coins from 15 to 1 to 16 to 1. The bullion ratio of that time being about 15.73 to 1 gold coin was slightly overvalued at the mint and, therefore, was restored to circulation, but for the same reason, silver disappeared, and a new problem was created, namely that of supplying the country with small change. That problem was solved in 1853 by an act which reduced the half-dollars, quarters and dimes to the status of subsidiary coins by diminishing the amount of metal in them by 7 per cent, by taking away from private persons the privileges of having silver bullion transformed into them at the mint, and by providing that hereafter they should be manufactured only on government account and sold to private persons at par for gold and that in the future they should be legal tender only for sums not exceeding five dollars. The silver dollar was not affected by this act, but its coinage was unprofitable because the bullion necessary to manufacture it was worth considerably more than a dollar.

The acts of 1834 and 1853 together with the increased production and falling value of gold occasioned by the discoveries of new mines in California and Australia gave the country for the first time an adequate supply of specie. The greater part of the circulating medium even during this period, however, was supplied by the state banks, which increased rapidly in number, especially after the removal of the competition of the second United States bank in 1836. This portion of the currency was defective on account of wide differences in the

character of the banks which were issuing notes. There was no uniformity in the laws passed in the various States for the regulation of banks, nor in the practices of the banks themselves. The notes of most banks, therefore, enjoyed a local circulation only and the country lacked a uniform credit medium.

The Civil War inaugurated a new era in American monetary history. In February 1862 an act was passed authorizing the government to issue legal tender inconvertible notes in denominations suitable for circulation as money and within a few months these notes had depreciated to such an extent that gold and silver of all denominations disappeared from circulation. The National Banking Act, passed in 1863, provided another form of currency in the form of national bank notes secured by government bonds. These notes, being redeemable in the depreciated legal tender notes of the government, shared their depreciation. State bank notes were forced out of circulation by a 10 per cent tax levied on them in 1865 and have not formed an element of our circulating medium since that time. This combination of government and national bank notes constituted the currency of the country until 1879, on 1 January of which year specie payments were resumed by the government in pursuance of an act passed in 1875.

While the problem of resuming specie payments was being considered in Congress two important coinage acts were passed. That of 1873 dropped the silver dollar from the list of coins authorized to be manufactured, thus completely depriving private persons of the privilege of transforming silver bullion into silver coin at the United States mints, that privilege in the case of half-dollars, quarters and dimes having been taken away from them by the Act of 1853. Silver having fallen greatly in value in 1876 and subsequent years on account of greatly increased production from recently discovered mines in Nevada, the loss of this privilege seriously affected the profits of the owners of these mines, and agitation for the restoration of the free coinage of the silver dollar was started by them in combination with the opponents of the resumption of specie payments, politicians and speculators who saw in the free coinage of silver an opportunity to further their own ends. This combination was not strong enough to force through Congress the free coinage act they wanted, but it was strong enough to force the passage of a compromise measure in 1878 known as the Bland Act which compelled the Secretary of the Treasury to purchase each month not less than two and not more than four million dollars worth of silver bullion and to coin it into silver dollars. This act also originated the silver certificate which has been an element of our currency since that date.

Like all compromises, the Bland Act was unsatisfactory to both parties to the controversy. The advocates of free silver continued their agitation both in and out of Congress, and in 1890 secured a further concession in the form of the Sherman Act, which directed the Secretary of the Treasury to purchase each month 4,500,000 ounces of silver and to pay for it in Treasury notes redeemable on demand either in silver dollars or gold coin at the option of the Secretary of the Treasury. However,

since the act declared it to be the policy of the United States to maintain a parity between the two metals at the existing legal ratio, the Secretary was practically compelled to redeem these notes in gold so long as the mint ratio remained above 16 to 1.

The steady injection of a stream of over-valued silver into our currency combined with the obligation of the government to redeem on demand in gold the United States and the Sherman notes helped to create the crisis of 1893 and seriously embarrassed the Treasury during that crisis. The result was that the silver purchase clause of the Sherman Act was repealed at a special session of Congress called by President Cleveland in the summer of 1893 and in 1900 an act was passed providing among other things for the gradual retirement of the Sherman notes and for the establishment of a gold reserve of \$150,000,000 to be used for no purpose except the redemption of the United States notes, such notes when redeemed to be retained in the Treasury until they should be withdrawn in exchange for gold coin.

The only noteworthy change in the currency system of the United States since the Act of 1900 was the result of the establishment of our Federal Reserve system in 1913. Under the operation of that system a new element has been added to our currency in the form of Federal Reserve notes issued in exchange for rediscounted commercial paper. This new element has supplied the necessary element of elasticity which our currency previously lacked, since these notes automatically expand and contract in volume in response to the changing needs of commerce. The other elements of our currency are either stationary in volume or fluctuate in response to other influences than currency needs. *Professor of Political Economy, University of Wisconsin.*

**MONEY, Coin.** See COINAGE; NUMISMATICS.

**MONEY, Paper,** a money issue of a nation or government; a stamped sheet of paper or parchment, given an official value and used as a medium of exchange. Although coins were used before paper money, the latter was known among the ancients. Corn, cattle, iron, leather, cocoa, shells, tobacco and other commodities

were all, in point of fact, used as money, in different ages and different countries; but they have long ceased to be so used, by commercial nations. The high estimation in which the precious metals have been held, in nearly all ages and all regions, made it practicable to use them as money. The scarcity of gold and silver, the need of bills of exchange and the want of a money more convenient for the individual to carry, and lastly, the issuance of government credits forced on bankrupt nations, brought about the use of paper money in European countries, and Colonial America early adopted this medium of exchange from the English.

**Provincial Paper Money.**—In the earliest days of America paper money was first issued by Massachusetts in 1690. The object was not to supply any supposed want of a medium for trade, but to satisfy the demands of some clamorous soldiers. Other issues were subsequently made, partly with a view of defraying the expenses of government and partly with a view of making money plenty in every man's pocket. The ill-judged expedition of the Carolinas against Saint Augustine, in 1702, entailed a debt of £6,000 on that colony, for the discharge of which a bill was passed by the provincial assembly for stamping bills of credit, which were to be sunk in three years by a duty laid upon liquors, skins and furs. For five or six years after the emission the paper passed in the country at the same value and rate as the sterling money of England. To defray the expenses of an expedition against the Tuscaroras and to accommodate domestic trade the legislature of South Carolina established a public bank in 1712 and issued £48,000 in bills of credit, called bank-bills, to be lent out on interest on landed and personal security, and to be sunk gradually at the rate of £4,000 a year. Soon after the emission of these bank-bills the rate of exchange and the price of produce rose, advancing in the first year to 150 and in the second to 200 per cent. By the year 1731 the rate of exchange rose to 700, at which it continued with little variation upward of 40 years. In the year 1723 the province of Pennsylvania made its first experiment of a paper currency. It issued in March £15,000 on such terms as appeared likely to be effectual to keep up the credit of the bills. It made no loans but on land security or plate deposited in the loan office; obliged the borrowers to pay 5 per cent for the sums they took up; made its bills a tender in all payments, on pain of confiscating the debt, or forfeiting the commodity; imposed sufficient penalties on all persons who presumed to make any bargain or sale on cheaper terms in case of being paid in gold or silver, and provided for the gradual reduction of the bills by enacting that one-eighth of the principal as well as the whole interest should be annually paid. These early specimens of provincial paper money were large notes, printed from copper-plates, having engraved borders on three sides. The inscriptions on the bills were in type, with arms or motto engraved in the left side centre. The signatures of the province officials were signed in red ink.

**Continental Money.**—The first issue of paper money under the authority of the Continental Congress was dated 10 May 1775, but the notes were not actually placed in circula-

tion until the August following. On 31 May 1781 the continental bills ceased to circulate as money, but they were afterward bought on speculation at various prices, from 400 for one, up to 1,000 for one. The value of continental paper was not the same in different parts of the country. The exchange was, for example, at 35 for one in New England, New York, the Carolinas and Georgia, and at 40 for one in Pennsylvania, New Jersey, Delaware, Maryland and Virginia. An account taken from the books of merchants in Virginia shows that the depreciation there regularly followed that in Philadelphia, though, toward the close, it sometimes lagged a month or more behind. Thus when exchange was in Philadelphia at 100 for one, in January 1781 it was in Virginia at 75 for one. As late as May 1781 speculations were entered into at Philadelphia to purchase continental money at 225 for one and sell it at Boston at 75 for one. It is worthy of remark that the depreciation of continental money never stopped the circulation of it. As long as it retained any value at all it passed quickly enough, and would purchase hard money or anything else as readily as ever when the exchange was 200 for one, and when every hope or even idea of its being ultimately redeemed at nominal value should have entirely vanished. The facility of raising ways and means, in the early part of the Revolutionary War, by issues of paper, led to much extravagance in the commissary department and prevented the establishment of a sound system of finance. It is said that when a proposition was before Congress to establish a regular revenue system one member exclaimed, "Do you think, gentlemen, that I will consent to load my constituents with taxes, when we can send to our printer and get a wagon load of money, one quire of which will pay for the whole!"

**Connecticut.**—Under date of 4 March 1762, Connecticut issued a series of colonial notes of the following values: 9 pence, 1 shilling, 2 shillings and 6 pence, and 10, 20, 30 and 40 shillings. There were 19 regular issues, the last being dated 1 July 1780. There were also three single bills in the nature of treasury notes, the last dated 26 Jan. 1791. Over 100 different bills were issued by this colony. The smaller values were for 2, 3, 4, 5 and 7 pence, issued 11 Oct. 1777. In Connecticut the 6 shilling bill was not infrequently raised by clever counterfeiters to the value of 10 shillings.

**Delaware.**—In this colony paper money was issued in 1735. One value only of these notes has been preserved; the denomination is 10 shillings. The designs of the early issues are all about the same, a type body with a border of the same and wood cut of the royal arms. On 28 Feb. 1746 a new series was issued of the same general design, but noteworthy from having been printed by the celebrated Benjamin Franklin and his partner D. Hall. On bills of this colony we first get the information that "To Counterfeit is Death," which is repeated in every possible form. The 2 shilling 6 pence bill of January 1776 issue is adorned with pillars, and probably to show that the edifice supported can stand any sort of usage, one is placed upside down. The last series issued, May 1777, contains bills from 3 pence to 20 shillings, and changed the cut of the royal arms

for that of the State. Sixty bills emitted by this colony are known.

**Georgia.**—The earliest bill printed in Georgia was of the value of 2 shillings 6 pence and was dated 7 March 1749. The Georgia bills were printed on one side of white paper and were usually made attractive by copper-plate vignettes printed in various colors. The vignettes represented figures of liberty, soldier, deer, hog, rattlesnake, palmetto tree, etc. The last issue was dated 16 Oct. 1786. There are over 110 varieties from 3 pence to £5.

**Maryland.**—The first bill of this colony is dated 1740 and of the value of one shilling. This was followed by a series of five values in 1748 and from then a regular succession of issues until their final extinction in 1781. The design of the early issues may be described, as the arms of Lord Baltimore supported by two men in the costume of the day, one with a fish and the other with a spade. This is differently placed on the various bills. The lettering or form of contract is in the following words, "This indented Bill of Eight Dollars shall entitle the bearer to receive Bills of Exchange payable in London, at the Rate of Four Shillings and Six Pence Sterling per Dollar for the said Bill, according to Directions of an Act of Assembly of Maryland, Dated in Annapolis, this 1st day of January, Anno Domini 1767," followed, of course, by two signatures. The quaint idea of scalloping the end of a legal document to show that it has been prepared with due care and thought and not cut off in a hurry is carried out on these bills. In some values even the word "indented" is printed in a wavy line, and that there should be no mistake as to what is meant by a dollar a minute representation of a Spanish dollar is inserted in the text. The values of the Maryland bills were 3, 4, 6 and 9 pence, and so on up to £3. There were over 100 varieties issued.

**Massachusetts.**—Prior to 1775, some 13 examples of paper money were issued in this colony. One of these is a copper-plate engraving said to have been the work of the noted patriot, Paul Revere, of Boston. The series was issued by order of the general assembly of the Colony of Massachusetts Bay, 7 Dec. 1775. The reverse of these bills bear the figure of a man in continental dress, with a drawn sword in one hand and a copy of the Magna Charta in the other, above "Issued in defence of American Liberty," below in Latin, "He seeks by the sword calm repose under Freedom." The series of 16 Oct. 1776 repudiates the title of Colony for that of State. Coin must have become scarce, as more than half of the denominations are under one shilling. The codfish was the principal design on these bills. The next issue of eight values was of interest-bearing notes which are guaranteed by the United States. Upward of 135 bills were issued by Massachusetts.

**New Hampshire.**—The design of the New Hampshire bills was usually the British arms with inscriptions in elaborate frames. The earlier issues were type-set. About 60 varieties are known.

**New Jersey.**—The issues in this colony began in March 1724 and continued regularly to May 1786. In shape the bills were a small, narrow oblong. The high value notes were printed in blue and red. In 1781 the royal

arms became the arms of the State, the type reading as follows: "State of New Jersey, Five Shillings, This bill shall pass for Five Shillings agreeably to an Act of the Legislature of this State, passed the ninth day of January, One Thousand Seven Hundred and Eighty-one." An entire collection of New Jersey bills would number 185.

**New York.**—The first bill issued was in 1709, and then followed a series of four dated 18 Dec. 1737. In the next issue the form reads "By a Law of the Colony of New York this Bill Shall Pass current for Three Pounds New York the 20th April 1756." A set of United States guaranteed notes appeared 15 June 1780.

**North Carolina.**—The earliest notes were dated 1748, and upward of 120 varieties were printed up to 1780. The most of the North Carolina bills bore motto inscriptions such as "Virtuous Councils the Cement of States"; "A Righteous Cause the Protection of Providence"; "A Lesson to arbitrary Kings and wicked Ministers"; "Liberty and Peace the Reward of Virtuous Resistance"; "Persecution the Ruin of Empires"; "Union of Hearts the Strength of Interests"; "American Virtue Triumphant," etc.

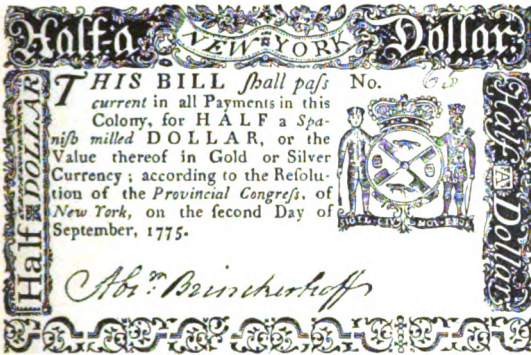

**Pennsylvania.**—The earliest known bill was dated 10 Aug. 1723 and was printed by Benjamin Franklin. The general style of the notes is the same as used in Delaware, bearing the royal arms, or in 1756 those of William Penn, with his motto, "Mercy Justice." In 1764 a curious notion was adopted of spelling the name of the colony differently on each bill, thus on the series we find Pennsylvania, Pennsylvania, Pennsylvania and Pensilvania. This was perhaps designed as a protection against counterfeiting. On some of the notes issued in 1771 is the signature of Francis Hopkinson, and on the bills of April of the following year that of John Morton, both signers of the Declaration of Independence. In 1777 the shape of the bill changed to the oblong form, and the arms of Pennsylvania took the place formerly devoted to those of Great Britain. This series are found both in black and red with black type. In 1780 a set guaranteed by the United States, of the same design as issued for other States, was put in circulation, and on 16 March 1785 the last of the series saw the light, the denominations running from 3 pence to £4, 16 values in all. The varieties issued by this colony were over 250.

**Rhode Island.**—The paper money of Rhode Island was similar in design and value to that of Connecticut. The first issue was in 1715 and the last in 1786. There were about 75 varieties.

**South Carolina.**—There were various notes issued in this colony from 1712 to 1770. The bills dated 6 March 1776 were supposed to have the value of silver, equivalent in currency is given thus, 6 Spanish milled dollars = £9 15s. currency. In 1779 appeared the handsomest notes heretofore used in the country, the backs of the \$50, \$70 and \$90 bills representing Atlas, Prometheus and Hercules being especially noteworthy. The total number of bills for South Carolina was 105.

**Vermont.**—In this colony there were but two series, the first issued in February 1781 is an ordinary type-printed note, with engraved border on three sides with the State seal about the centre. This consists of a pair of scales

AMERICAN COLONIAL PAPER MONEY

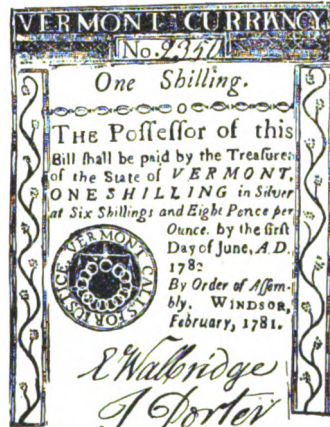

1

2

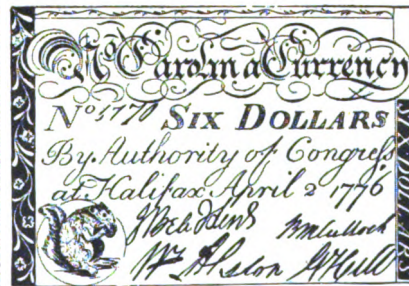

3

4

5

6

- 1 New York Province Half-dollar. 1775
- 2 Connecticut Colony 5 shillings. 1776
- 3 U. S. Continental Currency, \$3. 1775

- 4 Vermont State Currency, 1 shilling. 1781
- 5 New Jersey State Currency, 1s. 6 pence. 1781
- 6 North Carolina Currency, \$6. 1776

and a chain of 14 links (the only instance where the number is carried above the original 13) enclosed in a circular band inscribed "Vermont Calls For Justice." The second issue is in the form of treasury notes, the amounts being filled in with ink.

**Virginia.**—The first issue for this State was in 1755. The notes are of two varieties, the first a fine, large bill after the English style, and then something between a draft and a bank-bill, being probably made to fill a pressing want. The bills are copper-plate engravings filled out in ink. On the issue of 1775 are the royal arms of Virginia in an engraved frame. The lettering reads "Three Pounds Current Money of Virginia Pursuant to Ordinance of Convention Passed 17 July 1775." The following year introduces the "sic semper tyrannis" in place of the arms.

**Bank Notes.**—From the Revolutionary period to the days of the Civil War and to the present time many issues of paper money have been made by the government and by national, State and local banks. See BANKS AND BANKING.

**Confederate Paper Money.**—During the Civil War the Southern States in secession issued millions of dollars in paper money, beginning in July 1861, with bills of from \$5 to \$100. On these were designs of the Confederate flag, a train of cars, cotton bales, etc. In September 1861 appeared at least 50 varieties of bills in value from \$5 to \$100. They were of various designs. A \$20 bill showed a head of Alexander H. Stephens in one corner; a \$10 bill pictured General Marion offering a breakfast of sweet potatoes to a British officer. Portraits of Davis, Hunter, Memminger, Stephens, Mrs. Pickens, Mrs. Davis, Benjamin, General Jackson and others appeared on the high value notes. There was an issue of \$1 and \$2 bills in 1862 and in April 1863 appeared a series in value from 50 cents to \$100. Some of these bore designs of the capitol buildings at Richmond, Nashville, Montgomery, etc. The last issue of bills from 50 cents in value to \$500 appeared 17 Feb. 1864. Many of these are still in existence, and in 1917 some one with an accumulation sold them on the streets of downtown New York at five cents a bill.

**Postal Currency.**—The United States government printed a paper money as a substitute for fractional currency during the Civil War, owing to the scarcity of silver. This was the suggestion of General Spinner, United States Treasurer under Lincoln, and was commonly known as "shin-plaster" money. The issue was in small scrip of the denominations of 3, 5, 10, 25 and 50 cents. It disappeared from general circulation about 1870.

**Greenbacks, Silver and Gold Certificates.**—The more recent issues of American paper money in circulation at the present day are printed at the Bureau of Engraving and Printing at Washington. The engravers are specialists, and the figures and intricate designs of their work are often marvels of artistic skill. Portraits of living persons are never put on the notes, and all the figures, vignettes, borders, lettering, etc., are engraved separately before they are put on the plates. First the engraver works out his design and after transferring it by hand to a plate of soft steel the plate is hardened and a soft steel roller takes the im-

pression from it. After this roll is chilled another impression is taken on another steel plate, and after this latter has been hardened it is ready for use. The geometric lathe which makes the border is a complete and wonderful piece of mechanism. The lines for the borders, backs and other conventional designs seen on the notes are made by this machine. The paper for printing the bank-notes is manufactured under the supervision of government officials. It has various lines of short, uneven colored silk threads running through it.

**Foreign Paper Money.**—The notes of the Bank of England are five by eight inches in dimensions and are printed in black ink on Irish linen water-lined paper, plain, white with ragged edges. The notes of the Bank of France are made of white water-lined paper, printed in blue and black, with numerous mythological and allegorical pictures. South American currency is about the size and appearance of the American, but is commonly inferior in appearance and easier to counterfeit, being produced by a cheaper lithographic process. The German notes are printed in green and black. The Chinese paper money is in red, white and yellow, with gilt lettering and various devices. Italian notes are printed on white paper in pink, blue and carmine and ornamented with a vignette.

**Bibliography.**—Sumner, 'History of American Currency' (New York 1884); Johnson, J. F., 'Money and Currency' (Boston 1906); United States Mint, 'Monetary Systems of the Principal Countries' (Washington 1912).

**MONEY ORDER SERVICE.** See POSTAL MONEY ORDER SERVICE.

**MONEYWORT, CREEPING CHARLEY, CREEPING JENNY, or HERB-TWOPENCE,** are popular names for *Lysimachia nummularia* of the primrose family. The plant, which is a native of Europe, is a perennial with roundish leaves and axillary flowers borne from early summer until autumn. It is very popular for planting in rookeries, vases, hanging-baskets and shady situations, and has become naturalized in the eastern United States. Propagation by seeds or cuttings is very simple, and the plants seem to thrive in any moist, shaded garden soil, cool greenhouse, or window. Several other plants are sometimes called moneywort; for example, *Anagallis tenella*, *Dioscorea nummularia*, and *Thymus chamadrys*. See LOOSESTRIPE.

**MONGE**, mōnzh, Gaspard, French mathematician and physicist: b. Beaune, France, 10 May 1746; d. Paris, 18 July 1818. He was educated at Beaune and Lyons and at 16 was a teacher. He made rapid progress and some valuable discoveries in engineering, and in 1783 was called to the professorship of hydrodynamics in the Paris Lyceum. He was a supporter of the French Revolution, became Minister of Marine and was temporary Minister of War and one of the signers of the death warrant for Louis XVI. He resigned soon after the king's death and was engaged in manufacturing arms and gunpowder for the army. He founded the Ecole Polytechnique under the Directory and was professor of mathematics there, but was later sent to Italy to assist in the removal to France of the art treasures captured by French

armies, and there gained the friendship of Napoleon whom he accompanied to Egypt in 1798, continuing his scientific researches. He resumed his position in the Ecole Polytechnique upon his return to France and in 1805 was elected senator. Napoleon gave him an estate in Westphalia, and the title of Count of Pelusium, but the downfall of the emperor resulted in reverses for Monge who was expelled from his positions in 1815. He is renowned principally as the founder of descriptive geometry, and one of the earliest scientists in modern geometry. He published 'Traité élémentaire de statique' (1788); 'Leçons de géométrie descriptive' (1795). Consult Dupin, 'Essai Historique sur les services et les travaux scientifiques de Monge' (1819); Obenrauch, 'Monge der Begründer der darstellenden Geometrie als Wissenschaft' (1893-94).

**MONGHYR**, mōn-gēr', or **MONGHIR**, India, the capital of a district in the Bhagalpur division of Bahar, Bengal, on the right bank of the Ganges, 80 miles east of Patna. It communicates by a steam ferry with its railway depot on the opposite bank. It is of great antiquity, and has an elevated fort, enclosing the district administrative offices. Monghyr still enjoys a local reputation for its former important manufactures of swords, firearms and hardware. Pop. 36,000.

**MONGOLIA**, China, a vast northern central and eastern colonial territory, between lat. 35° and 52° N., and long. 82° and 123° E., bounded on the north by Asiatic Russia, east by Manchuria, south by China proper, and west by Sungaria and East Turkestan; estimated area, about 1,367,600 square miles.

The central portion, nearly a fourth of the whole, is occupied by the Desert of Gobi, an extensive sandy plateau, with a few spots of pasture and brushwood. Other parts are intersected by lofty granitic chains, the principal of which are the Altai, the Thian-shan, the Khinghan, and the In-shan. The largest rivers are — in the north the Salenga, in the south the Shiramuren, and in the west the Irtish. The climate presents the opposite extremes of intense winter cold and summer heat. Agriculture is but little developed, and that only in the south on the borders of China proper; cattle raising, a few domestic industries and the transportation of goods are the chief occupations of the inhabitants. There is a considerable transit trade with Russia and China; the principal commercial centres are Kuku-Khoto, Kalgan, Biru-Khoto, Dolon-nur, and Kuku-erghi, in southern and southeastern Mongolia; Kerulen in the northeast, Kobdo, Uliasutai and Urga, in the northwest. Urga is the principal town, a populous frontier emporium for the caravan trade across the Gobi Desert from China to Kiakhta, Siberia, 170 miles to the north and 100 miles east of Lake Baikal. The chief exports are wool, skins, hides, furs, horns, etc., to an annual value of nearly \$5,000,000; while the varied imports amount in value to \$7,800,000 annually. The population is estimated at about 2,600,000, divided into tribes chief of which are; (1) the Khalkas, or Mongolians properly so called, who occupy the entire north of Mongolia; (2) the Ouryantai and the Darkhat, who are Mongolized Turks; (3) the Ordos of pure Mongolian

blood; (4) the eight tribes of the Tsaktar, of Mongolian blood.

The Khalkas are divided into four "aimaks," or principalities, the creation of which, it is said, dates back to Genghis-Khan. These are Toucheton, Tsetsen, Sain-Noin, and Tsatsatkou. Each aimak is divided into "hoshuns," which are subdivided into "sumuns." Such distribution of the territory is very ancient.

Although the Mongolians are vassals of China they govern themselves. In each administrative subdivision there is elected a chief, whose election is ratified by the Chinese government, and who receives from Peking a title of honor of slight importance, along with a button or peacock's feather for his cap. At Urga, the seat of the Bogdo Khan the Mongolian prince in charge (theoretically) of the administration of the affairs of the Khalkas has for adjunct (theoretical) a Manchu envoy, the "amban," who is really the master of the situation; and the decisions made in common (or that are supposed to be) by the two exalted persons are those dictated by the amban, that is to say, the Peking government.

The Khalkas are nomads, but only relatively so. Within the limits of their hoshun and sumun they periodically shift their quarters in search of "pastures new" for their herds of camels, horses and sheep, but they never travel very far, and it is always possible to find an encampment within a radius of a few miles.

They live under the "yourte," which consists of a light circular framework covered with pieces of felt. The form is that of a dome supported by a small sub-basement, and about 10 feet in height. In order to render it habitable, it suffices to cover it with pieces of felt and close the central orifice above with a movable piece of the same material. Through this orifice the smoke of the "pot à feu" escapes. The fireplace is situated in the centre of the abode, the household gods are placed opposite the door, and the housekeeping utensils are arranged along the walls. Around the fireplace are spread out, in lieu of seats, pieces of felt, for which the well-to-do substitute carpets. The princely yourtes are furnished with board floors and decorated with silken hangings.

In summer the men wear wide trousers and a shirt of calico, in most cases blue. Over this they place a long robe, which is buttoned upon the shoulder and side. This is of blue or brown cotton, but sometimes of red or dark green silk. The lamas, or church people — the religion being Buddhism — affect yellow. This robe is gathered in at the waist by a cloth girdle whence, to the right, hangs a knife, and to the left a tobacco bag and tinder box.

Boots with pointed upturned toe and high heel, generally of red leather with a thick sole, complete the accoutrement. The fact that the Mongolian shoemakers make but one size of footgear explains why the son can wear the boots of his father, and why the Mongolian (who also is naturally lazy) does not like to take even the shortest walks afoot. He strides his horse in order to travel a distance of a hundred paces, and it is only during the coldest weather that he decides to dismount from his steed in order to walk half a mile or more.

The Mongolians shave and wear a cue. The headgear or national hat consists of a small cone of figured silk or damask, which forms the

skull-cap. The rim, which is of black velvet, is turned up so as to describe an acute angle with the central cone. Behind, float two long wide ribbons, which are invariably of red silk. The button or the tuft that crowns the cone is likewise always red. When it rains (a rare event in the Khalka country) the velvet rim is turned down, and the hat assumes the form of an extinguisher that protects the ears and neck. In winter, these hats are replaced by a head-gear trimmed with fur, squirrel among the poor, and sable among the rich, the change of hat is accompanied with a change of costume. The long cotton or silk tunic is replaced by a mantle of sheep or deer skin, or among the rich, by a long coat of silk trimmed and lined with costly fur.

The majority of the Mongolians are thin and emaciated. Although they are not strong, they are wiry and capable of withstanding considerable fatigue on horseback. But they object to muscular work. It takes two or three to lift a weight that could be easily handled by one Cossack. To the European eye, they are, with their broad, flat noses, their high cheek-bones, and their little, beady eyes, intensely ugly. They are generally of a low stature, and sometimes have a certain nobility of countenance. Almost all have a kind, benevolent expression to which one soon becomes habituated.

In their youth, the women are prepossessing. Their lineaments are refined, their eyes languishing and their faces plump and smiling like those of the Japanese. They wear the same style of underclothing that the men do; the same boots and the same hat. But the married women wear a long tunic with very narrow sleeves that are generally red from the middle of the arm to the wrist, which is covered by a small point of the sleeve, if the latter is not rolled up. The robe may be blue, brown, violet, or red, but the sleeve is always red. Above the shoulder the sleeve is padded to a considerable height. A tucker of this same red color covers the top of the throat. Maidens, whose robes resemble those of men, wear their hair in a single braid hanging down the back. The children go nude during the summer season, and it is not till they have reached the age of 10 that they are clad in the long national tunic. The name of the Mongolians became suddenly known in the 13th century, and the world was soon filled with the narratives of the exploits of these nomad warriors. The celebrated chief known to history as Jenghis-Khan (or Genghis-Khan) was born probably in 1162. By his ardor, courage and successes he grouped around him a band of young warriors, took part in a number of wars between the Chinese and Mongolians, fighting now on one side and now on the other, subjugated all the tribes living between Irtish and the Khingan Mountains, and in 1206, at the diet of the Mongolian nobles that he had assembled, received the title of Jenghis-Khan, or "the most powerful prince," under which he was to be known to posterity. Marching from conquest to conquest, he soon became master of the southern provinces of China, and in 1210 made himself master of Bokhara and Samarkand. Seven years later, he died, while his army divided into three parts, one of which marched against Afghanistan, another against Russia and the third completed the conquest of China. In 1237 the whole of

Russia, except Novgorod, was paying tribute to the Mongolians, who next invaded Poland and Silesia, and finally Moravia and Hungary. At this period the power of the Mongolians was at its apogee; but, at the end of the 13th century, it declined, and in 1368 these people were driven from China, and the prince who had occupied the Chinese throne returned to the steppes of the north, with his vassals, where he reigned over his fellow countrymen only. A century later, the Mongolians were beaten and dispersed by the Russians, who had been their vassals for two centuries. Subsequently, the Khans of southern Mongolia acknowledged themselves vassals of the emperor, Son of Heaven, the "Bogdo-Khan." Northern Mongolia, that is to say, the country of the Khalkas, divided into four principalities, remained independent for a longer time, but in 1691 placed itself under the protection of the emperor of China. Soon after the Chinese Revolution in 1912, Outer Mongolia declared its independence which was recognized by the Russian Government in a convention and protocol signed at Urga, 3 Nov. 1912. On 5 Nov. 1913 at Peking, Russia and China reached an agreement to recognize Outer Mongolia as territory under Chinese suzerainty, China recognizing its autonomy. Frontier and other questions were settled June 1915, at a tripartite conference between Mongolians, Chinese and Russians.

Consult Bulstrode, B., 'A Tour in Mongolia' (London 1916); Carruthers, D., 'Unknown Mongolia' (London 1913); Gilmour, J., 'Among the Mongols' (London 1888; 1893); Podsnéeff, A., 'Mongolia and the Mongols' (7 vols., Saint Petersburg 1896).

**MONGOLIAN RACE**, a general name applied to a majority of the people of Asia. In ethnology, the term is used for one of the five great races of the world discriminated and named by Blumenbach, and adopted by Cuvier when he reduced Blumenbach's five to three. The head of the Mongolian is square; the face flattish, nearly as broad as long, the parts not well distinguished from each other; the eyelids narrow, obliquely turned up at their outer angle; the space between the eyes flat and broad, the nose flat, the cheeks projecting, the chin somewhat prominent. The hair is straight, the color black, that of the face and body yellowish (sometimes inaccurately called olive, which implies an admixture of green). The race includes not merely the natives of Mongolia properly so called, but the Tartars, the Chinese, the Japanese, the Cochin Chinese, the Burmese, the Tamuls, the Turks, and the Finns. See ETHNOLOGY.

**MONGOLIAN SUBREGION**. In zoogeography, a subdivision which includes the tablelands of central Asia, from the Caspian Sea to Japan. Its separation from other Asiatic faunal regions is mainly on ornithological grounds, and is neither distinct nor important.

**MONGOOSE, MONGUSE**, etc. See MUNGUS.

**MONICA**, Saint, mother of Saint Augustine (q.v.): b. Africa 332; d. Ostia 387. A Christian who, in accordance with the wishes of her parents, also Christians, married a pagan. She devoted nearly all her life to the conversion of her husband and son Augustine. Her self-

sacrifice was at last rewarded; her husband, Patricius, became a Christian, and Augustine, seeing the error of his ways, reformed. After the baptism of Saint Augustine at Easter, 387, she set out with her two sons for Africa. Arriving at Ostia she became ill and here died. A friend asked her in Ostia if she were not afraid to be buried in a place so far from her own country. She replied: "Nothing is far from God." Her eminent son preserved many of her holy sayings which he often repeated in his sermons. In the Roman Catholic Church she is regarded as the model and patroness of wives and mothers. Her feast is 4 May. In 1430 her relics were brought to Rome, and were later deposited in the Church of Saint Augustine. Consult 'Saint Augustine's Works' edited by Tillemont; Butler, 'Lives of the Saints.'

**MONIER-WILLIAMS**, SIR **Monier**, English Sanskrit scholar: b. Bombay, 12 Nov. 1819; d. Cannes, France, 11 April 1899. He was a son of Monier-Williams, surveyor-general. He was educated at Oxford, and was for a short period a student at the East India College, Haileybury. He was professor of Sanskrit at Haileybury from 1844 to the extinction of the college in 1858, and in 1860 became Boden Sanskrit professor at Oxford, a post which he held till his death. Among his numerous works are 'Practical Sanskrit Grammar' (1846); 'English-Sanskrit Dictionary' (1851); edition with notes, translations, etc., of the *Sakuntalā* (1853); 'Introduction to Hindustani' (1858); 'Indian Epic Poetry' (1863); 'Sanskrit-English Dictionary' (1872; 2d edition 1899); 'Indian Wisdom' (1875); 'Hinduism' (1877); 'Modern India and the Indians' (1878); 'Religious Life and Thought in India' (1883); 'The Holy Bible and the Sacred Books of the East' (1886); 'Brahmanism and Hinduism' (1889); 'Reminiscences of old Haileybury College' (1894). He traveled extensively throughout India in order to study the native religions, and to further his scheme of an Indian institute, which he succeeded in getting established at Oxford.

**MONISM**, a philosophical term which may be briefly translated by "doctrine of unity." The word was coined by Christian von Wolff, a German philosopher of the first half of the 18th century, and is derived from the Greek *monos* which means "single; alone; lonely; unique; existing in only one copy." Wolff, the inventor of many happy terms that acquired currency in philosophy, introduced the word to characterize such philosophies as recognized the

existence of one ultimate form of reality only, be it spirit or matter, and he contrasted it with "dualism," that is, doctrine of duality, held by all those thinkers who believe that both spirit and matter are ultimate forms of existence. Monism is also opposed to a view like that of Leibnitz, which maintains the existence of many substances; the latter is called *pluralistic*. The word "monism" has come to be applied to views maintaining a unity of a non-substantial nature. It has been adopted as the label of a certain type of positivistic theory that emphasizes the owners of things. (See **DUALISM** and **PLURALISM**). Consult Haeckel, E. H., 'Riddle of the Universe' (New York 1900); Walker, W. L., 'Christian Theism and Spiritual Monism' (New York 1906); Worsley, A., 'Concepts of Monism' (London 1907). Discussions of monism will also be found in any of the numerous introductions to metaphysics.

**MONITEUR**, *mō-nē-tēr*, **Le**, French journal, established 5 May 1789 by Panckoucke under the name *Gazette Nationale, ou le Moniteur Universel*. Under the title of *L'Ancien Moniteur* the issues for 1789-99 were published in 32 volumes by Gallois (Paris 1840-45). In 1800 the *Moniteur* published the official Actes du government. The name in 1811 was changed to *Moniteur Universel*. Four years later the government publications were omitted from the paper and printed separately in the *Journal Officiel*. Its policy again changed and it continued as the government organ until 1868, when the *Journal Officiel* was again published separately.

**MONITITE**. See **MONETTE**.

**MONITOR**, **The**, an ironclad, the first of a class of naval vessels designated as monitors (see **WARSHIPS**). It was designed and built for the United States government in 1861-62 under direction of the engineer John Ericsson (q.v.), who adopted as the most essential feature of its construction the revolving gun-turret devised by the American inventor, Theodore Ruggles Timby (q.v.). The *Monitor* was launched at Greenpoint, L. I., 30 Jan. 1862, only 100 days after the laying of her keel. She put to sea 6 March following, under command of Lieut. John L. Worden (q.v.), arriving on the night of the 8th at Hampton Roads, Va. Extraordinary energy had been displayed by the builders to meet a grave emergency of the government, then weak in naval resources, for making effectual the blockade of Southern ports

Theodore R. Timby's Model sent to China by Caleb Cushing in 1843, which suggested to J. Ericsson the Low Freeboard.

which President Lincoln had proclaimed, as well as for aggressive action and coast-defense. This emergency soon became a dire peril which threatened the destruction of the Union through superior sea power acquired by the Confederacy with foreign aid or connivance. How this danger was first averted is shown in the account of the famous action in Hampton Roads (see MONITOR AND MERRIMAC).

The *Monitor* was built by a company of men, John F. Winslow and John A. Griswold of Troy, N. Y., and their associates, who were actuated by patriotic motives. With T. R. Timby, who had taken out patents "for revolving towers for offensive or defensive warfare whether placed on land or water," they entered into a contract for the use of his inventions covering the revolving turret, paying him \$5,000 as royalty on each turret constructed by them. They built the *Monitor* at their own risk, Winslow and Griswold furnishing 90 per cent and C. S. Bushnell of New Haven, Conn., 10 per cent of the cost. Ericsson, for his services as engineer, received 5 per cent of the gross sum paid to the company for the *Monitor* and kindred vessels built by them. A contract with the government was made by the company and Ericsson, and the government paid for the *Monitor* \$275,000, the actual cost being \$195,000.

Ivory model of the turret made by T. R. Timby in 1841; now in possession of the Patriotic League of the Revolution.

The contract with the government provided for the building of "an iron-clad, shot-proof steam battery of iron and wood combined," and the hull of the *Monitor* was of iron with wooden deck beams and side-projection. Her dimensions were:

Extreme length.....	172 ft.
Extreme breadth.....	41 ft. 6 in.
Depth of hold.....	11 ft. 4 in.
Draft.....	10 ft. 6 in.
Inside diameter of turret.....	20 ft.
Height of turret.....	9 ft.
Thickness of turret.....	8 in.
Thickness of side-armor.....	5 in.
Thickness of deck-plating.....	1 in.
Diameter of propeller.....	9 ft.
Diameter of steam cylinders (two).....	36 in.
Length of stroke.....	2 ft. 2 in.
Displacement.....	1,255 tons
Armament, two 11-in. shell-guns, each 15,668 pounds.	

In all the models, drawings and plans of his invention made by T. R. Timby himself, the pilot-house or "lookout" was placed on top of the turret. "For some inexplicable reason," he has said, "the *Monitor* had her pilot-house placed upon the deck, forward of the turret, in the way of her own guns."

The success of the *Monitor* aroused much interest in all maritime nations, and was the direct cause of many modifications in the construction of vessels in the navies of Europe,

though nowhere except in the United States navy was the monitor adopted as a distinct type of warship. During a gale off Cape Hatteras, 31 Dec. 1862, the *Monitor* was sunk.

JOHN H. CLIFFORD.

**MONITOR LIZARD**, the type of a family of pleurodont lizards (*Varnidae*). They are found in Africa, the Eastern Archipelago, etc., and are the largest of modern lizards, some species attaining a length of six or eight feet. The skin is covered with very small juxtaposed scales and tubercles dorsally, while ventrally the scales are square and arranged transversely. The tail is long, cylindrical in the terrestrial, but compressed laterally in the aquatic forms, and possesses a sharp underridge or keel. The limbs are well developed and the toes provided with claws. Most of these great greenish-gray lizards inhabit rivers and ponds, and are active and fierce enemies of all lesser aquatic life. They feed upon eggs and young of crocodiles, turtles and aquatic birds; and on fishes, amphibians, swimming-birds, anything in fact, small enough to be mastered. There is one genus and nearly 30 species. The most familiar species, probably, is that of the Nile and other African rivers (*Varanus niloticus*), upon which the English name "monitor" was first fastened by a ridiculous misinterpretation of the Arabic word *ouaran* (lizard); it is aquatic and frequently exceeding five feet in length. An equally well known kind is the East Indian monitor (*V. salvator*), which is to be met with from Ceylon and western India to the Philippines, and is equally at home in the water, on land or in trees. Its rapacity is great and varied; and it is connected with many extraordinary rites and superstitions among the natives, some of which are given in Fennent's 'Sketches of the Natural History of Ceylon' (1861). Australia has a large species (*V. gouldi*).

**MONITOR AND MERRIMAC.** The contract for the construction of the *Monitor* was entered into by the Navy Department in the hope that she could be completed before the *Merrimac*, then building by the Confederates at the Norfolk navy yard, could be finished, and that the *Monitor* would be able to cope with this formidable ironclad. The *Merrimac*, called by the Confederates the *Virginia*, was being reconstructed upon the hull of the United States frigate *Merrimac*, of 3,200 tons, which had been sunk, when the Norfolk navy yard was abandoned, by the Union forces, and was subsequently raised by the Confederates. Her armament was two 7-inch rifles, two 6-inch rifles and six 9-inch smooth-bores.

Each side was aware of the effort of the other to be first ready for active service. The Confederates won a day. At noon 8 March 1862, the *Merrimac*, attended by two gunboats, *Raleigh* and *Beaufort*, each one gun, was discovered coming out of the Elizabeth River into Hampton Roads (q.v.) and standing toward the Union fleet off Newport News and Fort Monroe, composed of the steam-frigates *Minnesota*, *Roanoke* and *Congress*, each 50 guns; the sailing-frigate *Saint Lawrence*, 12 guns, and the sloop *Cumberland*, 24 guns. Their armament was mainly 8-inch and 9-inch guns, with several 10-inch pivot guns. These vessels had the

heaviest batteries which the government had been able to assemble to watch the *Merrimac*. The latter bore down directly upon the *Congress* and *Cumberland*. At less than a quarter of a mile the *Congress* delivered her broadside, her heaviest shot making no impression. The return-fire of shells crashed through her sides with terrible effect. Passing the *Conaraess* at 300 yards, the *Merrimac* received the fire of the heaviest guns of the *Cumberland* without the slightest harm resulting, and without replying she drove her iron prow through the side of the Union frigate, crushing it, and at the same time pouring in a fire of shells. Leaving the *Cumberland* rapidly sinking, the ironclad steered for the *Congress*, which had been run ashore, and from a point 150 yards astern raked her decks with shells which caused general destruction and set the ship afire. The *Congress* was obliged to surrender. The *Cumberland* fired a broadside as the water reached the gun-deck, and went down with her flag flying. As she sank, the Confederate steamers *Patrick Henry*, 12 guns, and the *Jamestown*, two, came out of the James River and joined the *Merrimac*. The *Minnesota* had grounded where the *Merrimac* could not approach within a mile, and her firing was so bad that only one shot struck the frigate. The other Confederate vessels were finally driven off after inflicting much damage with their rifled guns. After several hours' ineffectual attempts to reach the *Minnesota*, the *Merrimac* and attending gunboats returned to Norfolk. Several shore-batteries which had attempted to help proved as useless as the batteries of the frigates had been. The *Congress* continued to burn, and finally blew up. Over half the crew of the *Cumberland* were lost. The crew of the *Congress* were made prisoners, but, with the exception of the officers, were released. The total loss was some 250, the Confederate loss was nominal. The battle of an afternoon had ended the day of wooden navies.

The reports of the destruction by the *Merrimac* caused consternation at Washington, and in the coast cities and, indeed, throughout the North. Secretary Stanton ordered all preparations made for obstructing the channel of the Potomac far below the capital, and warned those in charge of coast-defenses to use every means that could be devised for protection.

Meantime the *Monitor*, in command of Lieut. John L. Worden, had left New York and after a rough voyage entered Hampton Roads at 9 o'clock the night after the battle. At 2 o'clock on the morning of the 9th she had anchored alongside the *Minnesota*. At 6 o'clock the *Merrimac* appeared bearing down on them, but at first passed by, gained the channel in which the *Minnesota* lay, and then steamed directly toward her. The *Monitor* swept in between the two and steered for the *Merrimac*. At close quarters the latter brought her bow-guns to bear and missed. There was little to fire at except the low turret with a cross-section of 20 feet. The first reply of the *Monitor* was a solid 11-inch shot which shook the *Merrimac* from stem to stern. The answer was a broadside, some of the shot of which struck the turret, either glancing or falling as harmless as the shot of the frigates the day before had proved against the *Merrimac*. Then followed broadside after broadside without producing the

slightest effect on this "cheese-box on a raft," as spectators described it. At every opportunity of maneuver the *Monitor* closed in and smote with her 11-inch solid shot, bending the heavy armor and straining the timbers of her adversary. Finally the *Merrimac* left the *Monitor* and crowded steam for the *Minnesota*. Upon reaching point-blank range she received a full broadside, and a shot from a 10-inch pivot gun, without suffering the slightest damage. In reply she raked the *Minnesota* with a shell, set her afire, blew up a tug alongside, and but for the *Monitor*, which had followed under full steam, and now swept in between the two, the *Minnesota* would have shared the fate of the *Congress* and *Cumberland*. In changing position to meet the *Monitor* the *Merrimac* grounded, and the *Monitor* continued her hammering with 11-inch shot. As soon as the *Merrimac* was floated she started rapidly down the bay, pursued by the *Monitor*. Suddenly she turned and attempted to run the *Monitor* down. The blow she struck with her prow glanced, and the *Monitor* was unharmed. The *Merrimac* then started for the *Minnesota* for the purpose of ramming her; but when within easy range the *Merrimac*, with all the Confederate ships, changed course at noon headed for Norfolk. Her officers subsequently gave as a reason that in attempting to ram the *Monitor* her iron prow was broken, and their vessel was leaking. The armor was reported damaged, the stem twisted, the muzzles of two guns shot away and the steam-pipe and smokestack riddled. The casualties were only two killed and 19 wounded. The consternation of the day before at Washington and the North was transferred to Richmond and the South. Preparations were hastily made by the Confederates for blocking the channels in the Elizabeth and Nansemond rivers, and to obstruct the channel of the James.

The *Merrimac* did not again engage the *Monitor*, and after the evacuation of Norfolk, which occurred 9 May, she was destroyed by the Confederates.

The *Monitor* had hurried direct from her shipyard to Fort Monroe and fought without a previous trial-trip, and before she had been accepted by the government. Her five hours' battle settled many questions, and once again in American history had been fired a "shot heard round the world."

**MONITORIAL SYSTEM.** See LANCASTERIAN SYSTEM.

**MONK, mŭnk, or MONCK, George, DUKE OF ALBEMARLE,** English general and naval commander; the restorer of the Stuart dynasty: b. Potheridge, Devon, 6 Dec. 1608; d. Newhall, Essex, 3 Jan. 1670. At 17 he enlisted and served in the Cadiz expedition under Sir Richard Grenville, a relative; then entered the Dutch army; and returned to England in 1639, fought brilliantly in Scotland and after 1640 in Ireland, and on the outbreak of the Civil War kept his commission in the king's army. But in 1644 he was captured by the Parliamentary forces, and after two years' imprisonment in the Tower, joined the victors, for whom he went to Ulster as governor. Accused of exceeding his powers by arranging a truce (which was almost an alliance) with Owen O'Neil, he was recalled to England in 1649 and reprimanded.

manded at the bar of the House of Commons. At the victory of Dunbar in 1650 he did good service; a year later he was made lieutenant-general of the ordinance and in Cromwell's absence was commander-in-chief of Scotland. In 1652 he was made a general of the fleet. He introduced the elements of land tactics into naval formation and administered two crushing defeats to the Dutch, van Tromp being killed in the latter battle. In 1654 he again was sent to Scotland on the Royalist rising as commander of the army, and acted there with much more prudence and success. After Oliver's death and Richard Cromwell's resignation Monk set himself to effect the Stuart Restoration, quietly shifted the forces in England until all was so arranged that there was no chance of armed resistance, and then (1660) brought back Charles II—a bloodless revolution meeting with general favor. He was made Duke of Albemarle, received other high honors, maintained order and showed rare courage in London during the Plague, but with an empty treasury in 1667 could not keep the Dutch from burning the shipping in the Thames. Short, fat, fair and wrinkled, Monk was not a winning personality, being cold, prudent past a virtue and rather unprincipled; but he was a wonderfully able general, with technical skill rare in one so lacking in theoretical training. His life was written by his chaplain, Dr. Thomas Gumble (1671). Consult also the biographies by Guizot (1838 and 1850); and that by Corbett, J., in the 'English Men of Action' series (New York 1889).

**MONK**, a bird. See FRIAR-BIRD.

**MONK**. See MONACHISM.

**MONK-FISH, ANGEL-FISH, or FIDDLE-FISH**, a broad, flattened fish (*Squatina angelus*), closely allied to the sharks, but more like a ray in appearance, five or six feet long, having enlarged, wing-like pectoral fins. It is found near the coast in the warm seas of Europe and North America; it usually stays near the bottom, is from three to four feet long, slow in motion, dull, voracious and useless, except that some shagreen may be obtained from its skin.

**MONK-SEAL**, a seal of the genus *Monachus*, so called from a humorous suggestion in colors to the habit of a monk, the species properly so called is that (*M. albigenter*) of the Mediterranean; but the West Indian seal (*M. tropicalis*) is very similar to it, and is of interest as being almost extinct. See SEALS.

**MONKEY-BREAD**, the fruit of the baobab tree (q.v.).

**MONKEY-FLOWER**, any of many plants of the genus *Mimulus* (figwort family), so called because the face of the fox-glove-like corolla suggests that of a cheerful monkey. They are erect, tall herbs, with opposite, clasping, lanceolate dentate leaves, which bear in late summer solitary, axillary irregular blossoms of showy colors. The genus contains some 50 North American species, of which the most familiar is the square-stemmed of the Eastern and Central States (*M. ringens*). Its flower is violet. A common species in California and on the Pacific Coast (*M. guttatus*) has the corolla yellow, often blotched with red or purple.

**MONKEY-POT**, the fruit of a forest tree of Brazil. See BRAZIL NUT and SAPUCAIA NUT.

**MONKEYS**, a general name for the animals of the highest mammalian order, the *Primates* (q.v.), excepting mankind and the lemurs; ordinarily also excepting the anthropoid apes (see APE) and the baboons (q.v.). The term in fact, then, is suitably limited to three families, considered in their broadest sense, the *Hapalidæ*, *Cebidæ* and *Cercopithecidæ*. General characters are as follows: the short hallux, or great toe, is opposable to the other digits of the foot, so that the feet become converted functionally into hands. The pollex, or thumb, of the fore limbs may be absent, but when developed it is usually opposable to the other fingers. These animals may thus be called "four-handed" or quadrumanous; hence the old designation *Quadrumanæ*. The limbs are nearly of equal length. There is only one pair of mammary glands, which are pectoral in position. In many cases the cheeks are dilated into pouches. The teeth consist of two incisors in each side of each jaw. The premolars, or false molars, vary in number. The true molars number three in each side of each jaw, the latter teeth being furnished with tubercles of various sizes and shapes, adapted for crushing fruits and vegetables. The canine teeth are generally strong and of large size. A *diastema* or interval exists between the lower canine and the first lower premolar tooth, and between the upper canine and outer incisor teeth; this interval admitting of the large canines being brought into apposition when the jaws are closed.

For information as to the probable descent and geological history of monkeys, see PRIMATES.

The small American monkeys of the family *Hapalidæ*, more usually called marmosets (q.v.), seem to be lowest in the scale of structure and nearest the lemurs, and are by some naturalists separated from the *Cebidæ* in a group *Arctopithecini*. They are least in size of the race, have the tail long, hairy and not prehensile; no cheek-pouches or natal callosities; the fore limbs shorter than the hind ones; the thumb not opposable; the ears hairy and of large size; the body covered by a close fur. Their dental formula gives four incisors, two canines, six premolars and four molars in each jaw—this dentition resembling that of the Old World monkeys, and also that of man himself. The molars are provided with blunt processes. They are confined to tropical America, and wholly arboreal, feed on insects and fruit, and are tamable, gentle and intelligent. See MARMOSET.

Next to these come the *Cebidæ*, called New World monkeys, because the family is confined to the American continent, and also known as *Platyrrhini*, because of the broad partition in the nose, which widely separates the nostrils and causes them to open somewhat laterally, though this term is often applied to the *Hapalidæ* also. They are characterized by the possession of an extra premolar on each side of each jaw; and by the length and strong prehensility of the tail in most forms—an arrangement by which the end of the tail (naked there on its underside) curls without effort around a limb and clings firmly to it, giving so great assistance in climbing that many of these monkeys exhibit wonderful agility among the trees, grasping and

swinging by their tails alone, leaving all four feet (or hands) free. The ears are rounded and with most of the face are destitute of hair, there are no cheek-pouches or callosities on the buttocks, so characteristic of the Old World forms. The hind limbs are generally the longer in this section. In the spider monkeys, however, the fore limbs are longer than the hinder members. The thumbs are not generally opposable, and may be wanting; and the thumb in these monkeys nearly approaches the other fingers in size and form when present. Unlike other monkeys, they have the thumb placed in nearly the same plane as the other fingers, so that the mere position of the thumb renders it unfitted. The great toe is generally of large size, and is more capable of being opposed to the other digits than the thumb. The diet is mainly of a vegetable nature, and their life almost exclusively arboreal, a fact which, more than any question of climate, seems to limit them in range to the region of the tropics, between the plains of northern Mexico and those of southern Brazil, since several species dwell in the cold regions of high mountains. Of the *Cebidæ* the spider-monkeys (*Ateles*) present very typical examples. In these forms the tail reaches its greatest development as a prehensile organ. The limbs are exceedingly slender, and the thumb is rudimentary. (See SPIDER-MONKEY.) The capuchin monkeys, or Sapajous (q.v.) form the type of the genus *Cebus*, and include many species, as also does the genus *Callithrix* (see SQUIRREL-MONKEY). The howling monkeys (*Mycetes*) are so named from the loud howling noises they are capable of producing, through the possession of a bony "drum," which opens into the larynx, and which greatly increases the resonance of the voice. Other genera are *Pithecia*, the sakis, or hooded monkeys; *Uacavia*, the woolly monkeys; *Chrysothrix* or golden monkeys; and *Nictipithecus*, the Dorocouli monkeys.

The last and highest section of the monkeys (next to the anthropoid apes) is that of the Old World tribe *Cercopitheciidæ*, if that family name is used, as is recently the custom, to cover all the formerly called "catarrhine" monkeys, distinguished by their obliquely-set nostrils, the nasal apertures being placed close together, and the nasal septum being narrow. Opposable thumbs and great toes exist in all, except the genus *Colobus*, the members of which want thumbs. The teeth are arranged to exhibit four incisors, two canines, four premolars and six molars in each jaw; the incisors are prominent, and the canines are especially large and strong — the latter teeth being separated by an interval or diastema from the upper outer incisor, and from the first lower premolar. The tail may be rudimentary or wanting, but in no case is it prehensile. Cheek-pouches, or pocket-like cavities excavated in the cheeks, which are used as receptacles for food preparatory to its mastication, are present in many; and the skin covering the prominences of the buttocks is frequently destitute of hair, becomes hardened and thus constitutes the so-called *natal callosities* of these animals. Sometimes these callosities exhibit brilliant colors, and the skin in the neighborhood of the nose, as in the mandrill, may also be striped with gay hues. In their distribution all the catarrhine monkeys inhabit Asia and Africa, a macaque inhabiting the Rock of Gibraltar, and called Barbary ape (q.v.).

Many of these monkeys are small or of moderate size, handsome and graceful. Such are the African guenons, green monkeys and mangabays (qq.v.) of the genera *Cercopithecus* and *Cercocebus*. Nearly related to them are the macaques (q.v.); and the baboons (q.v.). These have cheek-pouches, and the fore limbs the longer. The genera without cheek-pouches and with the hind limbs longer than the fore limbs are the African thumbless genus *Colobus*, which contains the guerezas (q.v.); and the East Indian tribe *Semnopitheous* which contains the Hindu sacred monkey or entellus (q.v.), the proboscis monkey, negro monkey and several others described elsewhere under their names, some of which are large and extraordinary.

These Old World monkeys are more varied in their food and activities than are those of America, and are far superior to them in intelligence; consequently they furnish nearly all the pets, circus-performers and servants of wandering musicians that we see from time to time. Many of them breed in captivity, adapt themselves well to civilized life and betray a surprising ability to learn in various directions, though prone to be inattentive, and growing dull and surly in old age. Few, however, when taken into cold climates live long, even when most carefully treated, as they seem peculiarly susceptible to diseases of the lungs, which usually have a fatal termination.

Excellent accounts of the monkeys of the world exist in the 'Standard,' 'Royal,' 'Cassell's,' and 'Allen's Natural Histories'; the last and most recent being a monograph by Forbes. Otherwise information must be gleaned mainly from the books of scientific travelers.

**MONKHOUSE, William Cosmo**, English author, poet and art critic; b. London, 18 March 1840; d. Skegness, Lincolnshire, England, 2 July 1901. He received his education at Saint Paul's School in London and in 1857 became a junior clerk in the Board of Trade office with which he was connected with advancement for the remainder of his life. Although not a great poet his work enjoys a high reputation among the works of the minor poets and as an art critic he won considerable attention. His work for the 'Dictionary of National Biography' takes within its scope practically all of British art. He published 'A Question of Honor,' novel (1868); 'The Works of John Henry Foley' (1875); 'The Italian Pre-Raphaelites' (1887); 'British Contemporary Artists' (1899), etc. Among his poetical works are 'A Dream of Idleness' (1865); 'Corn and Poppies' (1890); 'The Christ upon the Hill' (1895); and 'Pasi-tele the Elder,' published after his death.

**MONKSHOOD.** See ACONITE.

**MONLUC, mô'n'lu'k', or MONTLUC**, French marshal and military writer; b. Sainte Gemme, near Auch, 1502; d. Estillac, near Agen, July 1577. He entered the army as an archer, fought (1525) at Pavia, accompanied the campaign of Francis I against Charles V and aided much in the outcome by improvements in tactics and in the artillery and engineering. His defense of Siena (1555) was brilliant, but he became hated, as governor of Guienne, for his severity against the Protestants. He was first to recommend the introduction of caring for the wounded and the testing of officers. His 'Memoirs,' which takes in from 1521 to 1574

## AMERICAN MONKEYS

1 Titi or Death's Head Monkey (*Chrysothrix sciureus*)  
2 Uakari Monkey (*Uacaria calva*)  
3 A Group of Capuchins or Sapajous (*Cebus*)

4 Barrigudo (*Lagothrix humboldti*)  
5 Spider Monkey (*Ateles bartletti*)  
6 Black Couxios (*Pithecia satanus*)

OLD WORLD MONKEYS

1 Hanuman Monkey (*Semnopithecus entellus*)  
2 Negro Monkey (*Semnopithecus maurus*)  
3 Green Monkey (*Cercopithecus callitrichus*)

4 Pig-tailed Monkey (*Macacus leoninus*)  
5 Bonnet Macaque (*Macacus cynomolgus*)  
6 Diana Monkey (*Cercopithecus diana*)

and Henry IV, and called the 'Soldier's Bible,' has considerable value in the history of warfare. The best issue is by A. de Ruble (5 vols., Paris 1865-72); 'Les Guerres d'Italie' (ib. 1886, was edited by Baudrillart. Consult Rüstow, 'Military Biographies' (Zürich 1858); Norman, 'Les mémorialistes, Monluc' (Paris 1892); Courteault, Paul, 'Blaise de Monluc, historien' (ib. 1908), contains a bibliography.

**MONMOUTH**, mön'müth, James, DUKE OF, royal pretender and claimant to the English throne: b. Rotterdam, 9 April 1649; d. London, 25 July 1685. He was the natural son of Charles II and of Lucy Walters, as seems certain from the king's open recognition of him, although he so closely resembled Robert Sidney, whose mistress his mother had been, that Sidney has been supposed his father. Placed under the guardianship of Lord Crofts, he assumed the name of James Crofts and was brought up in France under the care of Henrietta Maria, the queen-dowager; was recognized and summoned to England by his father after the Restoration: was married to Anne Scott, heiress of Buccleuch and made Duke of Monmouth; and served in Holland in 1673. His Protestant sympathies, his clemency to the Scottish Covenanters whom he defeated at Bothwell Bridge (1679), and a story persistently circulated (and denied before Privy Council by the king) that Charles had secretly married his mother in Holland, made him popular with the Protestant party; and Shaftesbury repeatedly urged the king to legitimize him and ensure a peaceable Protestant succession. He did his best to exclude James from the throne. After the Rye House Plot he escaped to Holland. Thence after the accession of James II he invaded England, possibly with the complicity of William of Orange, called the people to arms, raised a large force of Protestants, was proclaimed king at Taunton, but was defeated by Faversham at Sedgemoor. Taken prisoner he begged for his life from the king to no purpose, and was executed at the age of 36. He was handsome, weak, fickle and in his claims to the throne no doubt entirely under the control of political plotters. The 'Diaries' of Evelyn and Pepys give the setting of Monmouth's career; his rising is sketched with some historical verisimilitude in Doyle's 'Micah Clarke' (1888), a romance. Consult also Roberts, 'Life of Monmouth' (1844) and Fea, A., 'King of Monmouth' (New York 1902); the latter work outlines the popular legend that Monmouth was not executed, a substitute having taken his place, and tells how the country people long expected his return.

**MONMOUTH**, Ill., city, county-seat of Warren County, on the Chicago, Burlington and Quincy and the Iowa Central railroads, about 95 miles north by west of Springfield. It is in an agricultural region, and nearby are coal fields and valuable clay deposits. It was settled in 1836, and in 1852 was incorporated, receiving a new charter in 1874. The chief manufactures are pottery, sewer pipe, stoneware, boxes, agricultural implements, stump-pullers, soap, flour and dairy products. The trade is principally in coal, grain, flour, poultry, dairy products and livestock. Monmouth College, founded in 1856 under the auspices of the United Presbyterian Church, is here, also the Warren County Library. The chief city officers are the mayor,

who holds office two years, and the council. The waterworks are owned and operated by the municipality. Pop. 10,000.

**MONMOUTH, Battle of**, in American history, a celebrated engagement between the American and British forces, the former commanded by General Washington and the latter by Sir Henry Clinton, which took place at Freehold, Monmouth County, N. J., 28 June 1778. On 18 June Sir Henry Clinton, acting under peremptory orders from the British Ministry, evacuated Philadelphia, which had been occupied by his army since the preceding September, and proceeded across New Jersey toward Brunswick, with a view of embarking on the Raritan. On hearing of this movement, Washington broke up his camp at Valley Forge, and having sent forward some light troops to harass the enemy started in pursuit. Owing to excessive heat the march of both armies was slow. At Allentown, Clinton turned to the right by a road leading through Freehold to Sandy Hook, to embark at the latter place; and Washington, who had hitherto been deterred by the advice of his officers, and particularly of Gen. Charles Lee, from attacking the enemy, determined at once to give him battle. The evening of the 27th found the main body of the enemy encamped on high ground near Monmouth courthouse, while the American advance, about 4,000 strong, under Lee, was posted at Englishtown, five miles distant, with the main body about three miles in the rear. The command of the advance had originally been given to Lafayette, with the consent of Lee; but the latter subsequently applied for and obtained it. Early on the 28th Lee engaged the rear division of the enemy, his orders being to hold it in check until the main body under Washington could come up. The Americans were at first successful, but owing to causes which have never been satisfactorily explained, the whole body soon after fell into a confusion and commenced a disorderly retreat, closely followed by the British. Washington, who was advancing hastily with the main body, received the first intimation of this movement in the crowds of fugitives who poured along the road. Exasperated at the failure of Lee to execute his orders he rode up to that general and reprimanded him. Then he reformed them, and hastened back to bring up the main body. Lee, resuming his command, held his position with spirit until compelled to retire and brought off his troops in good order. The main body, which had meanwhile taken a favorable position on an eminence, with a morass in front and a wood in the rear, opened an effective cannonade upon the British. The latter, after an ineffectual attempt to turn the American left under Lord Stirling, directed their chief efforts against the right commanded by Greene, where Wayne, under cover of an orchard, was harassing their centre by a severe fire. To dislodge him Colonel Moncton advanced with a column of royal grenadiers, but fell at the head of his troops, who were repulsed with considerable loss. The enemy at length fell back to the ground occupied by Lee in the morning, whither Washington was preparing to follow them when the approach of night and the exhaustion of his men induced him to defer the execution of his plan until the morning. During the night Clinton effected a

noiseless retreat, and at daybreak was many miles away from the scene of battle. The excessive heat of the weather and the fatigued condition of the troops rendered a pursuit impracticable, and the royal army was suffered to proceed unmolested to the place of embarkation. The American loss in this engagement was 69 killed and 160 wounded; the British 300 killed and 100 prisoners including wounded. Their total loss by desertions and the casualties of battle during their march through New Jersey has been estimated at 2,000. For his conduct in this battle Lee was court-martialed and suspended for one year from his command. Consult Carrington, H. B., 'Battles of the American Revolution' (New York 1876); Dawson, H. B., 'Battles of the United States' (New York 1858); 'Lee, C., Trial of, 4 July 1778' (New York 1864).

**MONMOUTH COLLEGE**, in Monmouth, Ill., a coeducational institution, under the auspices of the United Presbyterians. It was founded in 1856, and in 1915 there were connected with the school 26 professors and instructors and 451 students. There were about 12,000 volumes in the library; the grounds and buildings were valued at \$340,000; the productive funds amounted to \$284,000; and the annual income was about \$49,000. The departments are the preparatory, music and art and graduate. The college courses consist of nine groups which lead to the degrees of B.A. and B.S.

**MONNA LISA**, or 'La Gioconda,' the famous masterpiece of Leonardo da Vinci, disappeared from the Louvre in Paris 21 or 22 Aug. 1911. The picture had been taken out of the frame, which was found on a back staircase of the building. For over two years the mystery remained unsolved. On 12 Dec. 1913 the Italian Minister of Education announced that the painting had been recovered in Florence. It had been stolen from the Louvre by an Italian workman named Vincenzo Perugia, who gave as his reason for the theft that he wished to retaliate on France for taking so many Italian masterpieces from Italy. On 5 June 1914 Perugia was sentenced to one year and 15 days' imprisonment with payment of costs.

**MONNA VANNA**. In 1902 Maurice Maeterlinck, who for a dozen years had been composing tenuous dramas of the imagination, expressive of vague fears, and symbolic of the coming of death, turned in 'Monna Vanna' to a more usual type of play. In place of an airy plot but half suggested, he developed a close-knit story; in place of shadowy figures uttering childlike phrases and implying as much by their silence as by their talk, he presented living figures engaged in rhetorical debate; and in place of the merest impressionism of mood, he displayed a sudden practical interest in problems of conduct. Two such problems, in particular, he considered: first, as to whether a woman might ever honorably sell her honor; and, second, as to whether her husband's disbelief in the purity of her motives might ever justify her leaving him for one who could understand her. Monna Vanna, in order to save the lives of 30,000 starving Pisans, besieged by the Florentines, consents to yield her honor to the commander of the enemy. But the latter, her boyhood lover, refuses to

profit from the advantage he has taken of her, and, assailed by the state he serves, returns with her to Pisa as her guest. Her husband, who has raged against her decision to go to Prinzeville in the first place, refuses to believe that this warrior has spared her. She can rescue him from death only by falsely proclaiming his guilt and her own desire for vengeance, thus gaining possession of the keys to his dungeon, from which she will flee with him at the earliest opportunity. Thus Maeterlinck, like Shakespeare in 'Measure for Measure' and Phillips in 'Pietro of Siena,' though he raises the question of a woman's right to barter her honor for the life or lives of others, does not venture to exact of her the price. Such is his procedure, also, in two other plays, 'Joyzelle' and 'Marie-Magdeleine.' Neither of these has been so successful upon the stage as 'Monna Vanna,' which may be read in the English versions of A. I. du Pont Coleman (1903), Charlotte Porter (1904) and Alfred Sutro (1907). The piece is discussed in the monographs on Maeterlinck by Gerard Harry, M. J. Moses, Edward Thomas and Una Clark.

FRANK W. CHANDLER.

**MONO**, mō'nō, a lake or "sink" in Mono County, Cal., on the eastern slope of the Sierra Nevada, in a gold and silver mining region, about 150 miles southeast of Sacramento. The lake is circular in form, nearly 15 miles across; area, about 200 square miles, contains almost as a central point, Mono Island. A short railroad passes along the eastern shore, chief village station, Monolake. A number of streams enter the lake, but it has no apparent outlet. The waters are alkaline and contain no fish. A species of insect deposit their ova on the surface of the waters, and sometimes so great are the numbers that they look like islands. The Digger Indians collect the insects and ova and prepare from them an edible delicacy. See KOO-CHA-BEE.

**MONO**, the common name in Guatemala for the Central American howling monkey (*Myctes villosus*).

**MONOCACY**, mō-nōk'a-sī, Battle on the, an engagement during the Civil War when on 4-5 July 1864, General Early with 20,000 Confederate troops, after driving the Union forces, under General Sigel, from the lower Shenandoah Valley, crossed the Potomac into Maryland north of Harper's Ferry, on his march to Washington, demonstrated on Sigel, who had retreated to Maryland Heights and, crossing South Mountain by Turner's and Crampton's Gaps, concentrated his main body on the night of the 8th near Middletown in the Catoctin Valley, his cavalry, after some sharp skirmishing during the day, being in advance, between Middletown and Frederick. Meanwhile Union forces had gathered to oppose his march. Gen. Lew Wallace, commanding the Middle Department, with headquarters at Baltimore, on the 6th collected a mixed force, numbering 2,700 men, under Gen. E. B. Tyler, at Monocacy Junction, near Frederick, and disposed it to cover the Baltimore and Ohio Railroad and its bridge, and the Baltimore pike with its stone-pier bridge. Cavalry was sent out on the road beyond Frederick, which ran into Bradley T. Johnson's cavalry, and fell back. On the 8th Wallace was joined by a part of Ricketts' divi-

sion of the Sixth corps from the Army of the Potomac, which was advanced to Frederick, but during the night it was withdrawn and crossed to the east bank of the Monocacy, where meanwhile other parts of Ricketts' division had come up by rail from Baltimore. Ricketts' division of about 3,350 men was formed on Tyler's left, covering the Washington road and its wooden bridge. Both flanks and the fords were guarded by cavalry and skirmishers were deployed on the bank of the river. Wallace had but six field-guns; three were given to Tyler and three to Ricketts. An earthwork and two blockhouses commanded both the railroad bridge and the bridge on the Washington road. On the morning of the 9th Early advanced from Frederick to attack Wallace, Rodes' division on the left, along the Baltimore pike, and Ramseur's in the centre on the Washington road, while Gordon's division, following McCausland's cavalry, inclined to the right to reach the fords a mile below Wallace's left. Rodes and Ramseur drove the Union skirmishers to the bank of the river; Ramseur drove those in his front beyond it; and four heavy batteries of 16 guns crowning the heights near the river, at 9 A.M., opened fire upon the Union lines opposite. By noon the Confederate cavalry had forded the river, and dismounting, advanced on Ricketts' left, gaining a temporary advantage, but were soon driven back. Gordon then crossed his infantry and reinforced the cavalry. Ricketts, holding on the bridge with his right to check Ramseur, changed front to the left and engaged Gordon and the cavalry, sometimes yielding ground, and again regaining it, but the enflading fire of the guns across the river, and the continued heavy pressure of Gordon on his front, right and left flanks, caused Wallace at 4 P.M. to withdraw him toward the Baltimore pike, having first burned the wooden bridge and the blockhouse at its farther end. Tyler had continued to hold his position against Rodes, in part west of the river, covering the stone bridge of the Baltimore pike, but Gordon's troops, following up the east side of the stream, on Ricketts' heels, struck the pike before the bridge-guard could get away, capturing several hundred prisoners, Tyler narrowly escaping. Wallace fell back by the Baltimore road in the direction of Ellicott's Mills, Early following but a short distance. Early buried his dead and sent over 400 of his severely wounded to the hospitals in Frederick. He levied and collected \$200,000 from the citizens of Frederick, seized a good supply of shoes, bacon and flour, and on the morning of the 10th resumed his march on the direct road to Washington, halting at night within four miles of Rockville. The Union loss at Monocacy was 123 killed, 603 wounded and 568 missing, a total of 1,294, of whom 1,073 were of Ricketts' division. Early reports his loss as about 700 killed and wounded, but it must have been greater, as Gordon reports the loss in his division alone as 698. The great importance of the battle on the Monocacy lies in the fact that the day gained in delaying Early enabled the remainder of the Sixth corps to reach Washington from Grant's army, as well as a part of the Nineteenth corps from New Orleans, before Early could make an attack on the city. General Grant says: "Whether the delay caused by the battle amounted to

a day or not, General Wallace contributed on this occasion, by the defeat of the troops under him, a greater benefit to the cause than often falls to the lot of a commander of an equal force to render by means of a victory." Consult 'Official Records' (Vol. XXXVII); Pond, 'The Shenandoah Valley in 1864'; Grant's 'Personal Memoirs' (Vol. II); Early, 'Last Year of the War for Independence'; Haynes, E. M., 'History of the Tenth Regiment, Vt.' (Vol. III, pp. 184-238, Rutland 1894); The Century Company's 'Battles and Leaders of the Civil War' (Vol. IV).

E. A. CARMAN.

**MONOCEROS**, mō-nōs'ēr-ōs, or **UNICORN**, from the Greek *μόνος*, *monos* (single), and *κέρας*, *keras* (horn), a constellation in the astronomical chart lying between Canis major and Canis minor, south of Gemini and Cancer, and introduced (1624) by Bartsch. It is made up of multiple stars, clusters and nebulae but has no star brighter than fourth magnitude.

**MONOCHORD**, a musical instrument with one string, invented by Pythagoras, and much employed by the ancients in the musical training of the voice and ear. The modified form of the instrument used in natural philosophy lecture-rooms is often called a sonometer; it consists of one or more strings stretched over a sounding-box. A string is fastened at one end of the box, and passes at the other end over a fixed pulley, which enables it to be stretched by means of weights; it passes over two fixed bridges near the ends of the box, and there is a movable bridge between to alter the length of the vibrating portion of the string. Strings are employed to produce musical sounds in the violin, harp, guitar, piano, etc. The sonometer is an indispensable piece of apparatus to lecturers on acoustics not only for the proof of the law of vibrating strings, but also to illustrate the relations of harmonics and the fundamental ideas of undulations.

**MONOCHROMATIC LIGHT**, in physics, a light which consists of a single color which is so pure and so definite that when it is examined by the spectroscope it gives but a single bright line. An approximately monochromatic light may easily be obtained by volatilizing salt, or some other sodium compound, in the flame of a Bunsen burner. An orange-yellow color, of great purity, results. Viewed by this light, everything white or yellow looks bright, while vermilion, ultramarine and other colors that do not contain any sensible proportion of yellow appear black. Monochromatic light is greatly used in physics, for the study of certain kinds of phenomena in optics.

**MONOCHROME** (Greek, *monos*, single, and *chroma*, color), in ancient art, a painting executed in a single color. The word is generally applied to painting in the various shades of the same color. The first specimens of the art of painting were of one tint only, which was most commonly red, made either with cinnabar or minium. Instead of red, white paint was sometimes used. The first four plates in the first volume of the paintings of Heracleum contain several monochromes upon marble. The most numerous monuments existing of this kind of painting are on terra cotta.

**MONOCLINE**. See FOLDS.

**MONOCOTYLEDONS**, plants of that great division of angiospermous plants whose embryos sprout in only one seed-leaf or cotyledon, which springs from one side of the axis of the growth; the opposite of Dicotyledons (q.v.). In one system of botany the term was employed as a synonym of *Endogens*, but this use is obsolete.

**MONOD**, mō'nō, **Adolphe**, French Protestant theologian: b. Copenhagen, 1802; d. Paris, 6 April 1856. He studied at Geneva, was minister at Naples (1825-27), where he founded an Evangelical congregation; then at Lyons (1828-31). From 1836 he was a professor at Montauban, and from 1844 he was minister of the Reform Church. He wrote 'Sermons' (Paris 1860; 3d ed., 4 vols.); 'La Femme' (Paris, 11th ed., 1894); 'Les adieux à mes amis et à l'Eglise' (1856; 12th ed., 1894). Consult Monod, S., 'Life and Letters of A. Monod' (London 1885); Stapfer, 'La grande prédication chrétienne en France. Bossuet, Adolphe Monod' (Paris 1898).

**MONOD**, Frédéric, French Protestant clergyman: b. Monnaz, Switzerland, 17 May 1794; d. Paris, 30 Dec. 1863. He was educated at Geneva, but came under the influence of Robert Haldane and was ordained in 1818. He then went to Paris in service of the Bible Society, then assisted (1820) his father, a pastor at Paris, becoming (1832) titular pastor of the Oratoire. As editor of the *Archives du christianisme au dix-neuvième siècle* for 43 years, he became prominent (1848) when religion was menaced by the revolution. He favored the separation of Church and State and a Reformed Church creed; he, opening the synod, in September, found his motion for formulation of a creed lost. Thereupon he decided on establishing a free church on orthodox basis in spite of the persuasion of his brother Adolphe (q.v.), the synod and the Paris Consistory. Resigning from his Oratoire pastorate (1849) he opened a small chapel and founded the *Eglise Libre*. He was successful in uniting the Protestant congregations who had left the State Church, and established a constitution the first clause of which stated: "We believe that the entire Scripture of the Old and New Testament is inspired by God, and thus constitutes the sole and infallible rule of faith and life." At the Third Biennial Synod (1852) evangelization commenced and 22 posts exist at present besides affiliations, but the number of congregations (73 in 1873) has fallen off to 36 recently, many returning to the Reformed Church. Consult Monod, G., 'La Famille Monod' (Paris 1890); Pédezert, J., 'Cinquante ans de souvenirs religieux' (Paris 1896).

**MONODELPHIA**, a name formerly applied to all mammals esteemed higher than marsupials (*Didelphia*) considered as a group distinguished primarily by the fact that the uterus or womb is single and shows a single uterine cavity. It has been shown that this distinction does not hold and the term has consequently become obsolete.

**MONODY**, from the Greek monodia, a solo in contradistinction to the polyphony, the song of several or many voices. The term has been brought down to modern times as conveying a sense of melancholy or sadness in its

diction. Thus in literature a monody is a composition dwelling on some single emotional subject. In poetry the monody of the Greeks was a lyric solo in tragedy, an ode voiced by an actor on a painful motive, hence, when of a funeral or dirge character, it closely approaches *threnody*. In music monody is a song for a single voice with musical accompaniment; monodies have been introduced into opera, Peri's 'Dafne' (1597) being probably the first occasion, and they have found a regular place in the growth of operatic composition as well as in oratorios. The term is also used recently as synonymous with monotony as "the monody of the waves," etc.

**MONŒCIUS INFLORESCENCE**. See **DIOŒCIUS FLOWER**.

**MONOGRAM** (*monos*, single or only, and *gramma*, meaning "a single mark"), a character or cipher composed of one, two or more letters interwoven, being a sort of abbreviation of a name, used as a seal or badge, in coats of arms, etc. Monograms were much used on coins by the Greeks and the Romans. They were also used on standards, walls and tapestry, seals and documents, in which they were employed not only by princes and ecclesiastical dignitaries, but also by magistrates and notaries. At the commencement of the Christian period their use was universal. The titles and rubrics of Greek manuscripts are frequently monogrammatic, and numerous and diversified monograms are found in Latin manuscripts. Alphabets like the Roman, of an angular character, have many letters with corresponding parts; and the upright strokes, the horizontal lines and the curves are easily made by arranging them so that similar portions shall coincide, to produce numerous combinations. Monograms are generally combinations of more than two letters; when only two were incorporated they were generally designated ligatures. After the 12th century they gradually went out of use. The use of them remained longest in Germany, where it was formally abolished by the Diet of Worms in 1495. The knowledge of monograms of this public kind is of great importance for the illustration of the monuments and documents of the Middle Ages, and therefore forms a particular branch of diplomatics; for they were much employed in the mediæval diplomatic art. The term was subsequently applied to all sorts of ciphers and signs, with which artists, particularly painters and engravers, were accustomed to designate their works. The mediæval seal-engraver, to economize as much as possible the annular space available for the legend, favored both ligatures and monograms. Many of those seals had the initials of their owners blended and incorporated with the devices, called merchant-marks, corresponding somewhat to the modern trade-marks, which were the stamp, as it were, by which the work of each artist was known. Many of the modern monograms are copied from mediæval examples. Consult Brulliot, 'Dictionnaire des Monogrammes' (1832-34); Duplessis and Bouchot, 'Dictionnaire des Marques et Monogrammes de Graveurs' (1886-87); Bouvenne, 'Les Monogrammes Historiques' (1870); Fagan, 'Collectors' Marks' (1883).

**MONOLITHS**. See **STONES, STANDING**.

**MONOMANIA**, from the Greek *μόνος*, *monos* (single), and *μανία*, *mania* (madness). That form of mental derangement which distinguishes itself by an abnormal conception or action on one subject only, leaving the mind sane on all other points. The eccentricity of delusion does not extend to any other subject or act. The term *craze* is often used to cover mild forms of monomania.

**MONOMETALLISM**, the principle of having only one metallic standard in the coinage of a country, opposed to bimetallicism. See **BIMETALLISM**; **COINAGE**; **CURRENCY**.

**MONONA**, mō-nō'na, a lake in Wisconsin, one of a group of lakes near Madison in Dane County. See **FOUR LAKES**.

**MONONGAHELA**, mō-nōn-gā-hē'lā, a river which has its rise in the northwestern part of West Virginia, and flows north into Pennsylvania, where it unites at Pittsburgh with the Allegheny to form the Ohio River. The headwaters of the Monongahela are in the Alleghany Mountains near the headwaters of the Potomac. The two head-streams of the Monongahela unite near Fairmont in Marion County, W. Va., and from the point of junction on the north become a swiftly flowing stream, furnishing water power for several manufacturing towns and cities. The whole course is very irregular; the length is about 300 miles. It was made navigable about 106 miles from its mouth to Morgantown, in Monongahela County, W. Va., by a system of locks, nine in number, and other locks above Morgantown now make the river navigable as far as Fairmont. The largest tributary is the Youghiogheny, a navigable river, which has its source in the mountains in the southwestern part of Garrett County, Md., and enters the Monongahela near Pittsburgh. The Cheat River, the next largest tributary, is a stream in the northeastern part of West Virginia. It joins the Monongahela in Pennsylvania, a few miles north of the border. The river flows through a country which has fertile farm lands in the valley and the whole section is rich in coal. Near Pittsburgh, then Fort Duquesne, on the banks of the river, on 9 July 1755, the French and Indians won a victory over Braddock's Anglo-American troops.

**MONONGAHELA CITY**, Pa., city, in Washington County, on the Monongahela River, and on the Pennsylvania, and the Pittsburgh and Lake Erie railroads, about 32 miles south of Pittsburgh. It is in a coal region, in which the chief industries are coal mining and manufacturing. It was settled in 1792 by Joseph Parkison, was incorporated as a borough 3 April 1833 and chartered as a city 24 March 1873. It has large industrial establishments, employing about 6,000 persons, or about 600 more than the whole population as given by the federal census of 1900. The chief manufactures are glass, foundry and machine-shop products, flour, lumber, chemicals and paper. It has considerable trade in the home manufactures and in coal and farm products. The principal buildings are 15 churches, six public schools, an academy, government building, memorial hospital and municipal building. The four banks contain a combined capital of \$2,500,000. The government is administered under a third-class city rule. The

government provides for a mayor, comptroller and a board of commissioners, four in number, the mayor being president of the board. All are elected every four years. The majority of the inhabitants are American born, but there are quite a number of Italians and Slavs. Pop. 9,600.

**MONOPHYSITES** (from Greek *monos*, single, and *physis*, nature), those followers of the opinion in the early Church which ascribes but one nature to Christ in contradistinction to the orthodox doctrine that he was both divine and human, true God and true man. The Monophysites were mainly confined to the Eastern Church and obtained no footing in the West. The edict called Henoticon, issued by the Emperor Zeno in 482, was not able to quiet the long and often bloody contests incident to this controversy, and the orthodox Church, by its sentences of excommunication, occasioned a formal secession on the part of the Monophysites. This separation took place in the first half of the 6th century. Nor did they remain united among themselves. In 519 controversies arose among them respecting the question whether the body of Christ is corruptible or not. About 560, a Monophysite, Askunages, and after him Philoponus, a noted Alexandrian philosopher of that century, conceived the idea of styling the three persons of the Deity three Gods. These Tritheists and their adherents, even in the eyes of the Monophysites, were heretics, and were the occasion of many Monophysites turning Catholics. In Egypt, Syria and Mesopotamia the Monophysite congregations, however, remained the strongest, had patriarchs at Alexandria and Antioch, existing, without interruption, by the side of the imperial orthodox patriarchs; and after the Syrian, Jacob Baradaeus had, about 570, established their religious constitution, formed the independent churches of the Jacobites and Armenians, which separated from the Greeks as well as the Romans, and have for that reason been able to maintain themselves since the 7th century, even under the dominion of the Mohammedans. Excepting their doctrine of one nature in Christ they coincide, in the main points of belief, with the Greek Church; their worship also resembles the Greek rather than the Roman, but has, from their national character and their superstition, received variations, which are most striking in the religious constitution of the Egyptian Jacobites (q.v.). See **JACOBITES**; **Armenian Church under ARMENIA**.

**MONOPLÉGIA**, mōn-ō-plē'jī-ā, a paralysis limited to one organ or part, e.g., one arm or one leg. If both arms or legs are stricken the condition is called paraplegia; while if arm and leg and other organs on one side are affected it is called hemiplegia. It is caused by circumscribed lesions of the nervous system, in brain, spinal cord or nerves. An example of monoplegia is Bell's palsy (q.v.). See **BRAIN, DISEASES OF**.

**MONOPOLI**, mō-nōp'ō-lē, Italy, town, in the province of Bari, on the Adriatic Sea and on the Bari-Brindisi Railway. It is the site of the ancient Minopolis and the present seat of a bishopric. Its old castle and remains of the encircling wall and its prehistoric graves lend it considerable archaeological interest. It has a 12th century cathedral, a gymnasium, technical

school, open harbor, and its industrial activity extends to oil-pressing, soap-making and trading in oil and wines. In 1911 it had a population of 24,104.

**MONOPOLY** (Greek, *monopolia*, single or sole selling) is an exclusive right, secured to one or more persons, to carry on some branch of trade or manufacture, in contradistinction to a freedom of trade or manufacture enjoyed by all the world. The most frequent monopolies formerly granted were the right of trading to certain foreign countries, the right of importing or exporting certain articles, and that of exercising particular arts or trades. Such exclusive rights were very common in Great Britain previous to the accession of the house of Stuart, and were carried to an oppressive and injurious extent during the reign of Queen Elizabeth. The grievance at length became so insupportable that, notwithstanding the opposition of government, which looked upon the power of granting monopolies as a very valuable part of the prerogative, they were abolished by an act of 1623. However, various companies for the exploitation of the colonies and possessions of Great Britain, such as the Hudson Bay and East India companies (qq.v.), of an essentially monopolistic nature, continued to exist until well on in the last century. Nevertheless this act secured the freedom of industry in Great Britain, and has done more perhaps to excite a spirit of invention and industry and to accelerate the progress of wealth than any other in the statute book. Government monopolies, however, are common on the Continent, and constitute one of the chief means of obtaining revenue. There is one species of monopoly sanctioned by the laws of all countries that have made any advances in the arts, namely, the exclusive right of an invention or improvement for a limited number of years. It is, in fact, a kind of property created by law for the benefit of the inventor, and which he could not effectually acquire or secure without the aid of the law. The exclusive right of an author to the publication of his own work is hardly a monopoly, but rather a right of property, resting upon the same principle as the right to lands or chattels. The law, therefore, by giving an author the exclusive right to the publication of his own work for a limited number of years makes no grant; it is only allowing him what is his own for a limited time. But the exclusive right to the use of an invention or improvement is a monopoly, since it deprives others, for that period, of the chance of the advantage of making the same improvement, discovery or invention themselves. Capitalists, either single or combined, may produce commodities so much better and cheaper than others can do as practically to command the entire sale, and are in popular language called monopolists. But having no legal rights or advantages that are not open to all, they are not in the legal sense in possession of a monopoly. In the oldest sense of the term they are monopolists; but since the term is now used in an unfavorable sense, its discontinuance as applicable to these is only just. It may be assumed as an economical axiom that every interference with absolute freedom in acts of exchange can be defended only on the highest grounds of public policy. Any advantage given to a particular interest is not

only a wrong to the general public, but will in time bring a just retribution to the favored class.

In the United States the only monopolies that the laws and the individual states look on with favor consist of the post office, which is a government monopoly, and the rights granted to individuals under the patent and copyright laws. Monopolies commonly known as trusts are looked on with odium, and various States have enacted laws making a trust an illegal combination of individuals. See TRUSTS; COPYRIGHT; PATENT.

**MONORAIL**, a single-rail type of railway designed for economy of construction, increased speed and for mountainous regions. The first idea of a single-rail railway dates back to 100 years ago, and many such are now being used in various parts of the world.

The first car run on a single rail, the invention of M. Charles Lartigue, has been in practical operation for many years in Djiboniti, a French-African post. The car is kept vertical by its attachment to a laterally placed horse, which balances the car as a hansom is balanced by attaching the horse in front. The development of this primitive idea attracted the genius of all great civilized countries, and aided by government patronage, individual effort and fortunes, made great progress.

An early type of monorail was one where all the different resistances to a swiftly moving car or train, except the atmospheric resistance, was concentrated in the vertical plane of the centre of gravity of the car or train, being par-

The Tunis Monorail.

tially concentrated by centrifugal force, and those resistances which were not concentrated at the centre are nearly compensated for by friction removing devices. When the said body is at rest, or slowly moving, the unbalanced forces, only, are mechanically concentrated with a minimum friction, and the stability is positively and absolutely preserved without jarring movement. The downward vertical force consists of the weight of cars, trucks and load. This weight is delivered to, and directly sustained by, two centrally disposed bearing rails laid with precision as to alignment and surface, and closely gauged to each other, so as to constitute practically a single support, while the vertical integrity or stability of the weight thus delivered to a central point is conserved when necessary by upward forces acting through the medium of dependent tension members, fitted with frictionless wheels bearing against inverted girders or rails; when moving at speed,

stability is almost entirely preserved naturally and automatically, and only slight strain is on the dependent tension members. The magnitude of the downward forces is a matter simply of weight of cars; the upward forces are a matter of mechanical moments or leverages; the upward forces may amount to 10 per cent of the downward forces for usual cases. The downward force is delivered through the medium of the main central wheel, bearing on the two central rails as on a single rail. The side clutch wheels, that bear against the inverted girders or rails, guide, clutch and secure the car truck to its normal plane or path, forcing the truck to follow precisely any assigned inclination; for example, around curves. The central bearing rails and the inverted side clutch rails being laid with precision as to line, grade and inclination, the lateral and top-heavy swaying and recurrent oscillation now observ-

perenced railroad men as Austin Corbin. Several short test roads were built and operated. The Tunis plan, here illustrated, is a modification of Boynton's. As will be seen, the single rail is laid on the ground like the rails of steam roads and trolley lines. Over the single rail

Behr System.

at fixed intervals are trusses, or bents, joined by cross pieces at the top and supporting the guides which prevent the car from toppling over. The car itself also embodies some unique and interesting features. It is narrower than the standard trolley or railroad car and rests on a single pair of wheels, or, in the full-size coach, on two trucks of two wheels each, arranged tandem, just under the centre of the floor, the platform and superstructure being balanced on them. The car is balanced on the single rail, the wheels being of the grooved pattern. So accurately are the weights adjusted that a slight lurch of the body will sway the car from side to side. At first some apprehension was expressed that in going around curves the centrifugal motion of the car would impose too great a strain on the bents, but this fear has proved wholly groundless. By allowing for the centrifugal force by the slant toward the inner side of the circle which is

For surface street construction, showing overhead truck at the maximum height of 14 feet.

able in locomotives in motion can never obtain; nor can the truck derail, as it is clutched to the track.

The propulsion of cars is effected by electric motors, two or four motors to each truck, the number of motors being dependent upon the starting pull, acceleration and speed required.

William B. Mack's design, shown here, appears to have been awarded more consideration among engineers than any of the many similar plans patented. As far back as 1872 a charter was granted in the State of New York for the building of a hanging railroad which had the general mechanical principles of the hanging roads more recently exploited in Germany, France and Russia, but the Cook system, shown here, appeared to be the only serious effort made to date at hanging cars on the side of the structure in place of underneath.

E. Moody Boynton patented plans for a monorailway which were approved by such ex-

Romanoff System.

accomplished on ordinary roads by raising the other rail the weight is thrown off the bents and approximately equalized.

The English monorail known as the Behr System, here illustrated, has been in operation for a number of years at Ballybunnion, Ireland,

and was successfully tested by the Belgian government, securing a speed of 83 miles per hour with a car weighing 70 tons. In 1901 and 1902 the English Parliament granted Mr. Behr's company the right to construct a road between Manchester and Liverpool, after the plans had been examined and approved by many eminent engineers.

The track is a single rail of the same shape and weight as generally used on steam roads. This rail is fastened at the top of an A-shaped structure made of steel. The structure is riveted to steel ties firmly imbedded in cement and rock ballast. The triangular supports for the rail are only four feet high, and one is placed every three feet three inches. At each side and 18 inches from the ground is placed a light guide rail to keep the moving car in position. The entire weight of the car rests upon large grooved wheels which travel upon the large rail at the top of the framework. As electric motors are used to propel the train, each of these wheels is a "driver." Current is conducted on rails placed upon the ties, but insulated from them.

The car consists of two compartments, one on each side of the structure, and are 60 feet long, weighing four tons each.

The monorail idea has been exploited in Germany, France and Russia in its application to hanging cars, but Germany alone has se-

Suspension Railway, Barmen, Germany.

cured results. A suspended overhead railway system of rapid transit is now in operation between the three manufacturing towns of Vohwinkel, Eberfeld and Barmen, near Cologne, Germany. The road is built on a system of latticed longitudinal girders, one vertical and two horizontal, assembled into the form of an I-section. The main girders form the web of the I, and the lateral girders, which give the requisite lateral stiffness, serve as the top and bottom flanges of the I. Diagonal tie-rods extend from the upper panel points of the central girder to a connection with the chords of the bottom lateral girder. The last mentioned chords consist of steel I-beams, and upon their upper flanges is laid the single T-rail, from which the cars depend and on which they run. The girders, which vary in span from 21 to 33 metres (68.88 feet to 108.24 feet), are carried upon supports varying in structure with the locality where they are used. Where the railway is carried immediately above the Wupper River the A-frame style of pier is used, while in the towns through which the line passes the trusses are carried upon substantial U-frames. The A-frame consists of two rectangular latticed struts, which are united at the top by a rectangular plate yoke.

The cars are 37.7 feet long, 8.5 feet high and 6.88 feet wide; are therefore fairly long and narrow, and are slightly tapered at the ends.

They have a seating capacity of 50, and are built with two side doors opening inwardly, and two auxiliary doors at the ends. The total weight of each car is 12 tons. The cars are freely suspended from two trucks spaced eight metres apart and having a diameter of 0.9 metres. The wheels are mounted in tandem to run on a single rail and are driven by two electric motors of 36 horse power each, through the medium of transmission gearing. The motor trucks receive current by means of a slipshoe and a contact rail, which is carried on the bottom of the lateral girder, somewhat to the inside of the main supporting beam.

The truck-frames embrace the rail-girders and the rails so closely that a play of seven millimetres is allowed and that derailment is impossible. If a wheel or axle should break the cars would be held up by the frames.

Oscillation of the car is limited by two projections on the lower part of the hook-shaped frame. The cars swing around the curve in a slightly inclined position and spontaneously re-assume their normal vertical position when a straight part of the rail is reached. To the passengers the change in equilibrium is imperceptible. Since a sudden change in equilibrium causes an oscillation proportionate to the velocity and the angle determined by the radius of the curve, which oscillation lies within twice the value of this angle, comparatively long transitional bends have been provided by reason of which the equilibrium is gradually changed, with the result that almost inappreciable oscillations are produced.

A Russian electric engineer named Hippolyte Romanoff has invented a monorailway of some merit. The invention consists of a monorail hanging car as shown here. The rails are supported by T-shaped columns, the carriages being suspended in the air and propelled by wheels running along the rails. These wheels are without flanges, which Romanoff asserts retard speed by clinging to the rails while rounding curves, but are prevented from leaving the rails by means of smaller wheels which grip the rails horizontally.

An electric feed-wire runs parallel with the rail. The cars have three supports each. If the first is broken the second comes into play automatically, and then the third. Should any one of the cars be stopped by an accident or for any reason other than the natural one of pausing at a station, all the cars behind would stop also, thus preventing any rear-end collisions.

In May 1907, with a gyroscope monorail car Mr. Louis Brennan, C. B., the inventor of the Brennan torpedo used by the British government, demonstrated before the Royal Society of Great Britain that he had discovered a practical application of the gyroscope.

The invention is, briefly, a system by which a vehicle or a train of vehicles supported by a single row of wheels may travel on a single rail and maintain perfect equilibrium in motion regardless of the distribution of the load, wind pressure, etc. Automatic stability mechanism carried by the vehicle itself endows it with this power. The mechanism consists essentially of two flywheels rotated directly by electric

motors in opposite directions at a very high velocity and mounted so that their action can be utilized. These flywheels are mounted on high-class bearings and are placed in exhausted cases, so that both air and journal friction is reduced to a minimum, and consequently the power required to keep them in rapid motion is very small. The stored up energy in the flywheels when revolving at full speed is so great and the friction so small that if the driving current is cut off altogether they will run at sufficient velocity to impart stability to the vehicle for several hours, while it will take from two to three days before they come to rest. The model car, while running on a curved monorail, leans and so automatically balances the effect of centrifugal force, while a single wire hawser stretched across a river or ravine is all that is necessary in the shape of a bridge.

In 1909 Froelich, a German, developed another type of gyroscopic car with a so-called "precession motor," which did not pass beyond the experimental stage, and about two years later the Schilowsky system was brought out in which the gyroscopic principle is also employed. Consult *Journal of the Franklin Institute* (Vols. CLXIX and CLXXIV) and files of the *Scientific American*, the *Engineer* and *Engineering* (London).

**MONOTHEISM** (Greek *μῦθος* single *θεός* god), in religion, the belief that God is one or that there is only one God. Several religious beliefs are in opposition to this tenet: polytheism, which holds that there are many gods; atheism, which denies the existence of God altogether; and scepticism or agnosticism, which doubts the existence of a supreme being. The historical sources of monotheism are very ancient and involved, and need not be dealt with here. However, in the history of religious thought, three philosophical types of monotheism have developed which are distinct enough logically, if not practically, to make analysis possible.

The first type is exemplified in the later monotheism of the Israelitish tribes. The unity of God is derived from an ethical concept of the universe. God is one, holy and the righteous ruler of the world. He is the dispenser of justice, the giver of the law. He derives his power from the fact that he is the creator and, therefore, he enjoins upon his creatures ethical responsibility and heightened moral consciousness. Apart from the world, he sits in supreme jurisdiction over it.

In Greek philosophy we find the second type of monotheism, in which God as a unity or unifying principle is the source, the explanation of the order and rational coherence of the universe. According to Aristotle, he is at once the commanding general of the universe and the rational order of it.

The Hindu philosophy represents the third type. In its teaching, a distinction is maintained between the reality of the world and the reality of God. The earth on which man lives and its phenomena are of the "stuff that dreams are made"; it is ephemeral, transitory, unreal. God, who is imminent in all things, is at the same time transcendental, superior — the ultimate reality. Knowledge of God cannot be obtained by intellectual reasoning alone. It must come as a direct revelation by insight to

those souls who are best prepared to receive it. Therefore, the contemplative life is to be desired and commended in preference to the practical. Logically, this mysticism argues that, since knowledge obtained through sensuous experience is at best defective and limited, some comprehensive perfect reality partaking of the nature of all things must exist somewhere — and this is the one God.

These various types of monotheism did not exist as pure concepts practically, however. The continued study of the problem of the relation of the world to God brought about interesting syntheses of these several philosophies. The intellectualism of Greek monotheism which conceived the "Logos" or divine essence of things to be the ruler and the order of things at the same time, soon found its position besieged by ethical questionings. How establish the proper relationship between a remote, righteous God who orders all things and a lawless unjust world? How reconcile, in other words, the Greek rational and the Jewish ethical monotheism? The Neo-Platonic school turned to mysticism for the solution. Likewise, early Christianity found itself beset with similar problems, and in its answer also found recourse to transcendental philosophy necessary. In Christian monotheism, a curious synthesis of all three monotheistic concepts is found, together with the doctrine of the personality of God. The ethical and mystical concepts predominate. The existence of a rational world is acknowledged to the point of fixing the ethical responsibility of human relationships. But beyond that, the things of the earth are untrue, imperfect, unreal. The whole truth is in God, of whom knowledge is obtained through insight and revelation. The concept of immortality solves the problem of injustice and evil, for in the after life all ethical readjustments are made. The Hellenistic concept of the universe as a well-ordered system capable of being fathomed by the intellect also survives in Christianity in the attempt to rationalize its doctrines and to build up a definite convincing system to establish the unity between the finite world and its infinite ruler.

Constant revivals of the third type of monotheism arise also out of the problem of synthesizing all three forms. The escape from the difficulties attendant upon the acceptance of any of the three per se is generally in transcendentalism of some form or in scepticism. True monotheism must take into just consideration the ethical, rational and intuitional elements of religious philosophy.

Consult Martineau, J., 'A Study of Religion' (Oxford 1888); Inge, W. R., 'Christian Mysticism' (London 1899); Royce, J., 'The World and the Individual' (New York 1900-01); Höfding, H., 'The Philosophy of Religion' (New York 1906); King, I., 'The Development of Religion' (New York 1910); Lang, A., 'The Making of Religion' (3d ed., New York 1910).

**MONOTHELITES** (Greek, *monothelētai*, from *monos*, and *thelō*, I will), a sect who maintained that though Christ had two natures co-existing distinctly in the unity of the person, yet these natures possessed or acted by but a single will — the divine, which so predominated over or absorbed the human as to deprive it of all action or efficiency. They have been regarded

as an offshoot of the Monophysites, though they themselves denied all connection with them. The doctrine originated with the Emperor Heraclius, who in 630, by adopting a middle course, attempted to reconcile the Monophysites to the orthodox church. The attempt was for a time successful. Heraclius consulted Sergius I, patriarch of Constantinople, on the new dogma, and he not only approved of it, but became its most active propagandist. At his instance, and mainly in consequence of his representations, Pope Honorius I addressed two letters to Sergius, which according to some interpreters would seem to favor Monothelism. The successors of Honorius condemned the Monothelites, and Martin I, in 649, issued a bull anathematizing them. For this he was sent prisoner to the Chersonesus by the Emperor Constans, who protected the Monothelites. The sixth ecumenical council, that of Constantinople (680), condemned this heresy, and with this the early controversies on the incarnation became gradually fainter, till they were forgotten amid the disputes between the Iconoclasts and their opponents.

**MONOTREMATA**, an order of mammals belonging to the subclass *Protothesia* (q.v.) and represented by the duckbill (q.v.) of Australia and Tasmania, and the spiny anteaters (see *ECHIDNA*), the range of which extends into New Guinea. In many respects they recall the *Sauropsida* and especially the birds, a fact reflected in the name *Ornithodelphia* sometimes applied to them. The most marked of these peculiarities are the obliteration of the sutures of the skull, the possession of a terminal canal (cloaca) into which both the digestive tract and the urogenital organs empty; the possession of a well developed coracoid bone; and the fact that they do not, like other mammals, bring forth living young, but lay eggs. After the eggs are laid they are transferred to a temporary pouch beneath the abdomen, where they hatch and the young are nourished by the mammary glands.

**MONOTYPE**. See **COMPOSING MACHINES**.

**MONOXIDE**, in chemistry, a compound consisting of one atom of oxygen united to one atom of another divalent substance, or of one atom of oxygen united to two atoms of some other monovalent substance. The word is used when it is necessary to distinguish two or more states of oxidation of the same substance. Thus CO is called "carbon monoxid," in distinction CO<sub>2</sub>, which is called "carbon dioxid." Similarly Na<sub>2</sub>O is "sodium monoxid," while Na<sub>2</sub>O<sub>2</sub> is "sodium dioxid." See **OXIDE**.

**MONREALE**, mōn-rā-ā'lā, Italy, town in the Sicilian province Palermo, five miles southwest of Palermo city and connected with it by surface car tracks. It is the seat of an archbishopric, has a well-preserved cathedral (built 1174-89) with old bronze doors and beautiful mosaics, monumental graves of Norman kings; also there is a Benedictine abbey dating from the 12th century with a magnificent cloister of 216 mosaic pillars and large library. Among its other public edifices are a gymnasium and a lyceum. In 1911 it had 20,103 inhabitants.

**MONRO**, mūn-rō', **Alexander**, Scottish anatomist: b. London, 8 Sept. 1697; d. Edin-

burgh, 10 July 1767. He studied at Edinburgh, afterward in London under Cheselden, and still further both in Paris and Leyden, at the former under Bouquet, and at the latter under Boerhaave. On his return to Edinburgh in 1719 he was made professor of anatomy and surgery to the surgeon's company; in 1720, the first university professor of anatomy, though not inducted till 1725. He attended the wounded on the field at Prestonpans (21 Sept. 1745), and was an accurate observer, having studied the effect of the presence of solid bodies in the vermiform appendix, and otherwise anticipated later views. He resigned his professorship in 1764. His principal work is 'Osteology, a Treatise on the Anatomy of the Human Bones' (1726), once a popular textbook.

**MONRO**, **Alexander**, known as *Secundus*; Scottish anatomist: b. Edinburgh, 20 May 1733; d. there, 2 Oct. 1817. He was son of Alexander Monro, called *Primus* (1697-1767) (q.v.). Educated at Edinburgh University (M.D. 1755), he also studied on the Continent, and in 1759-1808 lectured at Edinburgh. In 1783 he described the communication between the lateral ventricles of the brain, known as the foramen of Monro. He published 'Three Treatises on the Brain, the Eye, and the Ear' (1797) and other medical works.

**MONRO**, **Alexander**, known as *Tertius*, Scottish anatomist: b. Edinburgh, 5 Nov. 1773; d. Craiglockhart, near Edinburgh, 10 March 1859. He was the son of Alexander Monro (1733-1817) (q.v.). He obtained his M.D. at Edinburgh in 1797, was appointed conjoint professor with Monro *Secundus* of medicine, surgery and anatomy, and in 1817-46 was sole professor. His works include 'Observations on Crural Hernia' (1803), and other publications.

**MONRO**, **Dana Carleton**, American historian: b. Bristol, R. I., 7 June 1866. He was graduated (1887) at Brown University, then studied (1889-90) at the universities of Strassburg and Freiburg. He was instructor and assistant professor of Roman and mediæval history (1893-1902) at the University of Pennsylvania, and professor of European history (1902-15) at the University of Wisconsin. In 1915 he accepted the chair of mediæval history at Princeton University. He received the degree L.H.D. from Brown University in 1912. From 1894-1902 he was editor of *Translations and Reprints from Original Sources of History*, and has written 'Mediæval History' (1902); 'A Source Book of Roman History' (1904); 'Syllabus of Mediæval History' (7th ed., 1913); 'German War Practices' (1917), and was a collaborator on 'Essays on the Crusades' (1902) and 'Mediæval Civilization' (1904).

**MONROE**, **Harriet**, American author: b. Chicago, Ill., 23 Dec. 1860. She was graduated from the Visitation Academy, Georgetown, D. C., in 1879 and has since devoted herself to literature. In 1889 she wrote the text of the cantata given at the opening of the Chicago Auditorium and in 1891 wrote by request of the committee the 'Columbian Ode' which was sung at the dedicatory ceremonies at the World's Columbian Exposition in 1892. She has published 'Valeria and Other Poems' (1892); 'John Wilborn Root—a Memoir' (1896); 'The Passing Show—Five Modern

Plays in Verse' (1903); 'The Dance of the Seasons' (1911); 'You and I—Poems' (1914). In 1912 she established and became editor of *Poetry*, a magazine of verse.

**MONROE, James**, fifth President of the United States: b. in Westmoreland County, Va., 28 April 1758; d. New York, 4 July 1831. His father, Spence Monroe, was descended from Hector Monroe, an officer of Charles I; while his mother, Eliza Jones, of King George County, was of Welsh descent. Monroe attended William and Mary College, but with the outbreak of the Revolutionary War he became a lieutenant in a Virginia regiment (1776). He was with his troops at the battle of Harlem Heights, White Plains and at Trenton, where he distinguished himself, being wounded in the shoulder. During the campaign of 1777-78 Monroe served on the staff of Lord Stirling with the rank of major, taking part in the battles of Brandywine, Germantown and Monmouth. As staff officer Monroe lost his place in the Continental army, and failing to raise a new regiment authorized by the legislature of Virginia, Monroe withdrew from active military services, confining himself to volunteer efforts in defense of his State. In this capacity he attained the rank of lieutenant-colonel in a new regiment to be raised in Virginia. In 1780 his military services were definitely interrupted and concluded by his undertaking the study of law under Thomas Jefferson, then governor of the State. So began the life-long friendship and intimacy between these two representative Virginians. In 1782 he was elected to the Virginia legislature, and although still a very young man, was appointed to the executive council. From 1783 to 1786 he served in the Congress of the Confederation where he played a conspicuous part in endeavoring to strengthen the Confederation's powers for the regulation of commerce, and the favorable report of the special committee appointed as the result of his motion on this topic contributed to the ultimate alteration of the articles. Monroe also disclosed a lively interest in the development and division of the West, on the right of the United States to the navigation of the Mississippi, on the subject of trade between the States and in the public lands. On retiring from Congress he began the practice of law at Fredericksburg, Va.; but in 1787 he was chosen a member of the Virginia legislature and in 1788 a member of the State convention to ratify the Federal Constitution. In this convention Monroe sided with the opponents of the new draft, and in the two main speeches which he made—characterized as "dull and weighty"—he objected to the ratification on account of "the power of direct taxation, absence of a bill of rights, the lack of legislative and executive responsibility, and the re-eligibility of the President." In 1790 he was selected by the legislature United States senator to fill the vacancy caused by the death of William Grayson. From 1790 to 1794, as United States senator, he was classed as one of the most decided Anti-Federalists of the administration of Washington. Yet, in 1794 he was appointed Minister to France to succeed Gouverneur Morris, at the same time Jay was sent to England. These were troublesome days for American commerce when the United States endeavored to preserve its strictly

neutral attitude in the death struggle between France and England. Morris had made himself unpopular to the Republican government of France, and undoubtedly one reason for Monroe's appointment was his well-known opposition to England. In other words, Monroe's selection was "forced by the exigencies of the situation." It was hoped that Monroe's well-known French inclinations would harmonize the strained relations between France and the United States. He was instructed to assure France of the firm friendship of the government; the determination of the United States to maintain strict neutrality; to help adjust outstanding disputes between the two lands over spoliations, but to refrain from negotiating a treaty of commerce; and to quiet French suspicions regarding the Jay mission. Monroe was not informed of the wide latitude of Jay's instructions toward negotiating a treaty of commerce with Great Britain. Trouble therefore ensued, due to the fact that Monroe's French sympathies caused him to act indiscreetly on certain occasions; and also to the fact that he was not fully in the confidence of his home government concerning the Jay negotiations. Accordingly, in 1796, he was recalled because the Federalists criticized his republicanism and his failure to appease the French. Nevertheless, he had accomplished almost all the points set forth in his instructions by securing the recall of the French decree injuring American commerce, by protecting the interests of American citizens in France, by securing treaties with Algiers and Spain and by maintaining peace between the United States and France.

On his return to America, Monroe published, in December 1797, a defense of his conduct in a pamphlet of 500 pages entitled "A View of the Conduct of the Executive in the Foreign Affairs of the United States as connected with the Mission to the French Republic during the years 1794-96." The pamphlet was widely circulated and aroused much discussion throughout the nation. In 1799 Monroe was chosen governor of Virginia and occupied this office until 1803, when he was appointed by President Jefferson as Envoy Extraordinary and Minister Plenipotentiary to France to aid the resident Minister, Robert R. Livingston, in obtaining the territory at the mouth of the Mississippi, including the island of New Orleans, as an outlet for the traders of the West, and to cooperate with Charles Pinckney, our Minister at Madrid, for cession of the Floridas. By the secret treaty of San Ildefonso (October 1800), Spain had ceded Louisiana to France, and in 1801 the Spanish intendant had given notice that New Orleans "would no longer be a 'place of deposit.'" This had aroused the inhabitants of the West and had occasioned the appointment of Monroe. However, by the time Monroe had reached Paris, Napoleon had given up his scheme of a colonial empire, and through one of his ministers had offered all of Louisiana to Livingston. On the arrival of Monroe, the two Ministers determined to exceed their instructions and so negotiated the purchase of Louisiana. In the same year he went as Minister to England and while there he met Nicholas Biddle of Philadelphia, who was then touring Europe. A friendship sprang up between the young man and the Minister which continued

throughout their lives and ultimately resulted in Biddle's appointment by President Monroe as one of the directors of the Second Bank of the United States. In 1804 he proceeded to Spain to help Pinckney define the boundaries of Louisiana and acquire the Floridas. Failing to accomplish his purpose, Monroe returned to England where, assisted by William Pinckney of Maryland, a treaty was drawn up (December 1806) between England and the United States. But the treaty failed to provide against the impressment of American seamen and to secure indemnity for American losses, and accordingly Jefferson "pigeon-holed" it. In 1807 Monroe returned from England only to find his conduct the subject of much discussion; this called forth a pamphlet in defense, and for a time caused an estrangement between Monroe and Jefferson. In 1810 he was elected to the Virginia legislature, and in 1811 governor of the State, which office he held from January to November, when he resigned to become Secretary of State under Madison. He held this office until his election as President, during part of the time acting as Secretary of War. In both offices he displayed energy and diligence.

In 1816 Monroe was elected President by the Republican party, receiving 183 electoral votes against 34 for Rufus King, the Federalist candidate. His administration marks the advent of what is erroneously called the "era of good feeling," when political rancor is supposed to have ceased. As a matter of note during his administration the first crisis of the slavery issue took place, resulting in the Missouri Compromise in 1820 and the Seminole Campaign of 1817, laying the foundation for the political strife of the Jacksonian era. In 1820 he was re-elected, receiving all the electoral votes but one, and this was cast by an elector of New Hampshire for J. Q. Adams, in order, it is said, that no one might share with Washington the honor of a unanimous election. The important events of Monroe's two administrations are the Seminole Campaign, 1817-18; the acquisition of Florida, 1819; the Missouri Compromise, 1820; the veto of the Cumberland Road bill on constitutional grounds in 1822, and his celebrated message of 2 Dec. 1823, setting forth the Monroe Doctrine (q.v.). In 1825 Monroe retired to private life and took up his residence in Loudoun County, Va. He took part in the Constitutional Convention in 1829 called to revise the State constitution. In his later years, owing to financial difficulties, he was forced to seek aid from Congress, which body in 1826 authorized the payment of \$30,000 to him, and after his death the purchase of his papers. He died in New York in 1831, and in 1858, the centennial year of his birth, his remains were re-interred with solemn ceremonies at Richmond, Va.

Theodore Roosevelt has characterized Monroe as "a very amiable gentleman, but distinctly one who comes in the category of those whose greatness is thrust upon them." This statement is undoubtedly true. Monroe was not a good speaker, he lacked tact and was often indiscreet, and he often allowed party feelings to get the better of his own judgment. Yet he was highly respected by his associates, and retained their friendship and admiration until his death.

R. C. McGRANE,

*Assistant Professor of History, University of Cincinnati.*

**MONROE, La.,** city, parish-seat of Ouachita Parish, on Ouachita River, and on the Missouri Pacific and the Vicksburg S and P. railroads, Arkansas and Louisiana Midland Railway and L. R. and Monroe Railway, about 155 miles north by west of Baton Rouge and 97 miles east of Shreveport. It has steamer connections with New Orleans and way towns on the bay. It is in an agricultural section in which raising cotton, corn, oats, cattle and hogs and lumbering are the chief industries. There are cotton-seed oil mills, cotton compresses, brick yards, lumber mills and woodenware factories. Pop. 17,500.

**MONROE, Mich.,** city, county-seat of Monroe County, on the Raisin River, and on the Michigan Southern, the Père Marquette, the Michigan Central and the Lake Shore railroads, about 40 miles southwest of Detroit and 85 miles southeast of Lansing, the State capital. Was settled in 1784 by people from Canada, and was first called Frenchtown. In 1815 the name was changed to Monroe in honor of James Monroe (q.v.). It was chartered as a city in 1836. Here took place 22-23 Jan. 1813 the "Battle of Raisin River." (See FRENCH-TOWN, BATTLE OF). The city is in a fertile agricultural region and a trade centre for a large section of the southeastern part of the State. Its principal manufactures are flour, lumber, paper, paint, brick, agricultural implements, stoves, furnace products, furniture and canned goods. The nurseries nearby and the fisheries give employment to a number of people. The chief buildings are the courthouse, opera-house, armory and two orphan asylums, a home for the aged, Saint Mary's Academy, a public library and a convent. It has the mother house of the Sisters of the Immaculate Heart of Mary, a teaching order of sisters who have schools in various parts of the country, and whose pupils number about 10,000. In connection with the convent and academy are a large library and a fine museum. Pop. 6,893.

**MONROE, N. C.,** city, county-seat of Union County, on the Seaboard Air Line Railroad, about 120 miles in direct line southwest of Raleigh. It is in a cotton-growing region, and nearby are gold mines. Municipal enterprise includes waterworks and electric-lighting plant. The chief industrial establishments are cotton mills, cotton gins, lumber mills and iron works, with an active trade in their products, and tobacco. Pop. 4,500.

**JAMES MONROE**  
Fifth President of the United States

**MONROE**, Wis., city and county-seat of Green County, on Chicago, Milwaukee and Saint Paul and Illinois Central railroads, 40 miles south by west of Madison. It is situated in a cheese-making and dairy cattle-breeding region, Green County manufacturing more foreign type of cheese than any other county in the Union. Over 15,000,000 pounds of cheese are shipped annually. Industrially the condensing of milk and manufacturing of carriages, wagons, lumber and foundry products lead. Telephone, gas and electric companies are privately owned and waterworks is operated by municipality. It has excellent public schools and a fine library, which contains 8,000 volumes. In 1859 Monroe was incorporated as a village and chartered as a city in 1882. Pop. 5,200.

**MONROE DOCTRINE, The.** The term "Monroe Doctrine" has been popularly used for a variety of principles intended to explain or to define the policy of the United States toward Latin-American countries. The same words have had very different meanings at different periods of our history, but are now generally used to declare that it is contrary to the interest of the United States that any European powers should establish new settlements or colonies in any part of the Americas, or should exercise preponderant influence in Latin America. The whole subject may best be taken up under the following topics: (1) Conditions of the doctrine from 1775 to 1823. (2) Monroe's Doctrine as stated in his message of 1823 and applied down to 1845. (3) Theories as to Latin America put forward by Presidents and Secretaries of State from 1845 to 1900. (4) The modern doctrine of "the paramount interest" of the United States in American affairs, as developed since 1901. (5) The present status of the doctrine in our relations to European, Asiatic and American powers.

#### I. Conditions of the Doctrine (1775-1823).

— The prime reason for the Monroe Doctrine was the rise of a new kind of nation in the western hemisphere. Down to the American Revolution all the occupied parts of both continents and the Caribbean basin were simply outlying parts of European countries and shared in the religion, institutions, law, foreign policy and wares of their mother countries. They were in the same situation as Africa at the present time, a group of dependencies, incapable of direct influence upon the world at large.

The Revolution, with its theories of the right of every people to choose their own government, resulted in the creation of the first American state. The new United States had no territory, claims or ambitions outside of the continent of North America. During the French Revolution and Napoleonic wars it stood aside as a neutral and insisted on several new principles of neutral rights in trade and citizenship. Europe quickly saw that this example was likely to be followed elsewhere and was not surprised when in 1806 the colonies of Spain and Portugal in the New World began to drop off. In 15 years the process was completed, for by 1821 not a Spanish colony remained loyal except Cuba and Porto Rico; and Brazil was forever lost to Portugal.

These new communities appealed to the example of the United States, imitated its gov-

ernment and expected its friendship. By 1823 there appeared on the map the independent states of Mexico, Colombia, Peru, Chile, La Plata, Haiti, Paraguay and Brazil. In the West Indies and on the north coast of South America small colonies remained to Great Britain, France, Holland, Sweden and Denmark. These, with Canada and the British plantation of Belize, were the only American colonies remaining to Europe. America boasted no longer a single star of liberty, but a brilliant constellation of independent republics.

The people of the United States felt a natural and deep interest in what seemed a repetition of their own experience of breaking away from a mastering European government. They welcomed the liberal trade opened up to them in regions where for centuries Spain had restricted communication. They enjoyed the sensation of being the pioneers and leaders in what they hoped was a world movement in democracy.

The new states at once demanded recognition by their elder sister. In 1822 President Monroe, under powerful pressure from Henry Clay and other statesmen, received authority to recognize the new countries, and soon exchanged ministers with Colombia, Chile, Mexico, Brazil and LaPlata. This step gave the certificate of the American Republic to the new freedom of her neighbors. It committed the United States to the principle that they were self-sustaining, self-governing, genuinely independent and entirely separated from their former European connections. They were too confidently accepted as equal sister states, a part of a free America.

**II. Monroe's Original Doctrine (1823-1826).**— This feeling of confidence in the continuance of the new governments received a severe shock when the combination of central European powers, commonly called the Holy Alliance (q.v.), after crushing several attempts at liberal government in Europe, turned its attention to Spain and to the Spanish colonies. A French army, with the mandate of the Holy Alliance, in 1823 overran Spain and restored the royal despot to power. The Bourbon monarch naturally asked for the application to these revolted colonies of this principle of supporting the legitimate sovereign. Metternich, the grand master of the Alliance, thought well of the idea, and it was discussed at the Congress of Verona of 1822. The United States feared that France would undertake this commission also, and would claim Cuba as the price of the service to Spain, thereby securing a broader foothold in America and gaining a rich island almost overlooking the American coast. The tension was increased by the attitude of Russia on the northwest Pacific Coast, where the tsar claimed exclusive ownership of the mainland and islands as far south as the 51st parallel by an imperial ukase dated 4 Sept. 1821. The Russians also asserted the right to keep the vessels of other powers out of the north Pacific Ocean.

The United States was thus pressed in two directions by what looked like an attempt of several European powers to come in and occupy the territories wrested from Spain and the unsettled part of North America. For many years the government had been practising the

"Policy of Isolation," which was early laid down by Washington, Hamilton, Jefferson, John Adams and other statesmen. Its purport was that the United States had no share in European political combinations, was not a party to European wars and would pursue the policy of developing itself as an American state. From this policy it was an easy transition to the complementary doctrine that European powers ought not to interfere in American affairs.

The time seemed to have come in 1823 for some sort of action that would head off the threatened invasion of Latin America by third parties in behalf of Spain. Something was also needed to check the Russian advance into North America; and the opportunity was convenient for expressing the undying love of Americans for the popular government that they had chosen. At this moment George Canning, Foreign Minister of Great Britain, stepped into the controversy. England was interested in unrestricted trade with the Spanish-American countries and was extremely opposed to the constricting policy of the Holy Alliance, both in Europe and America. Hence, in August and September 1823, Canning four times proposed to Richard Rush, our Minister in London, that the United States join England in a declaration against intervention, and Monroe was inclined to accept the proposal. After long Cabinet discussions John Quincy Adams, Secretary of State, convinced the President that it would be better to make an independent declaration. Adams' papers show that he not only suggested but formulated most of the important presidential message of 2 Dec. 1823, several passages in which, construed together, constitute the original and genuine Monroe Doctrine.

The principal points in this declaration, which is the original form of the Monroe Doctrine, are substantially as follows: (1) *The two spheres.* The whole statement is based upon the theory that there were two natural spheres of world influence, separated by a meridian drawn through the Atlantic Ocean; and that the European and the American regions had two different sets of political and commercial interests. Since the United States took no part in the affairs of the European sphere it was common sense that European powers should keep out of American affairs.

(2) *Intervention.* The message assumed that the Latin-American states were permanently independent and capable of conducting civilized governments; and it explicitly and strongly protested against "any interposition for the purpose of oppressing them, or controlling in any other manner their destiny, by any European power." (3) *Colonization.* "The American continents, by the free and independent condition which they have assumed and maintain, are henceforth not to be considered as subjects for future colonization by any European powers." This was directed against Russia but had a general bearing and has often been cited as applying to all European powers.

(4) *Political system.* Monroe held that it would be hostile and dangerous to the United States if "the allied powers should extend their political system to any portion of either continent." This clause plainly refers to the mutual assistance given by members of the Holy Alliance; but history shows that Adams and

Monroe both meant to protest against the principles of absolutism in government—and were replying to a reference to the European "political system" in a recent Russian state paper.

(5) *Protection of the United States.* The fundamental reason for setting forth the principles just stated was not America's interest in the Latin Americans but in the United States. Many statesmen then felt an apprehension that, after having subdued the Latin Americans in the South, the Holy Alliance might move its forces northward. (6) *Geographical extent.* The doctrine in terms excepts from its application the then existing European colonies, which meant Canada, Cuba, Porto Rico, the English and French West India islands and the three South American plantations. From that day to about the time of the Spanish War of 1898 there was little objection to the continuance of the old colonies. (7) *Peace.* Clearly the Monroe Doctrine was intended to keep the peace—to prevent wars from breaking out in other parts of America and to avoid dangers to our own republic. In that respect the doctrine has been an eminent success. With the exception of the French invasion of Mexico in 1861, no serious or devastating wars have taken place between Latin-American and European countries.

The original Monroe Doctrine was at once effective. Canning was so much interested in the result that he claimed it for himself and said (21 Dec. 1826): "I looked another way . . . I sought for compensation in another hemisphere. . . . I called the new world into existence to redress the balance of the old." In reality it was John Quincy Adams who struck out the policy and clothed it in a set of appropriate phrases for his country. European intervention was abandoned; but when our Latin-American neighbors asked for a more distinct promise of military protection, at the Panama Congress of 1826, the United States took the ground that our neighbors must protect themselves in case of a fight with European powers; that the Monroe Doctrine was only a pledge by the United States to itself.

III. *Enunciations (1845-1900).*—In the 75 years from 1826 to 1900 a variety of official statements were made on Latin America by Presidents, Secretaries of State and other statesmen; and from time to time new questions were raised as to the application of the Monroe Doctrine to new circumstances. Out of these may be selected the following, as the principle attempts to state and apply the doctrine. (1) Van Buren, Webster and other statesmen, from 1829 to 1843, gave public notice that the United States would not permit the transfer of Cuba to any other European power; an extension of the doctrine to prevent the transfer of colonies from one European power to another. (2) President Polk in 1845 and 1848 favored the annexation of parts of America which might be in danger of European dominion. This statement was backed up by the Mexican War, as a practical demonstration that the United States was not bound by the Monroe Doctrine to refrain from enlarging her territory at the expense of Latin-American states. (3) In the disputes over the Clayton-Bulwer Treaty in the fifties, the principle of the Monroe Doctrine was invoked against the British colony in Honduras, on the ground that it was an exten-

sion of European influence. (4) Secretary Seward, undoubtedly in accord with President Lincoln, from 1861 to 1865 warned the French not to force a foreign empire upon unwilling Mexicans, and in 1865 Seward gave formal notice that the French must leave Mexico, which was backed up by a display of military force on the border. Though Seward avoided the term Monroe Doctrine, he applied its principles very effectively. (5) President Grant in 1869 repeated Polk's warning by announcing that no territory in America could be transferred to any European power, whether the inhabitants were willing or unwilling. (6) Secretary Fish in 1870 proposed that the United States should take the lead in a general political and commercial policy for the republics of America. This is the first distinct statement of a policy of leadership by the United States, which had undeniably been in the mind of John Quincy Adams. (7) Secretary Evarts in 1880 was the first American statesman to see the relation of the Isthmus Canal to the Monroe Doctrine. He claimed "paramount interest" for the United States in any land or water communication across the American isthmus. President Hayes added the significant declaration that any inter-oceanic canal would be "virtually a part of the coast line of the United States." (8) Secretary Blaine in 1881 made the position of the United States more precise by stating that for any European power to share in the construction and control of the canal would be an introduction of the European political system. (9) Secretary Blaine drafted for the Panama Congress of 1889 the statement that the "principle of conquest" should not be considered as admissible under American public law. This was intended to apply to the wars between Latin-American powers, and also to foreign invasion. (10) Secretary Olney in 1895 went to the farthest point in a protest addressed to Great Britain, in relation to a boundary dispute between that power and Venezuela. He stated that the Monroe Doctrine "has been the accepted public law in this country ever since its promulgation"; he thought "any permanent political union between an European and an American state unnatural and inexpedient"; he asserted that "to-day the United States is practically sovereign on this continent and its fiat is law upon the subjects to which it confines its interposition." President Cleveland restated the same principle in the words "The Monroe Doctrine finds its recognition in those principles of international law which are based upon the theory that every nation shall have its rights protected and its just claims enforced."

This series of utterances, along with others of a similar tenor, clearly show a steady growth of responsibility and authority in American affairs. The Panama Canal brought out many rival interests between the United States and European powers, and the State Department at Washington insisted that it was for this government and no other to decide where, how and when the canal should be constructed. Secretary Olney and President Cleveland pushed the doctrine far beyond any previous statement. Their doctrine was certainly not the original Monroe Doctrine, for it really laid down the new principle that Great Britain, which for nearly three centuries had been one of the lead-

ing American powers, was no longer to exercise influence on Central and South America. Olney's farther expressions, if carried to their logical outcome, would justify the United States in doing anything and taking anything in North or South America that seemed desirable, under penalty of the hostilities at which President Cleveland distinctly hinted.

IV. Modern Doctrines (1901-19).—So far as the relation of Great Britain to American affairs was concerned the Olney Doctrine was successful, for Great Britain took the lesson to heart, accepted the arbitration with Venezuela which was thrust upon her, cheerfully accepted the finding of the arbitrators (which were almost entirely in her favor) and prepared to give up that joint control of the Canal which was embodied in the Clayton-Bulwer Treaty of 1850. During the Spanish War of 1898, Great Britain made it clear that other European powers must not interfere with the American policy of the United States. The next step was for Great Britain in the first Hay-Pauncefote Treaty of 1900 freely and without consideration to give up the joint control over isthmus transit. The Senate insisted that there should be a formal abrogation of the Clayton-Bulwer Treaty and Great Britain gave way and accepted the second Hay-Pauncefote Treaty of 1901, by which the United States was left free to control any isthmus canal that might be constructed and to "neutralize" it in her own way.

When England was fairly out of the way, Germany loomed up on the horizon. That power for some years had been looking about the world for an opportunity to plant colonies, and was supposed to have a special interest in South America. President Roosevelt took up this question and in 1902 faced the issue of intervention by European powers in Venezuela. This was one of the Latin-American states which objected to foreigners coming in and occupying a privileged status superior to that of natives, by calling on their home governments to press claims for the fulfilment of contract and for damages for personal injuries.

A combination was made between Germany, Great Britain and Italy which prepared to land forces on the Venezuelan coast and hold part of the country till the claims of the subjects of those countries were satisfied. The great Brazilian jurist, Calvo, had laid down what was known as the Calvo Doctrine, to the effect that foreign governments ought not to use even diplomatic methods in behalf of private claims. Drago, Foreign Minister of the Argentine Republic, during the Venezuelan crisis proposed a modification, commonly called the Drago Doctrine (q.v.), which was to the effect that no intervention ought to be allowed to enforce the obligation of contracts, whether made by individuals or by the government. This principle was accepted by President Roosevelt as reasonable and was afterward incorporated into The Hague Conventions of 1907.

When it came to the actual dispatch of the fleets, President Roosevelt demanded from the German government a point blank statement that they would not land or occupy Venezuelan territory. The promise was reluctantly given and was kept. The squadron therefore contented itself with blockades and captures of vessels on the coast and mild bombardments.

The Venezuelans finally agreed to arbitrate and the fleets were withdrawn.

The episode led the mind of President Roosevelt to consider what ought to be done in cases where Latin-American countries went beyond the negative refusal to execute contracts and advanced to attacks on the persons, property or diplomatic representatives of a foreign country. He, therefore, in various public speeches and messages declared that the Monroe Doctrine was intended to be one of peace, and that to keep the peace the United States might be forced in flagrant cases "to the exercise of an international police power." This is the so-called "policy of the Big Stick," and President Roosevelt and his successors proceeded to apply it in various cases.

(1) In 1902, Cuba which had been released from Spain by the Spanish War, was obliged to consent to the Platt Amendment, to the effect that the nominally independent state must not incur any obligations to foreign countries which would interfere with the interests of the United States. This virtually made Cuba a protectorate of the United States. (2) In 1903 the infant republic of Panama ceded the canal strip to the United States and entered into a treaty which left it also a dependency. (3) In 1905 President Roosevelt made an agreement with the government of the Dominican Republic to administer its customs, setting apart a portion of the proceeds for the public debt service. Santo Domingo thus ceased to be a really independent country. (4) In 1911 President Taft made a similar arrangement with Nicaragua. (5) In 1915 Haiti entered into a financial arrangement which virtually placed it under United States control and provided for an American receivership of customs.

In every instance the reason for this assumption or acceptance of authority over Latin-American republics was based upon the belief that otherwise some foreign country would come in and interfere with American interests and threaten the future of the country affected. That is, the United States acquired six protectorates lest some European power might have cause to descend upon them by armed force. A supposed attempt of Japan in 1912 to secure a footing at Magdalena Bay on the west coast of Mexico led to the adoption by the Senate of a resolution introduced by Senator Lodge against such occupation for naval or military purposes. Ex-Secretary Root in 1914 attempted to show that the Monroe Doctrine did not require the United States to exercise a domination over its neighbors. President Wilson also in public statements and addresses in 1913 disclaimed any ambition of the United States to extend its territory in America. The only way to reconcile these statements with the facts of our protectorates is to admit that the Monroe Doctrine is a check to the territorial greed of European powers but does not restrain the United States from bringing portions of Latin America under her influence.

**V. Present Status.**—The war of 1898, including the annexation of the Philippine Islands by the United States, was a frank admission that there were no longer two spheres in modern world politics. Eastern Asia is honeycombed with European settlements and interests, and the occupation by the United States, of the Philippine Islands, near China,

makes us near neighbors of Russia, France and Great Britain. On the other side, at the conference of Algeciras in 1906, the United States accepted membership on the pressing invitation of the German emperor and had the determining voice in the result. It was therefore, no longer possible for our government to insist that European powers must keep out of America because we keep out of European affairs. The Japanese have been thought to have some designs on the western coast of North or South America which would be contrary to the Monroe Doctrine. At the other extreme was the danger, which for a time was feared, of German occupation of a part of Brazil or other South American countries. Should either danger ever occur the Monroe Doctrine would presumably become active.

As respects the Latin Americans themselves, they have always welcomed whatever protection the declarations and influence of their powerful neighbor might give against foreign aggression; but many of them fear that the United States will eventually seek extensive annexations to the southward. The taking over of the six protectorates and the great interest of the United States in the Mexican question heighten that apprehension. The growth and steadiness of the ABC powers—Argentina, Brazil and Chile,—with about half the total Latin-American population, give a more positive basis for permanent alliances and relations. It has been suggested that the Monroe Doctrine will naturally develop into some kind of Pan-American Union (q.v.) in which the United States will be the most populous and strongest member of a great American federation. The difficulties in the way of a permanent union between a country of 100,000,000 and 20 other countries which together aggregate 75,000,000 are hard to surmount.

The question of the right of a nation to exercise special authority over its neighborhood was raised in another form by the steady growth of Japanese power in Eastern Asia. On 30 Nov. 1908, by the Root-Takahira agreement, the United States recognized this special interest; and in November 1917, in the Lansing-Ishii agreement, went still farther in approving practically the doctrine of special interest, it being tacitly understood that Japan would in like manner respect the American Monroe Doctrine.

The negotiations of 1919 at the end of the Great War seemed for a time likely to weaken the Monroe Doctrine by substituting a system of world peace organization which would take the place of the earlier method, inasmuch as the League of Peace provided a machinery for hearing complaints and settling controversies such as were likely to arise between Latin American and European powers. A strong protest was made in public discussions on the subject in the United States. In the final form the covenant of the League of Nations included the following limitation: "The covenant does not affect the validity of international engagements, such as treaties of arbitration or regional understandings like the Monroe Doctrine, for securing the maintenance of peace."

This clause would seem to be a guarantee of the special relation of the United States to Latin America; and so far as ratified by those States would bind them to accept the doctrine

as a "regional understanding." It is likewise a reaffirmation of the Japanese Monroe Doctrine, and is likely to be claimed in support of spheres of interest in the Mediterranean, Asia and Africa. Acceptance of the treaty by most world nations is therefore an assertion of the right of powerful nations in various parts of the earth to exercise a general protection over groups of small or weak powers, and at the same time to exclude external powers from interfering with the leadership of the strongest power in such a combination.

ALBERT BUSHNELL HART,

Professor of Government, Harvard University.

**MONROVIA**, Cal., town in Los Angeles County, on the Atchison, Topeka and Santa Fe Railroad, about 19 miles east of the city of Los Angeles and 10 miles east by south of Pasadena. It has a healthful climate and a beautiful situation near the southern border of the San Gabriel National Forest. It has extensive fruit-growing interests and is a thriving progressive town with modern improvements. Pop. 1,600.

**MONROVIA**, mün-ró'vi-á, Liberia, the capital of the West African Republic, a commercial and seaport town, on Cape Mesurado near the mouth of the Saint Paul's River. It has regular steamship service by British and Spanish vessels, direct cable communication with Europe and New York, and two wireless stations. It exports rubber, palm kernels and oil, pissara fibre, cocoa, coffee, ivory, ginger, camwood and annatto. A college is maintained by the government and one by Methodists; missions are carried on by Catholics and American Protestants, and the city is the see of a Protestant Episcopal bishop. Monrovia was named after James Monroe, President of the United States. Pop. (with Krutown) 6,000.

**MONS**, môns, Belgium, the capital of Hainault, on the Trouille, 38 miles by rail southwest of Brussels. An encircling belt of promenades occupies the site of the fortified ramparts demolished in 1862. The Canal de Condé connects Mons with the Scheldt. The church of Saint Waldru (1450-1589) is a masterpiece of Gothic; and there are a town-hall (1458), a belfry (1662) 275 feet high, a good

library, etc. The manufactures include woolen and cotton goods, cutlery, hardware and sugar; while in the vicinity is the extensive coal field of Borinage. Mons, occupying the site of one of Cæsar's camps, was made the capital of Hainault by Charlemagne in 804. France, Spain and Austria often contended for its possession. The battlefields of Malplaquet and Jemappes are in the neighborhood. In 1914 Mons was captured by the Germans in their advance on Paris, and around Mons some of the severest fighting occurred during the progress of the war. See WAR, EUROPEAN. Pop. about 28,000.

**MONS.** See MENSA.

**MONSEIGNEUR**, môn-sā-nyèr (French my lord), a title of dignity in France. Before the Revolution the king's oldest brother was styled *monseigneur*. Princes, dukes and peers, archbishops, bishops, cardinals, marshals of France, presidents of Parliament, etc., were addressed by this title.

**MONSELL**, mün'sèl, James Samuel Bewley, Anglican clergyman and hymn-writer: b. Londonderry, Ireland, 2 March 1811; d. Guilford, England, 9 April 1875. He was graduated at Trinity College, Dublin, in 1832, and took orders in the Church of England in 1835. As a writer of hymns he became famous, over 100 of his hymns still continuing in popular use. Among his publications are 'Parish Musings'; 'Simon the Cyrenian and Other Poems'; 'Spiritual Songs'; 'Our New Vicar' (1867; 13th ed., 1890).

**MONSIGNORE**, môn-sè-nyô'rè, a title of honor given to prelates of the Roman Catholic Church. Prior to the Revolution in France the corresponding title of Monseigneur was allowed to all high dignitaries of the Church, but its use was forbidden in 1801 by a law of the French Convention.

**MONSIGNY**, môn-sè'nyè, Pierre Alexandre, French composer: b. Fauquemberg, 17 Oct. 1729; d. Paris, 14 Jan. 1817. He went at an early age to Paris and was appointed, under the influence of the Duke of Orleans, majordomo. He studied counterpoint under Gianotti and composed a series of comic operas which were highly successful, to be followed, with equal success, by grand opera plays. But the Revolution, having robbed him of his position and his fortune, he lived his later days on a pension from the Opera Comique, becoming (1815) a member of the Academy. Among his most popular operas were 'Les aveux indiscrets' (1759); 'Le cadu dupe' (1760); 'Le roi et le fermier' (1762); 'Le déserteur' (1769), his most prized work; and 'Le Faucon' (1772), which was very popular. Consult Pougin, A., 'Monsigny et son temps' (Paris 1908).

**MONSON**, mün'sôn, Sir Edmund John, British diplomat: b. Chart Lodge, Kent, 6 Oct. 1834; d. 29 Oct. 1909. He was educated at Eton and Balliol College, Oxford; was Fellow of All Souls, Oxford, 1858; had entered diplomacy in 1856; held various minor posts, as attaché or under-secretary, until 1876, when he was sent on special service to Dalmatia and Montenegro. He was Minister to Uruguay (1879), to Argentina and Paraguay (1884), to Denmark (1884), to Greece (1888), was appointed arbitrator of the Butterfield claims be-

tween Denmark and the United States in 1888, Minister to Belgium 1892, Ambassador to Austria 1893, and to the French Republic 1896-1904. He was made a Privy Councillor in 1893. His decision in 1900, in favor of the action of the Danish authorities in 1854-55 at the island of Saint Thomas, disposed of the claims of the two American vessels belonging to Butterfield and Company. In 1903 he received the order of the G.C.V., and was knighted in 1905.

**MONSOONS**, *môn-soonz'*, in meteorology, are certain winds, operative from the tropic of Cancer to lat. 7° S., and from the coast of Africa through the Indian Ocean and the Bay of Bengal to Japan and the western Pacific. There are two monsoons, the southwestern and the northeastern. The latter prevails from October to April, and the former from April to October. Monsoons are caused by the unequal heating of the land and water and of the several land masses themselves in the regions which they affect. Independently of their great use in bringing rain to countries which otherwise would degenerate into deserts, they are useful for navigation. As in the case of the trade winds, navigators of sailing vessels plan their voyages to take advantage of the monsoons. Consult Ferrel, W., 'A Treatise on the Winds' (New York 1889).

**MONSTERS.** See TERATOLOGY.

**MONSTRANCE** (Lat., *monstrare*, to show), called also *ostensorium* or *expositorium*, the sacred vessel in which, in the Roman Catholic Church, the host is shown to the people, through a glass-covered opening, at benedictions, processions and other solemnities. Its use dates from the institution of Corpus Christi Day (1264) by Pope Urban IV. It was not until after the Council of Cologne 1452 that the consecrated wafer was exhibited to the people, having been previously deposited in the ciborium which enclosed and concealed it.

**MONSTROSITY.** In anatomy and physiology any deviation in form or function so great as to be noticeable may be termed a monstrosity by the extension of the term. But it is customary to consider as true monstrosities only such deviations from the normal as are excessive. Supernumerary fingers, toes, legs, arms, etc., or the absence of any or all of them from birth are not called true monstrosities. Deviations from the normal in form or function are almost limitless, the study of them being otherwise known as teratology. The subject of human teratology has been systematized by Saint Hilaire and slightly modified by Hirst and Piersol and is as follows: (1) Hemiterata are all abnormal developments which are not true monstrosities, lacking the element of excess, with the exception of excess in numbers referred to. They include, however, anomalies in size such as dwarfs and giants, anomalies in form of head, pelvis, etc., of color such as albinism or melanism, of position, including curvature of the spine, hernia, clubfoot, etc., of continuity, including imperforate esophagus, rectum or vagina. (2) Heterotaxes, which include the anomalous position of heart, liver, etc. (3) Hermaphrodites, which according to the definition of Ahlfeld are those individuals which possess sexual glands both masculine and feminine, but show all possible variations

of one sex organ upon the other. (4) True monsters, where there are either more or less than the normal number of legs, arms or there are no heads or rudimentary heads or two or more. This group also contains what are called omphalositic monsters which are embryos attached to an original foetus and depending on it for what nourishment and development they can get. The best-known type of monsters, those which have been frequently exhibited, are the composite monsters of which the Siamese Twins and the Tocci Brothers are examples. Other illustrations are of children with two bodies joined together at the pelvis but having no legs, and the bodies pointing in opposite directions. There are also terata with two heads and two faces or with one head and two faces like the ancient conception of the god Janus.

It is almost impossible to imagine any deviation in form, function or size which has not been recorded, since the curiosity of mankind has been such as to be attracted from time immemorial to anything in the nature of the marvelous. The composite monsters on record have shown almost all varieties of union of lower extremities and of reduplication of both lower and upper; and of the partial or total reduplication of the entire body, the climax being reached in the twins which are united by only a comparatively small cartilage. Double monsters are either parasitic or independently nurtured as was the case of the Siamese Twins, who lived to the age of 63 years. There are also known triple monsters, one case being recorded by Saint Hilaire of a three-headed child who was born in Italy in 1832.

The very unpleasant side of anatomic teratology has its more cheerful compensation in the records of extraordinary developments in vitality and fecundity and in the recovery of many persons who have suffered accidents or other misfortunes ordinarily found fatal, or who have shown remarkable abilities of adaptation to apparently impossible conditions. For not only do we see the monstrosities of fatness and leanness, the people with elastic skin, the bearded women, etc., but there have been recorded a large number of cases of extraordinary ability to function in spite of adverse circumstances. Examples of teratology of function are seen in suspended animation, a case being recorded of a man who could, apparently at will, cause his heart to stop beating. He succeeded once in prolonging this inactivity of the heart for about 30 minutes. The function appeared to be restored automatically. A post mortem examination of his heart showed nothing extraordinary. Other illustrations of purely physiological wonders without, however, showing any other abnormality are seen in very high temperature. One case is on record of a man whose temperature ran up to 148° and was between 120° and 125° for five days in succession.

Among anomalies of excess in function are to be included also mental prodigies such as extraordinary memory and other mental functions of which one of the most remarkable was Jacques Inaudi born in 1869 in Piedmont. He had an extraordinary mathematical ability which enabled him to perform mentally operations with numbers in the billions and trillions.

He had no other unusual ability. Many prominent men such as Edmund Burke, John Locke, Pascal, Leibnitz and Euler were noted for super-normal memory. Another mathematical prodigy was a man named Rube Fields of Johnson County, Mo., who added columns of figures as rapidly as they were read to him, and performed incredibly enormous operations in multiplication. He was an uncultivated boorish man with no other mental ability worth mentioning.

These facts are of importance from the point of view that the average individual probably possesses powers of endurance, toleration of disease and of mental development far above that which the ordinary person acquires, and that the mine of human abilities has up to the present age not merely not been worked but has probably not even been more than sampled. What may be the cause of this relatively undeveloped mentality in men in general is suggested by the recent investigations into the unconscious mental activity.

**MONT BLANC**, mōn blōn (white mountain), France, a mountain, the loftiest of Europe, belonging to the Pennine chain of the Alps, and rising 15,781 feet above sea-level, the main portion and the highest summit being in France (Haute Savoie), seven miles south of the Switzerland frontier. It forms a huge mass stretching northeast and southwest, in which direction the boundary line between France and Italy runs along it. Its northeastern extremity enters Switzerland. In this latitude the snow line is at 8,000 feet; consequently 7,700 feet of the mountain are within the region of perpetual snow and ice. Its shape, when seen on the north or south, is pyramidal. On the southeast it presents an immense wall-face, on which few glaciers can be formed. These, of which 18 in all are counted, are chiefly on the northwest slope, where the glaciers Des Bossons, Bois, Talèfre and Mer de Glace are seen. The mass of the mountain consists almost entirely of granite. In 1760 the scientist, Saussure, offered a prize for the discovery of a practicable passage to the summit, which was reached by Jacques Balmat, a guide, June 1786. The "Grande Ascente" in the 19th century became an ordinary tourist excursion, regularly made every season by great numbers and is now facilitated by the railway built up to a short distance from the summit by French engineers. In 1893 an observatory was erected on the summit of the mountain by Pierre Janssen.

**MONT CENIS**, mōn sē-nē, or **MONTE CENISIO**. See **CENIS**, **MONT**.

**MONT CERVIN**, mōn sēr-vān. See **CERVIN**, **MONT**.

**MONT PELÉE**, mōn pā-lā. See **PELÉE**, **MONT**.

**MONT-DE-PIÉTÉ**, mōn-dē-pē-ā-tā (in Italian *Monte di Pietà*), an authorized licensed or government pawnshop; a bank of charity which lends money on pledges at a low rate of interest, and whose aim is purely philanthropic. The chief customers of such institutions, which are found in France, Italy, Germany and other Continental countries, are workmen pressed by a temporary failure of employment; small tradesmen without a bank account; or travelers in a large town whom some acci-

dent has subjected to a momentary strait; to all of whom it is a matter of necessity to conceal any compromise of their position in procuring money for present necessities. These institutions were established to prevent the scandal and abuse of usury. They date their origin from the Middle Ages, when the loan of money on pledges was almost exclusively in the hands of the Jews. They originated in Italy about 1450, and not long after were approved by several papal bulls. Several French and Italian cities possessed monts-de-piété in the latter half of the 15th century, among others, Mantua, Parma, Milan, Rome, Padua, Trèves, Boulogne, etc. The French monts-de-piété, with the exception of those of Montpellier, Toulouse, Grenoble and Angers, which lend without interest, exact interest at the rate of from 4 to 12 per cent. The chief mont-de-piété in France is that of Paris, which transacts a greater amount of business than all the rest together. In the United States and Great Britain pawnbrokers take the place of monts-de-piété, which were introduced in the beginning of the 18th century, but failed. See also **GOVERNMENT PAWNSHOPS IN FRANCE**; **PAWNBROKERS**.

**MONT-SAINT-MICHEL**, mōn-sān-mē-shēl, France, a famous seat of learning and pilgrimage resort of Normandy as early as the 12th century, now an equally celebrated tourist resort. It consists of a collection of mediæval houses, hostelries, ecclesiastical buildings, and fortifications, grouped on a conical rock in the Bay of Cancale or Saint Michel, at the mouth of the Couesnon River, here forming the boundary between Normandy and Brittany, 15 miles southeast of Granville. Anciently a lofty hill in the forest of Scissy which was submerged in the 7th century by a tidal cataclysm, the rock in prehistoric times was crowned by a Celtic temple; it was the Roman *Mons Tumba*, and the "*mons in periculo maris*"—the mount in danger of the sea—of the monastic chroniclers. The Bay of Saint Michel, 15 miles wide at its mouth, and 8 miles long from north to south, is nearly dry at low water, but fills with treacherous rapidity at flood tide. In 1830 a dyke nearly a mile long was completed which connects the Mont with the mainland. Ramparts, towers and bastions of the 16th century encircle the base of the rock which has a circuit of about two miles, and the entrance is through a gate which opens on the single, narrow, winding street of a small village (pop. 250) built around the southern slope and leading by several flights of stone steps to the fortified abbey on the summit. Crowning the abbey is a superb 15th century Gothic basilica, a fine statue of the Archangel Michael capping the spire, which towers conspicuously 250 feet above the wide expanse of sandy bay and low-lying country around. Saint Aubert, bishop of Avranches, founded the abbey in 709 and his first chapel, restored, is on a rocky projection on the north side of the Mont. In 1203 the abbey was destroyed by Philip Augustus, and the present buildings date from that period. It was an important fortified post during the English and religious wars and was successfully defended against all assaults by the Knights of the Order of Saint Michael. At the Revolution it was converted into a prison for political offenders, and now ranks as one of the protected

historical monuments of France. An elaborate process of restoration since 1863 has renewed its ancient strength and beauty. Among the chief features of the Mont are the abbey church, elaborately decorated cloisters, La Merveille, "the marvel," or massive north wall of the abbey, the Salle des Chevaliers, the Châtelet or guardhouse, the crypts with their remarkable columns, the cellars, the dungeons, the mediæval elevator with its enormous hoisting wheel formerly operated by a donkey, etc.; and in the village the ancient parish church, a museum, the famous *Porte du Roi* and Duguesclin's Tower.

**MONTAGNA, Bartolommeo**, bār-tō-lōm-mā'ō mōn-tān-yā, Italian painter: b. Orzinovi, near Brescia, about 1450; d. Vicenza, 11 Oct. 1523. He settled at Vicenza in 1480, was influenced by Bellini, Carpaccio and Andrea Mantegna, worked in Padua and Verona, and from 1496 until his death was again in Vicenza, being the first great master resident there. His work in general resembles the earlier Venetian school, is serious, marked by distinctness, power and severity of drawing, and has harmonious coloring in which a brown gleaming tint is noticeable. The human form is almost always shown as over-muscular. His principal works are the 'Madonna and Child' at the Venice Academy, 'Ecce Homo' at the Louvre, frescoes in the church of San Nazaro at Verona and an altar piece in the Brera, Milan. In the Johnson collection at Philadelphia he is represented by a 'Madonna with Saints' and in the New York Metropolitan Museum by 'A Lady of Rank as Santa Bibiana' and a 'Madonna and Child.'

**MONTAGNAIS** (mōn-tān-yā) INDIANS, a general name applied to several American Indian tribes. One of these, of the Athapascan family in British North America, were Christianized by Roman Catholic missionaries. Another and best-known tribe of this name was of the Algonquian family, and resided along the shores of the Saint Lawrence River. They have practically disappeared in recent years.

**MONTAGNARDS**, mōn-tān-yār (Fr. mountaineers), a popular name in French history, applied in 1793 to the radical democratic party, the leaders in the French Revolution and its excesses. Soon after the fall of Robespierre the denominations of "Montagnard" and "Montagne" gradually disappeared from party nomenclature. After the Revolution of 1848 an abortive attempt was made by the extreme party in the National Assembly, under Louis Blanc and Rollin, to revive the title.

**MONTAGU, mōn'tā-gū, Andrew Jackson**, American lawyer and statesman: b. Campbell County, Va., 3 Oct. 1862. He was graduated at Richmond College in 1882 and studied law, taking the degree of LL.B. at the University of Virginia, 1885. He was admitted to the bar and began the practice of law in 1885; from 1894 to 1898 he was United States district attorney for the western district of Virginia, and in 1898-1902 attorney-general of the State. In 1902 he was elected governor of Virginia for a term of four years. He became one of the foremost advocates of direct primaries to prevent party machine rule. He was also active in the movement for improved popular educa-

tion in the South, and gave many public addresses throughout the State, advocating the increase of educational facilities for all without regard to race or creed. In 1903 he received the degree of LL.D. from Brown University. From 1906 to 1909 he was dean of the Law School of Richmond College, and member of the 63d and 64th Congresses, 1913 to 1917, serving as delegate on various international conferences.

**MONTAGU, Edwin Samuel**, British statesman: b. 1879. He became Under-Secretary of State for India under Lord Morley in 1910, and his first budget speech a few months later in the House of Commons created a highly favorable impression. He entered the Cabinet as Chancellor of the Duchy early in 1915. He was Minister of Munitions in the first Coalition Government but retired with Mr. Asquith on the accession of Mr. Lloyd George. When Mr. A. Chamberlain resigned the Indian secretaryship in the summer of 1917, Mr. Montagu was chosen for the post. He proceeded to India to investigate the political situation of the country in association with the viceroy, with a view to the gradual development of self-government for India. In July 1918 their joint report on Indian constitutional reforms was issued. In the new Lloyd George Cabinet of January 1919 Mr. Montagu was reinstated Secretary for India with a native under-secretary in the House of Lords, Sir S. P. Sinha (q.v.).

**MONTAGU, Elizabeth Robinson**, English author and society leader: b. York, 2 Oct. 1720; d. London, 25 Aug. 1800. In 1742 she married Edward Montagu, grandson of the first Earl of Sandwich, who died leaving her a fortune. To wealth she added literary accomplishments, and these, joined to other personal qualities, enabled her to secure her social leadership. Among her visitors and associates were Lord Lyttelton, Samuel Johnson, Horace Walpole, Burke, Sir Joshua Reynolds, Garrick, Hannah More and other celebrated persons. To the gatherings at her house the term *bluestocking* (q.v.) is said to have been first applied. Three of the dialogues in Lord Lyttelton's 'Dialogues of the Dead' were written by her in 1760. She also wrote an 'Essay on the Writings and Genius of Shakespeare, compared with the Greek and French Dramatic Poets' (1769). Much of her correspondence was published (1809-13). Consult the 'Memoirs' of Elizabeth Carter (London 1816); Doran, 'A Lady of the Last Century' (London 1873); 'Elizabeth Montagu, the Queen of the Bluestockings; Her Correspondence from 1720-1761' (2 vols., New York 1906); Huchon, R., 'Mrs. Montagu and her Friends' (New York 1907).

**MONTAGU, Lady Mary Wortley**, English author: b. 1689; d. 21 Aug. 1762. She was the eldest daughter of Evelyn Pierrepont, afterward Duke of Kingston. She learned Latin very early, and also became versed in English literature, especially its romance and drama. The Kit-Cat Club (q.v.) by acclamation admitted her to membership. In 1712, without the consent of her father, she married Edward Wortley Montagu, a wealthy Whig scholar, with whom the former had quarreled. On the accession of George I in 1714 Montagu ob-

tained an official position in London, and Lady Mary came out from the seclusion in which she had lived. Her beauty, wit and vivacity gained her admiration and influence, and she became familiarly acquainted with Addison, Congreve, Pope and other distinguished writers. In 1716 her husband was appointed Ambassador to Turkey, and Lady Mary accompanied him to Constantinople, where they remained from January 1717 to May 1718. During this period her famous 'Turkish Letters' were written. On her return to England she re-entered the world of wit and fashion. She had a quarrel with Pope, and a long and keen literary war ensued, which did honor to neither. In 1739, for reasons never satisfactorily explained, she left England to live on the Continent. This she did with the full concurrence of her husband. She lived chiefly in Italy until her husband's death in 1761, and soon after her return to England she herself died. Her letters are marked by great sprightliness, combined with graphic power and keen observation, and with independence of judgment. Lady Mary has another claim to remembrance in her courageous adoption for her own children of the Turkish practice of inoculation (q.v.) for small-pox, and for her energy in promoting its introduction into England in the face of violent prejudice. Consult her 'Works,' edited by Lord Wharncliffe, her great-grandson (1837; latest ed., 1893); and Symonds, E. M., 'Lady M. W. Montagu and her Times' (New York 1907).

**MONTAGUE, Francis Charles**, English historian: b. London, 31 Aug. 1858. He was educated at University College, London, and graduated (M.A.) at Balliol College, Oxford, became (1881) Fellow of Oriel and was called to the bar in 1884. He has been, since 1893, professor of history at University College, London; lecturer in modern history since 1897 at Oriel College, Oxford. He was curator of Indian Institute, Oxford (1900-13). He wrote 'Limits of Individual Liberty' (1885); 'Life of Sir Robert Peel' (1888); 'Elements of English Constitutional History' (1894). He contributed to *Cambridge Modern History* 'The History of England from the Accession of James I to the Restoration,' in Vol. VII; and to Longman's 'Political History of England' (1907). He edited Macaulay's 'Essays' (1903).

**MONTAGUE**, Mass., a town including several villages, in Franklin County, on the Connecticut River and on the Central Vermont and the Fitchburg railroads, about 35 miles north of Springfield. The most important village in the town is Turner's Falls, the location of a large electric-power plant. Montague was settled about 1716, and in 1753 was incorporated as a district. It is in an agricultural and manufacturing region. The chief industrial establishments are large cotton mills, paper and pulp mills, brick, water-wheels, hardware, cutlery, pumps, toilet articles, soap and machinery. There are three public libraries. The government of the town is determined by popular vote at regular town meetings. Pop. 6,866.

**MONTAIGNE**, mōn-tān' (Fr. mōn-tān-yè), **Michel Eyquem de**, French essayist: b. Château Montaigne, Périgord, 28 March 1533; d. there, 11 Sept. 1592. He was educated by his father after a fashion all his own, learning

Latin from house servants who never spoke French, and being roused from bed every morning by soft music. At six he was sent to the Collège de Guyenne in Bordeaux, where he stayed for seven years, apparently under the charge of the great classical scholars, Buchanan and Muretus. Thereafter he probably studied law at Bordeaux and Toulouse, and when he came of age was made a member of the Cour des Aides at Périgueux. This court was abolished three years afterward and Montaigne with the other members was appointed counsellor to the Bordeaux parliament, a body in which he made the acquaintance of La Boétie about 1559. For the next few years he was at court, now at Paris, now at Bar-le-Duc; we know that in 1562 he swore allegiance to the Catholic Church on his own motion; that in 1565 he married Françoise de la Chassaingne, daughter of one of his fellow-counsellors, and that the death of La Boétie in 1563 and that of his father in 1568 had greatly lessened Montaigne's interest in public affairs. These events had also no doubt sobered him—he admits that his youth had been wild; at any rate in 1571, having prepared La Boétie's posthumous works for the press, having received himself the Order of Saint Michel for a rather mediocre version of the 'Theologia Naturalis' of Raymond de Sebonde, his only literary venture so far, after selling his post as counsellor, he retired to Montaigne. There he began, and in the next nine years completed, the first two books of his essays, whether purposing them for publication or not is unknown, though their style seems to point to the fact that in their earliest form they must have been mere jottings in a commonplace book. By the middle of 1580 his health had so much failed that he left Château Montaigne for the first time since 1571, save for an occasional trip to Paris, and traveled through Switzerland, Germany and Italy, meeting Tasso at Florence. His 'Journal' of this trip, discovered and published in 1774, adds nothing to his literary fame and not much more to our knowledge of his personality. During this absence from France, and apparently quite against his will, Montaigne was elected mayor of Bordeaux; he served in this office from 1581 to 1583 and then was re-elected for another two years; at the close of this successful administration, in which with no small skill he had steered safely the king's lieutenant in Guyenne and the king of Navarre, governor of the province, he refused to be present in the city as was required for the election of his successor, because of the plague—one of the few lights on his personal character and not a pleasant one. The three years immediately following (1585-88) were occupied in the revision of his two books of essays and the addition of a third. He received the rites of the Church upon his death-bed. His wife bore him several children; "two or three," he says, died in infancy; and one, a daughter of whom he was very fond, survived him. But his family ties were not strong; his life with his wife seems to have been a philosophic makeshift; and his love for his daughter cannot compare with his attachment to Mlle. de Gournay, a Parisian, who was attracted to him by his literary fame, was called by him his adopted daughter and was fortunate enough to receive from Montaigne's widow a copy of his 'Essays' with

manuscript additions and corrections, the basis of a new edition, published in 1595. Montaigne's literary reputation is safe, though in the hands of the few, not the many. His spirit is skeptical, essentially typical of his time, and it was not for nothing that his study at Château Montaigne was decorated with texts from Ecclesiastes, Ecclesiasticus, Lucretius and Horace, for he was akin to these ancient writers who proclaim the vanity of all things. His theme is varied, his treatment discursive and his charm largely due to this very variety, together with a quaintness and raciness of style that did much for French prose and was mostly original even if patterned on Amyot. His manner of approaching the questions of life and criticism is apparently purely subjective; indeed, his delightful egoism that makes his own life, experiences and thoughts the theme of the essays seems at first to be quite independent of so serious a purpose. But this subjective manner brings him nearly as close to the analysis of universal problems as does the dramatic objectivity of a Shakespeare. His entire attitude is skeptical, but he is not to be ranked as the enemy of religion. He is the curious, interested skeptic, not the doubting cynic. Professor Saintsbury well says that the nearest spiritual parallel to Montaigne in literature is Charles Lamb.

Montaigne affected English literature scarcely less than he did French. His essays, translated by Florio (1603), seem to have been known to Shakespeare in their English form, and this same version, revised by Hazlitt (1893), is still the standard in English. The best editions of the original are those by Amaury-Duval (1820) and Le Clerc (1865). (See MONTAIGNE'S ESSAYS, FLORIO'S TRANSLATION OF). Consult the appreciations by Emerson, 'Representative Men' (1850); Church, 'Miscellaneous Essays' (1888); Pattison, 'Essays' (1889), and Pater, 'Gaston de Latour' (1896); also Bonnefon, 'Montaigne et ses Amis' (1892); Stapfer, 'Montaigne' (1894); Lowndes, 'Michel de Montaigne' (1898); Guizot, 'Montaigne' (1899); Champion, 'Introduction aux Essais de Montaigne' (1900); Dowden, E., 'Michel de Montaigne' (Philadelphia 1905); Woodberry, G. E., 'Great Writers' (Garden City 1907); Sichel, E., 'Michel de Montaigne' (New York 1911).

**MONTAIGNE'S ESSAYS, Florio's Translation of.** The interest of Florio's translation of the essays of Montaigne is manifestly due in the first place to Montaigne and only very secondarily to Florio. The world has never failed to find the good-natured and wise father of the modern essay both amusing and interesting, and Montaigne, in whatever dress he might wear, would be sure of a welcome in any reflecting but not too serious society of men and women. Yet it is no small credit to Florio that he has not only kept Montaigne alive and to the fore in his translation, but has also managed to slip in by the way some considerable flavor of himself. His translation of his French original is not always accurate in detail, though it is perhaps not less accurate than translations customarily were in the days when it was made. It has something better, however, than simple verbal accuracy, it has color and life. Like most Elizabethan trans-

lators, Florio was seldom content to let a single English word stand as the equivalent of a significant word of his original. In order to be sure to get the full content of his French source, he amplified by the addition of intensifying modifiers and synonyms. The result is that the translation is often more wordy and more highly colored stylistically than the original, is often quaint and colloquially picturesque when Montaigne is simple and direct. Florio was above all a lover of the ingenious style, and his ingenuity not infrequently betrayed him into the grotesque. He was fond not only of strange words, but also of puns, alliteration and the other frippery of the courtly writing of his day. When it suited his convenience he did not hesitate to Anglicize a French word, with the result that though he put Montaigne "in English clothes" it was done "many times with a jerke of the French jargon." Yet when one compares the 'Epistle Dedicatoire' of the translation, addressed to his "best-best Benefactors and most-most honored Ladies, Lucie Countesse of Bedford; and her best-most loved-loving Mother, Ladie Anne Harrington," where he was writing in his own person, with the body of the translation, one notes with gratitude that Florio has not done his worst in the way of verbal ingenuity. His original exerted a salutary restraining influence when he came to the actual task of translating, and few readers will cavil at him for being occasionally Florio, since he really gives us Montaigne.

GEORGE PHILIP KRAPP.

**MONTALEMBERT, Charles Forbes de Tryon,** shärl fôrb dé trê-ôn môn-tä-lôn-bär, COMTE DE, French publicist and historian: b. London, England, 29 May 1810; d. Paris, 13 March 1870. He received a university education at Paris; identified himself with the Liberal Catholic movement of Lamennais (q.v.) and Lacordaire (q.v.), whom he assisted in establishing (18 Oct. 1830) and editing *L'Avenir*, and in efforts to obtain the freedom of education at that time impossible under the state system, and in 1831 went with these two leaders to Rome to present their cause. On his return he opened with Lacordaire and De Caux at Paris a free Catholic school, which was promptly closed by the police, while the directors were arraigned for infringement of the laws respecting instruction. Montalembert made a notable defense before the Chamber of Peers, but the directors were sentenced to pay the costs and 100 francs apiece in fines. When the doctrines of *L'Avenir* were condemned by Gregory XVI in an encyclical of 15 Aug. 1832, Montalembert duly submitted and did not proceed with Lamennais to final revolt. He entered the Chamber of Peers in 1835, spoke much and eloquently on ecclesiastical matters, and in 1836 published his 'Histoire de Sainte Elizabeth de Hongrie,' which appeared in an English rendering by Hackett and Sadlier (1854). His Catholic zeal was combined with liberal ideas and after the Revolution of 1848 he was elected as a Moderate Republican to the Constituent Assembly; but here, as in the Legislative Assembly, where he sat from 1849 to 1857, he became more and more conservative. In June 1851 he debated against Victor Hugo in opposition to the proposed constitutional re-

vision. He found himself unable to support the measures of the Empire; was known as one of the most determined opponents of Napoleon III; and for an article, 'Un Débat sur l'Inde au Parlement Anglais,' unfavorably contrasting French and British institutions, was sentenced to six months' imprisonment and a fine of 3,000 francs, though the penalty was remitted. His chief work is 'Les Moines d'Occident depuis Saint Benoît jusqu'à Saint Bernard' (1860-67; Eng. trans.), which, though of much value, has been criticized as in general too argumentative and oratorical in manner to fulfil the highest demands of history. He wrote many pamphlets, the last of which, 'La Victoire du Nord aux Etats-Unis' (1865; Eng. 1866), was an appreciation of the triumph of the Union cause in the Civil War. He opposed in a letter of 28 Feb. 1870 the opportuneness of the definition of the doctrine of papal infallibility, but acquiesced at once when the dogma was published. Consult the memoir by Mrs. Oliphant (London 1872); the study by De Meaux (Paris 1897); Craven, 'Le Comte de Montalembert' (London 1873); Lecanuet, 'Montalembert d'après ses papiers et sa correspondance' (3 vols., Paris 1895-1905).

**MONTALEMBERT, Marc René, Marquis de**, French military engineer: b. Angoulême, 16 July 1714; d. Paris, 29 March 1800. He took part in a number of campaigns (1736-41) in Italy, Flanders and Germany and wrote during the following peaceful years several dissertations for the Academy, of which he became a member (1747). In the Seven Years' War he was chief of commissary, and directed the fortifying of Anklam and the strengthening of Stralsund. Later he fortified Oléron Island after his own system, newly worked out. He invented the low-framed gun-carriage. He wrote 'La fortification per pendiculaire' (Paris 1776), and this, his chief work, was severely criticized, which caused him in self-defense to write 'L'art défensif supérieur à l'offensif' (1796, 11 vols.).

**MONTALVÁN, món'tál-ván, Juan Perez de**, Spanish dramatist and novelist: b. Madrid, 1602; d. there, 25 June 1638. He was already making success as dramatist at 17 years of age and was soon working with Lope de Vega. In 1625 he was ordained to the Church and became apostolic notary of the Inquisition. A collection entitled 'Comedias' which distinguish themselves through their national attitude appeared in two volumes (Madrid 1635, Alcalá 1638 and 2d ed., Valencia 1652); seven plays are in *Biblioteca de autores españoles*, and eight novels of his in 'Sucesos y prodigios de amor' (Madrid 1624, with frequent new editions), and others in Ochoa's *Tesoro de novelistas españoles* (Paris 1847); in 'Paratodos' (Huesca 1633) are novels on morals and dissertations. His 'Orfeo' (Madrid 1624) is a poem in octaves. On the death of Lope he wrote 'Fama postuma de Lope de Vega' (Madrid 1636). Consult Bacon, G. W., 'Life and Dramatic Works of Dr. J. P. de Montalván' (in *Revue Hispanique*, Vol. XXVI, Paris 1912); Fitzmaurice-Kelly, James, in *Bibliographie de l'histoire de la littérature espagnole* (ib. 1913).

**MONTALVO, Garcí Ordóñez De**. See ORDÓÑEZ DE MONTALVO, GARCI.

**MONTANA, mōn-tā'na**, the "Treasure State" (admitted to the Union 8 Nov. 1889), is bounded north by Canadian provinces, east by North Dakota and South Dakota, south by Wyoming and eastern Idaho, west by Idaho. Capital, Helena; area, 147,182 square miles; population (1910) 376,056; percentage of increase in 10 years, 54.5; estimated population, 1918, based on school census, 750,000. The name is Spanish for mountain. The floral emblem of the State is the bitter-root. The yellow pine is the State tree. The State seal contains the words Oro y Plata, gold and silver.

**Topography.**—The State has within its borders 94,196,780 acres of land. Of this amount approximately 26,000,000 acres are classed as mountain lands, 50,000,000 acres as farming lands and 18,000,000 acres as grazing lands. This is approximately 40,000 square miles of mountains, 78,000 square miles of farming lands and 19,000 square miles of grazing lands. The mountain area of the State is about equal to the area of either Indiana, Kentucky, Virginia, Ohio or Tennessee. Its grazing land is about equal in area to Delaware and Maryland. Its farming land embraces an area about as large as Michigan or Minnesota. The mountain area is mainly in the western part. The main range of the Rocky Mountains enters the State on the north at a point about a hundred miles east of the Idaho-Montana State line, and extends across the State from northwest to southeast, in a very tortuous line, leaving the State where the Divide enters Yellowstone National Park. Glacier National Park (q.v.) embraces a portion of the main range and outlying and projecting spurs. In this section is some of the finest scenery and sharpest peaks of the entire State, although the altitude of the mountains is by no means as high as in the southern part. Among the peaks included in Glacier Park are Cleveland (10,438), Merritt (9,948), Wilbur (9,293), Grinnell (8,836), Gould (9,541), Seyeh (10,004), Going-to-the-Sun (9,594), Red Eagle (8,800), Little Chief (9,542), Gunsight (9,250), Blackfeet (9,570), Stimpson (10,155), Pinchot (9,332), Jackson (10,023), Kintla (10,100). Hanging on these mountains are many glaciers, large and small, which give the name to the park. The most important of these glaciers are Agassiz and Kintla glaciers, on Kintla Peak; Rainbow glacier on Rainbow Peak; Carter glaciers on Mount Carter; Chaney glacier on Mount Merritt and the Divide; Sperry glacier on Edwards and Gunsight; Harrison glacier on Mount Jackson and Walton; Blackfoot glacier on Mount Jackson and Blackfoot; Pumpelly glacier on Blackfoot; Grinnell glacier on Grinnell and Gould; and Vulture glacier on Vulture Peak. About the middle of the State a portion of the main range is called the Anaconda Range, with Mount Haggin (10,598). Mount Howe (10,475) and Evans (10,635). Here the range makes a sweep to the west, then turns at a sharp angle southward, forming the boundary between Montana and Idaho. The remainder of this boundary line of mountains is made by the Bitter Root and Cœur d'Alene ranges. The higher portion of the former range is in projecting spurs, and includes Lolo (9,075), Saint Mary (9,335), Ranger (8,810), Ward (9,010) and El Capitan (9,936). The smaller ranges in the western part of the State

are variously named. In the extreme northwestern part is the Kootenay, which extends northward into British Columbia. Between the Kootenay and the Bitter-Root Range are the Cabinet Mountains, extending approximately southeast and northwest, and continuing westward into Idaho. The Mission Range extends almost due north and south for about 100 miles, the northern end beginning in the valley at the upper end of Flathead Lake, rising higher toward the southern end, containing McDonald (10,100), Sinyaleamin (9,500) and McLeod (8,500). East of the Mission Range lies the Swan range, extending almost parallel with the former, and continuing much farther north. Like the Mission Mountains, the Swan Range is highest at the southern end, culminating in Swan Peak (over 10,000), and Baptiste. East of the main range are many small ranges, in some cases quite isolated, and in others connecting the Great Plains to the Continental Divide. The Big Belt Mountains form the boundary line between Meagher County on the east side, and Lewis and Clark and Broadwater counties on the west. The range extends from northwest to southeast for more than a hundred miles. Between Chouteau and Cascade counties are the Highwood Mountains, a range of beautiful summits, including Highwood (7,600), Middle (7,000) and Arrow (7,420). The Little Belt Mountains are between Meagher and Cascade counties. The highest summit is Neihart (9,000); Thunder Mountain is 8,000. Between the Little Belts and the Crazy Mountains further south are the Blue Mountains, the Elk Range and the Castle, a series of crags with an elevation of 8,606. The Crazy Mountains, the first mountains the traveler is likely to see as he speeds along the railroad near Bigtimber, lie partly in Meagher and partly in Park counties. They contain some beautiful mountains, Crazy Peak (11,178), Sunlight (10,087), Conical (10,731), Loco (9,187) and Fairview (8,400). In Fergus County, which is about as large as the State of Massachusetts, are three small ranges called the Big Snowy, the Little Snowy and the Moccasin mountains. In the southern part of the State, just north of Yellowstone Park, in Park County, are the Absaroka Mountains, also called the Snow Range, with some high summits, whose majestic snow-caps are seen 100 miles away. Among these are Pyramid (10,760), Haystack (10,990), Emigrant (10,969), Cowan (11,190), The Needles (10,939), Douglas (11,300), and Sheep (10,620). East of the Absarokee Range, and bordering the State line, are the highest mountains in the State, the Beartooth Range, culminating in Granite Peak, with an elevation of 12,850. Extending north and south in Gallatin County is the Gallatin Range, with many lofty and beautiful summits. Among these are Blackmoon (10,196), Hyalite (10,110), Twin (10,246), Bighorn (10,000) and Gallatin, between the Gallatin and Madison ranges (10,967). Also in Gallatin County, and north of the Gallatin Range, is the Bridger Range, with Bridger Mountain as the highest point (9,106). This range also contains a mountain named for the Indian Bird Woman who accompanied the Lewis and Clark expedition, Sacajawea. West of the Gallatin Range, in Madison County, are the Snow Crest Range, the Ruby Mountains, the Tobacco Root Moun-

tains and the Madison Range. The last named contains the Sphynx (10,000), and the Wedge (10,606). Along the Wyoming boundary, and east of Yellowstone Park, are the Pryor Mountains, in Bighorn County, and still farther east are the Rosebud Mountains. In the extreme southeastern part of the State is the High Plateau Ridge. Southeast of Billings is a long elevation called Pine Ridge, which in level countries would be called mountains, but which in comparison with the high ranges is not so called. In the central part of the State near the eastern boundary, in Wibaux and Dawson counties, is a series of high and wooded hills called the Blue Hills. In the central portion, Sweet Grass County, is a range called the Sweet Grass Hills. In the eastern and northern part of the State is a series of isolated buttes, some of them of sufficient size and extent to be called mountains. Among these are Mountain Sheep Bluffs, nearly 100 miles long. Between the Yellowstone and Missouri rivers, and between Yellowstone and Musselshell counties, are the Bull Mountains, the location of a big field of coal. North of the Missouri River are several important small ranges, although the larger portion of the country is in the plains country. Where Chouteau, Hill and Blaine counties join is located the Bear Paw Range, culminating in Mount Garfield (5,794), Hancock (5,078) and Centennial (6,074). Much of the mountainous region is yet unexplored, save by the hardy trapper and prospector. The transcontinental railroads give the traveler a poor idea of the sublimity of the scenery which the mountain ranges afford. Many of the peaks, lakes, glaciers and creeks are unnamed. Owing to the varied topography and elevation of the State there is great variation in the soil and climate, resulting in corresponding variation in occupations of the people.

**River Systems and Lakes.**—Montana is unique in one respect; unlike any other State or country, the waters from the mountains are carried by different river systems to the three oceans, the Arctic, the Pacific and the Atlantic through the Gulf of Mexico. In the western part the Bitter-Root River gathers the waters from the snow crests of the Bitter-Root Range and from the spurs of the Rockies, and unites with the Missoula near the city of Missoula. The Missoula River through its various tributaries gathers the waters from a large portion of the western slope of the main range, including that which is used in the great smelters of Anaconda, and that which comes from the rich mines of Butte. Further north, the North-Fork, Middle-Fork and South-Fork of Flathead River receive the drainage from the Mission and Swan ranges, the west slope of the main range and a part of the Kootenais. These unite to form the Flathead River, which first pours its waters into the greatest reservoir of the State, Flathead Lake, and later joins the Missoula in the beautiful but narrow Paradise Valley to form Clark's Fork of the Columbia. The Kootenay River takes the drainage from the extreme northwestern corner, a part of the Columbia drainage system. The rivers on this western side are clear and swift, with rocky and picturesque cañons. The Belly and Saint Mary rivers in the northern part of the main range carry the ice-cold water from the glaciers of the Continental Divide, Chaney, Swift Cur-

rent, Grinnell, Sexton, Blackfoot and Red Eagle glaciers, and from Cleveland, Merritt, Wilbur, Gould, Piegan, Going-to-the-Sun, Citadel and Red Eagle mountains, and the adjacent region in Glacier National Park, on to the Arctic Ocean. The sources of these two rivers are in the wildest and most picturesque region of the State. By the plans of the Federal government much of the water of the Saint Mary will be diverted by canal to the Milk River, and used in the vast system of irrigation for the northern part of the State. Triple Divide Peak (8,001) claims the proud distinction of sending its waters to three oceans. By far the greater portion of the State is in the Missouri River drainage system. The Madison, Gallatin and Jefferson rivers gather the waters from the many small ranges adjacent to the Yellowstone Park and unite at Three-Forks to form the Missouri. Near the city of Great Falls are the "Falls of the Missouri." From Fort Benton, a short distance below the Great Falls, the river is navigable to its juncture with the Mississippi. The Yellowstone River rises in Yellowstone Lake in the Yellowstone Park, and after taking its two mighty leaps in the park and flowing through its magnificent gorge, it emerges as a restless river, continuing in swift descent until its waters merge with the muddy Missouri. The Yellowstone is the most rapid navigable stream in the world, but it has long since ceased to be used by boats as a commercial highway. From the north the Missouri receives the waters of the Marias, Teton, Sun and Milk rivers, all of which flow through valleys of great fertility. The scenery along the rivers is varied and exhibits some striking antitheses. The valley of the Bitter Root is one of remarkable beauty. The river, as it winds back and forth like a stream of silver, when viewed from Mount Lolo, Ward's Peak or Saint Mary's in the Bitter-Root Range, is probably equaled in quiet and peaceful grandeur only by the Yellowstone as it flows through Hayden Valley in the Park. The three branches of the Flathead present to the few travelers along their course many gorges and cañons. The South-Fork in one place in the Lewis and Clarke Forest reserve has cut its way through solid rock, making a cañon so narrow that pack horses may be and are forced to leap from brink to brink, while the river seethes and boils many feet below, its ominous roar announcing certain death if the leap is short. The Missouri has made the famous "Gateway of the Mountains," its splendor first told by Lewis and Clark, and later made famous by the brush of artists. At the city of Great Falls, it hastens its speed before tumbling over the beautiful Black Eagle Falls, spanned by a bridge on the Great Northern Railroad, and does not diminish its speed until the bottom of the Great Falls is reached. The valleys of these rivers and their smaller tributaries make rich farming soil, suitable for grain, vegetables and fruit. The Bitter-Root Valley in the West was settled first, and is a great farming and fruit raising region. The country adjacent to Flathead Lake is thickly settled, and produces abundant harvests without irrigation. The Gallatin Valley has become famous for its bountiful harvests, and the Yellowstone is being largely used for agriculture and fruit. The Musselshell River

takes its first waters from the crests of the Crazy, Castle, Little Belt and Big Snowy mountains. It flows eastward, through the central portion of the State, makes an abrupt turn northward, emptying into the Missouri. The Judith takes its rise on the northern slopes of the Little Belt and Big Snowy mountains, flows north and gives its waters to the Missouri. The Milk River heads in the Hudson Bay Divide east of Upper and Lower Saint Mary lakes, turns north into Canada, flows east for over 100 miles, returns to the State for another 200-mile stretch before it reaches the Missouri. The Dearborn, Sun and Teton rivers are short but important streams which head in the main range of the Rockies and flow eastward to the Missouri in the Great Falls Region. They furnish the water for large irrigation systems. The Bighorn River rises far south, in the mountains in middle Wyoming, and flows north into the Yellowstone near Custer. The Little Bighorn is a tributary of the former, famous in history because of the Custer massacre on its banks by the Indians. The Powder River also rises far south in middle Wyoming, flowing north with a tortuous course, emptying into the Yellowstone east of Miles City. The Tongue River heads in northern Wyoming and flows into the Yellowstone at Miles City. There are many smaller streams designated as rivers, of greater or less importance, depending upon their location and usefulness in irrigation. There are several large lakes in the State, and many small ones. In the Glacier Park alone (q.v.) are some 250 lakes, large and small. Other sections have numerous lakes, many of which are unnamed. Flathead Lake, in the western part, is about 30 miles long, has an area of 189 square miles and is 289 feet deep. The size and depth of lakes in Glacier Park are given under that heading. The larger ones are Upper and Lower Saint Mary, Kintla, Logging, Bowman and McDonald. Georgetown Lake, near Philipsburg, has an extreme length of several miles. Hauser Lake, a widening of the Missouri River near Helena, was made by the construction of the Hauser Dam.

**Climate and Rainfall.**—The climate of the State is exceedingly varied, and is much more salubrious than is generally supposed. West of the main range the winters are mild, the summers and falls are delightful. The rainfall at Missoula and Kalispell averages about 16 inches, while at Culbertson and Glendive in the eastern end the rainfall is about 13 inches. Rain and snow prevail during the spring until early July. July, August and September are largely without rain, although in many places there is no need of irrigation. During the last decade, possibly due to increased irrigation and to the tilling of many millions of acres that formerly were used only for range, the rainfall during summer months has increased. In many sections of the State large crops have been raised without irrigation. It must be remembered, however, that there is no certainty of summer rains, and most lands without irrigation are liable to suffer from drouth. Owing to the different altitudes, snow may fall later in the spring at some places than at others. An area of 40,700 square miles is below 3,000 feet elevation above the sea; this is equivalent to a State the size of Georgia. About 10,200 square

miles exceed 8,000 feet altitude. The climate on the Pacific slope is milder and less changeable than that of the Atlantic side. The majority of the areas of high barometer, and accompanying cold, originate in the Arctic Region, and are deflected southward or eastward by the Rocky Mountains. While eastern Montana and the Dakotas may be in the throes of a blizzard the western end may be enjoying balmy weather. As in any extreme northern state, the thermometer occasionally records a low midwinter temperature, but the cold spells are short. While they remain there is practically no wind. The air is dry and the sunshine clear. Ordinary outdoor occupations may be carried on with little inconvenience. Summer temperatures are not oppressive, and heat prostrations are unknown. In 1916 Missoula, on the west side of the range, had maximum temperature of 98° F., minimum — 17° F.; east of the mountains Havre, from which the climate of Montana seems to be determined, because it is the first weather bureau station in the United States to record advancing cold waves, had maximum 92° F., and minimum — 33° F. These are merely typical of the greatly varying temperatures. The mean temperature in the western end is 44° F. At Helena, altitude 4,500, the mean temperature is 43°. Chinook winds may occur over the entire State, melting large quantities of snow in a short period of time. Owing to the usual absence of a high percentage of humidity, the cold weather is not extremely disagreeable, nor the warm days smotheringly oppressive. The hot days may blister the skin, while the nights following will be cool enough to require blankets. Rarely does one sleep without considerable covering, and some people wear the same clothing summer and winter, donning extra coats or wraps in winter. This may be given as the general summary: the springs are rainy; the summers are clear and dry; the autumns are delightful; the winters are clear and bracing. Owing to the absence of high humidity the climate is very beneficial to health, as statistics will show. It is especially beneficial to those affected with pulmonary diseases. Malaria is entirely absent. The central Weather Bureau Station is located at Helena. There are stations at Kalispell, Havre and Miles City.

**Agriculture and Husbandry.**—In the early days of Montana's history it was not thought possible to grow crops in the State to much extent. Nearly everything was shipped in from the outside. As the mines developed the demand for food became so great as to stimulate agriculture, and fruit raising was also attempted. Marked success attended the efforts, and large acreages of grain and orchards were put out annually until agriculture and husbandry have developed in rank above the mineral wealth. In 1902, nearly 250,000 fruit trees were set out; the number was almost doubled the next year. At the close of the year 1903 nearly 1,500,000 fruit trees had been set out in various parts of the State. Since then the acreage has been very greatly increased. The trees in the orchards include apples, cherries, plums, apricots and peaches. Small fruit, such as gooseberries, strawberries, blackberries, currants and the like, produce enormous crops from small acreage, while to describe the size and weight of the fruit is almost beyond belief. Apples are

shipped to all parts of the country and to Europe. As they are quite free from insect pests, owing to the stringent legislation and watchful care in orchard inspection, home-grown apples are always in demand, the demand being far in excess of the supply. The Bitter-Root Valley, in the western part of the State on the Pacific slope, is the oldest orchard section, and has become famous as a fruit-growing valley. But the orchards are not confined to this beautiful and fertile valley. The valley to the north of Flathead Lake is filled with orchards, already breaking beneath their loads of fruit. The Yellowstone Valley is developing rapidly as a fruit-growing region, even growing grapes. The most recent observations show that fruit trees may be grown and that apples will mature in every portion of the State. Since the portion of the State east of the Rocky Mountains is much greater than on the west the fruit-growing possibilities of the State may be readily understood when it is known that the great majority of the fruit trees of the State are on the Pacific side. About 10,000,000 acres of the 94,000,000 acres of the State were in crops in 1918. This does not include pasture. In the last 10 years the State has had such a large increase of farmers that no safe comparisons with former periods can be made. Great stretches of former prairie land that was given over to grazing and stock raising have been taken by homesteaders, and used for farming purposes. The former prairie wilderness has become a settled country, with farmhouses, schoolhouses, towns, and even cities of good size. The total acreage in farms in 1900 was almost 85 times that reported in 1870, and the increase since 1900 has been tremendous. In the extreme eastern part are the "Bad Lands," a continuation of the "Bad Lands" of the Dakotas, Wyoming and Nebraska, practically non-irrigable because of the uneven surface. The Yellowstone Valley has become famous for its growth of alfalfa. Two or three cuttings, a total of four to seven tons per acre, are had. The Gallatin, Madison and Jefferson valleys in the southeast produce rich harvests of cereals, never failing through irrigation. In the west the Bitter-Root, Missoula and Flathead valleys, while less extensive, produce as abundant harvests, often without irrigation. The lands are of three general classes—the bottom lands, near the streams, with rich, black, alluvial soil; the bench lands, whose soil is a sandy loam, capable of wide range of cultivation; and the high bluffs, suitable largely for grazing. The crops in 1918 were, wheat, 31,963,000 bushels; oats, 19,040,000 bushels; rye, 121,000 bushels; barley, 1,879,000 bushels; flax, 3,487,000 bushels; great quantities of corn, hay and forage, potatoes, peas and vegetables. During the past few years, many small fruit and truck farms have been started, promising greater returns per acre and greater variety of farm products, as ready market awaits all kinds of farm products. Montana leads the Union in the number of sheep, there being more than 5,500,000 in 1910. The sheep industry has proven profitable in the eastern portion where there is much open range. In 1910 there were 925,000 cattle and 319,000 horses, the assessed valuation of the former being about \$3,700,000, and of the latter \$6,061,000. Since then the increase has been enormous.

**Forests and Lumber.**—Twenty-nine per

cent of the total area of the State is covered with timber, which is 8 per cent less than for the average of the entire United States. The timber growth is largely of coniferous trees, yellow pine, tamarack and Douglas spruce (red fir), comprising the most of the commercial product. Along the streams occur forests of cottonwood. In the drier portions of the State, stunted red cedars often grow along the smaller water courses, of great value to settlers, as they supply posts and wood. Forests of white cedar or arbor-vitae, white pine and Engelmann's spruce occur in the western part. On the higher slopes and summits the alpine species thrive; but as they have limbs to the base of the tree and inaccessible, they are not of value commercially. They are useful in preventing the rapid melting of the snow in the spring, holding it until later in the season when it is needed in irrigation. A considerable portion of the State's timbered area is included in government forest reserves. The area embraced in each is as follows:

FOREST	National forest land	Other lands	Total
	<i>Acres</i>	<i>Acres</i>	<i>Acres</i>
Abies	842,467	145,243	987,710
Bearbrush	662,537	19,393	681,930
Berryhead	1,337,223	27,777	1,365,000
Bitter Root	1,047,012	108,856	1,155,868
Blackfoot	865,077	202,013	1,067,090
Cabane	830,676	195,874	1,026,550
Custer	428,922	83,888	512,810
Deer Lodge	833,178	130,822	964,000
Flinthead	1,802,905	285,815	2,088,720
Galatin	564,855	344,575	909,430
Helena	687,983	232,497	920,480
Jefferson	1,039,766	135,919	1,175,685
Kootenay	1,336,061	287,279	1,623,340
Lewis and Clark	811,161	15,199	826,360
Lolo	850,677	330,341	1,181,018
Madison	958,691	77,169	1,035,860
Missoula	1,031,529	336,662	1,368,191
Snow	96,743	17,798	114,541
<b>Total</b>	<b>16,027,463</b>	<b>2,977,120</b>	<b>19,004,583</b>

The annual output of lumber from Montana mills is quite large. The cut for 1916 is considerably above the average for the 10-year period, 1906 to 1915, and also higher than the 1917 cut. The total lumber cut for 1916, based upon mills cutting 50,000 feet board measure or more per year, was 383,884,000 feet board measure. A conservative estimate of the total cut for 1916 was in round numbers at least 385,000,000 feet board measure. The lumber production by species for 1916 is shown below:

	Feet board measure
Yellow pine	138,206,000
Douglas fir	56,845,000
White pine	10,497,000
Larch	163,829,000
Spruce	6,790,000
Cedar	2,612,000
White fir	3,408,000
Lodgepole pine	1,631,000
Cottonwood	66,000
<b>Total reported</b>	<b>383,884,000</b>

In addition to the lumber produced in 1916 there were 25,522,000 pieces of lath and 16,266,000 shingles. Figuring that 7,000 lath is equal to 1,000 feet board measure and that

10,000 shingles is equal to 1,000 feet board measure of lumber, the lath and shingles produced are equal in round numbers to approximately 5,200,000 feet board measure. The total forest products amount to 594,740,000 feet board measure. In 1916 there were 138 saw mills in the State, 157 in 1917. The annual increment of all timber lands in the State and the annual cut are approximately equal at present. Under proper management, Montana has sufficient timber land to supply the present annual consumption of the State indefinitely with a surplus for disposal elsewhere. It is roughly figured that western Montana forests, if properly protected and managed, will sustain an annual cut, under present conditions, of about 700,000,000 feet of sawtimber, as compared to a cut at present of less than 400,000,000 feet. The entire State will probably sustain a cut of 900,000,000 feet annually. The United States Forest Service is the only organization in Montana growing and planting forest trees for timber production. A nursery, perhaps the largest evergreen nursery in the United States, is maintained at Haugan, Mont., along the foothills of the Bitter-Root Mountains in the extreme western portion of the State. Until the present year, 1918, in which shipments have been curtailed by the war, the annual production of two and three-year-old forest trees has been approximately 4,000,000 annually, thus making it necessary to keep a stock on hand of trees of all ages of approximately 12,000,000. These trees are field planted on burned-over areas, not capable of restocking naturally, in the White Pine belt of western Montana and northern Idaho. About two-thirds of the output of the nursery is planted in Idaho and one-third, or approximately 1,300,000, are planted in western Montana. Forest fires in the State of Montana during the 10-year period 1908-17 inclusive have caused a damage of approximately \$6,500,000. For suppressing the 5,833 fires, which caused this damage, the State of Montana, the United States Forest Service and private agencies have spent about \$1,170,000. By far the greatest damage was done in 1910 when the fires escaped from control and destroyed nearly \$6,000,000 worth of standing timber and other property. The largest expenditure for suppression was in 1917 when a little over half a million dollars was spent in controlling nearly 1,400 fires. The result of this expenditure is shown in greatly reduced damage. Only about 16.2 per cent of the fires are caused by lightning, which is the only natural cause of any consequence. Railroads cause 37.2 per cent; campers, 17.2 per cent; brushburning, 10.2 per cent; incendiaries, 4.3 per cent; lumbering, 0.9 per cent; miscellaneous causes, 2.3 per cent, and 11.7 per cent are from unknown causes. Prior to December 1908 the Forest Service was administered from Washington, with inspection districts in charge of inspectors throughout the West, each containing a number of national forests. In December 1908 the headquarters of District No. 1 was established at Missoula. The organization of the district office consists of a district forester with four assistants. These heads of administrative offices have each a corps of assistants. The total number of people employed in the district office

is approximately 80. In addition to the timber resources of the national forests of Montana, they yield each year an abundant crop of forage for the production of livestock. In the fiscal year ending 30 June 1918, 193,108 cattle and horses and 810,355 sheep and goats grazed on the 18 national forests of Montana, mainly during the summer period, and yielded a revenue to the United States of \$136,478.68. The revenue, however, represents merely a nominal charge for the forage used. The true commercial value would perhaps reach approximately \$500,000 annually.

**Mines and Mining.**—In the early years of the State's history Montana was known principally on account of her mines. Although mining has taken second place to agriculture the State is still a mining section, with vast expenditure and enormous returns. A thousand million dollars worth of precious and semi-precious metals is a fair estimate of the mineral products, extending over half a century. The early history is the search for gold, and many of her towns and cities are built in gulches where placer gold was mined. Helena and Virginia City are illustrations, the latter being the oldest camp in the State. Although Butte is the greatest mining camp in the State, and indeed the greatest in the world, there are many other places where mining is carried on. Gold was discovered in Montana in paying quantities in 1862. The find was in Grasshopper Creek, where later the town of Bannock was built, and where the first seat of government was established in 1864. The diggings of Alder Gulch and Last Chance Gulch, where Helena now stands, followed. It is estimated that in the first 20 years of placer mining \$200,000,000 in gold was taken, although no accurate system of determining is possible. Montana Bar in Confederate Gulch, Broadwater County, yielded \$1,600,000. This was packed in kegs, hauled in freight wagons to Fort Benton and taken thence by boat to Sioux City, the nearest railroad. The men of

the Lewis and Clark Expedition probably stirred big values in gold, unknowingly, as they laboriously poled and dragged their boats up the Missouri past this bar. The true source of the gold found in the placer mines is yet a mystery. Following the discovery of free gold came gold quartz mining. The first mine was the Ore Cache at Summit in Adler Gulch. Other discoveries were made rapidly. In the 60's every reef and outcrop in Madison County was staked and recorded. Then came the attempt to mine and smelt silver-lead ores. Long before a railroad reached the State lead-silver bullion was shipped to Crinne, Utah, in freight wagons, for smelting. Copper ore of value was not discovered in Butte until about 1880. Ore was found in seemingly inexhaustible quantities. Smelting works were erected, big plants being constructed. In later years zinc deposits have been developed and an electrolytic zinc-reducing plant has been constructed at Great Falls. Manganese ores, which have heretofore been of a negligible quantity, have been found in the Butte mines. The Phillipsburg region is also rich in manganese. The high price for this ore on account of the war caused great activity in manganese production in 1917 and 1918. Other mineral producing regions are Jardine, Park County, which produces gold, silver, selenium and tungsten; Emigrant Gulch, placer gold; Hell Gate, copper ore; Radersburg, gold and other ores; Silver Camp, at the headwaters of the Big Blackfoot, silver, copper and zinc; Elkhorn, in Beaverhead County, several ores; Neihart, Cascade County, silver-lead ore; Castle, Meagher County, lead; mines near Helena, gold. The total value of all minerals produced in 1914 was about \$47,800,000. In 1915 the output was almost doubled, reaching \$87,000,000. In 1916 this was again almost doubled, \$145,300,000. Production in 1917 and 1918 was still enormously increased. The output of the different counties is given for the year 1916, showing the distribution of the mineral wealth.

† Includes placer production.

Montana is one of the richest coal States in the West, although much of it is undeveloped. The cretaceous, bituminous and semi-bituminous coal areas in the State cover about 13,000 square miles, and the lignite area about 25,000. Not all of this territory contains coal, of course, but the deposits are found quite abundantly throughout the State. The quality varies from anthracite to low grade lignite. Anthracite is present, but not in commercial quantity. The inferior lignite is in the Great Plains section. The grade of coal improves as the mountains are approached, culminating, usually, in highest grade in or near the mountains. Tests show the bituminous coal to be little inferior to Pennsylvania bituminous coals. Lignite is not yet extensively used because methods of making briquettes are as yet commercially expensive, and without briquette moisture and gas rapidly leave the coal. But lignite is a natural resource with great future value. One lignite bed near Miles City is 40 feet thick. Over 1,810,000 tons of coal were mined in the State in 1910. In 1916 the output was doubled, having risen to nearly 3,700,000 tons. New mines are being opened annually. Bituminous coal or lignite has been found in nearly every county in the State. The undeveloped coal industry will, without doubt, be a prominent factor in the future expansion of other industries of the State. In addition to its coal, the State has extensive beds of clay, of different grades and qualities. Stones for building purposes are quarried in many sections. Montana leads the States of the Union in the production of sapphires, the actual mining of which began in 1891. Four mining regions may be mentioned: A belt 12 miles northeast of Helena on the Missouri River; the Rock Creek region, 30 miles west of Anaconda; the Cottonwood Creek fields, 10 miles east of Deer Lodge, and the Yago mines in Fergus County, 13 miles west of Utica. The last is the most productive region. In recent years both oil and gas have been found in the State. Oil was first discovered in the Elk Basin, Carbon County, near the Wyoming line, 11 Nov. 1915. Since then seven Montana wells are producing in this district. The first well was sunk to a depth of 1,494 feet, with a production during the first 24 hours of 150 barrels. The flow continued about 200 barrels daily after the first day. In October 1917 two oil prospects were discovered near Laurel in Yellowstone County. Exploratory work is conducted in the Dry Creek Basin in Carbon County, near Bridger and Laurel in Yellowstone, in Toole and Sweet Grass counties, in Musselshell County, near Lavina and Roundup, in Deer Lodge, Lewis and Clark, Cascade and Dawson counties. The Montana oil wells marketed in 1916 44,917 barrels. Gas has been discovered in the northern, the central, the southern and eastern parts of the State. A number of gas wells near Havre were brought in in 1915, with a supply more than ample to heat the city. A fine deposit of gas has been found near Baker and the gas has been piped to the town for use. About 70 miles from Billings, near the State line, a well was blown in in 1916 with a flow of 100,000,000 cubic feet of gas every 24 hours and was extremely difficult to plug and control.

**Manufactures.**—The predominating industry is the smelting of ores. The largest smelter of the world, the Washoe, is located at Anaconda. For the treatment of ores water is brought from Silver Lake, some 15 miles away, in the mountains. Ores from Butte and elsewhere are treated at the Washoe. The ores are transported by an electrically operated railroad 28 miles in length. The smelter reduces about one-fourth of the copper mined in the United States. In connection with the smelter is a large sulphuric acid plant. Another great smelter is built on the sloping bank of the Missouri River at Great Falls, securing an abundance of water from the river. The third great smelter of the State is at East Helena. In 1916 about \$8,000,000 worth of lumber was cut by the mills of the State. The larger mills are located at Hamilton, Missoula, Bonner, Saint Regis, Somers, Eureka and Libby. At most of these places there are, in connection with the mills, factories for the manufacture of sash, doors, windows and various forms of cases and cabinet work. Considerable furniture is made from native lumber. Large flour mills have been built in practically every section of the State. With the increase in grain growing in the State the manufacture of flour and cereal products has in very recent years made great advancement. In 1916 the flour production was 1,500,000 barrels. Much of this went outside of the State. The manufacture of beet-sugar was first started at Billings, where the large factory produces as high as 35,000 tons a year. The byproducts of the factory are of great commercial importance. A beet-sugar factory has been erected at Missoula and others are being planned for various places in the State. Creameries have been built in nearly every valley, and with many of these a cheese factory is associated. Flax fibre mills have been built in the eastern part of the State, where flax is extensively raised. Nearly every large town has a factory for the brewing of beer. As the State went dry 1 Jan. 1918, this will cease to be an industry. In a number of cities meat packing is an industry, but small as compared with the big houses. Although the State leads in wool production it is shipped East for cleaning and carding. Brick, tile and some kinds of pottery are made quite extensively in places, and there are many remarkable clay beds unused. A cement factory is located at Trident. The State's population is yet small, but has grown very rapidly in the last 10 years. Manufacture has in that time increased enormously. The great natural resources of the State will make it in the years to come a great manufacturing region.

**Railroads.**—There are three transcontinental systems crossing the State from east to west, the Great Northern, Northern Pacific and Chicago, Milwaukee and Saint Paul, with many branch lines. It is the only Rocky Mountain State to be crossed by three transcontinental lines. These roads traverse some of the most beautiful and picturesque portions of the State, giving travelers an idea of the scenic beauty of plains, rivers and mountains. The long distance across the State from east to west by the Northern Pacific is 806 miles. The Oregon Short Line connects the States to the south

with these main trunk lines. It terminates at Butte. The Burlington enters the State south of Billings, giving a short route to all points toward the southeast. The Great Northern and Northern Pacific operate nearly 4,600 miles of track in the State, including sidings, spurs and sidetracks. The Chicago, Milwaukee and Saint Paul operates by electricity all its trains from Harlowtown, Mont., to Avery, Idaho, a distance of 450 miles. Powerful electric locomotives requiring neither coal nor water, and making no smoke nor cinders, draw the heavy trains over the Rocky Mountains. The engines are so constructed that on down grade electricity is generated, the current thus produced being transmitted to the feed wire. This electrical generation acts as a brake. It requires 24 hours or more to go the entire length of the State by rail. The Northern Pacific follows the Yellowstone River from Glendive to Livingston. At this place a branch line goes to Yellowstone Park. At and near Bozeman the road crosses the famous Gallatin Valley. It then follows the Missouri River to Townsend, where the ascent to the main range of the Rockies really begins. In the western part of the State it follows the beautiful scenic shore of Clark's Fork of the Columbia. The Great Northern follows the Missouri for a long distance after it enters the State, and then along the Milk River for several hundred miles. Continuing westward across beautiful prairie country to the Rockies it crosses to the Pacific side, giving superb view of some of the beautiful peaks in Glacier Park. Near the western border it follows the Kootenay River with majestic mountains on either side. The Milwaukee enters from Dakota in the eastern prairie region, crosses the Yellowstone River at Terry, follows this river about 75 miles to Forsyth, continuing westward from here to the Musselshell River, and further west to the Three Forks of the Missouri. Here the ascent of the main range begins. On the west the road traverses the Bitter-Root Mountains, over a pass with beautiful view in every direction, and down hill to Spokane. During the past few years not much construction has been undertaken, although prior to that many hundred miles were built in a short time. In 1917 and 1918 more than 100 miles of new road were built and put in operation. The rapid development of the State agriculturally has made great demand for railroad construction. The immediate future will doubtless see a great increase in railroad mileage.

**Finances.**—The total assessed valuation of the State in 1917 was \$582,286,529. The valuation for 1918 was approximately \$596,000,000. The valuation of railroads was a little more than \$82,000,000. The total wealth production of the State in 1917 was \$317,000,000, of which \$113,000,000 came from the mines.

**Politics.**—Montana was admitted as a Republican State 8 Nov. 1889. It was organized as a Territory in 1864. Owing to the silver question its politics were for a time very undecided. In 1896 the State was overwhelmingly for free silver. In 1900 the fusion of Democrats, Laborites and Socialists carried almost everything. In 1902 a Republican was elected to Congress. In 1912 the Progressive party carried the State, which went for Wilson in 1916.

The State has two Congressional districts, and is represented in Congress (1919) by two congressmen and two senators. In 1916 Montana elected the first woman to Congress, Miss Jeannette Rankin, a graduate of the State University in her home town, Missoula.

**State Government.**—The Constitutional Convention met at Helena 4 July 1889, concluding its labors 19 August. The constitution was approved by the people at a special election in October, and the proclamation making Montana a State was issued 8 November. Women are now possessed of the full franchise and may vote at all elections and hold office. In 1919 women fill every position for county superintendent of schools. The office of State superintendent of public instruction is filled by a woman. Women are elected to different county offices. Two women sat in the State legislature in 1917. The governor and State officers hold office four years, elected by a plurality vote. The Territorial and State governors and their terms of office are as follows:

#### TERRITORIAL.

Sidney Edgerton.....	22 June 1864, to 12 July 1866
Thomas F. Meagher, Acting	1865 to 1866
Green Clay Smith.....	13 July 1866, to 9 April 1869
James M. Ashley.....	9 April 1869, to 12 July 1870
Benjamin F. Potts.....	13 July 1870, to 14 Jan. 1883
J. Schuyler Crosby.....	15 Jan. 1883, to 15 Dec. 1884
B. Plat Carpenter.....	16 Dec. 1884, to 13 July 1885
Samuel T. Hauser.....	14 July 1885, to 7 Feb. 1887
Preston H. Leslie.....	8 Feb. 1887, to 8 April 1889
Benjamin F. White.....	9 April 1889, to 8 Nov. 1889

#### STATE.

Joseph K. Toole, Democrat	8 Nov. 1889, to 2 Jan. 1893
John E. Rickards, Republican	2 Jan. 1893, to 4 Jan. 1897
Robert E. Smith, Democrat and Populist	4 Jan. 1897, to 4 Jan. 1901
Joseph K. Toole, Democrat and Populist	4 Jan. 1901, to 1 April 1908
Edwin L. Norris, Democrat	1 April 1908, to — Jan. 1913
Samuel V. Stewart, Democrat	Jan. 1913, to —

The governor is a member of the State board of prison commissioners, State board of examiners, State board of land commissioners, State board of equalization, State board of education, State board of commissioners for the insane, State board of commissioners for the deaf, dumb and blind, State board of horticulture, State board of farmers' institutes, State board of livestock commissioners. By and with the advice and consent of the State senate he appoints the members of the various boards where the law does not particularly specify. He appoints the State land agent, the register of lands, the veterinarian, the forester, the engineer, the commissioner of labor and industry, the dairy commissioner, the recorder of marks and brands, the mine inspectors and some other appointive officers. The legislature has biennial sessions in odd-numbered years. The State senate is composed of one member from each county. The State house of representatives has such apportionment as is made by the legislature. There are 43 in the senate, four years, one-half holding over, and 97 in the house, making a total legislative assembly of 120. The State has two representatives in Congress from two districts. There are three judges of the State Supreme Court, for a term of six years. There are 18 judicial districts, the judges elected for four years. The term of county commissioners is four years, each county having three members. State officials

MONTANA

State Capitol at Helena

are elected for four years, county officials, except commissioners, for two years.

**Banks and Banking.**—At the close of the fiscal year ending 30 June 1917, Montana led the nation in the number of new national banks chartered during the year. Thirty new banks brought the total of national banks to nearly 100. There were at that time 264 State banks and 13 private banks. The total capitalization of banks is about \$11,200,000; loans and bonds, \$80,000,000; cash on hand, 11 Sept. 1917, \$24,000,000.

**Education.**—Although young among the States, Montana ranks high in the efficiency of her educational system. When Montana was admitted to the Union the common schools received as an endowment from the national government one-eighteenth of all the public land in the State. When fully completed by survey and selection of lien lands the total will be approximately 5,234,000 acres. Up to 1918 the total sales of 794,914 acres netted the common school fund \$14,539,887. More than one-third of this is invested in bonds, warrants, and farm loans, bearing interest. Nearly \$8,000,000 is represented by deferred payments, drawing 5 per cent interest. The State treasurer has \$1,247,576 in cash awaiting investment. The total income from this source in 1917 was \$877,536, a total of \$5.50 per capita for school children. Land grants to the State institutions for higher learning aggregate 668,080 acres, much of which has been sold. The fund accumulating from sales is loaned at interest. In 1917-18 there were 122,000 children enrolled in the schools of the State, an increase in nine years of 88 per cent. In the same year there were 5,781 teachers, an increase in 10 years of 203 per cent. The greatest increase in teachers and children was in the northeastern part, where heavy immigration had taken place. Summer school attendance of all Montana teachers in 1918 was 1,227. The average salary of superintendents and principals in the county-seats was \$2,282.67. All of the county superintendents in the State are women. All but five county superintendents have supervision of territories larger than Rhode Island, and six county superintendents have counties to travel that are larger than Delaware and Rhode Island together. The public schools of the State are under the supervision of the State department of public instruction. Under the State superintendent there is a deputy, and two rural school inspectors. The legislature in 1918 made provision for an inspection of high schools. The control of the higher State institutions is in the hands of the State board of education. This board consists of the governor, the attorney-general and the State superintendent of public instruction, ex-officio members, and seven other members appointed by the governor. The University of Montana, composed of its four schools, as well as the State School for Deaf, Dumb and Feeble-Minded, at Boulder; the State Industrial School, at Miles City, and the State Orphans' Home, at Twin Bridges, all come under the jurisdiction of the State board. Each of these institutions has a local administrative board to carry on its work, and the four schools composing the University of Montana have, in addition to the local board, a chancellor of the university, located at Helena, whose duty it

is to correlate and unify the work. The State has a system of county high schools, under a separate board of trustees and with separate administration from city schools. These schools are maintained by county assessment, and are free to pupils in the county. The law was passed in 1898. Eighteen counties in the State have county high schools. For these schools, expensive and lasting buildings are constructed. The State Normal School at Dillon has 535 in attendance. The State Agricultural College and experiment station at Bozeman (1892) has about 1,000 students. The State School of Mines (1899) is at Butte, with about 100 students. The State University (1895), at Missoula, has about 1,000 students. The university established a summer school for science at Flat-head Lake in 1899, known as the University of Montana Biological Station. It has continued in successful operation since, and has drawn many from the State and from Eastern States. The Montana Wesleyan College (Methodist) is at Helena. The College of Montana (Presbyterian) was for years the only institution for higher education in the State. Financial difficulties caused its suspension about 1898. The Billings Polytechnic Institute is at Billings. Many private schools are maintained by the Catholic Church. The Sacred Heart Academy at Missoula has an attendance of several hundred, as have also the academies in Butte and other places. In accordance with an act of the legislature approved 8 March 1915, teachers who have taught 25 years, the last 15 of which have been in Montana, may retire on an annual retirement salary of \$600. School officials are required to deduct \$1 every month from the salary of every teacher in their employ for the benefit of the retirement salary fund. This applies to all teachers except those actually in the employ of Montana schools at the date of the approval of the act, who were allowed till 1 Jan. 1916 to decide whether to avail themselves of the law or not. There are 18 county high schools. The number of accredited high schools (1918) is, for four years, 55; for three years, 10; for two years, 38; for one year, 18. There are nine academies and private schools accredited for four years. The number of county libraries (1918) is four; high schools with normal training courses, 11; school nurses in city schools, 11.

**Charitable and Penal Institutions.**—The penitentiary is located at Deer Lodge. Convicts are given outdoor work on the public highways in different parts of the State, on parole. The system gives highest satisfaction both to the inmates and to the guards. It is no uncommon sight to see from 50 to 100 convicts at work, absolutely unguarded. Of the inmates a small proportion is native born, the remainder being from other States. Many criminals flee to the mountains, and Montana undoubtedly helps care for the criminal population of many other States. Charities and reform are placed in the hands of a board of three members, appointed by the governor for four years. The reform school for boys is located at Miles City. The school for deaf, dumb and blind, and for delinquents, is located at Boulder. The soldiers' home is at Columbia Falls. The asylum for the insane is at Warm Springs. A sanatorium for tuberculosis patients

with capacity for 80, is located at Galen near Deer Lodge.

**Government Reservations.**—Notwithstanding the large area of the State much of it is set apart by act of Congress as reserves. The Glacier National Park includes 915,000 acres, or about 1,450 square miles. The forest reserves, with about 16,000,000 acres, or nearly 15,000 square miles, are mentioned elsewhere. In the early days the Northern Pacific Railway Company received a grant from Congress of every other section for a distance of 50 miles on either side of the railroad, approximating 15,000,000 acres in Montana, or nearly one-sixth of the area. Of this amount much has been sold. Approximately 3,500,000 acres are yet in the hands of the company. There are several large Indian reservations in the State. In recent years the only reservation west of the divide, the former Flathead Reservation, was opened for settlement. Each Indian was given an allotment, and the remainder was opened for settlement, the homesteader paying a stipulated amount per acre. This money was placed in a fund for the Indians. This reservation covered 2,240 square miles, and is now largely in farms. In the northeastern part of the State, with its southern boundary made by the Missouri River, is the former Fort Peck Reservation, comprising 2,775 square miles. This, also, has been opened to settlers, and has been homesteaded. Four Indian reservations are left: the Crow, in Yellowstone and Custer counties, covering an area of 5,475 square miles, larger than the State of Connecticut; the North Cheyenne, in Rosebud and Bighorn counties, 765 square miles; the Fort Belknap, in Blaine and Phillips counties, 840 square miles; and the Blackfeet, which includes about a third of Teton County, or about 2,000 square miles. The total land now comprised by Indian reservations is about 3,700,000 acres, and about 3,800,000 have been opened for settlement. There are about 300,000 acres in military reservations. The State lands comprise about 3,000,000 acres. The National Bison Range, under the control of the United States Biological Survey, located at Ravalli, a few miles west of Missoula, contains nearly 20,000 acres. In it are buffalo, antelope, elk and deer. The Willow Creek Bird Reservation, about one section, is near Augusta, in Lewis and Clark County, and is for the protection of plover and avocets. The Flathead Lake Bird Reservation consists of two small islands in Flathead Lake.

**History.**—The first explorations are believed to have been made by Pierre and Chevalier Verendrye, who, with two Canadians and a party of Indians, are supposed to have entered Montana about 1743. The route they took and the points to which they reached are puzzling and the records conflicting. It was at first thought they had gone as far west as the Gate of the Mountains, and is so recorded in the 'Contributions to the Historical Society of Montana.' It seems to be generally agreed by later investigators that the party went only into the southeastern part of the State, and it is doubtful if they came into Montana at all. While in the country of the Choke Cherry Indians they planted on an eminence a leaden plate on which were engraved the arms of France, and erected a monument of stones. In

1913, 170 years later, this leaden plate was found by some school children, but this was in Pierre, S. D., much farther east than had been supposed, as it was supposed to have been buried near the Great Falls of the Missouri. For 50 years the country remained unknown to history. The whole territory was ceded to Spain by France along with Louisiana in 1764. In 1800 the country again passed to France by treaty. In 1803 the Louisiana grant, embracing a large part of what is now Montana, was ceded by France to the United States for a consideration of \$15,000,000. The portion of the State west of the Rocky Mountains was embraced in the Territory of Oregon, when Oregon was organized in 1848. In 1863 a new Territory of Idaho was formed, including Montana. In 1864 the Territory of Montana was organized with its boundary the same as that the State now has, except that about 2,000 square miles have been added in the southeast. In 1804 President Jefferson sent an expedition to explore the northwestern territory. The expedition was under the direction of two army captains, Lewis and Clark, and has become famous in history as the Lewis and Clark Expedition (q.v.). They ascended the Missouri, explored some of its tributaries, crossed the range to the Pacific Ocean, and returned in safety to Saint Louis. The first trading post was that of Manuel Lisa, built in 1807 on the Big Horn River. In 1827 another was established on the Missouri at the mouth of the Milk River. In 1829 Alexander Mackenzie, for the American Fur Trader Company, built Fort Union on the Missouri above the mouth of the Yellowstone. In 1832 the steamboat *Yellowstone* ascended to this point. Previous to this all supplies were taken overland, a distance of nearly 2,000 miles. In 1835 a steamboat went 60 miles up the Yellowstone. In 1846 Fort Benton was built. Steamboats ascended the Missouri to the fort in 1860, and the property was turned over to the United States in 1869. On the western side Father DeSmet established Saint Mary's Mission at Stevensville in 1845, still standing in 1919. Later he founded Saint Ignatius' Mission in the valley at the foot of Flathead Lake and in the shadow of the beautiful Mission Mountains, which for 50 years was a great power for good among the Indians. From 1840 to about 1860 the history of Montana is occupied mainly with the missionary labors of Father DeSmet and his associates among the Flathead Indians. About 1855 there were rumors of gold. In 1852 a half-breed named François Finlay, commonly known in Indian as Benetese, found gold in the sands of Gold Creek in Deer Lodge County. Rich discoveries were found in 1861. In 1862 Grasshopper and White's Bar were discovered, and Bannack in January 1863. Gold dust to the amount of \$25,000,000 was taken from Alder Gulch in a few months. Last Chance Gulch, where Helena now stands, produced many fortunes. The early mining was largely from placers, but the introduction of machinery made the treatment of ores of silver, gold and copper very productive, and made the permanent prosperity of Butte. The introduction of so many settlers was not without a struggle. The Indians resisted the advance of the white men. Many minor conflicts occurred, but two are worthy of special mention. The war with the Sioux

2 Law Library, Montana State Capitol

opened in 1876, and was a desperate conflict. General Custer was dispatched against the Sioux, under the leadership of Sitting Bull, numbering 6,000 warriors. Pushing up the Rosebud to its headwaters Custer found the Indians encamped on the Little Big Horn. Custer was surrounded and his entire command massacred, not a man escaping. Within a year a series of victories under General Miles had destroyed the power of the Indians. In 1877 Chief Joseph, of the Nez Perces in the western part of Idaho and his tribe prepared to cross the Bitter-Root Mountains against the orders of the government. They crossed the mountains and passed up the Bitter Root, pursued by soldiers under the command of General Gibbons. At the Big Horn a bloody and indecisive battle was fought. Chief Joseph passed through, up the Madison, through the Yellowstone National Park, across the prairie to Snake Creek and was captured only a few miles from the Bear Paw Mountains—a trail of over 1,500 miles, more than half of which was a running battle. A convention met in Helena in January 1884 which adopted a State constitution. This was approved by the people in November of the same year. Congress refused to sanction the request for statehood, and this was not granted until 1889. Since then immigration has brought many citizens from other States. The former restless population has changed into people who are desirous of making permanent homes. Agriculture and fruit culture, through irrigation, has added a new industry to the State, and the people of the farm join hands with the toiler beneath the surface in the mines, in an exchange of products, to the advantage of both and for the material advancement of the State.

**Population.**—The first Territorial census in 1860 shows but 288 people in the Territory, exclusive of Indians. The population as given by the census for each decade is as follows: (1860) 288; (1870) 20,595; (1880) 39,159; (1890) 132,159; (1900) 243,329; (1910) 376,056; (estimated 1918) 750,000. Illiteracy is low. There are 50 counties in the State, as follows, with their county-seats:

COUNTY	County seat
Beaverhead	Dillon
Big Horn	Hardin
Blaine	Chinook
Broadwater	Townsend
Carbon	Red Lodge
Carter	Ekalaka
Cascade	Great Falls
Chouteau	Fort Benton
Custer	Miles City
Dawson	Glendive
Deer Lodge	Anaconda
Fallon	Baker
Fergus	Lewistown
Flathead	Kalispell
Gallatin	Bozeman
Garfield*	Jordan
Glacier*	Cutbank
Granite	Philipsburg
Hill	Havre
Jefferson	Boulder
Lewis and Clark	Helena
Lincoln	Libby
Madison	Virginia City
McCone*	Circle
Meagher	White Sulphur Springs
Mineral	Superior
Missoula	Missoula
Musselshell	Roundup
Park	Livingston
Phillips	Malta
Pondera*	Conrad

COUNTY	County seat
Powder River*	Broadus
Prairie	Terry
Ravalli	Hamilton
Richland	Sidney
Roosevelt*	Mondak
Rosebud	Porsythe
Sanders	Thompson Falls
Sheridan	Plentywood
Silver Bow	Butte
Stillwater	Columbus
Sweet Grass	Big Timber
Teton	Choteau
Toole	Shelby
Treasure*	Hysham
Valley	Glasgow
Wheatland	Harlowton
Wibaux	Wibaux
Yellowstone	Billings

\* Established by the legislature in 1919, without county-seat, which was to be determined by county commissioners of each county.

The following is the population of cities with more than 10,000 population, as given by the 1910 census: Butte, 39,165; Great Falls, 13,948; Missoula, 12,869; Helena, 12,515; Anaconda, 10,134; Billings, 10,031. Cities of over 2,000 population are Glendive, Miles City, Red Lodge, Roundup, Dillon, Hamilton, Glasgow, Havre, Kalispell, Walkerville, Bozeman, Livingston, Lewistown. Nearly all of the cities and towns are growing rapidly. Many important business places have appeared within a few years, as Baker, Hardin, Roundup, Valier, Polson and Hysham. Many small places far inland from railroads do very large business. Butte, the largest city in the State, is situated on the Pacific side of the main range, at an altitude of 5,700 feet, a few miles from the summit of the range. It is noted for the wonderful richness and extent of its mines. It is a railway centre, the transportation facilities making it an important wholesale and distributing point. The State School of Mines is located at Butte. Great Falls, the second city in the State, was located and plotted by Paris Gibson, yet living, and James J. Hill, in 1883, before the coming of the railroad or the building of a house. It is a beautiful city, with parks and boulevarded streets. It is an important commercial centre and the several falls in the river make it a great source of electrical power. A large smelter is located on the bank of the Missouri River. It has many factories and is the centre of a large agricultural country. Missoula, the Garden City, is on the west side of the range, at the mouth of Hell Gate Cañon. It has a large surrounding agricultural, fruit-growing and lumber country. The Milwaukee and Northern Pacific transcontinental roads pass through the city and there are branch roads up the Bitter-Root River, over the Cœur d'Alene Mountains to Idaho and up the Big Blackfoot River. It has a beet sugar factory, erected in 1917, flour mills and other factories and is the seat of the State university. A few miles out is the government army post, Fort Missoula. Helena, the capital of the State, owes its existence to the discovery of gold in Last Chance Gulch. The capitol is a beautiful building, constructed from sandstone from Columbus, costing \$1,100,000. The elevation of Helena, 4,700 feet, and its location near the summit of the main range of the Rockies, give it a delightful climate. The Montana Wesleyan and Mount Saint Charles College are located in Helena. The State Fair is held annually near the city. Anaconda, the Smelter City, was

founded by Marcus Daly as a suitable place for the erection of smelter works. The Washoe Smelter, employing between 3,000 and 4,000 men, is the largest in the world. Anaconda is on Warm Spring Creek in the Deer Lodge Valley, elevation one mile above sea-level. A State fish hatchery is located in Anaconda. Billings is the largest city in eastern Montana and is in a rich agricultural region, with extensive livestock interests. It has excellent railroad facilities and is a large distributing centre. A large beet sugar factory is located at Billings and near the city is the Billings Polytechnic Institute. Miles City is "the greatest primary horse market" in the world. Bozeman is the home of the State College of Agriculture and Mechanic Arts and of a United States fish hatchery. Livingston is the gateway to the Yellowstone National Park. Red Lodge has great coal mines.

P. Railway, Saint Paul; *Rocky Mountain Magazine*; Proceedings of the State Historical Society. Publications from the agricultural experiment station at Bozeman, from the University of Missoula and by the various State officers. Annual report, Bureau of Agriculture, Labor and Industry, Helena.

MORTON J. ELROD,

*Director of Biological Station, University of Montana.*

**MONTANA NATIONAL BISON RANGE AND HERD.**—The range is in western Montana, along the Northern Pacific Railroad between Ravalli and Dixon. The tract set apart for the home of the herd contains approximately 20,000 acres, with both grazing land and timber. In the centre is a mountain about 2,500 feet high, with grassy slopes and wooded ridges. On the north side of the range several miles of Post Creek are included. On the south side the range takes

in about a mile of the Jocko River. In the interior are several large springs. The place is ideal for buffalo. It is estimated the food supply is sufficient for a herd of from 1,500 to 2,500 animals. The range was selected by Prof. M. J. Elrod, of the University of Montana, for the American Bison Society, with W. T. Hornaday, then president. In 1908 Senator Dixon of Montana introduced in Congress a bill to provide for the purchase of the range and for fencing. This became a law in May 1908. The American Bison Society raised a fund of \$10,560 for the purchase of bison for the range. Thirty-seven animals made the nucleus of the present herd, about 300 (spring of 1919). In addition, elk, antelope and white-tailed deer have been added since, and are doing well. The selection of the range was a part of the plan of the American Bison Society to save the bison from extinction. Mr. Hornaday expressed the opinion that this herd alone, one of several now in the United States, is sufficient to save the species from becoming extinct. The location is ideal, the surface is sufficiently undulating to afford protection from storms from any direction, there is abundance of bunch grass, it is easy of access and the animals subsist summer and winter upon the vegetation of the range. Consult Report of the American Bison Society (1908) and subsequent reports.

**MONTANA STATE SCHOOL OF MINES,** made one of the component parts of the University of Montana by act of legislature in 1913, founded in 1899, is located at Butte, the greatest mining centre in the world. Its work is confined exclusively to the preparation of mining engineers. It was endowed by a land grant of 100,000 acres, of which 33,085 acres have been sold, cash and deferred payments amounting to \$661,192.93. This amount draws interest. The number of students in 1917 was 88, in 1918, 52. The number of alumni was 135. There were seven professors, one of whom acted as president. The total value of all property (1918) was \$134,735. The total income was \$38,500. The departments include chemistry, geology, mineralogy, mathematics, mechanics, metallurgy, mining engineering and mining law. The course of instruction covers four years.

**MONTANA STATE COLLEGE OF AGRICULTURE AND MECHANIC ARTS,** made one of the component parts of the University of Montana in 1913, founded in 1893, is located at Bozeman. It was endowed by a land grant of 140,000 acres, of which 41,543 acres have been sold, the cash and deferred payments amounting to \$668,637.50. This draws interest. The number of students in 1917-18 was 789—382 men and 407 women. Several hundred additional students were enrolled in the short courses for farmers and their wives, and ministers. The total number of instructors, not including Experiment Station workers and members of the extension service, was 66. The alumni numbered 353. The State Experiment Station, with its director and staff of workers, is connected with the college. The college receives the benefit of the Federal land grants of 1862 and 1890, and also State and Federal appropriations. The

income in 1918 was, for the college, \$241,668; for the station, \$106,250; for extension service, \$93,023. The total endowment fund from land grants amounted to \$680,250. The college course is offered under several groups: the College of Agriculture, the College of Engineering, College of Applied Science, College of Household and Industrial Arts, School of Home Economics, School of Agriculture, School of Music and Vocational Education. The degree of Bachelor of Science is given for the completion of the various courses, and graduate work is offered. Short courses are offered in some lines of work. Farmers' Week brings several hundred people for intensive work. Ministers' Week has brought together nearly 50 each year. The buildings are modern and of permanent construction, and include the Main Hall, Hamilton Hall (dormitory for women), Agricultural Hall, Chemistry (new), Drill Hall and Engineering, with many smaller buildings and barns for experimental and laboratory work.

**MONTANA STATE NORMAL COLLEGE, The.** One of the four components of the University of Montana. The institution is located at Dillon and was created by act of the State legislature in 1892. In March 1913, made effective 1 July 1913, the several higher institutions of the State were constituted the University of Montana. The first chancellor was appointed and assumed his duties on 1 Feb. 1916, on which date the Normal College really became a part of the university through methods of administration. There were 19 members of the faculty on the instructional force. The number of students was 535. The income from all sources in 1918 was \$105,600. The land grant of the institution totals 100,000 acres, 33,000 of which have been sold. The proceeds of sales, invested in bonds, amount to \$423,625, with deferred payments of \$119,599 in 1919. The Shakespeare Club Loan Fund, to aid seniors, the Alumni Loan Fund, to aid seniors, and the S. P. Wells Loan Fund, to aid juniors and seniors, total more than \$1,000. For high school graduates two courses of instruction are provided, one two years in length, the other three years in length leading to the degree bachelor of pedagogy. Special courses for the preparation of rural school teachers and for supervision of domestic science, manual training and music in elementary schools are also offered. The public elementary schools of Dillon are utilized as a training school. This training school enrolls 600 pupils.

**MONTANA STATE UNIVERSITY,** originally the University of Montana, made one of the component parts of the latter by legislative act of 1913, is located at Missoula. It was endowed by a grant of land, 46,560 acres, from Congress in 1892. Of this amount 30,668 acres have been sold, the sales amounting to \$539,715. The doors of the institution were opened September 1895 with a few students and six members of the faculty. In September 1918, the faculty included 65 professors, assistant professors and instructors, 19 lecturers and 7 librarians, a total of 91. The total number of students was 941,—304 men and 637 women. The total number of alumni was 488. The income from all sources was \$309,409.78. Courses

are offered in the College of Arts and Sciences in biology, botany, chemistry, economics, education, English, fine arts, geology, history and political science, home economics, Latin and Greek, mathematics, modern languages, physics, psychology, public speaking, physical education. There are professional schools in forestry, journalism, law, music and pharmacy. Provision is made for graduate work. A biological station is maintained at Flathead Lake. The work of the university continues throughout the year, on the four-quarter system. The degrees conferred are A.B. and B.S., and the corresponding masters' degrees. Women are admitted on equal terms with men. The income is derived in part from the sale of land, in greater part from legislative appropriation. The campus contains about 50 acres, with an adjoining portion of Mount Sentinel of 560 acres. This beautiful mountain rises from the level plain 3,200 feet high. In 1918 the buildings were main hall, science hall, Craig hall (women's dormitory), library, natural science building (new), gymnasium, two barracks buildings constructed for the Student Army Training Corps, a hospital to care for 50 patients and a Y. M. C. A. hut. Legislative appropriation was made for a new library building. The library contains about 40,000 volumes and 18,000 pamphlets, and receives over 400 periodicals.

**MONTANAR, mōn-tā-nār, Valentine Hilaire,** French-American missionary: b. Marignane, France, 14 Feb. 1870. He was educated at the seminaries of Aix, France, and the Paris Seminary for Foreign Missions. In 1889 he joined the Society for Foreign Missions, was ordained priest in 1893 and the same year was sent on the Kwang-tong mission, China. While in that province he was stationed successively at Linchow and San Ning. From 1908 to 1912 he was in New York in charge of the Chinese Catholics of that city and from 1912 to 1915 he was in charge of the Catholics of Chinese birth at Montreal, Canada. He was persecuted during the Boxer uprising in China and saw many of his Christian chapels and villages laid waste. In 1905 he was accused by Chinese officials at San Ning of implication in the massacre that took place there that year. He was exonerated of all blame, however, upon investigation by Mr. Lay, American consul at Canton, and Commander Evans of the United States navy. He compiled a Chinese-French dictionary, for use in the missionary schools conducted by him and is the author of 'Method of Learning the Cantonese Language'; 'Fifteen Years in China,' and contributions to 'The Catholic Encyclopedia,' the *Bulletin de Notre Dame de Beauregard*, and various American and French periodicals.

**MONTANELLI, mōn'tā-nēll'ē, Giuseppe,** Italian author and patriot: b. Fucecchio, January 1813; d. there, 17 June 1862. He studied law. He became counsel, writing at the same time on philosophical subjects and (1836) issued a volume of lyric poetry. In 1840 he was made professor of Italian and commercial law at Pisa. He founded the Society of Fratelli Italiani (1844), started (1847) the periodical *L'Italia*, fought at Curtatone (1848) and was made (1849) a member of the triumvirate with Guerrazzi and Mazzini. He was given a mission in

Paris, from whence he issued a series of works of a striking character such as 'Memorie sull' Italia e specialmente sulla Toscana dal 1814-1850' (Turin 1853-55); 'La sensazione' (Paris 1856), a dramatic poem; 'Camma,' a gripping tragedy; also the political works, 'Il partito nazionale italiano' (Turin 1856); 'L'impero, il papato, la democrazia in Italia' (Florence 1859). In 1859 he was again called to arms and (1862) was elected to Parliament. Consult Provençal, 'Alla cara memoria di Giuseppe Montanelli' (Lephorn 1862); Redi, Ricardo, 'Biografico di Giuseppe Montanelli' (Florence 1883); Orlando, 'Il Montanelli poeta,' in *Marzocco* (ib. 1910).

**MONTANISM**, mon'-, the religious system of Montanus (q.v.).

**MONTANITE**, a mineral consisting of the hydrated oxides of bismuth and tellurium, and having the formula  $\text{Bi}_2\text{O}_3 \cdot \text{TeO}_2 \cdot 2\text{H}_2\text{O}$ . It occurs as an incrustation, frequently in connection with the mineral teradymite, from which it is often formed by alteration. It is soft and opaque with a waxy lustre, and is variable in color. Montanite is found at Highland, Mont., and also in Davidson County, N. C., and at Norongo, N. S. W.

**MONTANUS**, mōn-tā'nūs, Phrygian sectary of the middle of the 2d century A.D. Of him practically nothing is known save in connection with his sect, the Montanists. He was a heathen priest, a native of Ardahan; was converted to Christianity about 156; and about 171 A.D., proclaimed himself the Paraclete or Comforter promised by Jesus. He soon gathered around him a group of followers who believed with him that he was the mouthpiece of the Holy Spirit, as were his companions Prisca, or Priscilla, and Maximilla, each of whom had left her husband to join Montanus. Both these women uttered prophecies, but like Montanus claimed to be only the passive agents of the Holy Ghost. Montanus' principal tenets, apart from his belief that every believer may be the means of special revelation, were largely millenarian; in view of the approaching end of the world he enjoined asceticism, strict church discipline with the exclusion of all offending members, the terrible effect of mortal sin and the incompetency of the Church to forgive it. He and his followers counted it sin to attempt escape from persecution. He was excommunicated with his followers about 175, and died soon after; Maximilla, the last of the prophets, died in 179. His teaching spread after his death, his most notable disciple being Tertullian (q.v.). The sect soon died out in the West, but survived in the East until the time of Justinian, when it was suppressed. Consult Bonwetsch, 'Geschichte des Montanismus' (1881); Erlangen, De Loyres F., 'Montanism and the Primitive Church' (Cambridge 1878).

**MONTARGIS**, mōn-tār-zhē, France, a town in the department of Loiret, 47 miles east by north of Orleans. It is a manufacturing town with an important trade in paper, cotton goods, leather, shoes, chemicals and agricultural produce. Mirabeau was a native; the castle anciently a favorite residence of the reigning family was called "The Royal Cradle," and here in 1371 occurred the famous judicial combat between the "dog of Montargis" and Macaire, its mas-

ter's murderer. The dog not only showed the spot in the forest of Bondy where its dead master was buried, but singled out the murderer, and when Charles VI granted the ordeal of battle to test his guilt, the dog flew at his throat and so proved its charge upon his body. Pop. 13,000.

**MONTAUBAN**, mōn-tō-bōn, France, capital of the department of Tarn and Garonne, on the Tarn, 342 miles south by west of Paris. It is situated on a plateau surrounded by the Tarn, the Tescou and a deep ravine. The cathedral, episcopal palace, hôtel de ville and the bridge over the Tarn are its principal features. Montauban has manufactures of silk bolting cloths, of common cloths, colors, porcelain, starch, candles, etc.; silk and wool spinning-mills, dye-works, potteries, etc. During the religious wars in France, Montauban was a stronghold of the Huguenots, and was besieged in 1580 by Montluc, and in 1621 by the troops of Louis XIII, without success; but it was taken in 1629 by Richelieu, and its walls razed to the ground. The Protestants maintain both an academy and a theological college. The artist Ingres was born at Montauban; many of his pictures are in the museum and his celebrated 'Vow of Louis XIII' hangs in the cathedral. Pop. 30,000.

**MONTAUK INDIANS**, an American tribe of the Algonquin family formerly occupying the extreme eastern end of Long Island, N. Y. They were formerly a powerful people, but a pestilence in the 17th century reduced their number to less than 1,000. Since 1903 only about a dozen of the Montauk tribe survive on Long Island.

**MONTAUK POINT**, N. Y., the eastern peninsular promontory of Long Island, in Suffolk County, with lighthouse and life-saving stations, the lighthouse, in long.  $41^\circ 4' \text{ N.}$ ; lat.  $71^\circ 51' \text{ W.}$ , being built of stone, 170 feet high, and its light visible 19 miles. The peninsula has a height of from 50 to 100 feet above the sea, is rolling and wooded and noted for its bracing healthful climate. Here in 1898 Camp Wikoff was established for the sick, wounded and convalescent soldiers who had served in the Spanish-American War.

**MONTAUSIER**, mōn'tō'zyā, Charles de Sainte-Maure, MARQUIS DE, French diplomat: b. 6 Oct. 1610; d. 17 May 1690. He entered the army young, distinguished himself in Italy and Lorraine and in his 28th year became major-general. After seceding from the Reformed Church and subscribing to the Catholic faith (1645) he was created lieutenant-general and governor of Saintonge and Angoumois. He remained true to the court during the Fronde war and, in 1665, he was raised to marquis and peer, being appointed guardian of the Dauphin in 1668. In 1680 he was made chief chamberlain. Under his supervision Bossuet and Huet edited the classical writers in *Usus Delphini*. He was distinguished for strict morality and love of the truth, in fact his character was inclined to be sombre, from which fact he was used by Molière as the original Misanthrope. He married Julie Lucine d'Angennes, daughter of Marquis de Rambouillet, a lady of great beauty and whose talents made their home the centre of the most noted sages

and artists of the day. Consult Roux, A., 'Montausier, sa vie et son temps' (Paris 1860).

**MONTBÉLIARD**, mōn'bā'lyār, France, capital town and fortress in the department Doubs, located on the Allaine, into which the Lisaine discharges at this point. It is on the Rhine-Rhone Canal and on the Lyons Railway and has a lofty castle dating from the 15th and 16th centuries, a Protestant church (Saint Martin's), erected 17th century, and a modern Catholic church. There are monuments to Cuvier, who was born here, and Denfert-Rochereau, also a natural history and an archæological museum, a college, trade school, library, Chambers of Agriculture and Trade, also manufactures of hardware, clocks, tools, cotton goods. Considerable trade is done in building lumber and cheese. It was formerly the capital of the dukedom of Burgundy, becoming the domain of Würtemberg (1397) by marriage but was repeatedly occupied by the French (1674-97 and 1723-48), becoming French territory (1801) by the Treaty of Lunéville. Pop. (1911) 10,392, mostly Protestants.

**MONTCALM**, mōnt-kām' (Fr. mōn-kālm), Louis Joseph de Saint Vêran, loo-ê zhō-zêf dè sãn vâ-rãn, MARQUIS DE, French soldier: b. near Nîmes, 1712; d. Quebec, Canada, 14 Sept. 1759. He entered the army at 14, distinguished himself in the war for the Austrian Succession and gained the rank of colonel in the battle of Piacenza, Italy, in 1746. In 1756, being then a brigadier-general, he was appointed to command the French troops in Canada, where he began operations against the English with great activity and success. Fort Ontario at Oswego was carried on 14 Aug. 1756, after a well-conducted attack. The next year he took Fort William Henry, at the head of Lake George, which was held by a garrison of over 2,500 men, and thus became possessed of 42 guns and large stores of ammunition and provisions. In the campaign of 1758 he occupied the strong position of Fort Carillon (Ticonderoga), made it still stronger by entrenchments, and on 8 July held it with 3,600 men against a British force of over 15,000. His personal bravery had gained him great popularity among his soldiers, but the want of energy on the part of the home government, the scarcity of food all over New France and personal dissensions between himself and the civil governor forbade him to look for much assistance; and he expressed his conviction that in a few months the English would be masters of the French colonies in America; yet he prepared as best he could for the campaign of 1759. The English had sent strong reinforcements and were preparing for an attack on Quebec. As the success of the whole campaign and indeed the conquest of Canada depended upon the taking of that city, Montcalm had concentrated his principal forces on the banks of the Montmorency River to protect it. In the first attack, 31 July, the English general, Wolfe, was repulsed; he later succeeded in landing his troops above Quebec, and on 13 September brought his whole force to the Heights of Abraham; Montcalm at once opposed his advance, but though he led the attack in person, his troops soon broke before the fire of the British. Wolfe fell in the moment of triumph; Montcalm was mortally wounded and died the next morning.

Consult Bonnechose, 'Montcalm et la Canada Française' (1877); Parkman, 'Wolfe and Montcalm' (1885); Falcaïrolle, 'Montcalm devant la Postérité' (1886); Doughty, 'The Siege of Quebec and the Battle of the Plains of Abraham' (1901).

**MONTCEAU-LES-MINES**, mōn'sō-lāmēn', France, town in the department Saône-et-Loire, on the Canal du Centre and the Lyons Railway. It is the centre of coal mining, lime-burning and copper foundries and has woodenware factories. Pop. (1911) 26,830.

**MONTCHRESTIEN**, mōn'krā'tyān', Antoine de, French dramatic author: b. Falaise, about 1575; d. near Tourailles, 1621. Having killed his adversary in a duel he had to flee to England but was pardoned by Henry IV and was killed in a Huguenot uprising. Of his tragedies worth notice are 'Sophonisbe' (1594); 'Aman' (1599); 'L'Écossaise, ou Marie Stuart' (1601). He was also the first to give a conception of political economy in his 'Traité d'économie politique' (1615; new ed. by Funck-Brentano, Paris 1889). Consult Duval, 'Mémoire sur Antoine de Montchrestien' (Paris 1868); Funck-Brentano, 'Montchrestien, sa vie et son œuvre' (ib. 1889); Julleville, Louis Petit de, 'Les tragédies de Montchrestien' (ib. 1891); Lavalley, Paul, 'L'œuvre économique d'Antoine de Montchrestien' (Caen 1903).

**MONTCLAIR**, mōnt-klār', N. J., a town in Essex County, five miles northwest of Newark, on the Lackawanna and Erie railroads. The upper portion was originally called Speertown when settled by Hollanders from Hackensack, and the lower portion was first called Crantown, then West Bloomfield, by its English settlers from Newark. It was at first included in Newark, and afterward in Bloomfield. It received its present name in 1865 and received its charter of incorporation in 1868. Montclair is situated on the first range of the Orange Mountains, at an average altitude of 300 feet, its highest point at 650 feet embracing an extensive view. It is noted for its healthful climate, and is principally a residential place, the home of many New York business men. It has a hospital, military academy, two orphan asylums, high schools, public library, national and State and savings banks. Its industrial establishments include electric construction works, printing establishments, et. Pop. 25,029.

**MONT-DE-MARSAN**, town, capital department Landes, France, 65 miles south of Bordeaux. It has a mineral spring, manufactures of resin and oil, and a trade in lumber, wine and cattle. Pop. 12,000.

**MONTE**, Saint Angelo, mōn'tā sânt ān'jā-lō, Italy, town in the province of Foggia, located on the southern slope of Monte Gargano near the Gulf of Manfredonia. Its noted 11th century grotto church dedicated to Saint Michael is much visited by pilgrims. The inhabitants of the entire commune were 23,012 in 1911.

**MONTE CARLO**, mōn'tē kār'lō, Monaco, a town of the principality about one mile northeast of the capital, celebrated for its Casino, the most luxuriously appointed gambling establishment in the world, founded in 1858. Monte Carlo is also noted for its scenic surroundings, its mild and healthful climate and its attractive

appointments of perfect roads, magnificent gardens, handsome promenades and elegant residences. Its situation on an isolated elevation overlooking a bay of the Mediterranean is particularly beautiful. The "Association of the Watering-Place and Strangers Club of Monaco," with a capital of \$6,000,000 in 60,000 shares, holds the contract, which was made with the late M. François Blanc to expire in 1913, whereby the reigning prince was paid annually the sum of \$350,000 for the concession to play. The society in 1898 was granted an extended concession to 1947, for a cumulative decennial increase in its annual payment; it practically bears also the cost of the temporal and spiritual government of the principality, its annual expenditure alone amounting to over \$4,000,000. Roulette and trente et quarante are the principal games played. Pop. 10,000. See MONACO.

**MONTE-CASINO.** See CASINO, MONTE.

**MONTE CRISTO**, mōn'tē krēs'tō, or kris'tō, a small island in the Mediterranean belonging to the Italian province of Leghorn, 28 miles south of Elba. In the 16th century it was ravaged by pirates, and as it is rocky and barren, rising 2,000 feet above the sea, it long remained uninhabited. Since 1874 there is a penal agricultural colony here. The elder Dumas gave the name of this isle as title of the hero of one of his most popular romances, 'The Count of Monte Cristo.'

**MONTE ROSA**, rō'sā, on the Italian-Switzerland boundary, is an Alpine mountain mass of the Pennine ridge, with numerous peaks, eight of which are over 13,000 feet high. Dufour Spitze, the principal peak, is second to Mont Blanc as the highest peak of the Alps, reaching an altitude of 15,217 feet, 564 feet less than its rival, 50 miles to the southwest. Monte Rosa is covered on all sides with glaciers, chief of which is the Gorner Glacier on the west, six and one-half miles long. The peak was first ascended—a most difficult feat—in 1855. Copper and iron mines are worked in the mountain.

**MONTE SAN GIULIANO**, mōn'tā san joo-lyā'nō, Italy, town in the Sicilian province of Trapani and located 2,540 feet above sea-level on an isolated mountain, the Eryx of the ancients. Remains of the old Phœnician walls still exist and a few remnants of the ancient temple of Aphrodite as well as the cistern (Venus spring). It has a 14th century church and a castle affording a magnificent panoramic view. Its industrial life consists of olive culture and marble quarries. In 1911 it had 28,663 inhabitants.

**MONTEBELLO**, mōn'tā-bēl'lō, Italy, village in the province of Pavia, situated on the Coppa. It is noted through two battles fought here. The first occurred 9 June 1800, and is frequently called the battle of Casteggio, in which General Lannes defeated the Austrians thereby gaining the title Duke of Montebello. The second, fought 20 May 1859, was won by the French under Forey, while the Austrians were commanded by Stadion. Pop. 2,183.

**MONTECUCULI**, mōn-tē-koo-lē, or **MONTECUCOLI**, Raimondo, Austrian military commander: b. near Modena, 21 Feb. 1609; d. Linz, 16 Oct. 1680. He entered the Austrian service and served during the Thirty Years'

War with great distinction. After the Peace of Westphalia (1648) he visited Sweden and England in a diplomatic capacity; and in 1657 the emperor sent him to the aid of the king of Poland against Rakoczy and the Swedes, and next year he assisted the Danes against the latter. In 1664 he gained a great victory over the Turks after having driven them out of Transylvania. In 1673 he was placed at the head of the imperial troops and checked the progress of Louis XIV by the capture of Bonn and by forming a junction with the Prince of Orange in spite of Turenne and Condé. Montecuculi's subsequent advance into Alsace was repulsed by the Prince of Condé. His last military exploit was the siege of Philipsburg. The Emperor Leopold made him a prince of the empire and the king of Naples gave him the duchy of Melfi. His memoir on the Turkish war, written in Italian (1703), was translated into several languages. Consult Campori, 'Raimondo Montecucoli, la sua famiglia e i suoi tempi' (Florence 1877); Grossmann, 'Raimund Montecucoli' (Vienna 1878).

**MONTEFIASCONE**, mōn'tā-fyas-kō'nā, Italy, town in the province of Rome and circuit of Viterbo, situated on a hill to the southwest of Lake Bolsena and on the Attigliano-Viterbo Railway. It is the seat of a bishopric and has among its most prominent buildings a beautiful cathedral, a Romanesque church (San Flaviano), a 16th century castle, etc. The muscatel wine cultivated here is known as "Est, Est, Est," which has some connection with the grave inscription here dedicated to the Canon John von Fugger. Its population in 1911 was 9,563 for the commune. Consult Buti, L. Pieri, 'Storia della città di Montefiascone' (Montefiascone 1870).

**MONTEFIORE**, mōn-tē-fē-ō'rē, **Claude Joseph Goldamid**, English author and Jewish communal worker: b. London, 1858. He studied at Balliol College, Oxford; identified himself with Hebrew charities and educational movements in London; was president of the Jewish Historical Society (1899-1900); and is head of the Anglo-Jewish Association, the Jews' Infant Schools, etc. With Israel Abrahams he edited *The Jewish Quarterly Review* and wrote a series of sermons, 'Aspects of Judaism' (1895). He has published besides the Hibbert Lectures for 1892, 'The Origin of Religion, Illustrated by the Ancient Hebrews'; 'Liberal Judaism' (1903); 'The Synoptic Gospels' (1909); 'Some Elements of the Religious Teachings of Jesus' (Jowett Lectures, 1910).

**MONTEFIORE**, **SIR MOSES HAYIM**, Jewish philanthropist: b. Leghorn, Italy, 24 Oct. 1784; d. Ramsgate, England, 28 July 1885. He was descended from a family of wealthy Anglo-Italian bankers; was educated in London; became a leading member of the Stock Exchange; and retired from active business in 1824. From that time he devoted himself to the service of his race, working for the removal of disabilities and oppression under which the Jews in England and elsewhere had suffered great hardship. His wife, whom he married in 1812, was Judith Cohen, a relative of the Rothschilds, and in her Montefiore found a companion who entered ardently into his philanthropic undertakings. He was for a time high sheriff of Kent, and after long exclusion and repeated

*Moses Montefiore, Bart*

re-election was legally recognized as sheriff of London in 1837. In that year he was knighted and in 1846 raised to a baronetcy in recognition of his meritorious public services. He distinguished himself by his practical sympathy for his race in various countries, chiefly in Poland, Russia, Rumania and Damascus. He made seven journeys to the East, the first in 1827, and the last in 1874, mainly for the amelioration of the condition of the Jews. At Bucharest during an anti-Jewish tumult, he boldly faced the mob at the risk of his life. In 1865 he endowed a Jewish college in memory of his wife, who died three years before, at Ramsgate, where he passed the last years of his life, dying there in his 101st year. In his 100th year he was a type of hale and venerable manhood.

**MONTEGO BAY**, West Indies, harbor on the north coast of the island of Jamaica. It contains a teachers' seminary, hospital, etc., and has a considerable export trade in fruits and other produce. It is the seat of an American consular station and had 6,616 inhabitants in 1911.

**MONTELEONE DI CALABRIA**, mōn'-tā-lā-ō'nā dē kə-lā'brē-ā, Italy, capital of a circuit in the province of Catanizara, near the Gulf of Sant Eufemia and located on the Naples-Reggio Railway. It contains the ruins of the castle built by Frederick II, and also of the 15th century San Michele Church, besides a lyceum and grammar school. Its commerce consists chiefly of silk and oil production. The town was utterly destroyed by earthquake in 1783, and again much injured in 1905. In 1911 it had 13,066 inhabitants. Consult Pignatari, 'Sunto di notizie storiche intorno alla città di monteone' (Monteleone 1896).

**MONTELMAR**, mōn'tā'lē'mār, France, capital town of the arrondissement in department Drôme, located at the juncture of the rivers Roubion and Jahron on the Mediterranean Railway. It contains an ancient castle, now a prison, with a Romanesque chapel, a college, library, museum, Chamber of Agriculture, etc. Among its manufactures are hats, silks, paper goods, agricultural instruments and its noted almond candy (nougat). It has also considerable trade in silk, wine, truffles, lime, etc. The town receives its name from Adémar de Monteil who rebuilt it after its destruction, in the 10th century, by the Saracens. In the 15th century the town fell into the possession of the French Crown. It withstood the siege of Coligny heroically in 1570 but was taken by the Huguenots in 1587.

**MONTEMAYOR**, mōn-tā-mā'yōr, **Montemor Jorge**, Spanish-Portuguese poet and novelist: b. about 1520; d. 1561. His real name was Montemór, but it assumed the Spanish form Montemayor in Spain. There is little definitely known of the life of Montemayor. He was one of the poet musicians of his day who found refuge and welcome at the Spanish court where he was already on familiar terms in 1548. Six years later he accompanied Juana, the Infanta, to Lisbon where she was to be married to Dom João. He seems to have visited England and Holland with Philip II, and he may have been to Paris. He was assassinated in 1561. His most famous work is a pastoral novel entitled

'Diana Enamorada' (Madrid, between 1545 and 1559). Inflated in style, artificial in its depicting of character, indifferent in poetical value yet, as Cervantes had said, "it has the honor of being the first of the books of its class." Partly in verse and partly in prose, the latter is much the superior. The 'Diana' is written principally in Spanish, but it contains songs and prose passages in Portuguese. It became immensely popular and was widely imitated not alone in Spain but in the other countries of southern and western Europe. It was translated into English by Bartholomew Young in 1583 and published in 1598 and was very widely read in England. Sidney's 'Arcadia' probably owed its existence to the 'Diana' and it was certainly strongly influenced by it; and Shakespeare, in 'Two Gentlemen of Verona' and in parts of other plays shows the effect that the 'Diana' had already had upon English literature. Montemayor's work, being modeled on the Italian pastoral novel which had, to a certain extent, already had its influence upon English literature, the 'Diana' found the proper soil in which to plant itself. Montemayor, who had not finished the 'Diana Enamorada' at the time of his death, left instructions that it should be completed by Dr. Alonso Pérez of Salamanca who wrote accordingly 'Segundo del Salamantino' in 1564. In the same year Gil Polo wrote a second 'Diana Enamorada.' Both of these books are patent imitations of Montemayor's novel. Scores of other imitations followed, among the authors thereof being no less personages than Cervantes and Lope de Vega. The 'Cancionero' of Montemayor (2 vols., Antwerp 1544-58) contains some of his own lyrics. An edition of Montemayor's works was published in Barcelona in 1886.

**MONTENEGRO**, mōn-tē-nā'grō (native, *Tzernagora*; Turkish, *Karadagh*, Black Mountain), a former kingdom northwest of Turkey, bounded north by Bosnia and Herzegovina, east by Bosnia, south by Albania and west by the Adriatic Sea and a strip of Dalmatia. Its area was increased by the Treaty of Berlin of July 1878, from about 1,710 to about 3,630 square miles, and after the Balkan War in 1913 to about 5,603 square miles. The country is a succession of elevated ridges, diversified here and there by a lofty mountain peak, some of them attaining elevations of 5,000 or 6,000 feet, or even 8,000

feet on the borders of the country, with a few beautiful and verdant plains and valleys, in which the soil is tolerably fertile; chief of these are the department of Tzernitza and the valleys of Bielopavlich, watered by several streams, the principal of which is the Mortasa, which falls into the Lake of Scutari. The climate is healthful. Forests of oaks and holly, ash, beech, firs, walnuts, hazel, wild pears, poplars, willows, alders and the sumach, used for dyeing and tanning, cover many of the mountain sides. The cultivated productions are corn, potatoes, cabbage, cauliflower and tobacco, with several kinds of fruit-trees, including the peach, olive, pomegranate, mulberry and others. In the department of Tzernitza, already mentioned, apples, vines, carobs, almonds, figs, quinces, walnuts, etc., also grow in abundance. Agriculture is in a rude state, though every cultivable piece of land, even if only a few feet square, is planted with corn, potatoes or some other useful plant. Sheep, goats and pigs are reared in great numbers; the two former affording a profitable supply of wool and cheese for exportation. Game is not abundant, but fish are taken in great quantities, and are of excellent quality, particularly the trout, which are celebrated, and some of them of immense size; and a kind of carp is caught in large quantities, and dried and salted for export to Vienna and Trieste. Manufactures, with exception of a coarse woolen stuff, are unknown. The chief occupations of the inhabitants are agriculture and fishing; the latter carried on principally in the Lake of Scutari, which lies partly in Albania. The exports of Montenegro are smoked mutton-hams, salted fish, wax, honey, hides, tallow, cheese, butter, cattle and other agricultural produce. The chief imports are cattle, tobacco, salt, wine, brandy, coffee, sugar and manufactured goods. The Montenegrins belong to the Serbian branch of the Slavonic family of peoples. They are generally of tall stature and well proportioned, with singularly powerful voices, which enable them to carry on conversations at incredible distances; foreheads good, face rather square, moderately aquiline or straight nose and animated eyes. Both men and women are robust: the latter are often beautiful when young but soon lose their good looks by laborious and unfeminine occupations. The people generally are cheerful in manner, extremely brave and hospitable and courteous to all except the Turks, whom they hate. The men go at all times fully armed. The houses are of stone, generally with thatched roofs; but many are covered partly or entirely with wooden shingles. There are few towns in Montenegro, but there are some 300 villages; Cetinje (q.v.) is the capital; Podgoritz (pop. 14,000); and the seaports Dulcigno and Antivari are the principal towns. The language of the Montenegrins is a Slavonic dialect. In religion they are all of the Greek Church. Education, which was formerly much neglected, is now becoming freely diffused, the public schools having increased from one in 1851 to about 70 in 1890. Montenegro, until 1851, was a theocracy, governed by a Vladika or prince, who was at once a bishop, a judge, a legislator and a commander-in-chief. The office was hereditary in the family of Petrovitch from 1697. But as the Vladika could not marry, the dignity was inherited through brothers and nephews. In 1851 the civil and ecclesiastical

offices were disjoined, the Vladika confining himself to the latter, while the former devolved on the Hospodar. The revenue of the principality was estimated for 1914 at about \$390,000. Montenegro has no coinage of its own. Pop. about 516,000.

Montenegro formed a part of ancient Illyria, and in the Middle Ages belonged to the great Serbian kingdom. The origin of the sacerdotal power dates from 1516, when the secular prince, having no children, withdrew to Venice, and transferred the government to the Archbishop Germanos. In the reign of Peter the Great the Montenegrins placed themselves under the protection of Russia, both sharing in a common enmity against the Turks. In 1796 the Prince-bishop, Pietro I, inflicted such a loss on the Pasha of Scutari, who had invaded Montenegro, that for many years they left it unmolested. Pietro II (1830-51) made strenuous efforts to improve the condition of his people by liberalizing the constitution, and attempting to reclaim his subjects from their vindictive and predatory habits. His successor, Danilo I, having separated the civil and ecclesiastical offices, Russia withdrew her subsidy of 8,000 ducats, but subsequently resumed payment of it, not, however, before great internal commotion had arisen from the necessary imposition of taxes to meet the deficit so caused. The Turks, led by Omar Pasha, again invaded the country, but a treaty was arranged 15 Feb. 1853. Danilo was assassinated in 1860, and was succeeded by Prince Nicholas I. In 1861 the Montenegrins excited a rebellion against the Turkish sway in the Herzegovina, the result of which was the infliction of such punishment on them that they were compelled (1862) to accept a disadvantageous peace, in which it agreed to the occupation of several points on the road from Herzegovina to Scutari by Turkish troops. In 1870, however, the principality managed to get these troops withdrawn. In 1876 Montenegro joined Serbia in a war against Turkey, and on the conclusion of the Russo-Turkish War of 1877-78, and the Balkan War in 1913, it received, as already mentioned, an accession of territory. On the 50th anniversary of his accession, 28 Aug. 1910, Nicholas I, by request of the National Skupshtina, assumed the title of king. When the European War began in 1914, Montenegro allied herself with Serbia, and in 1915 was overrun by the Teutonic forces. Ipek was captured, 6 Dec. 1915, and the capital, Cetinje, occupied, 13 Jan. 1916, the Montenegrin government retiring to Neuilly-sur-Seine, France. For later history see WAR, EUROPEAN. Consult Denton, W., 'Montenegro: Its People and Their History' (London 1877); Murray, W. S., 'The Making of the Balkan States' (London 1912); Stevenson, F. S., 'A History of Montenegro' (London 1912); Trevor, R., 'Montenegro, a Land of Warriors' (London 1913).

**MONTENOTTE**, mōn'tā-nōt'tā, Italy, village in the province of Genoa, in the district Savona, and located on the Cairo-Montenotte-Alessandria Railway. It is noted on account of the battle in which Napoleon won his first victory here, 12 April 1796, over the Austrians under Argenteau. It has but about 200 inhabitants.

**MONTEPIN**, mōn'tā'pān, Xavier Aymon, Count de, French writer: b. Apremont, 18

March 1824; d. Paris, 30 April 1902. He was one of the most fertile and successful representatives of the strung-out *feuilleton* novel writers of small literary merit. Most of his novels appeared in fragments in the *Petit Journal* before being brought out in volume form, when they were dramatized by his friend Dornay for use on the *Ambigu* stage. Among the best-known works are 'Confessions d'un Bohème' (1850); 'Mignonne' (1851); 'Mademoiselle Lucifer' (1853); 'Les viveurs de Paris' (1852-56, 14 vols.); 'La maison maudite' (1867); 'Les tragédies de Paris' (1874); 'La Majesté l'Argent' (1877); 'Trois millions de dot' (1891), etc. Successfully placed on the stage were 'Le Connétable de Bourbon' (1850); 'La Sierene de Paris' (1860); 'Le médecin des pauvres' (1865); 'La porteuse de pain' (1889); 'La joneuse d'orgue' (1896).

**MONTEPULCIANO**, mōn'tā-pūl-chā'nō, Italy, a district capital in the province Siena, located on one of the Subapennine heights of Tuscany and on the Empoli-Chiusi Railway. It has churches and palaces dating from the 14th to the 17th centuries, among which are the cathedral with its funeral monuments by Donatello and Michelozzo, and the beautiful cupola church Madonna di Saint Viaggio outside the town, started by Antonio da Sangallo the Elder (1518); an ancient castle, 14th century town-hall, gymnasium, technical school, library, collection of ancient Etruscan antiquities, etc. It has an excellent wine culture and produces much oil and silk. It is the birthplace of Cardinal Bellarmine and the sage and poet, Angelo Ambrogini (Poliziano). Its population in 1911 was 15,994 in the entire commune.

**MONTEREAU**, mōn'tē-rō, France, a town in the department Seine-et-Marne and arrondissement Fontainebleau, located on the left bank of the Seine which is here joined by the Yonne. It is the junction of the Lyons and East railways and has a church dating from the 13th-16th centuries, a statue of Napoleon I on the Seine bridge, a commercial court of justice, chamber of manufactures, military hospital. Among its chief manufactures are porcelain, earthenware, mosaic tiles, shoes, agricultural machines, etc. Considerable trade is done in wine, grain, wood and cattle. This location was the Gallo-Roman Condate and received its name in the 6th century from a monastery (*Monasteriolum*). Duke John the Fearless (q.v.) was assassinated (1419) on the Yonne bridge here by the followers of the Dauphin. In the vicinity the French, under Napoleon I (18 Feb. 1814), won a victory over the Allies.

**MONTEREY**, mōn-tē-rā, Cal., city in Monterey County, on Monterey Bay and on the Southern Pacific Railroad, about 100 miles south by east of San Francisco. The site of the city was first discovered by Juan Rodriguez Cabrillo in 1542. In 1602 it was rediscovered by Viscaïno, who named it "Monterey" in honor of his patron, the Vicomte de Monterey, but it was not until 1770 that the Spanish, under Junipero Serra, made the first settlements and founded the mission San Carlos de Borromeo de Monterey, the second in California. From 1774 to 1825 it was the capital of the Spanish province. On 26 March 1825, the constitution of the republic of Mexico was ratified and the city remained the capital of Cali-

fornia during Mexican rule. Commodore Jones, of the United States navy, captured the place in 1842 and held it for one day, under the erroneous impression that war had been declared against Mexico. On 7 July 1846 Monterey was captured by Commodore Sloat. The American flag was raised over the custom house, which still stands, and California passed to American rule. In 1849 the State Constitutional Convention was held here and the first legislature of the State of California met in Colton Hall, another historic building which still stands. In 1850 the place was incorporated. The section in which the city is located consists of farm lands upon which are raised grains and fruits. Fishing and stock-raising are prominent industries. Over 10,000,000 pounds of fish are packed here annually and many tons shipped to the market. The total annual value of the combined catch is estimated at \$1,500,000. The combined resources of the Bank of Monterey and Monterey Savings Bank amounts to \$1,193,386; the combined deposits to \$999,625. Monterey is a favorite resort for summer and winter. Here is located the famous hotel and resort, Del Monte, with its 134 acres of beautiful gardens and grounds. Other points of interest are San Carlos Mission, Carmel Mission, home of Robert Louis Stevenson, home of Thomas O. Larkin, first American consul, headquarters of Generals Sherman and Halleck, ruins of the old Spanish fort, first brick house in California and the presidio of Monterey. It has good public and parish schools and a public library. The harbor at Monterey is the only undeveloped deep-water port on the Pacific Coast. It is the only harbor where vessels can enter in all kinds of weather and drop anchor without the aid of a pilot. Governmental appropriations aggregating \$800,000 have been made for the construction of a breakwater to destroy the currents which make it dangerous for large vessels to lay alongside at times and which is the harbor's only defect. Pop. 5,000.

**MONTEREY**, Mexico, capital of the state of Nuevo Leon, situated at the foot of the Sierra Madre Mountains at an altitude of 1,800 feet above sea-level, an important railroad centre for trade and commerce with the United States, 168 miles from the Texas boundary. The most notable industry is an extensive iron and steel mill, which employs a great number of men and produces large quantities of heavy iron and steel manufactures, both rolled and cast. Over \$25,000,000 are represented by the manufacturing and industrial enterprises of the city. No other point in northern Mexico is so important commercially, as Monterey. There are two local financial institutions, the Bank of Nuevo Leon, with a capital of \$2,000,000 and the Mercantile Bank, with a capital of \$2,500,000. The National Bank has a branch here and the Bank of London and Mexico an agency. The principal educational institutions are the School of Jurisprudence, Normal School for males, Normal School for females and the Academy of Drawing. There is a Natural History Museum and a well-equipped public library. The principal buildings of the city are the Juarez Theatre, the cathedral and the churches of San Francisco and the Purisima. The streets are well paved. In the centre of the city there

is a large spring of clear water. Four miles distant are the Topo Chico Hot Springs, the hourly output of which is 68,000 gallons. The waters of these are much like those of the famous hot springs of Arkansas. The prevailing style of architecture is Moorish. Pop. 78,500. The city was founded by the Spaniards in 1585 as Ciudad de Leon but renamed Metropolitan City of Our Lady of Monterey in 1596. The city was besieged in 1846 by General Taylor and compelled to capitulate. See MONTEREY, BATTLE OF.

**MONTEREY, Battle of**, in American history; in the early part of the war between the United States and Mexico, Monterey, which occupies a strong natural position and was well fortified by art, was held by the Mexican General Ampudia, with about 10,000 regular troops. In August 1846, General Taylor (q.v.) with a force of 6,625 men, mostly volunteers, marched from Matamoras to attack Monterey; and on 9 September he encamped within three miles of the place. Ten days were spent in reconnoitring, and on the afternoon of 19 September General Worth was ordered to march with his division around the hill occupied by the bishop's palace, to take a position on the Saltillo road and to carry the enemy's detached works in that quarter, while the main body of the army were to make a diversion against the centre and left of the town by batteries erected during the night. In the morning these batteries opened upon the city, which replied by a heavy fire from the citadel and other works. The lower part of the city was assaulted and entered by the Americans, and a Mexican work of great strength captured after hard fighting by a brigade under General Quitman. General Butler also entered the town at another point with the 1st Ohio regiment. Meanwhile General Worth carried the heights south of the river and the Saltillo road, and turned the guns of the Mexican works in that quarter upon the bishop's palace. The Mexicans evacuated the lower part of the city during the night, and early next morning General Worth stormed the height overlooking the bishop's palace; and by noon that stronghold itself was taken by the Americans and its guns turned upon its flying defenders. The houses of the city being solidly built and capable of defense, and the streets strongly barricaded, the Americans were forced to take each house in succession by breaking through the walls till they reached the principal plaza. The conflict lasted till the 23d, the Mexicans contesting desperately every foot of ground till nothing remained in their possession but the citadel. On the morning of the 24th General Ampudia capitulated and was allowed with his army to march out with the honors of war. The loss of the Americans in these operations at Monterey was 120 killed and 368 wounded. That of the Mexicans was not ascertained, but was probably much greater. See MEXICAN WAR. Consult Howard, O. O., 'General Taylor' (New York 1892); Ladd, H. O., 'The War with Mexico' (New York 1883); McElroy, R. M., 'The Winning of the Far West' (New York 1914).

**MONTESA**, mōn-tā'sā, Order of Our Lady of, one of the Spanish military orders established by James II of Aragon (1319) after the fall of the Knights Templar (1311)

and endowed with the latter's estates. The town and castle of Montesa also came into their possession as residence. The order followed the rule of the Benedictines. In 1587 it became united with the Spanish Crown and in 1872 was abolished, to be re-established in 1874. The decoration of the order is a golden lozenge with a red cross in the field surmounted by a trophy on a red ribbon. The garb is a white mantle with red cross. The knights are divided into *Caballeros profesos* and *Caballeros novicios*.

**MONTESANO** mont-e-sano, Wash., town, county-seat of Gray's Harbor County, on the Chehalis River, at the head of tide-water navigation and on the Northern Pacific Railroad, about 45 miles west by south of Olympia. It is in a region in which the chief occupations are farming, lumbering and fishing. It manufactures considerable lumber and lumber products and has creameries and important salmon fisheries. Three miles above the town on the Chehalis River is a salmon hatchery. Pop. 2,500.

**MONTESINOS**, mōn-tā-sē'nō, Fernando, Spanish historian: b. Osuna, Spain, 1593; d. Seville, Spain, 1655. He went to Lima, Peru, in 1610 and served under the government, afterward becoming visitor of the *audencia* of Charcas and councillor of the viceroy. By his considerate treatment of the Indians he won their friendship and their caciques placed at his disposal valuable information concerning their history. He ranks at the head of the Peruvian archæologists and he published several able works on metallurgy. Among his books are 'Ophyr de España, ó anales de los reynós de Quito y Lima' (1640); 'Memorias históricas del antiguo reyno de Quito' (1652), etc. Consult Prescott's 'History of Peru,' Vols. I and II and Jimenez de la Espada, M. (ed.), 'Memorias antiguas historiales y politicas del Peru' (in 'Coleccion de libros espanoles raros ó curiosos' Vol. XVI, Madrid 1882).

**MONTESPAN**, François Athenais, frān-swāz āth-ē-nā mōn-tēs-pān, MARQUISE DE, mistress of Louis XIV of France: b. 1641; d. Bourbon-l'Archambault, 27 May 1707. She was the 2d daughter of the Duke of Mortemart, and was, in 1663, married to the Marquis de Montespan. To great beauty she added a natural liveliness and wit, and a highly-cultivated mind. Soon after her appearance at court she attracted the king's attention and from 1668 till 1674 shared his favor with Mlle. de la Vallière, but supplanting her in 1674; M. de Montespan after a detention in the Bastille had already been ordered to retire to his estate. Mme. de Montespan bore eight children to the king, four of whom died in infancy. The others were entrusted to the care of Mme. Scarron, afterward De Maintenon. The influence of Mme. de Montespan was often exercised in public affairs, and her sway over the king continued until about 1679, when a growing attachment to Mme. de Maintenon finally estranged his affections from Mme. de Montespan. She rarely appeared at court after 1685, and in 1691 entirely quitted it. Her last years were devoted to religious exercises, acts of benevolence and penitence. The regent Orléans married Mademoiselle de Blois, one of her daughters by the king.

**MONTESQUIEU, Charles Louis de** *Secondat, Baron de la Brède et de*, French philosophical historian: b. at La Brède, near Bordeaux, 18 Jan. 1689; d. La Brède, 10 Feb. 1755. He was of a noble family, received an excellent education and studied law which was the family traditional profession. From his father and his mother he inherited titles, property and position, and his uncle, who died in 1716, left him his whole fortune, his very important judicial office of "président a mortier" and his old and noble family name of "Montesquieu." The office thus bequeathed him he held for 12 years, but his serious occupation was writing on philosophy, politics, natural science and various other subjects. In 1721 his 'Lettres persanes' were published at Amsterdam anonymously. In these Montesquieu satirizes the follies of his age in literature, society, politics and religion. So popular were these letters that the public called for several editions in the first year following their publication. They pointed the way to a new field in literature and are credited with being the first book in the so-called "Philosophie" movement. Montesquieu became a sort of literary lion in Paris and he enjoyed his reputation and the peculiar advantages it brought him to the full. But to do this he sold the life tenure of his office in Brède and removed to the capitol in 1726, and two years later he was elected a member of the Académie Française. He suddenly resolved upon an extensive tour of Europe with the purpose of observing the life of the various countries visited. His tour took him to Austria, Hungary, Italy, England and the Rhine country and occupied nearly four years which were very fruitful in the life of the author. Returning to La Brède he set up a great study hall and library 60 feet long by 40 feet wide. The result of his work here was, in part, 'Considérations sur les causes de la grandeur et de la décadence des Romains' which was published anonymously in Amsterdam in 1734. This became at once popular, not alone in France, but all over Europe, and was probably the most widely read of all Montesquieu's works. It opened the wide field of the philosophy of history. In the meantime he was carrying on deep and original researches for a still greater work. But he loved the literary salons and the brilliant life of Paris and much of his time was spent in the capital, however, not to the neglect of his literary investigations, for the 'Esprit des lois,' the most original book of its age, appeared in Geneva in 1748. It was published in two volumes comprising in all 31 books. Though the 'Esprit' met with considerable opposition at first, in France, it became popular in other European countries, and France soon also fell into line and Montesquieu was looked upon as the greatest literary man of his day. His passion for literary work continued; but most of his subsequent writings remained unpublished during his lifetime. His fame continued long after his death and for more than a century he was the one great authority of the moderate reform party, not alone in France, but also in other countries where the spirit of reform was abroad. Of all the early writers on the science of comparative politics and history he easily stands first on account of the actual excellence of the work

done, the originality of thought which he constantly displays and the deep and lasting influence he had upon the thought of his own day and upon succeeding generations. In France, however, Montesquieu's enemies and detractors have accused him of being more English than French in literary form and in manner of thought; and, in fact, so great an admirer was he of everything English, that he was looked upon, during his lifetime and long afterward as an Anglomaniac. Montesquieu is a much more rational thinker than Voltaire, though the latter far outran him in popularity. The two men were, however, so far apart in their modes of thought that neither was able to appreciate the greatness of the other. The cool, moderate reasoning of Montesquieu was not only in every way fitted for the age in which he lived, but it was couched in language that attracted and commended itself to all men of liberal tendencies. Thus it was a preparation for the work that Voltaire himself was called upon to do; and both Montesquieu and Voltaire, though working along different lines and imbued each with a different spirit, were both on the broad road to the Revolution of 1789 and the rejuvenation of France. In an age when the real spirit of all just law was hidden from the sight of most men, the original, truthful and clear-cut views of Montesquieu on politics and their relation to law came as an inspiration and took hold of the imagination of thinking Europe. He made men think clearly and powerfully along lines that they had been unaccustomed to think rightly for centuries. His masterly genius for generalization may be said to have created the science of politics. His plain, unadorned, forceful language and withal beautiful composition is in marked contrast to the spirit that ruled the literature of his own and the following generation. To this simplicity of language and directness of thought he owed much of his popularity. Montesquieu was well known to the more inquiring spirits of the English colonies in America and his work had a strong influence over the revolutionary spirit that began to make itself felt among the colonies early in the latter half of the 18th century, where, during the struggle for independence, it became a veritable textbook of the Revolutionary party. There have been many editions of Montesquieu's works published in French and in all the languages of Europe. (See *LES LETTRES PERSANES; SPIRIT OF THE LAWS*). Consult Sorel (translated by Masson), 'Montesquieu' (London 1887); Vian, 'Histoire de la vie et des œuvres de Montesquieu' (Paris 1879); Lowell, E. J., 'Eve of the French Revolution' (Boston 1893); Ilbert, C. P., 'Montesquieu' (Oxford 1904); Dargan, E. P., 'Æsthetic Doctrine of Montesquieu' (Baltimore 1907).

**MONTESQUIOU-FEZENSAC, môn-tēs-kē-oo-fā-zān-sāk, Robert, COUNT DE**, French poet: b. Paris, 9 March 1855. He was well known as an art collector and as an amateur goldsmith and enameler in 1892, when he published 'Les Chauves-souris,' a volume of verse symbolizing the mystery of night. It was followed by 'Chef des Odeurs suaves' (1893), of which the theme was flowers and perfumes, 'Les Hortensias Bleus' (1896) and 'Perles Rouges' (1899), the latter a series of sonnets

reviving Versailles at its glory; by 'Les Paons' (1901), on precious stones and their mystic meanings; and by two volumes of essays, 'Roseaux pensants' (1897) and 'Autels privilégiés' (1899), both attempting to appreciate some wronged artist. Later works include 'Professionnelles beautés' (1905); 'Altesses sérénissimes' (1907); 'Assemblée de notables' (1909); 'La petite mademoiselle' (1911); 'L'inextricable graveur Rodolphe Bresdin' (1913). He appeared in New York in the winter of 1902-03 as a lecturer and reader. His style is hyper-æsthetic, with much weird beauty, and his themes strangely far-fetched.

**MONTESSORI**, mon'tès-sô'rè, **Maria**, Italian educator: b. Rome, about 1872. She was educated to be a physician, and while studying applied herself especially to the investigation of nervous diseases in children, and to the problem of evolving a form of training that would draw out the capabilities of those of diseased and abnormal temperaments. She was the first woman to be graduated in medicine at the University of Rome (1894), and for some time she acted as an assistant in the Psychiatric Clinic and later as a lecturer on anthropology in that institution. Then for six years she was in charge of one of the hospitals for defective children in Rome. Having acquired a familiarity with the systems of Pestalozzi, Fröbel, Seguin, Itard and other early masters, she now developed therefrom a method of educating feeble-minded children under more modern conditions. In 1898-1900 she was directress of the Scuola Ortofrenca, or mind-strengthening school, where she met with marked success in applying the methods, particularly, of Seguin and Itard to the education of defectives. She then devoted herself to the study of experimental psychology, pedagogic anthropology and the methods of modern education. An occasion offered in 1907 for putting her theories to practical test, when a school was established in connection with the tenets erected by the Roman Association for Good Building. The first house (Cora dei Bambini) was opened in January 1907, and was soon followed by three others. Dr. Montessori maintained her connection with these schools until 1911 when she devoted her time to the extension of her methods to older children. Both professional educators and laymen have taken a deep interest in her work, the principles of which she has set down in 'Antropologia pedagogica' (Eng. trans. by F. T. Cooper, 'Pedagogic Anthropology,' New York 1913) and 'Il metodo della pedagogia scientifica applicato all'educazione infantile nelle case dei Bambini' (Eng. trans. by A. E. George, 'The Montessori Method,' New York 1912).

**MONTEVERDE**, môn'tā-vār'dā, or **MONTEVERDI**, **Claudio**, Italian composer: b. Cremona, May 1567; d. Venice, 29 Nov. 1643. He was a pupil of Ingegneri at Mantua, became (1590) violinist and singer at the Mantuan court and was appointed (1602) bandmaster. In 1613 he was appointed bandmaster of Saint Mark's, Venice, in which position he served till his death. His is one of the most interesting personalities in the history of modern music. He was a pioneer in opera and became noted as composer of madrigals before entering (1583) the operatic field. Among his operas are

'Orfeo' (1607); 'Arianna' (1608); 'Proserpina rapita' (1630); 'Adone' (1639); 'Enca e Lavinia' (1641); 'Ulisse' (1641); 'L'incoronazione di Pappaea' (1642). He also composed a ballet, 'Tirsi e Clori' (1615) and the dramatic scene 'Il combattimento di Tancredi e Clorinda' (1624), besides numerous religious works as masses, psalms, motets, etc. Consult Vogel, Emil, 'Claudio Monteverde' (in *Vierteljahrsschrift für Musikwissenschaft* 1889); Goldsmith, 'Studien der geschichte der Italienischen Opera in 17 Jahrhundert' (Leipzig 1904); Mitjana, Rafael, 'Claudio Monteverde' (Malaga 1911).

**MONTEVERDE**, **Giulio**, Italian sculptor: b. Bistagno, 8 Oct. 1837. He was at first wood-carver, but went to the academy at Genoa (1859) and won (1865) the Prize of Rome. His first works were a statuette of 'Columbus as a Boy,' 'a Group of Children playing with a Cat,' 'the Genius of Franklin,' copies of which are found everywhere. He became noted outside Italy by his group 'Jenner inoculating his own Child,' a work showing great refinement and sentiment. Of his more recent works should be mentioned 'Crucifixion' in marble; memorial to Bellini for Catania; King Victor Emanuel for Bologna (1888). From 1874 he has been professor of San Luca Academy at Rome.

**MONTEVIDEO**, Minn., village, county-seat of Chippewa County, at the junction of the Minnesota and the Chippewa rivers, and on the Chicago, Milwaukee and Saint Paul Railroad, about 125 miles west of Saint Paul. It is in a fertile agricultural region where wheat is one of the important products. The chief industrial establishments are flour-mills, grain elevators, a creamery, cheese factories and a coöperage. It is the seat of Windom Institute (Congregational) and it has a high school, a public library and a town-hall. Near the village is a monument erected to commemorate the surrender of Little Crow, the Sioux chief, in 1862. Pop. 3,100.

**MONTEVIDEO**, môn-tè-vid'e-ò (Sp. mōn-tā-vé'dā-ò), Uruguay, capital of the department of the same name; also capital and emporium of the republic; situated on the northern coast of the Rio de la Plata (see LA PLATA, RIO DE). Founded in 1726, its inhabitants numbered only 3,500 in 1818, and 9,000 in 1829; indeed, it was scarcely more than a fortress until 1834, and at various times the governments of Argentina, England and Brazil attempted to gain possession of this stronghold, commanding the entrance of the great waterway of the south. Montevideo was taken by a British force of 4,600 men on 2 Feb. 1807, after a vigorous assault by land and sea (English fleet under Commodore Popham). Subsequently the combined English forces in the river, under command of General Whitelocke, were defeated at Buenos Aires, and, withdrawing from Montevideo, abandoned the Rio de la Plata. The demolition of the walls, the opening of new streets, and (in 1836) the beginning of foreign immigration, transformed the place. In the years from 1838 to 1841, about 28,000 European immigrants entered the port. There were 45,000 inhabitants in 1860; 105,000 in 1872; 238,080 in 1892; and at the beginning of 1902

about 278,186 in the territory of 256 square miles embraced in the department. Immigrants arriving in 1901 were: Italian, 3,777; Spanish, 2,708; Brazilian, 715; French, 512; German, 336; and English, 209. The harbor is the best on the Rio de la Plata; but formerly was far from satisfactory. An elaborate system of moles and docks, projected for harbor improvement, began in July 1901. The water at the harbor's entrance being but 15 to 17 feet deep, vessels of great draught formerly anchored in the outer roadstead and discharged their cargoes on lighters. Since 1913 further improvements have increased the port's facilities. The city is built on a chain of hills of moderate elevation with a gradual slope toward the shore; the conditions are therefore favorable for efficient drainage. An active commerce is maintained with foreign countries and towns of the interior. As it is the only port of entry it furnishes nearly all of the revenue of the government, receiving or forwarding about 90 per cent of the importations of the entire country and about 67 per cent of the total exportations. The imports in a recent year amounted to \$21,876,987, and exports to \$23,340,239. The steamers of 20 different companies, including 12 British and three French, visit the port periodically. Conspicuous buildings are the Parliament House, Government Palace, National Bank, Solis and San Felipe theatres, Uruguay Club and School of Arts and Sciences. There are commercial houses of every class, street railways, telegraph and telephone service, electric-light works, printing establishments and foundries. The streets are wide, straight and generally well kept. The water supply is obtained from the Saint Lucia River, at a point about 12 miles distant. Plazas, 16 in number, occupy high ground in the middle of the city, the most attractive of these public squares being the Zabala, Independencia and Constitución. The University of Uruguay has more than 400 students and a relatively very large number of native and foreign professors; there are also normal and elementary schools, a military college, etc. Banks are: English (2), and Italian, Spanish and French (1 each). No city in South America is more cosmopolitan in character: nearly all the languages of the civilized world are heard in its streets. The environs contain beautiful residences surrounded by gardens; at a distance of about three miles from the city is the fine park called El Prado.

MARRION WILCOX.

**MONTEVIDEO**, Department of. See URUGUAY.

**MONTEZ, Lola** (assumed name of MARIE DOLORES ELIZA ROSANNA GILBERT), adventuress: b. Limerick, Ireland, 1818; d. Astoria, N. Y., 17 Jan. 1861. Her parents took the child to India, where her father died, and her mother, again marrying, sent Lola back to Europe. In 1837 she married a Captain James, went to India with him, tired of him and returned to England in 1842. She next became a public dancer, performing in London and in cities of the Continent, and in 1846 went to Munich, where she fascinated the old artist-king Louis I of Bavaria who made her his mistress, created her Countess of Landsfeld and granted her a large annuity. For a while she also exercised

great political power, which she directed against the Jesuits and in favor of liberalism; but with the outbreak of the Revolution of 1848 she was once more set adrift. In London she married a guardsman, Stafford Heald, was soon divorced from him and in 1851 sailed for the United States. After touring through this country with a play called 'Lola Montez in Bavaria,' she went to Australia, returned here, was twice married in California and in 1858 lectured in New York where she settled and spent her last days in rescue work among women. Her writings include 'Lectures,' with an autobiography, and 'The Arts of Beauty' (1858).

**MONTEZUMA**, mön-tē-zoo'mā (Aztec MONTECUHZOMA, the severe or sad one; found written also MONTECUMA, MOCTEZUMA, MUTEZUMA, MOTEZUMA), surnamed ILHUICAMINA (archer of heaven) and called MONTEZUMA I, chief, or emperor, of ancient Mexico: b. about 1390; d. 1464. He succeeded his brother Izcohuatl in the chieftainship in 1436, but was not inaugurated until 1440. His success in war with neighboring tribes was great, and he is said to have extended Mexican conquest to the Gulf. With Netzahualcoyotl, chief of Tezcucoc, he built, to prevent inundations from Lake Tezcucoc, huge dams, the ruins of which in the San Lorenzo Valley have shown them to have been a marvelous feat of engineering. He also rebuilt Tenochtitlan (on the site of the modern Mexico), the chief Aztec city, substituting for the primitive buildings others of lime and stone; established a severe legal code and developed the ceremonial and influence of the tribal religion. Consult Bancroft, H. H., 'Native Races' (San Francisco 1874-82).

**MONTEZUMA**, surnamed XOCOYOTZIN and called MONTEZUMA II, chief, or emperor, of ancient Mexico: b. 1479 (authority of Bernal Diaz); d. Tenochtitlan, Mexico, 30 June 1520. He is well known as the ruler of the Aztecs at the time of the Spanish invasion. He succeeded his uncle Ahuizotl as chief in 1503. Almost constant wars were carried on by him with the Tarascans and Tlascalans, and he is said to have led an expedition as far south as Honduras. His internal policy was in many respects wise. He severely enforced the laws, introduced valuable changes in the courts and built many public works, including temples, a new conduit for the water supply and a hospital for invalided warriors. But by his arrogance and pomp, his seclusion, his restriction of appointments to those only of noble rank and his heavy taxation he made himself greatly disliked. His conquests enlarged the empire, but the various parts were without cohesion, and insurrections were frequent. When news was brought in 1518 that ships and white men (of Jean de Grijalva's expedition) had been seen off the coast, Montezuma was greatly alarmed, because an ancient prophecy foretold that Quetzalcoatl, the white god, would at some time come to reign over Mexico. He sent presents to Cortéz, who had landed at Vera Cruz in April 1519, and tried to prevent him from marching to Tenochtitlan. Cortéz, however, arrived there in November and was well received. Fearing an outbreak of the people, who did not agree with the conciliating policy of the monarch, Cortéz then took Montezuma prisoner and retained him as a hostage in the

quarters of the Spaniards. The Aztecs finally made an attack upon the quarters (June 1520). Montezuma, at the request of Cortéz, attempted in a speech from the wall to end hostilities, but was wounded by a volley of stones and died four days later. The Indians came to regard him as a deity, and indeed called him their chief god, though this reverence did not include worship. Consult Prescott, W. H., 'Conquest of Mexico' (1843); Bancroft, H. H., 'Mexico,' Vol. I (Vol. IX of his 'Works' 1883-90); Diaz, B., 'Historia verdadera de la conquista de la Nueva España.'

**MONTEZUMA**, Iowa, town, county-seat of Poweshiek County, on the Chicago, Rock Island and Pacific and the Iowa Central railroads, about 60 miles east of Des Moines. Agriculture and stock-raising are the principal industries of the surrounding region. Bituminous coal-fields are in the vicinity. The chief industrial establishments are a pearl-button factory, wagon factory, foundry, machine-shop and a creamery. Pop. 1,200.

**MONTEZUMA CASTLE**. A remarkable prehistoric dwelling situated in an alcove in a high cliff on the west bank of Beaver Creek, three miles from old Camp Verde, near Prescott, Ariz. It is accredited to Aztecs and even supposed to have been occupied by Montezuma, but ethnologists doubt the validity of this claim, or especially of the existence of any evidence to sustain it. The building consists of five stories, with walls two feet thick at base. It contains about 20 rooms, most of them extending along cliffs which support the higher stories. The structure shows evidence of having been occupied a long time. It was repaired by the Arizona Antiquarian Society in 1895, and in 1906 was made a National Monument. Consult description by Mearns in *Popular Science Monthly*, 1890.

**MONTEFAUCON, Bernard de**, bār-nār dé môn-fô-kôn, French critic and classical scholar: b. Languedoc, France, 18 Jan. 1655; d. Paris, 21 Dec. 1741. He entered the army but resigned to become a Benedictine monk and devoted himself to classical studies. His 'Palæographia Græca,' published in 1708, made him famous and constituted him the founder of scientific palæography. He traveled in Italy where he was honored by Innocent XII, and in 1719 was elected a member of the Academy of Inscriptions. In the course of his work he examined thousands of manuscripts and his books are a storehouse of classical archæology. Among them are 'L'Antiquité expliquée et représentée en Figures' (15 vols., 1719-24); 'Monuments de la Monarchie française' (5 vols., 1729-33). Consult De Broglie, 'Bernard de Montfaucon et les Bernardins' (Paris 1891).

**MONTFERRAT**, môn-fēr-râ, Italy, a former independent duchy, bounded by Piedmont, Genoa and the Milanese territory. It lay in two detached portions between the Maritime Alps and the Po and had an area of about 1,000 square miles. The capital was Casale. Mention is made of a Marquis of Montferrat in 980. In 1305 the marquisate was inherited by a branch of the imperial family of the Palæologi, and in 1536 was granted by Charles V to Federico II, duke of Mantua. It was erected into a duchy by Maximilian in 1573 or

1574. In 1631 a considerable part of it was ceded to Savoy by the Duke of Mantua, to whose ancestors Charles V had granted it in 1536, and in 1703 the remainder was annexed to the same duchy. See SAVOY.

**MONTFORT**, mõnt'fört (Fr. môn-fôr), **Simon de**, EARL OF LEICESTER, English political reformer: b. France, about 1208; d. Evesham, 4 Aug. 1265. His father was Simon, the Conqueror of the Albigenses, his mother, Alice of Montmorency; the former had been disinherited of his English estates by King John in 1207 and hence had joined the more readily the orthodox French party in fighting the Albigenses, who were led by John's brother-in-law, Raymond of Toulouse. But the younger and greater Simon in 1229 was forced to leave France and throw himself on the mercy of the English king, Henry III, who restored him his lands in Leicester and married him to his own sister Eleanor, the young widow of Lord Pembroke, secretly and without dowry in 1238. The irregularity of this match endangered Simon with the nobles, who had not been consulted; almost immediately afterward he quarreled with the king and was only saved by his crusader's vow, which he fulfilled under Richard of Cornwall in 1240. In France he fought under Henry III (1242-48), who made him commander of the army in Gascony. There he crushed successive rebellions, but another quarrel between the monarch and his subject followed and Simon was removed from office. Henry soon had to recall Simon, who in 1257 and 1258 quarreled hotly with William of Valence, one of the king's foreign favorites and his half-brother. Simon's boldness in this matter put him at the head of the movement among the barons for administrative reform. In June 1258 the 24 commissioners, of whom he was one, drew up the famous Provisions of Oxford, signed in October of the same year, but repudiated in 1262 by the king. Simon de Montfort had been actual head of the reforming party since the conclusion of the peace with France (4 Dec. 1259) which had made reform possible. Now, after the cause of the nobles had been submitted to the king of France to arbitrate and his sentence had been entirely favorable to the king, setting aside the Oxford Provisions entirely and reserving to the people only such rights as they had before possessed, Simon put himself at the head of the party which was eager to fight for the privileges of the nobles. On 16 May 1264, after a brilliantly conducted engagement, Simon captured the king; a new constitution was formed giving the power to a council of nine, over whom were three electors, removable by Parliament; and in this new régime Simon was practically master of the kingdom. He summoned a Parliament 30 Jan. 1265, which was the actual basis of the present English Parliament and of British constitutional freedom. But the Parliament was marked by a quarrel between Simon and the Earl of Gloucester; the latter went over to the border nobles. Simon moved against him with splendid fearlessness; made a sudden peace with the Welsh king, and turning to meet Gloucester failed to effect a juncture with his son. At Evesham on 4 Aug. 1265, fighting to the last and scorning to retreat, he was slain, his forces being so outnumbered by the troops

with Gloucester and Prince Edward that at sight of the enemy Simon is said to have exclaimed, "Let us commend our souls to God, for our bodies are theirs." Personally haughty and high tempered, but sober, simple, pious and cultured, he was a great general, one who stood firmly by the right, the idol of the people, who made his tomb a shrine and carried on the work he had begun. To call him the "creator of the House of Commons," however, is a misapprehension of his work, which forwarded rather than fathered representative government. Consult Pauli's life which treats primarily of the constitutional bearings of Montfort's career and is translated into English by Miss Goodwin (1876); the English life by Prothero (1877); the French biography by Bémont (1884), which first untangles Montfort's continental career; the 'Song of Lewes' (edited by Kingsford, 1890); the 'Miracles of Simon de Montfort' (edited by Halliwell for the Camden Society, 1840), showing the popular canonization of the hero; and such general works as Stubbs, 'Constitutional History' (Vol. II, 6th ed., Oxford 1897), and Green, 'History of the English People' (Vol. I, new ed., London 1908).

**MONTGOLFIER**, mönt-göl'fi-ër (Fr. mön-göl-fè-à), two French inventors, JOSEPH MICHEL (b. Vidalon-les-Annonai, France, 1740; d. Balarue-les-Bains, 26 June 1810); and JACQUES ETIENNE (b. Vidalon-les-Annonai, 7 Jan. 1745; d. Servièrès, 2 Aug. 1799). They were sons of a paper-maker and devoted themselves to the study of mathematics, mechanics, physics and chemistry. As their scientific labors were always carried on in combination it is not easy to decide to which of the two the credit of their several inventions is due. The first idea of the balloon seems to have arisen in the mind of Joseph, but Jacques Etienne suggested many improvements upon it. Joseph was also the inventor, among other things, of the water-ram which raises water to the height of 60 feet, and Jacques Etienne of vellum paper, which he was the first to make in the manufactory formerly carried on by his father. See BALLOON.

**MONTGOMERY**, mön-göm-è-rè, Gabriel, COUNT DE, French captain: b. about 1530; d. Paris, 26 June 1574. He was son of the commander of the Scottish troops in the service of the French court, but in 1559 he accidentally wounded King Henry II with whom he was tilting and killed him. Montgomery was condemned to retirement in the country, where he read many religious books, and was soon led to join the Protestant party. In 1562 he entered Condé's army, serving with much bravery and ability. He saved himself by the swiftness of his horse during the Massacre of Saint Bartholomew. In 1574 he led a band of Huguenots and began war in Normandy, was captured at Domfront, taken to Paris, tried and beheaded.

**MONTGOMERY**, mont-güm'è-rì, George, American Roman Catholic archbishop: b. Daviess County, Ky., 30 Dec. 1847; d. San Francisco, Cal., 10 Jan. 1907. He was educated at Saint Charles College, Maryland, and Saint Mary's Seminary, Baltimore, and was ordained to the priesthood in 1879. He officiated as a priest for 15 years in San Francisco and in 1894 was consecrated coadjutor bishop of Los

Angeles. He was elevated to the rank of coadjutor archbishop of San Francisco in 1902.

**MONTGOMERY**, James, British poet and journalist: b. Irvine, Ayrshire, 4 Nov. 1771; d. Sheffield, Yorkshire, 30 April 1854. The son of a Moravian divine, he was educated for the ministry at the Fulneck Moravian Seminary near Leeds, but in 1792 he procured an engagement with a bookseller in Sheffield the proprietor, editor and publisher of the local *Register*. Montgomery succeeded Lim later as editor and publisher of the paper, the name of which he changed to the *Sheffield Iris*. The publication of a liberal journal was at that period fraught with manifold dangers. He was twice prosecuted for trivial offenses and condemned on the first occasion to three and on the second to six months' imprisonment. During his confinement he composed a volume of poems, 'Prison Amusements,' published in 1797. In 1806 appeared his 'Wanderer in Switzerland,' his first popular effort. It was followed in 1809 by the 'West Indies,' a poem exposing the iniquities of the slave trade. Later volumes were 'The World before the Flood' (1813); 'Greenland,' a missionary poem (1819); and 'The Pelican Island' (1827). In 1825 he resigned the editorship of the *Iris* and passed the remainder of his life in religious and literary work. To the world of to-day he is known as a hymn writer. Over 100 of his hymns still keep their places in hymnals, their authorship frequently and unfortunately confounded with the work of Robert Montgomery (q.v.). Consult Carruthers, ed., 'Political Works of James Montgomery' (Boston 1860); Holland and Everett, 'Memoirs' (London 1854-56); King, 'Life of James Montgomery' (London 1858).

**MONTGOMERY**, John Berrien, American naval officer: b. Allentown, N. J., 17 Nov. 1794; d. Carlisle, Pa., 25 March 1873. In 1812 he entered the navy as midshipman and was on board Perry's flagship at the victory on Lake Erie in 1813 where for gallant service he received the thanks of Congress. He was later engaged at Mackinaw in 1814 and in 1815 served in the Algerine war. In 1839 he became commander, and in the war with Mexico, aboard the *Portsmouth*, established United States authority on the coast of California, blockaded Mazatlan and assisted in the capture of Guaymas. In 1849-51 he was executive officer of the navy-yard at Washington and he commanded the Pacific squadron in 1861-62. He was made a commodore in 1862 and rear-admiral on the retired list in 1866. Consult Montgomery, T. H., 'A Genealogical History of the Montgomery Family' (1863).

**MONTGOMERY**, Richard, American soldier: b. Convoy House, near Raphoe, Ireland, 2 Dec. 1736; d. Quebec, 31 Dec. 1775. At 18 he obtained a commission in the British army, in 1757 began his career of active service in America, and at the siege of Louisburg in 1758 and elsewhere gave evidence of high military capacity. After a period of residence in England from 1765, in 1772 he sold out his commission and, emigrating to New York, settled in Rhinebeck, Dutchess County. In 1775 he represented Dutchess County in the provincial Congress, and in the same year was appointed

one of the eight brigadiers to serve in the newly organized army of the united colonies of the young Republic. He was immediately attached to the larger of the two divisions sent to Canada in the summer of 1775 and by a series of well-directed movements successively acquired possession of Chambly, Saint John's and Montreal, thereby becoming in the middle of November master of a great part of Canada. Effecting a junction on 4 December with Arnold's troops, then recently arrived, he immediately proceeded to take a position before Quebec. At a council of officers it was determined to attempt to capture the place by a *coup de main*, and accordingly, on 31 December at 2 A.M., an attack on the town was begun. Montgomery, who headed the attack on the Cape Diamond bastion, fell dead at the first and only discharge by the British artillerymen. His men, panic-stricken by the loss of their leader, began a disorderly retreat, and the assault on the city ended in failure. He was interred within the city walls. British statesmen vied with Americans in their praise of Montgomery. Congress testified "their grateful remembrance, profound respect, and high veneration" by placing a monumental tablet to his memory in the front of Saint Paul's Church, Broadway, New York. In 1818 the State of New York had his remains transferred from Canada and buried with imposing solemnities beneath the monument. Consult Armstrong, 'Life of Richard Montgomery' (in 'American Biography,' Sparks, J., ed., Boston 1834).

**MONTGOMERY, Robert**, English versifier and Anglican clergyman: b. Bath, 1807; d. Brighton, 3 Dec. 1855. His name survives chiefly through the merciless criticism and ridicule of his work by Lord Macaulay in the *Edinburgh Review*. Having taken orders in the Church of England, he officiated at Percy Street Chapel in London till his death in 1855, with an interval of four years as pastor of Saint Jude's Episcopal Chapel in Glasgow. His chief works, overpraised by uncritical sentiment for their popular vein, amply justify Macaulay's strictures, though hardly their offensively dogmatic tone. They include 'The Omnipresence of the Deity' (1828); 'Satan' (1839), whence his sobriquet of "Satan Montgomery," and 'The Messiah.'

**MONTGOMERY, Ala.**, State capital and third city of the State in population, and seat of Montgomery County, 52 miles southeast of the centre; on the left bank of the Alabama, 410 miles above the Gulf by water and 180 by rail. It is the greatest railroad centre in the State, seven lines converging there, the Louisville and Nashville, Mobile and Ohio, Atlantic Coast Line, Central of Georgia, Seaboard Air Line, Union Springs and Northern and Western of Alabama; 62 passenger trains a day arrive and depart from its union station. The city is a leading Southern trade and social centre.

**Commerce and Industry.**—Montgomery lies in the heart of the famous Black Belt, the band of rich dark soil which stretches across and beyond Alabama. 120 miles wide, and one of the chief cotton districts in the country, as well as a great producer of grain, fruit and vegetables. It is the great central market of all this territory, and one of the foremost trucking centres for the supply of vegetables to

the northern markets; its wholesale grocery business amounts to some \$14,000,000 a year, out of a total of over \$50,000,000. It is one of the chief cotton marts and distributing points of the South, handling 150,000 to 175,000 bales a year in its extensive warehouses. The export of this is, to some extent, sent in barges down the river to Mobile, and there reloaded for foreign shipment. The Alabama is one of the best rivers in the United States for steamer navigation, having a deep, broad channel open as high as Montgomery for eleven months in the year. Lying between the coal and iron fields on the north and the vast forests of yellow pine on the south, as well as in the midst of the cotton belt, the city has great natural advantages for manufacturing; and a dam across the Tallapoosa at Tallahassee, 30 miles away, furnishes 25,000 horse power applied to its manufacturing, and used for trolley and lighting. An English syndicate, the Alabama Power Company, has developed other water power in this section with a potentiality of 500,000 horse power. Already electricity is sold in Montgomery as low as one cent per kilowatt hour. The city's interests are considerable and varied. There are 181 manufacturing enterprises, employing \$12,000,000 capital and 6,000 employees. Carshops and foundry work for the numerous railroads, with boilers, and other iron goods, are the largest items; but there are two cotton factories and a cordage factory; four ginning and compress plants, five cotton-seed oil and cake works and 11 great fertilizer plants; 13 woodworking and lumber concerns, besides cooperage works (mainly for the oil and allied products), carriages, cabinets, show cases, furniture, confectionery, crackers and brushes and paper boxes, saddlery and harness, brick and tile, paving and roofing materials, etc.

The aviation depot, or aeroplane construction plant, of the United States government is located at Montgomery. It employs 600 civilian mechanics and is the only plant of its kind in America.

**Finance and Government.**—The city's banking facilities have kept pace with its commercial increase. In 1919 Montgomery had four national banks, and three State banks, having a combined capital of \$2,500,000; surplus, \$635,000; individual deposits, \$13,000,000. The post-office receipts had increased 35 per cent within five years. There are trolley systems covering city and suburbs, and electric light, good sewerage and artesian water almost chemically pure; the streets are well paved and the country roads of remarkable excellence. Assessed valuation about \$35,000,000. Of about \$150,000 yearly expenditure, aside from interest on debt, \$90,000 is spent for schools. Montgomery has commission government.

**Public Buildings, Institutions, Etc.**—The city is handsomely built on a high red clay bluff bordering the river, and stretching back to undulating hills; it has many fine old gardens, and 50 acres of public parks. The centre is Court Square, and the foundation streets are Court, Commerce, toward the river, and Dexter avenue to the capitol. The Union Station, costing \$250,000, the government building, the city hall, the courthouse, the Young Men's Christian Association and the Young Women's Christian Association buildings, the Masonic temple and the Carnegie

**MONTGOMERY, ALA.**

**1** Montgomery County Courthouse  
**2** A Residential Street in Montgomery  
**3** Court Square. Exchange Hotel and First National Bank

library are the chief structures in the centre. The capitol dates from 1846; in its grounds is a handsome Confederate monument. There are 86 church societies of all denominations; several of them with handsome, modern edifices. There is a State Normal School for the colored here with 1,500 students, the Montgomery Industrial School for Girls and charitable institutions. Montgomery is the home of the Women's College of Alabama. There are three daily newspapers and several institutional libraries. There are 19 public school buildings, the same provision being made for colored as for white students.

**History.**—Montgomery was founded in 1817 by Andrew Dexter, of Rhode Island, on the site of the legendary Indian village of Ecunchatty; it was part of the Creek Lands. Dexter named the place New Philadelphia; the situation was tempting, and in 1818 two more settlements were made—East Alabama Town closely adjoining, divided by the present lower Court street (whence the streets on its two sides run from it at different angles), and Alabama Town, a mile or so down the river. On 3 Dec. 1819, the former was consolidated with it as Montgomery, named after the Indian fighter Lemuel Montgomery or the Revolutionary hero Richard Montgomery. The early society was like many pioneer communities, and vigilance committees had to be invoked to restore the reign of the law. The first steamer arrived 22 Oct. 1821; the Montgomery Railroad opened its first 12 miles in 1840. The place received a city charter about 1837; on 22 Jan. 1846 it was made the State capital; the capitol was occupied 1847, burned 1849, replaced by the present, in 1851. Montgomery's interests and central location made it the focus of the secession movement; its position as capital drew in some of the ablest leaders and orators of the South, the famous William L. Yancey (q.v.) being one; and it was made the first capital of the Southern Confederacy, whose government was organized there 4 Feb. 1861. The next year the capital was removed to Richmond; the Union army reoccupied Montgomery 12 April 1865. Alabama was among the first of the States to create a Department of History and Archives, which is located here. This department has a complete record of all State documents since territorial days. It maintains a museum and art gallery.

**Population.**—The population in 1840 was 2,179; 1850, 6,728; 1860, 8,843; 1870, 10,588; 1880, 16,713; 1890, 21,883; 1900, 30,346; 1910, 38,136; 42 per cent of which are colored. Estimated population 1919 (city directory), 59,710. Its suburbs, however, have far overspread the official limits, and the population within a few miles is toward 60,000. The city directory compilation for 1916 fixes the population in the city limits at 55,410.

BRUCE KENNEDY,  
*General Secretary, Montgomery Chamber of Commerce.*

**MONTH**, a period of time derived from the motion of the moon. The "sidereal" month may be regarded as the period in which the moon, as seen from a fixed star, would appear to make a complete revolution round the earth; it is evidently the period in which she passes through the 12 signs of the zodiac; its mean value during the year is 27.32166 days. The

"synodical" month, more commonly called a "lunar month" or "lunation," is the period during which the moon goes through all her phases. It is usually reckoned from new moon to new moon; to complete the lunation the moon must not only pass through the 12 signs of the zodiac, but also come again to occupy her old position relatively to the sun, which has itself advanced in the zodiac, hence the lunar is longer than the sidereal month. The mean value of the lunation is 29.5306 days. The "solar" month is the 12th part of one solar year, or 30.4368 days. The "anomalistic" month is the period in which the moon passes from perigee to perigee of her orbit; it differs from the sidereal month because the perigee varies its position. The line of nodes of the moon's orbit varies its position, and the "nodical" month, or the period of her motion from ascending to ascending node, differs from the other months mentioned above. The 12 civil or calendar months of the year have from 28 to 31 days each. The lunar month was used by the Chaldeans and Egyptians, and is still by the Jews, Turks and some uncivilized nations. The calendar months are not equal divisions of the year, some (April, June, September and November) consisting of 30, and the remainder of 31 days, except February, to which a period of only 28 days is assigned (see LEAP YEAR), with the addition every fourth year of one more day. These distinctions often give rise to much confusion as to the time intended to be designated by a month. In popular language it is often understood to be four weeks, as this is very nearly an equal period, expressed in the division by weeks, to the month. This was even laid down by Blackstone as the legal definition of the term, so that a lease for 12 months was only for 48 weeks. The expression of "a twelve-month," however, has been legally held to mean a solar year. See CALENDAR; MOON; ZODIAC.

**MONTHOLON**, Charles Tristan, shārl trēs-tān mōn-tō-lōn, COMTE (later MARQUIS) DE, French soldier: b. Paris, 21 July 1783; d. 21 Aug. 1853. After service in the navy, he entered the army in 1798, took part in the Napoleonic campaigns in Italy, Austria and Prussia, distinguished himself at Wagram (5–6 July 1809), was made chamberlain (1809), was sent on an important diplomatic mission to the Archduke Ferdinand of Austria (1811) and became general of brigade (1814). During the Hundred Days he was adjutant-general to Napoleon, whom he accompanied in his exile to Saint Helena, and by whom he was appointed one of his executors. Proclaimed chief-of-staff by Prince Louis Napoleon (later Emperor Napoleon III [q.v.]) when the latter landed at Bologna in 1840, he was condemned by the Peers to 20 years' imprisonment, but was liberated after the February revolution (1848). He was elected to the Legislative Assembly in 1849. He published 'Mémoires pour servir à l'Histoire de France sous Napoléon, Ecrits à Sainte Hélène sous sa Dictée' (with Gourgaud 1822–25; 2d ed., 1830), and 'Récits de la Captivité de Napoléon' (1846).

**MONTH'S MIND**, the requiem mass celebrated in the Roman Catholic churches for the deceased the 30th day after death. The prayers of the mass are the same as those of the

requiem mass celebrated on the day of decease or burial except the "Collect," "Secret" and "Post-Communion." In the early English church the prayers were offered daily for a month after the person's death. The anniversary of the death is commemorated similarly by the mass called the YEAR'S MIND. Consult 'Missal'; O'Brien, 'The Mass'; Sullivan, 'History of the Mass.'

**MONTI, Vincenzo**, vĕn-chĕnd'zō mōn'tĕ, Italian poet: b. Fusignano, near Ravenna, 19 Feb. 1754; d. Milan, 13 Oct. 1828. He was educated in law against his inclination; became secretary to Prince Luigi Braschi; won his literary spur with 'Saggio di poesie' in 1779; gained speedy popularity with various occasional odes; and in 1787 and 1788 brought out his two great tragedies, 'Aristodemo' and 'Galeotto Manfredi,' both in the style of Alfieri. His 'Basvilliana,' a Dantesque poetic chronicle of recent happenings, notably the massacre of the French envoy Basville by the Roman populace, showed ability to treat a theme in politics; but from the detestation expressed in that poem for the excesses of the Revolution and his appeal to the Austrians against the French, he soon came to the most ardent praise of Napoleon and fled to France to escape punishment from Austria. His panegyric of the mathematician Mascheroni (1801) is largely an attack by the poet upon his personal enemies. (See MASCHERONIANA). After Marengo he returned to Italy and became professor of oratory at Pavia, imperial poet-laureate in Milan, and, after the coronation of Napoleon, historiographer of the Italian kingdom. From that time until the restoration of Austrian rule in Italy, Monti was devoted to Napoleon and wrote numerous odes of victory in his honor. In his latter years, a period of study and adversity, he joined his son-in-law, Giulio Perticari, in his fight with the Della Crusicans, and published his single great work, a version of the 'Iliad' (1810). His translation of Persius should be mentioned and his most successful drama, 'Caio Gracco' (1802). Monti was an ardent classicist and in his 'Sermone sopra la mitologia' (1825) combated romantic tendencies. Consult the biographies and appreciations by A. Monti (1873), Vicchi (1879-87) and Zumbini (1894); and the Milan (1839), or Florence edition (1817) of his works.

**MONTICELLI, mōn-tĕ-cĕll'ĕ, Adolphe**, French painter: b. Marseilles, 1824; d. Marseilles, 1886. He made a short stay in Paris and contributed to the Salon; but, not meeting with success, returned to his native town, where he died poor, ignored and insane. Unappreciated, he sold his pictures in *cafés* for 10 or 20 francs; to-day they bring large sums. Collectors have made fortunes out of the small canvases which have given Monticelli posthumous fame. His 'Court of the Princess' is in the Metropolitan Museum, New York. "Monticelli," writes a French critic, "painted landscapes, romantic scenes, still life and *fêtes galantes* in the style of Watteau. One cannot imagine a more inspired sense of color than shown by his works, which seem to be painted with powdered jewels, with powerful harmony, and beyond all else with an unheard of delicacy in the perception of fine shades. There are tones which nobody had ever invented be-

fore, and a richness, a profusion, a subtlety which almost vie with the resources of music. The fairyland atmosphere of Monticelli's pictures surrounds a very firm drawing of charming style; but, to use the words of the artist himself, "in the canvases the objects are the decoration, the touches are the scales and the light is the tenor." Monticelli has created for himself an entirely personal technique, which can only be compared with that of Turner. He painted with a brush so full, fat and rich that some of the details are often modeled in relief, in a substance as precious as enamels, jewels, ceramics—a substance which is a delight in itself. Every picture by Monticelli aroused astonishment. Constructed upon one color, as upon a musical theme, a picture by Monticelli rises to an intensity which one would have thought impossible. His pictures are magnificent bouquets, bursts of joy and color, where nothing is ever crude and where everything is ruled by a supreme sense of harmony." Consult biographies by Faure (Paris 1908); Gouirand (Paris 1900).

**MONTICELLO, mōn-tĕ-sĕll'ō, Ark.**, town, county-seat of Drew County, on the Saint Louis, Iron Mountain and Southern Railroad, about 81 miles south by east of Little Rock. The industries and trade are connected with the lumber, fruit, cotton and grain of the surrounding region, and stock raising is also carried on. Municipal enterprise has installed waterworks, sewage-disposal system and electric lighting. It is the seat of the Hinemon University school, the Arkansas Orphans' Home (Baptist) and of the State agricultural school. Pop. 2,500.

**MONTICELLO, Fla.**, town, county-seat of Jefferson County, on the Seaboard Air Line and Atlantic Coast Line railroads, about 32 miles east by north of Tallahassee. It is in an agricultural section, where the chief products are cotton and fruit, of which it prepares and ships large quantities for northern markets. Pop. (est.) 2,000.

**MONTICELLO, Ill.**, city, county-seat of Piatt County, on the Illinois Central and the Wabash railroads, about 147 miles south by west of Chicago. It is situated in an agricultural and stock-raising region and has attractive high school, library and court buildings. The chief manufactures are foundry and machine-shop products, dairy products, patent medicines, sirups, tile, brick, wagons and carriages. It is the trade centre for a large part of Piatt and the nearby counties, and ships considerable hay, livestock and vegetables. Pop. (est.) 2,100.

**MONTICELLO, Ind.**, town, county-seat of White County, on the Tippecanoe River and on the Chicago, Indianapolis and Louisville and Pittsburgh, Cincinnati, Chicago and Saint Louis railroads, about 75 miles north by west of Indianapolis. The river furnishes good water power for manufacturing. The chief manufacturing establishments are flour and lumber mills and creameries; farming implements, thread, cement and tiles are also manufactured. The town owns and operates the waterworks. Pop. (est.) 2,500.

**MONTICELLO, N. Y.**, village, county-seat of Sullivan County, the terminus of the Port Jervis, Monticello and New York Rail-

road, about 67 miles northwest of New York city. It is situated in an agricultural region from which large quantities of potatoes, apples and a considerable amount of dairy products are shipped to New York markets. Perfumery, gloves and leather goods are manufactured. The nearby Mongaup Falls furnish ample water power and the village owns its waterworks. The village is a favorite summer resort on account of its pleasant climate and beautiful scenery. A destructive fire in 1909 cost a property loss of \$1,000,000. Pop. 2,200.

**MONTICELLO**, mōn-tē-sē'lō (It. Little Mountain), Virginia, the estate and residence once owned by Thomas Jefferson (q.v.), third President of the United States. It is in Albemarle County, Va., about two miles from Charlottesville. The estate was an unbroken forest in the early part of the 18th century, until in 1735 the land came into possession of the father of Thomas. Peter Jefferson, the father, and his brother-in-law decided to "go West" and try a new country, so they left the tide-water settlements on the James River and journeyed about 100 miles toward the west, to what is now Albemarle County, and located 20 miles east of the Blue Range and among the foothills of the Southwest Mountains. Peter Jefferson "patented" a tract of land of about 1,000 acres. In looking over his new possession he found no site for a home, such as pleased him; his neighbor, Randolph, sold him from his tract 400 acres for "Henry Weatherbourne's biggest bowl of arrack punch." The place was then called Shadwell, after Shadwell street in London, and the country around Goochland. Thomas Jefferson was born in the old residence at Shadwell, and this house was his home for 27 years. From his boyhood his favorite spot on the estate was Little Mountain. Often he and his most intimate friend, Dabney Carr, afterward his brother-in-law, ascended the mountain in the twilight, and in the long vacations they studied many an hour under an oak tree, their favorite of the forest. They agreed that whichever one died first, the other would have buried under this tree, and at an early age Dabney Carr was here laid to rest. Later Jefferson, his wife, two daughters, and others of his descendants were buried in the little cemetery which was formed around this oak.

It was when Jefferson was a member of the house of burgesses of Virginia, to which he was elected in 1769, that he began the erection of his residence on the summit of the world-renowned eminence, Monticello. (Jefferson changed the English name to the Italian, Monticello). The Shadwell mansion was on a hill on the north bank of the Rivanna River, and Monticello is south, just where the stream cuts its channel through the outlying range of the Alleghanies, the Southwest Mountains. On the northeast Monticello has a steep rocky base, washed by the Rivanna, on the southwest is a dip of about one-third the height of the mountain which connects it with Carter's, a higher peak. Monticello is still covered by a dense growth of timber, mainly hardwood deciduous trees.

Before the residence on Monticello was completed, the Shadwell mansion was burned down, 1 Feb. 1770. The first building on Monticello was a brick story-and-a-half structure containing one good-sized room and some smaller

rooms; it still stands as the south pavilion. Here Jefferson brought his bride in 1772. He was often absent from this beloved home, but his own manuscripts, especially his garden-book, show his love for a quiet domestic life. This same garden-book shows that in 1769 he planted a variety of fruit trees on the southeast slope of the mountain, many of them still in existence. The house was enlarged to suit the needs of the family, and in accordance with the owner's plans. From his European journeys he brought back many new ideas, so that the architecture of the house is somewhat complex. It has the appearance of an Italian villa, with a Greek portico, and considerable of the features of Colonial architecture. The Marquis de Chastellux in a book of travels mentions a visit to Monticello in 1782, and says of Jefferson: "He is the first American who has consulted the fine arts to know how to shelter himself from the weather." Architecture in America has advanced since that time. Some of the plans, drawn by Jefferson himself, are still in existence. The part of the home that was to last was made of good material and possessed a certain elegance, but the furniture was most simple. His last days saw the estate of Monticello so deeply in debt that it was feared he would have to end his life an exile from his beloved mountain. He sacrificed some of his estate hoping to save the residence and some land for his daughter. His friends assisted him so the estate was not lost to the Jefferson heirs until after his death; it had been his home for 56 years. No debt was allowed to defame the name of Jefferson; Thomas Jefferson Randolph, the grandson, and his daughters paid every dollar of debt their eminent ancestor owed after Monticello had been sold. The great-granddaughters kept a school to assist their father in paying this debt. Ten years after Jefferson's death, Monticello was purchased by U. P. Levy, U. S. N., who bequeathed it to the nation. His will was contested and Jefferson M. Levy, New York congressman, bought off the other heirs, and restored the building and estate to their original condition. From 1912 a campaign conducted by Mrs. Martin W. Littleton was carried on to induce the government to purchase the property as of national interest. It was finally bought for \$500,000, the owner stipulating that it should be used only by Presidents of the United States as a Virginia home and not converted into a museum. Consult 'Century Magazine,' Vol. XII, p. 643, article by Nicolay, 'Monticello; Home of Jefferson'; Craighill, 'The Virginia Peerage'; Foote, 'Sketches from Old Virginia.'

**MONTIGNIES-SUR-SAMBRE**, mōn'tē-nyē'sūr-sān'br', Belgium, town in the province Hainaut, located on the Sambre 30 miles south of Brussels and on the Lodefinsart-Givet Railway. It is the centre of a coal mining industry and has manufactures of ovens, machinery, steel ware, etc. Its population in 1910 was 21,748.

**MONTIJO**, mōn-tē-zhō, Eugénie-Marie de. See EUGÉNIE, EMPRESS OF THE FRENCH.

**MONTJOIE SAINT DENIS**, mōn-zhwā sān dēn-ē, a French war cry dating from the 12th century. The name is derived from the hill near Paris on which Saint Denis suffered martyrdom.

**MONTLOSIER**, mōn'lō'zyā, François Dominique Reynaud, Count de, French publicist and politician: b. Clermont, Auvergne, 11 April 1755; d. 9 Dec. 1838. He was elected a member of the States-General (1789) and favored protection of royalty and nobility. He fled (1791) to London where he started an anti-revolutionary paper, the *Courrier de Londres*. In 1800 he was won over by Bonaparte and given a position in the ministry of foreign affairs. He frequently accompanied Napoleon I as political correspondent during his campaigns, but resigned in 1812. After the first Restoration his 'De la monarchie française depuis son établissement jusqu'à nos jours' (Paris 1814) was a work in praise of the feudal state. Under the Restoration he took a prominent place fighting the activities of the Jesuits and published his 'Memoir à consulter' (1826), but in his 'De la crise présente et de celle qui se prépare' (1829) he tries to intermediate between the parties, returning to his early aristocratic views in his 'Mémoires sur la Révolution française, le Consulat, l'Empire et la Restauration' (1829). He defended the Louis Philippe government and was created a peer.

**MONTLUÇON**, France, town in the Department of Allier, located on the Cher, starting point of the Berry Canal and junction of the Orleans Railway. It consists of the old town with its 15th century castle, and the modern industrial section which has been built up since the opening up of the coal field of Commentry. It possesses a lyceum, commercial court, chambers of agriculture and manufactures, a library and theatre. Its industries are important and consist chiefly of iron and steel works, glass and mirror factories, chemical products, machinery and considerable trade. In 1911 it had a population of 33,799.

**MONTMAGNY**, Charles Jacques Huault de, shārl zhāk ü-ōlt de mōn-mān-yē, French colonial governor; d. France, about 1649. He was Canada's second governor-general, 1636-48, and proved himself a wise and able ruler. The condition of the colony improved under his administration, he defeated the Iroquois and concluded a treaty with them at Three Rivers in 1645; and had begun the subjugation of the Hurons when he was recalled in 1647. Under his rule the Jesuits made extensive explorations and settlements, but though deeply religious Montmagny disapproved of the founding of Montreal, considering it a weakening of the missionary forces.

**MONTMARTRE**, mōn-mār-tr, France, a northern district of Paris, a former suburban village, on a conical hill commanding an extensive view of the metropolis. See PARIS.

**MONTMÉDY**, mōn'mā-dē, France, capital of the Arrondissement of the same name in the Department of Meuse, located on the river Chiers and the East Railway. It is a fort of the second class and consists of the citadel on a rock 960 feet above sea-level with its old or upper town built in 1235 by Arnoux III, Count of Cas and Chiny, and surrounded by its high walls and tower, and the lower town (Bas-Médy). It was several times taken by the French but always released to the Spaniards until, in 1659, it came permanently under French rule. Louis XIV had Vauban greatly strengthen

the fortifications. In 1815 the Prussian and North-German allies besieged and then took the lower town by storm when it capitulated. In 1870 it became a useful railroad centre for the Germans. In the World War it was again captured by the Germans. In 1911 it had a population of 2,774.

**MONTMORENCY**, mōn-mō-rōn-sē, Anne, Duc de, French soldier: b. Chantilly, 15 March 1492; d. Paris, 11 Nov. 1567. He was a distinguished general in the wars of Francis I, and was taken prisoner at Pavia (1525). In 1538 he was made constable of France, but by a rapid change of fortune was banished the court in 1541 under suspicion of conspiracy. He was restored by Henry II (1547), in 1557 was defeated by the Spaniards and taken prisoner at Saint Quentin, and in 1562 was again captured while commanding against the Huguenots at Dreux. In 1563 he drove the English from Havre, and in 1567 received a fatal wound in the battle against Condé at Saint Denis. Consult 'Life' by Decrue (1885-89).

**MONTMORENCY**, mōn-mō-rōn-sē, Henri, Duc de, French soldier: b. Chantilly, 30 April 1595; d. Toulouse, 30 Oct. 1632. In 1612 he purchased the viceroyalty of Canada from the Prince of Condé for 11,000 crowns, and was wise enough to retain Champlain in command at Quebec. He wearied, however, of the post, which gave him constant trouble, and in turn sold it. His services against the Huguenots in the civil wars were distinguished, and included a victory over the Duc de Rohan in 1628; but he took part in the insurrection of Gaston of Orleans in 1629, was made prisoner, condemned for treason, and beheaded.

**MONTMORENCY**, mōnt-mō-rēn'sī, Falls of, Canada, a beautiful cascade near the mouth of the Montmorency River, on the Saint Lawrence River, seven miles below Quebec. The river has an irregular course north and south of about 15 miles, and just above its confluence with the Saint Lawrence falls over a precipice 251 feet high, and 100 feet wide at its crest. The falls are visited by great numbers of tourists, and are utilized to supply the power necessary for the electric and street railway plants of Quebec.

**MONTOJO**, mōnt-ō'hō, Patricio, Spanish naval officer: b. 1833. He entered the navy when a young man, and at the outbreak of the Spanish-American War was in command of the Spanish fleet in the Pacific. This force was attacked by the American Pacific squadron under Dewey in Manila Bay 1 May 1898. Montojo's flagship, the *Reina Christina*, was successively engaged by the *Olympia*, *Baltimore*, *Raleigh* and *Boston*, received 70 shots, which killed 52 men and wounded 150; and finally caught fire. Montojo transferred his flag to a gunboat. In September 1899 he was court-martialed in Madrid, and urged in his defense that the fault of the defeat was the Spanish government's, as it had not given him proper equipment. He was retired without right of promotion.

**MONTORO**, mōn-tō'rō, Spain, town in the province of Cordova on the rocky left bank of the Guadalquivir and on the Madrid-Sevilla Railway. It has a beautiful church and a fine bridge built in the 16th century and remains of

the ancient Moorish fortifications. Its chief industry is olive oil and cultivation of tropical fruits. Its population in 1910 was 15,144.

**MONTORSOLI, Fra Giovanni Angelico da**, fra jō-vān nē ān-jēl'ē-kō dā mōn-tōr-sō-lē, Florentine sculptor and architect: b. Montorsoli, 1507; d. Florence, 1563. He was a member of the religious order known as Servites; worked at Genoa, after retiring from that order, and by building the Serra and Doria palaces and adding a chantry and Doria tomb to the church of San Mateo, established his reputation as a sculptor and architect (1525). He was soon afterward engaged as assistant by Michelangelo in his work on the chapel of the Medici at Florence; the statue of Saint Cosmas there is by him. Among his other productions are the fountain in the Cathedral square at Messina (1547); he also designed several chapels in the cathedral there and built the light-house.

**MONTOUR, mōn-toor', Esther** (called "Queen Esther"), American half-breed Indian of the 18th century. She had French blood in her veins and was supposed to have been a descendant of Count de Frontenac, governor of New France. She married Eghobund, chief of the village of Sheshequin, and her keen intelligence enabled her to completely dominate the Senecas over whom she reigned as "Queen Esther." She was friendly to a Moravian mission which was located near her village for some years, and accompanied the delegates to various congresses of the Six Nations in Philadelphia, where she was well received among the best people owing to her pleasing manners and beautiful person. In the Wyoming massacre in July 1778 the savage in her nature, however, asserted itself and to avenge the death of her son she deliberately tomahawked 14 prisoners. Consult Cook, 'General Sullivan's Indian Expedition' (1887).

**MONTPELLIER, mōnt-pēl'yēr**, Vt., city, capital of the State, county-seat of Washington County, on the Winooski River, and on the Central Vermont, the Montpelier and White River, and the Montpelier and Burlington railroads, about 38 miles southeast of Burlington. It is situated in a beautiful valley surrounded by hills and in an agricultural region. In the vicinity are valuable granite quarries. The chief industrial establishments are flour, feed and lumber mills, machine shops, hardware, patent medicines, granite works, lathes for turning steel clothes pins and creameries. It controls a large portion of the trade of the surrounding country, and ships considerable farm products, especially hay, maple sugar, apples and potatoes, and also dairy products, poultry, granite and lumber. One of the prominent buildings is the State capitol, a fine granite structure built in the form of a cross, the dome, 124 feet high, surmounted by a statue of agriculture. A marble statue of Ethan Allen is at the entrance, under the portico; large State administration building under construction. Another fine building is Montpelier High School built 1915, also the Heaton Hospital, opened in 1896. The city has public and parish schools, the Washington County Grammar School, the Montpelier Seminary, under the auspices of the Methodist Episcopal Church, the Wood Art Gallery, the State Library, the Washington

County Grammar and Montpelier Union School Library, and the seminary library. The Y. M. C. A. is in flourishing condition. The government is administered under a charter of 1900 which provides for a mayor, who holds office one year, and a council. The mayor appoints, subject to the approval of the council, the police; and the council elects the health officer, overseers of the poor, superintendents of streets and water and other officers. The waterworks, owned and operated by the city, were opened in 1884, and now (1913) comprise about 40 miles of mains. The water is brought from Mirror Lake, or Berlin Pond, situated about four and one-half miles southeast of the city. The land which is the town site was chartered in 1781, but the first permanent settlement was made in 1787 by people from Massachusetts. The town was organized in 1791, and in 1805 Montpelier was chosen as capital of the State. It was incorporated as a village in 1855. For 40 years it maintained town, village and school district organizations, until 1894, when it was chartered as a city. Among the noted people who have lived in Montpelier are Admiral George Dewey and Rear-Admiral Charles E. Clark, Joseph A. Deboer, an authority on insurance and loans. Pop. 7,856. Consult Hemenway, 'Gazeteer of Vermont,' and 'History of the Town of Montpelier'; Thompson, 'History of Montpelier.'

**MONTPELLIER, mōn-pēl-lē-ā**, France, chief town of the department of Hérault, on the Lez, six miles north of the Mediterranean, and 80 miles northwest of Marseilles. It is one of the handsomest towns of the south of France and with its equable climate a favorite tourist and winter resort for invalids. Among its noteworthy features are the Peyrou, a splendid promenade, on which is the Château d'Eau, at the termination of a lofty double-arched aqueduct; the citadel; the cathedral; the Palais-de-Justice; the university buildings, and Porte de Peyrou, a triumphal arch of the Doric order. Montpellier is well equipped with educational and other institutions, and since the 12th century has been famous for its school of medicine, said to have been founded by Arab physicians driven out of Spain. It is now merged in the celebrated University of Montpellier, dating from 1289, which has also "faculties" of law, science and literature, and an average annual attendance of 1,500 students; there is a public library of 130,000 volumes. The botanical garden, begun under Henri IV in 1593, is the oldest in France. Montpellier manufactures cottons, candles, soap, verdigris, chemicals, etc. It carries on an active trade, Cette serving as its harbor. Montpellier dates from the 8th century as a village built around a Benedictine abbey. It was a stronghold of the Huguenots, and suffered much in the religious wars. The edict of Montpellier (20 Oct. 1622) granted the free exercise of their religion to Protestants, and confirmed the Edict of Nantes. The philosopher Comte was one of Montpellier's distinguished sons. Pop. about 80,250.

**MONTPELSIER, Anne Marie Louise d'Orleans**, ān mā-rē loo-ēz dōr-lā-ān mōn-pōn-sē-ā, DUCHESSE DE, French princess, better known as MADEMOISELLE OF LA GRANDE MADEMOISELLE: b. Paris, 29 May, 1627; d. there, 5 April 1693. Her father was Gaston d'Orleans,

Louis XIII's brother; and her mother was Marie de Bourbon-Montpensier, who died when her daughter was five days old, leaving her the richest princess of Europe. Her wealth, pride and romantic disposition prompted her to a high match. In 1646 she refused the Prince of Wales, later Charles II, and her chance to marry Louis XIV was ruined in 1652, when she sided with Condé for whose protection she had the cannon at the Bastille fired on the royal troops. Upon her return to the court in 1657 she fell in love with Lauzun, a Gascon cavalier, whom Louis refused to let her marry. Lauzun was imprisoned for 10 years, but Mademoiselle seems to have married him secretly, in spite of the king, only to find him a brutal husband; they were separated and her last years were spent in pious devotion. Her 'Memoirs,' covering the years 1630-88, are particularly valuable for the light they throw upon the history of the Fronde; they are edited by Chêrueil (1858). Consult Barine, 'La Jeunesse de la Grande Mademoiselle 1627-52' (New York 1901); Price, E. C., 'A Princess of the Old World' (New York 1907).

**MONTPENSIER, Antoine Marie Philippe Louis d'Orleans**, ân-twân mâ-rê fê-lêp loo-ê dôr-lâ-ân, Duc DE, French prince and claimant to the Spanish throne: b. Neuilly, 31 July 1824; d. San Lucar, near Seville, 4 Feb. 1890. The fifth son of King Louis Philippe, he studied at the Collège Henri IV, entered the army in 1842, served in Algiers, and in 1846 married the Spanish infanta Maria Luisa Fernanda. After the revolution of 1848 he lived in England and Holland; then settled in Spain, where he received the title of Infante and was made captain-general of the Spanish army; was suspected of a plot against the Crown and was exiled from Spain, returning only after the revolution of 1868. In 1870 he quarreled with the Duke of Seville, also a claimant for the throne, and killed him in a duel. During the reign of King Amadeus (1871-73), Montpensier was exiled to the Balears; upon his recall in 1873 he sided with Alfonso XII, and married to that prince his daughter, Maria de las Mercedes, who died without issue in 1878, the close of Montpensier's political activity. His eldest daughter married the Comte de Paris, and his only son became the husband of the Infanta Eulalia in 1886.

**MONTREAL**, Canada, the largest and most important city of the Dominion, and fourth in population among American cities, is in the province of Quebec. It lies on the left or north bank of the Saint Lawrence, at the head of ocean navigation, 985 miles from the Atlantic, 180 miles southwest of Quebec and 420 miles north of New York.

**Topography.**—Montreal lies in the middle of that great plain which stretches from the Laurentians to the Adirondack Mountains and extends from the sea into the middle of the Continent. The rivers which traverse this plain, the Saint Lawrence and the Ottawa, fall together at the head of the Island of Montreal, which is 32 miles long and 10 miles wide at the broadest part. The city is built upon the southeast side of this island, at a point where the Lachine Rapids make further navigation impossible. It owes its importance to this situation. Immediately behind the city Mount Royal rises

to a height of 753 feet above the level of the sea. Upon three sides the mountain ends in a sheer cliff, but toward the west it extends in broken ridges for three miles. Mount Royal gives to the city its character. It was converted into a park by Frederick Law Olmstead, who succeeded admirably in bringing to light its characteristic beauties, by obeying the design which nature had already laid down. By following the terraces a roadway was constructed, devious, but always ascending until after a complete circuit the summit is reached. From the various levels and the different points of outlook a wide and diversified view is obtained. To the south, the White, Green and Adirondack mountains may be descried upon the horizon. In the middle-distance a number of rounded eminences arise from the plain, which are, like Mount Royal itself, the roots of old volcanoes. Villages, Longueuil, Saint Lambert and La Prairie, mark the southern bank of the Saint Lawrence, which at this point is two miles wide. Away to the westward the valley of the Ottawa opens out, and the river, dividing on the Island of Montreal, sends its waters on either side to mingle their dark colors with the blue of the Saint Lawrence. Further to the west Lake Saint Louis is spread out like a sea. The Lachine Canal threads the plain, and upon occasion one may see the leap and sparkle of the Rapids. To the north the Laurentians extend their dark purple irregular masses. Immediately around the mountain and upon its lower terraces lies the city.

**Geology.**—Fourteen distinct geological formations or horizons have been described within a radius of a few miles from Montreal. Four of these belong to the quaternary or newest system; one is doubtfully but probably referable to the Devonian, one to the Silurian (Upper Silurian of Murchison), seven to the Ordovician (Lower Silurian and Cambro-Silurian of many authors), and the remainder to the Laurentian or part of the great Archæan Complex.

**History.**—The site of Montreal was first visited by Jacques Cartier in 1535. He landed upon the island and followed an Indian pathway: "And we, being on the road, found it as beaten as it was possible to see, in the most beautiful soil and the fairest plain; oaks as fair as there are in any forests of France, under which all the ground was covered with acorns.

... And about a league thence, we commenced to find the lands tilled, and fair large fields full of the corn of their lands, which is like Brazil rice, as large, or more, than peas, whereof they live as we do on wheat. And in the midst of these fields is situated and fixed the said town of Hochelaga, near and adjoining a mountain which is in the neighborhood, well tilled and exceeding fertile: therefrom one sees very far. We named that mountain *Mont Royal*."

The next European to visit the spot was Samuel de Champlain in 1611. He landed at a place which he called Place Royale, a name it still bears. He found "in the middle of the river an island about three quarters of a league in circuit, fit for the building of a good and strong town, and I named it the Isle of Sainte Heleine. The rapids come down into a sort of lake, where there are two or three islands and fine meadow-lands." By this time all trace of Hochelaga had vanished, leaving only ob-

**MONTREAL, CANADA**

**City of Montreal from Mount Royal**

MONTREAL, CANADA

Dominion Square

scure legends of a Huron Helen and of the evil which had been wrought by her.

The founding of the present city dates from 1642 and it was marked by voices and visions and dreams and signs. Its inception is shrouded in mysticism; there was Dauversière who whipped himself with a scourge of small chains; there was Olier who afterward founded the Sulpician Seminary, to whom came a revelation as the choir was chanting *Lumen ad revelationem gentium*. These two men were miraculously brought together in the church of Notre Dame de Paris, and to them in an ecstasy the Virgin appeared. All these things are set forth in the *Relations des Jesuites*.

The proposal was to found at Montreal three communities, one of secular priests, to direct the colonists and convert the Indians; one of nuns to nurse the sick; and one to teach the Faith to children white and red alike. This was at a time when, from the condition of Indian warfare, it was like entering a kennel of wolves. The soldier captain of the expedition of 40 men was Paul de Chomedey Sieur de Maisonneuve, a valiant and sober man of grave demeanor and full of courage. Accompanying the expedition was the devoted Jeanne Mance. Arriving at Quebec they encountered only jealousy and distrust. It was then the leader cried: "I have not come to deliberate but to act; it is my duty and my honour to found a colony at Montreal, and I would go if every tree were an Iroquois." Upon the 17th of May 1642 this strange expedition arrived at the foot of Saint Mary's current. Maisonneuve sprang ashore on the spot where the Customs House now stands. In the words of the officiating priest, Père Vimont, "tents were pitched, campfires were lighted, evening fell and mass was celebrated. Fire-flies caught and imprisoned in a phial upon the altar served as lights." An altar was raised, and kneeling together the adventurers heard the voice of the priest: "You are a grain of mustard-seed that shall rise and grow till its branches overshadow the earth. You are few but your work is the work of God. His smile is upon you and your children will fill the land." To trace the trials and growth of the Colony would be to write the romance of Christian chivalry.

As a result of the victory which Wolfe obtained over Montcalm on the Plains of Abraham, Canada fell to the British, and Montreal formally capitulated to General Amherst on 8 Sept. 1760. When the war of the American Revolution broke out, operations were directed against Canada. Montreal yielded to Brigadier-General Wooster, and General Carleton was obliged to withdraw to Quebec. During the winter of 1775-76 the Commissioners of Congress, Benjamin Franklin, Samuel Chase and Charles Carroll, took counsel as to how they might detach Canada from its allegiance to the British Crown, which had lasted only six years. The ecclesiastical authorities, with the astuteness of their race, took the occasion to drive a hard bargain with England, by which their religion and laws were guaranteed to them for ever. To England Canada was, in the mocking words of Voltaire, nothing more than a few acres of snow, and the mother country adopted an easy way out of her difficulties. The Commissioners were outwitted and resorted to force. The expedition, which was sent to Quebec un-

der General Montgomery, received no support on the way, and it was ultimately defeated and its commander slain before the barriers of Quebec.

**Monuments, Parks and Public Buildings.**—Place d'Armes is a small enclosure surrounded by several noble buildings. The parish church of Notre Dame, with the seminary of the Sulpicians, occupies the southern side. The Bank of Montreal with its classic front faces the church, and upon either hand are large buildings for commercial purposes. The most notable feature of the Place d'Armes is the statue erected in honor of Sieur Chomedey de Maisonneuve, the founder of Montreal. He is represented in bronze, in the costume of the 17th century, holding a fleur-de-lis banner. The granite pedestal shows the inscription: "*Paul de Chomedey de Maisonneuve, Fondateur de Montreal, 1642.*" It rests upon a fountain and displays bas-reliefs representing Maisonneuve killing the Indian chief; the founding of Ville-Marie; the death of Lambert Closse defending his enclosure near Saint Lambert Hill; the heroic death of Dollard, who fell with his companions at the Long-Sault on the Ottawa, and saved the colony. At the four corners are life-size bronze figures, representing an Indian, a colonist, with the legendary dog Pilote, a soldier and Jeanne Mance, all finely done by Philip Hébert, the Canadian sculptor.

Jacques Cartier Square fronts the river and is adorned with a column and statue of Lord Nelson, erected in 1808, and recently restored. Into this square the traffic from Bonsecours market overflows, and it has lost all the dignity of a public place. At the head of this square Frontenac burned four Iroquois in 1696, with good effect upon the tribe.

Victoria Square is in the centre of the city, at the foot of Beaver Hall Hill, and contains a good bronze statue of Queen Victoria, of colossal proportions, by Marshall Wood. A monument to King Edward VII adorns Phillips Square.

Dominion Square occupies the site of an old cemetery. The square is a pleasant place and acquires dignity from the buildings on either side; the Canadian Pacific Depot, the Windsor Hotel and on the east the cathedral of Saint James. Here have been erected the ice palaces when Carnival was king. Near the centre of the square is a structure containing a figure in bronze of the late Sir John A. Macdonald. The figure itself is of commanding proportions with a reasonable degree of harmony in its parts, but the canopy with its obscure adornments and trifling decorations, disguises the value of the figure.

Saint Helen's Island, at the foot of the current, is a small island called by the name of Helen, wife of Champlain, the first European woman to visit Canada. The English government acquired it from the Barons of Longueuil for a military depot and station. There is yet upon the island a battery of guns and barracks. The place is prettily wooded and has many secluded spots.

**Churches.**—The Catholic cathedral of Saint James has an imposing situation upon Dominion Square. It is erroneously called the cathedral of Saint Peter, because it is a reproduction of Saint Peter's at Rome, modified to suit the exigencies of the Canadian climate;

for example, the roof is sloping to throw off the snow. This noble edifice was projected by the late Archbishop Bourget in 1852, when his church and palace on Saint Denis street were consumed in the great fire of that year. The work was commenced in 1868 and is now nearly finished. Apart from the plan the exterior is hard and gloomy in appearance. The dome is a noble adornment and a salient feature in the architecture of Montreal. Its height with the cross is 250 feet and its diameter 90 feet. The plan is cruciform after the manner of its prototype, the tribune and ends of the transept being rounded. The total length is 330 feet, the breadth of the transept 225 feet, the height to the roof-tree 80 feet. The interior is upon the model of the Italian churches. At the north entrance is a statue to the founder by Hébert.

The parish church of Notre Dame faces the Place d'Armes. It is a plain stately edifice of late Gothic style, built of graystone in 1824, by James O'Donnell. The present site was occupied by a church built in 1672, a long low structure with a pointed roof. Notre Dame is one of the largest churches in America, being 255 feet long and 134 feet wide, and capable of containing 18,000 persons. There are two towers, 227 feet high provided with an elevator, and from the summit a notable view may be obtained. They contain a chime of 10 bells which are rung upon special occasions. There are three others, one "le Gros Bourdon," the largest bell in America, weighing 15 tons. The interior is florid and tasteless in its decorations, but the wood carving is good. The organ was built at Saint Hyacinthe in 1890. Behind the choir is a richly adorned Lady Chapel.

Adjoining the church is the seminary of Saint Sulpice, erected in 1710 and now used for the offices of the Order. As in the days of Charlevoix, it is "a stately great and pleasant house, built of free-stone, after the model of that of Saint Sulpice at Paris; and the altar stands by itself, just like that at Paris."

Notre-Dame-de-Lourdes, on Saint Catherine street, is the only church in Canada in which all the interior decoration is meant to illustrate one central idea; in this case, the dogma of the Immaculate Conception. M. Bourassa, the artist, was stimulated to this effect by the declaration in 1854, of Pius IX, that this dogma was of faith. The style of architecture is Byzantine and Renaissance in harmonious proportions. Within and without the effect is one of unity and force.

Notre Dame-de-Bonsecours dates from 1673, when it was founded by Marguerite Bourgeois. The present edifice dates from 1771, and several times has been in danger of being swept away by the tide of commerce at its base. It has been sorely mishandled by the renovator.

The church of the Gesu on Bleury street, with Saint Mary's College adjoining, is the abode of the Jesuits. They returned to Canada in 1847, and erected the present church in 1864. Members of this Order were the first to establish missions in Canada, and an account of their trials affords the most romantic reading of its history. Individual priests penetrated the wilderness and lived and died often in hideous torment amongst the savages of the Iroquois confederacy. At the time of the conquest they were expelled from Canada, and their estates

confiscated. Up to 1892 their revenues were devoted to educational purposes when, under arrangements, their estates were restored to the Order. The church is 194 feet long, 96 feet wide, the transept 144 feet and the nave 95 feet high. The frescoes are in grisaille, grayish tints imitative of bas-reliefs—a very effective decoration for the interior. The evening music is very fine, and an admirable sermon in English is often preached which attracts many non-adherents of the Roman communion.

Amongst the churches of Montreal the Anglican Christ Church Cathedral holds first place in correctness of style. The style chosen is early English. The architect has insisted very clearly upon its proportion and symmetry, and has succeeded in erecting one of the most important architectural units in America. Its conception is due to Bishop Fulford, the first resident bishop of Montreal, and his memorial on the east side is much admired. It resembles the Martyrs' Memorial at Oxford. The church is in the form of a Latin cross. The total length is 212 feet, transept 100 feet, height of spire 224 feet, nave 67 feet. The material of which it is built is Montreal limestone faced with Caen sandstone, which, though soft for the climate, has weathered to a very delicate tone of color. There is no attempt at interior decoration, except in the staining of the glass, which is well done, especially the northern windows and those of the transept. Other features are the seats of the choir, and the capitals of the columns carved to imitate Canadian flowering plants. The chapter-house, an octagonal building with broken outlines, adds to the general effect. In spite of, or perhaps by reason of, the correctness of the design and the adherence to it, the edifice somehow lacks the true cathedral feeling.

Saint George's Church, Anglican, on Dominion Square, is a very dainty piece of building, after the manner of the 13th century Gothic. One notes the following features: the stone porch, the spire 230 feet high, with a fine chime of bells, the wide span of the roof, and the freedom of the nave from pillars. The church was erected in 1870, of limestone and olive sandstone.

The church of Saint James the Apostle, on Saint Catherine Street West, is a pleasing little edifice. It contains a chime of six bells which ring with good effect. One admires the pulpit church was erected in 1870, of limestone and the stalls of carved buttonwood.

The principal Presbyterian churches are Saint Andrews (Church of Scotland) on Beaver Hall Hill; Saint Paul's, Knox, American, and Crescent on Dorchester street; and, most important, Erskine Church, on Sherbrooke street.

Saint James is the chief of the Methodist churches. It is situated on Saint Catherine street; it is elaborate in design and within the arrangement is of a very modern kind.

**Educational Institutions.**—McGill University, non-denominational, was founded in 1821, when James McGill, a native of Glasgow, born 1744, died 1813, under a will dated 1811 bequeathed £30,000 to the Royal Institution for the Advancement of Learning. This corporate body dates from 1801 and it secured a new charter in 1821, but it was not till 1829 that educational work was undertaken. McGill University contains four faculties, Arts, Law,

**MONTREAL, CANADA**

**Notre Dame Church**

Medicine and Applied Science, the Royal Victoria College for Women and a Conservatorium of Music. In 1917-18 the enrolment was 1,040; about 2,300 students and graduates were serving in the Great War.

The university library, a fine Romanesque building, erected in 1893, contains over 150,000 volumes. It is particularly strong in history. The museum, erected in 1882, is rich in geological collections. The observatory is the centre of much valuable work in astronomy. Connected with the university are the Presbyterian, Wesleyan, Anglican, Diocesan and Congregational colleges. There is also in Montreal the Medical Faculty of Bishop's College, Lennoxville.

Laval University was founded in 1852 by the Quebec Seminary, which itself was founded in 1663 by Mgr. de Laval Montmorency, the first bishop of Quebec. Laval operates under a royal charter signed at Westminster 8 Dec. 1852 and under the bull, *Inter Varias Sollicitudines*, promulgated by the Sovereign Pontiff Pius IX, 15 April 1876. In conformity with the decision of the Propaganda a branch of Laval University was established in Montreal in 1877, enjoying all the privileges of the mother university at Quebec. A new building which is a modern adaptation of the Renaissance was erected on Saint Denis street out of the large funds of the seminary. The first floor is occupied by the law faculty, the second by the faculty of medicine. This faculty was formed by an amalgamation in 1891 with the Montreal School of Medicine and Surgery, which had existed since 1843. It is attended by 300 students.

The Seminary of Saint Sulpice undertakes the theological teaching for the Montreal branch of Laval University, and a portion of the work in arts. Its buildings extend from Sherbrooke street up the slope of the mountain and include the grand seminary and the Seminary of Philosophy. There are more than 450 students in residence with 28 professors. Two towers, the remains of the fort constructed in 1671, still stand in front of the seminary.

Saint Mary's College is conducted by the Jesuits and adjoins the church of the Gesu on Bleury street. Here 400 students are assembled and receive an excellent training in classics.

The Sisters of the Congregation of Notre Dame was established in 1653. These sisters have 91 educational establishments in Canada and the United States with 1,000 nuns and over 30,000 pupils. The mother house, Villa Maria, was burned in 1895, but it is now being replaced on a new site.

The Sisters of the Holy Names of Jesus and Mary inhabit the Hochelaga Convent for a mother house. They have 36 minor houses in which 10,000 children are taught.

**Hospitals.**—The Hotel Dieu, 253 beds, founded in 1643, occupies a pile of buildings erected in 1859. During the Iroquois Wars and ever since this hospital has done good service. It is attended by the surgeons of Laval. The Montreal General Hospital (484 beds) was founded in 1819, and opened in 1822. The Royal Victoria Hospital (355 beds) was founded, erected and endowed between 1888 and 1893 by Lord Strathcona and Mount Royal and Baron Mount-Stephen. Other hospitals are the Notre Dame, with 148 beds,

which is now erecting new buildings with accommodation for contagious cases, the Western General Hospital and the enormous hospital of the *Soeurs Grises* for foundlings and the aged infirm. The "Alexandra Hospital" for contagious diseases was erected by the Protestant community at a cost of \$200,000.

Other public buildings are the city-hall, an imitation of the Hotel de Ville in Paris; the courthouse, in a classical style with a dome; the Art Gallery, with some good pictures but not equaling those held in private collections; the Fraser public and reference library with accommodation for 300,000 volumes, opened by Field Marshal Joffre on 1 September; the Canadian Pacific Railway Station, a fine castellated structure. Many of the private residences are fine, and the general material of construction being gray limestone gives to the city an appearance of dignity.

**Navigation and Trade.**—The Montreal-Quebec channel, with a minimum depth of 31 feet, accommodates vessels of 15,000 tons, and the port handles one-third of Canada's commerce. Montreal has eight miles of deep water in the harbor, and it is well equipped for the expeditious handling of traffic. Port statistics for 1917 show 6,921 arrivals, of which 579 were Atlantic ships, 68 from the Maritime Provinces and 6,274 from inland waters (gross tonnage, 5,217,309 tons). The total value of the imports for year to 31 March 1916, \$129,139,817, and of the exports of Canadian products, \$173,436,739. The customs receipts for 1917 were \$37,857,723, and the inland revenue receipts, \$15,685,451.

**Banking and Finance.**—Montreal is the banking centre for Canada. There are 20 chartered banks in Canada, many of which have their head offices in Montreal and nearly all have branches. The bank clearings in Montreal for 1917 were \$4,188,255,210; the assessment valuation was \$824,630,229 (doubled in six years). The municipal budget, \$14,230,492 in 1916, is the highest in Canada.

**Railways.**—Three great railway systems, the Grand Trunk, Canadian Pacific and Grand Trunk Pacific, have their headquarters in Montreal with general offices and large works. Two bridges span the Saint Lawrence. The Victoria bridge, one and three-fourths miles long, tubular, costing \$6,300,000, was designed by Robert Stephenson, and the work was inaugurated by the Prince of Wales in 1860. It was long regarded as one of the engineering feats of the world, but in 1898 it was converted into a structure more suitable for modern needs with two tracks, a driveway and foot-path. The Canadian Pacific Railway bridge, light and graceful, crosses the river at Lachine. It is built on the cantilever principle, and has two spans each 408 feet long. In order to obtain terminal facilities for the Canadian Northern Railway, a tunnel has been constructed through Mount Royal.

**Population.**—The population of Greater Montreal is now (1917-18) approaching 800,000. In the city 75 per cent of the population are of French-Canadian extraction. Both French and English languages are officially recognized and the majority of the population speak both languages. In 1800 the city had 7,000 population. Montreal has the largest birth rate of any of the world's large cities, being in 1915

36.96, the death rate was 19.60; but infant mortality is heavy, 185 per 1,000.

**Schools.**—The public schools are controlled by boards of commissioners, one for Catholics and one for Protestants. These are elected by the legislature and the city council. The schools are in the main effective, though the commissioners are chiefly clergymen, and education is free. The city was placed under government by commission in 1918.

**Climate.**—The weather in Montreal is cold in winter and pleasantly warm in summer. The greatest cold, however, is rarely below 20° zero, and the greatest heat above 88°. The annual mean temperature is about 42°. There is generally plenty of snowfall in winter and sleighing begins about 1 December. Consult Bosworth 'Hochelaga Depicta' (new ed. 1901); Dawson's 'Handbook' (1888); Hinshelwood, 'Montreal and Vicinity' (1904); Brumath, 'Histoire populaire de Montréal' (1890); Dollier de Casson, 'Histoire du Montréal 1640-1672' (1868).

ANDREW MACPHAIL.

**MONTREAL, Capture of, in American Revolution.** See QUEBEC, BATTLE OF.

**MONTREUIL, mōn'trē'y',** France, town in the arrondissement Sceaux and department of Seine, five miles east of Paris and north of Vincennes. It has a church dating from the 12th-14th century. The place is noted for its remarkably fine fruit especially its cherry orchards. It has manufactures of chemicals, India-rubber goods, dolls, pianos, porcelain and art furniture. Its population, approximately, 43,217.

**MONTREUX, mōn'trē,** Switzerland, invalid resort in the canton of Vaud, located on Lake Geneva and on the Geneva-Saint-Maurice line of the Simplon Railway. It consists of several villages scattered on the cliffs and lake shore, among them Vernex (the capital), Clarens, Terriet, Veytaux, Glion, etc. In 1910 the communities numbered 18,800 souls. On account of its lovely scenery and mild and healthy climate the year round it is greatly frequented by invalids and convalescents. The ancient noted castle of Chillon is in the neighborhood. A rack-and-pinion railway takes visitors from Glion up to the Rochers de Naye, 5,800 feet above sea-level. Consult Gribble, F. H., 'Montreux' (New York 1908); Bühler, C., 'Le climat de Montreux' (Montreux 1902).

**MONTROSE, mōn-trōz', James Graham, Marquis of, Scotch Royalist general:** b. 1612; d. Edinburgh, 21 May 1650. He was son of the Earl of Montrose, whom he succeeded in that title in 1626. He was educated at Saint Andrew's; joined the opposition to Charles I's attempt to introduce episcopacy into Scotland in 1637, becoming one of the leaders of the Covenant. In 1638-39 he three times overran Aberdeen. In the latter year he was an envoy to the king at Berwick; in 1640 he was the first to cross the Tweed in the Scottish invasion of England. In 1641, being found in secret correspondence with the king, he was imprisoned by Argyll for five months. In the following year he was offered the command of the Covenanting army, but declined; and in the following year definitely turned to the Royalist side. In 1644 he left Oxford disguised as a

groom and penetrated to Blair Atholl. He then united the western clans, united by their common hatred of Argyll against the Covenanters, and with them he won several victories—at Tippermuir, Aberdeen, Inverlochy, Auldearn, Alford and Kilsyth—only to be crushed at Philiphaugh (12 September) by David Leslie. Montrose escaped to Norway. In 1649 he succeeded in urging the younger Charles to send him again to Scotland, raised an army at Gotenburg, landed at Orkney, was defeated at Carbisdale in Southerlandshire and afterward was captured, taken to Edinburgh and there drawn and quartered. His loyalty to the Stuart cause is only less remarkable than his own scheme of Scottish independence of ecclesiastical control, an ideal to which he always remained faithful. Montrose was a political poet, whose verse is vigorous. As a general he ranks first among the Scottish Royalists. Consult Buchan, John, 'The Marquis of Montrose' (London 1913); Gardiner, 'The Great Civil War' (Vol. II, which is particularly able in its criticism of Montrose's strategy); Mowbray, Morris, 'Montrose' (in the 'English Men of Action' series, London 1892); and Napier, 'Montrose and the Covenanters' (ib. 1838).

**MONTROSE, Colo.,** town, county-seat of Montrose County, on the Uncompahgre River, and on two branches of the Denver and Rio Grande railroad, about 355 miles southwest of Denver. It is in the Uncompahgre Valley, in which there is a large acreage of fertile soil, which is made productive by irrigation. The chief products are fruit, grains and vegetables. The three local banks have combined resources amounting to \$1,586,830. The assessed property valuation is \$3,002,320, on a real value estimated at \$5,000,000. The town's principal public buildings are the courthouse, city hall, library, fire house, and pump station. The annual revenues are about \$160,000. There are two graded schools and a county high school. Considerable attention is given to stock-raising. The government is on the commission-manager plan. Pop. 4,500.

**MONTROSE, Pa.,** borough, county-seat of Susquehanna County, on the Montrose, the Lehigh Valley, and the Delaware, Lackawanna and Western railroads; also on the Scranton and Binghamton Electric Railroad; about 40 miles north by west of Scranton. It is about 2,000 feet above the sea, and its cool climate in summer and the beauty of its scenery make it a favorite summer resort. The value of taxable property is about \$400,000 on a basis of 33 per cent valuation. The tax rate is about 5 per cent. The manufactories are machine shops, lumber mills, flour mills and creameries. The public buildings include the county courthouse, jail and the public library. The government is of the regular borough pattern common in Pennsylvania. Pop. 1,914.

**MONTROSE, Scotland,** a seaport town and royal burgh in Forfarshire, 90 miles northeast of Edinburgh by rail, at the mouth of the South Esk, which widens out into a shallow expanse behind the town, known as Montrose Basin. The river is crossed by a suspension bridge, and by a railway bridge. Montrose is well built and has the usual public buildings and institutions, including two public libraries and one of

the largest parish churches in Scotland. It has one of the best golf links in Scotland. The principal employment is flax-spinning. Boat building is also carried on. There are extensive saw-mills, and a large aerodrome nearby. The foreign trade is largely in timber, flax, etc. Montrose is also the centre of a fishery-district. It dates from the 10th century. Pop. 12,666. Consult Mitchell, 'History of Montrose' (Montrose 1866).

**MONTROYDITE.** A mineral, oxide of mercury, HgO in ore mined in the Terlingua district, Texas.

**MONTS, Pierre du Guast, pē-ār dü gā mōn,** French colonist in North America: b. Saintonge, France, about 1560; d. Paris, 1611. He was of an Italian family and educated in the Roman Catholic faith, but became a Protestant, fought on the Protestant side in the wars of religion, and was made governor of Pons in Saintonge. He made several voyages to America, and is believed to have accompanied Chauvin's expedition of 1600. In 1603 he was appointed lieutenant-general with vice-regal authority of a company of colonists to whom Acadia had been granted, a territory which included the present maritime provinces of Canada, and part of the province of Quebec and the greater part of New England. He sailed from Havre in 1604 with Samuel Champlain and the colonists, and after exploring the Bay of Fundy discovered Annapolis Basin, which they called Port Royal, and then explored and named Saint John River. He established a colony at Saint Croix and at Port Royal and then returned to France, but his patent for colonization was canceled in 1607, and afterward renewed for a year. At his own expense he sent relief to his colonists and assisted Champlain and Pontgrave to make a voyage to the Saint Lawrence in 1607; and Quebec was founded by explorers aided by him in 1608. He lost favor at court upon the death of Henry IV. The date of his death is uncertain. Consult Lescarbot, 'History of New France' in the Champlain Society's edition, edited by Grant and Biggar (3 vols., Toronto, 1907-14); Parkman, 'Pioneers of France in the New World' (1865); and 'Tercentenary of De Monts' Settlement at Saint Croix Island' (Maine Historical Society's publications, Portland 1905).

**MONTSERRAT, mōnt-sēr-rāt',** Spain, a deeply eroded mountain 4,070 feet high in the province of Catalonia, 30 miles northwest of Barcelona, famous for its ancient Benedictine monastery, composed, in part, of 13 hermitages, accessible only by steps hewn out of the steep rock, and founded by Sifredo el Vellaso, count of Barcelona, on the spot where a miracle-working image of the Virgin Mary was found in the 9th century. It was enlarged and richly endowed by Philip II. Learned Benedictines had established themselves here as early as 976; and they and their successors formed a large library, which was destroyed when the monastery was pillaged by the French and partly destroyed in 1811. After the restoration of Ferdinand VII the rebuilding of the monastery was begun, but was stopped again when the monks were expelled by the Carlists in 1827. The monastery has fallen more and more into decay since the abolition of the order to which it belonged. While living in this monastery

Ignatius of Loyola (q.v.) conceived the idea of founding the order of Jesuits. According to legend Montserrat was the site of the castle of the Holy Grail.

**MONTSERRAT, mōnt-sē-rāt',** West Indies, a British island of the Leeward group, almost at the same distance (about 30 miles) from the islands of Nevis, Antigua and Guadeloupe. It is 32 square miles in extent, nearly two-thirds of which is mountainous and barren. Its culminating point is the Souffrière, a volcano 3,000 feet high. The climate is on the whole healthful. The principal exports are sugar, molasses, tamarinds and lime-juice, and the principal imports, cottons and clothing materials, hardware and other manufactures. Revenue (1915-16), £10,722; expenditure, £11,969; imports, £33,686; exports, £43,141. The government of the island is vested in the governor-in-chief of the Leeward Islands, who is represented by a commissioner, assisted by a nominated executive and legislative council. Plymouth, the capital (pop. 1,500), is on the southwest side of the island. The island was discovered by Columbus and was colonized by the British in 1632. It was twice in the hands of the French, but since 1783 has been uninterruptedly possessed by the British. Pop. 12,215, of whom not more than 200 are whites.

**MONTT, mōnt, Jorge,** Chilean sailor and politician: b. Santiago, Chile, 1846. He was a son of the Chilean statesman Manuel Montt (q.v.) and early entered the navy, where he had gained the rank of captain when in 1890 an uprising against President Balmaceda was threatened. When the revolution broke out in 1891 Montt was given command of the naval and land forces subject to the control of Congress, and after the suicide of President Balmaceda was appointed provisional President and in November 1891 was elected to the office. His moderate and conciliatory administration did much to heal the wounds of war; he reformed the currency, reorganized the navy and army and made the municipalities locally autonomous.

**MONTT, Manuel,** Chilean statesman: b. Petorca, Chile, 5 Sept. 1809; d. Santiago, Chile, 20 Sept. 1880. He was graduated from the National Institute in Santiago and was engaged as instructor there until he entered upon his political career. As assistant secretary of state he sternly suppressed the revolt of 1837, and in 1838 was made a judge of the Supreme Court. His election to the chamber of deputies followed and he was for a time president of that body. He was Minister of Justice 1841-45 and of the Interior 1846-48, was elected President in 1851 and under his firm, conservative policy a succession of revolts were crushed, many industrial improvements were introduced and the laws reorganized and codified. After the expiration of his second term he resigned his office to his successor and assumed the presidency of the Supreme Court. He was president of the American Congress which met in Lima in 1865.

**MONTUCLA, mōn'tu'kla', Jean Étienne,** French mathematician: b. Lyons, 5 Sept. 1725; d. Versailles, 18 Dec. 1799. He was surveyor-in-chief of the royal buildings in Paris (1766-92). He wrote 'Histoire des recherches sur la quadrature du cercle, etc.' (2d ed, Paris

1831); 'Histoire des mathematiques' (ib. 1758, 2 vols.; 2d ed., 1799-1802, 4 vols.), the first and most important work on the scientific history of mathematics up to the time of Moritz Cantor (1860).

**MONTYON (môn-tê-ôn) PRIZES**, rewards from a fund left in charge of the French Academy by Jean Baptiste Robert Auger, Baron de Montyon (b. 1733; d. 1820), a French economist and philanthropist and a friend of Franklin. He founded in his lifetime six prizes, of which two, that for useful discoveries in the arts, and that for valuable medical discoveries, lapsed after his death. The others are (1) a prize, founded in 1782, granted annually to the author of a literary work adjudged the most beneficial to the temporal good of mankind; (2) founded in the same year, for the most important discovery making more healthful the occupations of workmen; (3) founded in 1783, to promote mechanical research, and (4) a prize, first given in 1783, for the most heroic act on the part of any poor French citizen. For each of these prizes he left a capital fund of 10,000 francs (\$2,000).

**MONUMENTA GERMANIÆ HISTORICA**, a great historical work dealing with the monuments and antiquities of Germany, the first volume of which was published in 1826. It was begun in 1819 and later was placed under the direction of the Prussian Academy of Sciences. In 1914 upward of 114 volumes had been issued.

**MONUMENTAL INTERIOR DECORATION.** See INTERIOR DECORATION.

**MONUMENTS.** The term monument is applied to structures which are characteristic or remarkable on account of their being erected as memorials, and also, though loosely, to those buildings which express some form of worship, or have peculiar prominence on account of their beauty, proportion or grandeur. In modern times, churches are often erected as memorials to individuals, and yet the term monument is not applied to them except in the vague general sense named above. It is evident, therefore, that such buildings may be commemorative monuments, as well as columns or tombs. Sepulchral monuments are the memorials most commonly erected. In Egypt, pyramids are monumental on account of their size, showing very little of so-called architectural art. There are about 100 of these, each containing a room which was used as a royal sepulchre. The Great Pyramid built by Khu-fu, called by the Greeks, Cheops, about 950 B.C., measures 764 feet square at its base and is 482 feet high. As Saint Peter's, at Rome, is about 15 feet less in height, it could be covered by the shell of this pyramid. In Assyria and Chaldæa there are few temples and no tombs remaining of sufficient architectural importance to be classed as monuments. Important buildings in these countries were placed on huge mounds or terraces of earth, which raised them above the surrounding country, but as these structures were mainly of unburned bricks, they have fallen into shapeless mounds.

The earliest existing Greek monuments are found at Mycenæ and Tiryns. The Lion Gate at Mycenæ shows two large lions rampant on each side of a column, carved in bas-relief above the lintel; and this sculpture is wholly

monumental in character, related both to religious and dynastic associations. The gateway at Mycenæ is one of the earliest of porches or towers of entrance which were among the chief monuments of Greek art: these were the Propylæa of which the most important was that of the Acropolis of Athens, with the small Ionic temple of Nike Apteros close by. The choragic monument erected by Lysicrates to commemorate his choral victory may still be seen at Athens. This was built at the time of Alexander's conquest, when Athens was declining and Asia Minor was being filled with magnificent temples of the Corinthian order. Other choragic monuments still exist at Athens in a partly ruined condition. The Tower of Winds, or Clepsydra of Andronicus, was erected at Athens about 100 B.C., but this was rather a utilitarian structure, as it served as a measure of time. Other Greek monuments were the Arch of Hadrian, of the later Roman period; entrances to other temple sites, similar to the Propylæa of the Acropolis, as that of Eleusis; theatres, colonnades, stadia and gymnasia. Greek tombs that remain at the present time are nearly all to be found in Asia Minor, the best known being the Mausoleum at Halicarnassus. The small Greek monuments and tombstones are very simple and refined in detail. Of the same epoch are the rock-cut tombs of Asia Minor. Some of these are of great beauty, the exterior face of the living rock having been smoothed and made vertical, and adorned with magnificent bas-reliefs of very large size.

The principal Roman monuments were on a large scale, the rough work being executed by cheap labor, soldiers, barbarians or slaves. The Roman Forum was crowded with temples, arches and individual memorials. Arches were characteristic products of Roman civilization and were generally erected in honor of some victorious general or in commemoration of some great event.

Columns were also frequently erected. The column of Trajan is still standing in Rome. It is 133 feet high and has a spiral line of figures in relief from the foot to the top of the shaft, showing the story of one of Trajan's campaigns. There is a staircase within the column leading to the top. The sepulchral monuments of the Romans were generally small. One of the larger ones was the circular tomb of Hadrian, now the castle of San Angelo. Small sepulchral monuments lined the sides of Roman roads for miles outside the city. Many have been found at Pompeii. The tomb of Cæcilia Metella, a characteristic example, was built by Crassus, about 60 B.C. It was circular in plan, with a square base.

Early Christian architecture, developing after the fall of Rome, used or copied Roman buildings. At Ravenna interesting monuments of this period were the tomb of Galla Placidia, built in the middle of the 5th century, and the tomb of Theodoric, erected early in the 6th century, a two-storied structure, roofed by a single stone 36 feet in diameter. Basilicas commemorating scenes in the life of Christ were erected as early as the 4th century in Syria, at Bethlehem, at the sepulchre near Jerusalem and on the site of the temple.

The principal monumental buildings of the Byzantine period were in Syria, where from the

4th to the 8th century what we call Syrian architecture was in full luxuriance. The noble tombs of cut stone are, together with the churches and villas built of the same material, rather Græco-Syrian than strictly Byzantine in construction and design. Romanesque architecture in western Europe has not left us many monuments of great size and importance, but some tombs of great beauty remain in the churches of England, France and Germany.

Prominent monuments of the Gothic period were erected in the cathedrals at Paris, Chartres, Rouen, Amiens, Rheims and in the Sainte Chapelle, Paris. In England, early English Gothic is well shown in the crowd of altartombs, some of them with canopies, which are found in the churches, especially in Westminster Abbey. Memorial chapels were also built of great richness and splendor. A good example of the decorative period is to be found in Henry VII's chapel at Westminster. Italian Gothic monuments include many of the wall-tombs in the cathedrals at Florence, Sienna and Milan.

The Renaissance is represented by the Florentine wall-tombs of Santa Croce and the Venetian ones of the churches of Saints Giovanni e Paolo, the Frari and many others. The principal monument of Saracenic architecture in India is the Taj Mahal in India, built in the middle of the 16th century, but the tomb-mosques of the caliphs near Cairo are equally fine as architecture, however inferior in cost and splendor.

In the 19th century, a list of monuments should certainly include the triumphal arches of the French empire, the arch of the Carrousel and the Arc de l'Etoile, the Pantheon, the Madeleine, the Colonne Juillet, the Siegesthor in Munich and the Brandenburger Thor in Berlin; in America, the tomb of General Grant in New York, the many Lincoln and Washington monuments in different cities, and a host of statues, some equestrian, for which see SCULPTURE.

**MONVEL, Louis Maurice Boutet de**, loo-è mô-rès boo-tâ dê môh-vêl, French painter and illustrator: b. Orleans, 1850; d. 16 March 1913. He studied with Rudder, Cabanal and Carolus

Duran, with the last, after some work in the Atelier Julien. His first picture exhibited in the Salon appeared in 1874. He prefers the decorative to the realistic effect in color and modeling. The illustrations which he made for the 'Life of Jeanne d'Arc' (1897) in the *Century Magazine* are supremely successful both in line and color. In the Memorial Church at Domrémy he has painted six panels illustrating the career of La Pucelle. Among his best-known pictures is 'The Apotheosis' (1885) and his portraits are famous.

**MONYPENNY, William Flavelle**, English journalist: b. 1866; d. 23 Nov. 1912. He joined the staff of the London *Times* in 1893, and in 1899, shortly before the outbreak of the South African War, became editor of the *Johannesburg Star*. Under his direction the *Star* had strongly advocated the cause of the Uitlanders against the Kruger régime. The Boer President ordered his arrest, but Monypenny escaped in female garb and joined the Imperial Light Horse. He went through the siege of Ladysmith and after the war returned to his editorial duties in Johannesburg. He disapproved of the Chinese Labor Ordinance and resigned, returning to England in 1903. He was there appointed to write the authoritative 'Life' of Disraeli, but died before the work was completed. It was carried on by Mr. George E. Buckle, retired editor of *The Times*.

**MONZA**, mōn'zā, Italy, a town of Lombardy, in the province of Milan, 11 miles by rail northeast of Milan, on the Lambro. The town is of great antiquity and has a quiet, venerable air. The most remarkable edifice is the cathedral of Saint John the Baptist, originally founded at the end of the 6th century by the celebrated Lombard queen, Theodolinda, but subsequently renovated and enlarged. It contains the iron crown of Lombardy, which according to tradition was beaten out of one of the nails used at the Crucifixion and which was restored to the Italians by Austria in October 1866, as well as various other relics and some valuable art treasures. There is also an old imperial palace surrounded by a large and well-laid-out park. It has been a residence and the place of coronation of the kings of Lombardy for 900 years. Here, while on a visit, King Humbert of Italy was assassinated 29 July 1900. It has a technical school, a lyceum and gymnasium and there are manufactures of silk, hats, leather, bricks, tiles and sausages, for which the town has long been famous. Pop. 53,214.

**MONZONITE**. An igneous rock of granular texture often quarried and sold as "granite" which it closely resembles. In mineral composition, however, it is intermediate between syenite and diorite; both alkali feldspars (or orthoclase) and lime-soda feldspar (or plagioclase) being present in approximately equal amounts.

**MOODY, Agnes Mary (Claypole)**, American biologist: b. Bristol, England, 1 Jan. 1870. She graduated (1892) at Buchtel College, Akron, Ohio, then studied at Cornell, taking the degree M.S. in 1894 and obtaining (1896) the degree of Ph.D. at the University of Chicago. She taught two years at Wellesley College and two years at Cornell, being the first woman to teach in laboratory and recitation courses required of all students. She assisted her father

at Throop Polytechnic Institute, taking charge of the department on his death (1903). She wrote 'Embryology of Anurida Maritima' which appeared in the *Journal of Morphology* (1898).

**MOODY, Dwight Lyman**, American evangelist: b. Northfield, Mass., 5 Feb. 1837; d. there, 22 Dec. 1899. He worked for a time on a farm, then went to Boston as a salesman in a shoe store, and while there became a member of a Congregational church. He later obtained a position in a shoe store in Chicago and there began his active religious work in the Sunday school by forming a class of poor boys; from this beginning he built up a large Sunday school and after 1860 devoted himself entirely to religious work. During the Civil War he worked among the soldiers in the employ of the Christian Commission and at the close of the war resumed his mission work in Chicago, becoming president of the Young Men's Christian Association in 1865. A large church was built for his work, of which he became pastor, though never regularly ordained. In 1870 he was joined by Ira D. Sankey, the singer, and in 1873 the two visited England and Scotland, where, in spite of their American methods, they were the instruments in a great religious awakening that had not been paralleled since the days of Whitefield and Wesley. On their return large meetings were held in New York, Brooklyn and Philadelphia, and subsequently in many cities throughout the United States, at which it is estimated Mr. Moody addressed over 50,000,000 people. Without abandoning entirely his evangelistic tours, he made Northfield his headquarters and established there a girls' academy (1879) and a training school for religious workers, and at Mount Hermon a boys' academy. Later he founded a school for Bible study in Chicago; and inaugurated the custom of holding, at Northfield, summer conferences of college students and missionary volunteers, and the annual meetings of the Young Men's and Young Women's Christian associations. He also established systematic preaching and distribution of religious literature among inmates of the prisons; and built up at Chicago and Northfield establishments for the publishing of inexpensive religious books, tracts, etc. His marked executive ability won him the confidence of men of wealth, who gave generously to his enterprises. Though a Bible student, he was not a theologian and did not understand the methods of Higher Criticism; he was primarily a preacher of the Word of God as he believed it. The power of his preaching was due to his strong personality, his simplicity of thought and language, and his thorough sincerity and earnestness. In conjunction with his colleague, Mr. Sankey, he surrendered the great profits on their 'Sacred Songs and Solos' to public purposes. He published 'How to Study the Bible'; 'Men of the Bible'; 'Weighed and Wanting'; 'Arrows and Anecdotes' (1877); 'The Way and the Word' (1877); 'Heaven' (1880); 'Secret Power' (1881); 'The Way to God' (1884); and 'Bible Characters' (1888). Consult Drummond, 'Impressions of Dwight L. Moody'; Hartzler, 'Moody in Chicago'; Moody, W. L., 'Life of D. L. Moody' (1900); and Moody, P. D., and Fitt, A. P., 'Shorter Life of D. L. Moody.'

**MOODY, James**, American soldier: b. New Jersey, 1744; d. Sissibou, Nova Scotia, 3 April 1809. He was a New Jersey farmer at the outbreak of the American Revolution, but with 73 of his neighbors joined the British forces and was active in attacks upon his former friends. He was daring and unscrupulous in his movements and succeeded, in 1781, in seizing important despatches of Washington's; he was captured and imprisoned at West Point, but made his escape. Though unsuccessful in many instances, his knowledge of the country enabled him to make his escape after his expeditions as a spy and his name was regarded with fear in the region in which he worked. He went to England after the war, and then to Canada where he was presented with an estate and received half-pay as colonel of the militia during the remainder of his life. His adventures are recorded in his 'Lieutenant James Moody's Narrative of his Exertions and Sufferings in the Cause of Government since the Year 1776' (1783).

**MOODY, John**, American financial writer: b. Jersey City, N. J., 2 May 1868. He was engaged in newspaper work until 1890, then entered the service of Spencer Trask and Company, bankers, rising from office boy to manager (1890-1900). He founded (1900) *Moody's Manual of Railroads and Corporation Securities* and was its editor till 1907. In 1905 he founded *Moody's Magazine*, an investor's monthly, and (1909) *Moody's Analysis of Investments*, both of which he edited. He also wrote 'The Truth about the Trusts' (1904); 'The Art of Wall Street Investing' (1906); 'The Investor's Primer' (1907); 'Masters of Capital in America' (1911); 'How to Invest Money Wisely' (1912).

**MOODY, William Henry**, American lawyer and politician: b. Newbury, Mass., 23 Dec. 1853; d. 2 July 1917. He was graduated from Harvard in 1876; studied law and began the practice of his profession in Haverhill, Mass. He quickly attained success as a lawyer, was city solicitor for a time, and from 1890 to 1895 district attorney for the eastern district of Massachusetts. In this position he showed himself an active, fearless prosecuting officer, notably in the case of certain aldermen of the city of Lawrence whom he brought to punishment for receiving bribes; he was also associated with the Massachusetts attorney-general as prosecuting attorney in the trial of Lizzie Borden for the murder of her parents. In 1895 he was unanimously nominated for Congress by the Republicans, to fill a vacancy; he was elected at that time and also to the three succeeding Congresses. Through close study of the rules of the House he became distinguished as a parliamentarian and was suggested as a possible candidate for speaker; he was a most active and efficient member of the committee on appropriations and regularly had charge of the Sundry Civil Appropriations Bill, which he examined in detail; he was also appointed to the committee on insular affairs and through his work on both these committees gained special knowledge of naval matters. In 1902 he was appointed Secretary of the Navy to succeed John D. Long (q.v.), in 1904 he became Attorney-General and on 17 Dec. 1906 became an

## MOON

2 General Map of the Full Moon, showing the location of the Craters and of the Maria (as seen by the naked eye)

associate justice of the Supreme Court of the United States, resigning in ill-health in 1910.

**MOODY, William Vaughan**, American poet; b. Spencer, Ind., 3 July 1869; d. 17 Oct. 1910. He was graduated from Harvard in 1893, where he was for a time an instructor in English and afterward an assistant professor in English literature in the University of Chicago. He published 'The Masque of Judgment' (1900); 'Poems' (1901); and, with R. R. Lovett, a 'History of English Literature' (1902); 'The Fire Bringer' (1904); and the dramas, 'The Great Divide' and 'The Faith Healer' (1909). His verse is well wrought, not infrequently rising to a sustained high level as in his 'Ode in Time of Hesitation.' See FAITH HEALER, THE; GREAT DIVIDE, THE.

**MOON, William**, English philanthropist: b. Horsemonden, Kent, 1818; d. England, 1894. He was educated for the Church but was compelled to abandon this career upon becoming totally blind. He devoted his life to establishing schools and educational helps for blind children and invented a new and simple system of embossed letters for the use of the blind. He established libraries of his books in Europe and United States and greatly furthered the facilities for home instruction. Consult Rutherford, 'William Moon and His Work for the Blind' (1898).

**MOON, The**, from the earliest times, has been the chief object in the sky to attract the attention of the human race. The continual change in its appearance from day to day, its value as a light giver at night, the apparent irregularity of its motions, the curious markings on its face, its connection with the ebb and flow of the ocean, and many a real or supposed influence in terrestrial affairs, have always caused it to be a subject of speculation and inquiry among philosophers of every age. Yet it is only within the last 300 years that the various theories and superstitions connected with it have been put to the test, and that order has been evolved from the chaos of fact and fancy. Even at the present time many a belief, tested by science and found wanting, finds support in otherwise enlightened communities.

**Size, Weight, etc.**—The moon is a nearly spherical body with a diameter of 2,163 miles, a little more than a quarter of that of the earth, moving at an average distance from the earth of 239,000 miles. Its surface is therefore  $\frac{1}{16}$  and its volume  $\frac{1}{49}$  that of the earth. It is, however, less dense in the ratio of 10 to 16, or, on the average, its density is the same as that of the rocks on the earth's surface, so that it would require the materials contained in 81 moons to form our globe. Its smaller size and mass cause gravity at the surface to be only  $\frac{1}{6}$  of the terrestrial attraction: the same exertion which would lift a given weight here would raise a weight six times as great there, and a body, instead of falling 16 feet in the first second, would fall only  $2\frac{3}{4}$  feet. It moves so as to always turn the same face to the earth and therefore rotates on its axis in the same time that it takes to go round the earth—about 27 days. The rotation of the moon about its axis and its motion round the earth is neither quite uniform or circular, as will be seen later; consequently extra portions of the eastern and western faces come successively into view. Further, the

moon's axis is not quite perpendicular to the plane of its orbit, so that the north and south caps are in turn a little inclined toward the earth. These motions are called the librations of the moon, and they permit us to see rather more than half (about three-fifths) the surface.

**Light and Atmosphere.**—Like the earth, the moon possesses no light of its own, but receives all from the sun, and its day—the interval from sunrise to sunrise—is a month. At full moon it sends to us about one 600,000th part of that given by the midday sun. The surface is not nearly so white as its concentrated light would seem to indicate; its brightest portions are nearly of the shade of saff and its darkest that of slate, the average being the color of gray weathered sandstone. The long sunshine for two weeks and the absence of sun for the following two weeks must cause immense variations of temperature. But Professor Langley of Washington estimates that the temperature of the surface, even at the hottest, probably never rises above the freezing point of water; the heat is radiated out nearly as fast as it is received. In the long night the temperature must fall to something like 200° below zero. In spite of this small amount of heat, Professor Langley, by inventing a very sensitive instrument called a bolometer which would detect the heat from a candle a mile away, succeeded in detecting heat rays coming from the moon. His results depend partly on the many fruitless attempts which have been made to find evidences of the existence of an atmosphere. If air is present its pressure cannot exceed 1-750 that at the earth's surface and it is probably much less, as no refraction has ever been observed when the moon's limb passes over a star. A similar argument applies to the existence of water in any quantity, and no clouds have been certainly seen. It is possible that water—probably in the form of ice—may exist at the bottom of some of the deeper craters, but the low temperature would scarcely permit it to be liquified even when the sun was shining full on it.

**Surface Marks.**—The well-known resemblance of the full moon to a human face disappears almost immediately if a glass—even the smallest opera glass—is trained on to it. When it is looked at through a moderately large telescope, the surface is seen to be broken up into mountain ranges and valleys as well as darker portions, which seem to be comparatively flat. A closer inspection made at more favorable times when the moon is not full so that the shadows cast by the sun can be well seen, puts these features clearly into view. The magnificent telescope in the Lick Observatory in California brings the satellite so near that objects which might be seen with the naked eye if the moon were only 100 miles distant, can be distinguished on the surface under favorable circumstances.

**Craters.**—The most marked feature of the lunar surface is the number of craters which appear in almost every region. These are circular rings with diameters ranging from half a mile to 100 miles, and with exterior walls sometimes as high as 20,000 feet—formations comparatively rare on the earth's surface where they seldom exceed a diameter of a very few miles with much lower walls. In some parts they are scattered in the wildest profusion,

overlapping one another, smaller ones breaking into the walls of the larger and so crowded together that it is difficult to distinguish one from another. In many cases there is a central cone or a group of peaks which often rise as high as the walls of the ring and on which small craters can sometimes be seen. There are also lofty ranges of mountains ten to fifteen thousand feet high, some peaks of the Lunar Apennines rising to 20,000 feet.

**Seas.**—The so-called seas of the moon are simply portions of the surface darker in color than the average and very much less broken up by craters or mountain ranges. These form the main features of the face seen at full moon. They are crossed by thin lines known as rills or clefts which run in all directions, sometimes straight and unbroken for hundreds of miles, even intersecting ranges of mountains and craters and reappearing on the other side. These rills are generally two and rarely exceed 10 miles in width, their depth varying from 100 yards up. A curious feature of a different kind is an absolutely straight cut—the great Alpine valley—some 83 miles long, which crosses a range of mountains and under low magnification looks as if some wandering celestial body had grazed the surface.

**White Rays.**—The most puzzling feature of the surface consists in a series of white rays or streaks which radiate from a few of the principal craters in every direction. In their brightness they mask all other shades of tint on the surface and seem to continue their course, sometimes for hundreds of miles, quite independently of the nature of the country they cross. Prof. W. H. Pickering, however, who has studied the systems carefully, considers that their actual length has been much exaggerated and believes that the apparent length is due to lines of small craters from which they emerge. The most remarkable system is that starting from the crater Tycho, itself of a brilliant whiteness, and giving the whole region the appearance of a globe cracked by internal pressure—a suggestion made by Nasmyth who actually cracked a glass globe in this way and obtained a striking resemblance.

**Origin of the Formations.**—The origin of these various formations has been the object of much speculation. That the craters and mountain ranges came into existence after the cooling down of the outer crust and were produced by its contraction and by the enormous tidal disturbances caused by the earth seems a sufficiently probable hypothesis. Objection has been raised to this view on account of the fact that terrestrial volcanoes all show the presence of large quantities of water and that the earth has comparatively few of such formations. But weathering action has undoubtedly had little effect on the moon's surface, while it has been a powerful factor in eliminating such features on the earth. Another theory, that the craters are of the nature of cracked bubbles like those which appear in cooling slag which contains gases, does not require the presence of water, but it has not met with any general acceptance. The rills or clefts are unexplained; some astronomers incline to the idea that they are dried watercourses, others with greater probability that they are fissures produced in cooling. The white streaks or rays are considered by Mon-

sieurs Loewy and Puiseux, whose work on the moon accompanies a big atlas of photographs taken lately at Paris, to be formed of volcanic dust or cinders shot out from the craters and carried for considerable distances by currents of air before being deposited on the ground. Prof. W. H. Pickering inclines to the same theory. The rays were the last evidences of activity before the body of the moon became cold and absorbed the small quantities of air and water which at one time were present outside.

**Surface Changes.**—The evidence as to changes in the moon's surface since the first careful observations were made—about a century ago—is doubtful. One crater, Linné, observed by Beer and Mädler, is given as having a diameter of about six miles. At various times it seems to have appeared and disappeared again—possibly owing to the different circumstances under which it was seen; at present it is scarcely visible. In the absence of air and water such changes must be very rare, the weathering action which takes place on the earth having little or no effect; possibly the enormous differences of temperature every two weeks may in time cause a breaking up of the rock.

**Photographs.**—The photography of the moon's surface was started by Draper and Bond in America about the middle of the 19th century. The pictures of the latter were shown at the London Exhibition in 1851 and inspired De la Rue in England and others as to its possibilities for the accurate investigation of the lunar surface. The magnificent photographs of Rutherford made in New York and published in 1873 have only recently been surpassed by those taken at the Lick, Yerkes and Paris observatories. It is possible that photographs taken 20 or more years from now may, on comparison with these, enable astronomers to detect changes if such occur. The varying aspects of the moon will make this difficult, but the personal element, always present when drawings have to be made, will at any rate be eliminated. At the same time the eye can detect minute details which are absent from photographs.

**Periods.**—The average time occupied by the moon, in moving in its orbit round the earth, is 27d. 7h. 43m., its sidereal period. The synodic period is the interval between successive new moons and it is a little longer owing to the time,  $365\frac{1}{4}$  days, occupied by the earth in moving round the sun. The moon performs  $\frac{1}{27\frac{1}{2}}$  of its orbit and the earth  $\frac{1}{365\frac{1}{4}}$  each day, and therefore the difference between these  $\frac{1}{27\frac{1}{2}} - \frac{1}{365\frac{1}{4}} = \frac{1}{29\frac{1}{2}}$  is the daily fraction of its path which the moon describes with respect to the sun; that is,  $29\frac{1}{2}$  days (29d. 12h. 44m.) is the synodic period. If the plane of the moon's orbit coincided with that of the earth's equator, the moon would rise about 50 minutes later each day, but the inclination of these planes to one another varies between  $18^\circ$  and  $29\frac{1}{2}^\circ$ , so that this retardation is quite different at different times. When full moon occurs near the autumnal equinox, it may, in the latitude of New York, be as small as 23 minutes, while further north it may reduce to nothing, so that for several nights the full moon rises about the same time, soon after sunset. The feature is known as the harvest moon and in countries where the autumn weather is very uncertain, it is a valu-

able help to the farmers, furnishing them with light to get in their crops after the setting of the sun. The hunter's moon is the next full moon after the harvest moon; the same phenomenon, less marked, occurs. The anomalistic month, a little over  $27\frac{1}{2}$  days, is the interval between the times when the moon is in its perigee, that is, when it is nearest to the earth.

**Moon's Path.**—The shape of the moon's path is approximately an ellipse whose two axes are nearly of equal length, but an ellipse will only represent its orbit for a very short time. In order to give an idea of its complicated motions, a model, on a scale of 1:125,000,000, can be constructed as follows: The first part, to represent the motion of the earth, consists of a rail on raised supports (which are movable) in the shape of an ellipse whose semi-axes are respectively 390 feet 10 inches and 390 feet 3 inches long and whose plane we shall for convenience take to be horizontal. The earth is represented by a carriage moving on this rail and the sun by a ball placed on the longest diameter, distance 6 feet 7 inches from the centre of the ellipse. A straight bar two feet long is attached to the carriage by a ball and socket joint at a point  $\frac{3}{4}$  inch from the centre of the bar. The bar forms the longest diameter of an elastic tube in the shape of an ellipse and the tube is so attached to the bar that it may change its size and shape slightly. The plane of the tube is to be inclined about  $5^\circ$  to the horizontal. A bead sliding freely within the tube represents the moon.

**Motion.**—Now let the carriage run along the rail not quite uniformly but so that its angular velocity about the ball representing the sun varies inversely as the square of its distance from the ball, and it makes it a complete circuit once in  $365\frac{1}{4}$  days. At the same time the plane of the tube attached to the carriage is to turn round slowly in the opposite direction, so that the horizontal line in it (that formed by the intersection of the plane of the tube with the horizontal plane and called the line of nodes) will describe a circuit once in  $18\frac{3}{4}$  years; the inclination of the tube is to oscillate not more than  $5'$  on either side of the mean inclination of  $5^\circ 8'$  to the horizontal. With these motions, the bar carrying the tube is to slowly turn round in its own plane in a forward direction so as to complete a circuit once in about nine years, and the tube is to slightly change its shape and size to and fro as it moves, finally, the bead representing the moon moves according to the same law and in the same direction as the carriage, that is, not quite uniformly, but so that its angular velocity about the joint varies inversely as the square of its distance from the joint; its circuit in the tube is completed once in 27.5546 days—the anomalistic period. These various motions, complicated as they are, only give a general idea of the way in which the moon moves, but the model is sufficient to explain most of the phenomena connected with the moon's motion. All the parts are in a state of oscillation about their average positions, the periods varying from a few days to many thousand years. Even the plane, size, shape and position of the rail are not quite constant but vary slowly from year to year. The attempt to disentangle even the principal oscillations had become an almost hopeless task until Isaac Newton in the 17th

century was able to reduce them all to manifestations of a single law known as the law of gravitation. This law states that every two particles of matter in the solar system attract one another with a force which is proportional directly to the product of the masses and inversely to the square of the distance between them, that is, if either of the masses be doubled, the force is doubled, but if the distance be halved, the force is increased four-fold. From his time mathematicians have been engaged in working out the consequences of this law. If there are only two particles acting, they describe ellipses about one another, but if more than two act, the motion is so complicated that it taxes the mathematician to the utmost to determine it completely. The moon is attracted mainly by the earth, but it is much disturbed from its elliptic motion round the earth (that in the tube) by the pull of the sun (which mainly causes the motions of the tube), and to a small extent by that of the planets. Up to the last quarter of the 19th century this work was undertaken by European mathematicians, among whom may be mentioned Euler, Laplace, de Pontecoulant, Hansen, Delaunay and Adams: the tables of Hansen, published in London in 1857, are still used, with a few corrections, for the places of the moon in the nautical almanacs of the present day. The greatest advance made during the last 30 years was started by Dr. George William Hill, who was for many years on the staff of the 'American Nautical Almanac' at Washington. His two papers published in 1877 opened a new era in the mathematics of astronomy and especially in that of the moon, and they have formed the basis of nearly all the progress which has since been made in all departments of celestial mechanics. His name, though fully known to astronomers all over the world, is less familiar to the public, on account of the highly mathematical nature of his work. In a different part of the subject, the work of Professor Newcomb is not less valuable, comprising as it does, difficult and laborious investigations into the sufficiency of Newton's law for the explanation of every detail of the moon's motion, and involving researches into ancient records of eclipses of the sun. A new theory of the moon's motion, leading to the formation of new tables, has now been nearly completed by E. W. Brown on the basis of Dr. Hill's work. Brown has shown that Newton's law of gravitation will account for the motion of the perigee of the moon within ~~1/1000~~ of 1 per cent.

**Secular Acceleration.**—In illustration of the great accuracy with which calculations and observations may be compared at the present time may be mentioned what is known as the secular acceleration. Observation shows that at the end of each century the average time of revolution of the moon round the earth is 2 seconds less than it was at the beginning. Newton's law shows that a slight change in the shape of the earth's orbit (that is in the shape of the rail above) due to the attractions of the planets will account for  $\frac{1}{3}$  of this amount; the other  $\frac{2}{3}$  are still unexplained. This means that astronomers are searching for the cause of a monthly change of less than  $1/1000$  of a second in the length of the month.

**Phases.**—The phases of the moon arise from the combined motion of the earth and moon. To resume our mechanical model, imagine the

tube to be transparent and the ball an electric light. When the bead is furthest from the ball, the side of the bead facing the carriage is illuminated and this corresponds to full moon. As the bead moves round the tube a spectator on the carriage sees less and less of the illuminated half; the bead then passes through its third and last quarters until it is at its nearest to the ball and almost invisible. Still progressing, its illuminated half begins to be visible from the other side (new moon) and passing on to its first and second quarters its illuminated half is again fully seen.

**Eclipses.**—An eclipse of the moon takes place whenever the earth gets between the moon and the sun, cutting off the light of the latter from the moon, an eclipse of the sun when the moon gets between the earth and the sun. (See ECLIPSE). It so happens that the apparent size of the moon as seen from the earth is very nearly equal to that of the sun. Owing to the varying distance of the moon and sun from the earth, sometimes the moon, as seen from a place on the earth, will completely cover the sun for a time which may be as long as eight minutes, and we have a total eclipse; at other times it fails to cover it and we get a partial eclipse or, if its centre passes across the sun's centre, an annular eclipse. A total or annular eclipse is seen over only a narrow band of the earth's surface. From our mechanical illustration it is evident that an eclipse of the moon can occur only at full moon, and one of the sun just before new moon. If the plane of the tube were horizontal there would be eclipses of both moon and sun every revolution of the bead, that is, once a month; actually, it is only when the bead is very near the horizontal plane (or near the line of nodes) at the time when it is nearest or furthest from the ball, that the event can take place. A complete cycle of eclipses will evidently occur each time the line of nodes completes a circuit—once in about 18 years. This is known as a lunar cycle and during that period there will be on the average 41 eclipses of the sun and 29 of the moon.

**Tides.**—Besides the indirect effect of the moon as a light-giver on the earth the most important influence it exerts is that which causes the tides. (See TIDES). These have in their turn a slight reactionary effect on the motion of the moon as we shall see presently. Some slight traces of lunar effect are also observable in the variations of the earth's magnetism. But the most widespread idea with regard to lunar influence is its supposed connection with the changes in the weather. Many an old saying exists, handed down the ages, giving a rule for prophesying the weather by its condition at certain phases of the moon. Since the time when careful daily records have been kept of the temperature, height of the barometer, rainfall, etc., science has been employed in examining whether any kind of period can be traced in them and especially periods connected with the moon's changes. Little positive success has attended these efforts, but there is plenty of negative evidence. Every attempt to connect a periodical change in the weather with one in the moon's motion has resulted in failure. Undoubtedly some slight connection of a tidal nature must exist, but it is very small and is entirely masked by variations of the weather due to unknown causes. A reason for the pop-

ular error is not far to seek. The weather changes, especially in countries lying within the temperate zone, follow one another at short and seemingly irregular intervals; the changes of the moon's phases occur also at short but regular intervals. Coincidences between the two must frequently occur, but humanity is apt to notice these and to forget the failures of coincidence which are just as numerous if not more so.

**Origin.**—The past and future history of our satellite has been the subject of interesting researches during the last 30 years, principally undertaken by Prof. George Howard Darwin. The chief influence in its life history is assigned by him to tidal action, an idea first broached in 1754 by the philosopher Emmanuel Kant. Imagining that the earth, unattended by any satellite, was in a molten condition—the most probable supposition in view of its nearly spherical form and the nature of its surface—Professor Darwin inquires under what conditions its rotation should be so rapid that, like a bursting fly-wheel, portions of matter should be thrown off. He finds that this would happen if the earth were rotating about its axis in something like two hours. He has also shown that pear-shaped and dumb-bell shaped forms will result from a rapid rotation and from the action of the sun in producing tides; the moon might have been evolved from such a figure by the thinning and breaking of the handle. The earth would then have a satellite revolving very close to its surface in the same time that the earth took to turn on its axis. Either of these hypotheses seems to be allowable.

**Past History.**—From this point, rigorous argument takes the place of speculation. The period of the satellite's revolution (a "month") begins to be slightly longer than that of the earth's rotation on its axis (a "day"). The moon raises tides on the earth and the friction of these, like a break on a fly-wheel, gradually lengthens the day; the reactionary effect on the moon is to increase the length of the "month" also, but more rapidly than the "day." This goes on until the number of "days" in a "month" is 29. After this date the month and day still go on getting longer, but at different comparative rates, so that the number of days in a month diminishes until it is  $27 \frac{1}{3}$ —the present condition. The time in which all these changes have taken place must be reckoned in millions or tens of millions of years and though both bodies have grown cool and solid, the water on the earth's surface has in the later portion maintained the process at a slower rate. All this time the tidal friction has also had the effect of sending the moon further and further away from the earth.

**Future.**—In the future, the same processes will continue. The lengths of the month and that of the day will continue to increase, the latter overtaking the former until they are both over 1,300 hours or about 55 of our present days. Then, not only will the moon turn always the same face to the earth, but the earth will turn the same face to the moon and they will move together as if strung on a rigid bar. The same causes have operated to cause the moon always to present the same face to the earth. When the satellite was in a molten condition and not far from the earth, the tides raised on it by the attraction of the earth must have been

**SURFACE OF THE MOON**

**1 The Crater of Copernicus**

**2 The Appenine Mountains and Crater of Archimedes**

enormous. The friction of these tides passing over the surface of the moon then slowed down the rotation of the moon on its axis until it was in a position where no more friction could act: that is, high tide on the moon was always at the same place on the moon and just under the earth. The axis of the moon in the direction of the earth must from this cause be a little longer than the other axis, though the difference has not been certainly observed.

**Bibliography.**— Besides the numerous textbooks on general astronomy, all of which contain information, readers may consult Nasmyth, 'The Moon' (2d ed., 1903); Neison, 'The Moon' (1873); Proctor, 'The Moon' (1876); the 'Lunar Theory' (1896) by the writer is a mathematical treatise on its motions. 'The Tides,' by Darwin, contains the latest theories concerning its past and future history. A new photographic atlas and description by Pickering has just appeared. The Lick and Paris observatories are also gathering materials for a complete description and charts of the surface.

ERNEST W. BROWN.

*Professor of Mathematics, Yale University.*

**MOON, Mountains of the, Africa,** a mythical chain of mountains designated by Ptolemy as containing the sources of the Nile and extending across the broadest part of Africa from Cape Guardafui, on the Indian Ocean, to the Bight of Benin, on the Atlantic. Modern exploration has proved that no such range exists, though there are numerous different mountain systems in that extensive region. The only mountains that can be looked upon as representing the ancient Mountains of the Moon lie in eastern Equatorial Africa. The loftiest of these are Mount Kilimanjaro, 19,200 feet high; Mount Kenia, which has an estimated elevation of 17,191 feet, and Ruwenzori, which is 16,816 feet in height.

**MOON GODDESS.** See MYTHOLOGY, *Man and Nature.*

**MOONEY, James,** American ethnologist: b. Richmond, Ind., 10 Feb. 1861. He was educated in the public schools and began his career as a teacher. In 1879 he engaged in journalism and in 1885 began his connection with the Bureau of American Ethnology, Washington, with which he has remained ever since. He has conducted extended field investigations among the Indians of the South and West, notably the Cherokees; has prepared government Indian exhibits for Chicago, Nashville, Omaha and Saint Louis expositions and discovered the Cherokee ritual. He is a member of the American Anthropological Association, the Anthropological Society of Washington, the American Association for the Advancement of Science. He has published 'Sacred Formulas of the Cherokees' (Washington 1891); 'Siouan Tribes of the East' (Bull. 22, Bureau American Ethnology, Washington 1895); 'Ghost-dance Religion and the Sioux Outbreak of 1890' (ib. 1896); 'Calendar History of the Kiowa Indians' (ib. 1898); 'Myths of the Cherokee' (ib. 1900); 'Cheyenne Indians' (Lancaster 1907). He contributed Indian articles to various encyclopedias and also to the *Therapeutic Gazette* and *Harper's Monthly*.

**MOONEYE,** a fish of the small family *Hyodontidae*, related to the herrings and sometimes called toothed herrings. They inhabit the

rivers and lakes of the interior of North America, and are elegant, silvery, large-eyed fish, eight to 12 inches long, extraordinarily well supplied with teeth and voracious. "They are eager biters and take indiscriminately the feathered lures, small spoons, grasshoppers, grubs and other natural baits." In Canada they afford much sport in fly-casting and repeatedly leap into the air when hooked, like trout. The principal species called moon-eye is *Hyodon tergisus*; the more northerly one, called toothed herring and la quéche (Canada), is *H. alosoides*. Neither is good for food.

The "Mooneye cisco" is a small whitefish (*Argyrosomus hoyi*), related to the lake herring. See WHITEFISHES.

**MOONFISH,** any of the compressed ovate highly silvery fishes of the family Carangidae, genera *Selene* and *Vomer*, including small tropical forms allied to the pompanos. One greenish species (*Vomer setipinnis*) is well known in New York Bay and markets as a pan-fish, sometimes called blunt-nosed shiner. More widely recognized is the look-down or horse-head (*Selene vomer*), which reaches a length of more than a foot, and is regarded along the south Atlantic Coast as one of the best of food-fishes; it also occurs along the western coast of Mexico and Central America, as do certain other species. It has a rhomboidal outline, with a hind-head greatly elevated, the line of the profile almost equal to the length of the body, and the dorsal and ventral fins prolonged into streamers. Consult Jordan and Evermann, 'Food and Game Fishes' (1902).

**MOONGA, or MOOGHA.** See SILK-WORMS.

**MOONLIGHT SONATA,** a term used popularly in Germany and England for the Beethoven sonata *quasi una fantasia in C minor* (1802), dedicated to the "Damigella Contessa Giulietta Guicciardi." The term arose from the critic Rellstab comparing the first movement to a boat gliding by moonlight on Lake Lucerne. Vienna knows it as "Laubensonata."

**MOONSEED.** See SARSAPARILLA.

**MOONSHINER,** a term applied in the United States, and especially in the southern and western States, to makers of illicit whisky and other spirituous liquors. Moonshine stills are frequently raided by the secret service officers. Of late years the business has been largely confined to the Tennessee and Kentucky mountain regions.

**MOONSTONE.** A translucent or transparent variety of the mineral feldspar (orthoclase, albite or labradorite) which exhibits a delicate pearly opalescent play of colors. Used as a gem.

**MOONWORT,** a popular name for a fern (*Botrychium virginianum*) of the natural order *Ophioglossaceæ*, and also for various species of *Lunaria* of the natural order *Cruciferae*. The former is the most popular of its genus, being readily grown in partial shade and with no special treatment; the latter are also readily cultivated under ordinary garden conditions and are popular because of their showy flowers, but more especially because of their large, flat pods which are used in winter decorations. One of their popular names, honesty, is sug-

gested by visibleness of the seeds through the pods. *Lunaria annua*, especially its variegated variety, is the most valuable species.

**MOORCROFT, William**, English veterinary surgeon and traveler: b. about 1765; d. Andekhui, Afghanistan, 1825. He studied veterinary science in France, settled in London and made a fortune which he lost in patents, and then became veterinary surgeon (1808) to the Bengal army. He crossed the Himalayas, explored (1811-12) the sources of the Sutlej and Indus rivers, explored (1819-22) Lahore and Kashmir, visited Bokhara in 1825 and died at Andekhui, Afghanistan. Prof. H. H. Wilson edited and published his papers under the title 'Travels in the Himalayan Provinces of Hindustan and the Punjab from 1819 to 1825' (1841). He wrote also on veterinary surgery and made a translation of Valli's 'Experiments in Animal Electricity' (1793).

**MOORE, Addison Webster**, American professor of philosophy: b. Plainfield, Ind., 30 July 1866. He was graduated at De Pauw University (1893-94) and obtained Ph.D. diploma (1898) at Chicago University. He served in the University of Chicago as assistant in philosophy (1895-97), associate (1897-98), instructor (1898-1902), assistant professor (1902-04), associate professor (1904-09) and professor (1909). He was lecturing on philosophy at Harvard in 1918. Among his works are 'Pragmatism and its Critics' (1910); 'Existence, Meaning and Reality' (1903). He was president of the Western Philosophical Association in 1911 and of the American Philosophical Association in 1917 and associate author of 'Creative Intelligence' (1916).

**MOORE, moor or mör, Alfred**, American jurist, son of Maurice Moore (q.v.): b. Brunswick County, N. C., 21 May 1755; d. 15 Oct. 1810. At 20 he became captain in a regiment of North Carolina troops, but was soon afterward obliged to resign in order to provide for his destitute relatives. When the British seized Wilmington, however, he raised a troop of volunteers, with whom he rendered great service to the American cause. In order to alleviate the distress to which his patriotism had reduced him, the general assembly in 1782 made him attorney-general; and though he had not yet mastered the first rudiments of law, he soon attained, by hard study, a foremost rank in his profession, was raised to the bench in 1798 and became associate justice of the Supreme Court of the United States in 1799. He resigned in 1805.

**MOORE, Benjamin**, American Protestant Episcopal bishop: b. Newtown, L. I., 5 Nov. 1748; d. New York, 29 Feb. 1816. He was graduated at King's (now Columbia) College in 1768, studied theology and in May 1774 went to England to obtain orders and in June of the same year was ordained deacon and priest. On his return to New York he became an assistant minister of Trinity Church and succeeded to the rectorship in December 1800. In 1801 he was consecrated bishop of New York. He was also rector of Trinity Church and president and professor of logic in Columbia College. In 1811 an attack of paralysis rendered him incapable of further active duty.

**MOORE, Charles Herbert**, American professor of art: b. New York, 10 April 1840. He

was educated at Harvard and was professor of art at that university from 1896 to 1909. He has published 'Examples for Elementary Practice in Delineation'; 'The Development and Character of Gothic Architecture' (1889; enlarged ed., 1899), and 'Mediæval Church Architecture of England' (1912). In the latter work, which has been widely circulated among students of architecture, he takes the position, earlier adopted by Viollet le Duc, that English Gothic is wholly a development from a French source, and that the progress of the art in England was always some years behind its French original. His warm advocacy of this view has excited some opposition among English critics.

**MOORE, Charles Leonard**, American poet and essayist: b. Philadelphia, Pa., 16 March 1854. He was educated in the public schools of his native city. In 1878-79 he was one of the managers of the Madeira and Mamoré Railroad Construction Company and was United States consular agent at San Antonio, Brazil, the headquarters of that operation. He was afterward engaged in railroad construction in Pennsylvania. He was then secretary of one of the Disston Florida Sand companies for four years. For the last 20 years he has been occupied with literary work. He has been a constant contributor to *The Dial* during that time. He has published 'Atlas' (1881); 'Poems Antique and Modern' (1883); 'Book of Day Dreams' (1887); 'Banquet of Palacios' (1889); 'Odes' (1896); 'Ghost of Rosaly' (1900); 'Red Branch Crests' (1904); 'Incense and Iconoclasm' (1915).

**MOORE, Clarence Bloomfield**, American archæologist: b. Philadelphia, 14 Jan. 1852. He was graduated at Harvard (1873), then traveled through most of Europe, Asia and Egypt. He crossed the Andes and traveled down the Amazon (1876) and made a journey round the world (1878-79). During the last 20 years he has been exploring the Indian mounds of South Carolina, Georgia, Florida, Alabama, Mississippi and Louisiana. His many scientific writings have been mostly published by the Academy of Natural Sciences, of Philadelphia.

**MOORE, Clement Clarke**, American educator and poet: b. New York, 15 July 1779; d. Newport, R. I., 10 July 1863. He was a son of Benjamin Moore (q.v.); was graduated at Columbia College in 1798; in 1821 became professor of biblical learning at the General Theological Seminary, New York, and retired from that position in 1850. He gave to the seminary the ground on which it stands. A collection of 'Poems' which he published in 1844 included 'A Visit from Saint Nicholas,' better known under another title — 'Twas the Night Before Christmas' — which has long had great popularity with grown people as well as with children. Written in 1822 for his own children, these verses were printed anonymously and without Moore's knowledge, in the *Troy Sentinel* 23 Dec. 1823. He also compiled a 'Hebrew and English Lexicon' (1809) and wrote 'George Castriot, Surnamed Scanderbeg, King of Albania' (1850). Consult Stedman, 'An American Anthology' (1900).

**MOORE, Clifford Herschel**, American Latin professor: b. Sudbury, Mass., 11 March

1866. He was graduated (1889) at Harvard University and received (1897) the Ph.D. diploma (1897) at the University of Munich. He was classical master (1889-1892) at Belmont School, California, professor of Greek (1892-94) at Phillips Academy, Andover, Mass., instructor (1894-95), then assistant professor of Latin (1895-98) at the University of Chicago. From 1898 to 1905 he was assistant professor of Greek and Latin at Harvard and professor of Latin since 1905. He was professor of Latin (1905-06) at the American School of Classical Studies, Rome. He has been trustee for Phillips Academy since 1902. He wrote 'Religious Thoughts of the Greeks' (1916); and numerous articles on his special subjects and edited Allen's *Medea* (1899) and Horace's 'Odes and Epodes' (1902). In 1914 he received the degree of Litt.D. from Colorado College. Contributed to *International Encyclopædia*.

**MOORE, David Hastings**, American Methodist Episcopal bishop: b. Athens, Ohio, 4 Sept. 1838; d. Cincinnati, Ohio, 23 Nov. 1915. He was graduated from the Ohio University in 1860 and ordained to the ministry in that year, but entered the Federal army at the outbreak of the Civil War, remaining in it till the close of the war and attaining the rank of lieutenant-colonel. He was president of the Cincinnati Wesleyan Female College (1875-80) and of the Colorado Seminary, and chancellor of the University of Denver (1880-89). He was elected bishop in 1900 and had his episcopal residence during the three ensuing quadrennial periods in Shanghai, China, Portland, Ore., and Cincinnati, Ohio. He retired in 1912. He was a member of the General Conferences of 1888, 1892, 1896 and 1900, and of the North China Branch of the Royal Asiatic Society.

**MOORE, Edward**, English fabulist and dramatist: b. Abingdon, Berkshire, 1712; d. 1757. He was, by trade, a linen-draper but failed in business and took up literature. His first work was 'Fables for the Female Sex' (1744) and in 1748 his 'Trial of Selim the Persian' and 'The Foundling' were published. He owed, no doubt, some of his success in the literary world to such prominent patrons as George Lyttelton, 1st Baron Lyttelton, and Henry Pelham. His 'Gil Blas' was published in 1751 and 'The Gamester' in 1753, Garrick probably assisting him in the work. From 1753-57 he was editor of *The World*, a satirical periodical. A collection of his works under title of 'Poems, Fables and Plays' was published in 1756.

**MOORE, Edward**, English Dante scholar: b. Cardiff, 1835; d. 2 Sept. 1916. He was educated at Pembroke College, Oxford, where he received high honors and became Honorary Fellow, and was principal of Saint Edmund Hall, 1864-1913 and a canon of Canterbury from 1903. His early research was on Aristotle and his editions of the 'Ethics' and of the 'Poetics' are excellent. But he is much more favorably known for his studies of Dante, and published 'Time References in the Divina Commedia' (1887; revised, in Italian, 1900); 'Textual Criticism of the Divina Commedia' (1889); 'Dante and His Early Biographers' (1890); the 'Oxford Dante' (complete in one volume, 1894); and 'Studies in Dante' (3 series 1896, 1899, 1903).

**MOORE, Edward Caldwell**, American theologian: b. West Chester, Pa., 1 Sept. 1857. He was graduated (1877) at Marietta College, then at Union Theological Seminary (1884). He studied (1884-86) at the universities of Berlin, Göttingen and Giessen, then received (1891) the degree Ph.D. at Brown University. In 1884 he was ordained to the Presbyterian ministry and served as pastor at Yonkers, N. Y. (1886-89), and Central Congregational Church, Providence, R. I. (1889-1901). He then became Parkman professor of theology and Plummer professor of Christian morals at Harvard University (1901-) and served as preacher to the university (1905-06). He lectured at Mansfield College, Oxford, England, in 1894 and 1913, at Andover Theological Seminary, 1900; Yale Divinity School, 1906; Lowell Institute, Boston, 1903. In 1909 he received the degree of D.D. from Yale University. He wrote 'The New Testament in the Christian Church' (1904); 'History of Christian Thought since Kant' (1912). He was a member of the American Board of Commissioners of Foreign Missions (1899-1914), its chairman (1905-14) and was elected president in 1914.

**MOORE, Edward Mott**, American surgeon: b. Rahway, N. J., 15 July 1814; d. Rochester, N. Y., 4 March 1902. He studied medicine in New York and Philadelphia and was graduated (1838) as M.D. at the University of Pennsylvania. He served as resident physician at Blockley Hospital and Frankford Lunatic Asylum but settled in Rochester in 1840. In 1842 he received a call to the chair of surgery at the medical school of Woodstock, Vt., where he lectured for 11 years. He served then successively at Berkshire Medical College, Massachusetts (1853-54); Starling Medical College, Columbus, Ohio (1854-55), then went (1858) to Buffalo Medical College, serving in the same capacity till 1883. His greatest work was done in research and experiments on the heart's action. He was president of the New York State Medical Society; a founder of the American Surgical Association, succeeding Dr. Gross (1883) as its president; and was president of the American Medical Association (1889-90). For many years he was president of the board of trustees of the University of Rochester, and also of Reynolds Library and Rochester Public Health Association.

**MOORE, Eleakim Hastings**, American mathematician: b. Marietta, Ohio, 26 Jan. 1862. He was graduated (1883) at Yale, receiving the Ph.D. diploma in 1885. He then studied at Berlin (1885-86) and was appointed tutor in mathematics at Yale (1887-89), becoming assistant professor (1889-91) at Northwestern University and associate professor (1891-92). In 1892 he was made professor of mathematics at the University of Chicago becoming head of the department since 1896. He edited *Transactions of the American Mathematical Society* (1899-1907) and has been associate editor of the *Proceedings of the National Academy of Sciences* since 1915. He was vice-president at the International Congress of Mathematicians held at Cambridge, 1912. The mathematical periodicals of Europe and America have published many of his contributions.

**MOORE, Frank Frankfort**, British novelist and dramatist: b. Limerick, Ireland, 15 May

1855. He was educated at the Royal Academical Institution, Belfast, and has traveled extensively in Africa, India and South America. From 1876 to 1892 he was art editor of the *Belfast News Letter*. He has since lived in London. Among his recent novels are 'Nell Gwynne' (1900); 'The Capture of Coralie' (1900); 'He Loved but One' (1905); 'Priscilla and Charybdis' (1910); 'The Lady of the Reef'; 'The Romance of a Red Cross Nurse' (1915); 'The Rise of Raymond' (1916). Popular plays by him include 'Moth and Flame' (1878); 'Broken Fetters' (1881); 'Oliver Goldsmith' (1892); and 'Kitty Clive' (1895); and he is also author of 'The Discoverer' (verse, 1911); 'A Georgian Pageant' (essays, 1910); and a work on antiques, 'The Common-sense Collector' (1911).

**MOORE, Frank Gardner**, American educator: b. West Chester, Pa., 25 Sept. 1865. He was graduated (1886) at Yale, receiving the Ph.D. diploma in 1890. He studied (1890-91) at the University of Berlin and became tutor in Latin (1888-93) at Yale. He was made assistant professor in Latin (1893-1900) at Dartmouth College, then associate professor of Latin and Roman archaeology (1900-08). He was made professor of Latin (1908-10) at Trinity College, Hartford, Conn., and professor of classical philology at Columbia University from 1910. He edited Tacitus' 'Histories,' (Vols. I and II, 1910); Cicero's 'Cato Major' (1904) and 'Transactions and Proceedings of the American Philological Association,' of which society he was secretary (1904-16), becoming president in 1917.

**MOORE, George**, English author: b. Ireland, 1853. He studied art in London under Luyten, but completed his education in France and became thoroughly imbued with a Gallic spirit. Apart from a few contributions to periodicals, his first literary work was contained in two volumes of quasi-French verse, 'Flowers of Parnassus' (1877) and 'Pagan Poems' (1881). With his entry into fiction he allied himself immediately with the French realistic or naturalistic school, as may be seen in 'A Mummer's Wife' (1884), a story of the degeneration of a farmer's wife, her elopement with a strolling player, and the sufficiently squalid sequel; in 'Mike Fletcher' (1891), in which a gay young Irishman wins a fortune by his wits and his social success, and then swings from his riotous living to remorse and back again, only to commit suicide at the end; or in 'Esther Waters' (1894), a detailed sketch of life among the servant class and in a country inn, the theme being the allurements of gambling. 'Evelyn Innes' (1898) and its sequel, 'Sister Teresa' (1901), are a keen analysis of a musical and sensuous temperament under the successive influence of social temptation and of convent life. What he exemplified in these novels he stated abstractly but over-eagerly and passionately in 'Confessions of a Young Man' (1888) and 'Impressions and Opinions' (1890), both urging the dead level of mediocrity or worse in English literature of the day as contrasted with French. His desire to found an English 'Theatre Libre' and his growing conviction that the English stage and English novel were far gone led him to assist in founding the Irish Literary Theatre in Dublin and to

take a prominent part in the movement styled the Irish Renaissance, a movement of which his 'Bending of the Bough' (1900) is one of the most promising dramatic productions and ranking above 'The Strike at Arlingford' (1893). His later works include 'The Untilled Field' (1903); 'The Lake' (1905); 'Memoirs of My Dead Life,' which purports to be autobiographical; the autobiographical 'Hail and Farewell' (3 vols., New York 1911-14); 'The Brook Kerith' (1916), a brilliantly written novel of Palestine in the times of Christ, the publication of which gave rise to a good deal of criticism; 'Lewis Seymour and Some Women' (1916).

**MOORE, George Foot**, American Orientalist: b. West Chester, Pa., 15 Oct. 1851. He was graduated at Yale in 1872 and at Union Theological Seminary in 1877. Entering the Presbyterian ministry, he was pastor of the Putnam Presbyterian Church, Zanesville, Ohio, 1878-83, and in the latter year became Hitchcock professor of Hebrew and the history of religions at Andover Theological Seminary, and from 1899 to 1901 was president of the faculty there. In 1902 he was appointed professor of theology at Harvard and in 1904 Frothingham professor of the history of religions. For some years he edited the 'Journal of the American Oriental Society,' of which he was president 1911-12. He has written 'A Commentary on Judges' (1895); 'The Book of Judges,' a translation with notes for the Polychrome Bible (1898); and 'The Book of Judges in Hebrew' (1900); 'The Literature of the Old Testament' (1913); 'History of Religions' (Vol. I, 1913); and 'Metempsychosis' (Ingersoll lecture at Harvard, 1914).

**MOORE, George Henry**, American historical writer: b. Concord, N. H., 20 April 1823; d. New York, 5 May 1892. In 1839 he removed to New York and was graduated at the University of the City of New York (now New York University) in 1843. As assistant to his father, Jacob Bailey Moore (q.v.), librarian of the New York Historical Society, he had been long connected with that institution when, in 1849, he succeeded to his father's position, which he held until 1872, and then became first superintendent of the Lenox Library. This office he retained until his death. His contributions to the proceedings of historical societies and to historical magazines were numerous. He also published 'The Treason of Charles Lee' (1858); 'The Employment of Negroes in the Revolutionary Army' (1862); 'Notes on the History of Slavery in Massachusetts' (1866); and 'A History of the Jurisprudence of New York' (1872).

**MOORE, George Thomas**, American botanist: b. Indianapolis, 23 Feb. 1871. He was educated at Wabash College and graduated A.B. at Harvard (1895), A.M. 1896 and Ph.D. 1900. He was appointed assistant in cryptogamic botany at Harvard and teacher at Radcliffe College. From 1899-1901 he had charge of the botany department at Dartmouth College and was (1903-05) physiologist and algologist at the Bureau of Plant Industry, Department of Agriculture. He had charge of botany at the Marine Biological Laboratory at Woods Hole, Mass., and became professor of applied botany and plant physiology at Shaw School

of Botany, Washington University (1909-12), as well as being physiologist to the Missouri Botanical Garden, of which latter he became director from 1912. Among his most useful work was the discovery of a method of preventing water supply pollution through algae and pathogenic bacteria, and the perfection of a method of increasing crops by impregnation of the soil, through bacteria, with atmospheric nitrogen. He has contributed many useful scientific articles to the botanical periodicals.

**MOORE, Harry Humphrey**, American artist: b. New York, 1844. He studied under Gérôme at Paris and Fortuny in Madrid, and subsequently made painting tours through Germany, Italy and as far east as Japan. He has devoted himself to such genre pictures as his two masters excelled in, and his best-known works are 'Gypsy Encampment, Granada'; 'Moorish Water-Carrier'; 'Almeh'; 'The Blind Guitar-Player'; and 'A Moorish Beggar.' He is deaf and dumb.

**MOORE, Sir Henry**, English colonial governor: b. Vere, Jamaica, 1713; d. 1769. In 1756 he became lieutenant-governor of the island, and until 1762 was practically in control of its affairs. He suppressed the slave insurrection of 1760, and for that service was rewarded with a baronetcy. Appointed governor of New York in July 1765, he reached there at the outbreak of the Stamp Act excitement. Public opinion was strongly pronounced against the act, and Moore, yielding to the demands of the colonists, suspended its enforcement. He remained governor until his death.

**MOORE, Henry**, Irish Wesleyan clergyman: b. near Dublin, 1751; d. 1844. After conversion, he joined a Methodist class in 1777, began to preach, gave up his trade of wood-carver, opened a school, and in 1779 was appointed by Wesley to the Londonderry circuit. Called later to London, he assisted Wesley (1784-86) as traveling companion and amanuensis, serving again in the same capacities 1788-90. Wesley appointed him one of his three literary executors, and also selected him to become (after Wesley's death) one of 12 ministers in charge of services at the City Road Chapel, London. In 1804, and again in 1823, Moore was president of the Wesleyan Conference. Refusing ordination in the Church of England, he was ordained by Wesley, with two Episcopal clergymen assisting. The proposal to establish a hierarchy in the Methodist Church was opposed by Moore, who also objected to the scheme for establishing a Methodist theological school, and to the proposed acquisition of land by the Methodist body in 1839, when the centenary fund was created. In 1792, with Thomas Coke, he published a *Life of the Rev. John Wesley*. Although the work was authorized by the Conference, the third literary executor prevented them from using Wesley's papers in its preparation. With the aid of these he wrote a new 'Life,' which was published in 1824-25. Moore also wrote 'A Reply to Considerations on the Separation of the Methodists from the Established Church' (1794); 'Thoughts on the Eternal Sonship' (1816); two religious biographies: 'Sermons,' with an autobiography (1830). Consult 'Life' (with the autobiography) by Mrs. Richard Smith (1844).

**MOORE, Jacob Bailey**, American journalist and author: b. Andover, N. H., 31 Oct. 1797; d. Bellows Falls, Vt., 1 Sept. 1853. He learned the printer's trade on the *Concord Patriot*, became bookseller and publisher, then partner in the above paper. In 1826 he founded the *New Hampshire Statesman* to aid the election of John Quincy Adams as President, and became (1828) member of the State legislature and, in the same year, sheriff of Merrimac County (1828-33). In 1839 he edited the *New Hampshire Journal*, but soon moved to New York to edit the *Daily Whig*. He was government clerk in the Washington post office (1841-45), then librarian of the New York Historical Society (1845-49), when he moved to San Francisco as its postmaster (1849-53). He collaborated in compiling a topographical, historical and biographical work on New Hampshire (Concord 1822-24), and he published 'A Gazetteer of the State of New Hampshire' (1823); and histories of Concord and of Andover, N. H., and 'Memoirs of American Governors' (1846).

**MOORE, James**, American colonial governor: b. probably in Ireland about 1640; d. Charleston, 1706. He is supposed to have been a son of the Irish rebel, Roger Moore, and to have come to this country about 1665. Settling in South Carolina, he became a leader among those who openly resisted the lords proprietors in their oppressive demands. In 1682 he was made a member of the governor's council, and in 1692 was sent to the Assembly. In the latter year the proprietors named him for exclusion from their pardon. Two years later he was again one of the governor's council; that body in 1700 elected him governor; and he filled the executive office until 1703, when Sir Nathaniel Johnson arrived. Appointed by the Assembly to lead an expedition for the capture of Saint Augustine (1702). Moore took the town without difficulty, but failed to reduce the fort. Under Governor Johnson he served as attorney-general, and was successful in an expedition (1703) against the Apalachee (q.v.). Consult McCrady, 'History of South Carolina Under the Proprietary Government' (1897).

**MOORE, James**, American colonial officer: b. Charleston, S. C., 1667; d. 17 Feb. 1723. He was a son of the James Moore preceding, in whose expeditions against the Indians he participated. In 1713 Governor Craven appointed him commander of the forces sent to aid the North Carolina colony against the Tuscarora Indians, and two years later served as lieutenant-general of an expedition sent to subdue the Yamasi. In 1719, when Gov. Robert Johnston was deposed, the Convention having made an end of the proprietary government, Moore became governor. He was succeeded in 1721 by Francis Nicholson, who was commissioned by the English crown, afterward becoming speaker of the assembly.

**MOORE, James Hobart**, American lawyer and promoter: b. Berkshire, N. Y., 14 June 1852; d. 8 July 1916. He was bank clerk (1871-73) at Binghamton, N. Y., went to Chicago (1873) and was admitted to the Illinois bar (1881). In collaboration with his brother, William H. (q.v.), he created the great "Moore group" of four great corporations which

together had a capitalization of \$187,000,000, these since being incorporated in the United States Corporation. They were also the promoters of the great National Biscuit Company, and other mercantile amalgamations. He was a director of the American Can Company, American Tin Plate Company, and numerous other leading industrial corporations.

**MOORE, John**, Scottish physician and author: b. Stirling, December 1729; d. Richmond, Surrey, 21 Jan 1802. Having obtained a knowledge of medicine and surgery he went to the Netherlands in 1747, and served as a surgeon's mate in the military hospitals. Returning to Scotland he practised till 1772. In that year he became medical attendant to the ninth Duke of Hamilton, whom he accompanied on a five-year tour on the Continent. In 1779 he published 'A View of Society and Manners in France, Switzerland and Germany,' which passed through numerous editions, and has been translated into several foreign languages. In 1781 appeared his 'View of Society and Manners in Italy'; and in 1786 'Medical Sketches,' followed by 'Zeluco,' a novel (1786); 'A View of the Causes and Progress of the French Revolution' (1795); and two other novels, which were not so successful as his first.

**MOORE, Sir John**, British soldier, son of the preceding: b. Glasgow, Scotland, 13 Nov. 1761; d. Spain, 16 Jan. 1809. He served in Nova Scotia during the American Revolutionary War; from 1784-90 was member of Parliament for a group of Scottish burghs; served in Cordica, the West Indies (1795), in Ireland during the rebellion of 1798, in Holland in 1799 and in Egypt in 1800-01. He was created Knight of the Bath in 1804 and was in command in the Mediterranean (1806-08). He was appointed commander-in-chief of the British army in Portugal in 1808. His intention was to cut the French communications with Madrid, but struggling against the apathy of the Spaniards and intrigue among his own countrymen, he advanced to Salamanca in spite of the gravest difficulties, but was ultimately forced to make a midwinter march to Coruna, a distance of 250 miles, through a desolate and mountainous country, rendered almost impassable by snow and rain, and constantly harassed by the enemy who outnumbered him by three to one. His troops arrived at Coruna in a distressing condition; Soult was ready to attack him as soon as he began the work of embarkation, and in the battle that followed Moore fell, mortally wounded, in the hour of victory. Wolfe's celebrated poem, 'The Burial of Sir John Moore,' keeps his memory green. Consult Carrick Moore, 'Life of Sir John Moore' (1835), and his 'Diary' (ed. by Maurice 1904).

**MOORE, John Bassett**, American lawyer, diplomatist and author: b. Smyrna, Del., 3 Dec. 1860. He attended private schools and was graduated at the University of Virginia in 1880. He read law in the office of Edward G. Bradford, now United States district judge at Wilmington, Del., and was admitted to the bar there in 1883. In 1885 he passed the first civil service examination for admission to the Department of State, at Washington, and was appointed a law clerk in that department in July of that year. In August 1886 he was appointed Third Assistant Secretary of State. In the

summer of 1887, he acted as secretary to the conference between the Secretary of State and the British and German ministers on the affairs of Samoa; and in the winter of 1887-88 he acted as American Secretary in the conference on the North Atlantic Fisheries. He assisted at the organization of the First International American Conference at Washington, and later made a report to the conference on the subject of extradition. In 1891 he resigned the post of Third Assistant Secretary in order to take the newly-created chair of International Law and Diplomacy at Columbia University, New York, a chair which he has since continued to hold. In April 1898, on the outbreak of the war with Spain, he was without solicitation appointed by President McKinley to the position of Assistant Secretary of State. This position, which he had on three previous occasions declined, he resigned in September of the same year, in order to accompany the American Peace Commission to Paris as Secretary and Counsel, in which capacity he took part in the negotiation of the Treaty of Peace with Spain. In 1904 he acted as agent of the United States before the United States and Dominican Arbitration Tribunal. He was a member of the delegation of the United States in the Fourth International American Conference, at Buenos Aires, in 1910, and afterward served as a special plenipotentiary to the Chilean Centenary. In 1912 he was appointed the delegate of the United States on the International Commission of Jurists, which was organized at Rio de Janeiro in that year, under the Pan-American Treaty of 1906, for the codification of International Law. In March 1913 he became by appointment of President Taft a member of the Permanent Court of Arbitration at The Hague. In the following month he was appointed by President Wilson counselor for the Department of State and was invested with authority to sign as acting Secretary of State in the absence of the Secretary, the grade of the position thus being raised. He resigned the post of counselor in March 1914. Mr. Moore is a member of the Institut de Droit International, of the Institut Colonial International, of the American Philosophical Society, of the American Political Science Association, of which he was president in 1913-14, and of various other learned societies. He is a member and honorary secretary of the Hispanic Society of America; and an honorary member of the College of Lawyers at Costa Rica. He was a member of the Pan-American Financial Congress at Washington in May 1915, acting as chairman of the committee on uniform laws, by which the scheme of work of the Congress was drawn up; and he is vice-chairman of the American section of the International High Commission organized to carry out the plans of the Congress. He was a delegate of Columbia University and of various learned societies in the Second Pan-American Scientific Society at Washington, December 1915-January 1916. He is vice-president of the Pan-American Society of America. He is an incorporator of the American National Red Cross and a member of its central committee and of the executive committee of the New York chapter. His publications, apart from occasional papers and addresses, include 'Report on Extraterritorial Crime' (Washington 1887); 'Report on Ex-

tradition' (Washington 1890); 'Extradition and Interstate Rendition' (2 vols., Boston 1891); 'American Notes on the Conflict of Laws' (Boston 1896); 'History and Digest of International Arbitrations' (6 vols., Washington 1898); 'American Diplomacy, its Spirit and Achievements' (New York 1905); 'A Digest of International Law' (8 vols., Washington 1906); 'The Works of James Buchanan' (12 vols., Philadelphia 1908); 'Four Phases of American Development: Federalism, Democracy, Imperialism, Expansion' (Baltimore 1912). He is one of the editors of the *Political Science Quarterly*, of the *Journal du Droit International Privé*, etc.

**MOORE, John White**, American naval officer: b. Plattsburg, N. Y., 24 May 1832; d. 1913. He was educated at Plattsburg Academy, Williston Seminary and under private tuition at New York City. He was appointed (1853) third assistant engineer, United States navy, promoted (1855) to second assistant engineer, becoming (1894) chief engineer. For valuable service in the Civil War he was created (1906) rear-admiral. He originated chain cable protection on sides of wooden vessels and of "fighting tops," now in general use. After being in action with the West Gulf Blockading Squadron and the lower Mississippi River, engaging rebel batteries at head of passes and at defense of Pensacola (1861), passage and capture of forts Jackson and Saint Philip, capture of New Orleans and Port Hudson (1863), etc., he became superintendent of iron-clads at New York and Boston (1863-67) and served at various navy yards. He was fleet engineer (1867-68) on staff of Admiral Farragut, European squadron, and fleet engineer of Asiatic station (1872-75). He retired in 1894 with the rank of commodore, serving, however, as inspector of the New York navy yard during the Spanish American War.

**MOORE, Maurice**, American patriot and jurist: b. Brunswick County, N. C., 1735; d. 1777. Having studied for the bar, he acquired a high reputation as a lawyer, was one of the three colonial judges of North Carolina at the time of the Revolution, was a member of the provincial congresses at Hillsborough in 1775 and Halifax in 1776 and had a prominent part in framing the constitution of North Carolina. He was one of a committee appointed at the commencement of the Revolution to draw up an address to the people of Great Britain on the wrongs of the North American colonies. His letter to Governor Tryon, under the signature of "Atticus," is an incisive piece of work.

**MOORE, Robert**, American civil engineer: b. New Castle, Pa., 19 June 1838. He was graduated (1858) at Miami University, receiving A.M. diploma in 1866. He has been engaged principally in the location and construction of railways such as the Illinois Central, the Illinois Southern, the Baltimore and Ohio, etc. He was sewer commissioner and a member of the board of public improvements at Saint Louis (1877-81) and has been consulting engineer for a number of railway companies and reorganization commissions. From 1897-1913 he was a member of the Saint Louis board of education and its president 1905-06 and 1909-10. He was a member of the Brazos River Board and the South West Pass board of engi-

neers, and is a past-president of the American Society of Civil Engineers, etc.

**MOORE, Thomas**, Irish poet: b. Dublin, 28 May 1779; d. Bromham, near Devizes, 25 Feb. 1852. He was educated at Trinity College, Dublin, with a view of becoming a lawyer, and in 1800 entered as a student at the Middle Temple. In 1800 he published a translation of 'Anacreon' dedicated to the Prince of Wales (his enemy in after years), and in 1801 'The Poetical Works of the late Thomas Little.' His fine musical talent got him admission to the best society. The office of admiralty registrar at Bermuda was bestowed on him in 1803. The post was given to him as a sinecure, and he quitted it after appointing a deputy to perform his duties. In November 1804 after a tour through the United States and British America, he was back again in England. In 1806 he published 'Odes and Epistles,' which contained some attacks on America, and castigated by Jeffrey in the *Edinburgh Review*, occasioned the memorable frustrated duel between him and the distinguished critic who had no bullet in his pistol. Moore entered in 1807 into an engagement with Power, the music publisher, to produce a series of adaptations to the national Irish airs, he furnishing the words and Sir John Stevenson the music. This great undertaking, which extended over a number of years, only completed in 1834, is the work on which his reputation will mainly rest. Many of the numbers, such as 'The Last Rose of Summer,' and 'Those Evening Bells,' are generally familiar. His 'National Airs' (1815) included 'Oft in the Stilly Night' and the 'Sacred Songs' (1816); 'Sound the Loud Timbrel.' In 1811 he married Bessie Dyke, an actress. 'The Twopenny Post Boy, by Thomas Brown the Younger,' a series of satires on the proceedings of the prince-regent and his ministers, appeared in 1812, and by their genuine wit attracted much attention and in this kind of composition he afterward excelled. The same year he removed to Mayfield Cottage, near Ashbourne, Derbyshire, and here his 'Lalla Rookh' was elaborated. Its production was the result of an agreement with Messrs. Longman, by which he was to receive 3,000 guineas for a poem to form a quarto volume. It appeared in 1817, and its success fully justified the liberality of Moore's publishers. It was translated into numerous languages, and attained a European fame. Later criticism has deemed it rather a work, as Garnett says, "of prodigious talent," than of the genius ascribed to it in Moore's own day. The same year appeared a satirical-burlesque poem, 'The Fudge Family in Paris' (1818) in the form of a series of amusing letters supposed to be written by the different members of an excursion party to the Continent. 'Rhymes on the Road' and 'Fables of the Holy Alliance' followed in 1819. About this time he became involved in serious embarrassments by the defalcations of his deputy in Bermuda and found himself suddenly called upon to make up a deficiency of £6,000, ultimately reduced to about £1,000. This vast sum he contrived to clear off by his literary earnings. In 1822 appeared his 'Loves of the Angels' The 'Life of Sheridan' was produced in 1825, and the 'Epicurean,' a prose romance of small value, in 1827. Next came the justly praised

'Life of Lord Byron' (1830). (See BYRON). His remaining works include the 'History of Ireland' (1846), written for Lardner's 'Cyclopædia' and a task which he found very severe. For nearly the last 30 years of his life he resided at the cottage of Sloperton, near Devizes. Moore's fame, great in his own day, has suffered diminution, except in so far as his songs are concerned, his more ambitious poems being little read. A biography in eight volumes, edited from his journal and correspondence, was published after his death by his friend, Lord John Russell (1853-56). Consult also Clark, J. C. L., 'Tom Moore in Bermuda' (Boston 1909); Gwynn, 'Thomas Moore' (in the 'English Men of Letters' series, London 1905); Gunning, 'Thomas Moore, Poet and Patriot' (ib. 1900); Vallat, 'Thomas Moore sa vie et ses œuvres' (Paris 1887). See LALLA ROOKH.

**MOORE, William Henry**, American lawyer and capitalist: b. Utica, N. Y., 25 Oct. 1848; d. 16 May 1916. He was educated at Amherst College and called to the Wisconsin bar 1872. He settled in Chicago making a specialty of corporation law and, with his brother James H. (q.v.), he created the great "Moore Group" of four corporations having a total capitalization of \$187,000,000, all of which have since become absorbed in the United States Steel Corporation. Other immense industrial amalgamations brought about by them were The Diamond Match Company, National Biscuit Company, American Tin Plate Company, etc. He was known to the public as "Judge Moore," through his prominent position at European and American horse shows, his own stable taking frequent prizes for coaching teams. He was director of the Delaware and Lackawanna Railway Company, the Lehigh Valley Railroad Company, American Cotton Oil Company, First National Bank of New York, etc.

**MOORE, Willis Luther**, American meteorologist: b. Scranton, Pa., 18 Jan. 1856. At eight years of age he joined his father, with Grant's army, at City Point, Va., and sold papers to the troops in the field; was educated in the Binghamton public schools; was student of natural sciences under scientific staff of the Weather Bureau for 15 years and under private tutors six years. He served full apprenticeship as printer and pressman on the Binghamton *Republican*, and worked as union printer in Chicago, Burlington, Iowa and Washington, D. C.; entered Signal Corps (now Weather Bureau) 1876, and rose through successive grades to local forecast official in Milwaukee, 1891-94; won professorship of meteorology in open competitive examination against 23 contestants, 1894, and was assigned to duty as district forecaster at Chicago; was chief United States Weather Bureau, 1895-1913; professor applied meteorology George Washington University 1914. He was lecturer for the Royal Institution (London) in 1912; and is popular lecturer on the Lyceum and Chautauqua circuits; is fellow of the American Association for the Advancement of Science; and honorary member of the Royal Meteorological Society (London), and of the Austrian Meteorological Society; was president of the National Geographic Society, 1905-10; and vice-president Washington Acad-

emy of Science, 1900-10. He has published 'Descriptive Meteorology' (1904); 'Meteorological Almanac' (1901); and is a contributor to scientific and other publications.

**MOORE, Zephaniah Swift**, American educator, first president of Amherst College: b. Palmer, Mass., 20 Nov. 1770; d. 29 June 1823. He was graduated at Dartmouth College in 1793, entered the Congregationalist ministry, and preached at Leicester, Mass., from 1798 until 1811, when he was appointed professor of languages in Dartmouth College. He was chosen president of Williams College in 1815, but failing in his efforts to procure the removal of the institution to the banks of the Connecticut, he resigned in 1821, and was chosen president of Amherst College.

**MOOREA**, mō"ō-rā'a, or **EIMEO**, i'mē-ō, one of the Society Islands, in the Pacific Ocean, about 20 miles west-northwest of Tahiti, the principal member of the group; area 51 square miles. It consists of deep valleys and abrupt hills — the former well cultivated, and the latter heavily timbered. Here Christianity was first introduced in Polynesia; and here the South Sea College of the London Missionary Society was established. Most of the natives are Protestants. Pop. 1,500.

**MOOREHEAD**, moor'- or mōr'hēd, **Warren King**, American archaeologist: b. Sienna, Italy, of American parentage, 10 March 1866. He was educated in public schools of Ohio, and devoted himself to the study of Indian archaeology and later studied three years in the Smithsonian Institution, and was afterward engaged in investigations of the earthworks and other Indian relics in Ohio for four years. He had charge of the investigations in Ohio, Utah, Colorado and New Mexico for the Chicago exposition and was curator of the museum of the Ohio State University. He is at present curator in the department of archaeology at Phillips Academy. He is a member of the United States Board of Indian Commissioners; and since 1909 has investigated conditions on Indian reservations for the Interior Department; fellow of the American Association for the Advancement of Science. He received the degree of M.A. (honorary) from Dartmouth in 1901, and has published 'Primitive Man in Ohio' (1892); 'Stone Age in North America' (1910); 'American Indian in the United States' (1914).

**MOORE'S CREEK**, a short stream in North Carolina, which flows into Cape Fear River about six miles above Wilmington. Moore's Creek is noted on account of a battle fought on its banks, 27 Feb. 1776, between American and British forces. The British soldiers, nearly all Highland Scotch under Brigadier-General MacDonald, numbered 1,500, and the Americans under Caswell and Lillington numbered 1,000. The charge was made by the British, who tried to cross the stream on the girders of a bridge, the planks had been taken away, but the militia and minute men of the American force routed them. Fully 30 British were killed, many wounded, and about 700 taken prisoners. The victory gained by the Americans was an inspiration to the Carolinas; it had the same effect in the South that the Battle of Lexington had in New England.

**MOORES HILL COLLEGE**, in Moore's Hill, Ind.; coeducational; opened in 1856 by Methodist Episcopal. In 1917 the college had 14 professors and instructors, 106 students, and about 6,000 bound volumes and 2,000 pamphlets in the library. The grounds, buildings and apparatus were valued at \$35,000, the productive fund was \$30,000, and the annual income about \$13,000. The courses of the collegiate department lead to the degrees of A.B., B.S., and Ph.B.

**MOORHEAD**, mōr'héd, Minn., city, county-seat of Clay County, on the Red River of the North, and on the Great Northern and the Northern Pacific Railroad, opposite Fargo, N. Dak. It is in a productive farming region in which wheat is one of the great crops. It has flour mills, grain elevators, foundries, machine shops, brick yards, and stock yards. It is a trade centre for a large part of Clay and Norman counties, and ships large quantities of wheat. It is the seat of Concordia College, the Sharp High School, a State Normal School, and has public and parish schools. The city owns and operates the electric-light plant and the waterworks. Pop. 4,840.

**MOORISH ART.** See ARCHITECTURE; MOHAMMEDAN ART.

**MOORS** (Lat. *Mauri*; Sp. *Moros*; Dutch, *Moors*), the people of Morocco. The Arabs who conquered the Roman province of Mauritania in North Africa in the 7th century converted to Mohammedanism the native population, who in Europe were still called Moors, though in their own language they called themselves Berbers, while by the Arabs they were termed Moghribees, "westerners" or "men of the west." Arabic manners and customs, and in a corrupt form the Arabic language, soon prevailed in the country, the Arab conquerors freely amalgamating with their converts, who far exceeded them in numbers. In 711 an army drawn from this mixed population, under Arab leaders, crossed the straits at Gibraltar, so named from their leader, and began the conquest of the Spanish peninsula. The Spaniards and Portuguese called these invaders Moors because they came from Mauritania, and the term Moors with them soon became synonymous with Mohammedans or Moslems, as the invaders designated themselves. The Spanish writers subsequently applied the term to all the Mohammedans of northern Africa; and when, at the close of the 15th century, the Portuguese made their way around the Cape of Good Hope and encountered the Arabs on the coasts of East Africa and of Asia, they still called them Moors. See MOROCCO.

**MOOS**, mós, Salomon, German aurist: b. Randegg, Baden, 15 July 1831; d. Heidelberg, 15 July 1895. He studied at Heidelberg, Prague and Vienna; in 1859 he became privat-docent at Heidelberg, and in 1866 professor of aural surgery there. His most valuable researches were in relation to the diseases of the labyrinth of the ear, and he was the first to demonstrate that in certain infectious diseases, micro-organisms within the ear labyrinth cause derangement of hearing and equilibrium. He wrote 'Klinik der Ohrenkrankheiten' (1866); 'Anatomie und Physiologie der Eustachischen Röhre' (1874); 'Über Meningitis cerebro-spinalis epidemica' (1881); 'Über Pilzinvasion des Labyrinths im Gefolge von einfacher Diphtherie'

(1887); 'und im Gefolge von Masern' (1888); 'Untersuchungen über Mittelohrerkrankungen bei den verschiedenen Formen der Diphtherie' (1890). He also founded and edited with Knapp the 'Zeitschrift für Ohrenheilkunde.'

**MOOSE.** The deer family (*Cervidæ*) embraces not only all the round-horned deer, but also the caribou and moose, whose horns are flattened in a manner known as "palmation." Of this family, the American moose (*Alces americanus*) is the most colossal and also the most picturesque member. The moose of Europe and Asia, there called "elk" (q.v.), is a much smaller animal. Even in comparison with the largest American elk, our moose, is a giant, and it is impossible to appreciate fully the great height and bulk, length of leg and size of antlers of this wonderful creature, without seeing a full-grown bull, either in his native wilds or mounted in a museum.

At nearly every point the species presents a peculiarity. The largest specimens ever shot and measured by naturalists stood from 78 to 84 inches in height at the shoulders. The body is very short in comparison with the great length of the legs, but the depth of the chest is unusually great. The end of the nose is flabby and pendulous, and overhangs the end of the chin by three or four inches. In browsing it is half prehensile, and is of great use in conveying twigs into the mouth. A moose in full winter pelage is covered by a coarse thatch of straw-like hair, from three inches in length on the body to six inches on the neck and shoulders. The color of the hair is purplish-gray, and for an animal which lives so far north, the pelage is exceptionally coarse and open.

The antlers of the moose are strikingly peculiar. The upper two-thirds of the beam is enormously flattened, often to a width of 12 inches or more, and the upper end of this great shovel of solid bone terminates in a row of from 6 to 12 short points. The single brow-tine is also well palmated, and usually terminates in three or four long points of great strength. Occasionally the main shovel throws out sidewise a palmated spur of striking form and size, and such a head when seen from the front presents a chaotic jumble of tines and palmations. The largest antlers known are in the Field Columbian Museum, and have a spread of 78 inches, greatest width of palmation 16 inches, thickness of palmation 2½ inches, and a total of 34 points. The weight of the antlers and skull is 93¼ pounds. At least 25 pairs of antlers are known to exceed 70 inches in spread. The female has no antlers.

The moose is a browsing animal, and its favorite food consists of twigs of the willow, birch, hemlock, spruce, alder, aspen and maple. It also feeds upon moss, and in summer is very fond of wading in ponds and eating the stems and leaves of water-lilies. Because of their very unusual feeding-habits, moose are very difficult to rear in captivity to adult age. About 90 per cent die of gastro-enteritis before they attain the age of three years. For this reason the market value of a live moose is far below its rarity and general desirability in a collection. Moose calves are born either singly or in pairs, in May or June. At birth an average specimen stands about 32 inches in height, and is a most grotesque-looking creature. Its first coat of hair is sandy-red, like that of a buffalo calf. At 15

months old, a healthy young animal is about five feet high at the shoulders. The weight of a large adult male moose is between 1,100 and 1,200 pounds, but the maximum weight for the species would probably reach 1,500 pounds.

The range of the moose extends from Nova Scotia and New Brunswick to northern Alaska, a total distance along the axis of distribution of about 4,100 miles. This animal does not seem to have arrived in the United States, at least, before the final retreat of the ice of the last glacial age; and a somewhat different deer (see *CERVALCES*) probably preceded it.

The valley of the Ottawa River and its tributaries yet affords good hunting for moose, and so does northern Manitoba. The species still exists in small numbers in northern Minnesota, and along the western slope of the Rockies as far south as the head of Green River, Wyoming, (lat. 43°). Northward, moose are found in British Columbia, Alberta, Athabasca, Yukon and in many portions of Alaska. Those found on the Kenai Peninsula and north of Cook Inlet have the most massive and widespreading antlers to be found, and have even been described as an independent species, under the name of *Alces gigas*.

Everywhere throughout its range, the killing of moose is regulated by law. The open seasons are very short, the number that may be killed by each hunter is limited to one or two males, and the killing of females is forbidden. For the protection of the species in Alaska, Congress enacted in 1902 a stringent law, which will at least serve to prevent much of the reckless slaughter that up to that time had been proceeding. But, despite all laws that can be framed and enforced, the size of the moose, and its desirability, both as a hunter's trophy and for food, render it practically certain that the species will be destroyed far faster than it breeds, and that 25 years hence it will be as nearly extinct in America as the buffalo is today. Consult bibliography under *DEER* and *ELK*.

WILLIAM T. HORNADAY,

Director New York Zoological Park.

**MOOSE-BIRD**, one of the names in eastern Canada for the Canada jay. See *JAYS*.

**MOOSE-FLY**, a small biting fly (*Hæmobia alcis*), parasites on the moose and very annoying to that deer in the Northwest. It is closely related to the horn-fly (q.v.).

**MOOSE JAW**, city in Saskatchewan, Canada. It is 398 miles west of Winnipeg and 420 miles east of Calgary, on the Canadian Pacific (divisional point), Canadian Northern and Grand Trunk Pacific railroads. Is a well laid out centre in a rich wheat-growing tributary region, situated in a valley at the confluence of the Moose Jaw River and Thunder Creek, and is a thriving agricultural and industrial town. There are government elevators with a total capacity of 4,000,000 bushels; flour mills, brick works, brass and iron works, and coal mines have been opened 40 miles south of the city. The city is well equipped educationally, and has a handsome Collegiate Institute; there is a general hospital and one under construction for the Gray Nuns. The street railway, electric power, light and waterworks are municipally owned. The population (1,558 in 1901) was 13,823 in 1911, and, according to a local estimate, was over 16,000 in 1916.

**MOOSE-WOOD**, a local name in the Eastern States and Canada for either of two shrubby trees of whose leaves and twigs the moose is fond: (1) the striped maple or whistle-wood (see *MAPLE*); (2) leatherwood (see *CYRILLA*).

**MOOSEHEAD**, the largest lake in Maine, lies at an elevation of 1,026 feet on the boundary between Piscataquis and Somerset counties. It is about 35 miles long; its average width is about 7 miles and maximum 12. A number of rivers flow into the lake, and its direct outlet is Kennebec River. Part of its waters enters the Penobscot by way of a short stream and the lakes which are the source of the Penobscot. Game abounds, fish fill its waters and but few people inhabit the region near the shores. The Canadian Pacific Railroad passes along the southwest shore and connects the villages of Greenville and Moosehead.

**MOOSE, Loyal Order of**. A secret fraternal society founded in 1888 at Louisville, Ky., by Dr. J. H. Wilson. The first lodge was organized in Cincinnati, Ohio. The Supreme Lodge administers the society which comprises 1,610 subordinate lodges and has nearly 616,000 members. The society is beneficiary, furnishing the social advantages of brotherhood, and without obligation to buy life insurance or pledging to any specific cause, paying sick and funeral benefits. A home and vocational school for dependents and orphans of members of the society with suitable buildings are maintained on a farm of 1,000 acres at Mooseheart, near Aurora, Ill.

**MOPSUS**. (1) A seer, the son of Ampyx by Chloris, and one of the Thessalian Lapithæ, who died from the bite of a serpent which sprang from the blood of the Gorgon Medusa. (2) A legendary Greek prophet, son of Apollo and Manto, who vanquished Calchas in prophetic skill. Mopsus fell by the hand of the prophet Amphilocheus. The name is also commonly used of the shepherd poets of Greek bucolic poetry, and hence of pastoral poetry generally.

**MOQUEGUA**, mō-kā'gwā, Peru, a province in the southern part of the republic, bounded on the north by the department of Arequipa, on the east by Puno, on the south by Chile and on the west by the Pacific Ocean. Area, 5,549 square miles. The eastern part is crossed by the Andes Mountains. The fertile portions are on the mountain slopes, the region along the coast is a rainless desert. The chief products are brandy and wine and there is considerable mineral wealth. Pop. 31,920. (2) Moquegua, the capital, is southeast of the centre of the province, was destroyed by earthquake in 1868. Pop. 6,125.

**MOQUELUMNAN**, a family of North American Indians, living in California and consisting of the Miwok and other tribes. The Moquelumnan family was originally included with the Costanoan in the so-called Mutsun, named after the language, or more probably the village, at the mission of San Juan Bautista. The Moquelumnan family, as at present generally recognized, consists of two detached divisions, the principal one occupying the terri-

tory in the San Joaquin Valley and on the slope of the Sierra Nevada; the other, a smaller territory on and near the coast north of San Francisco. The smaller division comprises three dialects, which are spoken in two separate areas: one near Clear Lake, the other north of San Francisco Bay. That spoken in the area near San Francisco is again divided into two dialects. The people of the principal division of the Moquelumnan family call themselves by some form of the name Miwok. They occupy one of the largest territories held by a single family in California, extending from the Consumnes River on the north to the Fresno and Chowchilla in the south. There are three well-marked Miwok dialects: one in the northern plains, the second in the northern and central hills and mountains and the third in the south. These dialects resemble the northern neighbors of the Miwok people—the Maidu—and not those of the Yokuts to the south. Consult Barrett, S. A., 'Geography and Dialects of Miwok Indians' (Berkeley, Cal., 1908), and Viroeber, A. L. (in *American Anthropologist*, Vol. VIII, Lancaster, Pa., 1906).

**MOQUI** (mō'kē) INDIANS, a semi-civilized tribe living in northern Arizona. The first accounts of them date from the expedition of Coronado in 1540. Their history is strikingly similar to that of the Indians of New Mexico, except that after a successful revolt against the Spaniards, in 1680, they remained independent. They are kind-hearted and hospitable, cultivate the soil, raising grain and vegetables, possess large flocks of sheep and goats and weave very fine blankets. The houses are built of stone, set in mortar, and for security are perched upon the summits of almost inaccessible mesas. They number about 1,600. See INDIANS.

**MORA**, mō'ra, Francis Luis, American artist: b. Montevideo, Uruguay, 27 July 1874. He studied art in the School of Drawing and Painting, Museum of Fine Arts, Boston, and the Art Students' League, New York. From 1892 he worked on illustrations for magazines and other periodicals, receiving his first important commission (1900) for a large decorative panel for the Lynn (Mass.) Public Library. In 1904 he did some decorative paintings for the Missouri State building and for the Saint Louis Exposition. He received the Sears prize, Museum of Fine Arts, Boston; Rothschild prize, Arts Students' League; gold medals from the Philadelphia Art Club (1901) and the American Fine Arts Society, Philadelphia (1902); a bronze medal from the Saint Louis Exposition (1904); 1st Hallgarten prize, National Academy of Design (1905); Beal prize, New York Water Color Club (1907); Evans prize and Shaw prize, Salmagundi Club (1908 and 1910); silver medal, International Fine Arts Exposition, Buenos Aires (1910). His works are displayed in the Boston Art Club; Lotos Club, New York; Art Gallery, Oakland, Cal.; Columbia University; State Gallery, Dallas, Tex.; National Academy Collection, New York, etc. Spanish influence is apparent in most of his creations, which show true coloring and due attention to detail; his figures are full of expression. Of his best works might be named 'The Letter'; 'The Mendicants' (1906); 'Spanish Café' (1906); 'After the

Bull Fight, Granada' (1910); 'Studio Tea' (1911); 'Evening News' (1914).

**MORACEÆ**, a family of trees and shrubs (rarely herbs), related on the one hand to the elms and on the other to the nettles, whose botanical characteristics are: flowers unisexual, usually with four perigone leaves; stamens straight or inflexed in the bud; ovary dimerous, with one suspended, anotropous ovule; stipules caducous; juice milky. The species are mainly tropical and include the mulberries, figs, banyans, etc., bread-fruit, osage-orange, rubber or caoutchouc plants, upas tree (qq.v.) and others.

**MORAINE**, a deposit of sand, gravel or clay made by a glacier. Moraines may be divided into two classes, those that exist on the ice itself and those that are formed at the edge of or under the ice. Of the first type, the most common are the lateral moraines. These are ridges of débris that accumulate on the ice next to the rock wall on either side. They consist in part of material that the glacier has scraped from the valley sides and in part from avalanche débris. When two glaciers unite into one, two lateral moraines are brought together to form a medial moraine. Glaciers that result from many branches uniting may have several such medial moraines. The lower stagnant ends of many large glaciers are wholly covered with débris that was once frozen into the ice, but which has accumulated as the ice wasted away by melting. Such deposits are known as ablation moraines. Forests grow on the ablation moraine of the famous Malaspina Glacier in Alaska. Such moraines as the above three types seldom remain as distinct ridges after the glacier has melted away.

Of the second type, the frontal or terminal moraines are of the most importance. These are formed at the ice front, when loss by melting just equals ice advance, and all the débris is accumulated in one ridge. In the case of valley glaciers, these form dams across the valleys, often producing lakes. In the case of continental ice sheets the moraine may stretch for miles across the country as they do across our Northern States, at the southern margin of the glaciated region. Sometimes the ice in its retreat pauses several times, building a moraine at each pause, in which case they are called recessional moraines. The thin sheet of till (q.v.) that a glacier spreads over the country at large and which results chiefly from material that the ice is forced to drop from the bottom, due to overload, is called ground moraine. Drumlins (q.v.) are a special phase of ground moraine. Morainic débris is mostly unstratified and contains many polished and striated boulders. See also GLACIERS and the section on *Glaciology* in the article on GEOLOGY.

**MORAIS**, Sabato, American rabbi and educator: b. Leghorn, Italy, 13 April 1823; d. Philadelphia, 11 Nov. 1897. He was carefully trained in Hebrew lore, and taught first in Leghorn and then for a few years in London. In 1851 he came to Philadelphia and until his death was minister of the Mikve Israel Synagogue. In 1867 he was appointed professor of biblical exegesis in the short-lived Maimonides College of Philadelphia, and he was one of the founders and the first president of the Jewish Theological Seminary of New York. During nearly five decades of activity he was a representative of

conservative Judaism, unremitting in his efforts in behalf of education and charity and an earnest and scholarly contributor to the Jewish press on historical, literary and theological themes.

**MORAL EDUCATION.** See EDUCATION, MORAL.

**MORAL PHILOSOPHY.** See ETHICS.

**MORALES, Luis de,** loo-ès' dā mō-rā'lās, Spanish painter: b. Badajoz, about 1509; d. there, 1586. His early artistic life was spent in Andalusia, but he removed to Madrid in 1564, where he remained for the rest of his life, returning to his native city only to die. He was essentially Spanish in his conception of religious art, from his devotion to which he was called "El Divino." The main theme of his paintings was the Dead Christ and the Mater Dolorosa. There is in them a blending of religious austerity with a sense of beauty which recalls the early Italian school, but his figures have the distorted and macerated air which later became the accepted type in Spanish religious paintings. His drawing is monotonous and mannered, and his modeling such as to attenuate into half skeleton proportions the limbs and features, but his coloring is of sweet and melting tenderness. The Madrid Museum has several examples of this master, namely, an 'Ecce Homo,' a 'Mater Dolorosa' and a 'Madonna.' A half-length figure of 'Christ Bearing the Cross' is in the Louvre under his name. An 'Ecce Homo' of his hangs in the Dresden Gallery, and one in that of the New York Historical Society.

**MORALITIES,** the name given a class of allegorical plays, so termed because they consisted of moral discourses in praise of virtue and condemnation of vice. The dialogues were carried on by such characters as Good Doctrine, Charity, Faith, Prudence, Discretion, Death, etc., whose discourses were of a serious cast. Moralities were occasionally exhibited as late as the reign of Henry VIII. The morality play, 'Every Man,' was performed by Ben Greet's company in America and England in 1902 and 1903. Consult Mackenzie, W. R., 'English Moralities' (New York 1914); Moore, 'English Miracle Plays and Moralities' (London 1907), and Pollard, A. W., 'English Miracle Plays, Moralities and Interludes' (5th ed., Oxford 1909). See DRAMA.

**MORALITY.** See ETHICS.

**MORAN, mō-rān', Edward,** American painter: b. Bolton, Lancashire, England, 19 Aug. 1829; d. New York, 9 June 1901. He was a pupil of Hamilton and Weber in Philadelphia and in 1862 went to Europe, where he studied in France and England for seven years. He afterward made his permanent home in New York. His best-known pictures are marines, such as 'Outward Bound'; 'Launch of the Life-Boat' (1865); 'The Coming Storm in New York Bay,' etc. His historical series, representing epochs in American seafaring from the 'Landing of Leif Ericson' (1001) to 'Dewey's Return,' was completed in 1899 and exhibited at the Metropolitan Museum, New York, in 1904. He was a member of the National Academy.

**MORAN, Patrick Francis (CARDINAL),** Australian Roman Catholic prelate: b. Leighlin

Bridge, Carlow, Ireland, 16 Sept. 1830; d. Sydney, Australia, 16 Aug. 1911. He received his education at the Irish College, the Gregorian University and the Propaganda, Rome, and was ordained to the priesthood in 1853. He was successively vice-rector of the Irish College, Rome; professor of Hebrew at the Propaganda; vice-rector of the Scots College, and secretary to Paul, Cardinal Cullen, archbishop of Dublin. In 1872 he was consecrated titular bishop of Olba and made coadjutor to the bishop of Ossory. He succeeded to the diocese of Ossory in the same year and remained there until 1884, when he was appointed archbishop of Sydney, Australia. In 1885 he was made cardinal of the Roman Church with the titular church of Saint Susanna. He convened and presided at three plenary synods of the Church of Australia in 1885, 1895 and 1905, and also the Catholic congresses held at Sydney in 1900 and 1909. He was the author of 'Memoir of the Venerable Oliver Plunkett' (1861); 'Essays on the Early Irish Church' (1864); 'History of the Archbishops of Dublin' (1864); 'History of the Persecutions of the Irish Catholics' (1865); 'Acta Sancti Brendani' (1872); 'Monasticon Hibernicum' (1873); 'Spicilegium Ossoriense' (1874); 'Irish Saints in Great Britain' (1879); 'Pastoral Letters of Cardinal Cullen' (1882); 'Occasional Papers' (1890); 'Letters on the Anglican Reformation' (1890); 'History of the Catholic Church in Australasia' (1894); 'Reunion of Christendom and Its Critics' (1896); 'The Mission Field in the Nineteenth Century' (1900); 'Three Patrons of Erin' (1905); 'Priests and People of Ireland' (1905). He founded the *Irish Ecclesiastical Record*; edited it for some time and was a frequent contributor to its pages. He contributed to 'The Catholic Encyclopedia.'

**MORAN, Peter,** American artist: b. Bolton, Lancashire, England, 4 March 1842; d. Philadelphia, 9 Nov. 1914. He belonged to an artistic family, being brother of Thomas Moran and of Edward Moran, both painters of reputation; he became their pupil at Philadelphia and chose landscape and animal life as his special department. Among his paintings are 'Return of the Herd,' to which a medal was awarded at the Centennial Exhibition; 'Santa Barbara Mission'; 'Pueblo of Zia, New Mexico.' He was also successful as an illustrator and etcher and at the Centennial of 1876 received a medal for his etchings of animals.

**MORAN, Thomas,** American artist: b. Bolton, Lancashire, England, 12 Jan. 1837. He came to the United States with his parents in 1844, was educated in the public schools of Philadelphia and studied painting in that city, first exhibiting in the Pennsylvania Academy of Fine Arts in 1856. In 1862 he visited England and at this time formed his great and lasting admiration for the work of J. M. W. Turner, the English landscape painter. In 1871 he accompanied the F. V. Hayden expedition to the Yellowstone country and on his return painted 'The Grand Canyon of the Yellowstone,' which was purchased by the government for the Senate Hall in the Capitol. He made a trip to Arizona in 1873 and the result was 'The Chasm of the Colorado,' also bought by the government. He made many other expeditions into the western country and Mexico, also to

Europe and painted many canvasses of Venice. About 1873 he removed to New York and at this time did an enormous amount of drawings on wood for magazine illustration and for schoolbooks. He also did much etching. He is a member of the National Academy of Design, the American Water Color Society and similar societies. Other important works from his hand are 'Mountain of the Holy Cross'; 'Shoshone Falls'; 'The Grand Canal, Venice'; 'The Pearl of Venice'; 'The Dream of the Orient'; 'Solitude,' etc.

**MORANT**, mō-rānt, **STR Robert Laurie**, English educator: b. London, 7 April 1863. He was educated at Winchester, and at New College, Oxford; received (1885) the degree B.A. He undertook educational work of several kinds, becoming tutor to the royal family of Siam and organizer of education in that country. He then took up social and educational work in East London, becoming (1895) assistant director of special inquiries and reports in the Educational Department, Whitehall, which included education reports on England, France and Switzerland, etc. He was appointed Permanent Secretary, Board of Education, 1903-11, and has been chairman of the Insurance Commission since 1912. He was created Knight Commander of the Bath in 1902.

**MORAT**, mō'ra', Switzerland, town in the canton Fribourg, located on Lake Morat and on the Palézieux-Lys and the Ins-Fribourg railways. It has a 13th century castle, but is chiefly noted for the brilliant victory of the Swiss and their confederates over Charles the Bold, 22 June 1476. Consult Ochsenbein, 'Die Urkunden der Belagerung und Schlacht von Murten' (Basle 1876).

**MORATIN**, mō'ra-tēn, **Leandro Fernandez**, Spanish dramatist: b. Madrid, 10 March 1760; d. Paris, 21 June 1828. He was son of Nicolas (q.v.) and was early instructed in poetic art, and (1786) went to Paris as secretary of Count Cabarrus, where he gained the acquaintance of Goldoni who strengthened his purpose of reforming the Spanish stage by introducing French rules. Returning (1789) to Spain he was granted a benefice by Minister Florida-Blanca which permitted him to follow a literary life. His first comedy, 'El viejo y la niña' (1790) was successful and it was followed by the satyric play 'La comedia nueva' (1792) which revenged him for the opposition given him by the old adherents to the national taste. Prince Godoy afforded him the means to visit France, England, Germany, Switzerland and Italy, returning in 1796. Next year appeared his 'El baron,' 'La mogigata,' 'El sí de las niñas,' the latter proving an immense success and soon being translated into various languages. Under French occupation he accepted (1811) the post of librarian to King Joseph for which persecution drove him to exile and he settled (1822) in Paris. His plays have their characters drawn true to life, the dialogues are lively and these works show originality. Concerning the history of Spanish drama he wrote 'Origenes del teatro español,' a worthy work. The Spanish Academy published his operas (Madrid 1830-31) and the 'Biblioteca de autores españoles' (ib. 1867) published his 'Obras postumas.' Consult also Ford, 'Si de las niñas' (Boston 1899).

**MORATIN**, **Nicolas Fernandez**, Spanish poet and dramatist: b. Madrid, 20 July 1737; d. there, 11 May 1780. He studied law at Valladolid, devoting time also to fine arts, and received a position in court after finishing his studies. He first turned to the drama, starting with the play 'La petimetra' (1762), attempting to combine his national taste with that of the French. Next came 'El poeta' and the tragedy 'Lucrecia' in orthodox style which he held to in his later 'Hormesinda' and 'Guzman el Bueno.' The small income he derived from his literary work decided him (1772) in taking up the work of attorney-at-law, but he was soon made professor of poetry. His last and superlative work was 'Canto epico de las naves de Cortez destruidas' (1785), one of the finest of the Spanish heroics. His son Leandro edited a collection of some of his works under the title of 'Obras póstumas' (Barcelona 1821), but a more extended collection appeared in 'Biblioteca de autores españoles' (Vol. II, Madrid 1848), printed later in Paris (1881). R. Foulcké-Delbos published his remaining works under title of 'Poesias ineditas' (Madrid 1892).

**MORAVA**, mō'rā-vā, Serbia, a river about 250 miles long, formed by the confluence at Staladsh of its head streams, the western Morava rising near the southwest boundary, and the southern Morava, with its source in Kosovo, Turkey. It is the largest river in Serbia and is navigable 50 miles from its mouth in the Danube River, 30 miles east of Belgrade.

**MORAVA**, a river of Austria-Hungary. See MARCH.

**MORAVIA** (German, *Mähren*), Austria-Hungary, a western province and crownland bounded north by Prussia, northeast by Galicia, east and southeast by Hungary, south by Hungary and Austria and west by Bohemia; area, 8,584 square miles. Moravia proper consists of a large basin surrounded by mountains, on the north the Sudetes, on the east the Carpathians and on the west a low range of hills which gradually ascends toward the north until it unites with the Sudetes and open only on the south, at a central point, toward which all its slopes converge and all its drainage is carried. Its climate is milder and more genial than that of most European countries under the same latitude, the mean at Brünn being 48° F. Moravia belongs to the basin of the Danube, all the smaller streams falling into the March or Morava, a tributary of the Danube. About 55 per cent of the land is arable and 27 per cent is occupied by forests. The minerals are of considerable importance and include silver, lead, copper, iron, coal, graphite, etc. The soil is generally fertile and all the ordinary cereal, leguminous and root crops are raised in abundance. Flax of excellent quality is extensively grown in several districts and fruit is so abundant that many parts of the country have the appearance of one great orchard; but the favorite culture is that of the vine, for which both the soil and exposure of the province are admirably adapted. The pastures, in general excellent, occupy a large extent of surface. The rearing of cattle, nevertheless, gets comparatively little attention and is not sufficient to meet the home demand. Sheep, on the other hand, are reared in abundance and are of good

quality. They have been much improved by judicious crossing with the merino and furnish a wool, to the excellence of which the woolen manufactures of the country owe their prosperity. The horses, too, are of a strong, hardy, active breed and are much used in the Austrian service for heavy cavalry. Manufactures have made great progress and in all the great branches of industry—in iron and ironmongery, leather, linen, cotton and woolen tissues, particularly the last—Moravia takes precedence of most of the provinces of the empire. Other manufactures deserving of notice are silk, glass, paper, potash, tobacco and beet-root sugar. The trade in most of these articles is of considerable importance. The waterways are unimportant. About 71 per cent of the inhabitants are of Slavonian extraction and 28 per cent Germans, the latter found mostly in the towns and on the borders. The language chiefly spoken and called Moravian is merely a Slavic dialect; German, however, is generally understood by all classes. The religion almost universally professed is Roman Catholic (97 per cent) and 2 per cent are Jews. Elementary education is generally diffused and numerous gymnasia furnish education of a very superior order. There are theological colleges at Olmütz and Brünn, the latter city the capital of the province (pop. 125,737). Moravia was anciently inhabited by the Marcomanni and Quadi, afterward by the Rugii, and still later by the Longobardi. It was finally occupied by a colony of Slavs, who took the name of Moravians from the river Morava. In 1029 Moravia was united to the kingdom of Bohemia, with which it had the same constitution, administration and laws. In 1197 it was erected into a margraviate, with a separate court and a separate administration. With Bohemia it passed to the house of Austria in 1527. In 1849 it was separated from Bohemia and erected into a distinct province. Moravia subsequently sent 49 members to the Austrian House of Deputies and the provincial diet was composed of 151 members, the majority elected by nationalities German and Bohemian. Proportional representation was introduced in 1905. Pop. 2,622,271. For later history and the political position since 1919 see WAR, EUROPEAN: PEACE TREATY. Consult Monroe, W. S., 'Bohemia and the Czechs, together with an Account of Moravia and Silesia' (Boston 1910).

**MORAVIAN CHURCH,** The, the common name given in England and America to the renewed *Unitas Fratrum* or Church of the Brethren—for a time styled also in English the Church of the United Brethren—which originally flourished in Bohemia, Moravia and Poland, was disrupted and suppressed in the 17th century, was resuscitated in Saxony in the 18th century and at present exists in its reorganized form in Europe and America with an extensive mission work in many parts of the world. It was a product of the evangelical movement led by the Bohemian reformer, John Hus, who suffered martyrdom at Constance, 6 July 1415. It developed out of an association formed in 1457 near Kunwald in northeastern Bohemia to foster pure Christian teaching and life within the National Church. Its attitude toward the abuses of the time and its rapid growth caused it soon to be put under proscription by the

authorities. Drastic measures intended to suppress and disintegrate it had the contrary effect. It formed a more compact union, perfected its organization and gradually became a distinct church with its own ministry, established through the good offices of Waldensian bishops who conveyed the historic episcopate to it in 1467. A system was developed which followed primitive Christianity in its elementary principle. With the increase of congregations, the unit, based on Scripture, bound by a Brotherly Agreement and governed by an elected eldership. With the increase of congregation, the Synod was formed, legislating by delegated authority. The Synod committed executive control to the Council which was also elective and representative, for while the episcopacy stood at the head, the presbytery and the laity had a voice in it, with the central principle of confederal government and collegiate administration fixed. This principle, inherited with the ancient episcopate, is cardinal in the modern structure of the Church, adjusting together conceptions of polity commonly regarded as opposites and presenting affinities to widely divergent church types.

Its history during the ancient period is to a great extent one of cruel persecution. Its speedy recuperation after such ordeals and its increase during intervals of peace were phenomenal. When the German Reformation began in 1517, the Bohemian and Moravian Brethren numbered nearly 200,000 with about 400 places of worship. In the baronial castle and in the peasant's cottage loyalty to their Church, which embodied the best ideals of the nation, rendered them amenable to a discipline in which they stood pre-eminent and made them a strong moral power to be coped with by ecclesiastical and political authorities. In their highest ascendancy they led the educational and literary activity of the regions in which they were established. Their formulated conceptions of Christian doctrine were a gradual growth. Their last and most mature confession of faith before the overthrow of the Church in its original seats was published in 1573.

The Counter-Reformation inaugurated by Ferdinand II in 1621 brought the organized existence of the Church to an end in Bohemia and Moravia, subjected many of its members to martyrdom and drove thousands into exile. It was excluded from the terms made to other evangelical parties in the Peace of Westphalia which ended the Thirty Years' War in 1648, and the hope of its resuscitation in its home-lands was crushed. The parishes of its Polish province, founded in 1548, maintained an organized existence much longer, but they were gradually absorbed by the Reformed Church of Poland of which ultimately even the clergy in whose persons the episcopate of the *Unitas Fratrum* was being perpetuated in the hope of its renewal were legally recognized ministers.

The first step in the restoration of the Church occurred in 1722, when a little company of refugees from Moravia were given an asylum by Nicholas Lewis, Count of Zinzendorf, on his estate, Berthelsdorf, in Saxony where, on 17 June of that year, they began a settlement which was called Herrnhut. Many others from Moravia, Bohemia and different parts of Germany joined them during the next few years,

and a gradual process of organization took place in which the plans of the Moravians were merged with those of Zinzendorf who had in view rather an evangelical association harmonizing different confessional affiliations and Church traditions, with the necessary adaptation of the whole to its situation within the pale of the state church. The doctrinal articles of the Augsburg Confession were adopted and concessions from the Saxon and Prussian governments permitted the establishment of Moravian Church order and constitution modified to suit the new conditions.

The Moravian episcopate was transferred to the new organization on 13 March 1735, when David Nitschmann was consecrated a bishop at Berlin by Bishop Daniel Ernst Jablonsky with the written concurrence of Bishop Christian Sitkovius of Lissa, they being the last two surviving bishops of the old line. A notable spiritual experience which marked the year 1727, when the first definite organization took place at Herrnhut, produced an intense zeal for evangelization. The result, during the next few years, was the establishment of other congregations on the continent of Europe, the founding of the Church in England and America and missions to the heathen which have chiefly given the Church its reputation. The first such mission was begun in 1732 on the island of Saint Thomas, West Indies.

The first Moravian evangelist came to Pennsylvania in 1734. The first settlement in America and mission to the Indians was founded at Savannah, Ga., in 1735. Untoward political conditions caused its abandonment in 1740 and the removal of the colonists to Pennsylvania, where a permanent settlement arose in the present Northampton County, with organized activity in Philadelphia and New York and an extensive itinerary among white settlers and Indians. The Moravian pioneers in "the Forks of the Delaware" first located on a tract of land which the evangelist George Whitefield had purchased and named Nazareth, where he proposed to found a village and a negro charity school. This property came into possession of the Moravian Church in 1741. On another tract at the confluence of the Monocacy Creek and the Lehigh River its chief settlement was founded in that year and at Christmas 1741, when Count Zinzendorf was at the place, it received the name Bethlehem. In June 1742, a considerable colony from Europe joined the pioneers and the settlement was regularly organized. The population was divided into an itinerant and a local congregation, the former to engage in gospel work among white settlers and Indians, the latter to develop the settlement and provide support for the missionaries. Thus, from the first, Bethlehem was the centre of the Moravian Church in America and of its various activities.

Until 1762 a co-operative union was maintained at Bethlehem and Nazareth which was called the General Economy. All labored for a common cause and received sustenance from a common stock, but there was no surrender of private property and no obligation which prevented the individual from withdrawing when he chose. Numerous colonies came to America during those years on vessels owned and managed by the Church and under the arrangement which existed results were accomplished which would not otherwise have been possible. The

material benefits of the settlement were appreciated by the authorities of Pennsylvania, and the spiritual activities prosecuted by the Moravians, although misunderstood and opposed by some, as was the case also in Europe, were epoch-making in the religious growth of the country.

Two notable lines of effort in colonial times, in addition to the Indian missions, were the propagation of Zinzendorf's idea of evangelical alliance and denominational federation, and religious education of children. Desiring to diminish rather than increase denominational divisions the leaders of the Church generally refrained from organizing distinctly Moravian congregations and in consequence of this policy the Moravian Church remained numerically a small body. The European plan of the Church to concentrate in exclusive settlements to some extent was followed for a full century. Besides Bethlehem and Nazareth, such church-villages, founded prior to the Revolutionary War, were Lititz in Lancaster County, Pa., Hope in Sussex, now Warren County, N. J.,—abandoned in 1808— and Salem, now a part of Winston-Salem in Forsyth County, N. C., the central settlement on a large tract of land purchased of the earl of Granville and named Wachovia. These places continued long to be conserving centres of all that was distinctive in the religious and social life of the Moravian Church, as fostered under the influence of Zinzendorf's ideas and methods, presenting interesting experiments in municipal government, industrial order and general culture. They are yet the seats of widely known educational institutions, all founded in the 18th century. A few of the town and country congregations organized in colonial times, without the peculiarities of the church settlements, are yet in existence. During the years from 1844 to 1856, the exclusive system was entirely abolished by all of the Moravian villages in America and their unique character rapidly disappeared. At that period active home mission work was revived and since then many congregations have been founded in various parts of the United States. The most fruitful of these efforts have been in several of the Northwestern States.

The Moravian Church has no peculiar doctrines. It is simply and broadly evangelical, in harmony with other Protestant denominations on the cardinal doctrines of Christianity, and bound by no articles on the points of difference. Its only prominent doctrinal feature is the strongly Christ-centred tendency of its teaching which pervades its official statements, its liturgy and its characteristic preaching. The digest ("Results") of the General Synod, the catechisms and the Easter Morning Litany sufficiently set forth the doctrinal position of the Church. The Church has an established liturgical system, with a litany used regularly on the Lord's Day, and a variety of offices for different Church seasons, in which special prominence is given to singing; the cultivation of church music having always been a conspicuous feature of the Moravian cultus. The general order of the ancient church year is observed in the services. Of distinctive services retained by some congregations, the love-feast, introduced in 1727 in imitation of the Agapæ of the Apostolic Church, is the most conspicuous. Moravian orders of the ministry are bishops,

presbyters and deacons. A diocesan episcopacy does not exist. The bishops are, as such, everywhere on a parity, representing the entire *Unitas Fratrum*. They are *ex officio* members of the General Synod and of the synods of the several provinces in which they reside. Besides having the exclusive function of ordaining men, they are looked to as pre-eminently the guardians of sound doctrine and established order. In governing boards they officiate, not by virtue of episcopal authority, but by election, and those who do not occupy executive positions serve, meanwhile, in pastorates. The Moravian Church in America is divided into a Northern and a Southern province, constituting, with the British and German branches of the Church, an organic unity under the General Synod. The legislative authority of each province is the Provincial Synod which elects an executive board known as the Provincial Elders' Conference and composed usually of a bishop and two presbyters. The Northern province is divided into districts, each organized with its synod and its executive board. The communicant membership of the American Church in 1917 was 21,302 and its total 30,441. The enrolment in the 14 mission provinces of the Church was 109,079 and its grand total in all countries was 156,210, besides 70,000 members of the state churches of Europe, ministered to by Moravian home missionaries.

Bishop J. M. LEVERING.

Revised by J. H. CLEWELL,

President of the Moravian Seminary and College, Bethlehem, Pa.

**MORAVIAN SEMINARY AND COLLEGE FOR WOMEN**, at Bethlehem, Pa., founded almost at the beginning of the Moravian settlement of Bethlehem (1741), it is the second oldest girls' boarding school in the United States, the Ursuline Academy, New Orleans (7 Aug. 1727), being the first. "Colonial Hall," built in 1748, is the oldest structure in the group of buildings owned by the seminary. From the roof of this building it was customary in pre-Revolution days to play the trombone on festal occasions or to announce the death of members. Tradition says that on one occasion during the French and Indian War a band of Indians had planned to attack the settlement, and at sunset as they lay waiting on Calypso Island, for the darkness, they heard a

strange melody floating down from the sky. They had never heard anything like it before, and thinking it must be the voice of the Great Spirit warning them, they held a hurried council, and silently stole away in the darkness. In 1776-78, "Colonial Hall" served as a military hospital for the Continental troops. After the battle of Brandywine the place was crowded with wounded. On the slope of the hill, just west of Monocacy Creek, are the graves of over 500 of unknown dead. Many of the distinguished women of the nation have graduated at this institution. A preparatory school, music, art and science departments are connected with the seminary, and 10 years ago a fully accredited college course leading to A.B. and B.S. degrees was added, and is recognized by the College and University Council of Pennsylvania. The average attendance is about 200, the number of teachers 20.

**MORAVIANS.** See MORAVIAN CHURCH.

**MORAWETZ**, mör'a-wëts, Victor, American corporation lawyer: b. Baltimore, 3 April 1859. He studied at foreign universities, and received the degree LL.B. at Harvard (1879), and was admitted to the bar in 1880. In his practice of law he has acted chiefly in the capacity of counsel for railway and other corporations. He was general counsel, director and chairman of the board of directors of the Atchison, Topeka and Santa Fé Railway Company, and is now director and member of the executive committee of the Norfolk and Western Railway Company, as well as director in other corporations. He was made LL.D. in 1914 by Williams College. He wrote 'Law of Private Corporations' (1882); 'Banking and Currency Problem in the United States' (1909).

**MORAY**, mür'rë, Earl of. See STUART, JAMES, EARL OF MURRAY OR MORAY. More correctly STEWART: it was Mary Queen of Scots who adopted the latter spelling STUART.

**MORAY FIRTH**, Scotland, a large bay on the northeast coast, containing at its widest extent the sea enclosed by a line running from Duncansby Head in Caithness-shire to Kinnaid Head in Aberdeenshire. It thus comprises the Dornoch Firth and the inner Moray Firth, to which the name is more strictly applied, the entrance to which lies between Tarbet Ness in Cromarty and Burghead in Elginshire, and which gives off Cromarty Firth and Beaully Firth and Loch. The opening of the outer firth to the North Sea is 80 miles in width. The rivers which enter the firth include the Deveron, Spey, Findhorn, Ness, Beaully, Oykel.

**MORAYS**, eel-like fishes of the family *Muraenidae*. There, says Jordan, may be distinguished by the small round gill openings and the absence of pectoral fins. The skin is thick and tough, the narrow jaws are armed with knife-like or else molar teeth, and the lower one is moved by muscles of extraordinary size and power. They are carnivorous and pugnacious fishes, and some of them, which reach a length of five or six feet, may be dangerous to bathers and fishermen. They abound in the tropics, lurking in the crevices of rocks, coral-reefs and similar places, and most of them are colored in striking patterns, as fine marblings of black or lustrous green, or varied spottedness.

Several genera and more than 100 species are known, of which a celebrated type is the *Muræna* (*Muræna bellina*) of the Mediterranean Sea, which was extensively cultivated by the Romans, in the classic period, for the sake of its flesh. Two or three species are well known as food-fishes on both coasts of tropical America, and one, usually called "conger," is similarly utilized in southern California.

**MORAZAN, Francisco**, frän-sēs'kō mō-rā-sān', Central American soldier and politician: b. Tegucigalpa, Honduras, 1799; d. San José, Costa Rica, 15 Sept. 1842. He early entered political life and in 1824 was secretary-general of Honduras; when Honduras and Salvador revolted against President Arce of Central America, Morazan came rapidly to the front as a military leader, and in 1830, after a series of brilliant military exploits, was elected President of the Central American Confederation. Though a wise ruler, his administration was interrupted by several revolts. At the close of his second term it was found that no provision had been made for electing his successor, and in spite of his efforts the union of the states of Central America was dissolved and he himself compelled to find refuge in Peru. In 1842 he landed in Costa Rica, proclaimed the federation of the states, and after defeating Carillo assumed the Presidency at San José. A revolution followed directed against his federal proclivities and he was captured and shot. Consult Bancroft, 'History of Central America' (Vol. III, 1887).

**MORDANT**, in dyeing, a substance which is capable of penetrating the fibres of the substance that is to be colored, or of forming an insoluble deposit upon them, and which also forms an insoluble compound with the dye that is to be used. Mordants vary greatly in character, according to the nature of the dye and of the fabric. They may be classified, however, as "acid" and "basic"; an acid mordant being required to fix a basic dye and a basic mordant to fix an acid dye. Tannic acid is a typical example of an acid mordant. Cotton may be mordanted with this substance by soaking it in a solution of tannic acid and then passing the fabric through a solution of a salt of antimony, tin or some other suitable base, by which the tannic acid is fixed upon the fibre in the form of an insoluble tannate, with which the dye subsequently combines. The acetates and sulphates of aluminum and of iron may be cited as examples of basic mordants. Wool may be mordanted, for example, by boiling it in a dilute solution of such a salt (usually with the addition of certain other substances, such as cream of tartar or oxalic acid), the wool causing the mordant to partially dissociate, so that a more basic compound is deposited upon and within its fibres, while a more acid one remains in solution. Wool, when treated in this way, will fix dyes (such as alizarin) that are of a phenolic character. See DYEING.

**MORDECAI, mór'dē-ki**, Alfred, American engineer: b. Warrenton, N. C., 3 Jan. 1804; d. Philadelphia, 23 Oct. 1887. Graduating at the head of his class from West Point in 1819, he became 2d lieutenant of engineers, and after work as instructor at West Point and assistant engineer was appointed captain of ordnance

corps 30 May 1832. He was assistant to the chief of ordnance at Washington (1838-42) and member of the ordnance board (1839-60). Brevetted major (1848) for meritorious conduct in the Mexican War, he was sent to the Crimea (1855-57), his observations on military organization and ordnance being published by order of Congress in 1860. He resigned from the service in 1861, settling in Philadelphia, where, after acting as assistant engineer of the Mexican and Pacific Railroad (1863-66), he became (1867-87) treasurer and secretary of canal and coal companies controlled by the Pennsylvania Railroad. Among his works are 'Digest on Military Laws' (1833); 'Reports of Experiments on Gunpowder' (1845-49); 'Artillery for the United States Land Service,' as devised and arranged by the Ordnance Board with plates (1849); 'Ordnance Manual for the Use of Officers of the United States Army' (1841 and 1850).

**MORDECAI, Alfred**, American engineer, son of the preceding: b. Philadelphia, 30 June 1840. On graduating from West Point (1859) he was brevetted 2d lieutenant of topographical engineers. After service on the field (June-August 1861) he taught at West Point for nearly a year and then was promoted until he became chief of ordnance, Department of the South (1863-64). From May to September 1864 he was chief of ordnance, Army of the James, later holding similar office in the Army of Ohio, Army of the Cumberland, and military division of the Tennessee. Brevetted lieutenant-colonel for services in the war (13 March 1865), he was instructor of ordnance and gunnery at West Point 1865-70, and again 1874-81. He was commander, with rank of colonel, of the Benicia (Cal.) arsenal, 1899-1902; promoted brigadier-general and retired in January 1904.

**MORDENITE**, a native hydrous silicate of aluminum, potassium, sodium and calcium, occurring in small monoclinic crystals, or in small hemispherical concretions with a fibrous structure. It is white, or nearly so, with a vitreous lustre. Mordenite occurs at Morden, N. S., and in western Wyoming.

**MORDVINS, mórd'vīnz**, a race of people scattered over the Volga provinces of European Russia and to the south and east of these, and belonging to the Ural-Altaic family. There are two distinct groups, the Ersh or northern and the Moksha or southern, with differences in feature, and the latter of darker hue. They are a well-built, hardy race, and superior to the Russians by whom they are surrounded. Their chief sources of livelihood are cattle-rearing, hunting, fishing and bee-keeping, and they are famous as carpenters and woodworkers. They are nominally Christians, the work of conversion beginning at the time of the Empress Anna; but their Christian beliefs have been superimposed on remains of the old pagan worship. Pop. about 1,000,000.

**MORE, mōr, Hannah**, English moralist: b. Stapleton, near Bristol, 2 Feb. 1745; d. Clifton, near Bristol, 7 Sept. 1833. She was educated in the seminary in Bristol kept by her elder sisters, and her talents early made her acquainted with Johnson, Burke, Garrick and other literary men of the period. Her first

success was as a dramatic writer. 'The Inflexible Captive'; 'Percy'; and 'The Fatal Captive' were successfully brought out through the patronage of Garrick and her other friends. After the production of the last in 1779 she gave up playwriting from religious motives, and devoted herself to writing works of a moral and religious tendency, the diffusion of tracts and other philanthropic labors. In this new course her talents commanded an extraordinary measure of success. A series of tracts called the 'Cheap Repository,' commenced at Bath in 1795, is said during the first year to have had a circulation between 1,000,000 and 2,000,000 copies, and led to the foundation of the Religious Tract Society. Her most popular fiction, 'Cœlebs in Search of a Wife' (1809), ran through eight editions in the course of a year, and passed through 30 editions in America. Sydney Smith's hostile review of this work in the *Edinburgh* is highly diverting. Her works include 'Strictures on the Modern System of Female Education' appeared in 1799, followed by 'Hints Towards Forming the Character of a Young Princess' (1805); 'Practical Piety' (1811); 'Christian Morals' (1813); 'Character and Writings of Saint Paul' (1815); 'Moral Sketches, with Reflections on Prayer' (1817). Consult Roberts, 'Life of Hannah More' (1838); Thompson, 'Life of Hannah More' (1838); 'Correspondence of Hannah More with Zachary Macaulay' (ed. by Roberts, 1860); Yonge, C. M., 'Hannah More' (1888); Harland, Marion, 'Literary Hearthstones: Hannah More' (1900).

**MORE, Louis Trenchard**, American educator: b. Saint Louis, 9 April 1870. He studied at Johns Hopkins taking (1895) the degree Ph.D. He was instructor of physics (1896) at Worcester Polytechnic Institute and was appointed instructor and adjunct professor of physics at the University of Nebraska (1896-1900), becoming professor of physics (1900) and dean (1910-13). He was dean of the Graduate School (1916) at the University of Cincinnati. He has written 'The Limitations of Science' and contributed many articles to the technical press on such subjects as light, electricity, magnetism, ionization and sound.

**MORE, Nicholas**, English colonist: b. England: d. Philadelphia, Pa., 1689. He was a physician and left a promising career in England to come with William Penn to America in 1682. He was from the first prominent in the affairs of the colony, was president of the first assembly in 1682 and in that year presiding judge of the courts of Philadelphia. In 1683 he was clerk of the provincial council and the next year was speaker of the assembly. He was appointed first chief justice of the Supreme Court of the province in 1684, and in this position incurred the disapproval of the colony and was impeached for having wielded "an unlimited and arbitrary power." He retained the confidence of Penn, however, who appointed him in 1686 one of the five commissioners in control of the government.

**MORE, Paul Elmer**, American author: b. Saint Louis, Mo., 12 Dec. 1864. He was graduated at Washington University in his native city in 1887, studied later at Harvard and was instructor in Sanskrit there for a year and subsequently at Bryn Mawr for two years. He

was literary editor of the *Independent*, 1901-03, and of the New York *Evening Post*, 1903-14. He also was editor of the *Nation* from 1909 to 1914. To it he contributed many valuable reviews and essays in literary criticism. His fine scholarship and effectiveness of method have placed him in the front rank of American literary critics. He has published 'The Great Refusal'; 'A Century of Indian Epigrams: chiefly from the Sanskrit of Bhartrihari' (1898); 'The Judgment of Socrates'; 'Life of Benjamin Franklin'; 'Translation of the Prometheus Bound of Æschylus'; 'The Jessica Letters,' with Corra Harris; 'Shelburne Essays' (9 vols., 1904-13); 'Nietzsche' (1912).

**MORE, SIR THOMAS**, English statesman and author: b. London, 7 Feb. 1478; d. there, 6 July 1535. In 1492-94 he studied at Canterbury Hall, now Christ Church, Oxford, and in 1494 was a student in Lincoln's Inn. At 21 he obtained a seat in Parliament, and distinguished himself with spirit in opposition to a subsidy demanded by Henry VII. After being admitted to the bar he enjoyed great reputation as a pleader. In 1516 he accompanied the commissioners sent to renew the alliance between Henry VIII and Charles, then Archduke of Austria, and showed much ability. In 1516 he published his celebrated political romance 'Utopia.' Cardinal Wolsey pressed him to receive a pension, which he refused as inconsistent with his official duties; but he was induced to accept the place of master of requests. He was shortly after knighted, and taken into the Privy Council. In 1521 he was appointed treasurer of the exchequer, and in 1523, at the instance of Wolsey, was elected speaker of the House of Commons. He was joined with Wolsey in a mission to France in 1527 and on his return made Chancellor of the Duchy of Lancaster. In 1529 he succeeded the cardinal as Lord High Chancellor, which office he filled for three years with scrupulous integrity, but he was severe in his punishments for heretical opinions. Unable to acquiesce in the king's wishes respecting his divorce from Catherine of Aragon, he obtained permission to resign the seals. The affront rankled in the mind of Henry, and was further inflamed by his refusal to attend the coronation of Anne Boleyn. An attempt made to implicate him in the practices of Elizabeth Barton altogether failed; and he also perfectly cleared himself of the charge of inducing the king to publish the book against Luther, in which the Pope's authority was held forth—a doctrine now found inconsistent with the intended attack on the Roman See. The king was declared supreme head of the Church in 1534; but More steadily refused to recognize any other head than the Pope, declined to take the oath of supremacy and was consequently committed to the Tower and indicted for treason. After an imprisonment of 12 months, he was brought to trial, and despite his eloquent defense condemned and sentenced to be hanged and quartered. The king altered the sentence from hanging and quartering to beheading, and this act of grace More received with his usual vein of humor. While in prison he wrote a 'Dialogue of Comfort against Tribulation' and a treatise on Christ's passion. At his execution he comported himself with dignity and with a

great degree of good humor. The news of his death startled Catholic Europe, and British ambassadors were instructed to explain that all was done by due legal process. More's learning was varied and extensive, his wit abundant and his elocution ready and agreeable. He wrote elegant Latin prose and verse, and a terse and simple English. His 'Utopia' is a classic of literature, and he, one of the brightest spirits of the Renaissance. The second degree of beatification, that of Blessed, has been conferred on More by the Roman Catholic Church. His English works were published collectively, in 1557, and his Latin in 1567. (See *UTOPIA*). Consult the 'Life' by Roper (1626, reprinted 1716), and Stapleton's 'Tres Thomae' (1588), the principal sources; and the biographies or studies by Bremond (Eng. trans. with bibliography, London 1904); Bridgett (ib. 1891); Campbell's 'Lives of the Chancellors' (ib. 1845-48); Sir Sidney Lee's 'Great Englishmen of the 16th Century' (ib. 1904); Manning's 'Household of Sir Thomas More' (ib. 1851) and 'The Book of Sir Thomas More' in 'Malone Society Reprints' (ib. 1911).

**MOREA.** See *PELOPONNESUS*.

**MORÉAS**, mō'rá'a', Jean, French poet and author: b. Athens, 15 April 1856; d. 1910. His real name was Jean Papadiamantopulos. He was sent to Paris to study law but, from 1882, devoted himself entirely to poetry. His poems, 'Les Sytres' (1884) and 'Les Cantilènes' (1886), made him one of the most prominent representatives of symbolism. In the novel, 'Le Thè chez Miranda' (1886), so hard to understand, he tries to bring prose under the same new tendency. His poem, 'Le Pèlerin passionné' (1891), shows a happy leaning toward Ronsard. The six books of 'Stances' (1905) contain most of his more perfect works. He wrote a version of Euripides' 'Iphigenia in Aulis' (1903) in semi-archaic language, which was produced at the Odéon, Paris, with success. Consult Gourmont, J. de, 'Jean Moréas' (Paris 1905).

**MOREAU**, mō-rō, Gustave, French painter: b. Paris, 1826; d. there, April 1898. He began his career under the influence of Delacroix, but on going to Rome he chose as his especial subjects of study the fantastic architectural effects of Mantegna and the dramatic composition and sometimes violent poses of Luca Signorelli. His works show the characteristics of these masters and are eminently original both in design and coloring, though little known until the latter days of his life, as he seldom exhibited until he was past 40, or offered his works for sale. On his death he left upward of 800 canvases to the municipality of Paris to form the Musée Moreau. In 1892 he was appointed professor in the Ecole des Beaux-Arts and held the position till his death. He was made an officer of the Legion of Honor in 1883. His most notable pictures are 'Death and the Young Man' (1865); 'Orpheus' (1867) in the Luxembourg; 'Prometheus' (1869); 'Hesiod and the Muses' and 'The Apparition,' the last two in the Luxembourg also. Consult Ary Renan, 'Moreau' (Paris 1900); Flat, 'Le Musée Gustave Moreau' (ib. 1905); Muther, 'History of Modern Painting' (London 1896).

**MOREAU, Hégésippe**, French poet: b. Paris, 9 April 1810; d. there, 20 Dec. 1838. Of illegitimate descent, losing both parents early, he died young, in poverty and need, in a hospital. He set up type for a book-printer, first in Provins, then at Paris, but found no favor or success in his writings. Tenderness and nobility of character appear in his earlier poems with excellent effect but his more mature works show the ills of fashion and the world's sorrows. His finest poems are the elegies, 'La Voulzie,' etc. Among his novels are 'La Fermière,' 'Contes de ma sœur' and the shy prose nouvelles, 'Le gui de chêne,' etc. His works are published under the title 'Myosotis' (1838) and his correspondence in 'Œuvres complètes' (1890-91). Consult Moret, J., 'Hégésippe Moreau' (Provins 1871).

**MOREAU, Jean Victor**, French general: b. Morlaix Finistère, 11 Aug. 1763; d. Laun, Bohemia, 2 Sept. 1813. His father was a lawyer and the son, apparently against his will, studied law and held a post in the judiciary at Rennes. But at the beginning of the Revolution he entered politics, formed a company of the National Guard and in 1791 was elected lieutenant-colonel of a volunteer battalion which joined Dumouriez in the field. He rose rapidly, replaced Pichegru in 1795 as commander of the Army of the North, and in 1796 was put at the head of the Army of the Rhine and the Moselle. His retreat before a superior force after Jourdin's defeat at Würzburg, and his swift movement to the attack again before the truce of Leoben proved him a masterly strategist. Momentarily retired for failure to reveal Pichegru's Royalist plot, he was recalled in 1799; served under Scherer in Italy and largely recouped his superior officer's losses; succeeded Joubert after that general's death; was Bonaparte's confidant in the *coup d'état* of 18th Brumaire; passed the Danube and the Rhine; defeated the Austrians in a series of brilliant engagements culminating in Hohenlinden (1800); and then with the backing of the Royalists attempted to oust Bonaparte. He was found guilty of plotting against Napoleon and was exiled from France for two years, which he spent on a farm in Pennsylvania. Although Republican in his sympathies, in his last campaign he took arms with the Allies, served against France in 1813 and was killed at the battle of Dresden. Consult Jochmus, 'General Moreau' (Berlin 1814); Ary Renan, 'Moreau' (Paris 1900).

**MOREAU RIVER.** One of the larger branches of the Missouri River draining a wide area in northeastern South Dakota. Its length is about 180 miles. The name is a French one, signifying a dark horse or nosebags. On some maps the name Owl River is improperly given to this stream.

**MORECAMBE**, mōr'kām, England, a Lancashire seaside resort on Morecambe Bay, four miles by rail northwest of Lancaster. Its principal features are the promenade pier, three miles long, observation tower, winter garden, etc., and the fine beach of Morecambe Bay, this inlet of the Irish Sea being about 18 miles long and 10 miles broad. Pop. 12,131.

**MOREEN.** See *MOIRE*.

**MOREHEAD, John Henry**, American public official: b. Lucas County, Iowa, 3 Dec. 1861. He was educated in the public schools, removed to Nebraska in 1883 and taught school for some time. Later he engaged in mercantile affairs at Barada, Neb., and in 1896-99 served as county treasurer of Richardson County. In 1900 he was mayor of Falls City and in 1910 was elected member of the Nebraska senate. He was president pro tempore of the senate and lieutenant-governor in 1910-11 and served as governor of Nebraska for the terms 1913-15 and 1915-17.

**MOREL.** See FUNGL.

**MORELAND, William Hall**, American Protestant Episcopal bishop: b. Charleston, S. C., 9 April 1861. He was graduated from the University of the South in 1881 and was assistant rector at Christ Church, Hartford, Conn., in 1884-85. In 1885-93 he was rector at the church of the Good Shepherd, Nashua, N. H., and in 1893-99 rector of Saint Luke's, San Francisco. He was consecrated bishop of Sacramento in 1899. He has published 'What is Christianity?' (1887); 'The Church or the Churches: Which?' (1894), etc.

**MORELIA**, Mexico, capital of the state of Michoacan, situated on the line of the National Railway, 234 miles west from the city of Mexico, elevation 6,314 feet above the sea, distant by straight line from the nearest point on the Pacific Ocean about 140 miles. The city was founded in 1541 and known as Valladolid until 1828, when it was given the name of Morelia in honor of Morelos (q.v.), patriot and soldier, who was a native of the city, to whom the most notable monument in the city is dedicated. Morelia is set on a rocky eminence rising from the Guayangareo Valley, which is almost surrounded by mountains, and in climatic conditions favorable to the successful cultivation of nearly all grains, fruits and vegetables. Patzcuaro Lake, the most beautiful body of water in the republic, is only 39 miles to the southwestward. The College of Saint Nicholas was founded three centuries ago; the School of Medicine (in the General Hospital) and the Charity Hospital for Women, are among its institutions. There are several well-equipped libraries, the State Library having a remarkable collection of rare books. The great cathedral, begun in 1640 and completed in 1741, is a very imposing edifice. A stone aqueduct of exceeding beauty supplies water for domestic purposes. Cottons and woollens and sugar are among its industries, and *guayabate*, a high-class confection. There are extensive barracks. The streets are well paved, with electric lighting and a municipal tramway system. Pop. 40,042.

**MORELL, George Webb**, American soldier: b. Cooperstown, N. Y., 8 Jan. 1815; d. Scarborough, N. Y., 12 Feb. 1883. He was graduated at the West Point Military Academy (1835) but resigned (1837) to become civil engineer. He worked three years in Michigan and southern coast States on railroad construction, settling (1840) in New York to study law. He was admitted to the bar (1854) and began practice but was made commissioner of the United States Circuit Court for the southern district of New York. When civil war broke

out he was inspector-general on the staff of Major-General Sanford, with the first division New York State militia, and accompanied it to Washington. He was colonel on General Patterson's staff during the Shenandoah campaign and was promoted to brigadier-general, then major-general, commanding the 2d brigade, 2d division, 5th Army corps, to be given next command of a division. He was in command of the supports of the celebrated battery of 100 guns at Malvern Hill, and was engaged at Hanover Court House, Mechanicsville and Gaines's Mills. He contracted germs of disease during the Chickahominy campaign that later proved fatal. He lived on his farm at Tarrytown, N. Y., after being mustered out of the service and was senior warden for many years at Trinity Episcopal parish church, Tarrytown.

**MORELL, John Daniel**, English philosopher and inspector of schools: b. Little Baddow, Essex, 1816; d. 1891. He studied at Glasgow, taking (1841) the degree of M.A., when he went to Bonn to study theology and philosophy. He was made Congregational minister at Gasport (1842-45), becoming inspector of schools (1848-76) through Lord Lansdowne. He wrote numerous works dealing with English grammar and spelling, as well as his better known 'Historical and Critical View of the Speculative Philosophy of Europe in the Nineteenth Century' (1846), and his 'Philosophy of Religion' (1849). Other works are 'On the Philosophical Tendencies of the Age' (1848); 'Philosophical Fragments' (1878). Consult Theobald, R. M., 'Memorials of J. D. Morell' (London 1891).

**MORELLA**, mō-rā'lyā, Spain, town in the province Castellon de la Plana in the mountain district Maestrasgo. It has a 14th century Gothic church, and an aqueduct, a powerful castle and is surrounded by walls with towers. Its industries consist of cloth and cotton fabric factories, dyeing establishment, etc. This is the location of the old Roman Castra Aelia, and it played a prominent rôle during the Carlist wars. In 1839 it was stormed by Cabrera, who received the title Count of Marella. In 1910 it had a population of 6,722.

**MORELLI, mō-rē'lē, Domenico**, Italian historical painter: b. Naples, 1826; d. there, 13 Aug. 1901. His true name was Soliero. He studied at Rome under Camillo Guerra, advancing his talent under the influence of Filippo Palizzis, studying nature. He ripened thus into a historical and genre painter of the most successful form, especially through his attractive religious pictures. His chief early works were 'The Sicilian Vesper,' 'Count Lara,' 'The Refugees from Aquileja,' etc. In 1867 he turned to biblical work with his 'Christ Walking on the Sea,' a grand work; 'The Descent from the Cross,' 'Christ in the Desert,' etc. He painted the 'Ascension of the Virgin' for the royal palace at Naples. He created several 'Temptations of Saint Antony.' Among other work, the fruits of his journey in the Orient were 'A Street in Constantinople,' 'The Road to the Bath,' 'The Prayer in the Wilderness' and 'Mohammed before the Battle.' He was made senator of the kingdom of Italy and became director of the Institute of Fine Arts and the Museum of Applied Arts at

Naples, where he used his best influence to advance the decorative arts at the latter institution's classes. Consult Willard, 'Sketch of the Life and Works of Domenico Morelli' (Boston 1895).

**MORELLI, Giovanni**, Italian art critic and statesman: b. Verona, 25 Feb. 1816; d. Milan, 28 Feb. 1891. He was educated at Bergamo, then Aarau (Switzerland), but turned his studies to natural science at Munich, becoming interested at the same time in art through Genelli, the painter. After a short stay at Erlangen and a visit to Berlin, where he made the acquaintance of Waagen, the art critic, he joined (1838) Agassiz in investigating the Swiss glaciers. In Paris and Siena and through numerous journeys he gained increasing culture and made acquaintance with Manzoni, Gino Capponi and other prominent Italians. In 1848 he took to politics for a short while, never returning to that field till (1859) he was made commander of the National Guard at Magenta. In 1860-70 he was elected deputy for Bergamo, and (1873) became senator of the kingdom of Italy. His knowledge in art criticism gained during his travels he published in treatises in *Zeitschrift für bildende Kunst* (1874-76). His work 'Die Werke italienischer Meister in den Galerien von München, Dresden und Berlin' (Leipzig 1880), contains his criticism, empiric principles being their base, and show unexcelled connoisseurship. As sequels to this clever work amplifications are contained in the later published 'Kunstkritischen Studien über italienische Malerei': Vol. I, 'Die Galerien Borghese und Doria Pamfili in Rom' (Leipzig 1890), Vol. II, 'Die Galerien zu München und Dresden' (ib. 1891) and Vol. III, 'Die Galerie zu Berlin' (ib. 1893). Italian translations of these were published (Milan 1897). His 'Kunstkritische Studien' has been translated by Ffoulkes into English under the title of 'Italian Painters; critical studies of their works' (1892). In 1895 a monument was erected at Milan to the memory of this genius of keen critical art research.

**MORELLY, R.**, French publicist of the 18th century: b. Vitry-le-François. Beyond the place of his birth and the fact that he became an abbé there, nothing whatever is known of his life. His works, however, are known and important; they are philosophical and socialistic, and consist chiefly of 'Le prince; les délices du cœur, au traité des qualités d'un grand roi, etc.' (2 vols., Amsterdam 1751), a description of a prince who made his people happy by carrying into action philosophical ideas; 'Naufrage des îles flottantes, ou la Basilide du célèbre Bilpai' (1753), an allegorical communistic novel which depicts a people ruled by natural laws instead of political. His third work was 'Code de la Nature' (Amsterdam 1755; Paris 1841), erroneously attributed to Diderot, which sketches a perfect communistic organization and is said to have had considerable influence in the formation of the socialistic propaganda of the French Revolution.

**MORELOS Y PAVON, José Maria**, hō-sā' mā-rē'ā mō-rā'lōs ē pā-vōn, Mexican patriot: b. near Apatzingan, Michoacan, 30 Sept. 1765; d. near City of Mexico, 22 Dec. 1815. He worked for many years as a muleteer; at 32

entered the college of Valladolid; was ordained to the priesthood three years afterward; and from 1801 to 1810 was in charge of the parishes of Caracuaro and Nocupetaro. In 1810 he joined the standard of rebellion raised by Miguel Hidalgo, who had been rector of the college of Valladolid during Morelos' student days, and after Hidalgo's death kept the cause alive in the north by his own vigorous movements in the south. His few followers soon became an army, and having defeated several Spanish armies he advanced upon the City of Mexico, defeated Porlier 22 Jan. 1812, successfully held Cuautla for 62 days against the famous siege by the viceroy, finally making a skilful withdrawal of his forces, and captured Oaxaca (October 1812) and Acapulco (August 8113). He was made captain-general in November 1813 by the Congress convened at Chilpancingo, and the declaration of Mexican independence soon followed. He attempted to capture Valladolid, was defeated by Iturbide, and taken prisoner was shot as a traitor at San Cristobal Ecatepec. His remains lie in the cathedral of Mexico City.

**MORELOS**, Mexico, an interior state south of the Federal District and the state of Mexico. Capital, Cuernavaca (q.v.). Area, 2,773 square miles; pop. about 183,700. It was named in honor of Gen. José Morelos y Pavon.

**MORENO, Alfredo Baquorizo**, āl-frā'dō bā-kwō-rē'sō mō-rā'nō, Ecuadorian diplomatist and novelist: b. Guayaquil, Ecuador, 29 Sept. 1859. He was graduated in law from the University of Quito and began the practice of his profession in 1884. From 1897 to 1901 he was a member of the Superior Court of Guayaquil, was Minister of Foreign Relations, 1901-02, was elected Vice-President of Ecuador in January 1903, and is now Minister from Ecuador to the United States. He is author of 'Poetas' (1882); and the novels 'Titania' (1892); 'El Señor Peneo' (1892); 'Una Sonata en Prosa' (1894); 'Evangelina' (1895); 'Luz' (1901).

**MORESNET**, mōr'nā, a small neutral territory on the Belgo-Prussian border about five miles southwest of Aix-la-Chapelle, traversed by the Belgian Lüttich-Bleiberg on the west and the Prussian Herbesthal-Aachen railways. The only village is Neutral-Moresnet (or Kelmis) with the important calamine (zinc-silicate) mines and 3,400 inhabitants. The territory was under the protectorate of the signatories of the Vienna Congress (1815) and the citizens had choice of military service with either the Belgian or Prussian army. Many of the inhabitants were French and Dutch, as well as Flemish and German. Under the terms of the Peace Treaty, promulgated 7 May 1919, Belgium was awarded full sovereignty over the contested territory of Moresnet and over part of Prussian Moresnet.

**MORETO Y CABAÑA**, mō'rā'tō ē kā-bā-nyā, Augustin, Spanish dramatist: b. Madrid, 9 April 1618; d. Toledo, 28 Oct. 1669. Returning home from the University of Alcalá, where he had just been graduated in law, he began writing successfully for the stage (1640). In Madrid he soon found a friend and patron in Calderón. He was very prolific, turning out drama after drama until he finally passed the 100 mark before he had reached middle age.

His popularity was immense and he was rated as the equal, if not the superior, of Lope de Vega, by his admirers, among whom were the best critics of the age. Posterity, however, while recognizing the genius of Moreto and his valuable contributions to the Spanish drama, has not sustained this high verdict of his contemporaries. One reason is that Moreto was not original in the sense that Lope de Vega was. His dramas or "Comedias de capa y espada," while clever in themselves and instinct with the dramatic spirit, have more than an echo of Vega and Calderón, from whom he frequently borrowed and sometimes improved upon, as in 'El desdén con el desdén,' which is generally considered to be his masterpiece. In addition to "dramas of intrigue" he also produced historical dramas and wrote considerable lyrical poetry and autos sacramentales. Moreto's incursion into the field of historical drama was probably occasioned by the decree of the Royal Council and Chamber of Castile which, in 1644, reduced the numbers of dramas and comedies licensed and ordered that, in the future, the dramatists should turn their attention to historical drama and plays based on the lives of the saints. He found a new field in recasting old dramas, comedies and other plays and making them conform to the requirements of the censor, who was, in reality, controlled by the Church authorities who had dictated the new move for restricting the activities of the drama and the stage. Like Shakespeare, Moreto put so much of himself into this work of reconstruction that many of the new-made dramas were more deservedly his than the work of their first creators. He excelled in painting certain human passions and feelings, among them all the shades of love, including undying passion, disdain, the suffering of unrequited love, jealousy, friendship, faithfulness, unfaithfulness, intrigue in love and in the ordinary affairs of life. In this field he surpassed his predecessor and master, Lope de Vega, and led the way for true and delightful character painting in which the Spanish drama and novel have since shown such power and realism combined with idealism. Moreto painted people of more refined feelings, sentiments and position in life than did Lope de Vega, probably because he was better acquainted with upper class society than was the older dramatist. The complicated complexion of Spanish court life with its intrigues, ambitions, plots and insincerity is well pictured in the dramas of Moreto who swept into his dramatic net every character and condition that he met in his march through life. While he lacks invention and made use, without conscience, of his predecessors and followed the style of drama made popular by Lope de Vega, he gave the Spanish drama characterization and artistic development that it had not previously possessed. He rejuvenated old plays and scenes, breathing into them the breath of life, and he polished his work as no Spanish dramatist had done before his day. He thus pointed the way to the successes that have since his time, been achieved by dramatists and novelists in Spain. Spanish literature, therefore, owes him much. What he lacked in originality of invention he made up in his knowledge of the stage and in his ability to reconstruct the scenes and thoughts of others. His plots move along with rapidity, satisfactory

development and wonderful management of dialogue which is ever fluid and graceful. He surpasses his contemporaries in the number and variety of characters which he handles with great skill in his realistic pictures of the extravagances, customs and vices of the life of his day; so that he has made himself the greatest of the Spanish writers of character drama. In this field he shows his deep and wide knowledge of the world and his power to analyze characters and motives, passions and prejudices. Yet, on the whole, his plays are in better taste and superior in morality to those of any of his contemporaries. Comparatively early Moreto entered a convent, embracing monastic life. From there he sent out numerous plays that became the delight of Madrid and other Spanish theatrical audiences for 10 years or more. Among his more notable plays are 'De fuera vendrá quien de casa nos echara,' 'Trampa adelante,' 'Los Jueces de Castilla,' 'San Franco de sena,' 'La fuerza del natural,' 'El lindo don Diego,' 'El parecido,' 'Santa Rosa del Perú,' 'El desdén con el desdén,' 'Rico hombre de Alcalá' and many autos sacramentales.

B., 'Spanish Literature' (London 1909); Fernandez-Guerra y Orbe, Luis, 'Augustin Moreto y Cabaña' (Biblioteca de autores españoles, Vol. XXXIX); also in Vol. LVIII of the same work for 'Autos Sacramentales' of Moreto; Fitzmaurice-Kelly, 'A History of Spanish Literature' (New York 1898); Giyas, E., 'Studien og Essays' (Copenhagen 1898); Mariscal de Gante, Jaime, 'Los autos sacramentales desde sus origines hasta mediados del siglo XVIII' (Madrid 1911); Pérez Pastor, Cristóbal, 'Bibliographiá Madrilená' (part 3, Madrid 1907); Ticknor, G., 'History of Spanish Literature' (New York 1854).

**MORETON** (mōr'tōn) BAY, Australia, on the east coast of Queensland, formed inside the islands of Moreton and Stradbroke, is 40 miles long by 17 broad; its south half is dotted with islands and sandbanks. It receives six considerable rivers, including the Brisbane, with the important city of Brisbane at its outlet. The entrance at the north end is practicable at all times for vessels of the largest size; the entrance between Moreton and Stradbroke islands is narrow and less safe. Moreton Bay was discovered by Captain Cook in 1770, and explored by Flinders in 1799.

**MORETTO DA BRESCIA**, mō-rēt'tō dā brā'chē-ā (his proper name was ALESSANDRO BONVICINO), Italian painter: b. Brescia, 1498; d. there, 1554. He took Titian as his model, imitating also Palma Vecchio and Romanino, whose styles he developed on independent lines of his own. He was already famous as an artist at 18, and is reckoned a master of pictorial expression, uniting in his coloring tenderness and freshness of flesh tones with a brilliant power of chiaroscuro. His pictures are particularly noted for their bright background, from which his figures stand out with life-like clearness. His frescoes were less successful. His numerous religious paintings are full of devotional feeling. Most of these are at his native town of Bres-

cia. In Saint Clement's Church in that city is a vast altar-piece of his containing a Madonna and Child surrounded by singing angels and the Saints Clement, Dominick, Florian, Catharine and the Magdalen. He painted an 'Assumption' in the church of San Mazarò. His masterpiece, 'The Virgin Appearing to a Shepherd,' is in the church at Paitone, province of Brescia. There are some fine paintings of his in the galleries at Berlin and Frankfurt, and in the Brera at Milan; and examples are to be found also in the public galleries of Vienna, Petrograd, London and Paris. The portraits by this master are equally excellent in conception and power of coloring. Consult the volume in the 'Painters Series' (New York 1910), and 'Masters of Art' (Vol. IX, Boston 1908).

**MOREY, mō'ri, Samuel,** American inventor: b. Hebron, Conn., 23 Oct. 1762; d. Fairlee, Vt., 17 April 1843. He early evinced a talent for mechanics and engineering, and at the time of the opening of the Connecticut River to navigation designed and built the locks at Bellows Falls. On his large estates he built chutes with which to bring his pine logs to the mills years before Napoleon's accomplishment of the feat in the Alps. When but 18 he began his experiments with steam, and in 1790 had conceived the idea of propelling boats by means of an improved steam-engine. In 1793 he succeeded in building a boat which attained a speed of four miles an hour, which later he improved and exhibited in New York with a speed of five miles an hour. Morey was often in consultation with Professor Silliman of Yale College as to the value of his inventions; and when Chancellor Robert R. Livingston offered him \$7,000 for the patent allowing him to run the boat from North River to Amboy, Morey declined. He continued his experiments, encouraged by an offer of \$100,000 for an eight-hour steamboat which Livingston was said to have made, and several patents were issued to Morey which showed that he considered the object almost within his reach. In 1797 he exhibited a greatly improved boat at Philadelphia and became famous throughout the Middle and New England States. His object seemed practically achieved and arrangements were made for the operation of the steamboats, when misfortune overtook the capitalists who were to promote the enterprise and it failed of operation. Morey is believed by many authorities to have been the real inventor of the steamboat, as Robert Fulton visited him before the exhibition of his own invention.

**MOREY, William Carey,** American professor: b. Attleboro, Mass., 23 May 1843. He left his studies at the University of Rochester to enter the army as volunteer during the Civil War, becoming brevet major and lieutenant-general. Returning to college he graduated (1868) at the University of Rochester and entered (1869) the Rochester Theological Seminary. He was professor of history and English literature at Kalamazoo College (1870-72), becoming professor of Latin and history (1872-83) and of history and political science (1883-) at the University of Rochester. He had the degree D.C.L. conferred on him by Denison (1903) and Rochester (1908). He

wrote 'Outlines of Roman Law' (1884); 'Outlines of Roman History' (1900); 'Government of New York' (1902); 'Outlines of Greek History' (1903); 'The study of Roman Law in Liberal Education' (1911); 'Outlines of Ancient History' (1906).

**MOREY LETTER, The,** in American political history the forgery of a letter during the Garfield-Hancock campaign of 1880. The letter which favored Chinese immigration purported to have been written by General Garfield and to be addressed to H. L. Morey, Lynn, Mass., and was made public in the *New York Truth*, 20 Oct. 1880, and a facsimile published in the same paper three days later. James A. Garfield, Republican candidate for President, denounced the letter as a forgery, but Democrats made liberal use of the document and many votes, it is said, were lost to the Republicans through the publication of the letter. Consult Davenport, 'History of the Morey Letter' (New York 1884).

**MORGAGNI, Giovanni Battista, jō-vān'nē bāt-tēs'tā mōr-gān'yē,** Italian anatomist: b. Forlì, 25 Feb. 1682; d. Padua, 6 Dec. 1771. After taking his degree of M.D. at Bologna, he went to Venice and ultimately to Padua, where in 1712 he became professor of the theory of physics; and in 1715, as successor of Molinetti, was appointed to the principal anatomical chair in the same institution, which he continued to occupy till his death. He was the first to show the importance of anatomy as being the basis of all other medical studies, and is regarded as the founder of pathological anatomy. He established a great reputation, students from all parts of Europe flocking to Padua. His most celebrated works are 'Adversaria Anatomica' (1706-19), afterward enlarged and published under the title of 'Adversaria Omnia' (6 vols., 1741); and particularly his 'De Sedibus et Causis Morborum per Anatomem Indagatis' (1761; 6 vols., Leipzig 1827), which has been translated into various European languages.

**MORGAN, Charles Hill,** American mechanical engineer: b. Rochester, N. Y., 8 Jan. 1831; d. 1911. He was educated at public school and Lancaster Academy, entering his uncle's machine shop at Clinton, Mass., in his 18th year, studying in spare time mechanics and drawing. From 1855-60 he was draughtsman for Erastus B. Bigelow. He designed and constructed one of the first automatic paper bag machines and associated himself with his brother in paper and paper bag making in Philadelphia. He became superintendent (1864) of Washburn and Moen Wire Works, Worcester, Mass., where he became very prominent as mechanical engineer, bringing about great improvements in the wire drawing processes, etc. In 1887 he became consulting engineer for the American Wire Company, Cleveland, Ohio, and opened up an office in Worcester. In 1891 he established the Morgan Construction Company, of Worcester, Mass. for making rolling mill appliances, etc., and at the same time was president of Worcester Polytechnic Institute. In 1881 the Morgan Spring Company was organized at that city of which he became president. He was president of the American Society of Mechanical Engineers 1899-1900.

**MORGAN, Conwy Lloyd**, British zoologist: b. London, 6 Feb. 1852. He was educated at the Royal Grammar School, Guildford, and Royal College of Science. From 1878-83 he was lecturer in English and physical science at the Diocesan College, Rondesbosch, Capetown, then (1884) professor of zoology and geology at University College, Bristol, becoming principal (1887-1909). He was appointed vice-chancellor of the University of Bristol, but resigned after three months. He has written 'Animal biology' (1887); 'Animal Life and Intelligence' (1890); 'Animal Sketches' (1891); 'Introduction to Comparative Psychology' (1895); 'Instinct and Experience' (1912); 'Spencer's Philosophy of Science' (1913).

**MORGAN, Daniel**, American soldier: b. Hunterdon County, N. J., 1736; d. Winchester, Va., 6 July 1802. His early life was passed in obscurity and in 1753 he removed to Virginia where in 1755 he served under Braddock as a teamster. He was afterward engaged in Indian warfare and served in Pontiac's War and in Lord Dunmore's War. In 1775 he entered the army of the colonists and commanded a company of riflemen under Washington. He accompanied Arnold at Quebec in 1775 and rendered gallant service there but was captured by the British and not exchanged until nearly a year afterward. He was then given command of a Virginia regiment with the rank of colonel, and in the campaign against Burgoyne took a prominent part; but his services not being recognized by Congress, he resigned. In 1780 he returned to the service as brigadier-general under Gates, and under General Greene who succeeded Gates. Morgan won a brilliant victory over Tarleton at Cowpens, which was recognized by a gold medal from Congress. His subsequent movements were of serious annoyance to Cornwallis, but in 1781 he resigned from the army owing to ill health. In 1794 he returned to it as major-general and helped to crush the Whisky Insurrection, and from 1795-99 was a member of Congress. Consult Graham, 'Life of General Daniel Morgan of the Virginia Line' (1856); McConkey, 'The Hero of Cowpens' (2d ed., 1885).

**MORGAN, Edwin Dennison**, American politician: b. Washington, Mass., 8 Feb. 1811; d. New York, 14 Feb. 1883. He was educated in the public schools, at 17 entered the store of his uncle in Hartford, Conn., and three years later was made a partner in the business. In 1836 he removed to New York and engaged in the grocery business. During the cholera visitation of 1849 he rendered devoted service. Elected to the State senate in 1850, he continued in that office until 1858, when he was elected governor of the State and served until 1862, his administration during those trying times being marked by great sagacity and patriotism. About 223,000 troops were raised for the Federals; New York's firm attitude during the war being in large measure due to Governor Morgan's influence. In 1862 he was elected to the United States Senate; in 1865 he declined the secretaryship of the treasury offered him by President Lincoln, and again refused it under Arthur. He served in the Senate until 1869, and though still taking an active interest in politics held no further political office excepting that of chairman of the Republican

committee which conducted the presidential campaign of General Grant in 1872. He was connected with numerous great financial enterprises during the last years of his life and was a generous benefactor to education, notably to the New York Theological Seminary and Williams College.

**MORGAN, Edwin Vernon**, American diplomatist: b. Aurora, N. Y., 22 Feb. 1865. He graduated (1890) at Harvard University and studied (1891-92, 1894-95) at the Berlin University. He was appointed assistant in history (1892-94) at Harvard and instructor in history (1895-98) at Adelbert College, Cleveland. In 1899 he was appointed secretary to the Samoan Commission, and (1900) secretary of legation at Seoul, Korea. He served as second secretary of the embassy, Saint Petersburg (1901) and as consul at Dalny, Manchuria (1904), Minister Plenipotentiary to Korea (1905), filling the same diplomatic position at Cuba (1905-10), then Uruguay, Paraguay (1910-11), and Portugal (1911-12). He was made Ambassador Extraordinary and Plenipotentiary at Brazil 1912.

**MORGAN, George Campbell**, British Congregational preacher: b. Tetbury, Gloucestershire, 9 Dec. 1863. He was educated at the Cheltenham Douglas School, became master in the Jewish Collegiate School, Birmingham (1883-86), then mission preacher (1886-88), to be ordained (1889) to the Congregational ministry. He served as pastor at Stone, Staffordshire (1889-91); Rugely (1891-93); Westminster Road, Birmingham (1893-97); New Court Tollington Park, London (1897-1901). He was extension lecturer (1901-04), then pastor of Westminster Congregational Chapel (1904-17). He wrote 'The Analyzed Bible' (10 vols. 1910); 'Evangelism'; 'The Life of the Christian' (1904); 'God, Humanity and War' (1914). He has been editor of *The Westminster Bible Record* and *The Westminster Pulpit*.

**MORGAN, Sir George Osborne**, English politician: b. Gothenburg, Sweden, 8 May 1826; d. 1897. He was graduated at Oxford in 1848 and was admitted to the bar in 1853. In 1868 he became a member of the House of Commons and was a staunch supporter of various reform movements, particularly those concerning the English land laws, Welsh disestablishment and education. He was appointed judge-advocate-general in Gladstone's ministry in 1880 and carried through legislation abolishing flogging in the army; and in 1886 was Under-Secretary for the Colonies. He was created a baronet in 1892 and was leader of the Welsh party in the House of Commons until his death. He was the author of a work on 'Chancery Acts and Orders' (1858).

**MORGAN, George Washbourne**, American organist: b. Gloucester, England, 9 April 1822; d. Tacoma, Wash., 10 July 1892. When he was eight he played the entire service at Saint Nicholas' Church in Gloucester, and at 12 became assistant organist at the cathedral there. He removed in 1853 to New York, where he was organist in several leading churches, and gave recitals in different cities of the United States with marked success. He conducted an annual Lenten service in Chicker-

ing Hall, New York, after 1880, and was the author of an Episcopal service, and numerous compositions.

**MORGAN, George Washington**, American soldier: b. Washington County, Pa., 20 Sept. 1820; d. Old Point Comfort, Va., 26 July 1893. He left college in 1836 to enlist in the Texas army and fought for the independence of that country as lieutenant and then as captain when he resigned and in 1841 entered West Point. In 1843 he left the academy to study law and established a law practice at Mount Vernon, Ohio, in 1845. When the Mexican War broke out he became colonel and served under General Scott with distinction, becoming brevet brigadier-general. He returned to his law practice and in 1856 was sent as United States consul to Marseilles; in 1858 he went from there to Portugal Minister where he remained until 1861. He entered the army immediately upon his return to the United States and as brigadier-general was given a command under General Buell. In 1862 he took command of a division of the Army of Ohio, later was with Sherman at Vicksburg and held the command at the capture of Fort Hindman, Ark. He resigned in 1863 on account of failing health. He was a member of Congress from 1869 to 1873.

**MORGAN, Sir Henry John**, Welsh buccaneer, lieutenant-governor of Jamaica: b. Llanrhyyny, Glamorganshire, about 1635; d. Jamaica, 1688. While a boy he was kidnapped at Bristol and sold at Barbados. Just when he joined the Jamaica buccaneers is uncertain, as there were several Morgans in the marine at Jamaica at the time, but he may have commanded his own ship as early as 1663; a Captain Morgan who sailed from Jamaica in that year taking part in the sack of Vildemos, Truxillo and Granada (1665-66). In 1666 Morgan sailed under Mansfield to capture Curaçao, and was chosen admiral after Mansfield's death at the hands of the Spaniards. In 1668 he captured Puerto Principe in order to get information of Spanish plans for an attack on Jamaica; then took Porto Bello, Panama, after a sharp siege during which the buccaneers planted scaling ladders under the cover of captured priests and nuns, sacked the city and tortured and maltreated its inhabitants; and in the end of the summer again ravaged Cuba. The next year, 1669, saw Morgan's attack on Maracaibo, followed by fresh outrages. The arrival of three Spanish warships did not check Morgan's success, for he set fire to one ship, captured another and forced the Spaniards to beach and burn the third; he killed almost all his prisoners, recovered 15,000 pieces of eight from the sunken ship, got a ransom for the city from the Spanish forces in the fort and by a clever manoeuvre made his escape. Returning to Jamaica he was first reproved for exceeding his powers and then made commander-in-chief of the entire naval force of Jamaica, so that in 1671, with a stronger force under him than before, he approached the city of Panama, which he captured after a thrilling battle, in which the Spanish cavalry was broken by riding into a swamp, and further execution was done by a herd of cattle which the Spaniards intended should break the English ranks but which stampeded the Spanish. This attack and the

capture of Panama occurred some time later than the signature of peace between England and Spain, and in consequence Morgan was ordered to England for trial in 1672. Nothing serious came of this, however, possibly because Morgan made free use of his wealth in England. In November 1674 he held a commission as lieutenant-governor of Jamaica. He can hardly be called a pirate; his cruel, brutal methods were those of his enemies and England's enemies. The primary source for Morgan's life is Exquemeling, 'Buccaneers of America' (1684), the work of one of Morgan's followers and reprinted in the 'Adventure Series' (London 1891). Professor J. K. Laughton in the 'Dictionary of National Biography' (Vol. XXXIX, 1894), first set straight the chronology of Morgan's life. Popular accounts are Hutcheson, 'Sir Henry Morgan' (1890); Pyle, 'Buccaneers of America' (1891); Stockton, 'Buccaneers and Pirates of Our Coast' (1898); and Brady, 'Sir Henry Morgan,' a romance (1902).

**MORGAN, James Appleton**, American lawyer and author: b. Portland, Me., 2 Oct. 1850. He was graduated at Racine College, Wisconsin, in 1867, and at the Columbia Law School in 1869, and in 1871 began the practice of law in New York City, becoming professionally associated with railroad interests. In 1885 he founded the Shakespeare Society of New York, of which until 1910 he was president. His view of the First Folio of 1623 is that the plays as therein printed are not monographs almost solely attributable to Shakespeare, but "growths" embodying "improvements," alterations and expressions by many hands; and the society's publication, the 'Bankside Edition of Shakespeare' (22 vols., 1888-1906), edited by him, contains the earliest players' rendering printed in parallel columns with the First Folio. His writings include 'Macaronic Poetry' (1870); 'The Law of Literature' (1874); 'Legal Maxims' (1877); 'The Shakspearean Myth' (1880); 'Shakespeare in Fact and Criticism' (1884); 'Some Shakspearean Commentators' (1885); 'Digest Shakspeareana' (1887); 'The People and the Railways' (1888); and 'The Society and the Fad' (1890); 'Bankside Restoration Shakespeare' (5 vols., 1905-08).

**MORGAN, John**, American physician: b. Philadelphia, 10 June 1735; d. Philadelphia, 15 Oct. 1789. He was graduated (1751) at the College of Philadelphia (now known as the University of Pennsylvania) and served an apprenticeship in medicine under Dr. John Redman. He entered the provincial army as surgeon and lieutenant, resigning his commission to continue (1760) his medical studies in London and Edinburgh, receiving the degree of M.D. 1763. During a visit to Paris he was made member of the Academy of Surgery for clever anatomical preparation of a kidney. In Italy he was made member of the Society of Belles-Lettres, Rome, and on his return to London was elected Fellow of the Royal Society and licentiate of the Colleges of Physicians of both London and Edinburgh. Returning (1765) to Philadelphia he laid the plan for establishing a medical school in that city, which he had formulated, at the request of the trustees of the College of Philadelphia. The plan

adopted, he was elected professor of the theory and practice of medicine, and, three years later, five young men received medical degrees — the first conferred in America. In 1775 he was appointed by Congress director-general and physician-in-chief to the general hospital of the American army, and reorganized the hospitals of the army. But lack of supplies for the sick and wounded made his energetic efforts largely ineffective and complaints to Washington caused Congress (1777) to dismiss him without reason. A committee of that body, however, after an investigation, honorably acquitted him of blame, while Washington wrote him: "No fault could be found with the economy of the hospitals during your directorship." He wrote 'A Discourse on the Introduction of Medical Schools in America' (1765), and his dissertation 'The Reciprocal Advantages of a Perpetual Union between Great Britain and her American Colonies' (1766) won him a gold medal from England.

**MORGAN, John Hartman**, British publicist and educator: b. 20 March 1876. He was educated at Caterham School, studied at University College of South Wales, Balliol College, Oxford, and University of Berlin. From 1901-03 he was on the literary staff of the *Daily Chronicle*, became editorial writer on the *Manchester Guardian* (1904-05), and London University Extension lecturer as well as at the London School of Economics. He became lecturer in constitutional law at London University College (1907) and was Liberal candidate, in 1910, for Edgbaston (Birmingham), and later in the year for West Edinburgh. Since 1916 he has been staff-captain on the adjutant-general's staff. He has written 'The House of Lords and the Constitution' (1910); 'The New Irish Constitution' (1912); 'The German War Book' (1915); 'German Atrocities: An Official Investigation' (1916). Many articles from his pen have appeared in the leading periodicals.

**MORGAN, John Hunt**, Confederate general: b. Huntsville, Ala., 1 June 1826; d. New Greenville, Tenn., 4 Sept. 1864. His boyhood was spent in Lexington, Ky., where he was later a manufacturer of bagging. He served through the Mexican War as lieutenant of cavalry. At the outbreak of the Civil War he, with 200 men of the local militia, made for the Confederate lines, and he was appointed a captain of volunteers. Soon discovering that he could best serve the Confederacy by adopting guerrilla methods of warfare he began the series of raids which so annoyed the Union commander. Moving with great celerity, and accompanied by his own telegraph operator, he kept himself acquainted with the plans of the enemy while he misled them regarding his own position. As the result, bridges which they expected to cross were burned, much-needed supply trains were captured and railroad tracks were destroyed. In 1862 he was rewarded by appointment as major-general. In 1863 he projected an extended raid through Kentucky, Ohio and Indiana, but was captured and, with many companions, imprisoned in the Ohio Penitentiary. Escaping, he again attempted a raid but, while sleeping at a farmhouse near Greenville, Tenn., he was surrounded by National

troops under Gen. Alvin C. Gillem, and upon attempting to escape was killed. See **MORGAN'S RAID INTO INDIANA AND OHIO**.

**MORGAN, John Livingston Rutgers**, American chemist: b. New Brunswick, N. J., 27 June 1872. He was graduated (1892) at Rutgers College, received Ph.D. diploma at University of Leipzig (1895) and was appointed assistant in chemistry at Stevens Institute (1895-96). He became instructor of quantitative analysis at Brooklyn Polytechnic Institute (1896-97). He served at Columbia University as tutor of chemical physics and chemical philosophy (1897-1901), professor of physical chemistry (1901-05) and as professor since 1905. He has written 'The Principles of Mathematical Chemistry' from Helms' German work (1897); 'The Theory of Solution and its results' (1897); 'Elements of Physical Chemistry' (5th ed., 1914); 'Physical Chemistry for Electrical Engineers' (2d ed., 1909), besides contributing to the chemical periodicals.

**MORGAN, J(ohn) Pierpont**, American financier: b. Hartford, Conn., 17 April 1837; d. Rome, Italy, 31 March 1913. He was the son of J. S. Morgan (q.v.). He was educated at the English High School in Boston and at the University of Göttingen, Germany. He began his business career in the banking house of Duncan, Sherman & Co., New York City; in 1860 he became agent and attorney in the United States for George Peabody & Co. of London; in 1864 junior member of the banking firm of Dabney, Morgan & Co., and later member of the firm of Drexel, Morgan & Co., of which his father was also a partner. By the death of the older members of the firm he became the head of the latter house and the firm name was changed to J. P. Morgan & Co. He also controlled the firm of J. S. Morgan & Co. of London and had partnership interest in Drexel & Co. of Philadelphia. For many years his chief interest lay in railroad negotiations and combinations, and he gradually gained control of the New York Central system, the New York, New Haven and Hartford, the Reading, the Erie, the Lehigh Valley, the Southern, the Northern Pacific, the Big Four and the Chesapeake and Ohio. Shortly after this great railroad consolidation was completed (1901), he succeeded in organizing the "United States Steel Company," uniting the Carnegie Steel Works and other large concerns with a capitalization of \$1,100,000,000, and dominating the steel industry of the United States. In the same year he bought up a large English shipping line with the evident design of organizing a trust for the control of transatlantic shipping, but did not succeed in completing the consolidation. He was the head of both the anthracite and the soft coal trusts, and was several times prominent in the settlement of miners' strikes. In 1895 he organized the syndicate which floated the United States bond issue of \$62,000,000, for the increase of the gold reserve; and in 1901 secured American subscriptions of \$50,000,000 to the British war loan. In 1912 he testified before the Pujo Banking Committee in Washington, appointed by the House of Representatives to investigate the alleged "Money Trust." Probably no other American capitalist was so well known and so thoroughly

trusted in Europe as Mr. Morgan; particularly was this true as regards England, and a large majority of English investments in American securities were made through his house; everywhere he was recognized, not merely as a man of vast wealth, but also as a man of unusual organizing and constructive ability. He gave largely to many charities and institutions, particularly to hospitals, churches and the Trade School in New York, and to Harvard University. He was an enthusiastic yachtsman, was for two years commodore of the New York Yacht Club and built the yacht *Columbia*, which defeated Sir Thomas Lipton's *Shamrock* in the international yacht races. Mr. Morgan was the greatest art collector of his time, his collections being among the most varied and important ever owned by an individual. The historic and romantic aspects of art appealed more strongly to him than the purely æsthetic. He built a beautiful library adjoining his home, wherein he housed a collection of important manuscripts and rare and handsomely-bound books. The Metropolitan Museum of Art in 1913 exhibited most of his collections. Thirteen galleries were needed to house the many rare specimens of Byzantine and Gothic enamels and ivories, bronzes and marbles of the Renaissance, metal work, crystals, Flemish tapestries, a great collection of miniatures and paintings by artists of the first rank. His collection of porcelains, French furniture and objects of decorative art and the paintings of the celebrated Fragonard room were sold by his son in 1915. Mr. Morgan published elaborate catalogs of nearly all of his collections. Consult the catalogs published by the New York Museum of Art (1914), and for much valuable material on Mr. Morgan's career as financier, art collector and philanthropist, consult the New York *Evening Post* of 31 March 1913.

**MORGAN, J(ohn) Pierpont**, American financier, son of John Pierpont Morgan (1837-1913): b. Irvington, N. Y., Sept. 1867. In 1889 he was graduated at Harvard University and soon afterward entered the London branch of J. P. Morgan & Co., bankers, remaining until 1901. He became a member of the firm and upon his father's death in 1913 became its head. He inherited the greater portion of his father's vast wealth including his almost priceless art collections. He also succeeded to the directorate of several corporations in which his firm held large financial interests, including that of the New York, New Haven and Hartford Railroad. He resigned from the latter in 1914 when criticism of the financial management of that road became general. Mr. Morgan is a director of the United States Steel Corporation, of the International Mercantile Marine Company, of the Pullman Company, the Northern Pacific Railway, the First Security Company of the City of New York, the Ætna Insurance Company and the New York and Harlem Railroad Company. When the United States negotiated the purchase of existing canal rights in the Panama Zone Mr. Morgan arranged for the payment of \$40,000,000 in gold to the French Panama Canal Company. After the outbreak of the European War he made a first loan of \$12,000,000 to Russia. In January 1915 the Morgan firm was appointed the

commercial agent of the British government in the United States and thereafter conducted the purchase of all munitions and supplies for the Entente in the United States. In the same year the control of the Equitable Life Assurance Society was sold by Mr. Morgan to T. Coleman Du Pont. On 1 July 1915 at Glen Cove, L. I., Mr. Morgan was shot by a fanatic, but escaped with minor injuries. A loan of \$50,000,000 was made to the French government by the Morgan firm in April and a few months later the firm organized a syndicate of about 2,200 banks in the United States and floated a loan of \$500,000,000 to the Entente Allies. Mr. Morgan is a member of the advisory council of the Federal Reserve Board, member of the New York Exchange, trustee and treasurer of the Church Pension Fund and governor of the Peabody Donation Fund.

**MORGAN, John Tyler**, American lawyer and politician: b. Athens, Tenn., 20 June 1824; d. Washington, D. C., 11 June 1907. He went to Alabama when nine years old, received his education there, was admitted to the bar in 1845 and commenced practice. He rapidly gained a high reputation as a lawyer and speaker; was presidential elector in 1860, voting for Breckenridge, and in 1861 was a delegate to the Alabama convention which declared for secession. He enlisted in the Confederate army as a private in 1861; in 1862 raised a regiment in his State, of which he was made colonel; and in 1863 was commissioned brigadier-general and commanded a division under General Johnston. After the war he resumed the practice of law at Selma, Ala.; was presidential elector on the Democratic ticket in 1876, and sat in the United States Senate from 1877 until his death. He was long recognized as one of the ablest leaders of the Democrats in the Senate, was a member of the Senate Committee on Foreign Relations and for some years its chairman; in his last term he was chairman of the Committee on Inter-oceanic Canals and, favoring in that capacity the Nicaragua Canal route instead of the Panama, was removed from his post in November 1903. He was an earnest and able advocate of recognition of Cuban independence, and won popularity in all parts of the country by his eloquent speeches in behalf of Cuba. In 1892 he was a member of the board of arbitration on the Bering Sea Fisheries, and in 1898 was one of the commission appointed to prepare a system of laws and organize the government for the Hawaiian Islands.

**MORGAN, Junius Spencer**, American financier: b. West Springfield (now Holyoke), Mass., 14 April 1813; d. Monte Carlo, Monaco, 8 April 1890. He entered a dry-goods store when a boy and remained there until he came of age, when he was engaged for 18 months in banking in New York. He returned to the dry-goods business in Hartford, Conn., where he was junior partner in a leading firm and rapidly advanced until he formed a partnership under the name of J. M. Beebe, Morgan & Co., which became one of the largest dry-goods establishments in the United States. In 1854 he became a member of the banking house of George Peabody & Co., in London, which subsequently became J. S. Morgan & Co., and was ranked among the world's greatest banking

houses. He was a generous benefactor of various public and private institutions, among them being Trinity College, Hartford, and the Hartford Orphan Asylum. He established a public library in Hartford and made valuable donations to the Metropolitan Museum of Art, Yale College, etc.

**MORGAN, Lewis Henry**, American archaeologist and anthropologist: b. Aurora, N. Y., 21 Nov. 1818; d. Rochester, N. Y., 17 Dec. 1881. He was graduated at Union College in 1840, practised law at Rochester in 1844-64 and served in the State assembly (1861) and senate (1868-69). His enduring fame rests on his researches in the history and customs of the American Indians. In his labors he received the aid of the Smithsonian Institution and the United States government. He spent much of his time among the tribes and was regularly admitted into the Senecas. His earliest work, 'The League of the Iroquois' (1851; new ed., 1904), was the first scientific account of the organization and government of an Indian tribe; but even more valuable are his 'Systems of Consanguinity and Affinity of the Human Family' (1869) and his treatise on 'Ancient Society' (1877), each based on the same material, the former being a collection of facts, the latter a philosophical treatise. He also published 'The American Beaver' (1868) and 'Houses and House-life of the American Aborigines' (1881). In 1875 he was elected to the National Academy of Sciences and 1879 was president of the American Association for the Advancement of Science. He bequeathed \$80,000 to found a woman's college at the University of Rochester.

**MORGAN, Matthew Somerville**, American artist: b. London, 27 April 1839; d. New York, 2 June 1890. He studied scene painting, but soon abandoned it to become correspondent and illustrator for the *London News*, afterward studying in Paris, Italy and Spain, and in 1858 penetrated the interior of Africa on a sketching tour. Returning to London he became joint editor and proprietor of the *Tomahawk*, and his cartoons, which audaciously attacked the aristocracy and royalty, brought him into disfavor. He assisted in the establishment of the *London Fun*, and in 1870 removed to the United States, where he was engaged with Frank Leslie. He managed several theatres in New York, managed the Strobbridge-Lithograph Company of Cincinnati in 1878-85, and founded in that city the Matt Morgan Pottery Company and the Art Students' League.

**MORGAN, Morris Hickey**, American classical scholar: b. Providence, R. I., 8 Feb. 1859; d. 1910. He was graduated (1881) at Harvard, receiving (1887) the degree Ph.D. He held the chair of classical philosophy at Harvard. He wrote 'De Ignis Eliciendi Modis apud Antiquos' (1890); 'Dictionary to Xenophon's Anabasis' (1892); 'A School Latin Grammar' (1899); 'The Minor Works of Tacitus' (1904); 'The Language of Vitruvius' (1906). Among his published translations are 'Xenophon's Art of Horsemanship' (1893); 'Bibliography of Persius' (1893); 'The Phormio of Terence' (1895); 'Eight Orations of Lysias' (1895). Numerous essays and reviews from his pen have been published in the contemporary philological periodicals.

**MORGAN, Sydney Owenson, Lady**, Irish novelist: b. Dublin, Ireland, about 1783; d. London, 14 April 1859. Her father was an actor on the Dublin stage, of the name of Mac Owen, afterward changed to Owenson. She was a governess for a time. Her first literary effort was a volume of poems (1801), followed by a collection of Irish songs and two novels, 'Saint Clair' and the 'Novice of Saint Dominick' (1804). In 1806 appeared her 'Wild Irish Girl,' a novel which, avowedly nationalist in sympathy and containing good descriptive passages, established her reputation, became immediately popular and secured for her a high position in fashionable and literary life. She had by this time removed from Dublin to London, and in 1812 was married to Sir Charles Morgan, an eminent physician. She also contributed English words to be set to Irish airs. In 1837 she received a civil list pension of £300 a year, the first woman author to be so rewarded. Her style was inflated and gushing; her vanity was inordinate; but she drew many vivid characterizations of Irish character. Among her other works are novels 'O'Donnell'; 'Florence McCarthy'; and 'The O'Briens and The O'Flahertys'; the 'Life and Times of Salvador Rosa'; 'Woman and her Master'; and 'Passages from my Autobiography.' Consult Fitzpatrick, W. J., 'Lady Morgan' (London 1860).

**MORGAN, Tali Esen**, American choral conductor: b. Llangynwyd, Wales, 28 Oct. 1858. He studied music and came (1876) to Scranton, Pa., and was publisher of the *Cambro-American*, Scranton, in 1879, also editing *The People*, the State prohibition organ for six years. He was associated (1887) with Walter Damrosch on musical work and later with Anton Seidl; conducting the Ocean Grove (N. J.) Festivals since 1888, becoming manager and conductor of the Ocean Grove Summer Music Festivals from 1898. He was next conductor of the New York Festival Chorus. He is editor and publisher of *The American Musical Times* and president of the International Correspondence School of Music, Asbury Park, N. J.

**MORGAN, Thomas Hunt**, American zoologist: b. Lexington, Ky., 25 Sept. 1866. He was graduated (1886) at the State College of Kentucky, took the degree Ph.D. (1890) at Johns Hopkins and became professor of biology at Bryn Mawr (1891-1904). In the latter year he was appointed professor of experimental zoology at Columbia University. He was given the degree LL.D. by Johns Hopkins in 1917. He has written 'The Development of the Frog's Egg' (1897); 'Regeneration' (1901); 'Evolution and Adaptation' (1903); 'Experimental Zoology' (1907); 'Heredity and Sex' (1913); 'Critique of the Theory of Evolution' (1916). Many monographs and papers of his have been published on biology and embryology, etc.

**MORGAN, William**, American Freemason, whose death was the immediate cause of the formation of the Anti-Masonic party: b. Culpeper County, Va., about 1775; d. possibly near Niagara in 1826. He fought in the defense of New Orleans in 1815; removed to York, Canada, in 1821, where he became a brewer, and whence soon after he moved to Batavia, N. Y.; and in August 1826 disappeared soon after a

rumor had been spread that he was to reveal in a book the secrets of the Masonic Order. He was supposed to have been abducted by fellow-Masons and drowned in Lake Ontario, but his death was never proved. A corpse found near the mouth of Niagara River was stated to be his, and as such was claimed by his family, but disinterred and believed to be some one else. Much political capital was made of the alleged abduction and drowning and it was averred that Thurlow Weed, a leader in the anti-Masonic movement (see ANTI-MASONRY), cynically said that it was "a good enough Morgan till after election," a remark that has become proverbial for campaign deceit. Morgan's book 'Illustrations of Freemasonry, by One of the Fraternity Who Has Devoted Thirty Years to the Subject' (1826) roused much less excitement than the story of his death. This book under the title 'Free Masonry Exposed and Explained' was reprinted in 1912. Consult Greene, 'The Broken Seal' (1870); Morris, 'History of the Morgan Affair' (1852); O'Reilly, 'American Political Anti-Masonry' (1879).

**MORGAN, Fort.** See FORT GAINES AND FORT MORGAN.

**MORGAN CITY, La.,** city, port of entry, in Saint Mary's Parish, on the Atchafalaya Bayou and on the Southern Pacific Railroad, about 70 miles west by south of New Orleans, and 20 miles from the Gulf of Mexico. The place was formerly known as Brashear City. The Atchafalaya Bayou is navigable for steamers of light draught, and as it connects Grand Lake and the Gulf, Morgan City has steamer connections inland for some distance and with the principal Gulf ports. Considerable sugarcane is cultivated in the country around Morgan City. The chief industrial interests are connected with the cultivation of sugarcane, rice and with market gardening, fish and oysters. It has Oneonta Park in which are botanical gardens and a fine zoological collection. Water and sewage works are municipally owned. On 23 June 1863, a Confederate force of 3,000 soldiers under Richard Taylor captured the Federal garrison of about 1,000 soldiers. The Confederates secured property to amount to \$2,000,000; but they soon abandoned the city, and the Federals again took possession. Pop. 5,477.

**MORGANATIC MARRIAGE,** a marriage between a prince or noble and a woman of inferior rank in cases where a perfect marriage is not legal except with a woman of equal rank. The distinctive feature of the morganatic marriage is that the wife does not acquire the rank of the husband, and the children, legitimate though they are, do not inherit it: in some states they do not inherit either entailed estates or personality. In Great Britain under the Royal Marriages Act (1772) such a marriage is invalid in public law. A morganatic marriage and a regular marriage cannot exist at the same time, so that the Church regards the morganatic marriage as a perfect one. The custom originated in ancient German law, is prevalent among the princes and high nobility of that country and is also in force among the royal families of Europe.

**MORGANFIELD, Ky.,** city, county-seat of Union County, on the Illinois Central Railroad,

about 30 miles southwest of Evansville, Ind. It is in an agricultural region, in which tobacco is an important product. The principal industrial establishments are tobacco factories, flour-mills, carriage factories, brick yards and lumber-mills. It is the seat of Saint Vincent's Academy (R. C.). The city owns and operates the waterworks. Pop. 2,000.

**MORGAN'S RAID INTO INDIANA AND OHIO.** In the middle of June 1863 General Bragg ordered Gen. John H. Morgan, with 2,000 picked mounted infantry and four guns to move from Tennessee into Kentucky, break up the railroad upon which General Rosecrans depended for supplies, capture Louisville, destroy the public works and return to Tennessee as quickly as possible. Morgan determined to exceed his orders and make a raid north of the Ohio. On 2 July, with 2,460 men and four guns, he set out from Burkesville, crossed the Kentucky River in the face of Union troops guarding it, and marched northward, followed by all the Union detachments within immediate call. He passed through Columbia, after a sharp skirmish with about 300 Wolford's Kentucky cavalry, in which he lost about 40 in killed and wounded, and on the 4th reached Green River at Tebb's Bend, and demanded the surrender of Col. O. H. Moore, who, with about 300 men of the 25th Michigan, was guarding the bridge at that point. Moore replied that the Fourth of July was not a good day to surrender, and was instantly attacked with artillery and musketry. After a hard fight of three hours, in which Moore had six killed and 23 wounded, Morgan was repulsed, with a loss of 36 killed and 46 wounded, and drew off, crossing the river below the bridge. On the 5th he defeated and captured the small garrison of Lebanon and marched by Bardstown to Brandenburg, on the Ohio, where he arrived on the morning of the 8th, and seizing two steamboats began crossing his command. His passage was disputed by a gunboat and by militia with a field-piece on the Indiana shore, but by the morning of the 9th his whole command was in Indiana. Twenty-four hours later General Hobson, with 2,500 cavalry and mounted infantry and four guns, crossed the river in pursuit, and for 17 days hung upon Morgan's heels. Indiana and Ohio were aroused and turned out their militia by thousands. After crossing the Ohio, Morgan rode north through Corydon, where he was resisted by militia, who were soon overpowered. He then pushed on to Salem, where he captured nearly 400 militia, then through Lexington and Paris to Vernon, near which place on the evening of the 11th he encountered a stiff resistance from about 1,200 militia under Colonel Love. Under cover of darkness he withdrew from Love's front, and pressing on through Dupont and Sumansville, crossed the Indiana line on the 13th to Harrison, Ohio, and concentrated his command preparatory to making his way across the Ohio into Kentucky, detaching parties to burn bridges and confuse the pursuit, and impressing fresh horses. Under cover of a feint on Hamilton he marched by night a few miles north of Cincinnati, moving directly east, closely pursued next day by Hobson, who was marching 40 miles a day, and threatened from all directions by the militia. Turning toward Berlin,

where the government had a large number of animals, he was confronted by a small body of militia under Colonel Runkle, lost much precious time in threatening an attack, drew off closely followed by Runkle, and after dark of the 18th reached the banks of the Ohio, a short distance above Pomeroy, near Buffington Bar and Blennerhasset's Island, where from the first he had planned to escape. His pursuers were closing in on him from every direction. On the west Hobson was hanging on his rear; General Judah, who had been withdrawn from Kentucky, had landed his division at Portsmouth, and was marching up from the southwest; regiments were coming down the river from Parkersburg; and gunboats patrolled the river and watched the fords. Early in the morning of the 19th Morgan endeavored to cross the river, but was speedily checked. He was attacked in rear by the head of Hobson's column, Judah's cavalry struck him in flank and two gunboats opened upon his front. A severe engagement cost him about 120 killed and wounded, and more than 700 of his officers and men surrendered. Morgan with the remainder escaped up the river, where he attempted to cross to Belleville by swimming his horses. Three hundred men, under Colonel Johnson, had crossed when a gunboat stopped the remainder of the column, Morgan himself returning to the Ohio shore and with about 800 men retreating inland. He had lost all his artillery and trains. He pressed on northeast through Athens and Washington, marching 35 miles a day, burning bridges behind him, with General Shackelford and 500 men close upon his rear and skirmishing with it. Near Salineville on the 26th Shackelford's advance captured 250 men, and later in the day he was intercepted near New Lisbon and Beaver Creek, and surrendered with 364 officers and men. The Union loss in the campaign July 2-26 was 19 killed, 47 wounded and 8 missing. Consult 'Official Records' (Vol. XXIII); Duke, 'History of Morgan's Cavalry'; Senour, 'Morgan and His Captors'; The Century Company's 'Battles and Leaders of the Civil War' (Vols. III and IV).

E. A. CARMAN.

**MORGANTE MAGGIORE.** The 'Morgante Maggiore' of Luigi Pulci (1432-84), begun in 1460 and completed in 1483, is the first of the great Italian humoresque poems dealing with the material of the Old French epic, with the adventures and adventurers of the court of Charlemagne, with chivalry and deeds of valor, with Saracens, witches and magic, with all that distinguishes men from cowards and loyalty from treachery in a world of strong arms and generous appetites, good humor and simple passions. It is a reworking of an earlier popular poem called the 'Orlando,' with a few elements borrowed from another poem of the same cycle called the 'Spagna.' Pulci thus obtained the traditional schematic plot of the Italian chivalric tale: the struggle between the house of Clermont and the treacherous descendants of Ganelon, resulting in the slander of Orlando, his flight to the Orient, his adventurous battles with the Saracens, his return to Paris to raise the inevitable siege by the Saracens, his reconciliation with Charlemagne and ultimate vengeance on

his enemies at court. Pulci is more faithful to the spirit and the substance of the Carolingian tale than either of his great successors, Boiardo or Ariosto, who utilized the more fantastic and sentimental legends of the Round Table to such an extent as wholly to transform the character of chivalric romance. The earnestness of the popular legend passed over directly into the 'Morgante,' to constitute the solid base for its pervasive humorism, on which the author then erects an original comic structure of his own, with not a few deliberately satiric elements. Neither Petrarchism nor classical models were strong enough in their influence on Pulci to alter or to vitiate this humorous attitude toward his subject. The reader willingly remembers three salient figures from the 'Morgante Maggiore': that of the giant Morgante himself, whose size and corresponding appetite for food have a jolly time getting along in this world made for smaller people; that of the half-giant Margutte, liar, thief, glutton, blasphemer, and all-around rascal of perennial good-nature, the most popular personage in the rambling story; and finally that of the devil Astaroth, who treats learnedly on orthodox theology, and among whose many feats of magic the most famous and startling remains his discovery of a new Western world some years before the voyage of Columbus. Save in its best episodes, the 'Morgante' is no longer much read. Popular in its own day, it helped to fix the direction of the efforts of Boiardo and especially of Ariosto, who used the chivalric legends as vehicles for an art more personal and powerful than that of Pulci. There is an English translation by Roscoe.

ARTHUR LIVINGSTON.

**MORGANTOWN, N. C.,** town, county-seat of Burke County, on the Southern Railroad, about 80 miles west of Salisbury. In the vicinity are gold and silver deposits. It has lumber and cotton-mills, flour-mills, machine-shops and tanneries. It is the seat of the North Carolina School for the Deaf and Dumb and of the State Hospital for the Insane. It is a favorite health resort for people threatened with pulmonary diseases. Pop. 3,000.

**MORGANTOWN, W. Va.,** city, county-seat of Monongalia County, near the northern boundary of the State, on the Monongahela River which is navigable throughout the year, and on the Baltimore and Ohio, the Monongahela River Railroad and the Morgantown and Kingwood Railroad, 100 miles south of Pittsburgh. Electric trolley lines with a city loop system reach all suburbs, in a region noted for extensive coal and oil fields, glass-sand deposits and limestone quarries, with abundant water power used for electrical manufacturing purposes. Chief of the manufacturing industries is the Sabraton plant of the American Sheet and Tin Plate Company established in 1908, employing 900 people with a payroll of over \$1,000,000 a year; 12 glassworks employ 2,500 hands with an annual payroll of \$2,040,000; and there are important brickworks, while coal is obtained from 40 mines; all producing a large export and local trade. Besides eight flourishing building and loan associations, Morgantown has six banks with an aggregate capital and surplus beyond \$1,350,000 and de-

posits of upward of \$4,500,000. The city has gas and electric-light and power plants. Morgantown's greatest industry is the West Virginia State University founded in 1868; its staff is about 200 people, its annual enrolment of regular students reaches 1,200, and of summer students in the agricultural schools 1,400. The library contains over 44,000 volumes. The university, in addition to the Morrell and Hatch funds appropriated by Congress, received from the State for 1919-20 appropriations of \$1,250,000. Six commodious elementary and secondary schools and a high school furnish a perfect educational system. The leading religious denominations are represented by fine churches, including three for the colored population. Cheat River nearby is a summer resort of much scenic beauty and residential suburbs include Westover, Sabraton, Star City, Riverside and Granville. The first settlement was made in 1766 by Nicholas Decker, soon followed by the Morgan family, from whom it takes its name. Morgantown was incorporated in 1838 and received a city charter in 1901. Pop. (1918 est.) 16,000; with suburbs 22,000.

**MORGARTEN**, mör-gär'ten, Switzerland, a hill two miles west of Rothenthurm, on the margin of the lake of Egeri, on the confines of the canton of Zug, memorable as the scene of the battle of 15 Nov. 1315, in which a small body of Swiss mountaineers from Schwytz, Uri and Unterwalden, ill armed and undisciplined, totally vanquished an Austrian army of 20,000 under the Archduke Leopold, sent by Frederick the Fair to avenge the seizure of the abbey of Einsiedeln the previous year. This was the first victory achieved by the Swiss in their struggle for freedom.

**MORGENSTERN**, mör'gën-stërn, Lina (Bauer), German writer and reformer: b. Breslau, 25 Nov. 1830; d. 1909. She did much social work in Berlin after her marriage (1854) to Dr. Theodor Morgenstern. She was leader of the woman's Verein (1860-66) in their furthering the cause of the Froebel Kindergärten, and (1866) she founded the Verein Berliner Volksküchen (public kitchens). In 1868 she started the Kinderschützverein, for the protection of children; in 1869 she founded an institute for the training of young women in the useful arts; in 1873 the Berlin Hausfrauenverein (housewives' league) for protection against extortionate prices and adulteration; it existed till 1883. In 1880 she established a woman's society for the rescue of immoral girls, placing them in schools to teach housework and farming. She wrote 'Das Paradies der Kindheit' (Berlin 1865; 6th ed., Regensburg 1904); 'Die Volksküchen' (4th ed., Berlin 1882); 'Der Beruf des Weibes' (1869); 'Die Frauen des 19 Jahrhunderts' (1888-91); 'Hilfsbuch zur Gründung, Leitung und Kontrolle von Volksküchen' (3d ed., 1900), besides several works on the systems of economical cooking. Since 1874 she published *Deutsche Hausfrauen Zeitung* and from 1888-94 a monthly publication entitled *Für junge Mädchen*.

**MORGENTHAU**, mör'gën-thou, Henry, American lawyer, merchant and ambassador: b. Mannheim, Germany, 26 April 1856. He came (1865) to the United States and was educated at the New York public schools, studied at the

College of the City of New York and was graduated at Columbia Law School, receiving the degree of LL.B. He became partner in the law firm of Lachman, Morgenthau and Goldsmith, New York (1879-99), was president of the Central Realty Bond and Trust Company (1899-1905), and of Henry Morgenthau Company (1905-13), dealers in realty. He was a director in the Underwood Typewriter Company, American Metal Company, and Equitable Life Assurance Society, and president of the Herald Square Realty Company. As a Democrat he has taken a very active place in his party and was chairman of finance committee of the Democratic National Committee 1912, 1916-20. He was Ambassador to Turkey (1913-16) and at the outbreak of war took charge of the interests in Turkey of Great Britain, France, Italy, Russia, Belgium, Montenegro, Serbia, etc., rendering invaluable assistance to these nations. He is president of the Free Synagogue, Bronx House (Settlement), and director of Mount Sinai Hospital.

**MORGHEN**, Raffaello, räf-fä-ël'lö mör-gën, Italian engraver: b. Florence, 19 June 1758; d. there, 8 April 1833. He received his early instruction in his art from his father, Filippo, and his uncle, Giovanni Elia, and was afterward placed as a pupil under the celebrated Volpato, whom he assisted in engraving the pictures of Raphael in the Vatican. The print which represents the miracle of Bolsena is inscribed with his name. He settled in Florence about 1793 as professor of copper-plate engraving in the Academy of Art. Here the grand-duke employed him to engrave Leonardo da Vinci's 'Last Supper,' which is painted on the wall of the refectory in the Dominican convent at Milan. This picture is faded and effaced, and the drawing which was made from it for Morghen was by no means worthy of the original; so that, though the engraver has given to the world an admirable print, he has failed in giving a correct idea of the work of Leonardo. In 1803 he was chosen an associate of the French Institute; and in 1812 was invited to Paris by Napoleon, who treated him with flattering kindness. Among the most remarkable of the other numerous works of Morghen may be noticed the 'Transfiguration' from Raphael; a 'Magdalen' from Murillo; a 'Head of the Savior' from Da Vinci; the 'Car of Aurora' from Guido; the 'Hours' from Poussin; the 'Prize of Diana' from Domenichino; the 'Monument of Clement XIII' from Canova; 'Theseus vanquishing the Minotaur'; portraits of Dante, Petrarch, Ariosto, Tasso, etc.

**MORGIANA**, mör-gi-ä'na, a female slave figuring in 'Ali Baba and the Forty Thieves,' a story in the 'Arabian Nights Entertainment' (q.v.).

**MORGUE**, mörg (Old French, to look at solemnly), a place or building in large cities where the bodies of unknown persons who have perished by accident, murder or suicide are exposed, that they may be recognized by their friends. If not claimed within a certain period they are either buried or given over to medical institutions for dissection purposes. The name arose from the building in Paris, dating from the 5th century, devoted to this purpose.

**MORI, Arinori**, mō'rē ā-rē-nō'rē, Japanese statesman: b. Satsuma, 1848; d. 11 Feb. 1889. He was educated in England; as chargé-d'affaires in Washington arranged the postal convention between Japan and the United States; served as plenipotentiary in Peking and in London; and was Minister of Education from 1885 to his death. He was an extremely cultured man, with progressive educational ideas. On the day of the proclamation of the Japanese Constitution he was assassinated by a Shinto fanatic for violating a shrine at Ise by lifting the curtain with his walking stick.

**MORIAH**, mō-rī'ā, Palestine, the hill on which the temple of Jerusalem was built (2 Chron. iii, 1), and by many authorities believed to be the mount on which Abraham was commanded to sacrifice his son Isaac (Gen. xxii, 2).

**MORICE, Adrian Gabriel**, Canadian clergyman, ethnologist and author: b. Saint Mars-sur-Colmont, Mayenne, France, 27 Aug. 1859. He was educated at Oisseau, Sion and Autun, France, joined the Oblate Order in 1877 and three years later was sent to British Columbia. In 1882 he was ordained to the priesthood, and for the following three years labored as missionary to the Chilcotin Indians at William's Lake. From 1882 to 1906 he was stationed at Stuart's Lake, B. C., was then transferred successively to Kamloops 1906, Saint Boniface 1908, Winnipeg 1909, Duck Lake, Sask., 1910, and Winnipeg 1911. Since 1911 he has been lecturer in anthropology at the University of Saskatchewan. During his missionary career he mastered a number of Indian languages and compiled dictionaries and grammars of Chilcotin, Sekanais and Nahanais. He invented the Déné Syllabary and printed books in that language. He made maps during his wanderings up and down British Columbia. For one of these the Geographical Society of Paris awarded him a silver medal and another map was published by the provincial government. He is a member of the American Anthropological Association, the Historical Society of Saint Boniface, the Ethnological Committee of the British Association for the Advancement of Science, corresponding member of the Canadian Institute, the Geographical Society of Quebec and of many others in Canada and abroad. He is the author of 'Au pays de l'ours noir' (1897); 'History of the Northern Interior of British Columbia' (1904 et seq.); 'Aux sources de l'histoire manitobaine' (1907); 'Dictionnaire historique des Canadiens et des Métis français de l'Ouest' (1908); 'History of the Catholic Church in Western Canada' (2 vols., 1910). He collaborated in 'Encyclopædia of Religion and Ethics' and in 'The Catholic Encyclopedia.'

**MORICHI**, a palm. See MURICHI.

**MORIER, mō'ri-ēr, James Justinian**, English diplomatist, traveler and novelist: b. Smyrna, about 1780; d. Brighton, March 1849. He was educated at Harrow, England, and entered (1807) the Persian diplomatic service and returned (1809) to England via Turkey, making a journey that became celebrated and a description of which he published under the title of 'A Journey through Persia, Armenia and Asia Minor to Constantinople in the

years 1808 and 1809' (1812). Returning (1810) to Teheran as secretary of legation he made his journey (1815) back to Europe through Asia Minor and published another book entitled 'A Second Journey through Persia' (1818). After a trip to Mexico he settled in England and devoted himself to a literary life. Among his works are the Oriental novels 'Hajji Baba of Ispahan' (1824; new ed., 1914), perhaps his best work; 'The Mirza' (1842); 'Zohrab the Hostage' (1832); 'Ayesha, the Maid of Kars' (1834).

**MORIER, Sir Robert Burnett David**, English diplomatist: b. Paris, 1826; d. Montreux, 16 Nov. 1893. He was graduated (1849) at Balliol College, Oxford, entered (1851) the diplomatic service and served as attaché at the embassies of Vienna and Berlin. In 1865 he was appointed secretary of the embassy at Athens, then at Frankfort, becoming (1871) chargé-d'affaires at Stuttgart, and (1872) at Munich. In 1876 he was made English Minister at Lisbon, and at Madrid 1881-84, was appointed Ambassador at Saint Petersburg, 1884-93. In 1888 he was in a bitter conflict with Count Herbert Bismarck, who accused him of furnishing Marshal Bazaine with information as to the German advance over the Moselle at the outbreak of the Franco-Prussian War. Later it was proven that spies of the French government had obtained the information from other sources and that Bismarck's dislike was really caused through his knowledge of the diplomat's brilliant work. He was created K.C.B. (1882), privy councillor (1885), G.C.B. (1887), D.C.L. Oxford (1889).

**MÖRIKE, mé'ri-kē, Eduard**, German lyric poet and short-story writer: b. Ludwigsburg, Württemberg, 8 Sept. 1804; d. Stuttgart, 4 June 1875. His father was Kreis Medical Councillor Karl Friedrich Mörike, d. 1817; his mother Charlotte, née Bayer. He attended the Latin school at Ludwigsburg, the seminary at Urach (1818), where he made the acquaintance of Wilhelm Hartlaub and Wilhelm Waiblinger; and the divinity school at Tübingen where he came into contact with Ludwig Bauer, David Friedrich Strauss and F. T. Vischer. After completing his studies at these theological institutions, he spent the greater part of his life as a country pastor in various parts of Württemberg. His longest incumbency was at Cleversulzbach (1834-43), where he associated with Justinus Kerner, Hermann Kurz, Uhland and Karl Mayer. From 1851 to 1866 he taught literature at the Stuttgart Katharinenstift, receiving the title of professor in 1856. His first literary work was the short novel of artist life, 'Maler Nolten,' which passed through many revisions and was printed in its final form after his death (1877). His shorter stories are more finished artistically, especially 'Mozart auf der Reise nach Prag' (Stuttgart 1856). As a lyricist, no other Suabian poet attains his simple yet perfect form. His observations of life and of nature are realistic, and his depth of feeling sometimes approaches Goethe's. Some of his poems have even become favorites among the people, especially the ballad 'Schön Rotraut,' opening with the line: 'Wie heisst König Ringangs Töchterlein?'  
JACOB WITTMER HARTMANN.

**MORILLO**, mō-rēl'yō, Pablo, Spanish general: b. Fuente de Malva, Spain, 1777; d. Madrid, Spain, 27 July 1838. He enlisted in the navy in 1797 and was engaged at Trafalgar in 1805; but when the French invaded Spain he left the navy to enter the army and rose to the rank of major-general in 1814. In 1815 he was sent to South America to subdue the revolution in Venezuela and Colombia, and after varying fortunes, during which he made for himself a name as a cruel and tyrannous general, perceiving defeat to be inevitable, he asked to be relieved but was compelled to sign a truce with the victorious Bolívar before sailing for Spain. He was appointed to command the garrison at Madrid, and in 1822 became captain-general of Galicia, which he surrendered to the French. He retired in disgrace to Rochefort, France, but returned to Spain in 1832 and led an army against the Carlists. During his exile in France he published his 'Mémoires' (1826).

**MORIN**, mō-rān, Arthur Jules, French mathematician and engineer: b. Paris, 19 Oct. 1795; d. there, 7 Dec. 1880. He was educated at the École Polytechnique in Paris and at the École d'Application at Metz, and was for a time professor of mechanics in the latter institution. In 1819 he became lieutenant in a battalion of engineers and later accepted a professorship at the Conservatoire des Arts et Métiers in Paris of which he became director in 1847. He held the rank of general in the army and was a member of various military boards, and his researches and inventions were of great scientific value. He published 'Aide-mémoire de mécanique pratique' (1838); 'Salubrité des habitations' (1868), etc.

**MORIOKA**, mō-rē-ō'kā, Japan, a town in the island of Honshū, 40 miles from the coast, and 339 miles by rail with Tokio. It is the capital of the prefecture of Iwate, in the northerly province of Rikuchū, has manufactures of silk, copper and other ware, and is celebrated for its fine fruits and vegetables (many of these of American origin) and preserves. Mount Iwate (6,800 feet) is in the vicinity. Pop. 36,012.

**MORISCOS**, mō-rē'skōs, Spanish term applied to those Moors who accepted Christianity. After the fall of Granada (1492) many of the Moors returned to Africa. But most remained in Spain, permitted under pretense of conversion to Christianity and lived, under the name of Moriscos, as industrious, peaceful inhabitants, till they were driven to revolt by the cruel persecutions under Philip II (1568-70) and over 100,000 of them were exiled; the few remaining being now found in the mountains of Granada after Philip III (1609) deported another 500,000. Consult Rochau, 'Die Moriscos in Spanien' (Leipzig 1853); Boronaty y Barrachina, 'Los moriscos españoles y su expulsión' (Valencia 1901); Lea, 'The Moriscos of Spain' (Philadelphia 1901).

**MORISON**, George Shattuck, American civil engineer: b. Bedford, Mass., 19 Dec. 1842; d. New York, 1 July 1903. He was graduated from Harvard in 1863, and was admitted to the bar of New York in 1865. In 1867-73 he was engaged in engineering in Kansas, Michigan and Indiana, and then returned to New York,

which he thereafter made his headquarters. He was an expert on railroad conditions and became famous as a bridge builder; constructing five bridges across the Missouri and 10 over the Mississippi, the greatest of these being the bridge at Memphis, Tenn., which has a single truss span of 790 feet. He was a member of the Isthmus Canal Commission (1898).

**MORISON**, James Augustus Cotter, English biographer and essayist: b. London, 1832; d. 26 Feb. 1888. He was graduated at Oxford in 1859, was a Positivist in philosophy, was one of the most brilliant contributors to the *Saturday Review* and one of the founders of the *Fortnightly Review*. He wrote 'Life and Times of Saint Bernard' (3d ed., 1877); brief biographies of Gibbon, Macaulay and Madame de Maintenon; 'The Service of Man: An Essay toward the Religion of the Future' (2d ed., 1887), which he regarded as his best work. His knowledge of French literature and history was profound.

**MORISON**, Robert, Scottish botanist: b. Aberdeen, Scotland, 1620; d. London, 10 Nov. 1683. He was graduated from the University of Aberdeen in 1638 but having borne arms as a Royalist in the Civil War, was obliged to take refuge in France when the cause of Parliament triumphed, and took the degree of doctor at Angers in 1648. From 1650 to 1660 he was superintendent of the garden formed at Blois by Gaston, Duke of Orleans. After the Restoration he was appointed by Charles II one of his physicians and botanist royal, and in 1669 became professor of botany at Oxford. His strong point as a botanist was in classification. His chief work is 'Oxford University History of Plants' (1680). Consult Pulteney, 'Sketches of the Progress of Botany' (1790); Sachs, 'History of Botany' (1906); Tournefort, 'Éléments de Botanique' (1797).

**MORISONIANS**. See EVANGELICAL UNION.

**MORISOT**, mō'rē-sō, Berthe (MADAME EUGÈNE MANET), French painter: b. 1840; d. 1895. As great-granddaughter of Fragonard she inherited from this great French painter his gracefulness, his spirited elegance and other fascinating qualities. Her natural talents she placed under the influence of Corot, Renoir, Degas and Manet. Having married Eugène Manet, brother of the great painter, she exhibited with the "Impressionists," but always signed her pictures Berthe Morisot, delicately respecting Manet's great name. She acquired her own reputation by distinguished and beautiful coloring and dash. She was as much admired for her beauty as for her talent. A French critic sums up her qualities as follows: "All her work is bathed in brightness, in azure, in sunlight; it is a woman's work, but it has a strength, a freedom of touch and an originality, which one would hardly have expected. Her water-colors, particularly, belong to a superior art: some notes of color suffice to indicate sky, sea or a forest background and everything shows a sure and masterly fancy, for which our time can furnish no analogy. A series of Berthe Morisot's pictures looks like a veritable bouquet, whose brilliancy is less due to the color-schemes which are comparatively soft (gray and blue) than to the absolute correctness of the values. A hundred canvases

and perhaps 300 water-colors attest this talent of high mark. Normandy coasts, scenes with pearly skies and turquoise horizons, radiant gardens of Nice, fruit-laden orchards, girls in white dresses, with big hats wreathed in flowers, young women in ball-dresses and flowers are the favorite themes of this artist."

**MORITZ**, mö'r'its, **Karl Philipp**, German author: b. Hameln, 15 Sept. 1756; d. Berlin, 26 July 1793. He was born of poor parents and became one of the most extraordinary figures in the Sturm und Drang (Storm and Stress) period. After distressful attempts to gain a living he caught the attention of a patron in Hanover and entered the gymnasium to reach quick promotion, but soon accepted an engagement as actor under Ekhof at Gotha, failing in which he returned to study (1776) at Erfurt; but tiring again he joined the Herrnhuter (Moravians) at Barby, and studied theology at Wittenberg (1777); then taught philanthropy at the Potsdam military orphanage, soon again to take to wandering. Teaching in Berlin, he made a reputation as writer, preacher and poet, and went to England; then became professor at the Kölnisches Gymnasium; next tried editing the *Vossische Zeitung* to make it proletarian, but failed. Later, he traveled to Italy (1786) where he met Goethe, who made a favorable influence on his mind, and on his return to Germany he took up residence as Goethe's guest at Weimar. Duke Karl August aided him to a membership in the Berlin Academy of Sciences and he became (1789) professor of antiquities at the Berlin Academy of Art. He wrote much of his life's vicissitudes into his works, notably, 'Anton Reiser' (Berlin 1785-90), an autobiographical novel; 'Andreas Hartkopf' (ib. 1786), also contains other elements from his life. Other important works are 'Versuch einer deutschen Prosodie' (Berlin 1786; later ed., 1815); 'Ueber die bildende Nachahmung des Schönen' (Brunswick 1788; Heilbronn 1888) 'Götterlehre' (Berlin 1791 10th ed., 1851); 'Reisen eines Deutschen in England' (ib. 1783); 'Reisen eines Deutschen in Italien' (ib. 1792-93). Consult Dessoir, 'Karl Philipp Moritz als Aesthetiker' (Berlin 1889); Eibisch, Hugo, 'Anton Reisers kritische Autobiographie' (Leipzig 1909).

**MORLAIX**, môr-lâ, France, capital of an arrondissement in the department of Finistère, picturesquely situated on two hills on the river Dossen, rendered navigable to the town. It is the junction of the West Railway and has two churches dating from the 15th and the 16th centuries, besides ancient wooden houses, a commercial court of justice, chambers of commerce and of agriculture, a college, theatre, museum, hydrographic school, etc. Its industries consist of a tobacco factory, hardware, leather and candle factories, besides import trade in coffee, lumber, stearic acid, fertilizers, wine, brandy, petroleum. It has also an export trade in butter, grain, cattle, eggs, vegetables, fish, etc. In 1911 its population was 15,262. It is the birthplace of the generals Moreau and Souvestres.

**MORLAND**, môr'land, **George**, English painter: b. London, 26 June 1763; d. there, 29 Oct. 1804. His father, himself a painter, gave

the boy a severe early training in art, and his proficiency was such that his productions found ready purchasers, while at 10 he exhibited in the Royal Academy and became famous as a copyist of Dutch interiors. Soon after he rebelled against the strict discipline of his father's house, and entered upon a career of dissipation, in the company of stable-boys, money lenders, pimps and pugilists, supporting himself, meanwhile, by the pictures which he painted with amazing facility. So great was his productivity, that he was able to paint one or two pictures daily, and on one occasion completed a large landscape containing six figures, in six hours. The demand for his work was so great that dealers would take them before the oils had dried. In 1786 he took up his residence at Kensal Green, where he changed his mode of life and married the sister of James Ward, the animal painter, and William Ward, the engraver. Here he worked hard, and the moral subjects, after the manner of Hogarth, which he favored at this period, were engraved and became very popular. Soon again, however, he drifted back into his old habits, and, as his pictures were eagerly sought by the dealers, he was able for some time to carry on his reckless career. He had to make many changes of residence to avoid his creditors; and at length, in 1799, he was arrested for debt, but "obtained the rules of the Bench," took a house within the bounds and continued to practise his art up to his release in 1802. In his later days he suffered from a palsied hand. Under arrest for debt, he died in a sponging-house. His epitaph for himself was, "Here lies a drunken dog." The art of Morland is characterized by a picturesque representation of rural life in its homelier aspects, his rustic story being always happily conceived and skilfully told. He is one of the first genre and animal painters of the English school, and his reputation has increased of recent years. He painted about 4,000 pictures, 192 of which were engraved during his lifetime. Six of his best paintings are in the Kensington Museum, and the 'Farmhouse Stable' in the National Gallery is sometimes considered his masterpiece. The New York Historical Society possesses his 'Old English Sportsman' and 'Dogs Fighting'; the Metropolitan Museum the 'Mid-day Meal' and 'Weary Wayfarers' and the Corcoran Gallery, Washington, 'The Farmhouse.' Consult Collins, W., 'Memoirs for Picture' (1803); and memoirs or biographies by Dawe (1807); Gilbert and Cuming (1907); Richardson, Ralph (1895); Williamson, G. C. (1904) and Wilson, D. H. (1907).

**MORLAND**, Sir **Samuel**, English inventor and diplomat: b. Sulhampstead-Bannister, Berks, 1625; d. Hammersmith, 30 Dec. 1695. He studied at Winchester School and at Magdalen College, Cambridge; was a tutor at Cambridge in Pepys' day; and about 1650 devoted himself to diplomacy. Cromwell sent him to Sweden in 1653; and in 1655 to the Duke of Savoy, to protest against the persecution of the Waldensians, in whose history he became deeply but none too intelligently interested, his 'History of the Evangelical Churches of the Valley of Piedmont' (1658), relying as it did to some extent on documents that were forgeries, being absolutely misinformed and unreliable. He was

close in the secrets of Cromwell, and upon learning of Sir Richard Willis' plot against Charles revealed it to that prince. He then became privy to Charles' schemes, and was rewarded after the Restoration with a baronetcy. He then withdrew from public life, devoted himself to mechanical experiments, was one of the first to demonstrate the utility of steam power for propulsive purposes, improved the fire-pump or fire-engine, the lineal predecessor of the steam-engine, and invented a speaking trumpet. He wrote on cryptography, mathematics and mechanics.

**MORLEY**, mór'li, Edward Williams, American chemist: b. Newark, N. J., 1838. He was graduated from Williams College, Williamstown, Mass., in 1869. He was elected to the chair of chemistry in Western Reserve College, Hudson, Ohio (later Adelbert College, Cleveland), in 1869 and became professor emeritus in 1906. He was also professor of chemistry at Cleveland Medical College in 1873-88 and he has been connected with various scientific societies. He retired in 1906 and removed to West Hartford, Conn. He is the inventor of an improved apparatus for gas analysis and has published 'Atomic Weight of Oxygen' (1895). Some of his scientific papers relate to atomic weight of oxygen; densities of oxygen and of hydrogen; variations in the amount of oxygen in the air; vapor density of mercury from 0° to 100°; analyses of igneous rocks.

**MORLEY**, Frank, American mathematician: b. Woodbridge, England, 9 Sept. 1860. He studied at Kings College, Cambridge, obtaining (1898) the degree of Sc.D. He was master of Bath College, England (1884-87), becoming (1887-88) instructor, then (1888-1900) professor of pure mathematics at Haverford College, Pennsylvania. He has been, since 1900, professor of mathematics at Johns Hopkins. He was editor of the *American Journal of Mathematics*, and wrote 'Introduction to the Theory of Analytic Functions' (1898). In collaboration with Prof. James Harkness, he wrote 'Elementary Treatise on the Theory of Functions' (1893).

**MORLEY**, Henry, English author: b. Hatton Garden, London, 15 Sept. 1822; d. Carisbrooke, Isle of Wight, 14 May 1894. Educated at King's College (London), he practised medicine in Somerset and Shropshire; taught at Manchester and Liverpool; was editorially connected with Dickens' periodicals, *Household Words* and *All the Year Round*; was for a time editor-in-chief of the *Examiner*; and in 1865 was appointed professor of English literature in University College, London. In 1878 he received a similar chair at Queen's College, London; and in 1882-90 was principal of University Hall, London. As a popular lecturer on literature he was much in demand. He edited 'Morley's Universal Library' (1883-88); 'Cassell's National Library' (1886-90); and the 'Carisbrooke Library' (1889-91); published biographies of Palissy (1852), Jerome Cardan (1854) and 'Cornelius Agrippa' (1856); and wrote 'English Writers' (1887 et seq.); a smaller work on the same subject, 'First Sketch of English Literature' (1873), a much-used manual and 'Early Papers and Some Memoirs'

(1891). He was an enthusiast in the popularising of good literature. Consult the 'Life' by Solly (1898).

**MORLEY OF BLACKBURN**, Viscount (JOHN MORLEY), English author and statesman: b. Blackburn, Lancashire, 24 Dec. 1838. His father, a surgeon of good professional repute, was a Yorkshireman, and his mother a Northumbrian. He was straitly reared: "the rigors of Sabbatical observance forced on us a literary diet that neither enlightened the head nor melted heart and temper." His early education was obtained at an Independent school in his native town, from which he went to University College School, London, where Joseph Chamberlain had preceded him, and then to Cheltenham College; there he won a scholarship at Lincoln College, Oxford, where he lodged in the rooms at one time occupied by John Wesley, the founder of Methodism. It had been intended that in due course he should take orders in the Church of England; but his life at Oxford had shaken his foundations. Although never formally a Positivist, he was profoundly influenced by the teachings of Comte; and in political economy he became a disciple of John Stuart Mill, and imbibed the "pure milk of the Millite ward" from the master himself. After graduation (1869) he embarked on a journalistic career, and in 1873 he was called to the bar of Lincoln's Inn, of which he was elected a bencher in 1891. He was on the staff of the *Saturday Review* and afterward edited the *Literary Review* (later the *Parthenon*). He succeeded George Henry Lewes as editor of the *Fortnightly Review* in 1867, and during his reign, which terminated in 1882, the magazine became noted, not only for its high literary standards, but for the diffusion of radical ideas in things temporal, and in things spiritual for its pronouncedly aggressive agnosticism. His contributors included the most illustrious names in the letters and controversies of the time. Morley also became reader for the publishing house of MacMillan, and edited the 'English Man of Letters' series. In 1880 he became editor of the *Pall Mall Gazette*; and in that capacity began his long association with the Irish Home Rule cause, which throughout has been his chief political preoccupation; and he opposed the policy of coercion in Ireland which at this period found favor with the Liberal leaders. Morley had before this made two unsuccessful attempts to enter Parliament: in 1869 for Blackburn; and in 1880 for Westminster; and in 1873 had begun the friendship with Joseph Chamberlain which was to endure through life and the political identification with him which was finally to break in 1886. In 1883 he was returned for Newcastle-on-Tyne at a by-election, and his connection with journalism terminated. After the conversion of the Liberal party to Home Rule he accepted the post of Chief Secretary for Ireland on the formation of the brief Gladstone Ministry of 1886—an appointment that was acceptable to the Irish Nationalists, because, unlike his leader and the majority of his colleagues, he had no political "past" to wipe out; and he became the trusted intermediary in the difficult and delicate negotiations between the Irish members and the Cabinet leading up to the introduction of the first and second Home Rule Bills. After the defeat

of the measure of 1886 he, with the exception of Gladstone, came to occupy the chief place in the task of converting the English people to yield to the Nationalist claims. He again accepted the post of Chief Secretary in the Gladstone and Rosebery cabinets (1893-95); and on him fell to a large extent the task of adjusting and of piloting the Home Rule Bill of 1892 through the House of Commons. At the general election of 1895 he was defeated in the contest at Newcastle-on-Tyne—largely because of his refusal to vote for a statutory eight-hour day for miners; and in the following year he was elected for the Montrose Burghs—a seat he held until his elevation to the peerage in 1908. Between 1899 and 1903 he was half withdrawn from politics while engaged in the colossal task of writing the 'Life' of Gladstone; but he condemned the diplomacy that had led up to the South African War and was pro-Boer in his sympathies. From 1905 to 1910 he was Secretary for India in the Campbell-Bannerman and Asquith cabinets, his tenure being noteworthy for reforms in administration and the introduction of Indians into the Councils of India; and throughout his term his relations with the governor-general, Lord Minto, were markedly cordial. After his resignation in 1910, he accepted the lighter post of Lord President of the Council, which he continued to hold until his retirement from public life on the outbreak of the Great War in August 1914, with the participation in which by Great Britain he was out of sympathy. Morley held for 30 years a conspicuous place in British public life; but, as was to be expected from his training and earlier work, he never became a great Parliamentary debater. But the transparent honesty of conviction which had earned for him the sobriquet of "Honest John," the absence of overstatement and of superlatives, the profound thought and fine literary texture which marked his speeches, ensured for his utterances full reports, and they had considerable educative effect on the country. His tenure of the crucial Irish office—the most wearing and thankless of all posts and the grave of many reputations—was rendered only less difficult because he was in sympathy with Irish aspirations; and he was an undoubted success at the India office, where failure might have been anticipated. But his place in public life is secondary to his rank as an author. His writings include essays, studies of the French encyclopedists and political biography, and they bear the stamp of a rich, full, matured and balanced mind, which illuminates everything it touches. His works include 'Edmund Burke' (1867); 'Critical Miscellanies' (1871, 1877); 'Voltaire' (1871); 'The Struggle for National Education' (1873); 'Rousseau' (1874); 'On Compromise' (1874); 'Diderot and the Encyclopedists' (1878); 'Burke' (1879); 'Studies in Literature' (1891); 'Oliver Cromwell' (1900); and the standard and definitive 'Lives' of Cobden (1881), and of Gladstone (1903); the last named one of the greatest biographies in the English language. His latest work, 'Recollections' (2 vols., 1917), covers his entire life. While not abating one jot from his characteristic views the volumes are written in a large and gracious spirit, and contain many intimate and delightful sketches of the most distinguished figures in letters and public life of his time.

Many honors have come to him. He has been a trustee of the British Museum since 1894; was elected (in succession to Lord Acton) an honorary Fellow of All Souls, Oxford, in 1902; was one of the first recipients of the Order of Merit founded by King Edward VII in 1902; has been the chancellor of Manchester University since 1908; and holds numerous honorary degrees. He visited the United States in 1868 and 1904, on the last occasion as the guest of Mr. Andrew Carnegie; on the death of Lord Acton, Mr. Carnegie bought and presented his valuable library to Mr. Morley (1902), who in turn gifted it to Cambridge University; and in 1909 Mr. Carnegie gave Manchester University \$50,000 to establish a chemical laboratory to be named after his friend. Consult Cecil, 'Six Oxford Thinkers' (London 1909).

**MORLEY, Margaret Warner**, American educator and author: b. Montrose, Iowa, 17 Feb. 1858. She was graduated from the Normal College of New York in 1878 and has since taught in the Oswego Normal School and in the normal school at Milwaukee, Wis. She was for a time engaged in Armour Institute as teacher of biology. She has published 'A Song of Life' (1891); 'The Bee People' (1899); 'Wasps and Their Ways' (1901); 'The Insect Talk' (1903); 'Butterflies and Bees' (1905); 'Grasshopper Land' (1907); 'Donkey John of the Toy Valley' (1909); 'The Apple-Tree Sprite' (1915); and other works intended to familiarize young people with science.

**MORLEY, Samuel**, English philanthropist: b. Homerton, England, 15 Oct. 1809; d. near Tunbridge, Kent, England, 5 Sept. 1886. He engaged in hosiery manufacture in Nottingham and amassed a large fortune, which he used in philanthropic enterprises. He represented Bristol in Parliament in 1868-85 and upon his retirement was offered a peerage which he declined. In Parliament he supported various religious and social reforms and was opposed to capital punishment. He was one of the chief proprietors of the London *Daily News*, and was instrumental in reducing its price to one penny.

**MORLEY, Thomas**, English composer: b. 1557; d. London, about 1664. He may have been trained as a choir boy in Saint Paul's; was a pupil of Byrd; studied music at Oxford; from 1591 to 1592 was organist of Saint Paul's; in 1592 was appointed gentleman of the Chapel Royal and in 1598 he was given the exclusive right of printing books of music and selling ruled paper. He is best known by his 'Booke of Aires' (1600), which contains the page's song in Shakespeare's 'As You Like It' ('It was a Lover and his Lass'), with the original music. Morley's 'Plaine and Easie Introduction to Practicall Musicke' (1597), in dialogue form, is the earliest regular treatise on music published in England.

**MORLEY**, England, municipal borough in West Riding, Yorkshire, between Leeds and Dewsbury. It has two Gothic Anglican churches as well as others of different denominations, a very modern town-hall and a park. Its important industries are woolen goods, textile machinery, coal mining, stone quarrying, etc. Domesday Book mentions Morley. The borough was incorporated in 1885. The population in 1911

**JOHN MORLEY**

was 24,282. Consult Smith, 'Morely, Ancient and Modern' (London 1886).

**MORMON CRICKETS**, Western names for two species of longhorned, wingless, migratory (*Anobrus simplex*, and *A. purpurascens*), which are especially destructive at times in Montana and Idaho. See GRASSHOPPERS. —

**MORMONS**, a popular pseudonym for The Church of Jesus Christ of Latter-Day Saints, a religious body founded by Joseph Smith (see SMITH, JOSEPH) at Fayette, N. Y., 6 April 1830. Only six persons took part in the formal organization of the Church as a body corporate, such being the minimum requisite under the laws of the State, but the entire number of adherents at the beginning comprised only a few more. The founder averred that in 1823 he was visited by an angel, who revealed to him the repository of certain records, engraved on plates of gold, buried on the side of a hill near Palmyra, N. Y., and said by the angel to contain the history of the aboriginal peoples of the Western Continent. In 1827 these plates were delivered by the angel into the custody of Joseph Smith, with the assurance that through divine assistance he would be enabled to translate the records, to which labor he was specially appointed. With the plates were two stones set in bows of silver, and these, according to the angel's statement, were the Urim and Thummim, the power to use which constituted the special attribute of the seers of ancient days. Smith avowed that by the aid of these instruments under the inspiration of God he was able to read the ancient inscriptions, which consisted of characters said in the body of the record to be Reformed Egyptian and to dictate an exact rendering thereof in the modern tongue. In 1830 he published an English translation of the plates under the title 'The Book of Mormon,' and the work has been distributed by millions of copies through later editions in English and in numerous foreign languages. In every copy appear as separate affidavits the "Testimony of Three Witnesses" and the "Testimony of Eight Witnesses," in which the signers solemnly affirm their personal knowledge as to the plates, the engravings thereon and the genuineness of the translation; and it stands as a remarkable fact that although most of these witnesses apostatized from the Church, or were excommunicated, and though they developed bitter animosity against Joseph Smith, everyone of them stoutly maintained, even unto death, the truth of his testimony concerning the 'Book of Mormon.' The book sets forth that in the first year of the reign of Zedekiah, king of Judah, 600 B.C., an Israelitish prophet named Lehi, together with his family and parts of other families, migrated from Palestine to America under divine direction. In the New World the colony multiplied rapidly; but in course of time the people were rent by dissension and formed two opposing nations, known in the record as Nephites and Lamanites. The former, named after their first chief, Nephi, a younger son of Lehi, cultivated the arts of civilization, built cities in South, Central and North America, and through succession of duly appointed recorders kept a history of their doings. This historical record as later abridged in part and summarized by Mormon, one of their prophets, is the original of the 'Book of Mormon.' The Lamanites,

named after Lehi's eldest and rebellious son, Laman, led a nomadic life, neglected agriculture and productive industry and relied for subsistence upon war and the chase. They came under the predicted curse of darkness, specifically marked by a ruddy skin, and their degenerate posterity are the American Indians. The enmity of the Lamanites toward the Nephites culminated in the utter extermination of the latter at about the close of the 4th century, the final struggle being waged in the region now known as northern New York and near the Hill Cumorah, in which the Nephite records were in modern time disclosed to Joseph Smith. The Book of Mormon story, therefore, is seen to cover a period of approximately a thousand years. The Nephites were observers of the Law of Moses, a copy of which together with other Old Testament Scriptures had been brought by Lehi and his colony from Jerusalem. The birth, earthly ministry, death and resurrection of Jesus Christ were predicted by Nephite prophets; and the 'Book of Mormon' contains the record of the personal visitation of the resurrected Christ to these "sheep" other than of the Jewish fold, soon after the Lord's ascension from Olivet. Among them the Christ established His Church, prescribing the same ordinances, such as baptism by water and of the Spirit, the sacrament of bread and wine, etc., as were instituted among the Jews, and ordaining a body of 12 disciples to whom He gave commission to preach the Gospel and administer the ordinances thereof. Mormon's son, Moroni, finished the record of his people about 420 A.D.; and the angel who in 1823 revealed the depository of the plates to Joseph Smith announced himself as that same Moroni, the last prophet and historian of the ancient nation. Years after the first publication of the 'Book of Mormon,' a story purporting to explain the modern origin of the book, as a plagiarized and altered version of a work of fiction, attracted some attention; but the theory has been abandoned as utterly untenable. See BOOK OF MORMON.

From the day of its organization in 1830 the Church grew with surprising rapidity; and from that time to the present every year has witnessed an increase in membership and an expansion of propaganda. A temporary gathering centre was established at Kirtland, Ohio, where the first temple was reared. This building, an imposing structure as judged by the standard of the time, was dedicated in 1836. As early as 1831, however, the Mormons had begun to establish themselves in Jackson County, Mo., which region they still regard as the central place of the land of Zion. Persecution was waged against the Church from its beginning. Both in Ohio and Missouri the people met violent opposition. In 1833 they were driven from Jackson County, under cover of a charge that they were abolitionists. They sought refuge in Clay County, but their sojourn there was brief. In 1838 Gov. Lilburn W. Boggs of Missouri issued an exterminating order against all Latter-day Saints, and they were forcibly expelled from the State. In sorry plight the people turned again eastward and settled in Illinois, making the little village of Commerce in Hancock County their headquarters. There they founded the city of Nauvoo,

the phenomenal growth of which attested at once the industry and skill of the people and the vitality of their organization. Nauvoo was chartered by the State with liberal provision for local government. A university and a military organization were provided for, and both institutions were successfully established. The city flourished and in time numbered 20,000 inhabitants. A temple was reared, in proportions and beauty of architecture far surpassing the earlier structure in Kirtland. In 1844 a few apostates from the Church started a newspaper at Nauvoo with the avowed purpose of assailing the prophet and exposing alleged misdeeds. Only one issue of the paper was published. The city council of Nauvoo promptly declared the printing establishment a nuisance and ordered its immediate abatement. In the seizure by officers of the law the printing plant was wrecked. Smith was blamed for this by his enemies and they secured the issuance of a warrant for his arrest. As he was the officially recognized commander of the Nauvoo Legion, a duly constituted unit of the militia, the imminence of a military clash was exploited and public opinion in the State became intensely antagonistic. The governor of Illinois induced Smith to surrender himself under assurance of safeguard against mobocratic violence. The prophet was imprisoned at Carthage, where on 27 June 1844 a mob broke into the jail and shot to death Joseph Smith and his brother Hyrum, and wounded John Taylor, one of the prophet's party.

Even this outrage failed to bring about the end of Mormonism. Joseph Smith was succeeded in the leadership of the Church by Brigham Young (see YOUNG, BRIGHAM), who, early in 1846, was impelled through the violence of persistent persecution to leave Nauvoo with his people. They set out for the West. A party numbering 143, led by Young, started in the spring of 1847, and on 24 July arrived in the valley of the Great Salt Lake, which region the leader declared to be the land of promise to the Saints. To ordinary view the promise was most uninviting. The pioneer band placed a dam across the little stream later known as City Creek and flooded a small area of the hard-baked soil. After the planting the land was again watered. Thus was inaugurated the system of modern irrigation in America. The first crop raised by the colonists was small and the next was partly destroyed by an invasion of crickets; but the people pushed out into the remoter parts of the valley and beyond; and within a few years the wilderness—a part of the Great American Desert—was blossoming as a flower garden. The site of the present Salt Lake City was surveyed, streets laid out, the Temple block was marked by boundaries and other reservations for community use were made. Brigham Young returned to Council Bluffs, Iowa, where the main body of his people had established temporary headquarters. The migrating hosts followed the route of the pioneer band, traveling in well-organized companies; and people still living in the smiling vales of Utah and contiguous States relate their experiences of having crossed the plains afoot, guiding ox teams or pushing handcarts by dint of strenuous effort. Great Salt Lake City, as the new

settlement was first called, became at once important on account of its position on the route of wagon trains between the Missouri River and California; and as within two years from the time of the pioneer arrival, the gold fever was raging, travel was heavy. As a result of the wonderful genius for organization, management and well-disciplined activity exhibited by the Mormon colonists, and owing to their success in irrigation, the soil, inherently fertile and lacking only water and skilled cultivation, yielded abundantly and the city became the chief source of supply to the transcontinental travelers. When settled by the Mormons the region was under Mexican sovereignty. After its cession to the United States in 1848, under the Treaty of Guadalupe Hidalgo, the settlers petitioned for admission to the Union as a State; the request was denied, but in 1850 the Territory of Utah was formally established. Brigham Young was appointed governor and Congress made appropriations to the new Territory for public buildings and a library. In 1857 Alfred Cumming was appointed to succeed Brigham Young as governor, and Cumming with other Federal appointees was sent to the West along with "Johnston's army," a military expedition authorized by President James Buchanan, and sent ostensibly to suppress a "Mormon rebellion" that had no existence except as a popular opinion based on false reports. The expedition met with difficulties on account of the inclement season, and through determined opposition on the part of the Utah settlers to having an armed and hostile force sent against them in time of peace, when, as they claimed, they were guiltless of any overt act against the United States government. A peace commission was sent to Utah in 1858 and the people, who had already begun to move away from their homes (which they had prepared to burn if the invading soldiery attempted any depredations) were induced to return. Brigham Young, though no longer governor, exercised great influence in the Commonwealth. Many missionaries were sent out by the Church and the membership increased with great rapidity. Brigham Young died in 1877 and John Taylor succeeded him in the presidency of the Church. Taylor had been with the Smiths at the time of the assassination in Carthage jail and he himself had been shot and dangerously wounded by the mob. John Taylor died in 1887; and, after an interval, Wilford Woodruff became president of the Church. He was a remarkable man, 82 years old when made president, and he retained his physical and mental vigor until his death, which occurred in his 92d year. In 1890 President Woodruff issued his famous manifesto, which placed a definite injunction against plural or polygamous marriage, which practice had been inaugurated under prescribed regulation by Joseph Smith at Nauvoo. In 1896 Utah became a State, and in the following year the 50th anniversary of the entrance of the pioneers into Salt Lake Valley was impressively celebrated. Lorenzo Snow became president of the Church following the death of President Woodruff in 1898. He was in his 85th year at the time and died three years later. He was succeeded by Joseph Fielding Smith, a nephew of Joseph Smith, the martyred prophet, and son of Hyrum Smith, who had met death with

his brother Joseph. After an administration covering 17 years and marked by unprecedented expansion in all phases of Church activity, Joseph F. Smith died on 19 Nov. 1918, a few days after his 80th birthday. On 23 Nov. 1918 Heber J. Grant, the senior member of the apostolic body, was made president of the Church on the second day of his 63d year.

From the seemingly insignificant beginning of six the membership of the Church has now risen above half a million. In Utah and adjoining States, as also in Canada and Mexico, the people are organized according to residence into stakes, each of which comprises several wards; and outside the area so included, the whole of this country, as also many foreign lands, are covered by missions. The theology of Mormonism is epitomized in the following exposition:

#### The Articles of Faith of the Church of Jesus Christ of Latter-Day Saints.

1. We believe in God, the Eternal Father, and in His Son, Jesus Christ, and in the Holy Ghost.

2. We believe that men will be punished for their own sins, and not for Adam's transgression.

3. We believe that through the atonement of Christ, all mankind may be saved, by obedience to the laws and ordinances of the Gospel.

4. We believe that the first principles and ordinances of the Gospel are: (1) Faith in the Lord Jesus Christ; (2) Repentance; (3) Baptism by immersion for the remission of sins; (4) Laying on of hands for the gift of the Holy Ghost.

5. We believe that a man must be called of God, by prophecy, and by the laying on of hands, by those who are in authority, to preach the Gospel and administer in the ordinances thereof.

6. We believe in the same organization that existed in the Primitive Church, viz.: apostles, prophets, pastors, teachers, evangelists, etc.

7. We believe in the gift of tongues, prophecy, revelation, visions, healing, interpretation of tongues, etc.

8. We believe the Bible to be the word of God, as far as it is translated correctly; we also believe the Book of Mormon to be the word of God.

9. We believe all that God has revealed, all that He does now reveal, and we believe that He will yet reveal many great and important things pertaining to the Kingdom of God.

10. We believe in the literal gathering of Israel and in the restoration of the Ten Tribes; that Zion will be built upon this (the American) continent; that Christ will reign personally upon the earth; and, that the earth will be renewed and receive its paradisaical glory.

11. We claim the privilege of worshipping Almighty God according to the dictates of our own conscience, and allow all men the same privilege, let them worship how, where, or what they may.

12. We believe in being subject to kings, presidents, rulers, and magistrates, in obeying, honoring, and sustaining the law.

13. We believe in being honest, true, chaste, benevolent, virtuous, and in doing good to all men; indeed, we may say that we follow the admonition of Paul. We believe all things, we hope all things, we have endured many things, and hope to be able to endure all things. If there is anything virtuous, lovely, or of good report or praiseworthy, we seek after these things.— Joseph Smith.

The presiding council of the Church is the first presidency, consisting of the president and his two counsellors, each of the three being an ordained high priest. The president is officially designated as "prophet, seer, and revelator" to the Church. Next in authority is the council of 12 apostles, and in addition there are patriarchs, high priests, seventies, elders, bishops, priests, teachers and deacons, the organization operating as a theocratic system. Auxiliary organizations are maintained as helps in government; these comprise relief societies, Sunday schools, young men's and young ladies' mutual improvement associations, primary associations for the children and religion classes for supplying religious and ethical instruction as a supplement to the secular teachings of the

public schools. A system of church schools is operated for those who prefer denominational training, and these institutions range from the kindergarten to the normal school and college. The practice of plural marriage was a feature of the Church from the time of Joseph Smith's presidency to that of Wilford Woodruff. In 1862 the Federal government legislated against the system, but the constitutionality of the law was contested by the Mormons on the ground that it was in effect an infringement on religious freedom. More stringent laws followed, and numerous prosecutions resulted. Many members of the Church suffered fine and imprisonment rather than abandon the wives with whom they had covenanted under Church sanction. In 1887 the Mormon Church was disincorporated by Congress and the greater part of its property was confiscated by the government. In recognition of the final decision of the Supreme Court that the laws forbidding a plurality of wives were constitutionally valid, the Church in general conference assembled adopted as a binding rule the Woodruff manifesto; and except for sporadic cases of violation of this rule of action, plural marriage has ceased to be an issue in Mormon affairs. In 1898 Brigham H. Roberts was elected to Congress on the Democratic ticket, but a protest followed on the charge that he was living in polygamous relations, and on the recommendation of an investigating committee of the House of Representatives he was denied a seat in Congress. In 1904 an effort was made to unseat United States Senator Reed Smoot, on the charge that he, being a member and an official of the Mormon Church, did in effect abet and encourage the practice of plural marriage, and that he was disloyal to the Federal government. Both charges failed and the senator was confirmed in his place in the upper house of Congress.

Salt Lake City, which is still the headquarters of the Mormon Church, and both capital and metropolis of the State of Utah, is famed for its beauty of situation, its wide and excellent streets and its many imposing structures. The great tabernacle, a building begun in 1864 and completed in 1867, is oval in plan, 250 feet long, 150 feet in greatest width and over 70 feet high from floor to ceiling at the centre. The roof is a great dome of lattice-work construction and is self-supporting, the vast span being without a single pillar. As first constructed the enormous beams and trusses, entirely of wood, were held together by wooden pegs and rawhide thongs, for in that day iron spikes were unobtainable. The seating capacity of the building is over 9,000; but, with aisles and other standing space occupied, assemblies of nearly 11,000 are not uncommon. The great organ in the tabernacle is of world-wide fame, and the choral service is scarcely less renowned. The temple is built of solid granite, with walls eight feet thick in the first story and six feet above. This building was begun in 1853 and was dedicated in 1893, the time occupied in its construction being 40 years to the day. It is of composite architecture, with dimensions of 186 feet length, 118 feet width and 210 feet from ground to highest pinnacle. There are three other temples in Utah, one in Canada and one in Hawaii. The temples are used in ordi-

nance work and not for worshiping assemblies in general. A characteristic of Mormon practice is the rendering of vicarious service in baptism and other ordinances for the dead; and this labor is performed only within temples erected and dedicated for the purpose. Ordinances for the living are likewise administered in these structures; and the distinctive ceremony of "celestial marriage" is confined to the temple administration. This order of marriage involves a covenant between the parties for time and all eternity, and not only until death shall them part. No marriages are solemnized in the temples or elsewhere among the Mormons except such as are authorized by the license of the State. See SALT LAKE CITY; UTAH.

**MORMYRIDÆ**, môr-mîr'i-di, from the Greek *mormyros*, sea-fish. They are known as the *African-beaked fish* of the pike family, but, by Professor Cope, applied to the *Scyphophora*. They have the narrow parietal bones of the skull distinct both from one another and from the supraoccipital and they have the special distinction of having the petriatics (on each side of the parietals) large, funnel-shaped and enclosing a cavity expanding externally and covered by a lid-like plate of bone. The anterior vertebræ are simple and unmodified and the gill cover has a sub-opercular bone. Scales cover both body and tail, but the head is naked and barbels are absent on muzzle. The central portion of the upper jaw is formed by the united premaxillæ and the sides by the maxillæ. A small slit represents the gill opening and there are no false gills. The air bladder is simple. The beaked fishes are divided into two groups, the Nile having 11 species.

**MORMYRUS**, a fish of the Nile (*Mormyrus petersi*), regarded as excellent for the table, and caught with line and hook. Its lower jaw is extended into a fleshy appendage and its characteristic form is depicted on ancient Egyptian wall-paintings and carvings. It represents a group of malæopterous nocturnal North African river-fishes allied to the pikes.

**MORNAY, Philippe de**, fê-lêp dè môr-nâ, SEIGNEUR DU PLESSIS-MARLY, French statesman: b. Buhy, Normandy, 5 Nov. 1549; d. La Forêt-sur-Sèvre, 11 Nov. 1623. He was brought up a Huguenot; entered Coligny's service; escaped to England at the time of the Massacre of Saint Bartholomew; returned to France in 1573, and took up arms for the Huguenots; was captured at the siege of Dormans and afterward ransomed, and joined the army of Henry of Navarre, who used not only his sword but his pen and his diplomatic gifts, made him a member of his council and appointed him governor of Saumur. After Henry became Henry IV of France and a Catholic, Mornay was the sole Huguenot leader and was even styled the "Huguenot pope" by his enemies. He retired to Saumur (where he founded a Protestant university) soon after the Edict of Nantes, in the negotiations leading up to which he had taken a leading part. Mornay wrote, among other controversial works aimed now at pagans or atheists, now at the Roman Catholic Church, 'De l'Eucharistie,' urging the

Calvinistic view of the Lord's Supper as opposed to transubstantiation (1598). His 'Mémoires pour servir à l'Histoire de la Réformation en France,' re-edited in 1824, is a valuable source for the history of the period. His wife's memoirs (1824) detail his life down to 1606. Consult also Ambert, 'Duplessis-Mornay' (Paris 1847), and Baird, 'The Huguenots and Henry of Navarre' (New York 1886).

**MORNING-GLORY**, an annual twining or trailing vine (*Ipomœa purpurea*) or some related species (a native of South America), popular as a garden ornament all over the world and often found escaped to the fields and roadsides. The vine is sometimes 10 feet tall, with large roundish heart-shaped leaves and large delicate ephemeral flowers of very various forms and colors. The seed may be sown in any garden soil well exposed to the sun, where the plants may be expected to grow the following year. They self-sow readily. If the soil is very rich they increase so fast as to make an excellent screen for a low porch by midsummer. See CONVULVULACÆE; IPOMÆA.

**MORNINGSIDE COLLEGE**, in Sioux City, Iowa; coeducational; founded in 1894, under the auspices of the Methodist Episcopal Church. In 1916 the school had 35 professors and instructors and about 708 students. There were 28,000 volumes in the library; the grounds, building and apparatus were valued at \$157,000; the income was \$33,000, not including benefactions. The collegiate courses lead to the degrees of A.B., B.S. and Ph.B.

**MORNY**, môr-nê, **Charles Auguste Louis Joseph**, Duc DE, French politician: b. Paris, 23 Oct. 1811; d. there, 10 March 1865. He was a half-brother of Louis Napoleon (afterward Napoleon III), a natural son of Queen Hortense and Count Flahault. He was for a time in the army, then tried commercial speculation and finally politics. He became a deputy in 1842, took a prominent part on the side of Napoleon III in the *coup d'état* of 1851, and was a conspicuous figure under the Second Empire, during which he was Minister of the Interior (1851-55), president of the Corps Législatif (1854-65), and was sent on a special embassy to Saint Petersburg (1856-57) and was created duke in 1862. Possessed of a certain sort of ability, he employed it with perfect unscrupulousness for the advancement of his personal interest. Alphonse Daudet (who for a time served as one of his secretaries) has portrayed him as the Duc la Mora in 'Le nabab.' Consult the biographies by Castille (Paris 1859) and Loliée' (English trans., New York 1910).

**MOROCCO**, mô-rôk'ô, or **MAROCCO**, a sultanate or empire and French protectorate of northwest Africa, known to its inhabitants only by its Arabic name Moghrebel-Aksa, "The Extreme West." It is bounded on the west by the Atlantic Ocean, north by the Mediterranean Sea, northeast by Algeria and east and south by the Sahara, the boundary in the southwest being formed by the Wady Draa, while elsewhere there is no definite line of demarcation between the French Sahara and Morocco; area, about 219,000 square miles. The rulers of Morocco exercised sovereignty at one time over Twat,

or Touat and several other oases in the heart of the desert; they even carried their victorious arms across the desert to Timbuktu. Within recent times, however, they have had little or no power south of Atlas, the great chain which traverses the country diagonally northeast to southwest throughout its whole extent. Morocco has three capitals or imperial residences, at one of which the sultan and his army reside at uncertain intervals and for indeterminate periods. These are Fez (pop. 100,000), Makinas or Mequinez (30,820), Marrakesh, better known as the City of Morocco (50,000 to 80,000). Besides these the principal coast towns are Tangier (46,000, 11,000 European); Tetuan, a little way up the Martil River; Larache (El-Arish); Rabat and Sallee, on opposite sides of the Bu-Ragreb River; Casablanca or Dar-al-Baida (75,000, 31,600 European); Mazagan, Saffi and Mogador. The empire is divided into districts named from the occupying tribes; another division is into provinces or districts, fluctuating and very unequal in number, sometimes confined to a single town, sometimes embracing an extensive territory, administered each by a *kaid*, whose chief duty it is to collect the imposts.

**Topography.**—Physically considered, Morocco falls naturally into four regions: 1. The great range of Atlas, from southwest to northeast, composed of two or more parallel chains. (See ATLAS). 2. Er-Rif or the northern maritime district, comprising the chains of mountains which rise at no great distance from the Mediterranean Sea. 3. The wide belt of fertile plain, intermixed with gentle hill and valley, which lies between the two preceding regions. 4. The plains and valleys southeast of Atlas. The most remarkable natural feature is the great mountain system extending from northeast to southwest. This system—the Atlas—composed of several parallel chains, contains the most elevated points known in North Africa. Miltin, a peak distant about 30 miles southeast from the city of Morocco, has a height of 11,400 feet, while another peak, Jebel Ayashin, is estimated at 14,600. Adjoining the central chain are several table-lands of great extent, consisting of irregular plains, and at a little distance from it north extends the maritime chain now called Er-Rif, and formerly the Atlas Minor. Its general height is from 2,500 feet to 3,500 feet.

**Hydrography.**—The rivers flowing from the north side of the Atlas have generally the shorter course, but are well supplied with water; those running south, however far they may extend, are dry in summer, at least in their lower courses. The Muluya, rising in a principal knot of the Atlas flows in a northeasterly direction to the Mediterranean with a course of 350 miles and receives many tributaries. Of the rivers which run into the desert the most easterly the Ghir has a course southeast, occasionally traceable for 300 or 400 miles. The Ziz, which, with its numerous affluents, waters a very fertile and populous country, is wholly spent before it attains half that length. The Draa which rises in the central and most elevated portion of the range of Atlas (lat. 31° to 32° N.), first runs south for nearly 200 miles, forms Lake Ed-Debaya, and then, turning west, enters the ocean in lat. 28° 18' N., after a course

of 700 miles. The lower portion of its bed, however, is periodically quite dry. Lake Ed-Debaya, formed by the floods of the Draa, is reported to be very large; but it disappears annually, and gives way to richly cultivated fields. The fresh-water lake of Gebel el Akhdar (Green Mount) lies about 30 miles north of Morocco. The coast offers few good harbors; of these Tangier and Mogador, or Sweira, are the best; the rest are but open roadsteads at the mouths of rivers.

**Natural Resources, etc.**—The extent of the mineral wealth possessed by Morocco is not known with any accuracy. Copper, iron, and lead are obtained in larger or smaller quantities. The flora of Morocco includes the esculent oak and cork oak; in the higher regions of the Atlas the cedar and Aleppo pine, with many varieties of oxycedrus and juniper yielding fragrant gums; also the date-palm and the dwarf-palm east and south of the Atlas; and near the coast the *Eleodendron argan*, which yields an excellent oil. Among the wild animals are lions, panthers, ounces, wild boars, gazelles and several species of large antelope, especially the bubalus. The locust makes its appearance in May, when it lays its eggs. The young brood come forth a month later in countless multitudes, and in another month they take wing, consuming all vegetation in their progress and spreading desolation over the fields. They are gathered and eaten in large quantities. The ostrich is found on the south frontiers of Morocco.

**Climate.**—The climate west of Atlas is much more temperate than might be expected under such low latitudes. This is due to the circumstance that a lofty chain of mountains, covered in some parts with perpetual snow, intercepts the hot winds from the deserts of the interior, so that the equable and refreshing sea-breezes prevail throughout the year. Hence the extremes of temperature lie within moderate limits; the thermometer rarely falling below 40° F. in the winter, while it does not rise above 95° in summer. In the region east of the mountains intense cold is felt in winter, while in summer the heat of the plains is insufferable.

**Agriculture.**—The agriculture of Morocco was in the lowest possible condition and the annual production calculated barely to supply the wants of the country; though with proper cultivation and under an enlightened government Morocco will become one of the most productive countries in the world. Unfortunately, until the French protectorate was established, owing to oppression and extortion, there was nothing but discouragement for anyone attempting to reap advantage from these resources. The cereal crops are wheat barley and maize; but durrha or millet (*Sorghum vulgare*) constitutes the chief support of the population, though beans, the esculent arum, and even canary seed are much eaten by the poorer classes. Cotton growing was introduced in 1911. The vine was cultivated only near towns for the sake of the fresh grapes and for the raisins; but now the outlook for this product is promising. All the fruits of the south of Europe are cultivated to some extent. Large numbers of the inhabitants lead a pastoral life, subsisting wholly on the produce of their herds and flocks, or else on game and the wild fruits of the forests. The chief wealth of the tribes

scattered over Morocco consists in their herds and flocks. The spirited small horses, for which the country was famous in ancient times, are still numerous, particularly in the southern provinces. Horned cattle are numerous, particularly in the northern districts. The bulls are generally tractable and are employed in the labors of the field — bullocks being little known. The sheep are supposed to number at least 45,000,000; while the goats are estimated at 10,000,000 or 12,000,000, and goat-skins constitute one of the principal articles of export.

**Manufactures and Commerce.**— In general among the rural population, each family supplies all its own wants. In the towns, however, some manufactures are carried on. Fez makes and exports great quantities of the cloth caps which bear the name of that city. The tanners of Mequinez and other places have a great reputation, and Morocco carpets are much esteemed in Europe. The commerce is partly carried on with the adjacent countries, partly with European states. From the Sudan are obtained ivory, gold-dust, ostrich feathers, asafoetida, gums, Guinea pepper and slaves. Of the whole of the commerce with Christian states nearly half is carried on with Great Britain. The exports consist of beans, peas, almonds, goat-skins, eggs, wheat, wool, wax, etc.; the imports, of cottons, sugar, wine and flour. The French have constructed 1,500 kilometers of roads. A railway has been completed to Fez and another connecting Casablanca to Marakesh is under way, while a line to link up with the Algerian railways has been completed as far as Taza. Postal services have been introduced, there are several wireless stations, and in 1916 there were 4,185 miles of telegraph, exclusive of military lines. Imports (1915), about \$54,900,000; exports, \$12,834,000. The number of vessels entered at Moroccan ports in 1915 was 4,319, of a total tonnage of 1,963,540 tons.

**Money, Weights and Measures.**— Spanish dollars and pesetas, as well as Moorish coins minted for the Government in France are current, but of fluctuating value. The common currency consists of flocs (two two-thirds) the blankeel or muzoona of six flocs equaling approximately 16 cents; the okia or ounce of four blankeels, about 64 cents, and the miktal of 10 ounces equaling 76 cents. The kintar of 100 rotals for native produce is equal to about 168 pounds; the kintar for imported articles about 112 pounds. The drak of eight tomms is equal to about 22 inches. The mudd dry measure by which grain is sold equals 1 17/60 bushels; the kula of 28 rotals, by which oil is sold wholesale, equals 47 pounds in weight, or 53 pints by measure.

**Government.**— The sovereign or Sultan of Morocco, styled by Europeans emperor, bears the title of Emir el Múmenin, or Lord of the True Believers. He is ordinarily called by his subjects simply *Seid-na* — Our Lord. He is absolute in the strictest sense; the lives and properties of his subjects are at his disposal; from him alone proceed the laws, which he makes and unmakes at his pleasure. The imperial revenues are derived from imposts on property, from duties on imports and exports, from monopolies and from fines or confiscations. Under the sultanate régime every office was directly or indirectly purchased, small salaries or none were paid, the holders recouping

themselves by plunder and oppression, tempered by the fact that at any moment they may be forced to disgorge to the Sultan, or in default be left to rot in the loathsome Moroccan dungeons, or be beaten or tortured to death. All justice was bought and sold. Yet, owing to the religious fanaticism of the people, and the mutual jealousies of the European powers, especially France, Great Britain, Germany, Italy and Spain, these unsatisfactory conditions were until recently preserved. See *post*, under *Government*.

**Population.**— For an estimate of the population of Morocco there are no certain data. One of the most recent calculations estimates it at 5,000,000. An important element of weakness in the social and political constitution is to be found in the several distinct races, which, so far from uniting, repel one another. The Berbers are the oldest inhabitants of the country, and they devote themselves to agriculture rather than to pastoral pursuits. The Arabs form the bulk of the rural population in the plains; some of them are cultivators, and some are Bedawi. In the towns along the coast are found the Moors, a people now physically distinct, whose origin as a distinct race cannot be satisfactorily explained. Their chief physical characteristic is their corpulence and they are more indolent and much less social than the Arabs. A considerable number of Jews is to be found in all the commercial towns of Morocco, where, in spite of the oppressions to which they are subjected, they often accumulate wealth, being the sole dealers in bullion and holders of capital. To these various ingredients of a checkered population must be added the negroes and their posterity of every shade, who are particularly numerous in the southern provinces. The civilization of Morocco had sunk to a low condition. The education given at the schools in the chief towns, and completed at the University of Fez, does not go beyond the theology of the Koran; but under French rule progress has been made. The public libraries, once famous, are now dispersed; true science is unknown, and whatever monuments of art are to be found in the kingdom point to the time when literature and art flourished under the Arababian dynasties in Spain. Music is the only art for which the Moors are said to manifest a decided taste, but they have not as yet arrived at any proficiency in it.

**History.**— In the Mauri of ancient writers it is easy to recognize the Moors of modern times. These people were supposed to have come from Asia, and particularly from Palestine, but their origin is doubtful. The Berbers are believed to be the representatives of the race that inhabited the country in the earliest historical times. After being for more than four centuries a part of the Roman empire, and in the later period of its sway venerated with a corrupt Christianity, "Mauritania Tingitana" fell (429 A.D.) into the hands of the Vandals, who introduced the piratical habits which afterward became so characteristic of the coasts of Barbary and Morocco. They held it till 533, when Belisarius having defeated them, it became subject once more to the Eastern empire. But in the latter part of the 7th century the Arabs spread over North Africa, and having taken possession of Mauritania, penetrated to the

borders of the desert. About this time the Jews were expelled from Spain by decree of the Council of Toledo (694 A.D.), and sought refuge in great numbers on the shores of Africa. Near the close of the 8th century a Sherif or descendant of Mohammed named Edris obtained such an ascendancy over the Berber tribes that they made him their sovereign, with the title of Imâm. His son and successor founded in 807 the city of Fez. In 1035 the warlike sect of the Morabites rose into existence on the borders of the desert. In 1055 their chief was proclaimed sovereign of Moghreb-el-aksa. His grandson and successor crossed the mountains and in 1072 laid the foundations of the city of Morocco, which thus arose with the remarkable dynasty of the Morabites. The expulsion of the Moors and Jews from Spain (1440-1501 A.D.) added 800,000 souls, it is said, to the population of Moghreb-el-aksa. In the middle of the 16th century a new dynasty commenced with the descendants of the Sherif Hosein. The fifth of this family, commonly called Hamed Sherif el-Mansu (1579-1603), made himself master of the whole of Moghreb-el-aksa, and pushed his conquests through the desert as far as Timbuktu and Kaghô. His reign is regarded as the golden age in the history of Morocco. The ninth and last Moroccan dynasty was that founded in 1648, by Mulai Sherif el Fileli, or King of Tafilet. In 1814 the slavery of Christians was abolished and piracy was prohibited in 1817. Several complications arose with France, caused by the plundering of French vessels by pirates, but in each instance the emperor gave compensation. In 1859-60 there was a war with Spain, owing to attacks made by some of the wild tribes upon the Spanish territory; it resulted in a cession of land and an indemnity of \$20,000,000 to Spain.

The Sultan Abdul Aziz IV succeeded his father El Hasan III, in 1894, when he was 14 years of age, and he had a difficult task with his turbulent people. On 18 May 1904, Rais-Uli, a prominent chieftain, captured and held for ransom, the Hon. Ion Perdicaris, an American subject, and his stepson Mr. Varley, an English subject. The ultimatum of the United States Secretary of State, John Hay, "Perdicaris alive or Rais-Uli dead," a naval demonstration of American warships and representations from European courts, compelled the Sultan to comply with Hay's demands, and the captives were released. The Sultan's weakness became more and more apparent to the insurgent tribes of northern and central Morocco, and contempt for the rights of foreigners, with utter lawlessness prevailed throughout the kingdom. At the ports, especially Tangier, the property of Europeans, and even their lives, were in jeopardy. To safeguard the loan of \$10,000,000 which had been advanced to the Sultan, the French government arranged for the appointment of a French financial adviser, with agents, to undertake the control of the Customs; it was also arranged to police Tangier with French-Algerians, and a French military mission proceeded to Fez. By the Anglo-French Agreement of 8 April 1904, France as the nation whose dominions bordered on Morocco, was to be unhindered by Great Britain in guarding the tranquility of that kingdom, in return for allowing Great

Britain freedom of action in Egypt; moreover, freedom of trade was guaranteed for 30 years in Egypt and Morocco. In October 1904 a Franco-Spanish Agreement was also arranged, which recognized the terms of the Anglo-French Agreement, the maintenance of the territorial integrity of Morocco, the neutralization of the coast between Melilla and the Sebu River, the preponderating right of France to give the Sultan military, economic and financial assistance, and modified the limits of the Spanish sphere of influence. In January 1905 the reforms submitted by the French government were received with marked disfavor by the Sultan and by his Council of Notables. This was thought later to have been due to German diplomacy, which under the terms of the Madrid Convention of 1880, refused to recognize the agreements made by France with Great Britain and Spain concerning Morocco.

In 1880 the Madrid Convention with Morocco, bearing the signatures of Austria, Belgium, Denmark, Germany, France, Great Britain, Italy, Morocco, the Netherlands, Portugal, Spain, Sweden and Norway, and the United States, had established the right of protection in Morocco, and the 17th article of the treaty reads: "The right to the treatment of the most favored nation is recognized by Morocco, as belonging to all the Powers represented at the Madrid Conference."

The German opposition was further emphasized by the visit of the German Emperor, William II to Tangier, 31 March 1905, when he assured the Sultan of his intention to uphold the integrity of the Moroccan kingdom and the equality of Germany's commercial and economic interests in the country. A special German mission was sent to Fez, and British and Spanish missions also proceeded to the Moorish capital, ostensibly to support the French policy. The Sultan and his advisers, 28 May 1905, refused to entertain the proposed reforms and advised an international conference of the Powers to deliberate on the Moroccan situation. After protracted negotiations between France and Germany, which were shadowed by rumors of probable war between the countries, and in which the resignation of M. Delcassé, the French Minister of Foreign Affairs, and the downfall of the Rouvier Ministry were incidents, a program was arranged to place before the International Conference. Algeciras in Spain, opposite Gibraltar, was chosen as the meeting place.

Various reasons were assigned for the unexpected raising of the Moroccan question by Germany; among these were—alarm at the apparent isolation of Germany in European politics, at the increase of French influence in North Africa, and at the consummation of an agreement which implied a further territorial division of Africa by private arrangement between two powers, regardless of German and other economic rights.

The various countries signatory to the Madrid Convention of 1880 sent delegates to Algeciras, and the conference was opened 16 Jan. 1906. The presence of the United States representatives was explained as safeguarding the nation's commercial interests in Morocco; with the political aspects of the conference, arising solely from the strained relations between Germany and France, wherein a *casus belli* might

be found, the United States agents were specifically instructed not to participate. The meetings of the conference lasted until 31 March 1906, when after strenuous opposition and counter-proposals on the part of Germany, supported only by Austria, against the French program, supported by Great Britain, Russia, Italy, Spain, Portugal, the United States, Belgium and Holland, an agreement on all points was reached. The French program maintained that the police, under the Sultan's orders, should be commanded by French and Spanish officers and sub-officers nominated to the Sultan and appointed by him, and that the Inspector-General of the Police should report to the Sultan. Germany made a series of propositions in opposition to this general plan, seeking to bring the whole Moroccan business practically under the control of the European concert, requiring those Powers directly acting in Morocco to take a European mandate, and to be subject to the interposition of the other Powers, of which Germany would be an important one. Matters had almost reached a deadlock when a proposition relative to a mixed police force for the ports in dispute was brought forward by Ambassador White, under instruction from President Roosevelt, and introduced by the Russians, provided a solution for the existing difficulties. The division and the policing of the ports of Morocco was arranged as follows: Spain to police Tetuan and Larache; a Franco-Spanish mixed police to be established at Casablanca and Tangier, and a French police force alone to have charge of Mogador, Saffi, Mazagan and Rabat. The result of the conference was virtually a victory for France, which retained the preponderance of influence in the financial affairs of the kingdom, and lost little of what was demanded with regard to the policing of the country.

In 1907 Dr. Marchand was killed by natives at Marrakesh, and this was followed by French occupation of Udja, on the Algerian border. In 1908 Mulai Hafid succeeded to the throne. In 1909—and again in 1911—the Riffians made attacks on the Spaniards in the neighborhood of Melilla, which were ultimately defeated. In July 1911 the German government dispatched the cruiser *Panther* to Agadir in southern Morocco, where German financiers had acquired considerable concessions. The local chiefs were entertained on board the vessel and promised German support in any resistance they might make against French paramountcy in the country. The result was a threatened European conflagration: Great Britain assured France of her support, and for a time the situation was tense. Negotiations were entered into between France and Germany, which lasted for three months, and the result of which was the drawing up of two agreements (4 Nov. 1911), the one practically recognizing a French protectorate in the country but obtaining for German interests absolute equality in economic and commercial matters, with the cession to Germany of 250,000 square kilometres in the northern French Congo. In April 1912 the Sultan recognized the French protectorate, which has also been recognized by Great Britain, Germany and other great powers. General Lyautev was appointed resident general, with both civil and military powers. In that year Mulai Hafid abdicated

in favor of Mulai Yusuf, the present Sultan. Spanish rights in the Spanish Northern Zone have been conceded, and it is administered by a Khalifa chosen by the Sultan. A zone in the district of Tangiers 140 square miles in extent, has been created.

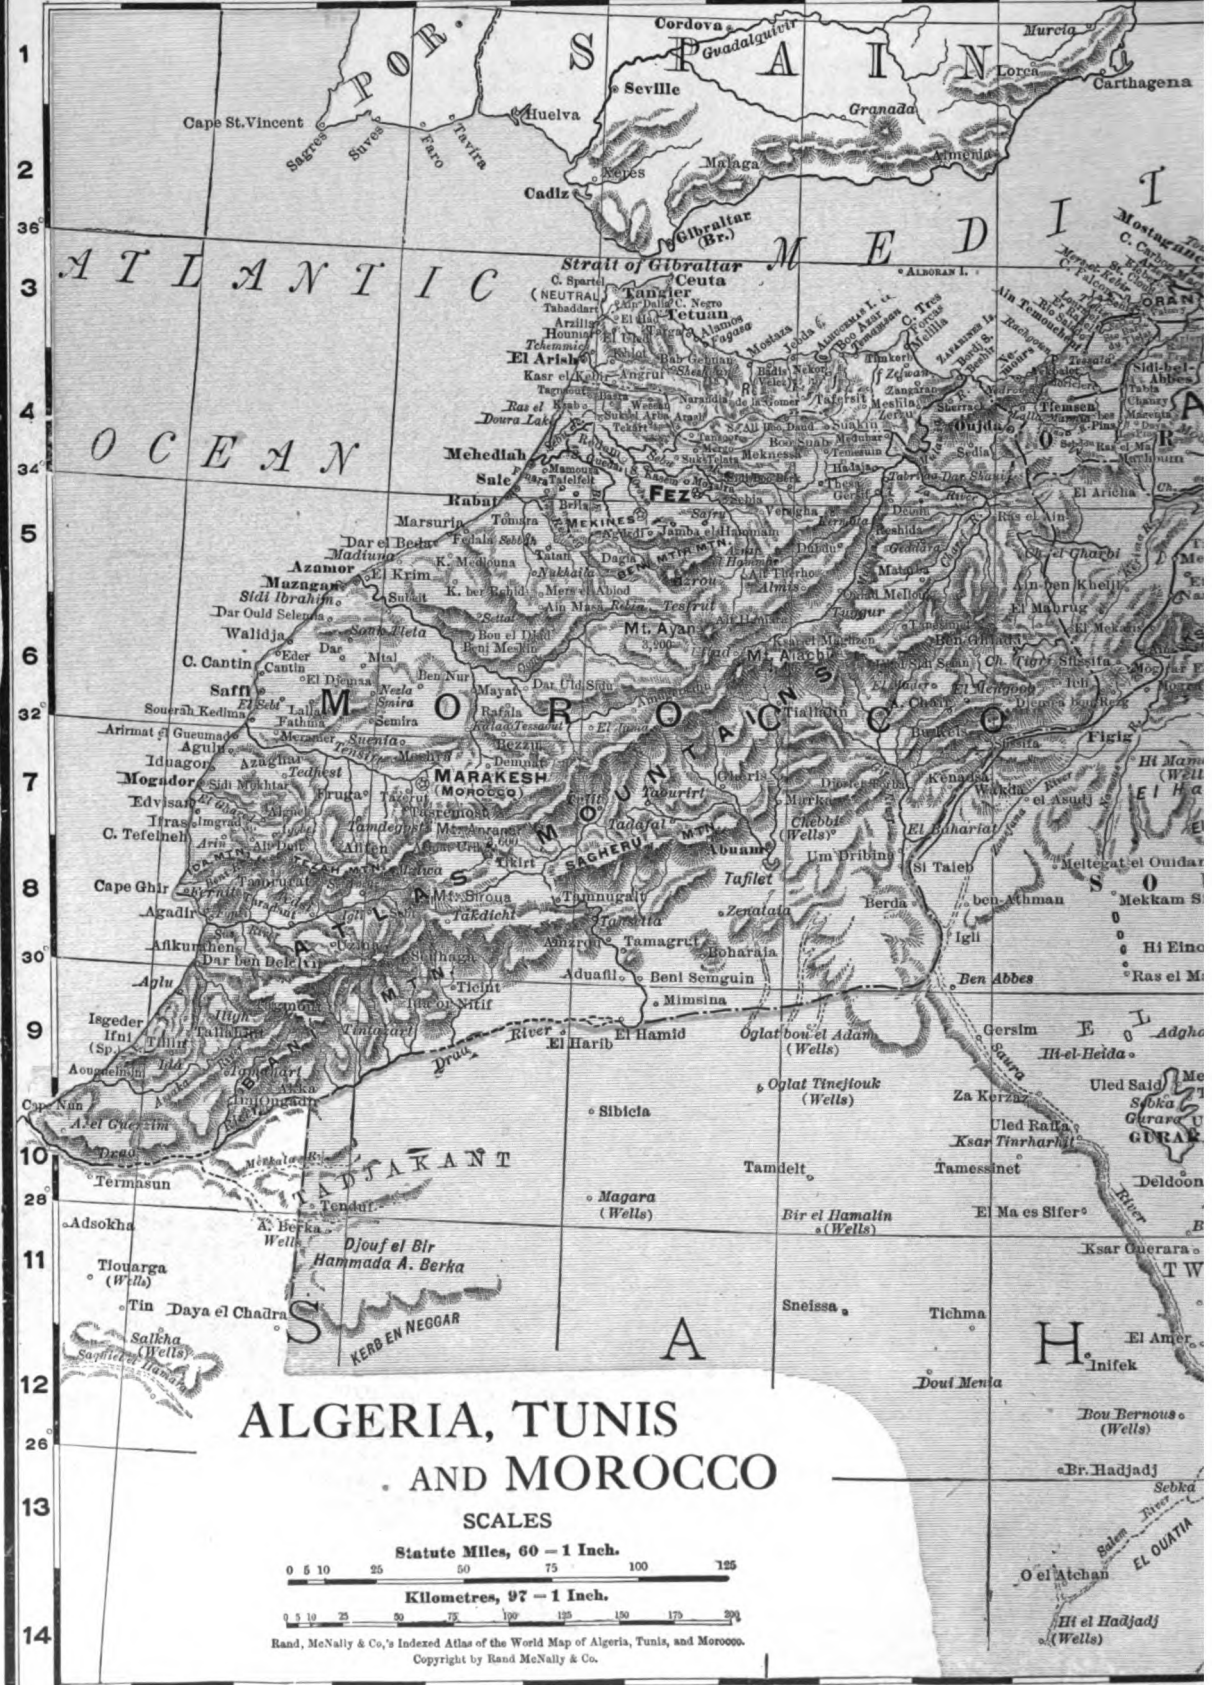

After the outbreak of the Great War in August 1914 the French army of occupation, amounting to 85,000 men, was required elsewhere; it was decided to withdraw troops from the interior and to hold only the towns on the coast, and a mobile column was organized to keep order. Disturbances were created at the outset, inspired by German agents in the Spanish zone. About 30,000 Moors have fought in Europe, and thousands have filled places in munitions and other industries in France.

**MOROCCO, or MARRAKESH**, the second capital of the sultanate of Morocco (q.v.) on the north side of an extensive and fertile plain, 1,500 feet above sea-level, about 96 miles from Mogador, its port on the Atlantic, and 230 miles southwest of Fez, the chief capital of the empire. It has an excellent situation in sight of the Atlas Mountains, from which cool streams are always flowing and is noted for its genial and healthful climate. It commands the trade routes across the mountains, but the city has long been hastening to decay, chiefly the result of war, plague and wretched government. It is encircled by a lime and earth wall nearly six miles in circuit, between 20 and 30 feet high, with square towers every 50 paces, and pierced by nine gates, but all in a ruinous condition. A large portion of the immense space within the walls is occupied by ill-kept gardens, open areas, and "soks," or market-places; the eight large cemeteries are outside the walls. In the bazaar and merchants' quarter a considerable local trade is carried on with the country people, the mountaineers from the neighboring Atlas, and with Sus, Taflet, Mazagan, Saffi and Mogador. Morocco possesses many mosques, one of which, the Kutubia, has a tower after the model of the Hassan in Rabat and the Giralda in Seville, 320 feet high. On the south of the city stands the palace, now seldom occupied by the sultan, comprising a space of about 1,500 yards long by 600 yards wide, and near it is the Jews' quarter (El-Millah), a walled enclosure of about one and one-half miles in circuit, one-half of it nearly in

ruins, thronged to suffocation and excessively filthy. There are several tanning and leather-dyeing establishments of considerable extent, though of late years European goods have been gradually displacing native manufactures. The population varies according to the presence or absence of the sultan, his court and army. Morocco was founded in 1072 by the Emir Yusef ben Tachefyn, and reached the summit of its prosperity in the 13th century and was famous as a seat of learning. In those days it is affirmed to have contained more than 700,000 inhabitants. During several centuries it suffered from civil wars, and was sacked by the rebellious Berbers more than once. Pop. estimated at from 50,000 to 80,000; Jews, according to one computation, totaling 17,000.

**MOROCCO**, or **MAROQUIN**, a fine kind of leather, prepared from the skin of the goat, originally brought from the Levant and the Barbary States, but now manufactured in most other countries. The colors most commonly communicated to it are red (by cochineal) and yellow (by the Avignon or yellow berries). Kano, in British Nigeria, is an important centre of production. Split calf and sheepskins are used in the production of good imitation (French morocco) for binding, the peculiar graining of the genuine article being imitated by machinery. See also **LEATHER**.

**MORÓN**, mō'rōn, or **MORÓN DE FRONTERA**, Spain, town in the province of Seville, situated at the foot of the Sierra de Morón on the Guadira and on the Ultrera-Morón Railway. It contains the ruins of an ancient Moorish castle of great strength; the French destroyed it on their evacuation in 1811. The industrial resources are limited chiefly to the production of olive oil and its red hematite mines and marble quarries. Pop. 17,099.

**MORONG**, Thomas, American botanist: b. Cahaba, Ala., 1827; d. 1894. He went in boyhood to Massachusetts, and was graduated at Amherst College in 1848. After studying law he pursued a course in theology at Andover, leaving the seminary in 1853. He had early developed taste for botany, and in 1888 he began a voyage which led to valuable botanical collections made in explorations in Argentina, Chile and Paraguay. Returning in 1890, he became curator of the Columbia College herbarium. With N. L. Britton he published 'An Enumeration of the Plants Collected by Dr. Thomas Morong in Paraguay, 1888-90.'

**MORONG**, mō'rōng, Philippines, capital of the province of Rizal, Luzon, situated on the bay Lagoon (Láguna de Bay), 19 miles southeast of Manila Point.

**MORONI**, Giovanni Battista, jō-vān'nē bāt-tes-tā mō-rō'nē, Italian painter: b. Bonda, near Albino, 1525; d. Bergamo, 5 Feb. 1578. He painted many altarpieces and historical compositions, some of which are to be found in the Brera Library at Milan, others in villages of the province of Bergamo. He was, however, most especially celebrated for his portraits which are lifelike and arrest the attention by their startling projection and lucid color tone. Many of them are to be met with in Italy. There are three examples in the Berlin Museum and five in the London National Gallery, amongst

which is 'The Tailor,' a masterpiece. There are also portraits in Boston, Philadelphia, Baltimore and the Metropolitan Museum, New York.

**MOROS**, mō'rōz, Mohammedan Malays inhabiting the southwestern part of the Philippines, chiefly the Sulu Archipelago and the islands of Palawan and Mindanao; various subdivisions include the Illanos, Samales, Joloanos, Maguendanaos, etc. Mohammedanism was propagated among the Moros in the 14th century by Malays from the island of Borneo, and is the prevailing religion. The Moro alphabet, which is still retained in writing, shows distinct traces of Arabic origin introduced by Arabic teachers of the doctrines of Islam. The Moros are governed by their local chiefs, dattos or sultans under a form of primitive feudalism.

They have no system of laws as such. The penal passages of the Koran, taken in connection with local customs, are referred to as the *Titab*; the local customs being mainly interpretations or even evasions of the Koran. Land is held in common, the dattos claiming sections as their own; in some localities, a "Master of the Field" allots plots of ground to individuals for permanent or temporary occupancy. Such real estate may not be alienated without permission having first been obtained from the authority granting residence thereon. Slavery and polygamy prevail among them; and they have for many years engaged in piracy and predatory expeditions against the neighboring Filipinos. They remained unconquered by the Spaniards until the era of modern firearms, and were still an inexhaustible source of trouble when the sovereignty of Spain terminated. Their religion and peculiar customs, as well as their spirit of independence, have made the government of their country one of the greatest problems of the United States occupation of the Philippines. The Sulu Archipelago in 1901 was placed under military supervision and government in accordance with a treaty made by the United States representative and the sultan of Sulu, who has relinquished his authority (see **SULU**). In 1903 a law was passed by the Philippine Commission providing government for the Moro country of Mindanao and adjacent islands. This act provides that the civil governor of the Philippine Islands shall appoint for the Moro Province a governor and other officials who were to form the legislative council, which was empowered to organize education, create a form of local government, establish courts and enact laws providing for the abolition of slavery and the suppression of all slave hunting and slave trade. The Moros were informed in 1900 that slaves who sought the protection of the United States garrison would be considered free and their freedom enforced. The datto at Zamboanga in 1901 abolished slavery among his followers. In 1903 the legislative council of the Moro Province passed a law prohibiting slave hunting in all the province, which law was immediately confirmed by the Philippine Commission. The order for disarmament of the Moros, made in September 1911, is being systematically carried out, but led in 1913 to a rebellion which was not quelled till they had been pursued and conquered in the mountain fastnesses of Bagsak in Northern Jolo. In 1914 the department of

Mindanao and Sulu was created. Pop. 154,706. See PHILIPPINE ISLANDS.

**MOROSAURUS**, a genus of sauropodous dinosaurs (q.v.), with an extremely long and flexible neck and small body; found fossil in the Upper Jura beds of Wyoming and Colorado. It was related to *Brontosaurus*.

**MOROSINI, Andrea**, *ân-drâ'a mô-rô-sê'-nê*, Venetian historian: b. Venice, 13 Feb. 1558; d. there, 29 June 1618. He was educated in belles-lettres at Padua, and from 1583 was in the service of the state. In 1600 he entered the senate, later was three times elected to the Council of Ten and in 1598 was made official historiographer of the republic to continue the work of Paolo Paruta. He was given access to the state papers as far as 1594. His 'History of Venice from 1521 to 1615, appeared in 1623 (2d ed., 1719), and has been esteemed for its accuracy and elegant Latinity.

**MOROSINI, Francesco** (called the *PÉLO-PONNESIAC*), Venetian soldier: b. Venice, 1618; d. Napoli di Romagna, 6 Jan. 1694. He was a leading military commander of his day, and four times made generalissimo of Venetian forces. His career was almost a continuous struggle with the Turks. In 1656 he became governor of Candia, but in 1669 was compelled to surrender the island to Mehemet Koprili. His sobriquet was gained by later victories in the Morea. From 1688 he was doge of Venice. Daru ('*Histoire de la République de Venise*' 1819; 4th ed., 1853) calls him "the last of the Venetians."

**MORPETH**, England, market town in the municipal borough of the same name in Northumberland County and located on the Wansbeck. It has two Anglican and one Catholic church, a town-hall (dedicated 1869), a large prison, ruins of a castle, etc. It has an iron foundry, brewery, tanneries, etc., and does considerable trade in grain. Nearby are the ruins of the Newminster Abbey, dating from 1138. The neighboring village of Mitford also has interesting ruins of a 12th century castle and Bothal Castle dating from the 14th century is on the northern bank of the Wansbeck. North of Morpeth is a 15th century "peel" tower. Its population in 1911 was 7,433.

**MORPHEUS**, *môr'fûs*, in classical mythology a minister of the god *Somnus*, sometimes called the god of sleep. He is generally represented as a slumbering child, of great corpulence, wearing wings, and holding a vase in one hand, and in the other some poppies.

**MORPHINE**, an alkaloid occurring in opium, and constituting from 3 to 20 per cent of the crude drug depending upon where it originated. It has the chemical formula  $C_{17}H_{19}NO_5 + H_2O$ . In the crude opium morphine exists in the form of two salts—the meconate and sulphate of morphia; and as both of these salts are soluble in water their recovery from the opium is of the simplest. In the preparation of morphine the opium is digested with water at 100° F., common chalk is added, and the solution is evaporated to a small bulk. Calcium chloride in slight excess is then added, to precipitate the meconic acid that the extract contains, and after filtration the solution is

evaporated. Calcium meconate separates out first, after which crystals of the hydrochlorides of morphine and codeine are deposited. The latter crystals are re-dissolved in water and decomposed with ammonia, the morphine with a little codeine being thereby precipitated while most of the codeine remains in solution. The codeine is separated from the morphine by dissolving it with ether. Morphine dissolves in 10,000 parts of cold water, and in 500 parts of boiling water. It is also readily soluble in hot alcohol, but is insoluble in ether, benzene and chloroform. It is bitter and very poisonous, and crystallizes in small rhombic prisms, or needle-like crystals. Morphine acts as a base toward acids, and numerous salts of the alkaloid are known. In medicine, morphine is usually administered in the form of the sulphate or some other salt. When morphine is heated with hydrochloric acid in a closed tube, for two or three hours at a temperature of about 290° F. it loses a molecule of water and it becomes converted into another alkaloid which has the formula  $C_{17}H_{17}NO_5$ , and is known as "apomorphine." Apomorphine is also poisonous. Its salts, when administered in small doses, however, do not act as a narcotic, but as a powerful emetic. Special attention has been paid, by chemists, to the positive identification of morphine, owing to the frequent importance of such identification in medical jurisprudence. The subject is full of technical difficulties, especially when (as is commonly the case) morphine, if present, is mingled with large quantities of animal tissue, from which it must be separated before the tests are applied. Many such tests are known, of which the following are the most familiar: (1) A neutral solution of a ferric salt, when added to a neutral solution of a morphine salt, gives a blue color which is destroyed by heat, by alcohol and by acids. (2) If iodic acid and starch are added to a weak solution of a morphine salt, and a weak solution of ammonia is floated upon the mixture, a brown ring below a blue ring will be formed at the bounding surface that separates the liquids from each other. Consult *Autenrieth, W.* (Warren's translation), '*Laboratory Manual for the Detection of Poisons and Powerful Drugs*' (Philadelphia 1915).

**MORPHOLOGY**, the division of biological science which deals with the *form* of parts and organs of animals and plants, from Gr. *morphê*, form, and *logos*, doctrine, the term being equivalent to "science of form." The investigation of the structure of living organisms is the only true method by which we may become acquainted with their relations to each other, singly or in groups. Morphology thus lies at the foundation of physiology, and all true systems of classification and explanations of serial development. Goethe was the inventor of the term and was the first to direct attention to relations in structure presented by living beings. See PLANTS, ANATOMY OF; PLANTS, MORPHOLOGICAL EVOLUTION OF.

**MORPHY**, *môr'fi*, Paul Charles, American chess-player: b. New Orleans, La., 22 June 1837; d. there, 10 July 1884. He showed his fondness for chess at a very early age, and at 12 had defeated many of the local amateurs. At the College of South Carolina he studied

law for several years, occasionally playing a game. In 1837 at the first American chess congress held in New York, he had no difficulty in defeating his strongest opponents. During the next year, in England, he successfully met such players as Bird, Boden and Löwenthal, and astonished the world of chess by playing as many as eight games simultaneously and without the board. His playing in Paris, where he won five games out of eight against Harrwitz, and exhibited his blindfold skill, was equally surprising. In 1859 he returned to the United States and here met the famous German player Anderssen, winning 7 out of 11 games. Being now admitted to the bar, Morphy began to practise law in his native city; but his mental powers had been so impaired by the strain of his blind-fold chess-playing that he not only gave that up but relinquished chess entirely, and a little later abandoned all intellectual work. Morphy's skill at chess appeared to partake of the quality of genius. His brilliant achievements were not the result of long or deep deliberation, yet displayed all the elements usually observed when mental strength and quickness are sustained by profound study. Consult Löwenthal, 'Morphy's Games of Chess' (1860).

**MORRELL, Imogene Robinson**, American artist: b. Attleboro, Mass.; d. Philadelphia, 22 Nov. 1908. She was married to Abram Morrell in 1869. She studied art in the United States and Europe and was a pupil of Adolf Schroder at Düsseldorf and of Couture at Paris (1864). In 1874 she returned to America, opened a studio at Washington as a portrait and historical painter, and there established and became first president of the Washington National Academy of Fine Arts (1879). Some of the more notable paintings are 'The First Battle of the Puritans'; 'Washington Welcoming the Puritan Trains at Newburgh, N. Y.'; 'Portrait of General John A. Dix.'

**MORRILL, mor'il, Anson Peaslee**, American politician: b. Belgrade, Maine, 10 June 1803; d. Augusta, Maine, 4 July 1887. He at first engaged in business in his native town, then in 1833 was sent to the State legislature; was sheriff of Somerset County 1839-40, and in 1850 land agent. In 1853 he was an unsuccessful candidate for governor on the Prohibition and Free-Soil tickets, but the following year he was elected as the first Republican governor of Maine, and later was a delegate to the convention which nominated Frémont. In 1860 he was elected to Congress, but declined a re-election.

**MORRILL, Justin Smith**, American senator: b. Strafford, Vt., 14 April 1810; d. Washington, D. C., 28 Dec. 1898. He received a good primary and secondary education, was a merchant and then a farmer; was first elected to the House of Representatives in 1854. In 1867 was transferred to the Senate, in which he was long chairman of the committee of finance. With his 12 years in the lower house and 31 in the upper, he was more closely connected with Congress than any other man of his time, and was styled "The Father of the Senate." His college bill of 1858, for the creation of seats of learning in newly-settled States, has, with supplemental legislation, resulted in the erection of some 70 colleges. He introduced the war revenue tariff of 1861,

commonly called the Morrill tariff, and during his later years consistently opposed the re-coinetization of silver. Senator Morrill wrote 'The Self-Consciousness of Noted Persons' (1886). Consult G. W. Atherton, 'The Legislative Career of Justin S. Morrill' (Washington 1901).

**MORRILL, Lot Myrick**, American politician: b. Belgrade, Maine, 3 May 1813; d. Augusta, Maine, 10 Jan. 1883. He was educated at Waterville College (now Colby University), studied law and was admitted to the bar in 1839, when he went to Augusta and established a law practice. He took an active part in politics, in 1853 was elected to the legislature, and in 1856 was chosen president of the senate. He was governor of his State 1858-60, and in the latter year was elected to the United States Senate, where he proved himself an indefatigable worker. He favored the resumption of specie payment and was an authority on financial, naval and Indian affairs. In 1876 he retired from the Senate to become Secretary of the Treasury under President Grant, and during his administration of that office constantly urged the return to specie payment. He declined an appointment to a foreign mission under President Hayes, and in 1887 became collector of customs at Portland, Maine, in which office he died.

**MORRILLTON**, Ark., capital town of the county of Conway, 50 miles by rail from Little Rock. It has manufactures of cottonseed oil, furniture, woollens, lumber, etc., and has a fair trade in cotton and cattle. The town owns its electric light and waterworks, and in 1910 had a population of 2,424.

**MORRIS, Benjamin Wistar**, American Protestant Episcopal bishop: b. Wellsborough, Pa., 30 May 1819; d. Portland, Ore., 8 April 1906. He was graduated from the General Theological Seminary in 1846 and held successive rectorates in Sunbury, Manayunk and Germantown, Pa. He was consecrated missionary bishop of Oregon and Washington in December 1868, and on the division of the diocese in 1880, became bishop of Oregon. He has published 'Presbyterian, Baptist and Methodist Testimony to Confirmation' (1860).

**MORRIS, Charles**, English song writer: b. 1745; d. near Dorking, Surrey, 11 July 1838. In 1764 he entered the 17th foot, with which he served in America, later exchanged into the Irish Dragoons and then into the 2d life-guards, in 1785 was made bard of the Beefsteak Society, and before its gatherings sang many of his wittiest efforts. He was a boon companion and associate of Fox and the Prince Regent. His humor and vivacity led Curran to say, "Die when you will, Charles, you will die in your youth." He wrote hundreds of songs, many being political ditties for the Whigs; and a posthumous volume, 'Lyra Urbanica' (1840) collected them. His 'A Reason Fair to Fill my Glass' was praised by Moore and set to music by Charles Dibdin.

**MORRIS, Charles**, American naval officer: b. Woodstock, Conn., 26 July 1784; d. 27 Jan. 1856. Entering the navy in 1799, he participated in the war with Tripoli, was an actor in the recapture of the *Philadelphia*, in the harbor of Tripoli (1804), being the first to gain her

deck when she was boarded. At the outbreak of the War of 1812 he was serving as executive officer of the *Constitution*; he was wounded in the engagement of *Old Ironsides* with the *Guerrière* (August 1812); and afterward successfully commanded the *John Adams* until, being blockaded by a British squadron in Penobscot River, he was compelled to destroy his ship to save her from being taken by the enemy. In the war with Algiers (1815) he commanded the *Congress*, and it was he who, in the *Brandywine*, carried Lafayette home to France (1825). After serving for some years as naval commissioner and as supervisor of the United States Naval Academy he became chief of the bureau of ordnance and hydrography, which position he held till the time of his death. Consult his 'Autobiography' (1880).

**MORRIS, Charles**, American author: b. Chester, Pa., 1 Oct. 1833. He was educated in Chester, engaged for a short period in teaching; for a considerable time was manager in a manufacturing concern; and since 1878 has devoted himself to literary work. His publications include 'A Manual of Classical Literature'; 'The Aryan Race'; 'Civilization, an Historical Review of its Elements'; 'Historical Tales' (12 vols.); 'The War with Spain'; 'Our Island Empire'; 'Man and his Ancestor'; 'Famous Men and Great Events of the Nineteenth Century'; 'Home Life in All Lands'; a series of histories of the United States; 'History of the World' and 'History of Pennsylvania,' for school purposes; 'The Old South and the New'; 'The Story of Mexico'; 'Heroes of America' (4 vols.); 'The Nations of Europe'; 'Famous Days and Deeds in Belgium and Holland,' and various others. He also compiled 'Half Hours with the Best Authors' (18 vols.); 'Elocution, Oratory and Entertainment' (4 vols.); 'The Famous Orators of the World'; 'Handy Dictionary of Biography,' etc. He edited 'Winston's Universal Dictionary'; 'The International Dictionary'; 'Winston's Cumulative Encyclopedia'; and did editorial work on 'Lippincott's Biographical Dictionary,' and 'Chambers'; 'Twentieth Century,' and other encyclopedias.

**MORRIS, Clara**, American actress: b. Toronto, Canada, 1849. After early study in Cleveland, she became leading lady in Wood's Theatre, Cincinnati, Ohio, and in the winter of 1869-70 joined Augustin Daly's Fifth Avenue Company, New York. She at once achieved success in emotional rôles and afterward made many tours throughout the United States. Her leading rôles include 'Camille'; 'Alixé in the 'Countess de Sommeville'; 'Mercy Merrick'; 'Miss Multon'; 'Lady Macbeth'; 'Leah the Forsaken'; and Cora in 'L'Article 47.' After her retirement from the stage she wrote much for periodicals and published in book-form 'A Silent Singer' (1899); 'My Little Jim Crow' (1900); 'A Pastboard Crown,' fiction (1902); 'Stage Confidences' (1902); 'The Trouble Woman' (1904); 'The Life of a Star' (1906); 'Left in Charge' (1907); 'New East Lynne' (1908); 'Dressing Room Receptions' (1911). She was married to F. C. Harriott in 1874. In her later years she was afflicted with blindness.

**MORRIS, Sir Daniel**, British colonial expert: b. Loughor, Glamorgan, 26 May 1844. He was educated at Cheltenham, at the South Ken-

sington Royal College of Science and at Trinity College, Dublin, where he received high honors. He was assistant director of the Royal Botanic Gardens of Ceylon in 1877; investigated and checked the coffee-leaf disease; became director of the Botanic Department of Jamaica in 1879; was commissioner in the West Indian Imperial Department 1898-1908; a member of the Canadian and West Indian Trade Commission 1909-10; and was scientific adviser in tropical agriculture to the Colonial Office 1908-13. He was created K.C.M.G. in 1903. Among his publications are 'Cacao: How to Grow and How to Cure it' (1882); 'Agricultural Resources of Saint Helena' (1884); 'The Vegetable Resources of the West Indies' (1888); 'Sisal Industry of the Bahamas' (1896); and 'Cantor Lectures on Plants yielding Indiarubber' (1898).

**MORRIS, Edward Joy**, American author: b. Philadelphia, Pa., 16 July 1815; d. there, 31 Dec. 1881. He was graduated from Harvard in 1836 and was admitted to the bar in 1842. He was a member of the Pennsylvania legislature in 1841-43 and of Congress in 1843-45, and in 1850 was appointed to a mission in Naples where he remained four years. He was again in Congress as a representative of Pennsylvania in 1858-61, and from 1861-70 was Minister to Turkey. He published 'Notes of a Tour through Turkey' (1842) and numerous translations.

**MORRIS, Edward Parmelee**, American Latinist, best known as a Plautine scholar: b. Auburn, N. Y., 1853. He was graduated at Yale in 1874, studied at Leipzig and Jena, was professor of Latin at Williams 1885-91, and since the latter date at Yale, and edited the following plays of Plautus: 'Mostellaria,' 'Pseudolus' (1890), and 'Captives and Trinummus' (1898); Horace's 'Satires' (1909) and 'Epistles' (1911); 'Sentence-Questions in Plautus and Terence'; 'The Subjunctive in Plautus' and 'Principles and Methods in Syntax' (1902).

**MORRIS, George Perry**, American journalist: b. Montclair, N. J., 18 Feb. 1864. He was educated at Rutgers College and Johns Hopkins University, and in 1891 was associate editor of the Boston *Congregationalist*. In 1888-90 he was on the editorial staff of the *New York Mail and Express*, on the Boston *Congregationalist* in 1891-1907 and on the staff of the Boston *Herald* 1907-11. Since 1911 he has been on the staff of the *Christian Science Monitor*. He has published 'The Norwegian Company System' (1894); 'Historic Towns of New England' (1898). He is a contributor to various magazines, especially character studies of living notables in *Review of Reviews*.

**MORRIS, George Pope**, American journalist and poet: b. Philadelphia, 10 Oct. 1802; d. New York, 6 July 1864. With Samuel Woodworth (q.v.), in 1823, he founded the *New York Mirror*, a weekly journal of literature, afterward published as the *New Mirror* and the *Evening Mirror*, in which many of the early writings of Bryant, Poe, Halleck, Willis and other American authors first appeared. In 1845 Morris established the *National Press*, which in the following year became the *Home Journal*, and which, with the assistance of N. P. Willis (q.v.), he continued to edit almost to the end

of his life. He wrote 'Briarcliff,' a popular drama (1825) and edited 'American Melodies' and (with Willis) 'The Prose and Poetry of America' (1845). His 'Poems' (final collection, 1860) included 'Woodman, Spare that Tree'; 'A Long Time Ago'; 'My Mother's Bible'; and other well-known pieces.

**MORRIS, George Upham**, American naval officer: b. Massachusetts, 3 June 1830; d. Jordan Alum Springs, Va., 15 Aug. 1875. He was appointed midshipman in the navy in 1846 and received steady promotion. In 1862 he was made lieutenant-commander and assigned to the *Cumberland*, and was in temporary command of her when she was attacked by the *Merrimac* in Hampton Roads. The gallant seamanship displayed by Morris on this occasion evoked the admiration of the country. He refused to leave the ship and stood at his post as she went down, but was rescued by some of his men. He afterward had command of the gunboat *Port Royal* and was engaged on the James River, at Fort Darling, and later at Fort Powell and at Grant's Pass. He was promoted commander in 1866 and retired in ill-health in 1874.

**MORRIS, Gouverneur**, American statesman: b. Morrisania, N. Y., 31 Jan. 1752; d. there, 6 Nov. 1816. He was graduated in 1768 from King's College (now Columbia University); after study of the law was licensed in 1771 to practise as an attorney; did excellently well at the bar; and during the earlier difficulties between Great Britain and the American colonies maintained a conservative attitude and was eager to effect a compromise. Finally, however, he identified himself with the patriot cause and was elected from Westchester County to the provincial congress of New York (1775). In this assembly he became the leader of the patriotic party and made an able speech favoring the adoption of the recommendation of the Continental Congress that the colonies establish new governments. A delegate to the constitutional convention of New York, he was chosen to the committees for drafting a plan for the constitution — in which Livingston and Jay were also prominent — and for establishing a State fund. In 1777–80 he was a member of the Continental Congress, and almost immediately upon taking his seat was appointed one of a committee of five to visit Valley Forge and examine the condition of the troops. Early in 1779 he was made chairman of the important committee for receiving communications from our ministers abroad, and from the envoy of France. In this capacity he drew up the draft of instructions to the ministers which was adopted by Congress and formed the basis of the Treaty of Peace with Great Britain. In February 1780 he began the publication in the *Pennsylvania Packet* of a series of essays on American finances, in which he endeavored to show the wisdom of the colonists submitting to a reasonable taxation and outlined a scheme for such assessment. These essays influenced his appointment in 1781 as assistant financier to Robert Morris, a post he successfully filled until 1785. He was really the founder of the national coinage, though his plan was later modified by Jefferson and Hamilton; he introduced the decimal notation and devised the word "cent" to indicate one of the lesser coins. In

1787 he was a delegate to the constitutional convention, and there he advocated a strongly centralized government, and finally revised the draft of the instrument. He was in France in 1788–91 for the transaction of private business, witnessing the stirring events of the French Revolution, and of which he kept a diary, and in 1791 was appointed by Washington a confidential agent to treat with Great Britain regarding certain unfulfilled articles of the treaty of peace. In 1792–94 he was minister to France, and in 1800–03 was United States Senator, filling a vacancy. He supported the Louisiana Purchase, but opposed the abolition of direct taxes and of the judiciary system. In 1810–13 he was chairman of the Erie canal commission; in the entire plan for this waterway, which he wished to make large enough for ships, he was a leader. He was keen in intellect, an excellent orator and rendered notable services to America. During the War of 1812 his ultra-Federalist views led him into positions that were extravagant and unwise. He pronounced funeral orations on Washington, Hamilton and Clinton; published pamphlets and addresses; and latterly contributed to newspapers political satires in both prose and verse. Consult Sparks, 'Life' (1832); Roosevelt, 'Life' (1888; 'American Statesmen' series); Morris, A. C., 'Diary and Letters of Gouverneur Morris' (1888).

**MORRIS, Gouverneur**, American novelist, great-grandson of the preceding: b. New York, 7 Feb. 1876. He was graduated from Yale in 1898 and has published 'A Bunch of Grapes' (1897); 'Tom Beauling' (1901); 'Aladdin O'Brien' (1902); 'The Pagan's Progress' (1904); 'The Footprint and Other Stories' (1908); 'Putting on the Screws' (1909); 'Spread Eagle, and Other Stories' (1910); 'The Voice in the Rice' (1910); 'It and Other Stories' (1912); 'If You Touch Them They Vanish' (1913); 'The Incandescent Lily and Other Stories' (1914); 'Seven Darlings'; 'When My Ship Comes In' (1915); 'We Three' (1916).

**MORRIS, Harrison Smith**, American author: b. Philadelphia, 4 Oct. 1856. He was educated in the public and private schools, and early began to do literary work. From January 1899 to 1905 he was editor of *Lippincott's Magazine*. He is versed in the history of art, and was managing director of the Pennsylvania Academy of Fine Arts, in Philadelphia, from 1893 to 1905. He has written 'A Duet in Lyrics,' poems, with J. A. Henry (1883); 'Tales from Ten Poets' (1893); 'Madonna and Other Poems' (1894); a continuation of Lamb's 'Tales from Shakespeare' (1893); 'Lyrics and Landscapes' (1908); a 'Life of William T. Richards' (1912) and has edited 'In the Yule Log Glow' (1892) and 'Where Meadows Meet the Sea' (1892). He was president of Wharton Steel Company (1909–17), and has been chairman of the committee on ways and means of the National Academy of Design, New York; was commissioner general of the United States of America to Roman Exposition of 1911 and decorated with Grand Cordon of Crown of Italy. He is a member and former vice-president of the National Institute of Arts and Letters; member of the American Philosophical Society and in 1915 became president Contemporary Club, Philadelphia.

**MORRIS, Sir Henry**, English physician: b. Petworth, Sussex, 7 Jan. 1844. He was educated at Epsom College and University College and studied medicine and surgery at Guy's Hospital, London. Established in practice, he delivered the Cavendish lecture (1893), Hunterian lectures (1898) and was Bradshaw lecturer at the Royal College of Surgeons (1903), since which he has distinguished himself frequently on the lecture platform. He was former surgeon and lecturer in anatomy and surgery at Middlesex Hospital Medical College, examiner in surgery at University of London and in anatomy at University of Durham. He was for six years chairman of the Court of Examiners of Royal College of Surgeons, president of the Royal Society of Medicine (1910-12) and Royal College of Surgeons (1906-09). He was created baronet 1909. Among his literary works are 'Anatomy of the Joints of Man' (1879); 'Surgical Diseases of the Kidney and Ureter' (1885); 'Gynecology' (1891); 'Injuries and Disease of the Genital and Urinary Organs' (1895); 'Treatise on Human Anatomy' (1898; 4th ed., 1907). His 'Treatment of Inoperable Cancer' (1902) and 'Suggestion in Relation to the Treatment of Disease' (1910); 'Looking Back; Christian Science Refuted' (1909), all contributed to his reputation.

**MORRIS, Henry W.**, American naval officer: b. New York, 1806; d. there, 14 Aug. 1863. He entered the navy in 1819 and in 1828 was made lieutenant. He was on duty in New York and various other stations from 1839 until 1855, when he was fleet-captain in the Mediterranean under Commodore Stringham. In 1861 he superintended the completion of the *Pensacola*, and in 1862 took command of her, successfully passed the Confederate fortifications on the Potomac and took a distinguished part in the battles at Fort Jackson, Fort Saint Philip and Chalmette. He guarded New Orleans after its capture, but failing health necessitated his return to the North; where he soon after died. He was promoted commodore in 1862.

**MORRIS, John**, English Jesuit: b. Ootacmund, India, 1826; d. 1893. He studied (1845) at Trinity College, Cambridge, became (1846) a Roman Catholic, was ordained (1849) to the English mission, and became vice-rector of the English College, Rome (1852-55). Returning to England he was appointed secretary to Cardinal Wiseman and to his successor Cardinal Manning. He entered the Society of Jesus in 1867, was rector of Saint Ignatius College, Malta (1877-78), was made professor of canon law and church history at Saint Bruno's College, Saint Asaph (1879) and was rector at Southampton 1880-86. He wrote 'Condition of Catholics under James' (1871); 'The Troubles of our Catholic Forefathers' (1875); 'Cardinal Wiseman's Last Illness' (1871); 'Life and Martyrdom of Saint Thomas Becket' (2d ed. 1885). Consult Pallen, J. H., 'Life and Letters of Father John Morris' (London 1896).

**MORRIS, John Gottlieb**, American Lutheran clergyman: b. New York, 14 Nov. 1803; d. Lutherville, Md., 10 Oct. 1895. He was graduated from Dickenson College in 1823 and studied theology at the Princeton and Gettysburg seminaries, receiving his license to preach in 1826. He founded the first English Lutheran

church of Baltimore and was in charge of it from 1827-60, after which he held various important charges. He was chiefly instrumental in the founding of the College for Women in Lutherville and of the town. From 1834 until his death he was lecturer at Pennsylvania College, and he also lectured in the Smithsonian Institution at Washington. He was prominently connected with scientific and religious societies, and founded the *Lutheran Observer* in 1831 which he edited until 1833. He was librarian of the Peabody Institute at Baltimore, 1860-64. Among his many publications are 'Catechumen's and Communicant's Companion' (1831); 'Life of John Arndt' (1853); 'Fifty Years in the Lutheran Ministry' (1878); 'Memoirs of the Stork Family' (1886), etc.

**MORRIS, Lewis**, American statesman: b. New York, 1671; d. Kingsbury, N. J., 21 May 1746. He practised law in New York, was judge of the Superior Court of New York and New Jersey in 1692, became one of the governor's council and a member of the assembly, and drew up and presented to Queen Anne the complaint against Governor Cornbury formulated by the assembly. From 1710-38 he was chief-justice of New York and New Jersey, in 1731 was acting governor of New Jersey, in 1738 was prominent in effecting the separation of New Jersey from New York, and from 1738 until his death was governor of New Jersey.

**MORRIS, Lewis**, American patriot, one of the signers of the Declaration of Independence: b. Morrisania, Westchester County, N. Y., 1726; d. there, 22 Jan. 1798. After being graduated at Yale College in 1746 he engaged in farming on a very extensive scale on his paternal estate at Morrisania. He took strong ground against the act of Parliament compelling the inhabitants of the province of New York to furnish with supplies the foreign troops quartered upon them. He was elected to the Congress of 1775, was a member of the committee to devise means for supplying the colonies with munitions of war, and after the close of the session was sent west to detach the Indians from the British. In 1776 he resumed his seat in Congress, and signed the Declaration of Independence, although his estate was at that time in the hands of the enemy. As a consequence his manor was laid waste and his family expelled. In 1777 he was succeeded in Congress by Gouverneur Morris, his half brother, but afterward served in the State legislature. The latter part of his life was spent at Morrisania. He was one of the boldest and most zealous promoters of the Revolution.

**MORRIS, Sir Lewis**, Welsh poet: b. Carmarthen, Wales, 23 Jan. 1833; d. London, England, 12 Nov. 1907. He was graduated from Jesus College at Oxford, studied law and was admitted to the bar of Lincoln's Inn in 1861, practising until 1881. Was deputy chancellor of University of Wales and prominently associated with the cause of education. In 1895 he was knighted. His verse was fluent, the utterance of simple truths in unaffected language, and it was very popular, but deficient in strength, his 'Epic of Hades' (1876-77) going through many editions. Other volumes of his verse are 'Songs of Two Worlds' (1871-75); 'Gwen: a Drama in Monologue' (1879); 'The Ode of Life' (1880); 'Songs Unsung' (1883);

'A Vision of Saints' (1890); 'Harvest Tide' (1901); 'The Life and Death of Leo the Armenian' (1904); 'The New Rambler: From Desk to Platform' (1905), etc.

**MORRIS, Mary Philipse**, American Tory; b. Philipse Manor, New York, 1736; d. York, England, 1825. She was one of the famous Philipse family, daughter of the second lord of the Manor, Frederick Philipse. A beautiful brunette, she is the original of Cooper's heroine in 'The Spy,' and was long said to be one of George Washington's loves; but the story that she rejected him is untrue. Two years after meeting Washington she married George Morris (1758), an English officer, with whom she lived in what was afterward Washington's headquarters and the Jumel house. Her property was confiscated at the opening of the Revolution and she went to England. Her surviving children, being free from attaind according to the ruling of the English Attorney-General, sold their rights to John Jacob Astor for \$100,000, and the British government paid them more for their losses.

**MORRIS, Robert**, American financier and statesman, a signer of the Declaration of Independence; b. Liverpool, England, 31 Jan. 1734; d. Philadelphia, 8 May 1806. He came to the colonies about 1747 and entered at Philadelphia the counting-room of Charles Willing, merchant; in 1754 formed a partnership with Thomas Willing maintained until 1793; acquired a very considerable fortune for the America of that time; and despite his strong loyalty to England, opposed the Stamp Act and signed the non-importation agreement of 1765. In October 1775 he was elected to the provincial assembly, and in 1776-78 was a member of the Continental Congress. On 2 July 1776 he voted against the Declaration of Independence and on 4 July absented himself; but on 2 August he was one of the signers. When hostilities began his services became of increasing value. When Congress fled from Philadelphia to Baltimore on 12 Dec. 1776, Morris was left in charge of its affairs, and when it reassembled at Baltimore on 20 December was made with George Clymer of Pennsylvania and George Walton of Georgia a committee for the execution of Continental business. Morris did all that was done. Most of the business of the colonies during December and January was transacted by him; he prepared American ships for sea, assumed charge of incoming freights and supplied Washington with money. On 20 Feb. 1781 he was elected superintendent of finance. He found the treasury in a disordered state through a vastly depreciated paper currency, and at the lowest point in the fortunes of the Continental army borrowed money on his own credit and was the instrument in the difficult task of financing the war. He presented to Congress a plan for the organization of the Bank of North America, accepted 28 May; and himself subscribing \$39,200 worth of shares. The bank was incorporated 31 Dec. 1781 and began operation 7 Jan. 1782. Morris resigned January 1783, but on request did not retire until 1 Nov. 1784. He was a member of the Pennsylvania assembly in 1776-78, 1778-79, 1780-81, 1785-87. In 1787 he was a member of the convention that framed the United States Constitution. He declined the Secretaryship of

the Treasury, and was United States Senator from Pennsylvania in 1789-95. With James Greenleaf and against Washington's advice, he entered land speculation, held vast territories, especially in the western half of New York State in anticipation of immigration after the war, and purchased in the new city of Washington 6,000 lots at \$80 each, and agreeing to build yearly 20 brick houses. Largely through the defaulting of his partner he was compelled to make an assignment, and was imprisoned for debt at Philadelphia from 19 Feb. 1798 to 26 Aug. 1801. The influence of his credit, his ability in raising loans and his financial skill were of the utmost importance to the struggling cause of the Revolution; and it is generally admitted that he was a momentous force in Washington's administration and fully earned the title of the "Financier of the Revolution." Consult Sparks, 'Diplomatical Correspondence of the Revolution' (1829-30); the 'Life' by Sumner (1892) in the 'Makers of America' series; Rolles, 'Financial Administration of Robert Morris' (1878), and Oberholtzer, 'Robert Morris: Patriot and Financier' (1903).

**MORRIS, Thomas**, American statesman; b. Augusta County, Va., 3 Jan. 1776; d. Bethel, Ohio, 7 Dec. 1844. He removed in 1795 to Columbia, Ohio, and was employed by the Rev. John Smith, the first senator from Ohio. He fixed his residence in 1800 in Clermont County, studied law, was admitted to the bar, was a member of the State legislature from 1806 to 1830, was a judge of the State Supreme Court (1815-21), and in 1832 was elected to the United States Senate as a Democrat, where he distinguished himself as an opponent of slavery and was engaged in important debates with Calhoun and Clay in defense of the right of petition and of the duty of the general government to discourage slavery. His anti-slavery sentiments rendered him distasteful to the Democratic party, by which he had been elected, and he permanently retired in March 1839. In 1844 he was nominated for Vice-President by the Buffalo convention of the Liberty party, on the ticket with J. G. Birney (q.v.) for President. Consult the 'Life' by F. B. Morris (1856).

**MORRIS, William**, English poet and artist; b. Walthamstow, Essex, 24 March 1834; d. Hammersmith, London, 3 Oct. 1896. He was educated at Marlborough College and Exeter College, Oxford, where he began a lifelong friendship with Edward Burne-Jones. Both were attracted by the Anglo-Catholic revival, and intended to enter the Anglican priesthood, but early abandoned that resolve, and was for some nine months a pupil in the office of the noted architect, George Edmund Street. In 1856 he founded *The Oxford and Cambridge Magazine*, to which he contributed often, and which he published at his own expense for the year it was issued. Two years later (1858) appeared 'The Defense of Guinevere and Other Poems,' in the pages of which the temper of the Middle Ages may be said to find its most accurate modern interpretation. In 1867 he published the 'Life and Death of Jason,' an epic of 17 cantos in heroic couplets, which showed him to be a teller of stories *par excellence*. By this time he had definitely entered upon his career.

of weaver anew of old tales from classic or mediæval sources, and the next year (1868) appeared the first volume of 'The Earthly Paradise,' a series of stories retold from classical and mediæval originals, but with a mediæval setting. A second and third volume followed in 1869 and 1870, the entire work comprising 24 tales with the addition of interludes and preludes and 12 lyrics of the months. In 'The Earthly Paradise,' as in the 'Jason,' Morris took Chaucer for his master as well in the structure of his verse as in what may be termed the processional nature of his descriptive passages. Three verse forms are employed by him, the seven-lined decasyllabic stanza known as the Chaucerian heptastich, the four-foot couplet and the heroic couplet. 'The Earthly Paradise' includes some 40,000 lines, but when once the reader has fallen under the poet's sway his leisurely manner will not be found wearisome. In 'The Lovers of Gudrun,' one of the tales of 'The Earthly Paradise,' Morris had already turned to Iceland for a theme and in 'The Story of Sigurd the Volsung and the Fall of the Niblungs' (1876) he returned to Icelandic myth for his subject. The poet regarded this poem as his masterpiece and in the opinion of not a few critics it ranks as almost the greatest, if not the greatest epic of the 19th century. In his hands the ancient myth becomes alive and throbs with all the intensity of primeval passion. Besides these works Morris published also in verse 'Love is Enough, or the Freeing of Pharamond' (1872); 'The Æneids of Virgil done into English verse' (1875), in which the metre adopted is that of Chapman's Homer; 'The Odyssey of Homer done into English verse' (1887); 'The Dream of John Ball' (1888), and 'Poems by the Way' (1892).

In 1859 Morris married Miss Jane Burden. In 1861 he founded the firm of Morris, Marshall, Faulkner and Company and began the manufacture of wall-paper, stained glass and artistic furniture, and to his labors in this particular is traceable much of the reform which English and American trade has experienced in household art during the last generation. In 1890 he established the Kelmscott Press at Hammersmith, and there published exquisitely printed editions of Chaucer, Beowulf and other works, as well as of his own writings. Still another side of his nature was shown in the trend of his human sympathies. He had long been known as poet and craftsman, but from 1885 he was active as a social reformer, lecturing frequently to workmen in halls or in the open air, and helping to support the *Commonwealth*, a Socialist journal. It is not wholly easy to understand this side of his nature, for intensely democratic as he became, in theory at least, he was an equally intense lover of that very beauty which a social upheaval would destroy. The ugliness of much of modern life led him to Socialism, but he was thoroughly sincere in his attitude, illogical as it may seem to many. However difficult it may be to adjust satisfactorily to our minds the attitude of the poet-Socialist with the character of his work as a craftsman, which was offered to the world at prices practically prohibitory for the majority of persons, it is an unquestionable fact that the world is a pleasanter, wholesomer world for his having lived in it. He helped

his generation to perceive that there is no necessary alliance between utility and ugliness; he raised the standard of household taste, and as a poet he was one of the most melodious of his time. In his later years he essayed a form of composition in mingled prose and verse greatly enjoyed by many, though perhaps not wholly to the taste of those who liked him best as the author of 'The Earthly Paradise' and 'Sigurd'—a series of romances beginning with 'The Tale of the House of the Wolfings' (1889), and succeeded by 'The Roots of the Mountains' (1890); 'News from Nowhere' (1891); 'The Story of the Glittering Plain' (1891); 'The Wood beyond the World' (1894); 'The Well at the World's End' (1896); 'The Water of the Wondrous Isles' (1897), and 'The Story of the Sundering Flood' (1898). With Erikir Magnusson, the Icelandic scholar, he published 'The Story of Grettir the Strong' (1869); 'Volsunga Saga' (1870), and 'Three Northern Love Stories and Other Tales' (1875). Still other works by him are 'The Decorative Art' (1878); 'Hopes and Fears for Art' (1882); 'Signs of Change' (7 lectures, 1888); with Belfast Bax, 'Socialism: Its Growth and Outcome' (1893); 'Architecture, Industry and Wealth' (1903). Morris received a tentative offer of the laureateship on the death of Tennyson, but his socialistic theories would have suited ill with the post, and he indicated that it would not be acceptable to him. He was a devoted admirer of mediæval architecture, and his account in the 'Earthly Paradise' of the front of Peterborough cathedral is one of the finest descriptions of an architectural feature to be found in English literature. He wrote the excellent monograph on 'Mural Painting' in the ninth edition of the 'Encyclopædia Britannica.' See THE EARTHLY PARADISE. Consult the 'Lives' or studies by Cary (1902); Clutton-Brock (1914); Jackson, Holbrook (1908); Mackail (1899); Noyes, Alfred (1909); Vallance (1897); Riegel, 'Die Quellen von William Morris's Dichtung, "The Earthly Paradise," in Erlanger Beiträge zur englischen Philologie' (1890); Warwick, 'William Morris, His Homes and Haunts' (1912); 'Collected Works of William Morris' (20 vols., London 1913); and Saintsbury, 'Corrected Impressions' (1895).

**MORRIS, William O'Connor**, Irish jurist and author: b. Kilkenny, 26 Nov. 1824; d. 3 Aug. 1904. He was educated at Oxford, was admitted to the Irish bar in 1854 and has been a county court judge from 1872. He is the author of 'Great Commanders of Modern Times'; 'Napoleon'; 'Moltke'; 'Irish History'; 'Hannibal'; 'Ireland: 1798-1898'; 'The Great Campaign of Nelson'; 'The Campaign of 1815'; and 'Memories and Thoughts of a Life' (1895).

**MORRIS**, an island at the entrance to Charleston Harbor, S. C., south of the main channel. It is east of James Island, nearly a mile south of Fort Sumter and about a mile and a half from Fort Moultrie. At Cummings Point, on the north end of the island, three small batteries took part in the bombardment of Fort Sumter, 12-13 April 1861. Later Battery Wagner was constructed on the south end of the island and the batteries on the north end

were strengthened and called Battery Gregg. Attempts were made, in 1863, by the Union forces under Admiral Du Pont and General Hunter, to secure possession of the island, and later by Admiral Dahlgren and General Gilmore. A landing was made on 10 July and on the 11th and 18th an encounter took place, and a regular siege began. See FORT SUMTER.

**MORRIS, Ill.**, city and county-seat of Grundy County, 59 miles southwest of Chicago, on the Illinois River, the Illinois and Michigan Canal, the proposed Lakes to Gulf Deep Waterway, the Chicago, Rock Island and Pacific Railroad; the Chicago, Ottawa and Peoria and the Fox and Illinois Union electric interurbans. The first settlement was made in 1834, and in 1857 the town was incorporated. The surrounding country is a fertile agricultural region in which there are large bituminous coal fields and beds of clay used for brick and tile. Industries include a paper mill with box-board factory in connection, oat meal mill, large tannery, cut glass, heavy hardware, novelties, factories and a brewery. Three national banks containing highest per capita deposits of any in State in towns of 5,000 class. Morris is the seat of one of the largest sheep feeding and shearing yards between Chicago and western ranges. The town is the seat of Saint Angela's Academy. It has a new, all modern high school building and four new modern ward schools. Also has large parochial school. Pop. 4,563.

**MORRIS, Minn.**, village, county-seat of Stevens County, on the Great Northern and Northern Pacific railroads, about 160 miles west by north of Saint Paul. Good water power is obtained from the Pomme de Terre River which is near. The chief product of the surrounding agricultural region is wheat. The principal manufactures of the village are flour and dairy products. The three local banks have combined resources of \$1,200,000. There are several grain elevators, flour mills, cement works, fanning mill plant, tiles, elevators, creamery, stock yards and lumber and brick yards. The village has two good schools, a high school, general hospital, parochial school, seven churches, two theatres, an armory, fire hall and a public library. It is also the seat of the West Central School of Agriculture and of Assumption College (R.C.). The value of all taxable property is \$650,000. The government is vested in a commission of three with city manager. The municipal receipts average about \$35,000. Pop. 2,500.

**MORRIS DANCE, or MOORISH DANCE**, supposed to have been derived from the Moriscos in Spain, was formerly danced at puppet-shows, etc. It was introduced into England in the reign of Edward III, when John of Gaunt returned from Spain. In the May-games morris-dancers formed an important part with Robin Hood, Friar Tuck, Little John and the Hobby Horse were introduced as characters in the dance. In the reign of Henry VIII the morris-dancers were dressed in gilt leather and silver paper, and sometimes in coats of white and spangled fustian. Suppressed by the Puritans it survives in the country dance so named in the north of England.

**MORRIS PARK.** See HORSE-RACING.

**MORRIS PLAN, The.** The Morris Plan of industrial loans and investments takes its name from a Southern lawyer, Arthur J. Morris, formerly of Norfolk, Va., but now of New York. Over 100 companies were organized to operate this plan within the nine years ended 23 March 1919; the capital invested was about \$12,000,000, and the amount of money lent to about 660,000 borrowers was near \$100,000,000. Loans are now running at the rate of \$36,000,000 a year. The urgent though unvoiced demand for a special banking institution for the benefit of the industrial class—such as had existed on the continent of Europe for over half a century—was first met in this country by the Fidelity Savings and Trust Company, of Norfolk, modestly capitalized at \$20,000, which began the operation of the Morris Plan on 23 March 1910. The Plan itself may be briefly described as follows:

A man needs a small sum of money to tide him over some urgent financial difficulty. Being unknown at the commercial banks and having no securities he can borrow on, he has to rely on the generosity of a friend, trust to the tender mercies of a loanshark, or seek relief at the counter of a Morris Plan company. Here, if his application is granted, for each \$50 borrowed he pays \$1 toward the cost of investigation, and gives a promissory note signed by himself and two friends who, as co-makers, guarantee his honesty and earning capacity. This note is discounted at the legal rate of interest, and for each \$50 of his indebtedness the borrower agrees to pay \$1 a week toward the purchase of a certificate of investment equaling the amount of his loan. At the end of 50 weeks he has paid for this certificate in full, and two weeks later he may cash it at the company's office and pay off his note, which is then due. He has not had to pawn his watch or mortgage his furniture, and instead of paying a ruinous rate of interest to a disreputable money-lender he has dealt with honest people who have treated him fairly and squarely. When his debt is paid he may, if he wishes, subscribe for one or more of the company's certificates of investment, bearing interest at 5 per cent from date of payment, and pay for the same either with cash down or on the instalment plan; and these certificates will be available as security for future loans, in which case no endorsements will be necessary. Many a man who begins as a borrower ends by becoming an investor in interest-bearing Morris Plan certificates; but one does not have to be a borrower in order to buy them.

Most Morris Plan loans are made to wage-earners or small-salaried workers, but many are made to individuals, firms or small corporations to extend their business.

The first Morris Plan companies were organized in the South, but to-day there are more of them in Massachusetts than in any other State, North Carolina coming second. They extend in the Atlantic States from Manchester, N. H., to Atlanta, Ga., and westward to New Orleans, Detroit, Chicago, Minneapolis, Denver, and the Pacific Coast. The New York Company, first capitalized at \$100,000 and now at \$1,000,000, began business on the last day of 1914; Cleveland's \$500,000 company on 8 March 1916; the Boston company, similarly capitalized, three months later; Chicago's \$1,000,000 bank

began on 27 July 1917, and the half-million dollars Detroit and Los Angeles companies date from the closing months of 1917. The officers and directors of these companies are chosen from among the most representative bankers and other business men in each community, and local interests own a large majority of the stock in every case. A minority interest—varying in amount, but usually substantial—is held by the Industrial Finance Corporation, a Virginia institution with headquarters in New York, capitalized at \$3,700,000, and having as its president Gen. Coleman du Pont and as its vice-president and general counsel Arthur J. Morris from whom the Plan takes its name. The purpose of this corporation is to organize Morris Plan companies in response to the demand from all parts of the United States, and to standardize and facilitate their operations. Early in 1919, the local companies began operating the Morris Plan of Retail Trade Acceptances, by which retail dealers in articles of general utility are relieved of the burden of acting as bankers for customers requiring time for the liquidation of their accounts. This natural development of the original loan-and-investment idea will vastly increase the business done by the Morris Plan banks.

A recent development is the formation of The Morris Plan Insurance Society to insure borrowers for the amount of their loans throughout the period of their indebtedness. From November 1917, when it began operating, to 31 March 1919 this Society issued over 28,000 policies for more than \$4,000,000 of insurance.

JOSEPH B. GILDER,

*Secretary of the Industrial Finance Corporation.*

**MORRISON, Arthur**, English author: b. 1863. He was for a number of years secretary to a charity-trust in London's East End, and there made the studies utilized in his 'Tales of Mean Streets' (1895), and 'The Child of Jago' (1896). He wrote also 'Martin Hewitt, Investigator' (1896), detective stories; 'The Dorrington Deed-Box' (1897); 'To London Town' (1899); 'The Hole in the Wall' (1902); 'The Red Triangle' (1903); 'Divers Vanities' (1905); 'Green Ginger' (1909); 'The Painters of Japan' (1911), and he has collaborated in the production of three plays.

**MORRISON, George Ernest**, British traveler and Sino-expert: b. Geelong, Victoria, Australia, 4 Feb. 1862. He was educated at the Melbourne and Edinburgh universities, receiving (1887) degrees M.D. and C.M., crossed Australia on foot (1882-83) and crossed from Shanghai to Rangoon by land (1894); as special correspondent for *The Times* (London) he traveled from Bangkok, Siam, to Yunnan City, China, and round Tonquin (1896), and in the same capacity, crossed Manchuria from Stretensk, Siberia, to Vladivostok (1897). He was in Pekin during the Boxer siege (1900) and was present at the Japanese triumphal entry into Port Arthur (1905). In 1907 he again crossed China from Pekin to the French border of Tonquin and has since done much travel and exploration in China and Russian Turkestan. On account of his great store of knowledge of Chinese topography and politics he has been political adviser to the President of the Chinese Republic since 1912. He wrote

'An Australian in China: being the Narrative of a Quiet Journey Across China to Burma' (1895).

**MORRISON, Henry Clay**, American Methodist (South) bishop: b. Montgomery County, Tenn., 30 May 1842. He was educated in the public schools and after teaching for several years entered the ministry in 1865. He has held important charges in Louisville, Ky., and Atlanta, and was missionary secretary in 1890-98 when he raised \$140,000 for the Board of Missions. He was appointed bishop in 1898, and has been five times elected to the General Conference.

**MORRISON, James Dow**, American Protestant Episcopal bishop: b. Waddington, N. Y., 1844. He was graduated from McGill University, Montreal, in 1865, took orders in the Episcopal ministry and after holding rectorates at Herkimer and Ogdensburg, N. Y., was consecrated first missionary bishop of the diocese of Duluth in 1897. In 1907 he organized the diocese of Duluth of which he became first diocesan bishop. He has published 'Fundamental Church Principles' (1899); 'Suffragan Bishops' (1910), and also sermons and addresses.

**MORRISON, John Frank**, American army officer: b. Charlottesville, N. Y., 20 Dec. 1857. He was graduated from the United States Military Academy and commissioned 2d lieutenant, 20th Infantry in 1881. During his service as a subaltern and captain he was noted as a student of tactics and an authority on general military science. He served in the Santiago campaign and later in the Philippines with distinction. In the Russo-Japanese War he was selected for service as an observer and accompanied General Kurski through the campaign from the Yalu to Liao Yang and Mukden. On his return home in 1905 he was detailed as a student to the nascent Army War College and in the following year went to Leavenworth service schools as instructor. In 1907 he became chief of the department of military art in that institution. The drastic reforms and reorganizations he there carried out led to a high degree of efficiency under his administration. During 1912 and 1913 he was sent to Hawaii and the Panama Canal Zone to plan the defenses of those places. He served on the Mexican border in 1914 as colonel and in 1915 was sent on a mission to China. At the end of 1915 he was promoted to brigadier-general, and to major-general in 1917. In January 1918, shortly after his return from a tour of observation and inspection in France, he was appointed to the newly-created office of Director of Training. His teaching has revolutionized American infantry drill regulations; a number of his lectures have been collected and published, among them being 'Seventy Problems: infantry tactics, battalion, brigade and division' (1914); 'A Study in Troop Leading,' etc. (in collaboration with E. L. Munson: 1911 and 1918); 'Training Infantry' (1914).

**MORRISON, John Tracy**, American lawyer and politician: b. Jefferson County, Pa., 25 Dec. 1860. He was graduated from the University of Wooster, Ohio, in 1887, and from the law department of Cornell University in 1890. In the latter year he moved to Caldwell, Idaho,

where he established his law practice. In the campaign of 1896 he was secretary of the Republican State Committee, and in 1896 and 1900 Republican candidate for Congress, but was not elected. From 1897 to 1900 he was chairman of the State committee, and governor of Idaho 1903-5.

**MORRISON, Robert**, English missionary and Orientalist, the founder of Protestant missions in China: b. Morpeth, Northumberland, 5 Jan. 1782; d. Canton, China, 1 Aug. 1834. He learned the trade of boot-tree maker. After studying at Hoxton Academy and the Missionary Academy, Gosport, he was ordained in 1807 and as an agent of the London Missionary Society he embarked for Canton. In 1808 he was appointed translator to the East India Company's factory at Canton, and in 1810 began to print the New Testament in Chinese from a text which he had carefully revised. In 1811 he completed a 'Chinese Grammar,' published in 1815. In 1814 he completed the New Testament, and with the assistance of Dr. Milne, who had joined him in 1813, the translation of the Old Testament which was completed in 1818 and published in 1823. In 1815 he completed a 'Chinese Dictionary,' published (1815-23), at the expense of the East India Company. Dr. Morrison and his colleagues superintended very extensive printing operations for the diffusion of tracts and Scripture portions among the Chinese, and he founded in 1818 the Anglo-Chinese Missionary College at Malacca. Besides the works mentioned he wrote 'Horæ Sinicæ, or Translations from the Popular Literature of the Chinese' (1812); 'Dialogues translated from Chinese into English' (1816); 'A View of China for Philological Purposes,' (1817), and several educational works in English and Chinese. Consult his 'Memoir' (1839); Townsend, 'Robert Morrison' (1888).

**MORRISON, Theodore Nevin**, American Protestant Episcopal bishop: b. Ottawa, Ill., 18 Feb. 1850. He was graduated from Illinois College, Jacksonville, Ill., in 1870, studied for the ministry at the General Theological Seminary, and took priest's orders in the Episcopal Church in 1874. After being rector of Saint Paul's Church, Pekin, Ill., 1873-76; and of the Church of the Epiphany in Chicago, 1876-99, he was consecrated bishop of Iowa in February 1899.

**MORRISON, William Ralls**, American lawyer: b. Monroe County, Ill., 14 Sept. 1824; d. 30 Sept. 1909. He was educated at McKendree College, Lebanon, Ill., and served in the Mexican War. In 1852-54 he was clerk of the Circuit Courts of Monroe County, and in 1854 was elected to the State legislature; was admitted to the bar in 1855 and he continued in the legislature until 1859, holding the speakership in the latter year. He served in the Civil War 1861-63, receiving the rank of colonel, and being present at the battle of Fort Donelson. He was a member of Congress from 1863-65 and 1873-87. He introduced the Morrison tariff measure providing for drastic tariff reductions, but it was defeated by a small majority. He was defeated as a candidate for senatorial honors in 1885 by one vote. From 1887 to 1897 he served as member of the Interstate Commerce

Commission, of which he was chairman after 1891.

**MORRISON, Ill.**, city, county-seat of Whiteside County, on the Chicago and Northwestern Railroad, about 120 miles west of Chicago and 12 miles east of the Mississippi River. It is situated in an agricultural and stock-raising region. The industrial establishments are furniture and carriage factories, school furniture and refrigerator, stove, range and furnace factories, flour mills and creameries. It has considerable trade in dairy products, livestock and manufactures. There are three banks with combined resources of \$2,015,217. The value of all taxable property is placed at \$3,000,000. The city has a public library, a museum, courthouse, county offices, city hall, two common schools, a high school and a gaol. Pop. 3,000.

**MORRISTOWN, N. J.**, city, county-seat of Morris County, on the Delaware, Lackawanna and Western, the Morristown and Erie and the Pennsylvania railroads; also Morris County Traction Company line from Elizabeth to Lake Hopatcong 40 miles; about 20 miles west of Newark. It is situated in an agricultural region in which market gardening and fruit growing receive considerable attention. It was settled in 1709-10 and was called West Hanover. In 1740 the name was changed to Morristown in honor of Lewis Morris (q.v.) then colonial governor of New Jersey. It was incorporated in 1865. It is about 700 feet above sea-level and overlooks a beautiful section of country. The place figured prominently in the Revolution; in 1777, from January to May, and from December 1779 to June 1780, Morristown was Washington's headquarters. The old Ford mansion, which he occupied, is now owned by the "Washington Association" who preserve here numerous mementoes of Revolutionary and pre-Revolutionary times. It was here that Samuel F. B. Morse (q.v.) and his associate, Alfred Vail, worked on the electric telegraph experiments about 1837. The shaft of the *Savannah*, the first steamboat to cross the Atlantic, was cast at the old Speedwell Iron Works. Morristown is largely a residential city; its climate, scenery and easy access to the cities of New York, Jersey City, and Newark make it a most desirable location for the homes of city business men. It has considerable trade and ships considerable quantities of flowers, fruit and vegetables. Some of the prominent buildings are the Young Men's Christian Association and the Young Men's Catholic Association buildings, and All Souls' and the Memorial hospitals, post office, Vail Museum, a new high school, new public library and lyceum. There is a beautiful and well-kept park, in which a soldiers' monument has been erected. A monument marks the site of Fort Nonsense, erected by Washington. The city has public and parish schools. At Morris Plains, about four miles northeast of the city, is a State hospital for the insane, which has accommodation for about 1,500 patients, and which cost about \$3,000,000. Government is vested in a mayor and council. Pop. 13,500. Consult Tuttle, 'History of Morristown'; Colles, 'Authors and Writers Associated with Morristown' (1893); Sherman, 'Historic Morristown' (Morristown 1906).

**MORRISTOWN**, Tenn., city and county-seat of Hamblen County, 42 miles northeast of Knoxville, on the Southern and the Knoxville and Bristol railroads. It has manufactures of flour, wagons, agricultural implements, furniture, mantels, hosiery, brooms, concrete blocks, leather, medicines, hardwood tops and panels, canvas gloves, harness, monuments, lumber, etc. It is also a large poultry and stock market, and the zinc, iron and lead mines and marble quarries in the vicinity add to the importance of its industrial interests. Its annual shipments are valued over \$3,000,000. It is the largest poultry shipping point in the South. It is the seat of the Morristown Normal and Industrial College for negroes. During the Civil War Morristown was the scene of two engagements. On 10 Dec. 1863 Colonel Garrard's Union cavalry brigade attacked Gen. W. E. Jones' cavalry brigade in works here, and drove it out of them and from the town. Four days later Col. W. J. Palmer, commanding the Anderson (Pa.) cavalry, had a skirmish near the town with a part of General Martin's cavalry brigade of five regiments, and withdrew leaving Martin in possession of the place. On 28 Oct. 1864 the town was held by Gen. John C. Vaughn's brigade of Confederate cavalry. Vaughn was attacked that day by Gen. A. C. Gillem, with a brigade of Union Tennessee cavalry. Vaughn was falling back to a more favorable position, when Gillem charged his right and centre and stamped the entire brigade, which fell back in disorder to Russellville. Gillem took 224 prisoners, including 19 officers, four guns and caissons, part of the ammunition train, and about 300 stand of small arms. The Union loss was eight killed and 18 wounded. Pop. 7,000.

**MORRO** (mōr'rō) **CASTLE**, a former Spanish fort at the entrance to the harbor of Havana, Cuba; also the name of an imposing fortification on the cliffs overlooking Santiago Bay. It was in sight of this fort and under fire of its guns that Lieutenant Hobson and seven men of the United States navy, on 3 June 1898, sank the Merrimac at the entrance to the harbor to prevent the Spanish fleet from escaping. See CUBA; HAVANA; UNITED STATES — SPANISH-AMERICAN WAR.

**MORROW**, Thomas Vaughan, American eclectic physician: b. Fairview, Ky., 14 April 1804; d. Cincinnati, Ohio, 16 July 1850. Educated at Transylvania University of Lexington, Ky., and graduated in medicine from the Reformed Medical College of the City of New York. He was the pioneer promoter and organizer of medical eclecticism in the West. He established the Reformed Medical College of Ohio at Worthington, Ohio, 1830; the Reformed Medical School of Cincinnati in 1842; the Eclectic Medical Institute at Cincinnati, Ohio, in 1845; was editor of the first eclectic medical journal, and author (with Dr. I. G. Jones) of Jones and Morrow's 'Practice of Medicine' (eclectic). Dr. Morrow was the first president of the National Eclectic Medical Association.

**MORROW**, William W., American jurist: b. near Milton, Ind., 15 July 1843. He was educated in the public schools of Illinois and California, and was admitted (1869) to the bar and became assistant United States attorney for

California (1870-74). He was (1879-82) chairman of the Republican State Central Committee, and (1880-83) attorney of the State Board of Harbor Commissioners. From 1881-83 he was counsel for the United States before French and American Claims Commissions, and (1882-85) before the Alabama Claims Commission. He was chairman of the California Delegation of the Republican National Convention, 1884, and member of the 49th and 51st Congresses (1885-91). From 1891-97 he was United States district judge of the Northern District of California, and judge of the United States Circuit Court and United States Circuit Court of Appeals, 9th Judicial Circuit, since 1897. In 1905 he was the incorporator of the American National Red Cross Society.

**MORS**, or **MORSØE**, Denmark, the principal island of the Limfjord in the northwest of Jutland, 23 miles long, 11 miles broad and with an area of 140 square miles. Capital, Nykjøbing (pop. 6,918), on the east coast. It reaches a maximum altitude of 250 feet and its shores are marked by precipitous cliffs. Pop. 24,270.

**MORSE**, mōrs, Edward Sylvester, American naturalist and Orientalist: b. Portland, Me., 18 June 1838. He was educated at the Lawrence Scientific School, Harvard University; taught zoology and comparative anatomy at Bowdoin College 1871-74, and at the Imperial University of Tokio, Japan, 1877-80; and in this way added to his reputation as a zoologist a remarkable intimacy with Chinese and Japanese art, especially ceramics, and with the folklore and early archæology of the two countries. His collection of Japanese pottery is now in the Boston Museum of Fine Arts; it keeps his name and he is its curator. In 1881 Morse became director of the Peabody Academy of Sciences, of which he was one of the founders. He is now president of the Boston Society of Natural History. He wrote 'Early Stages of Terebratulina' (1870); 'Embryology of Terebratulina' (1872), and other studies showing the non-molluscan character of the brachiopods; 'First Book in Zoology' (1875, and in German and Japanese versions); 'Early Races of Man in Japan' (1879); 'Japanese Homes and their Surroundings' (1886); 'Glimpse of China and Chinese Homes' (1902); 'Mars and its Mystery' (1906), and many papers on zoology, ethnology and archæology.

**MORSE**, Harmon Northrop, American chemist: b. Cambridge, Vt., 15 Oct. 1848. He was graduated (1873) at Amherst College and took the degree of Ph.D. (1875) at the University of Göttingen. He became assistant in chemistry (1875-76) at Amherst College, then (1876-91) associate professor of chemistry at Johns Hopkins, and professor of analytical chemistry and adjunct director of the chemical laboratory (1891), and is now professor of inorganic and analytical chemistry and director of the chemical laboratory. He was given the degree LL.D. by Amherst 1915. Special work has been done by him in investigating osmotic pressure. He wrote 'Exercises in Quantitative Chemistry' (1905).

**MORSE**, Harry Wheeler, American physicist: b. San Diego, Cal., 25 Feb. 1873. He was

graduated (1897) at Leland Stanford Jr. University, and took the degree of Ph.D. (1901) at the University of Leipzig. He was instructor of physics (1902-10), assistant professor (1910-12) at Harvard and professor of chemistry at the University of California (1912-13) and from 1913 has had charge of scientific work for the Western Precipitation Company, Los Angeles. He translated Ostwald's Letters to a Painter on the Theory and Practice of Painting (1906) and is joint author of 'Ostwald's and Morse's Elementary Chemistry' (1907), and author of 'Chemistry and Physics of the Lead Accumulator' (1912). Numerous monographs on spectroscopy, fluorescence, diffusion, electrochemistry, etc., are from his pen.

**MORSE, Hosea Ballou**, American authority on Chinese affairs: b. Brookfield, N. S., 18 July 1855. He was graduated (1874) at Harvard University and was appointed in the same year assistant in the Imperial Chinese Customs service, being promoted (1887) to deputy commissioner and (1896) commissioner. From 1903-07 he was statistical secretary (commissioner of customs) to the inspector-general of customs, retiring 1909. By Imperial decree (1885) he was sent on a special mission connected with the terminating of the Franco-Chinese War, and fulfilled special duties (1885-87) connected with the reorganization of the subsidized China Merchants' Steam Navigation Company. In 1889 he was appointed special commissioner to arrange for opening Hunan Province to foreign trade. For his numerous services he has received (by Imperial rescript) The Decoration of the Double Dragon, III division, 2d class (1885); Double Dragon 1st class (1903); Order of Chia Ho, 3d class, Republic of China (1916). He has written 'The Currency of China' (1906); 'Trade and Administration of the Chinese Empire' (1908, new ed. 1913); 'Guilds of China' (1909); 'International Relations of the Chinese Empire' (1910-18).

**MORSE, Jedidiah**, American Congregationalist clergyman and geographer: b. Woodstock, Conn., 23 Aug. 1761; d. New Haven, 9 June 1826. He was graduated from Yale in 1783; studied theology under Jonathan Edwards; was pastor at Charlestown, Mass., from 1789 to 1820; and spent his last years in New Haven. He was intensely orthodox; established in 1805 the *Panoplist*, a religious journal combating Universalist views; and was an able and successful teacher. He wrote 'A Compendious History of New England,' with Elijah Harris (1804); 'Annals of the American Revolution' (1824), and a series of excellent biographies.

**MORSE, John Torrey**, American historian: b. Boston, 9 Jan. 1840. He was graduated at Harvard in 1860, and was lecturer on history there from 1876 to 1879. For two years he was associated with Henry Cabot Lodge in the editorship of the *International Review*. Served on board of overseers of Harvard University for 11 years and was member of the Massachusetts legislature in 1875. He also studied and practised law in Boston for a time and wrote treatise on 'Law of Banks and Banking' which has now reached seventh edition; also 'Law of Arbitration and Award.' His literary work has been chiefly in historical biography, and he has edited the 'American Statesmen' series,

which is ranked among the best biographical works for the interpretation of American history. For this series he has written 'Abraham Lincoln' (1893); 'Benjamin Franklin' (1889); 'John Adams' (1884); 'John Quincy Adams' (1883); and 'Thomas Jefferson' (1883); his other works include 'Life of Alexander Hamilton' (1876); and 'Life and Letters of Oliver Wendell Holmes' (1896); also 'Life and Letters of Colonel Henry Lee' (1905).

**MORSE, Richard Cary**, American clergyman: b. Hudson, N. Y., 19 Sept. 1841. He was graduated (1862) at Yale and took (1865) the degree of A.M., when he studied theology at Princeton and Union Theological seminaries (1867). From 1867-69 he was assistant editor of the *New York Observer* and was ordained (1869) to the Presbyterian ministry. He was general secretary of the international committee Y. M. C. A. (1869-1915), continuing as consulting general secretary. His work has been connected with the supervision and extension of the Y. M. C. A., especially in North America; but his labors have taken him on tours to India, Australia, China, Korea, Japan, the Philippines and Russia. He has written 'Robert R. McBurney, a Memorial' (1899); 'Polity of Young Men's Christian Associations' (1904); 'Fifty Years of Federation of the Y. M. C. A.' (1905); 'History of the North American Y. M. C. A.' (1913).

**MORSE, Samuel Finley Breese**, American inventor and artist: b. Charlestown, Mass., 27 April 1791; d. 2 April 1872. He was the eldest son of the Rev. Jedidiah Morse (q.v.). After graduating at Yale in 1810, he visited England with Washington Allston (q.v.) to study painting. In 1813 his first attempt at sculpture, a 'Dying Hercules,' won for him the gold medal of the Adelphi Society, and he received the same from the hands of the Duke of York. He returned to New York in 1815, and in 1824-25 organized an association which became the present National Academy of Design. He was its first president and continued in office for 16 years. He again spent three years in study in Europe, and then returned to New York to take the professorship in the University of the City of New York.

Morse had always been fond of the study of chemistry and natural philosophy, and it became at last a dominant pursuit with him. In consequence of his intimacy with Prof. J. Freeman Dana, who was lecturing in the same institution on the electro-magnet, Morse became interested in electrical matters, and in 1832, while returning home from Havre on the packet ship *Sully*, he first conceived the idea of the telegraph. But though thus early devised, yet circumstances prevented the complete construction of the first recording apparatus in New York until 1835, when he exhibited it at the New York University building. In 1837 he made another and more perfect exhibition, and filed his caveat at Washington. He now considered his apparatus sufficiently perfected for commercial introduction, and in 1838 he asked Congress to construct an experimental line from Washington to Baltimore to show its practicability. From the skepticism of many and the ridicule of others, Morse's request was not acted upon by Congress, and, disappointed and almost disheartened, he repaired to England in hopes of

getting some foreign government to aid him. The result of this visit was a refusal to grant him letters patent in England, and the obtaining of a useless *brevet d'invention* in France. For four years he struggled and put up with many privations, and, as if it were designed to try him up to the last moment, no recognition of the matter was taken till the last night of the Congressional session. He retired to bed disheartened and discouraged before the session was closed. But in the morning — the morning of 4 March 1843 — he was startled with the announcement that the desired aid of Congress had been obtained in the midnight hour of the expiring session, and \$30,000 placed at his disposal for his experiment between Washington and Baltimore. In 1844 the work was completed, and demonstrated to the world the practicability and the utility of the Morse system of the electro-magnetic telegraph. The first message, "What hath God wrought?" was sent from the United States Supreme Court room in the Capitol at Washington to Baltimore, 24 May 1844. From that day the telegraph was a success.

Honors were showered upon him by European sovereigns and governments. Probably no American has ever received so many marks of distinction. In 1848 Yale College conferred on him the complimentary degree of LL.D., and in the same year he received the decoration of the Nishan Iftichar in diamonds from the sultan of Turkey. Gold medals of scientific merit were awarded him by the king of Prussia (set in a massive gold snuff box), the king of Württemberg, and the emperor of Austria. From the emperor of the French he received in 1856 the cross of chevalier of the legion of honor; in 1857 from the king of Denmark the cross of knight of the Dannebrog; and in 1858 from the queen of Spain the cross of knight commander of the Order of Isabella the Catholic. The sum of 200,000 francs was presented to him jointly by the principal governments of Europe. It has been said that much of this money was spent in the ceaseless litigation and lawsuits in which he was involved in the defense of his patent rights.

Professor Morse also had the distinction of laying the first submarine telegraph line, which was done in New York harbor in 1842. He likewise set up the first daguerreotype apparatus and was associated with John W. Draper in taking the first daguerreotypes in America. A letter from Professor Morse to the Secretary of the Treasury in 1843 seems to contain the earliest suggestion of the possibilities of an Atlantic cable. His last public act was the unveiling of the statue of Benjamin Franklin, in Printing House Square, New York. Consult Prime, 'Life of S. F. B. Morse' (New York 1875) and Morse, E. L. (son), 'Samuel Finley Breese Morse, his Letters and Journals' (2 vols., Boston 1914).

**MORSE, Sidney Edwards**, American journalist and inventor, son of Jedidiah Morse (q.v.) and brother of S. F. B. Morse (q.v.): b. Charlestown, Mass., 7 Feb. 1794; d. New York, 24 Dec. 1871. He was graduated at Yale in 1811; studied law; established the *Boston Recorder* in 1815 and the *New York Observer* in 1823, the pioneers of American religious journalism; invented a flexible piston-pump in

1817 and the cerographic method of printing maps in 1839; improved a bathymetre for deep-sea soundings; and, like his father, was an able and successful geographer. His 'New System of Modern Geography' ran to half a million copies.

**MORSE, Sidney H.**, American sculptor and editor: b. Rochester, N. Y., October 1832; d. San Mateo, Fla., 18 Feb. 1903. In youth he worked at marble-cutting and acquired a taste for sculpture. Later he studied at Antioch College and afterward began to preach in Unitarian pulpits in the West; still later made further preparation for the ministry at Harvard, and for some time was settled in Haverhill, Mass. From 1865 to 1872 he was editor of the *Radical*, a worthy successor of the famous *Dial*. Morse counted among his friends and contributors Emerson, A. B. Alcott, Samuel Johnson, Samuel Longfellow and many others prominent in literature and reform. When he discontinued the *Radical* he turned with enthusiasm to sculpture and produced many notable works. He made a bust of Emerson, which is in the Second Church, Boston, the present edifice of the society to which Emerson ministered (1829-32), and another of the same subject, regarded by Emerson's friends as the best extant. His other subjects include Channing, Parker, James Martineau, Walt Whitman, Carlyle, Thomas Paine, Lincoln, Holmes and President Cleveland. Morse wrote much for periodicals and attained fame as a lecturer. One of his poems, 'Sundered,' is to be found in Emerson's 'Parnassus.'

**MORSHANSK**, môr-shänsk', Russia, capital of the government Tombov, on the navigable river Tsna and on the Syfran-Vyasma Railway. It has a gymnasium for girls, a city bank and factories producing tobacco, soap, tallow, spirits, etc., besides doing a lively trade in grain. Its population in 1911 was 31,802.

**MORSÖE**, mörs'é-ë. See Mors.

**MORTALITY**, a term applied to that branch of investigation which determines the proportion of the number of persons who die in any assigned period of life or interval of age, out of a given number who enter upon the same interval, and consequently the proportion of those who survive. Tables showing how many out of a certain number of infants, or persons of a given age, will die successively in each year till the whole become extinct, are generally called tables of mortality. There is no fixed number of lives upon which such tables are based, but the observation of a large number is indispensable to accuracy, and the larger the number that can be duly observed the greater will be the degree of accuracy attained. It must always be borne in mind, however, that a strict observation of a moderate number will yield truer results than a looser induction from a larger number. The basis of such calculations must be an accurate register of the number of births and deaths, and in the case of the latter, at what ages, in a given district or extent of country.

In Great Britain the bills of mortality, or abstracts from parish registers, were long the only means of arriving at these results; but being found very imperfect and unsatisfactory, they were supplanted in 1836 by a general regis-

Sam. F. B. Morse.  
me

tration. The results furnished by such tables are very various and of great interest. The registers, if kept with sufficient accuracy and minuteness, enable us to determine the proportion of deaths, not only at different ages and in different regions, but at different seasons, in persons of different occupations and habits, in towns or the country; and thus afford valuable materials for the science of political economy. Although much more attention has been paid to this subject in recent times, yet the observations have not been so extensive nor so accurate as is desirable.

Although the collection of regular statistics of mortality is of recent origin, the subject has always excited much interest, and many general facts have been collected regarding it. The tendency of mortality to diminish with the progress of civilization has been satisfactorily established by statistics. The average rate of mortality is affected by regular or constant causes, such as race, climate, age, sex, profession, social position, density of population, political institutions, habits, etc., and by such irregular or occasional causes as war, famine, pestilence, etc., but notwithstanding the interruption of these occasional causes a constant tendency to a mean has been found to exist in any given state of society. The fact that the tendency of population to increase or diminish is quite independent of the rate of mortality was first established by Malthus, who showed that the increase of population depended on the facility of procuring the means of subsistence and not on the duration of life. The mortality in the United States, for example, is greater than in England, yet the population of the United States doubles itself in 25 years and that of England in 43 years, while in various European countries which have a lower mortality than the United States, the population will not double in a century.

Some statisticians have attached considerable importance to the effects of race on population. It is extremely difficult, however, to establish anything in regard to race independently of circumstances and social habits. It has been shown, for example, that the average mortality among the Jews in Prussia is less than among the Christians, that the mortality varies greatly among the various races who inhabit the Austrian Empire, being least among the Germans, and that a similar difference prevails in the departments peopled by various races in France, but all such evidence is open to the most obvious exceptions. The influence of climate on mortality is inseparably associated with that of migration. It cannot be established that any climate, except perhaps the extremes of heat or cold, moisture or dryness, is in itself exceptionally favorable or unfavorable to human life, but change of climate is frequently adverse to it.

The most remarkable fact in respect to age is the great mortality which commonly takes place among children under five years of age. This is especially remarkable in large towns, but is not wholly confined to them. Although the diseases to which infancy is liable may naturally account for part of this excessive mortality, the greater part of it must be attributed to ignorance and want of due care in the training of children, partly arising from the unfavorable circumstances in which, through the too rapid increase of population, they are

brought into the world. This is both directly and indirectly a considerable cause of the extra mortality of large towns and other dense centres of population. The question whether city or country life is most conducive to a low rate of mortality is still undecided. Direct statistics prove nothing, as the death rate of towns is raised by immigration from the country and other causes. In regard to sex it is established that women live longer than men, and that among men the married live longer than the single. The condition of life in respect of poverty or wealth is known to have a considerable influence on mortality. Dividing France into two classes, rich and poor, the annual mortality was found to be 1 in 46 in the former and 1 in 33 in the latter. This gave to the rich an average duration of life of 57 and to the poor one of 37 years. See **LONGEVITY**; **VITAL STATISTICS**.

**MORTAR**, a calcareous cement used in building. It differs in its characteristics according to the nature, proportions or treatment of its constituents. The proportions vary from one and one-half to four or five of sand to one of lime. Hydraulic mortar is made from certain limestones which include in their composition so large a proportion of iron and clay as to enable them to form cements which have the property of hardening under water and are called hydraulic limestones. The proportions of clay vary in different quarries, and often in the same from 8 to 25 per cent. See **CEMENT**; **LIME**.

**MORTAR**, or **MORTER**, a vessel of iron, porcelain or stone used by pharmacists and others in preparing powders and other medicines. Also a piece of ordnance. See **ORDNANCE**.

**MORTAR**, utensil employed by the Indians of America and other semi-civilized races for the grinding or mashing of grains and other substances used as food or for other ends. The Indian mortar naturally had a different name in each tribe, and some of these names were familiar to the whites. A survival of these Indian mortar names is the metate of Mexico (q.v.) derived from the Aztec word *metatl*. The mortar has many forms ranging from a flat stone to a deep receptacle of stone, bone or wood in which the grain or other substance is reduced by pounding or grinding to a floury or plastic state. Throughout the area occupied by the Pueblo Indians in the United States, and in Mexico, Central America and the greater part of South America, and especially in Colombia, Venezuela and the Pacific Coast countries the grinding of grain, seeds, nuts, roots and other substances is done on a flat stone, generally rectangular in form. For the most part the grinding is performed by means of a stone muller more or less cylindrical in shape, which is rarely used as a roller, the substances being crushed between the metate and the muller by pressure and rubbing. This was the process used throughout the great corn belt stretch from Arizona to southern Chile at the time of the discovery of America; and throughout this vast region it is the process generally in use to-day, more especially among the Indians and mestizos for reducing corn and other substances to a condition for cooking.

**Forms of Mortars.**—Throughout other parts of North America there were many forms of mortars distinctly different from those in use in the region already indicated, but closely related to one another in shape. Among the Iroquois and other northern and eastern tribes of the United States and parts of Canada the natives made use of wooden mortars hollowed into the top of a block cut from the trunk of a tree. In this hollow, which was of considerable size and depth, the corn or other substance was put, in a dry or wet condition, and pounded into a more or less fine powder or into a soft, semi-liquid mass, by means of a long wooden pestle, with a pounding surface at both ends. The remains of very primitive mortars in many parts of the American continents show the various processes through which the modern mortars have passed to reach their present perfection. Originally a rough unworked flat stone was used as a grinding surface and an unshaped rounded stone served to do the pounding. From this primitive utensil to the carefully shaped metate of the Mexican or the handsomely carved and hollowed mortar of the Alaskan and British Columbian tribes is a long step which bridges a lengthy period of cultural development. In the granite rock of California mortars in the shape of excavations are frequently found on the sites of old Indian villages. Some of these are very primitive in form, while others, evidently of a much later development, are carefully shaped and seem to follow a regular plan of structure. It is probable that the flat stone metate form and the hollow mortar form both originated in pounding grain on a flat surface, the two natural methods of preventing the loss of the pulverized grain being to reduce the pounding to rubbing or rolling, and to pound the grain, in a deepish hole, as was done in the California granite rock. The tribes of the great forest area of the North, having no hollow rock beds or stones easily worked, hollowed out the ends sections of tree trunks or sides of logs by means of fire which also hardened the inner surface of the mortars, dried the wood and made them very durable. In regions where stone and wood were not available, bone, rawhide and other materials were converted into mortars for the grinding of food materials. In the whale country some of the races addicted to whale hunting used the vertebræ of that animal for mortars. Some of these are still employed. In the Eastern States of the United States primitive mortars made of hollowed but otherwise unshaped boulders are frequently encountered; and similar mortars are formed in California, side by side with other globular mortars, which are evidently but a more artistic development of the boulder form. A further evolution of the artistic form was reached when stones were quarried from the rocky bed, shaped to exact pre-determined form and proportions and frequently decorated with conventional forms, mystic signs or figures of household gods.

The pestle took upon itself as many shapes and designs as the mortar, and like relation of the latter to the metate, it was first cousin to the muller, both of which had their origin in the rough, unworked stone used by primitive man to pound or crush his food, and other objects. Some pestles were heavy and several

feet long; others were short instruments which could be used with one hand. Metates and mortars were of many shapes, sizes and designs, and their uses were almost as varied as their forms.

**Uses of Mortars.**—Indians, throughout the buffalo country, put the buffalo meat into a rawhide bag which they placed in a hole in the earth with the open mouth upward. While here they pounded the meat into shape for pemmican. Some Indians placed their shallow mortars in closely-woven baskets considerably larger than the mortars so that the grain that fell from the latter, in the process of grinding or pulverizing, might be saved. Others of the Pueblo Indians placed a basket-shaped hopper in the mouth of the mortar to prevent the pounded grain from hopping out. It is probable that very large "mortar holes" found in rock were also used as boiling pots, in which the heated water was obtained by dropping superheated stones into the hole. The large wooden portable mortars of the forest-region Indians were generally set on the ground so as to make them firm and steady. The ordinary metate of Mexico and Central America has generally four legs upon which it stands steadily. In many cases these give it an artistic appearance. Most of these metates are made of lava rock, especially in the districts where lava is plentiful. Metates are made of rocks of different grades of coarseness. Thus it is possible, by passing ground grain from one metate to another, to finally obtain a flour as fine as the finest turned out by the best modern mill machinery. Fine metates and mortars are also made from granite, limestone, sandstone and other rocky material. Perhaps the most artistic development of the mortar is to be found among the Haida Indians of Alaska, who probably learned their art from Asiatic tribes. Not only are mortars of a great variety of forms and designs but they are also of many sizes, ranging from tiny little vessels to huge excavations. The reason is that they were put to a variety of uses. The smaller mortars were employed as receptacles in which to grind paints, medicines, shells, tobacco and other substances used in medicine, personal decoration, ceremonies, incantations and dances. All the grinding of corn and other food products was almost universally done among the American Indians by women; but in the case of the ceremonial substances, especially those considered of a sacred nature, where the efficacy of the charm, ceremonial use or medicine depended upon the manner in which the grinding was done, this work was generally left to the medicine men, who were learned in all the ceremonial forms and traditions of the tribe.

**Bibliography.**—Hodge, 'Handbook of American Indians'; Morehead, 'Prehistoric Implements'; 'The American Indian in the United States'; Morgan, 'League of the Iroquois'; Nordenskjöld, 'Cliff Dwellers of the Mesa Verda'; Schoolcraft, 'The Indian Tribes of the United States'; Thurston, 'Antiquities of Tennessee.'

**MORTARA**, mór-tā-rā, Edgar, Jewish boy whose forcible removal from his parents by the orders of the archbishop of Bologna in 1858 aroused great excitement in Europe and led to protests from several powers, but the Pope

declined to interfere. The plea made in justification of the act was that Mortara had been early baptized into Christianity by a Roman Catholic maid-servant. The Roman Catholic authorities, however, declined to return him; and despite the many protests in the matter, he remained, of his own choice in 1870, with the Church and entered the Augustinian order. Consult 'The True Story of the Jewish Boy, Edgar Mortara' (1860), and Vollet, 'Edgar Mortara' (1881).

**MORTARA**, môr-tâ'ra, Italy, capital of the province of Pavia, on the Arborgna, also chief town of the Lomellina, and junction of the Novara-Mortara-Alessandria, the Mortara-Milano and the Vercelli-Mortara-Pavia and the Mortara-Casale railways. It has a Gothic church (San Lorenzo) and the Santa Croce convent church, also a theatre, gymnasium and technical school. It has manufactures of machinery and hats and does considerable trade in its rice and cheese products. The Austrians under Duke Albrecht won a battle here against the Piedmontese in 1849. It had a population of 10,468 in 1911 for the entire commune.

**MORTE D'ARTHUR**. This great English collection of Arthurian romances, written before 1470 by Sir Thomas Malory, as one of the cardinal books whose influence has reached beyond any mere personal fame. Personally, indeed, Malory has remained almost unknown. Even the probability that this 15th century gentleman and soldier served with Richard, Earl of Warwick, pattern of chivalry, was recovered only 25 years ago; but 400 years have proved the vitality of his book. After inspiring the conduct of noble English youth for generations, it was reinterpreted in Tennyson's most popular poem, 'The Idylls of the King'; and, surviving so unusual a competition, it is still reprinted, read and loved. Yet as a translation, in great part from known French sources, it is not in our modern sense original. Therefore the reasons for its fame are the more significant as going to the roots of permanent literary interest. The first reason, of course, is style. Writing in the early days of English prose, Malory has the dignity and ease of such early historians as Froissart; but his even and leisurely pace does not preclude the force of direct diction. This rare combination of dignity with simplicity has been sufficient to preserve his work without any great strength of structure, any compelling movement of the whole. The 'Morte d'Arthur' is not composed as a whole, not planned to lead us on stage by stage to a culmination. True, the closing books are felt as the tragic conclusion of Arthur's chivalry in a world of violence; but with many of the preceding stories it has no specific connection. Rather Malory worked as the mediæval romancers from whom he drew had worked before him. Collecting all the well-known stories — and a few less well known — that had come to be associated with the great name of Arthur, he used them much as he found them; and he told each for itself. Though he sometimes suggests complication of plot or development of character, he never worked for these in the ways of the modern novelist. The Renaissance had but touched England; and its literary ideas, even if they had been prevalent, would hardly have moved so thorough a mediævalist as

Malory. He turned away from the actual wars of the Roses to the legendary wars of Arthur's knights because of his intense sympathy with the ideals of a passing chivalry. He is far more mediæval than Chaucer. Though in style he has his own distinction, in composition he is the typical mediæval transmitter.

Every one of the stories that he thus brought together has a long history. Many of them reach far back into folklore. Most of them before they came to him had been told over and over again. The successive versions, their relations, their combination, the transference of a tale from Gawain to Percival and then to Galahad, the building up of a cycle of Grail stories and the attaching of this to the Arthurian cycle — all these have claimed much scholarly investigation and still offer problems as difficult as they are significant. But of this Malory was no more aware than the thousands of readers who have gone to him, not for history or folklore, nor for psychology or drama, but for the solace and inspiration of high adventure.

Beginning with the perennial story of the prince wondrously born and sent in the nick of time to claim the crown, right wrong, and establish a kingdom of justice, courtesy, and honor, he ends with the traditional hope that the same king, though in his stricken age borne away to the Isle of Avilon, may yet return to reign. Only to the latter books belongs properly the title 'Morte d'Arthur,' which is borne also by several mediæval poems. Between the young prince smiting the stone with his miraculous sword and the old king fighting his last battle against treason in the dim West, what a store of quests and deliverances, what a goodly array. Balen and Balan still show a primitive wildness in spite of the faint hint of the coming Grail; and the fairies, though crowded to the back of the stage by the stir of chivalry, still peep from their Celtic twilight. Morgan le Fay is dangerous in revenge. The Lady of the Lake gives the magic sword, and to her at the last it returns. Merlin the wizard, after all his triumphs of wisdom and skill, "was assotted and doted on one of the ladies of the lake." But these are only old echoes. The stories are of chivalry; of Beaumains, youth proving its unconquerable force; of Tristram and Iseult, the immortal lovers, and Guenever, the queen mistress who drew the peerless Lancelot across steel and fire and even across loyalty; of Gawain, his earlier fame tarnished, but still the courteous; of a hundred good knights who sought wild paths and frightful risks and stiff battles because they must make life an adventure.

Following these old adventures with adventurous hearts, readers have always been glad that they are numerous, and have not missed in the thronging of Malory's stories that unity which he did not seek. From the conquest of Rome to the earliest adventures of Lancelot, from Beaumains to Tristram, Malory goes leisurely, but always with zest; and by the way he pauses for yet other stories. The 'Morte d'Arthur' is a storehouse of romance. And above all the other quests, above the errant fighting throng, shines the supreme quest of the Holy Grail, the great romance of the Mass. Malory's aim, then, was not that modern literary distinction which comes from

originality of composition; it was to make men love the high things that he loved. His work was to him the handing on of the great traditions of chivalry. Caxton, who printed it in 1485, well calls it a "noble and joyous book."

CHARLES SEARS BALDWIN.

**MORTEN-MÜLLER**, mör'ten-mül'lër, Norwegian painter: b. Holmestrand, Christianiafiord, 29 Feb. 1828; d. 1911. He began to study art in Düsseldorf (1847) first under Tidemand and Eude, and later as a pupil in the academy under J. W. Schirmer. He removed to Stockholm in 1850, but in 1866 opened an art school in Christiania under government patronage. He returned to Düsseldorf in 1871 and devoted himself to setting forth the wild scenery of his native country in a series of vast canvases. Fiord, valley and mountain height are represented with fine imaginative yet truthful line and color. The most noteworthy of his landscapes are 'Norwegian Landscape' and 'Entrance to Hardangerfiord' (both in the National Gallery of Christiania); 'A Fir Forest' (in the Gallery at Hamburg); 'Romsdal-fiord,' with historical figures put in by Tidemand (1876); 'Start of the Fishing-boats by Night'; 'Waterfall and Pine Forest' (1879); 'Fisherman's Cot in Christianiafiord' (1880); 'Woodland Lake by Moonlight' (1892). His works combine romantic picturesqueness with color power of startling realism. In 1874 he was appointed court painter and member of the Stockholm Academy.

**MORTGAGE**, mör'gāj ("dead pledge"), *in law*, the conveyance of property, movable or immovable, as security for the payment of a debt on the condition that if the debt be duly paid the conveyance shall be void. The term is applied: (1) To the act of making such a conveyance; (2) to the deed by which such conveyance is made; (3) to the rights thereby conferred on the mortgagee. He who makes the mortgage is the mortgagor; he for whose benefit it is made is the mortgagee. Whatever may be sold may be mortgaged. Mortgages may therefore cover chattels or real estate. Mortgages must be in writing, either in one single instrument containing the whole case or in two, one containing the conveyance, the other the condition of the conveyance, this last document being the "defeasance." A deposit of titledeeds, with a verbal agreement, creates an equitable mortgage in some States which recognize this proceeding as a mode of securing a debt. The different States regulate the time in which mortgages are to be recorded, in order to protect innocent purchasers, but an unrecorded mortgage is good as against the mortgagor or any purchaser knowing of its existence at the time of his purchase. The tendency of courts now is to regard a mortgage as a lien rather than a conveyance of the land, and it is now generally regarded as a mere security for the payment of a debt. In those States which recognize chattel mortgages (or mortgages of personal property), a record of the same within a specified time is required to render them valid as against other claimants. See also FORECLOSURE.

**MORTGAGE BANKS.** See BANKS AND BANKING — WORLD'S SYSTEM.

**MORTIER**, mör'tya', **Edouard Adolphe Casimir Joseph**, Duke of Treviso, French

marshal: b. Cateau-Cambrésis, 13 Feb. 1768; d. Paris, 28 July 1835. He entered the army in 1791, fought in the campaigns of 1792 to 1795, was brigadier-general in 1798 on the fields of South Germany and Switzerland, and besieged (1803) Hanover, being raised (1805) to rank of marshal. In the war with Prussia he commanded the army against the Swedes and was victorious at Anklam (1807), whereupon he agreed to an armistice at Schlatkow (18 April). He commanded the left wing of the army in the battle of Friedland and was created Duke of Treviso (1808), to be given in that year command in Spain, where he won the battle of Ocaña (1809). He commanded the young Guards in the Russian campaign and also in 1813. In 1814 he, together with Marshal Marmont, defended Paris, but submitted to Louis XVIII and was made a peer of France. By March 1815 he had again joined the forces of Napoleon, thereby losing his title of peer, on the latter's defeat and the second Restoration. He was elected (1816) member of the Chamber of Deputies and retained the place till the end of 1818. In 1819 the dignity of the peerage was restored to him, being made hereditary in 1824. He was made chief chancellor of the Legion of Honor (1834) and became Minister of War and president of the council in the same year. He was killed (1835) by the infernal machine of Fieschi at the king's side as he was passing along the Boulevard du Temple, Paris. Monuments have been erected in his memory in his native city and also Lille.

**MORTIFICATION.** See GANGRENE.

**MORTIMER**, mör'ti-mër, **John Hamilton**, English artist: b. Eastbourne, Sussex, 1741; d. 1779. After studying under Sir Joshua Reynolds, he carried off the first prize of the Society of Arts, London (1763). He was elected R.A. in 1779. A bold and vigorous draughtsman and a good colorist, he was fond of dramatic scenes in which there was an element of the terrible. His style and manner are well exemplified in the pictures 'Battle of Agincourt'; 'Vultigern and Rowena'; 'Hercules Slaying the Hydra'; now in the South Kensington Museum. He was very successful as an etcher, and designed stained glass for Salisbury Cathedral and Brasenose College, Oxford.

**MORTIMER**, Roger, 8th Baron of Wigmore and 1st Earl of March, English noble: b. about 1287; d. Smithfield, 29 Nov. 1330. He had been convicted of treason in the reign of Edward II and pardoned; but notwithstanding the king's clemency took part in the rebellion of the Earl of Lancaster, and was made prisoner in 1322. Having escaped from the Tower, where he was confined, he went to France and at Paris in 1325 met Queen Isabella, who had been sent thither by Edward to negotiate a treaty. Fascinated by his pleasing address, the queen was soon known to be living in guilty intimacy with the exile, and, having secured the person of her young son, began to mature plans with Mortimer and the other leaders of the barons for getting possession of the kingdom. Mortimer went with her to England in 1326; the king was deposed and his son Edward III proclaimed in his stead, and for some years Isabella and her paramour governed the realm in the name of the young prince. Mortimer is popularly regarded as responsible for the

death of the dethroned monarch in his prison (1327). The failure of the Scottish expedition in 1327, and the "shameful peace" with Scotland in the following year, had wounded the pride of the English people. The nobles wearied of his arrogance and Edward resolved to take the sceptre into his own hands. While the queen and Mortimer were in Nottingham castle during the session of Parliament at that town, the king and Lord Montacute with attendants entered by night through a subterranean passage and carried off the earl. The king summoned a new Parliament to meet him at Westminster, and on 26 November Mortimer was condemned by this Parliament and executed three days later.

**MORTMAIN**, *môrt'mân*, in English law, lands held by a corporation were said to be held in mortmain (*mortua manu*, by dead hand), because they were then not alienable. The expression has particular reference to estates held by religious and eleemosynary corporations in England. At one time half the land in England was vested in religious houses. As early as 1279 the English Parliament began to deal with the evils arising from the transfer of lands to religious corporations; the lords of the soil were deprived of escheats or other feudal profits: "a dead hand yieldeth no service." In 1736 by the Mortmain Act the power of devising land by will to charitable purposes was destroyed. The law on this subject was consolidated by the Mortmain and Charitable Uses Act (1888), under which no bequest for a charitable purpose was to involve the acquisition of land. The Act of 1891 enacted that land may be devoted to any charitable use, but it must be sold within a year from the testator's death, unless the time be extended by certain authorities. It also permits the acquirement of land directed to be acquired for a charity if the court or the charity commissioners consent. A large number of acts from 1841 onward have exempted from mortmain restrictions land bequeathed for school sites, burial-places, places of worship, literary and scientific institutions, public parks, but maximum limits are imposed in several cases.

The old English statutes of mortmain have not been regarded as in force in the United States except in Pennsylvania, where the dedication of property to superstitious uses, and grants to a corporation without statutory license, are forbidden. In some States the right of religious corporations to hold land, and the power to make, devise or bequeath land to religious societies or charitable purposes, is restricted.

**MORTON**, **Charles**, English-American Puritan divine: b. Pendavy, Cornwall, 1627; d. 1698. He studied at Wadham College, Oxford, was appointed (1655) rector of Blisland, but his puritanic tendencies caused his ejection in 1662. He was made master of the dissenters' school at Stoke Newington, London (1685), where Daniel Defoe was numbered among his pupils. Prosecutions by the ecclesiastical courts caused him to migrate (1686) to New England and he became minister of the first church at Charlestown, Mass. He was prosecuted for a seditious sermon (1687) but acquitted. He got into close connection with Harvard and was given (1692) the management

of the inward affairs of the college with the title of vice-president. His succession to the college's president, Increase Mather, seemed likely but for his death. He approved the prosecutions for witchcraft at Salem. Consult Quincy, Josiah, 'History of Harvard University' (Cambridge, Mass., 1840).

**MORTON**, or **MOURT**, **George**, Puritan colonist: b. York, England, about 1585; d. 1628 (?). He affiliated himself with the Puritans in 1600 and settled in Holland, but was for some years previous to 1620 London agent for the Puritans. Authorities disagree as to his career, some placing his emigration to America in 1620 while others fix it at 1623, and the same uncertainty prevails as to his death, the dates varying from 1624 to 1628; there is no conclusive evidence as to whether it occurred in England or America. For many years he was credited with the authorship of Mourt's 'Relation or Journall of the beginning and proceedings of the English Plantation at Plimoth,' published in London in 1622. Careful investigation, however, seems to prove conclusively that the authorship must be credited to Winslow and Bradford, and that at most only a small portion of it can be claimed by Morton. The work, which is regarded as the most authentic history of the times in existence, has been several times reprinted. Consult 'Mourt's Relation,' with introduction and notes by Henry Martyn Dexter.

**MORTON**, **Henry**, American scientist: b. New York, 11 Dec. 1836; d. there, 9 May 1902. He was graduated from the University of Pennsylvania in 1857 and became professor of physics and chemistry at the Episcopal Academy of Philadelphia in 1860. His lectures in 1863 at the Franklin Institute in Philadelphia attracted attention throughout the United States and Europe by reason of his brilliant and unique experiments. He was one of the founders of the Philadelphia Dental College in 1863 and its first professor of chemistry, and in 1864-70 was resident secretary at Franklin Institute, where he continued his lectures. In 1867 he was appointed professor of chemistry at the University of Pennsylvania, and in the same year became editor of the Franklin Institute *Journal*. He conducted the photographic branch of the United States eclipse expedition to Iowa in 1869, and in addition to securing several excellent photographs of the eclipse, proved that the bright line of the sun's disc adjacent to the moon is due to a chemical action in the process of developing the plate and not to diffraction as had hitherto been held by the best scientists. In 1870 he was chosen president of the newly-founded Stevens Institute of Technology, and under his direction the faculty was selected and the course of instruction formed. His management of the institute made it one of the leading technological schools of the country; he gave it the benefit not only of his great learning but also several munificent gifts in the establishment and endowment of various necessary departments. His reputation as a scientist became world-wide and his services as a chemical expert were eagerly sought in litigation. From 1878-85 he was a member of the United States Lighthouse Board and in 1876-81 he was president of the American Chemical Society. Besides writing numerous

papers on electricity and fluorescence, he assisted in the preparation of 'The Student's Practical Chemistry' (1868).

**MORTON, James Douglas**, 4th earl of, regent of Scotland: b. Dalkeith, Scotland, about 1530; d. Edinburgh, 3 June 1581. He married a daughter of the third earl and succeeded to the earldom on the death of his father-in-law, in 1553. He became Lord High-Chancellor of Scotland 10 years later, but fled to England in 1556 on account of his share in the murder of Rizzio. He was soon pardoned and on Bothwell's abduction of Queen Mary joined the confederated lords against him. He stood sponsor for James VI at his coronation, and led the van at the battle of Langside (1568). He again became one of the leading opponents of Bothwell; was chancellor, and in 1572 regent of the kingdom. Having made himself many enemies by maladministration, he resigned, but recovered authority not long after. His enemies, however, at length proving too strong for him, he was charged as accessory to the murder of Darnley, tried, condemned and beheaded by the decapitating instrument he himself had introduced into Scotland.

**MORTON, James St. Clair**, American soldier: b. Philadelphia, Pa., 24 Sept. 1829; d. Petersburg, Va., 17 June 1864. He was graduated from West Point in 1851, was appointed to the engineering corps and in 1855-57 was assistant professor of engineering there. He was in charge of the Chiriqui expedition in Central America in 1860, and later superintended the work on the Washington aqueduct. In 1861 he was in command of the fortification at Tortugas, and in May 1862 was appointed chief engineer of the Army of the Ohio. In October 1862 he was promoted brigadier-general and was transferred to the Army of the Cumberland as chief engineer in command of the bridge-brigade. He built the entrenchments around Murfreesboro, Tenn., and was engaged in the battles at Chattanooga and Chickamauga. He was chief engineer of the Ninth army corps in the Richmond campaign of 1864, and was killed in the battle of Petersburg. He published 'An Essay on Instruction in Engineering' (1856); 'Memoir on Fortification' (1858); 'Life of Maj. John Saunders, of the Engineers' (1860), etc.

**MORTON, John**, English prelate: b. Milborne, Saint Andrew, Dorsetshire, England, about 1420; d. Knoll, Kent, 15 Sept. 1500. He studied at Balliol College, Oxford, and subsequently became principal of what is now Christ Church College. He adhered with great fidelity to Henry VI and the house of Lancaster, but nevertheless Edward IV made him master of the rolls and bishop of Ely (1478). Richard III imprisoned him, but he escaped to Flanders and under Henry VII became archbishop of Canterbury and chancellor (1486). It was he who suggested the union of the house of Lancaster and York by the marriage of Henry with Elizabeth of York, daughter of Edward IV. In 1493 he became a cardinal.

**MORTON, John**, one of the signers of the Declaration of Independence: b. Ridley, Delaware County, Pa., 1724; d. April 1777. After working for several years as a surveyor he began the practice of law. In 1764 he was

elected to the general assembly of Pennsylvania, of which he became a conspicuous member, serving for a number of years and being speaker from 1772 to 1775. In 1765 he was a member of the Stamp Act congress; in 1766 became sheriff in his county, and was shortly afterward appointed one of the judges of the Supreme Court of Pennsylvania. He was always an earnest advocate of the rights of the colonies and warmly supported the Revolutionary War. In 1774 he was elected a delegate to the 1st Continental Congress, and was a member of that body till his death, taking active part in its debates and in the framing of the Articles of Confederation. He gave the casting vote of Pennsylvania in favor of the Declaration of Independence, the four other delegates present from that State being equally divided as to the measure, and affixed his signature to the Declaration.

**MORTON, John Maddison**, English dramatist: b. Pangbourne, 1811; d. 1891. He was educated in France, then held a clerkship in Chelsea Hospital, London (1832-40). In 1881 he became a Charterhouse brother when in sore need of a pension. He wrote farces, showing exceptional facility in the adaptation of French dialogues to suit English taste. While he was a prolific writer of plays little survives for recent presentation except his ever-popular 'Box and Cox' (1847). Consult 'Dictionary of National Biography,' Vol. XXXIX (London 1894).

**MORTON, Julius Sterling**, American agriculturist and statesman: b. Adams, N. Y., 22 April 1832; d. Lake Forest, Ill., 27 April 1902. He was graduated from Union College in 1854 and removed to Nebraska City in 1855, where he was editor of the *Nebraska City News*. In 1856-57 he was a member of the Territorial legislature, and in 1858 secretary of the Territory. Upon the resignation of Governor Richardson in 1858 he acted as governor, and in 1893-97 was Secretary of Agriculture under President Cleveland. He was the originator of Arbor Day and an active member of various agricultural and horticultural societies.

**MORTON, Levi Parsons**, American banker and politician: b. Shoreham, Vt., 16 May 1824. He received an academic education, and in 1843 established a mercantile business at Hanover, N. H.; in 1850 entered the banking business in Boston; and later removed to New York, where in 1863 he founded the large banking firm of Levi P. Morton & Company (later Morton, Bliss & Company), which assisted in floating the government war loan during the Civil War. He also established a branch of his firm in London, and the Morton Trust Company of New York, and gained a reputation as an able financier. He was elected to Congress on the Republican ticket in 1878 and served one term (till 1881); he was then appointed United States Minister to France, where he remained till 1885; in this capacity he secured legal status in France for American corporations. In 1888 he was elected Vice-President of the United States, and made an especially able presiding officer in the Senate. In 1894 he was elected governor of New York State, serving for one term; in the last year of administration he urged in a special message the abolition of the

ward-trustee system of school government in New York city public schools, and signed the bill which enforced this reform. In 1896 he was New York State's candidate for the Presidency at the National Republican Convention. After retiring from public life he resumed his banking operations and became a director in several insurance companies.

**MORTON, Nathaniel**, American historian: b. Leyden, Holland, about 1613; d. Plymouth, Mass., 29 June 1685. He was of English descent, came with his father to Plymouth in 1623, became an inmate of Governor Bradford's family and his public assistant, and from 1645 until his death was secretary of the colony. In compliance with the request of the commissioners of the New England colonies, he compiled (1669) and published his principal work, 'New England's Memorial, or a Brief Relation of the Most Remarkable and Memorable Passages of the Providence of God Manifested to the Planters of New England.' For nearly two centuries, or until Bradford's 'History of Plymouth' was discovered in 1855, Morton's work was the principal authority on the matters it dealt with. He compiled it largely from Bradford's manuscripts and Edward Winslow's journals. 'New England's Memorial' was several times reprinted in the American colonies, and was also reproduced in England. Besides various other works, Morton was also the author of 'A Synopsis of the Church History of Plymouth' (1680).

**MORTON, Oliver Perry**, American statesman: b. Salisbury, Wayne County, Ind., 4 Aug. 1823; d. Indianapolis, 1 Nov. 1877. He studied law, was admitted to the bar in 1846, began the practice of his profession in Centerville, Ind., and became a circuit judge in 1852. He was an anti-slavery Democrat, but, after being read out of the party for his refusal to support the Kansas-Nebraska bill, became one of the leaders of the new Republican party, and was defeated as its candidate for governor in 1856. Four years subsequently he was elected lieutenant-governor, and when, in January 1861, Governor Lane was elected to the national Senate, Morton became governor. His active loyalty to the government did much to sustain the administration during the trying times of the Civil War. At its outbreak he at once sent troops to the field, but in the next year was greatly hindered in his efforts by a hostile legislature and subsequently by the efforts of a secret, disloyal society known as the Knights of the Golden Circle. Several plots at his assassination were hatched. Nevertheless he surmounted all obstacles, and his services to the nation were thankfully recognized by its chiefs. He was elected a United States senator from Indiana as a Republican in 1867, serving till 1877, and in the latter year was a member of the Electoral Commission. Consult 'Life,' by Foulke (1899). After the close of the Civil War he had been stricken with paralysis in his lower limbs, but his intellectual powers rose above his physical disability, and he continued until his death one of the most eloquent, forceful and dominating figures in public life. The fact that he sometimes addressed the Senate standing supported by two canes earned for him the waggist sobriquet of the "Devil on Two Sticks."

**MORTON, Paul**, American financier and politician: b. Detroit, 22 May 1857; d. New York, 1911. He attended the Nebraska public schools, and at the age of 16 started his commercial career as office boy in the land office of the Burlington and Missouri River Railroad, at Burlington, Iowa; after several promotions he entered the employ of the Chicago, Burlington and Quincy Railroad, rising from clerk to chief clerk, then successively assistant general freight agent, general passenger agent, and general freight agent. In 1890 he became vice-president of the Colorado Fuel & Iron Co., for six years, when he accepted the vice-presidency of the Atchison, Topeka and Santa Fe Railroad, greatly distinguishing himself in railroad and public affairs. He influenced great advances in the railroad system, and was a true friend and advocate of the rights of the employees in large corporations; also favored publicity as assisting in the work of the investing public and productive of honesty in management. Until 1896 he had been very staunchly Democratic but the "silver question" won him over to the Republican party. In 1904 he was appointed by President Roosevelt Secretary of the Navy, but he retired (1905) to become president of the Equitable Life Assurance Society of New York. He thoroughly reorganized the corporation's system and advanced to fruition many measures that brought about uniformity in tariffs and stability in executive departments of insurance. His death occurred suddenly and unexpectedly as he was, unaccompanied, passing between the different public offices in the course of business.

**MORTON, Samuel George**, American anatomist: b. Philadelphia, Pa., 26 Jan. 1799; d. there, 15 May 1851. He studied medicine at the University of Pennsylvania and in Edinburgh; began to practice in Philadelphia in 1824; was immediately prominent in the Academy of Natural Sciences being its secretary 1825 and its president 1850; became professor of anatomy in Pennsylvania College in 1839; and made special studies of ethnology, craniology and plant physiology. His valuable collection of skulls, numbering 1,500 specimens (900 human), led him to urge the diverse origin of the human race. He contributed to Silliman's *Journal*, and published 'Crania Americana' (1839); 'Crania Egyptica' (1844), and 'Illustrated System of Human Anatomy' (1849). Consult 'Life' by Meigs (1851).

**MORTON, Thomas**, English prelate: b. York, 1564; d. 1659. He studied at Saint John's College, Cambridge, receiving the degrees M.A. (1590), and D.D. (1606), becoming a Fellow and university lecturer in logic. He became one of the chaplains of James I and (1606) dean of Gloucester, was transferred (1609) to deanery of Winchester, to canonry of York (1610) and was made bishop of Chester in 1616. He was translated to Litchfield and Coventry (1618), in which fields he devoted his endeavors to win over the Nonconformists and recusants. In 1632 he was appointed to the see of Durham, holding the position canonically till his death, though Parliament decreed his deprivation in 1647. He had been impeached (1641) on the fall of Charles I, but was released after four months' imprisonment without trial, and was again imprisoned in 1645

because he refused to surrender the seal of Durham. After being driven (1648) from Durham House, London, he ultimately resided at Easton-Maudoit with Sir Christopher Yelverton. Most of his written works were devoted to exposure of Romish fallacies. His three most noted works are 'Apologia Catholica' (1605); 'Catholic Appeal' (1609); 'Causa Regia' (1620).

**MORTON, Thomas**, English colonist in America: b. England about 1575; d. Agamenticus (or Acomenticus), Me., 1646. He was an attorney of Clifford's Inn, London, of a somewhat doubtful reputation, and seems to have practised mainly in western England. In 1622 he landed in New England, where he remained three months; and in 1625 returned with Wollaston's Company. Wollaston soon after left for Virginia, and in the summer of 1626 Morton assumed control over those of Wollaston's following that remained. The settlement, Mount Wollaston (now Braintree, Mass.), near the coast, he called Mare Mount (Merry Mount); and in the spring of 1627 he erected a Maypole, and with the "salvages" proceeded to hold May-day to the scandalizing of their Puritan neighbors of Plymouth. Contrary to law, he supplied the Indians with firearms and instructed them in their use; and he was a rival of the Plymouth settlers in the fur-trade. He was accordingly arrested by Capt. Miles Standish and sent back to England (1628). But in August 1629 he was again in New England. In August or September 1630 he was a second time arrested and banished. He published, in 1637, 'New English Canaan,' which Nathaniel Morton ('New England's Memorial') denounces as "full of lies and slanders, and full fraught with profane calumnies," but which as a satire is sometimes not unamusing, and contains information of interest regarding local features and the Indians. When he ventured back to New England (1643) he was imprisoned for about a year while evidence for a libel suit was being collected, and was finally let go on payment of a fine of \$500. Nathaniel Hawthorne's 'The Maypole of Merry Mount' (in 'Twice-Told Tales,' 1837) and J. L. Motley's 'Merry Mount' (1849) are based on Morton's career.

**MORTON, William James**, American physician: b. Boston, 3 July 1845. He is a son of W. T. G. Morton (q.v.), whose name is connected with the first anæsthetic use of ether. He was educated at the Boston Latin School, Harvard University and Vienna. On his graduation there, in 1872, his thesis on "Anæsthetics" gained him the Boylston prize. He practised medicine at Bar Harbor, Me., and in Boston; went to Kimberley, South Africa, where, besides practising his profession, he engaged in diamond-mining. Settling in New York he became editor of the *Journal of Nervous and Mental Diseases*; from 1882-85 was adjunct professor of nervous diseases at the New York Post-Graduate Medical School; served as neurologist to the New York Infant Asylum, 1887-90; and was afterward professor of nervous diseases and electrotherapeutics at the New York Post-Graduate School. As an authority in electrotherapeutics he has won wide recognition, and by his mechanical device for establishing the "static induced current" of elec-

tricity—the "Morton current" of the scientific world—has supplied a means for producing the X-ray, and rendered a service of great practical value to medicine and surgery. Indicted in January 1912, in association with Julian Hawthorne and others, on a charge of fraudulent use of the mails in the promotion of bogus mining companies, conviction followed nearly a year after; he was sentenced to 12 months' imprisonment, but was released in October 1913, pardoned by the President and reinstated in his profession.

**MORTON, William Thomas Green**, American dental surgeon: b. Charlton, Mass., 19 Aug. 1819; d. New York, 15 July 1868. He established himself in the practice of dentistry in Boston, and there in March 1844 became a student of medicine in the office of Dr. C. T. Jackson (q.v.), the scientist. In November 1846 he obtained a patent for the process of anæsthesia by what he called "letheon," now known as ether. Jackson claimed the discovery of etherization previous to the winter of 1841-42, and Morton's patent was contested by both Jackson and Horace Wells, another of Jackson's pupils. Morton communicated his knowledge of the process to Dr. J. C. Warren, and anæsthesia by ether was made public through an operation performed by Warren at the Massachusetts General Hospital 16 Oct. 1846. The French Academy of Sciences investigated the matter and decreed a Montyon prize of 2,500 francs to Jackson for the discovery, and another of like amount to Morton for the application of the discovery to surgical operations. In 1852 a bill appropriating \$100,000 as a national testimonial to Morton was introduced in Congress, but failed, as it did also in 1853 and 1854. Testimonials accrediting to him the application of ether as an anæsthetic were signed by the medical profession in Boston (1856), New York (1858) and Philadelphia (1860). Consult Weyman, 'Trials of a Public Benefactor' (1859).

**MORTUARY CUSTOMS.** See BURIAL; DEAD, DISPOSAL OF.

**MORWITZ, mor'vits, Edward**, German-American journalist: b. Dantzig, Prussia, 12 June 1815; d. Philadelphia, 13 Dec. 1893. After thorough training in the sciences and medicine at various German universities, he was graduated in 1840 from Berlin University, where he became an assistant physician and wrote 'The History of Medicine' (1848-49). In 1843 he practised his profession at Conitz, Prussia, but after the Revolution of 1848 settled in the United States. In 1853 he bought the German *Democrat* of Philadelphia and in 1855 issued a German political weekly, *The United States Journal*, followed in the same year by a German Sunday paper, *The New World*. He gave great support to the Union during the Civil War, and assisted in the raising of troops and the placing of government loans. In 1862 he took a leading part in establishing the German Press Association of Pennsylvania, and in 1870 organized the movement to raise funds for aiding German soldiers in the Franco-German War, about \$600,000 being received for that purpose. He at one time owned or controlled about 300 newspapers, both German and English, and was a powerful factor in welding together the German population of the State.

He invented a breech-loading gun before leaving Germany.

**MOSAIC**, an imitation or reproduction of a painting or ornamental design, formed generally by means of pieces of opaque glass of different colors; also by colored stones (especially marbles and precious stones) placed side by side, and attached by being bedded in a cement. The art originated in the East, but received its perfection from the Greeks, and was thus conveyed to the Romans. In Italy many floors ornamented with mosaic work have been found among ancient ruins. Afterward, when the art was revived in Italy, the Venetian school becoming very celebrated, Clement VIII, in the 17th century, had the interior of the dome of Saint Peter's decorated with this kind of work. The art was largely employed for copying painting by famous artists, and thus rendering permanent their original freshness and beauty. The Roman school of mosaicists is still the most famous, though excellent works have been produced in recent times by Venetian and also by Russian artists. There is a studio for the production of mosaics in the Vatican at Rome. The most important works executed here in recent times are a series of portraits of the popes. In the most costly mosaics precious stones have been cut to furnish materials; but in common works of this art enamels of different colors, manufactured for the purpose, are the material employed. Roman enamels are made of small rods of opaque colored glass. In the first place cakes of glass are made of every variety of color and shade likely to be required. As many as 10,000 shades are said to be in use. These cakes are drawn out into rods thicker or thinner, according as they are to be used for finer or for coarser work, a great number being mere threads. They are kept in bundles, and arranged in sets corresponding to their colors. For a work of moderate size a piece of dark slate or marble is prepared by being hollowed out like a box and filled with plaster of Paris; upon this plaster the artist draws the design or pattern, and the workman proceeds with his work by removing small squares of the plaster, and filling in these with pieces cut from the glass rods, the pieces being fixed in their places by a cement. Gradually, in this manner, all the plaster is removed, and a picture is formed by the ends of the pieces of colored glass. It will easily be understood that this is a very slow process, and there are large pictures that have taken as many as from 12 to 20 years to produce. When mosaic pictures are to be viewed near at hand they are polished perfectly smooth with a flat stone and emery, and present a glossy surface similar to that of paintings in oil. When they are to be viewed at a distance the surface is left rough, when they present an appearance similar to pictures in fresco. Inlaid works, of agate and other costly stones, are executed on the same principle as mosaic, except that the stones are larger, and cut to the shape of different parts of the object to be represented. Works of this class are known as Florentine mosaics. Flowers and ornamental designs are the chief objects of this branch of the art. A mode has been invented of sawing the plate with the mosaic pictures into two or three sheets, and thus increasing the number of works produced at one time. Consult Barwell

and Druitt, 'Mosaics and Stained Glass' (New York 1909); Furnival, W. J., 'Leadless Decorative Tiles' (Stone, Staffordshire, 1904).

**MOSANDRIUM**, or **MOSANDRUM** (from K. G. Mosander, a Swedish chemist), supposedly a new rare earth metal, whose oxide was thought to have been discovered in 1878 by Lawrence Smith, in specimens of the mineral samarskite obtained from North Carolina. It was afterward shown to be a complex substance containing terbium, samarium, dysprosium, traces of praseodymium and neodymium and probably gadolinium.

**MOSASAURIA**, an order of marine reptiles of the Upper Cretaceous Period, typical of the reptilian subclass *Pythonomorpha*. They were of world-wide distribution and their remains occur so plentifully in the western United States as well as in the Old World that their structure is thoroughly known. They were large predaceous marine lizards, resembling the modern monitors in many features, but reaching in many species the size of crocodiles—larger in some cases, but no skeletons are known indicating a greater length than 45 feet. They had four limbs with all the bones well developed but enclosed in a mitten of flesh and skin, forming paddles, which, with their great tails, must have made them powerful and agile swimmers. "Their cup-and-ball vertebræ indicate great flexibility of the body, their sharp teeth denote ability to capture slippery prey, and the structure of the lower jaw shows that they probably ate in a hurry and swallowed their food entire. . . . In the mosasaurs, as in the cormorants, among birds, there is a sort of joint in each half of the lower jaw, which permits it to bow outward when open; . . . if the reader will extend his arms at full length, the palms touching, and then bend his elbows outward, he will get a very good idea of the action of a mosasaur's jaw"—Lucas. The mosasaurs were of three types, namely, *Tylosaurinae*, resembling gavials, with a long slender beak or extension of the snout beyond the teeth, and long paddles strengthened with numerous phalanges; *Platecarpinae*, short-headed, very long-tailed reptiles, including *Platecarpus*, *Prognathosaurus*, *Brachysaurus* and some other genera; and *Mososaurinae*. The last were the typical mosasaurs, apparently the most completely marine and powerful and perfected of the race. The two genera are *Mosasaurus* and *Clidases*. None survived the close of the Cretaceous. Consult Zittel-Eastman, 'Text-book of Paleontology' (1902), in which will be found detailed and illustrated descriptions of various forms, and many references to the literature of the subject.

**MOSAYLIMA**, mō-sā-lē'mā, or **MOSEI-LEMA**, Arab prophet and rival of Mohammed (q.v.): b. early in the latter half of the 6th century; d. 633. He seems to have been a prophet in the tribe of Bani Hanifah, in Nejd, before Mohammed arose; and his name Rahmān, "the merciful," one of Mohammed's favorite titles for Allah, may be held proof that he claimed to be the Messiah. Tradition says that Mohammed scornfully refused Mosaylima's suggestion that they should share the spiritual leadership of the earth; but modern criticism makes it more probable that the Prophet compromised with him considerably, and it is even suggested

that Mohammed wished to make him his successor by testament, but was prevented by his attendants as he was dying. A break between Abu Bekr, the caliph, and Mosaylima came speedily; perhaps Mosaylima even openly opposed Islam. At any rate in the 11th year of the Hegira, his forces though far superior in numbers were met and defeated by Khaled, the Sword of God.

**MOSBY**, möz'bi, John Singleton, American lawyer and soldier: b. Edgemont, Powhatan County, Va., 6 Dec. 1833; d. Washington, 30 May 1916. He was graduated at the University of Virginia (1852), admitted to the bar (1855) and was practising law at Bristol, Va., when the Civil War broke out. He enlisted as private in the Confederate army and was later promoted adjutant of the 1st Virginia Cavalry. In two months' time, however, he was reduced to the ranks. Mosby, undaunted, then offered his services as scout to Gen. James E. B. Stuart, and in that capacity guided Stuart's cavalry in a desperate raid on McClellan's army on the Chickahominy in June 1862. In 1863, after enduring a short captivity, he went to Richmond and recruited an independent body of fighters which soon became famous under the name of Mosby's Partisan Rangers. This small cavalry command, of which he was colonel, became a terror to the Union troops and did much damage in cutting off means of communication and destroying supply trains, capturing outposts, etc. They adopted a guerrilla style of warfare and operated through Virginia and Maryland. Subsequently his force was pressed into the regular Confederate army as the 43d battalion of Virginia cavalry, and served till the cessation of hostilities. His men were dispersed and concealed when not engaged in raiding, and he had in force a perfect system of reassembling them at the shortest notice. At Chantilly (16 March 1863) he defeated a much larger force than his own. Probably his most brilliant exploit was the capture of Brigadier-General Stoughton, United States army, at Fairfax Courthouse, in the same month. To accomplish this he made a raid inside the Federal lines. At Danesville (1 April 1863) he successfully defended himself against a force sent especially to capture him. He harassed the rear of Grant's army, in its advance on Fredericksburg, to such an extent that Grant was forced to send a special detail to protect his communications and supplies. One of Mosby's most important raids resulted in the capture of Sheridan's entire supply train, which he surprised near Berryville.

Mosby was commissioned captain in March 1863, major two weeks later and colonel some time after that. His regiment was disbanded 21 April 1865, and he again took up the practice of law, settling at Warrenton, Va.

Mosby became a Republican after the War and supported General Grant for the presidency. It is said he originated the phrase "the solid South." He was United States consul to Hong-kong 1878-85, afterward practised law in San Francisco, Cal., and was assistant in the Department of Justice at Washington 1904-10. He delivered a lecture in Boston, on Stuart's Cavalry, in December 1886, which was afterward published in book form and entitled 'War Reminiscences' (1887). He also wrote 'The Dawn of the Real South' (1901). Consult

Crawford, 'Mosby and His Men' (1867); Scott, J., 'Partizan Life with Mosby' (1867); Williamson, 'Mosby's Rangers' (1896).

**MOSCHELES**, Felix, British portrait painter: b. London, 8 Feb. 1833; d. Tunbridge Wells, January 1918. He was the son of Ignaz Moscheles, the distinguished pianist and composer, and the life-long friend of the great Mendelssohn. Felix was educated at King's College, London, and was then sent to Hamburg and Karlsruhe. His childhood was spent amid a circle of literary and artistic celebrities, including Mendelssohn, Joachim, Malibran, Lablache and Dante Gabriel Rossetti. In later years the list was extended by many of the most famous characters of the age. In 1846 his father migrated to Leipzig to take over the directorship of the Conservatoire. Here Felix was taught drawing and architecture. In 1850 he went to Paris to pursue his art studies, arriving in the days of the Republic which followed the flight of Louis Philippe, and he witnessed the *coup d'état* which placed Napoleon III on the throne. A lucky arrest brought Moscheles into touch with Mme. Achille Fould, whose husband was then at the head of affairs, and who was a friend of the Moscheles family. The young artist was introduced into the best circles of Parisian society. At the Atelier Gleyre, where he studied, he made the acquaintance of Du Maurier, afterward the famous *Punch* artist. Moscheles pursued his later studies in Antwerp, where Alma-Tadema, Maris, Neuhuys and Heyermans were his fellow-students. He afterward opened a studio and settled in London, where he and Du Maurier formed a merry circle with Poynter, Whistler, Stacy Marks and Charles Keene. In 1862 he painted a portrait of Mazzini, which after the latter's death he offered to the Italian nation, but the offer was refused. Moscheles had long been interested in the question of universal peace and international arbitration. He discussed this subject with President Cleveland during a visit to America in the '80's, when he crossed the Atlantic with Henry Irving, carrying an introduction from Robert Browning. He painted Cleveland's portrait and later one of Browning, which is now in the Armour Institute, Chicago. Among his works are studies of Gounod, Rubinstein and Sir H. M. Stanley. He exhibited in Antwerp, Paris and London, and published two volumes of autobiography, 'In Bohemia with Du Maurier' and 'Fragments of an Autobiography,' besides editing Mendelssohn's letters to his parents. He was president of the International Arbitration and Peace Association and of the London Esperanto Club.

**MOSCHELES**, Ignaz, German pianist and composer: b. Prague, 30 May 1794; d. Leipzig, 10 March 1870. Of Jewish parentage, studied under J. D. Weber, director of the Prague Conservatory of Music, and afterward under that of Albrechtsberger and Salieri, at Vienna. On the completion of his studies he made a successful professional tour in Germany, and in 1820 arrived at Paris, where he met with an exceptionally enthusiastic reception and afterward made tours of other continental capitals. In 1825 he settled in London, where he was professor of music at the Royal Academy for 21 years. Here he had Thalberg for a pupil, as

he had formerly, in Berlin, had Mendelssohn. At the latter's request he went from London to Leipzig where he was professor of music in the conservatory there from 1846 till his death. Among his finest compositions may be mentioned his Concertos Nos. 3, 4 and 5, the Concertos Fantastique and Pathétique; his great Sextett and Trio; his Sonatas Caractéristique and Mélancolique; and his studies. Consult 'Aus Moscheles Leben' (1872); 'Briefwechsel mit Mendelssohn-Bartholdy' (1888).

**MOSCHEROSCH**, mō'shĕ-rōsh, **Johann Michael**, German satirist: b. Willstädt, near Strassburg, 5 March 1601; d. 4 April 1669. He was a descendant of an Aragon (Spanish) family and studied at Strassburg, after a short stay in France was appointed (1626) master of the court for the Duke von Leiningen-Dachsburg, then acted as district magistrate (1630) for Count von Criegingen and (1635) for the young Protestant Duke Bogislav von Croy at Finstingen-on-Saar. Between war, looting, famine and pestilence life was a series of disasters. In 1643 he was transferred to Benfelden, then a Swedish fortification, as member of the council of war, to become secretary of state at Strassburg. In 1656 he was appointed counsellor of war and of the Church for the Duchy Hanau, next entering the service of the Elector of Mayence and, from 1664, under the Landgrave of Hesse. He was admitted to the Fruchbringende Gesellschaft, in 1645, with the surname "Der Träumende" (the Dreaming One), his principal work ('Wunderlichen und wahrhaftigen Gesichte (Visionen) Philanders von Sittewalt' having been published in 1640 (revised editions, Strassburg 1642-43). It is clearly a keen satire of his times laid down on the lines of Quevedo's 'Sueños.' Consult Nickel's 'Moscherosch als Pädagog' (Leipzig 1883); Pariser, 'Beiträge zu einer Biographie von Moscherosch' (in *Münchener Dissertation* 1891); Martin, 'Johann Michael Moscherosch' (in *Jahrbuch der Gesellschaft für lothringische Geschichte und Altertumskunde*, Vol. III, Metz 1891).

**MOSCHUS**, mōs'kūs, Greek bucolic poet of Syracuse in Sicily, flourished about 150 a.c. Four idyls form the whole of the remains of Moschus, which exhibit great elegance of style and delicacy of conception. The *Ἐπιτάφιος Βίωνα* ('Lament for Bion') was imitated by Shelley in 'Adonais.' A translation by J. M. Edmonds was published in 1912. The works of Moschus have commonly been edited with those of Bion (q.v.) and Theocritus (q.v.), and the three have been well translated by Andrew Lang (1889). See THEOCRITUS, BION AND MOSHUS, IDYLS OR.

**MOSCOSO DE ALVARADO**, Luis de, loo-ēs' mōs-kō'sō dā āl-vā-rā'dō, Spanish adventurer: b. Badajoz, Spain, about 1505; d. Peru, about 1560. He served under his kinsman Pedro de Alvarado in his expedition to Guatemala in 1529 and in 1534 accompanied him to Peru where he was for two years a follower of Pizarro, and then returned to Spain to live in luxury for several years on the proceeds of his services. In 1538 he attached himself to De Soto's expedition to Florida and upon the latter's death in 1542 took command and after many hardships succeeded in returning to Mexico. He was honored by the viceroy, Mendoza, and in 1551 accompanied him to Peru

where he was entrusted with important commands until his death.

**MOSCOW**, Idaho, town, county-seat of Latah County, on the Northern Pacific, Oregon and Navigation Company's railways, about 95 miles south by east of Spokane, Wash. The chief industries of the country around Moscow are lumbering, farming, stock-raising, mining and fruit-growing. Considerable grain and vegetables are raised. The chief manufactures of the town are lumber, flour and machine-shop products. The University of Idaho and the State Agricultural College are located in Moscow. Pop. 3,670.

**MOSCOW**, Russia, the second capital of the empire, and until Peter the Great selected Saint Petersburg as a northern capital, the sole capital and imperial residence, situated in a highly cultivated district on the Moskva, 400 miles direct by rail southeast of Saint Petersburg. It is the capital of a government of the same name (area, 12,847 acres; pop. 3,662,900), and is especially esteemed by the Russians as the place of the coronation of the tsars, the favorite residence of many of the nobility, the commercial emporium of central Russia and western Asia, and a principal seat of Russian manufactures. It is the holy or white mother city in the creed of the people, and no tsar would omit visiting it at least twice a year, or presenting in the city his eldest son after he has reached his majority.

As a general rule the temperature ranges from a winter mean of 14° F. to a summer mean of 66°, the annual mean being 40°. Sections of the city are walled. A considerable portion of the enclosed space is unoccupied by buildings, has an undulating surface and is traversed by the navigable Moskva, which is crossed by five bridges, and entering at the middle of the west wall makes a series of serpentine windings, in the course of which it receives the Iaousa and the Neglina, and leaves the city at the southeast corner. The river is frozen for five months of the year. The general view of the town, as seen from Sparrow Hill, an eminence on the southeast, is peculiarly striking and picturesque. Its hundreds of churches and convents, surmounted by gilt and variously colored domes and spires, its imperial and other palaces, its boulevards, gardens, ponds and, above all, the high walls and numerous stately towers of the Kremlin or citadel, produce an effect unequalled by any other European city. It formerly comprised five principal divisions: the Kremlin, Kitai-gorod, Byeloigorod, Semlyanigorod and the Sloboden or suburbs.

**Public Buildings, etc.**—The Kremlin, situated on the north bank of the river, forms the centre of the town, and in it are found the principal civil and ecclesiastical buildings. The Kremlin has always been held in almost superstitious veneration by all Russians. "Above Moscow there is nothing but the Kremlin; above the Kremlin, nothing but the sky." Here in the first place is to be seen the Great Palace, a lofty building in a mixed style of architecture, erected in 1838-49, having the Treasury, forming a sort of wing, on the right, while also connected with it is the Terem or old palace of the tsars, belonging to the 16th and 17th centuries. The Cathedral Square, on

the summit of the Kremlin, contains the Us-penskiy Cathedral (cathedral of the Assumption), in which the emperors are crowned, built in 1475-79, a clumsy building with heavy pillars, which support five cupolas, these, like the walls, glittering with grotesque frescoes of sacred subjects, painted on a golden ground; another cathedral here is the Archangelskiy Cathedral (of the Archangel Michael), founded in 1333 and rebuilt in 1505-09, containing the tombs of many tsars down to Peter the Great; a third is the Blagovieschenski Cathedral (of the Annunciation), founded in 1397. The arsenal is an immense building lining one side of the northern angle of the Kremlin, the opposite side being occupied by the senate. The chief attraction is the upper story of the treasury, containing the crowns of the early tsars, several thrones, warlike trophies and miscellaneous curiosities; the arsenal contains an immense quantity of weapons and arms, the cannon taken from the French during their retreat and numerous other military trophies. Near the centre of the buildings of the Kremlin is the tower of Ivan the Great, which rises to the height of 322 feet, contains numerous bells and is surmounted by a gilded dome, on which the cross is displayed above the crescent. The great Tsar Kolokol, or king of bells, the largest in the world, stands at the bottom of the tower on a granite pedestal, to which it was raised in 1832, after having remained for more than a century buried on the spot where it had fallen while an attempt was being made to hoist it. The Kremlin also contains a bronze statue of Alexander II (1898). Outside of it the chief buildings are the cathedral of Saint Vassili (Saint Basil), one of the strangest specimens of architecture anywhere to be met with, having no less than 20 gilded and painted domes and towers, all of different shapes and sizes; and the temple of the Saviour, built (completed 1883) to commemorate the French retreat, at a cost of \$10,000,000, and which is regarded as the most beautiful church in Russia. Other buildings worthy of notice are the great riding school, the Gostinnoi Dvor or principal bazaar in the Kitaigorod, a colossal building of three stories, where the leading wholesale merchants carry on their business; the Riadi, in the same quarter, occupied by handsome shops. Among the principal educational establishments is the university, the largest in the country, founded in 1755 by the Empress Elisabeth; it consists of four faculties, is attended by nearly 10,000 students and has a library of about 400,000 volumes, an observatory and botanical garden. A popular university, bearing the name of its founder, Gen. Alphonse Shaviavsky, was opened in 1908. The gallery of art contains 2,000 pictures, mainly Russian, bequeathed by the brothers Tretiaka. There are several good museums, the largest and most important being the Rumiantzof, in a fine building, with library and reading-room. The founding hospital, in which children are received without questions being asked, supports annually 5,000 children, 1,500 being in the institution at one time. The number of the open and planted spaces throughout the city is great, but otherwise the streets are narrow, uneven and crooked, lined by mean-looking brick and wood houses. Beside the imperial palaces in the Kremlin are the

Petrofskoi Palace and gardens outside of the Saint Petersburg gate, the principal fashionable resort during the summer season, and the palace of the Empress Elisabeth; and among the favorite pleasure grounds are the beautiful gardens of the Kremlin and the Galitzin garden on Sparrow Hill. Moscow is the residence of two archbishops and of the governor-general of the province.

**Manufactures, Commerce, Communications.**—Moscow is the second manufacturing city in the empire, and of late years its industrial and commercial activity has greatly increased. The manufacturing establishments give employment to more than 125,000 workmen and annually turn out goods to the value of about \$150,000,000. The principal establishments are for textile fabrics, chiefly cotton, woolen and silk, besides manufactures of metals, railway trucks, looms, fibrine, paper, leather and other articles. The enamelware industry owes its beginning to an American, Henry Hiller. The machinery employed in the factories is generally of the most improved description, and though partly made in the city largely comes from Britain and elsewhere. From its central position Moscow is the great entrepôt for the internal commerce of the empire and toward which six railway lines converge. Great facilities for this commerce are given by water communication, which extends on one side to the Baltic, on another to the Caspian and on a third to the Black Sea; and by the railways to Saint Petersburg, Yaroslav, Nijninovgorod, Siberia, etc. In winter the traffic over the snow in sledges is enormous. Tea, silk, indigo and cotton are important articles of trade.

**Administration, etc.**—Moscow is under the immediate charge of a general governor and a military governor. It is the seat of important civil and criminal courts, and of various superintending boards of police, manufactures, trade, etc.; and has a number of literary, scientific and other societies of different kinds. Pop. (1891) 822,397; (1897) 977,269, with suburbs 1,035,664; (1913) 1,817,100, nearly all Great Russians of the Orthodox Greek Church, males greatly preponderating.

**History.**—Moscow is said to have been founded in 1147 by George Dolgoruki, Prince of Kiev. Its nucleus was the Kremlin, which at first was nearly surrounded by a palisade, and formed an important military station. For a long time it continued to be a dependency of the principality of Vladimir; and in 1238, when Batou-Khan devastated Russia, it was sacked and burned. In 1293 it was again sacked, and the inhabitants were dragged away into slavery by Khan Nagai. Ivan Danilovitch of Vladimir took the title of grand prince of Moscow in the early part of the 14th century and from that time it remained the seat of government until the beginning of the 18th, when the administration was transferred by Peter the Great to Saint Petersburg. Moscow was plundered by the Lithuanians and the Tartars of Tamerlane in the latter part of the 14th century, and was nearly consumed by fire in 1536, in 1547 and again in 1571, when the Tartars set fire to the suburbs, a large part of the population perishing on that occasion. During the insurrections caused by the pseudo-Demetrius (1605-12), when the Poles and Cossacks took the city, it

was again partly destroyed. In 1812 it was entered by the French under Marat on 14 September, and on the 15th by Napoleon, who took up his residence in the Terem Palace in the Kremlin. The city, deserted by its inhabitants, was set on fire by order of the governor, Count Rostopshin, compelling Napoleon to leave on 19 October and to take his final departure on the 23d, and resulting in the disastrous retreat of the French army. The greater part of the city was then destroyed, notwithstanding the efforts of the French to stay the progress of the flames. It was rebuilt within a few years. The railway to Saint Petersburg was opened in 1851. The chief of modern events are the coronations in 1856 of Alexander II and in 1896 of the late Nicholas II, at the latter ceremony 2,000 people being crushed to death, and hundreds injured, during the distribution of gifts. On 17 Feb. 1905 the Grand Duke Sergius was assassinated in the Kremlin, and there were revolutionary disturbances in that and the succeeding year. On 14 March 1918 the People's Commissioners (the new Russian Soviet Government) left Petrograd for Moscow, which thus became the centre and capital of the New Russia. Consult Wirt Gerrare, 'The Story of Moscow' (London 1900); Grove, H. M., 'Moscow' (New York 1912).

**MOSEILIMA.** See MOSAYLIMA.

**MOSELEY, mōz'li, Edward Augustus,** American lawyer: b. Newburyport, Mass., 23 March 1846; d. Washington, D. C., 18 April 1911. He engaged for several years in both the East and West Indian trade. He then studied law, was admitted to the Massachusetts bar and was also a member of the State legislature for several terms. His chief interest was in the lessening of danger in railroad travel, and he became the leading authority in the United States on all measures or appliances for procuring the safety of railroad employees and travelers. Largely for this reason he was appointed secretary of the Interstate Commerce Commission at the time of its formation. His efforts in obtaining and enforcing the Safety-Appliance Law gained him testimonials from all the railroad men's organizations in the United States, and the formal thanks of the Commonwealth of Massachusetts. He published 'Arbitration as applied to Railways and their Employees'; 'Safety Appliances on Railroads'; 'One Hundred Years of Interstate Commerce Law' (1900); 'The Transportation Question as Affected by the Cullom Bill' (1900); 'Federal Supremacy' (1907).

**MOSELEY, Henry,** English mathematician: b. Newcastle-under-Lyme, 1801; d. Bristol, 1872. He was graduated at Saint John's College, Cambridge, and after studying theology was ordained a priest of the Church of England. From 1831-44 he was professor of natural and experimental philosophy and astronomy at King's College, London, and was one of the first inspectors of schools to be appointed (1844). He was appointed canon of Bristol in 1853, next becoming chaplain to the queen. He was given the degree LL.D., *hon. causa*, Cambridge, 1870. Among his best-known works are 'A Treatise on Mechanics, Applied to the Arts' (1834); 'Astro-Theology' (1838; 3d ed., 1860); 'Lectures on Astronomy' (1839; 4th ed.,

1854); 'The Mechanical Principles of Engineering and Architecture' (1843), much in use to this day as a textbook and frequently re-edited and revised.

**MOSELLE, mō-zél** (German, *Mosel*), a European river which rises in France at a point over 2,400 feet high on the western side of the Vosges and quite close to the German boundary. After flowing northwest, through the department of Meurthe-et-Moselle, it proceeds northeast through German Lorraine into Rhenish Prussia. After passing Trèves in a remarkably winding course, it falls into the Rhine at Coblenz; total course, about 314 miles. It is navigable from its junction with the Meurthe. Its principal affluents are, in France, the Valogne, Meurthe, Seille, Madon, Math and Ornc, and beyond France, the Sarre, which joins it above Trèves; and the Sure, Kill and Elz. Of these affluents the Meurthe, Sure and Sarre are navigable. The fortress of Metz protects the valley of the Moselle, which forms the natural line of communication between France and Germany. The valley is famous for its fertility; the lower part for its vineyards. In the early days of the Great War in the fall of 1914, the German army of the Moselle took part in the attempted march on Paris.

**MOSELY COMMISSIONS,** two delegations known as the INDUSTRIAL and the EDUCATIONAL, which visited the United States in 1902 and 1903 to study conditions and methods in their respective branches, for comparison with those of Great Britain.

*The Mosely Industrial Commission* made a tour of the United States from November 1902 to January 1903, to investigate manufacturing, industrial and commercial lines, which in international competition had seriously affected the commerce and free trade policy of Great Britain. It was financed by Mr. Alfred Mosely (b. Bristol, England, 1855), a diamond merchant whose relations with American mining and other engineers in South Africa had developed the desire to discover the sources of their success, the comparative causes of Great Britain's industrial decline, and to evolve a plan whereby American methods could be introduced into the United Kingdom for the rehabilitation of its economic and industrial status. A suggestion to invite British trade-unions to select a representative from each to form a commission to study American industries and the condition of the workmen was acted upon, most of the unions electing as representative their general secretary. Twenty-three formed the commission and were given a free trip to the States, with expenses paid for nearly three months. Each man was pledged to study conditions carefully and to answer fully on his return a series of tabulated questions.

Mr. Mosely and the delegates made a circular tour in which they were afforded every opportunity to inspect some of the largest manufacturing in the United States. They visited Niagara, Buffalo, Cleveland, Chicago, Dayton, Pittsburgh, Philadelphia and New York, as one party, while individual members also took trips to other points. The chief results of their observations were published in the 'Reports of the Mosely Industrial Commission' (London, April 1903).

Some of the conclusions arrived at were: The American workman for two and one-half days' work receives remuneration equal to that of the British for a week; the American is more temperate than the British; he lives longer; is more thrifty, and after a few years frequently retires with his savings to an easier occupation, usually farming or market-gardening. Labor saving machines were more in evidence in America than in the United Kingdom, but, there was a considerable difference of opinion among the various delegates as to what could be learned from America in their respective trades, for instance, the shipbuilding and brick-laying in England were considered superior to those of America. To the question "Are there greater opportunities for the workingman to rise in America than in England?" "Yes," came as a unanimous answer. The average workman was considered as good in one country as the other, the difference was to be found in conditions. In Great Britain generations of workers toil in a confined area, and have become hidebound by inherited labor traditions; increased production to them does not mean increased wages—hence a lack of incentive. In the United States, the stimulating climate and abundance of undeveloped resources tend to a constant striving for direct results through the simplest means, whence the wonderful development of machinery, manufacturing equipment, output, increased wages, general prosperity and well-being of the American workmen, together with a unity of feeling between employers and employees along the lines of increased production, which is not to be found in England. The organization of capital and labor in the United States produced a great impression on the delegates, and the advantages of the Civic Federation to bring together these two great and active factors in production on all disputed questions, and at the initial stages to avert strikes by arbitration, were fully recognized as those of a model organization worthy of immediate adoption. The freedom accorded to religious belief and the excellent public school education of the States elicited the warmest praise from the commission, the advantage given to all the American youth being fully apparent.

The success of the Industrial Commission led to the organization of the *Mosely Educational Commission* to the United States, October–December 1903, in which 26 prominent British educators took part at the invitation of Mr. Mosely to investigate:

1. The development of individuality in the primary schools.
2. The social and intellectual effects of the wide distribution of secondary education.
3. The effect of specific instruction given (a) in business methods; (b) in applied science.
4. The present state of opinion as to the value of professional and technical instruction of university rank, designed with special reference to the tasks of business life.

As in the work of the Industrial Commission the conclusive deductions drawn were wholly in favor of the system of education in the United States which was described as practical, enlarged, enlightened, up-to-date and scientific. Consult Mosely, 'Reports of the Mosely Educational Commission to the United

States of America, October–November 1903' (London 1904).

C. LEONARD-STUART,  
*Editorial Staff of The Americana.*

**MOSEN**, mō'sēn, **Julius**, German poet: b. Marieneey, in Vogtland, Saxony, 8 July 1803; d. Oldenburg, 10 Oct. 1867. He was educated in the Plauen Gymnasium, studied law (1822) at Jena, travelled through Italy and then worked for some time under an attorney at Markneukirchen. In 1834 he settled at Dresden, taking up the practice of law, and soon becoming noted as an author. He became (1844) dramaturgist at the Oldenburg Hoftheatre, but incurable sickness greatly deterred his activities after 1848 and he was pensioned in 1850. He first came into prominence through his epic poem 'Das Lied vom Ritter Wahn' (Leipzig 1831), a very ancient Italian legend redressed in a liberal form. His 'Ahasver' (Dresden 1838) contains more of philosophy than poetry; but in his 'Gedichten' (Leipzig 1836; 2d ed., 1843) he shows national radiance in a string of ballads as 'Die letzten zehn vom vierten Regiment,' 'Andreas Hofer,' 'Der Trompeter an der Katzbach,' etc. In narrative form we have the novelle 'Georg Benlot' (Leipzig 1831), 'Bilder im Moose' (ib. 1846). His great ambition was centred in dramatical writing, but these works are too saturated in abstract rhetoric. Of his best might be mentioned 'Cola Rienzi,' 'Die Bräute von Florenz,' 'Wendelin und Helene,' 'Kaiser Otto III,' all of which are to be found in *Theater* (Stuttgart 1842), the latter being the most imposing. His talented work, 'Die Dresdener Gemäldegalerie' (Dresden 1844), should also be quoted. His works in eight volumes has been published under the title 'Sämtliche Werke' (Oldenburg 1863) and a fuller edition, including biography, was published in six volumes by his son (Leipzig 1880). Consult his 'Erinnerungen,' extended by Zschommler (Plauen 1893); 'Julius Mosen, eine biographische Skizze' (Oldenburg 1870) is anonymous.

**MOSENTHAL**, mō'sēn-tāl, **Joseph**, German-American musician: b. Cassel, German, 30 Nov. 1834; d. New York, 6 Jan. 1896. He studied music in Germany and in 1853 removed to the United States where he was organist and choir director of Calvary Church, New York, 1860–87. He conducted the famous Mendelssohn Glee Club in New York in 1867–96 and played the violin in several leading orchestras there. He composed both church and secular music, among which are the psalm 'The Earth is the Lord's' and part songs for 'Thanatopsis,' 'Music of the Sea,' 'Blest Pair of Sirens,' etc.

**MOSENTHAL**, Salomon Hermann von, German dramatist: b. Cassel, 14 Jan. 1821; d. Vienna, 18 Feb. 1877. He studied at the University of Marburg and in 1851 obtained a position under the Austrian government. His best-known dramas are 'Deborah' (1850); the original of 'Leah the Forsaken' and 'Sonnenwendhof' (1856), which were translated into English, Danish, Hungarian and Italian. He wrote also 'The German Actors' (1863); 'The Mayor of Altenburen' (1868); 'Maryna' (1871); the tragedies 'Düweke' (1860); 'Pietra' (1865), etc.

**MOSER, mō'zēr, Gustav von**, German dramatist: b. Spandau, Prussia, 11 May 1825; d. 1903. He obtained a military education and after serving in the Prussian army resigned in 1856 to devote himself to literature. He produced more than 100 successful comedies and farcical comedies, sometimes in collaboration; several of his works have been well received in English translations. Among his plays may be named 'Das Stiftungsfest' (1873); 'Ultimo' (1873); 'Der Bibliothekar' (The Private Secretary) (1878); 'Der Veilschenfresser' (1876); 'Krieg im Frieden' (1880). A uniform edition of his plays was published 1873-94 in 22 volumes. Consult the biography by Hans von Moser (Weimar 1908).

**MOSER, Johann Jakob**, German jurist and publicist: b. Stuttgart, 18 Jan. 1701; d. there, 30 Sept. 1785. He received his education at the University of Tübingen; in 1720 became teacher of law there, and in 1729 was appointed to the full professorship. In 1736 he became a director of the university at Frankfort-on-the-Oder, but in 1739, having fallen into disfavor with Frederick William I, was compelled to resign. He then founded the academy at Hanau for the education of the young nobility in political science; and he suffered imprisonment for five years at the instance of the Duke of Württemberg, his patron. He is credited with being the first to publish a systematic account of European international law. He was a prolific writer, his books numbering over 500, the most important of which are 'Deutsches Staatsrecht' (53 vols., 1737-54, with additions of 2 vols. 1766-75, and 3 vols. 1781-82); 'Lebensgeschichte' (1783). Consult the biography by Wächter (Stuttgart 1885).

**MOSER, Justus**, German historian and humorous writer: b. Osnabrück, 14 Dec. 1720; d. there, 8 Jan. 1794. He studied jurisprudence at Jena and Göttingen; in 1747 became attorney for the government, and for 25 years during the minority of Duke Frederick of York acted as his legal adviser, and was afterward appointed a judge. His most important work is 'Osnabrückische Geschichte' (2 vols., 1768; 3d ed., 1820; Vol. III, edited by Herbert von Bar, 1824). Of his humorous writings perhaps the most striking is 'Harlekin,' in which he attacks hypocrites and pedants of all kinds. He also published some valuable essays on local topics entitled 'Patriotische Phantasien' (4 vols., 1774-86). An edition of his complete works was published by Abeken in 10 volumes (Berlin 1842-43).

**MOSES**. Hebrew leader and legislator, the story of whose life and work is given with such singular clearness and strength in the Pentateuch, is one of those rare names that have stamped themselves permanently on the world's history, so that we turn again and again to the simple record of his career and achievements with an interest that never lags. With all his Oriental background and the fact that his concern was primarily with his own race to lead them from bondage to freedom, there is so much breadth and suggestiveness in the laws that bear his name, his moral statutes being at the basis of modern civilization, although promulgated 3,000 years ago, that he continues a familiar and fascinating figure to all eyes.

**Traditiona. Data.**—The Biblical account, with its rapid, stirring recital, which attains at times a kind of dramatic effectiveness, tells of his birth, how his mother, in dread of Pharaoh's mandate which consigned all Hebrew children to be thrown into the Nile, concealed him for three months, then set him in an ark of bulrushes on the river's banks, where Pharaoh's daughter discovered him and had him reared as her son (Ex. xi, 1-10). His days of ease were not to last. Not all of Egypt's luxurious life and his own hopes of future power as possible occupant of the throne could dull his innate racial sense of duty. Seeing an Egyptian attacking a Hebrew, he interferes and slays the aggressor, hiding the body in the sand. Then the next day he sees two Hebrews quarreling, and when he tries to separate them, one taunts him with slaying the Egyptian. In fear of further discovery and of death by Pharaoh, he escapes to the peninsula of Sinai, dwelling with the priest of Midian, whose daughter he marries. Then follow 40 years as a shepherd, when occurred the episode of the burning bush on Mount Horeb. Now began his mission—it was his task, divinely appointed, to return to Egypt and redeem his brethren from slavery (Ex. iv, 1-9, 20). How he was met and aided by his brother Aaron, how he gained a hearing with his brethren, how Pharaoh's heart was hardened against the departure of the Hebrews, until, after a series of successive plagues, the Egyptians in their terror bade the Israelites make every haste to leave, are steps in a thrilling drama that has served as material for preacher, poet and playwright, with its incidents to-day as fresh as when first read or narrated. Now began the long 40 years' march, but the Israelites had not advanced very far, they moved slowly, being accompanied by their wives and children, their flocks and herds, when Pharaoh and his army started in pursuit (Ex. xiv, 8-9). How the panic and despair of the people are changed to exultation as the waters recede and Pharaoh's hosts are drowned in the Red Sea, while the wanderers are saved, is another of those thrilling episodes immortalized in Miriam's Song of Triumph, that belongs to the highest strains of Hebrew poetry. Then the people are led by Moses through the wilderness to Sinai or Horeb, where he received the Ten Commandments and the Law and God enters into a covenant with Israel (Ex. xix et seq.). After this culminating incident, so vividly related, Moses continues his leadership and amplifies his message from Sinai with many details as to the tabernacle, the priests, the encampments. Cautiously now he marches forward to Kadesh, from which place the spies or scouts were sent to Canaan, the ultima thule of the people's journeyings. How characteristic—they refuse to advance in their alarm at the report of the spies, and were condemned to remain in the desert until that generation had passed away (Num. xiii-xiv). Nothing is extenuated in the flaming record—every act of weakness, of rebellion, of disobedience with its invariable penalty, all are frankly and unflatteringly told. Moses resumes the march eastward, making friends and foes on the journey, but receives warning that he will not be allowed to lead the people across the Jordan as he would die on the eastern side

(Num. xii). He gathers the tribes in consequence and gives them a farewell address, which is embodied in the book of Deuteronomy. He repeats the Law, adds his wise counsel, warns of the consequences of disloyalty and adjures the people to be faithful with an eloquence and persuasiveness that give his words perennial force. Then after a final blessing of the multitude, he ascends Mount Nebo to the summit of Pisgah, and dies in his 120th year. The place of his sepulchre is unknown (Deut. xxxiv), doubtless for good reasons as one familiar with the history of similar founders of religions can readily understand.

**Character of the Laws.**—The open pages of the Pentateuch relate the character of the laws of Moses with a minuteness of detail that leaves little, if anything, untold. The code, embracing 613 statutes, covers the entire requirements of priesthood, community and individual. While his training and early life in Egypt influenced in many ways his legislation, the distinctive features are vital, with their emphasis on a purer and more rational divine belief and their elements of a democracy after which later nations in certain respects have modeled their systems. Despite the elaborate forms of priesthood and sacrifices, concessions to a people not ready for a loftier attitude, from our 20th century point of view, although our later day civilization still needs balance wheels, and holds fast to signs, symbols, forms, ceremonies of its own, the essential truths of the Mosaic laws, its insistence on personal equality and personal morality, cannot be outgrown. Its spirit of broad humanity, its consideration for the old and the young, the slave and the enemy, the fruit tree and the animal creation, its health and food regulations full of suggestions to the modern physician and dietitian, all these show a wisdom in their author that accounts for his fame and the fact that so many of the Mosaic laws are still observed by the great majority of the people to whose ancestors the code was given.

**Moses in the Legends.**—It was to be expected that in course of time legends should arise as to the character of Moses and the various episodes in his career. In rabbinical literature, these have assumed a variety, a grandeur and a poetical beauty that account for their hold on the imagination for centuries to our day. To the average English reader Rev. S. Baring Gould's 'Legends of the Patriarchs and Prophets' will be found stimulating. Dr. Ginzberg's 'Legends of the Jews,' with its exhaustive chapters, will satisfy the more critical reader, although there is no attempt to elaborate the stories which are narrated with sober exactness. If it was denied the people to know his sepulchre and render him worthy post mortem honors, they had full license to draw upon their imagination and adorn the memory of so great a prophet, leader and law-maker by spinning the web of fairy tales in apt Oriental fashion so dear to the Semitic mind and in which the Occidental no less delights even if he assumes a more worldly-wise air. These legends stretch over his entire history from birth to death and seek to interpret in their own imaginative way, which is often far from being forced or unnatural, the scenes and incidents that he encounters, which so readily adapt themselves to

the story-teller's mood as well as to the teacher's vision. It is not necessary in the limited space at command to dwell at any length on the mass of legends so quotable and stimulating. The Hellenistic stories of Moses, if more limited, have a quaint interest of their own. The Mohammedan are obviously distortions or exaggerations of the rabbinical, although occasionally the treatment is original. Moses plays a part, too, in apocalyptic literature.

**Modern Critical View.**—Since Astruc in 1753 published his view of the composite character of the book of Genesis, due, as he stated, to the use by Moses of certain documents in its elaboration, the critics have waged a long continued battle as to the question of authorship, which has its piquant features and is still being contested almost as hotly as a century ago. The fact, too, that a parallel to the story of the birth of Moses and his experience in the bulrushes of the Nile is found in the cuneiform library of Assurbanipal and told of Sargon, a Babylonian king who ruled, it is said, about 3800 B.C., is not without its suggestions. The etymology of the name Moses, too, has given rise to much speculation, although the Biblical account has still its doughty defenders. However, whatever the criticisms as to name, authorship, date, whatever the differences in details, the prevalent opinion as to the man himself is one and the same, as a great historical figure, who added unity and strength to a nation, after setting it free, and under Providence, shaped its destinies and gave it the essentials of a religious and civil code of laws, which later ages developed. The verdict of the great majority of scholars from Wellhausen to Kittel, from Budde to McCurdy, from Cornill to Barton and Paton, is conclusive. Just as the story of the Exodus has been confirmed by modern investigation step by step on the long journey across the Desert, so the historical character of Moses stands out in clear relief after the fullest and most exacting analysis and research by the modern scholar and critic.

II and III, Philadelphia 1909-13); Ottley, 'A Short History of the Hebrews' (Chap. III, New York 1901); Warrington, George, 'When was the Pentateuch Written?' (London and New York).

ABRAM S. ISAACS.

**MOSES, Bernard,** American historian and political economist: b. Burlington, Conn., 27 Aug. 1846. After graduating from the University of Michigan in 1870, he went to Europe for further study, receiving his Ph.D. from Heidelberg in 1873. In 1875 he became professor of history at Albion College, but since 1876 has been professor of history and political economy at the University of California. His more important works are 'Politics' (with W. W. Crane); 'Federal Government in Switzerland'; 'Democracy and Social Growth in America'; 'Establishment of Spanish Rule in America' (1898); 'The Spanish Dependencies in South America' (1914); 'The Government of the United States' (1906). The volume on 'South America on the Eve of Emancipation' (1908) was later rewritten and embodied in the larger work on the Spanish dependencies. In March

1900 he was appointed a member of the United States Philippine Commission, and served in this capacity three years in the Philippine Islands. In 1908 he was a delegate from the United States government to the Pan-American Scientific Congress held in Santiago de Chile; in 1910 he was delegate to the International Conference of American States at Buenos Aires; and in the same year he was Envoy Extraordinary and Minister Plenipotentiary on special mission to Chile in connection with the centenary celebration of that country.

**MOSES, George Higgins**, American diplomat and public official: b. Lubec, Me., 9 Feb. 1869. He was graduated at Dartmouth College in 1890 and since 1898 has been president of the *Monitor and Statesman* Company of Concord, N. H. In 1890-91 he was secretary to the governor of New Hampshire, and from 1893 to 1906 was secretary of the State Forestry Commission. Mr. Moses was a member of the Concord board of education in 1902-03, 1906-09 and after 1913. He was delegate-at-large to the Republican National Convention of 1908 and 1916. From April 1909 to November 1912 he was Envoy Extraordinary and Minister Plenipotentiary of the United States to Greece and Montenegro. In November 1918 Mr. Moses was elected United States senator to fill the unexpired term of two years, occasioned by the death of Senator J. H. Gallinger, defeating John B. Jamison, Democrat, by a majority of 998.

**MOSHEIM, Johann Lorenz von**, yō'hān jō'rēnts fōn mōs'him, German Protestant theologian: b. Lübeck, 9 Oct. 1694; d. Göttingen, 9 Sept. 1755. He studied and taught at Kiel; became professor of theology at Helmstedt in 1723, abbot of Marienthal in 1726 and professor (1747) and university chancellor (1755) at Göttingen; was a notable preacher and an erudite theologian and church historian of liberal leanings; and wrote 'Institutiones Historiæ Ecclesiasticæ' (1755, translated into English by MacLaine); 'Institutiones Historiæ Christianæ' (1763); 'Attempt at an Impartial and Thorough History of Heresies' (1748-50); 'Morals of the Holy Writ' (1770-78); etc.

**MOSHER, mō'zhēr, Eliza Maria**, American physician: b. Cayuga County, N. Y., 1846. She was graduated from the University of Michigan in 1875, and studied at the School of Medicine in Paris from 1879-80. She was resident physician at the Massachusetts Reformatory for Women in 1880-81 and director of the institution in 1881-83. In 1883 she went to Vassar College as professor of physiology and resident physician; from 1886-96, she was engaged in general medical practice in Brooklyn, N. Y., and then became professor of hygiene in the department of literature, science and arts, and women's dean at the University of Michigan, holding this position till 1902 when she returned to her practice in Brooklyn. She has been lecturer at the Chautauqua Summer School of Physical Education since 1888. She is the author of 'Health and Happiness' (1911).

**MOSKVA, mōsk-vā**, Russia, an affluent of the Oka, a tributary of the Volga, which rises in a marsh in the east of Smolensk, flows east to the city of Moscow and thence 112 miles

southeast to the Oka, which it joins near Kolomna after a total course of 305 miles. It is connected with the Volga by the Moskva Canal. It is navigable from its mouth to Moscow except between November and April when it is frozen. The battle of Borodino or Moskva, between the French under Napoleon and the Russians under Kutusoff, was fought on its banks (7 Sept. 1812.)

**MOSLEM, or MUSLIM.** See MOHAMMEDANISM.

**MOSLER, mōz'lēr, Henry**, American artist: b. New York, 6 June 1841. A diligent student of wood-engraving, he was draughtsman on a Cincinnati comic weekly (1855), studied with James H. Beard (1859-61), and was art correspondent for *Harper's Weekly* with the Army of the West 1862-63. Realizing the need of study he followed art at Düsseldorf and Paris (1863-66), returning to Europe in 1874. He resided for many years in France, was appointed a Chevalier of the Legion of Honor in 1892 and has been a successful exhibitor and prize winner at many exhibitions at home and abroad. His specialties are portraits, figure paintings and groups of figures.

**MOSQUE, mōsk** (Arabic *mesjid*, Italian *moschea*), a Mohammedan house of prayer. The form of the oldest mosque was that of the Christian basilica, which however became modified in the progress of Mohammedan architecture. Mohammedans borrowed or adapted their ideas of architecture from the nations on whom they imposed their faith; the famous mosques of Turkey resemble the Byzantine architecture of Constantinople, and certain of those in India the temples of the Jains. Domes and minarets in course of time became emblematic of the more characteristic and ornate examples of Moresque or Saracenic art; but these are non-essentials, for in poor communities a bare whitewashed room may suffice for the public worship of the faithful. The mosques of the Arabs often include, in a quadrangular area, an immense number of columns ranged in files, the multiplicity and extent of which impress the mind of the beholder with surprise and admiration. These columns are, in numerous instances, the rich spoils of antique monuments. Mosque architecture possesses no fixed rules, deeming lightness and elegance alone to be the fundamental laws of architecture. In these Mohammedan churches we find neither altars, nor paintings, nor images, but a great quantity of lamps of various kinds, which form the principal interior ornament, and some sentences from the Koran written on the white walls. The buildings are often quadrangular in plan, and have an open interior court, where are fountains for ablutions. In the southeast of the building there is a pulpit for the imām; in the direction in which Mecca lies (the *Kibléh*) there is a niche toward which the faithful look when they engage in prayer. Opposite the pulpit there is a platform surrounded by a parapet, with a desk on which is placed the Koran for the purpose of reading to the congregation. On Fridays the five daily prayers, obligatory on the faithful every day, are recited in the mosque by the whole congregation, together with additional prayers. It is not customary for women to enter the mosques, and when they do they are placed

separately from the males. The chief officer of the mosque is the *nadir*, under whom are two imáms, muezzins who call the people to prayer, etc. These in addition to their religious vocation generally pursue secular callings. It is usual to cover the floor of the mosque with carpets, but there are no seats. On entering a mosque, the faithful remove their shoes. The building is never closed; and while nothing could exceed the devotion of the congregation gathered together in worship, at other times the mosques serve as convenient meeting-places, and in which wayfarers may accommodate themselves. They also serve as schools and seats of learning. Thousands of students are regularly in attendance at the most famous of these, the Azhar Mosque in Cairo. The mosques are maintained for the most part by endowments in land. The finest of the mosques of Constantinople and of the world is that of Saint Sophia, at one time a Christian church. In addition to schools, the imperial mosques have frequently hospitals and kitchens for cooking food for the poor.

**MOSQUERA Y ARBOLEDA**, mōs-ká'rā ē ār-bō-lá'dá, Tomás Cipriano de, Colombian politician and President: b. Popayan, 20 Sept. 1798; d. Coconuco, 7 Oct. 1878. After three years of service in the patriot army he was captured by the Spaniards, when he was only 18, but he escaped at Jamaica, returned to the army and in 1829 was made general by Bolívar, who made him also envoy to Peru. After Bolívar's death Mosquera traveled in North America and Europe. He became a senator in 1833; was President of New Granada 1845-49; in 1859 led the federalist revolt against Ospina, adopted a federal constitution by which the name of the country was changed from New Granada to the United States of Colombia, and became dictator of the new federation. His power was checked by a revolt led by Canal, with whom Mosquera in 1862 came to terms. Under the constitution then adopted Mosquera was elected President in 1863 and in 1866; the latter term was cut short by a successful revolution due to the President's arbitrary use of power. He was banished to Lima for four years, but upon his return again entered politics, was governor of Cauca and became a member of Congress. He was strongly anti-clerical; and wrote on the geography of New Granada, and a valuable life of Bolívar (1853).

**MOSQUITIA**, mōs-kē-tē'á. See **MosQUITO** COAST.

**MOSQUITO** (diminutive of the Spanish *mosca*, a fly), a name applied to insects of the dipterous family *Culicidae*. Mosquitoes are cosmopolitan, only a few oceanic islands, deserts and mountain tops being free from them. Frequently they occur in vast swarms, and they abound equally in arctic regions, as Alaska and Greenland, and in the tropical swamps of Africa and South America, while at many intermediate points they are intolerable pests. Vertically they range from the seashore to altitudes of at least 13,000 feet. While many species are local, others are very widely distributed. Typical mosquitoes have the following characteristics: The mouth is provided with a prolonged, suctorial, piercing proboscis; the greater part of the body and head and portions of the wings and legs are covered with scales

which determine the color pattern; the complicated venation of the wings is also highly characteristic. These features distinguish mosquitoes from the related midges (*Chironomidae* and *Cecidomyiidae*) and the black flies (*Simuliidae*); and from the crane-flies (*Tipulidae*) which inspire most of the stories of gigantic mosquitoes. Not less than 22 genera and 350 species are now known. The species are based largely upon differences in the form and arrangement of the scales and the resulting coloration, the form of the foot-claws, etc.

**Development.**—The typical life-history of a mosquito is as follows: The eggs are deposited at night in or (rarely) near shallow water, usually fresh but in the case of a few species brackish or salt. After one or a few days they hatch into legless, aquatic larvæ, popularly known from their activity as "wigglers." These have the mouth provided with small jaws for browsing at the bottom, and with brushes of hairs whose movements induce currents in the water and bring to the mouth floating particles or minute plants and animals which serve as food. The thorax is more or less swollen, and the abdomen slender and nine-jointed, with the last, or anal, segment bearing two pairs of leaf-like appendages and a more or less conspicuous fan of spreading hairs. On the dorsum of the eighth segment is a pair of spiracles, or breathing-pores, usually borne at the end of an elongated tube or siphon. By their active wiggling the larvæ come frequently to the surface and breathe, and then sink by gravity lazily to the bottom. After one or more weeks the larvæ molt finally and transform into pupæ, which have the head and thorax closely united, and the latter greatly enlarged, with the form of the future legs and wings apparent. At the tail end is a pair of fin-like expansions; while the respiratory organs, instead of being near the end of the abdomen, have the form of a pair of large mouthed tubes or funnels on the dorsum of the thorax. Like the larvæ the pupæ are active wigglers, but, unlike them, are buoyant and naturally float at the surface with the respiratory funnels uppermost and exposed. When alarmed they display much activity and wiggle violently toward the bottom. The imagoes escape from the pupal investments at the surface, and windrows of cast-off skins are thrown up at the water's edge. The males, which transform first, hover in little clouds and are sought by the females. In the males the antennæ are broad and feather-like, in the females slender and simply hairy. The duration of the period of aquatic life varies with the species and temperature; in our common *Culex pungens* it may be only 10 days, so that many generations may be produced during a favorable season. The winter may be passed in any stage from egg to adult, all of which are extremely resistant to cold, and the aquatic stages capable of withstanding repeated freezing and thawing. The hibernating imagoes, which are found in houses and other sheltered places, may become active on warm days and in the case of *Anopheles*, at least, are chiefly fertilized females. Mosquitoes have many natural enemies. The aquatic stages are preyed upon by carnivorous fishes, water-newts larvæ of dragon-flies and aquatic beetles and leeches. Vast numbers of the flying insects are destroyed by night-hawks and bats, and during

INDIA

1 Mosque at Delhi, India

2 Pool in Shaivite Temple, Madurai, India

the day they are pounced upon by dragon-flies, hornets and other carnivorous insects, and snapped up by swallows and swifts as they skim the grassy meadows. Of their parasites the recently discovered worm, *Agammomermis culicis*, is considered to exert an important checking influence in some years.

Mosquitoes are weak fliers and usually seek shelter when the wind blows, so that railroad trains, ships and wagons are far more effective than their own wings in accomplishing their dissemination.

Notwithstanding that the chief human interest in mosquitoes arises from their blood-sucking habits, yet the taste for blood is certainly an acquired one and a relatively unimportant factor in the lives of the majority of

mosquitoes. The normal food of both sexes of many species, and the only food of the males of nearly all, consists of the juices of flowers, fruits and other plant parts. In a few species a meal of blood by the female seems requisite to the maturation of the eggs, but this is decidedly exceptional. Most of the species are active chiefly at night, but a few, like *Stegomyia fasciata*, in which also both sexes bite, are most vicious during the early afternoon. The bites of all species are not equally irritating, probably the result of dissimilar qualities of the salivary secretion which is poured into the wound to facilitate the blood flow. Ammonia and glycerine allay the irritation. Besides the warm-blooded birds and mammals, mosquitoes attack fishes, frogs, turtles and even other insects.

Until within a few years mosquitoes were regarded merely as intensely annoying pests, but since the definite discovery of their relation to disease-transmission their momentous importance has been recognized. Besides several diseases of the lower animals three serious human maladies—malaria, yellow fever and elephantiasis—have been definitely traced to their agency, and they are suspected of others.

**Kinds and Characteristics.**—Within the limits of North America nine genera and upward of 30 species are known to occur.

Illustrations are here given of the three varieties which assume importance through their relations to the human race: the *Culex*, or gut-

ter mosquito, the *Anopheles*, or swamp mosquito, and the *Stegomyia*, or cistern mosquito. *Culex pungens* prefers the gutter and may be likened to the sparrow among birds; it is noisy and numerous, and always hungry.

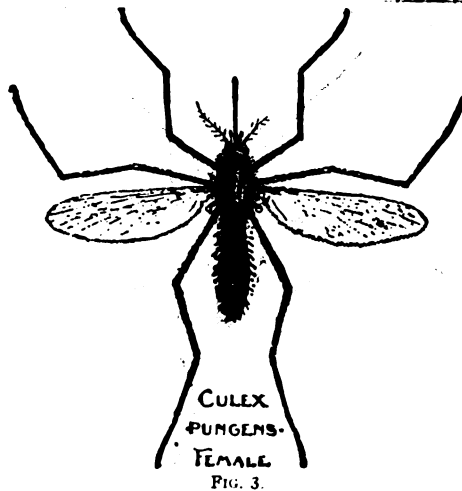

The male insect (Fig. 1) presents a rather bushy head-dress, by which it may be easily distinguished from the plainer but more dangerous female. Male mosquitoes are not blood-suckers, but vegetarians; for the reason that the male insect cannot pierce the skin and must, therefore, subsist on food more easily obtained.

The feeding organ of the mosquito, called the proboscis, is composed of seven parts (Fig. 2), which together form the organ by means of which the blood is reached and through which it is obtained.

In the male insect the stylet, or piercing instrument, is adherent to the neighboring parts and cannot move sufficiently to puncture the skin.

The female insect (Fig. 3) is plain as compared with the male. The palpi, those projections on either side of the central proboscis, are much shorter in the female; and the organs to the outer side, the antennæ, are not as beautifully plumed. The female of the *Culex* is very annoying, but is not known to transmit disease in this country, though it is suspected of conveying dengue fever. In eastern tropical countries a species of the *Culex* is connected with the disease known as elephantiasis.

The *Anopheles* is the spotted-winged swamp mosquito, responsible for malaria in the human. A peculiarity of this mosquito is its long, thin legs, and the dark spots on the wings are characteristic. The same general difference in the head-dress of the sexes obtains, save that the palpi are about equally long in both, as may be seen by comparing the pictures (Figs. 4 and 5).

The *Stegomyia* is for the South by far the most important mosquito; not because it is most numerous, but because it is the natural conveyer of yellow fever. It has been called

fect, when the object of his search is directly in front. The song of the insect is not produced solely by the buzzing of its wings, but also by the vibration of a peculiarly constructed

FIG. 4.

the tiger mosquito because of its striped appearance. It is a most beautifully marked mosquito and very dainty. It is essentially a domestic insect and is found only in inhabited localities. It is a day mosquito, and, resting on a dark background, such as a black coat or dress, presents a particularly striking appearance, the white bands on the legs and the peculiar marking of the back easily distinguishing it from any other (Figs. 6 and 6a).

The antennæ of all male mosquitoes are more hairy than those of the female. Some of these hairs respond to sound by a vibratory motion; they are, therefore, auditory. These

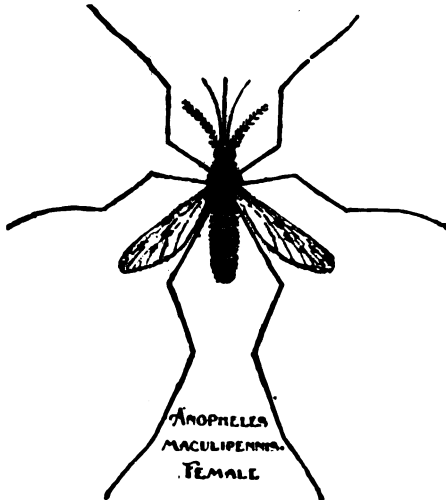

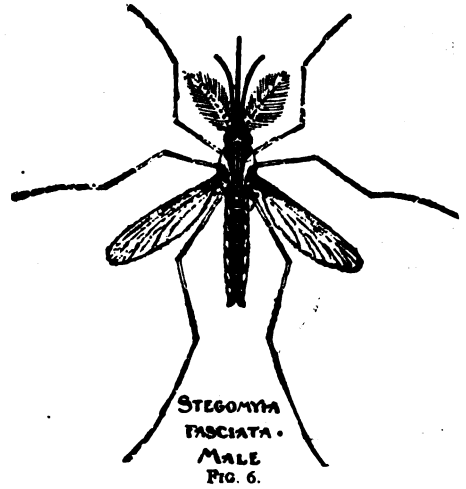

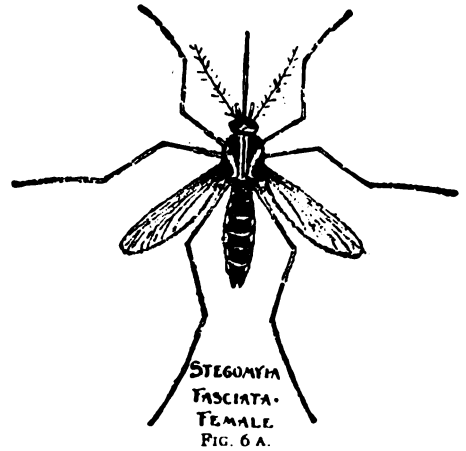

FIG. 5.

are the ears of the insect and it is believed that the male flies to the female guided by her song, adjusting the direction of his flight by turning his head until both antennæ are equally af-

chitinous process situated near the breathing apertures along the sides of the insect and set in motion by respiration. This is the famous yellow fever mosquito, which has been the greatest and most persistent enemy the South has

ever had, costing many thousands of lives and many millions of dollars, but which is at last, happily, conquered, if we but use the weapons that have been put in our hands by the patient searchers for truth in the field of science.

FIG. 7.

Mosquitoes cling to surfaces as a cat clings to the bark of a tree. A mosquito cannot rest on a perfectly smooth perpendicular surface; a

fly can. A fly's foot is a sucker; a mosquito's foot is a claw (Fig. 7). Mosquitoes resting upon window panes would seem to deny this, but a window pane, very shortly after a thorough cleaning, may collect enough moisture and dust to form a film over the glass sufficient, though invisible, to afford a firm hold for the insect.

RESTING POSITION OF ANOPHELES, and of CULEX and STEGOMYIA.

FIG. 8.

The resting position of *Anopheles* is peculiar in that the head, body and tail present a straight line, at an angle with the resting surface, while in the *Culex* and *Stegomyia* the body is bent as you observe in Fig. 8.

The eggs of *C. pungens* (Fig. 9), the gutter mosquito, are cone-shaped and float on end, being glued together in large masses to maintain this position in the water. The number deposited by a single mosquito varies from

EGGS OF CULEX. (PART OF EGG MASS IN WATER)

FIG. 9.

50 to 400, and they hatch in from one to three days, varying according to temperature and environment. When a sufficient time has elapsed to complete the hatching process, the larva (Fig. 10) or wiggle tail issues from the shell and begins to feed on the vegetable and animal matter contained in the water.

In its growth the larva sheds its skin several times before the pupal stage is reached—in

FIG. 10.

FIG. 11.

from 7 to 10 days. Mosquito wigglers get along apparently without air, when the surface of the water is covered with ice, and it is possible that they get air then, in the same way that fish do. This would account for their not being destroyed by surface freezing of the water. Entomologists must decide whether or not the larva have gills or some organ analogous to the gills

of the fish. The wigglers of some mosquitoes may be frozen in ice and hibernate until liberated by warmer weather.

The pupal stage in mosquito life corresponds to that of the chrysalis in the transition of a caterpillar into a butterfly (Fig. 11). The pupa does not feed. In about two days it becomes an imago, which is the technical name for the completed insect whose life begins with the ovum or egg.

The shell of the pupa breaks at its highest point and the completed mosquito issues, being supported by the floating shell until its wings spread for flight (Fig. 12).

The kind of mosquito that issues from the shell of the pupa depends of course on the kind of egg which has been deposited and hatched in the water.

The life cycle of *Culex*, the gutter mosquito, is from 10 to 15 days. Do not mistake the life

FIG. 12.

FIG. 13.

cycle for the length of life; mosquitoes may live as adult insects for many months, and some females must hibernate through the winter to furnish eggs for the next summer's supply.

Eggs of *Anopheles* (Fig. 13), the swamp mosquito, are boat-shaped and float singly on the surface of stagnant pools. They are deposited in numbers between 40 and 100. The bottom of the floating egg is marked somewhat like mosquito netting, the pattern being raised. The

FIG. 14.

FIG. 15.

top of the egg is smooth, black in color and partly covered by a transparent membrane which stands out from the surface of the top and sides, permitting intervening spaces of air, which float the egg like a lifeboat. The egg hatches in from three to four days.

The larva of *Anopheles* (Fig. 14) may be readily distinguished by its position at the surface of the water, as well as by its general appearance, differing from that of either *Culex* or *Stegomyia*. You will observe that the neck of the *Anopheles* larva is very slender, and that the head is turned upon the body. This is because the *Anopheles* larva finds its food on the surface and gathers it by the constant motion of little broom-like processes projecting from the sides of the mouth, and furnished for this purpose.

The breathing tube, you will observe, projects from the back or upper surface of the larva, near the tail end. To get its mouth to the surface while maintaining its position for breathing, requires that the head should be turned half round on the body, an impossible position to any but the thin-necked *Anopheles* larva.

The larva becomes a pupa (Fig. 15) in about 12 days. In about five more days the pupa is a full-grown mosquito.

Eggs of *Stegomyia* (Fig. 16), the yellow fever mosquito, float singly upon the surface of the water and are deposited in numbers varying

EGGS  
of  
*STEGOMYIA*  
(SIDE and TOP)  
FIG. 16.

LARVA  
of  
*STEGOMYIA*  
FIG. 17.

from 5 to 75. They hatch in from 10 hours to 3 days, according to climatic and other conditions. The shell is marked like mosquito netting, the white pattern being raised and somewhat similar to that of the *Anopheles* egg, and on the sides are air-chambers which float it.

The larva (Fig. 17) is very similar in appearance to that of the *Culex*, and its position in the water is also similar to *Culex* and unlike *Anopheles*.

In about six days the pupa (Fig. 18) develops and in a day or two the mosquito begins its flight.

The larvæ of all mosquitoes have a breathing-tube near the end of the tail and the pupæ have a pair of breathing-tubes projecting from the body near the head.

The insect, both in the larval and the pupal

PUPA of  
*STEGOMYIA*  
FIG. 18.

stage, requires air, to obtain which the breathing-tubes at frequent intervals protrude from the water surface into the air above.

The life cycle of the different mosquitoes varies, as to duration of the formative periods, according to conditions favoring rapid development; and no hard and fast rules can be laid down as absolute in this regard. It may be said, however, that the cistern mosquito breeds, approximately, in one week, the gutter mosquito in two weeks and the swamp mosquito in three weeks.

Observe how both the larvæ and the pupæ rise to the surface to breathe. This necessity suggested that they could be destroyed by pouring oil on the water surfaces so as to cut off the air. It is estimated that about two

tablespoonsful of ordinary kerosene will spread and film the water surface of an average cistern, and the oil will positively not affect the taste or healthfulness of drinking-water. The placing of oil upon drinking-water for the destruction of mosquitoes is not a new idea, for it was suggested as early as 1812 and has been practised for many years.

#### HOW MOSQUITOES TRANSMIT DISEASE.

**Mosquitoes and Malaria.**—Malaria is one of the greatest scourges to which man is subject. Its cause is fully established to be a minute unicellular animal parasite or hæmosporeidum of the class *Sporozoa* (q.v.), living within the red blood-corpuscles and introduced by the bite of a mosquito. Each well-marked variety of malaria has its especial causal parasite, which passes through a complicated life-cycle. (See **MALARIA**). The parasites enter the blood of the mosquito as minute slender sporozoites. When mature the sporozoites are freed into the body-cavity by the rupture of the wall of the sporocyst, when they migrate to the salivary glands, penetrate their walls and reach the proboscis through the salivary duct. When a mosquito harboring the parasites in this stage bites a susceptible human being, some of the spores pass into the blood with the saliva and induce an attack of malaria, mild or severe according to their number and other conditions. The malarial organism once introduced into the human system may continue to multiply indefinitely by the asexual method unless destroyed by drugs or some reaction of the organism, but that it can be transferred naturally to another person only through the intermediation of a mosquito and the intervention of the sexual generation. Properly speaking, man is the intermediate, the mosquito the final or definitive host, though the latter appears to suffer no ill consequences from the presence of the parasite. In pernicious tropical malaria, or æstivo-autumnal fever, the period for the complete development of the characteristic sporozoites (*Laverania malaria*) in the mosquito is seven or eight days, but owing to the vast number of parasites of different broods present in the blood and their overlapping stages of development the exact time of schizogony is doubtful. Tertian and quartan fevers, the two best differentiated types of mild or benign malarial fevers, are caused by related parasites known respectively as *Plasmodium vivax* and *P. malaria*, which differ from *Laverania* chiefly in the replacement of the crescent stage by an immediately spherical gametocyte. Asexual sporulation recurs in the first form at intervals of 48 hours, and in the latter of 72 hours, corresponding with rhythm of the fever's paroxysms. Daily or other intermediate recurrences are due to double or triple infections, in which the different broods sporulate on alternate days or in other combinations.

It was not until 1880 that Laveran, a surgeon in the French army, discovered the *amœbule* in the blood of malarial patients in Algiers; the development of the sexual generation in the mosquito and its relation to Laveran's parasite were traced by Ross in 1897-98, while to the Italian zoologist Grassi is due the first clear demonstration of the effectiveness of preventive measures directed at the mosquito.

Our scientific knowledge of the subject was almost entirely created within the five years subsequent to 1898, and workers in many countries are constantly adding details. That several species of *Anopheles*, and especially *A. maculipennis*, are the chief, and so far as known the sole disseminators of all types of malarial fever, is absolutely and thoroughly demonstrated from every standpoint.

**Mosquitoes and Yellow Fever.**—In the case of yellow fever our knowledge is in a very different and less satisfactory state. The relation of mosquitoes to this disease was suspected by Dr. Finley as early as 1881, but his theory excited little interest until, upon the occupation of Cuba by the American navy, a Yellow Fever Commission of inquiry, headed by Major Reed, was appointed. By a series of very careful experiments it has been established that mosquitoes are agents in the dispersal of this disease, and at the same time the old view of infection by contact and the old practice of isolation and fumigation for prevention have been nearly repudiated. The particular species of mosquito which transmits yellow fever is *Stegomyia fasciata*, an especially fierce biter in the early afternoon, which is found in the tropical parts of both hemispheres, and in America as far north as Virginia.

The germs of the disease may be taken by the mosquito only during the first three or four days of the fever; after that time the blood of the patient cannot infect the mosquito. The germs require about 12 days to migrate from the stomach of the insect to the salivary glands, from which they may be injected through the mosquito's biting organ into the human blood stream. Mosquitos, after becoming infectious, are capable of inoculating the disease into the human at intervals of three days (period of feeding) for practically an indefinite time.

The adaptation of protective measures to this important discovery renders the prevention or suppression of an epidemic very simple, theoretically. Screening the patient from mosquitoes during the first four days of fever (before the diagnosis), or killing all mosquitoes in the room before the 12th day after their possible infection, will certainly prevent a second case.

**Agency in Other Diseases.**—Elephantiasis or filariasis, like malaria, results from the presence in the blood of an animal parasite, but one of a very different nature. The adult males and females of the *Filaria*, which is a slender nematode worm, live together in the subcutaneous lymph vessels and produce enormous numbers of living, minute embryos which swarm in the blood, usually passing into the superficial capillaries at night and retreating to the deeper vessels by day. This peculiarity first led Manson to suspect the mosquito as a means of distribution and as a result of his studies and those of Bancroft and others on the *Filaria* of man and the dog, it is now known that when infected blood is swallowed by *Culex fatigans* and other mosquitoes the embryos pass through certain stages of development within the intestine and malpighian tubules and then migrate through the body-cavity and tissues to the proboscis, from which human infection occurs. About three weeks are required to complete the development within the mosquito, and a year before the worms become sexually mature in the final

host. Elephantiasis is a dreadful and prevalent disease in tropical countries, and is frequent in the Southern States, but rare in temperate climates.

The mosquito is suspected of being instrumental in the spread of leprosy and other diseases, and undoubtedly many important discoveries await the investigator in this field.

**Restraining Local Pests of Mosquitoes.**—The possibility of the control or complete extermination of mosquitoes has received serious attention from zoologists, physicians and sanitary engineers, and is encouraged by local and national governmental grants. Wherever the problems have been carefully considered, as in New Jersey, Long Island, the Connecticut coast and Winchester, Va., in this country, much has been already accomplished toward the mitigation of the pest. As to measures, the complete destruction of all breeding-places by the draining of swamps, pools and ditches is the most effective and permanent. This must be supplemented by emptying or suitably protecting by screening against the access of gravid mosquitoes all artificial vessels, such as pails, rain barrels, cisterns, privies and drains, which contain standing water in which mosquitoes may breed. A most effective and simple measure for local application is to pour a small quantity of kerosene upon the surface of the water of possible breeding-places. This spreads as a delicate film which deters the larvæ and pupæ from coming to the surface to breathe, so that they quickly suffocate, and at the same time kills or drives off females which come to lay their eggs. The application should be repeated at intervals of two or three weeks. Small fishes and the other natural enemies named above may be introduced into breeding-places to good purpose. The usual methods of ridding houses of mosquitoes by fumigation with sulphur dioxide gas; of preventing their entrance by thorough screening; and of protecting the person by the application to the skin of oil of citronella and other substances have a certain protective value. The most approved application is a mixture of one ounce each of oil of citronella and spirits of camphor with half an ounce of oil of cedar. The effect will last longer if incorporated with vaseline. It has been shown by the experiments of Grassi and others that this method alone is sufficient to grant immunity from malaria to inhabitants even of such fever-scourged districts as the Campagna of Rome. For the medical treatment of malaria we have a powerful specific in quinine, which is most effective at the time of the paroxysms, when the sporulæ are free in the blood-plasma and most susceptible to the action of the drug. See MALARIA.

**MOSQUITO BEE**, one of the small, gregarious, stingless honey-bees of the genera *Trigona* and *Melipona*, which make very large combs of bitterish honey in the tropical forests. Their stings are blunted and are never used as a weapon. Ordinarily they place these deposits in hollow trees, but sometimes suspend them from branches, protected from enemies in various ways.

**MOSQUITO BLIGHT**, a disease of Oriental tea-plants resulting from the attacks of great numbers of plant-bugs of the family *Capsida*. They breed upon the plant and young and old suck its juices.

**MOSQUITO COAST**, or **MOSQUITIA**, Central America, an extensive region on the Caribbean Sea, still unexplored, forming the eastern seaboard of Nicaragua; area, 26,000 square miles. It is inhabited by Mosquito Indians. For a considerable period it was governed, under British protection, by a native chief, but in 1860 it was made over to Nicaragua. (See CLAYTON-BULWER TREATY). In 1894 it was incorporated with Nicaragua and is now known as the department of Zelaya. Capital, Bluefields.

**MOSQUITO FLEET**, in the navy, a term given to what is known as "the second line of defense," which is used in protecting the fortifications and harbors along the coast line, and, like the insect for which it is named, annoys the enemy in every way, at the same time preventing the possibility of a blockade. A fleet of this kind was organized during the Spanish-American War in 1898, and was composed of all sorts and kinds of ships to the number of about 130.

**MOSQUITO LAGOON**, Fla., a salt water lagoon on the east coast 30 miles long by one mile wide, separated by a sandy strip of land, half a mile to five miles wide, from the ocean, and connecting with the latter by Mosquito Inlet and Haulover Canal, navigable for boats of very shallow draught. It connects also on the north with Halifax River and on the south with Indian River. Fish and oysters are plentiful in its shallow waters, but mangrove swamps, sand and coral banks obstruct navigation even by the smallest boats.

**MOSS, Frank**, American lawyer: b. Cold Spring, N. Y., 16 March 1860. He was educated in the public schools and in the College of the City of New York. In 1897 he was president of the board of police in New York and was counsel to the "Lexow Investigating Committee." In 1899 he was leading counsel for the "Mazet Investigating Committee," has since been connected with the Society for the Prevention of Crime and is professor of medical jurisprudence in the New York College and Hospital for Women. As assistant district attorney of New York he was associated with the prosecution of Lieut. Charles Becker for the murder of Herman Rosenthal. He is the author of 'The American Metropolis' (3 vols., 1897).

**MOSS, Lemuel**, American Baptist clergyman: b. Owen County, Ky., 27 Dec. 1829; d. New York, 12 July 1904. He was graduated from the University of Rochester in 1858 and became pastor of the First Baptist Church of Worcester, Mass., in 1860, and thereafter held professional and editorial posts. He was president of the University of Chicago in 1874-75 and of the University of Indiana in 1875-84. He was president of the American Baptist Historical Society in 1895-1900. He published 'Annals of United States Christian Commission' (1866); 'A Day with Paul,' etc.

**MOSS-ANIMALS**, or **BRYOZOA**. See POLYZOA.

**MOSS-BUNKER**, a common name about New York for the menhaden (q.v.). It is one of many forms of the Dutch name "mars-banker" for the scad, ignorantly applied by the early Hollanders, and has been misspelled and mispronounced in a great variety of ways. A detailed account of this matter will be found in Goode's 'Fishery Industries of the United States' (Sec. 1, 1884) as a part of the history of the menhaden.

**MOSS-PINK**. See PINKS.

**MOSS SIDE**, England, town in Lancashire, near Manchester, of which it really forms a part. It has a great cotton-goods industry. Among its public works are the Saint Edmund's Gothic Church (1882), a free library, slaughterhouses, etc., and the tramways are owned by the city, while gas, electric light and waterworks are the property of a Manchester corporation. In 1911 there was a population of 33,100.

**MOSS TROOPERS**, in English history, bands of marauders infesting the districts which divided the English and Scottish territories before the union in 1707. They were rarely heard of after that year. The name was derived from the character of the country over which they conducted their nefarious operations.

**MOSSAMEDES**, mōs-sā'ma-dēs, Africa, capital of the most southerly district of Portuguese West Africa, situated on a small bay, in a rainless, sandy, desolate neighborhood, but with healthy climate and palm-lined streets. It has a government building and does an increasing trade with Portugal, having connection by a steamship line with Oporto. It has a population of less than 5,000, nearly half white men.

**MOSSSES** (*Musci*), a class of cryptogamous plants, forming with the liverworts (*Hepaticæ*) the group *Muscineæ* or *Bryophyta*. The only plants likely to be wrongly called mosses are the foliose liverworts, and these are readily distinguished by their two-ranked nerveless leaves, their four-valved capsule and certain other characters. A germinating moss spore gives rise to a filamentous body called a *protonema*, from which buds arise and develop into the leafy shoots which constitute the true moss-plants. After a time the reproductive bodies are formed at the tips of certain shoots. The *antheridia*, or male reproductive organs, are club-shaped and contain cells which afterward develop into the *antherozoids*. These antherozoids, when liberated from the antheridium, move about until they come in contact

with an *archegonium*, or female reproductive body. The fertilized archegonium is then carried upward on a slender filament or *seta*, and now forms the fruit or *capsule*, usually closed by a lid or *operculum*, and often covered by a sort of hood called a *calyptra*. When ripe the capsule opens and liberates the spores, which by germination begin the life-history again. Mosses may also reproduce themselves asexually by the formation of buds or *gemmæ*. There are no true roots in mosses and the leaves are of very simple structure. New ones are continually springing from old shoots, so that in bogs the top remains growing while the underlayers die and the deeper ones slowly change into peat. Some 5,000 species of mosses are known, of which about nine-tenths belong to the order *Bryaceæ*. This order comprises the two suborders, *Cleistocarpæ*, with an indehiscent capsule, including the genera *Phascum*, *Ephemerum*, etc., and *Stegocarpæ*, in which the capsule opens by a lid. The stegocarpous mosses, again, may have the capsule either terminal (*Acrocarpæ*) or lateral (*Pleurocarpæ*), the former group including, among others, the genera *Grimmia*, *Fissidens*, *Polytrichum*, *Orthotrichum*, *Dicranum*, *Mnium*, *Bryum* and *Funaria*, and the latter, *Hypnum*, *Leskea* and *Climacium*. There are three other orders of mosses, namely, *Sphagnaceæ*, or Bog-mosses, with only one genus, *Sphagnum*; *Andreaeaceæ*, with the single genus *Andreaea*, and *Archidiaceæ*, with the genus *Archidium*. Mosses are of little or no economic value, but they form an important part of the natural covering of rocks and serve to prepare the way for higher forms of plants. Consult Campbell, 'Mosses and Ferns' (New York 1895); Grout, A. J., 'Mosses with a Hand-Lens' (2d ed., New York 1905); Hale, E. H., 'Flowerless Plants' (New York 1909); Strasburger, 'Textbook of Botany' (1903).

**MOSSES FROM AN OLD MANSE**, title of Nathaniel Hawthorne's second collection of tales and sketches (1846). The Old Manse, Hawthorne's Concord home, is described in the opening chapter of the book. The remaining contents include many of Hawthorne's most famous short sketches, such as 'The Birth-Mark,' 'Roger Malvin's Burial' and 'The Artist of the Beautiful.' These bear witness to his love of the mysterious and the unusual; and their action passes in a world of unreality, which the genius of the author makes more visible than the world of sense.

**MOSSLEY**, England, town in Lancashire, located on the Tame and the Huddersfield Canal. It contains great woolen factories and foundries and has among its public buildings a modern Gothic church, handsome town-hall in a park, besides markets, gasworks, etc. Its population in 1911 was 13,205.

**MOST**, *möst*, Johann Joseph, German-American anarchist: b. Augsburg, Bavaria, 5 Feb. 1846; d. Cincinnati, Ohio, 17 March 1906. He learned bookbinding and traveled on the Continent in the pursuit of his trade. Later he was editor of the *Freie Presse* at Berlin and in 1874-78 member for Chemnitz in the Reichstag. Expelled from the Socialist ranks in Germany, he went to London, where he founded *Die Freiheit*, an anarchistic sheet, in 1879. In 1881 he was arrested and sentenced

to 18 months' imprisonment for printing an article approving of the assassination of the Emperor Alexander II, and upon his release came to the United States. He continued *Die Freiheit* in New York. In 1901 he was arrested for a seditious editorial in his journal after the assassination of President McKinley and sentenced to a year's imprisonment, commencing June 1902. He published several anarchistic writings, such as 'Why I Am a Communist' (1890) and 'Down With the Anarchists' (1901).

**MOSTAGANEM**, *mös'ta-ga-nèm'*, Algeria, capital of the arrondissement in the province of Oran, located on the Bay of Arzeu. It has a branch of the Oran-Algiers Railway and is connected also with the military station Tiaret. It is situated on a steep cliff 280 feet above the Mediterranean Sea and has a deep-water harbor into which steamers enter. The Ain Safra River feeds water power here to flour mills, and it does considerable export to Europe in wine, wool, cattle, grain, figs, etc. It is situated on the ruins of an important city of the old Roman period and was flourishing in the 16th century under the Berbers, but lost its prestige till the French in 1833 captured the site and built up its industries. In 1911 it had 21,087 inhabitants in the commune.

**MOSTAR**, *mös'tär*, Bosnia, former capital of Herzegovina, now belonging to the circuit of Mostar. It is a station on the Bosnian Sarajevo-Mostar-Metković State Railway and is picturesquely situated along the cliffs from Podvelez and Ham in the narrow valley of the Narenta. The latter is spanned by an imposing, single-arched, stone bridge. The town is built of stone and was formerly strongly fortified with its star-batteries and walls. It has 25 mosques, two Oriental-Greek and one Roman Catholic church, besides a convent of the Sisters of Mercy. Its industries consist of arms, leather and tobacco factories and wine culture. There are several Catholic and orthodox schools, a trade school, high gymnasium, fruit and wine-culture schools, etc. It is the seat of a Catholic and a Greek bishop. Its population in 1910 was 16,369.

**MOSUL**, *mö'sool*, Asiatic Turkey, capital of a vilayet and sanjak of the same name, on the right bank of the Tigris, 220 miles northwest of Bagdad. A stone bridge continued by a bridge of boats crosses the river to the site of ancient Nineveh. The town is surrounded by decayed walls, and has houses of stone and brick, mosques, shrines, Christian churches, convents, etc. Formerly a place of much commercial importance, it has greatly declined, mainly owing to diversion of traffic due to the opening of the Suez Canal, but it still carries on some trade, especially in gall-nuts. Muslin is named from this town. Population about 80,000, mostly Mohammedans, but including about 7,000 Christians and 1,500 Jews. The vilayet has a population of 351,200.

**MOSZKOWSKI**, *mösh-köf'skë*, Moritz, Polish composer and pianist: b. Breslau, 23 Aug. 1854. At 19 he began to appear in public after studying at Dresden and Berlin. His success was immediate and striking and he made frequent concert tours. He has resided chiefly in Berlin and Paris. He is a talented composer; his opera, 'Boabdil' was presented at Berlin in

1892; his other works include a ballet, 'Laurin'; a symphonic poem, 'Jeanne d'Arc'; some 'Dances espagnoles' for the piano or violin; and the two orchestral series called 'Les Nations.'

—**MOTA-PADILLA**, mō'tā pā-dēl'yā, **Matias de la**, Mexican historian: b. Guadalajara, Mexico, 1688; d. 1766. He was a lawyer, and during the latter part of his life a priest. He wrote, among other works, 'History of the Conquest of New Galicia' (1870-71).

**MOTET**, or **MOTETT**, a vocal composition in harmony, set to words generally selected from sacred writings. Like the madrigal, the motet was at first set to words of a profane character, and there are ecclesiastical decrees extant forbidding its use in church.

**MOTH**, any insect of the order *Lepidoptera* not included among the butterflies (q.v.). Moths have antennæ of many forms, and on account of this variability are often grouped in a section *Heterocera*, but their antennæ are rarely swollen at the end, or "clubbed," and never in the North American forms. They are farther distinguished from butterflies by their wings being horizontal when at rest, and by their being seldom seen on the wing except in the evening or at night, although certain species of moth fly in the brightest sunshine, and some butterflies appear at twilight. In most cases there is a peculiar arrangement of interlocking spines (frenulum and retinaculum) by which the hind wings are kept in contact with the front wings during flight. The pupæ are never angular; are mostly smooth and dark-colored; and are often enclosed in a cocoon, which the larva spins before it passes into the pupal stage. Moths are in general larger than butterflies and more hairy or downy in character. A Brazilian giant measures nearly a foot from tip to tip, and there is a gilded species smaller than a pin's head. Similarly they present as great a variety of outlines and as much beauty (with less gaudiness) as do the butterflies; and they interest the philosophical naturalist by the extraordinary adaptations to conditions which many of them present, and which have come about in the development of the race. Some of the most extraordinary examples of sexual of protective coloration (q.v.) and resemblance, of mimicry (q.v.) and of curious armaments, are to be found among these creatures, whose small size, weakness and edibility, especially when in the larval condition, render essential means of concealment and of passive defense. Nevertheless caterpillars of moths, as well as of butterflies, furnish a large part of the food of birds and of various other insect-eating animals; and in the adult state they are seized by night-flying birds, by lizards, monkeys, turtles, and by some predatory insects and spiders. The eggs of moths are laid upon the proper food-plant of the species, and are various in form, ranging from that of a sphere or a cylinder to that of a disc, often with the surface beautifully sculptured or ornamented. Each has a micropyle or lidded opening from which the larva escapes. They are laid by most species of temperate regions in the early summer, and the life-cycle of the insect is completed before the end of the season; but some moths oviposit in the autumn, when their eggs remain quiescent

through the winter, or, in some cases, hatch in time for the larva to partly grow, then hibernate and complete their development the following spring.

The larvæ or caterpillars of moths, like those of butterflies, hatch as very minute objects, but rapidly grow, shedding their skins (see **MOLTING**) at intervals to permit of enlargement, until some attain a length of six or seven inches. Most moth-larvæ molt five times, but some oftener and a few less times.

The larval condition is the insect's period of feeding and growth, some species taking no food whatever in adult life. The vast majority feed upon green vegetable food, leaves most of all; and are among the worst foes of our parks, orchards and gardens, attacking cultivated plants in a great variety of ways. "A few larvæ," remarks Holland, "feed upon woody tissues, and bore long galleries under the bark or in the wood of trees." (See **MOTH**, **LEOPARD**; **MOTH**, **BROWN-TAIL**; **MOTH**, **GYPSY**). Others feed upon the pith of herbaceous plants. A number of species feed upon the inside of growing fruits. Only a very few species are known to be carnivorous. The household moths (*Tineæ*) are well known on account of the injury they work among clothes, carpets, furs, etc. Other species attack grain, meal, flour, hay, tobacco, dried herbs, drugs and a variety of stored products; other bore into timber, or damage human property in some other way. Some recompense is obtained, however, from the silkworms (q.v.), the moths whose cocoons furnish silk.

There is considerable variety in the form of the caterpillars of moths, but most are worm-like, and the structure and appendages resemble those of butterfly caterpillars (q.v.). The great majority possess besides the six minute thoracic legs the usual four pairs of "prolegs," or false feet, in the middle of the body, and a fifth pair on the hindermost (13th) segment (somite) of the body, which in reality are clasping organs needed for clinging to twigs in the process of molting. In some (numerous geometrids, noctuids and psychids) these prolegs are reduced in number, and in the geometrids they are placed in only two pairs on the 9th and 13th segments, and these larvæ can progress only by looping the body upward (see **MEASURING-WORMS**). Other variations of this feature exist, as the sucker-like pads of the *Megalopygidae* and *Cochliidiæ*.

"The bodies of the larvæ of moths," to quote Holland, "are covered with tubercles, the location and arrangement of which have in recent years received considerable attention from students, and are thought to furnish a clue to the lines of descent of certain families. These tubercles sometimes carry only a single hair, in other cases they carry large tufts of hairs; they may be small and inconspicuous, or they may be developed until they assume the form of great spines, horns, or bulbous projections."

Some moth caterpillars exhibit bright and beautiful colors, and move about fearlessly, protected by thorny projections, or nauseous exudations, or by hairs which possess severe stinging properties. Others present striking examples of protective resemblance and mimicry, in color or form or attitudes, or all three respects. While many are solitary in their habits

others are gregarious, forming "armies" and "processions" during their feeding life which disperse when the time for pupation arrives.

Many moth-larvæ enter the ground and surround themselves with an earthen cell in which to transform into and pass the pupal stage. Others spin cocoons in great variety, usually formed more or less of silk, and well protected against both the weather and enemies. Some are hidden away under leaves, beneath loose bark, in the crevices of rocks or old stumps or fastened to the branches of trees. As a rule the cocoons are whitish or brown in color, never ornamented with the bright silvery or golden spots characteristic of the chrysalids of many butterflies. Escape from the tough silken kind of cocoons is aided by a copious saliva which dissolves or cuts the silk, so that the newly-born insect may wriggle out.

The anatomy of the moths is substantially the same as that of butterflies, but in these heterocerous families the head is not so prominent. The eyes, however, are often larger and better, as would be expected of insects mainly crepuscular in their habits; and some have the suctorial apparatus in high perfection, so that many of the hawk-moths and noctuids can poise upon whirring wings, and inserting the long proboscis suck nectar from flowers without alighting; and these take a considerable part in the cross-fertilization of plants. On the other hand, in the bombycine moths and their allies, the proboscis is small and some of them have no mouth-parts or ability to feed at all. "They are simply animate winged reservoirs of reproductive energy, and, when the sexual functions have been completed, they die."

The antennæ of moths assume a great variety of forms. They may be simple or branched, thread-like, furiform, spatulate or like broad feathers; and those of the males frequently differ from those of the females. In an attempt at classification various subdivisions have been proposed, but lepidopterists no longer make artificial groupings of the families, whose inter-relationships seem very uncertain. Most of the families, of which about 50 are recognized by modern systematists, are represented in America, but several families are confined to the Oriental regions, and a few are exclusively African. The criteria principally used in separating families are found in the character and arrangement of tubercles, and in the structure of the wings. The lowest are the very small moths called *Micropterygidae*, with bronzy golden wings, whose larvæ show striking affinities with the caddis flies, and feed in damp moss. The large yellowish-brown "swift" moths (*Hepialidae*) come next, whose larvæ and incomplete pupæ live underground and feed on roots; followed by the *Zyganidae* or burnet moths, which are small day-flying insects adorned with bright metallic colors. Their larvæ feed openly on various plants, and spin elongated cocoons. The tropical *Chalcosiidae* and *Limacodidae* are allied to them; also the large, day-flying, brilliant tropical castniids, which have clubbed antennæ like butterflies. The small family *Megalopygidae*, of hairy American moths, are singular in having seven pairs of prolegs. The *Psychidae* are a small but universally distributed family characterized by the extreme degradation of the wingless fe-

males; the caterpillars live in portable cases made of sticks, grass, etc., and are called "basket worms" (q.v.). The *Cossidae* are large moths, unable to feed, most numerous in the tropics and exemplified in Europe by the well-known gnat and leopard moths (qq.v.); only two species are North American; and the *Sesiidae* are the clearwings (q.v.), resembling wasps. In the *Tortricidae* is found a very large assemblage of small species known as leaf-rollers (q.v.), plentiful in the United States and embracing many pests, as the codling moth, etc. Another immense family of evil repute is the *Tineidae*, represented by the clothes-moth, flour-moths (qq.v.) and the like, which damage woolen goods, furs and stored products of every kind, as well as feed upon plants, some of them performing an essential work in cross-fertilization, conspicuously the yucca-moths (q.v.); there are thousands of species. The plume-moths (q.v.) come next, followed by a series of families having obtect pupæ, which never emerge from the cocoon until the final molt. Among these are the *Pyralidae*, a huge and varied family, having nearly 800 beautifully marked species in the United States alone, and largely destructive to cultivated plants. Representatives are the grape-leaf-folder, print-moth, sugar-beet moth, clover-hay worm, snout-moths, grass-moths, corn-stalk borer, bee-moth, leaf-crumplers, dried-currant moth and others, many of which are elsewhere described in this work. The egger-moths, tussock-moths (qq.v.) and some minor families are nearly related to the pyralids. The gayly colored tiger-moths (q.v.) carry the list to the owlet-moths (q.v.), which belong to the cosmopolitan nocturnal group *Noctuidæ*, and these are followed by several families, chiefly belonging to the Old World. Then come the *Sphingidae* (see DEATH'S-HEAD and HAWK-MOTH), familiar all over the world; and the great assemblage of small, plainly but exquisitely colored geometrids (see MEASURING-WORM). Closely related are the tropical *Uraniidae*, which contain large and magnificent green and gold tropical species—the glory of the forests of Brazil and the East Indies. Many of these, as of the Oriental family *Epicopiidae*, are "tailed" and simulate the papilionid butterflies in many ways. Next to these are placed the silk-worm moths (*Bombycidae*), and several families of large tropical moths, leading up to the great Saturnians (*Saturniidae*), scattered over most of the warmer parts of the world; among them is the great *Attacus atlas* of India, the largest of all *Lepidoptera*, and many of the largest and most notable of American cocoon-making species, such as the *Ailanthus* silk-moth, the *Cecropia*, *Polyphemus*, *Luna* and several others well known and elsewhere described.

**Bibliography.**—The literature relating to moths is very extensive. The most complete and scientific account of the families, technically considered, is found in Hamson's 'Catalogue' of the moths of the world, published since 1898 by the British Museum. The Smithsonian Institution published simultaneously a 'List' of North American species by H. G. Dyar. The textbooks of Packard and Comstock give sufficiently full accounts of structure; and Carpenter's 'Insects and their Structure' (1899), and Sharp's 'Insects' (Vols. I and II, of Cambridge Natural History) (1895-99), contains a résumé

of general information and of modern views as to relationships, phylogeny, etc. A good reference book for the British species is Newman, L. W., and Leeds, H. F., 'Text-Book of British Butterflies and Moths' (Saint Albans 1913). The best general illustrated descriptive work on North American species is W. J. Holland's 'The Moth Book' (New York 1903), which contains an extensive classified list of books relating to the whole subject, including the splendid monographs of American families by Packard, Grote, Smith, Beutenmüller, Hulst, Dyar and others. Among the more or less popular works treating of the moths are Dickerson, Mary C., 'Moths and Butterflies' (Boston 1901); Robertson-Miller, Edith, 'Butterfly and Moth Book' (New York 1912); Stratton-Porter, G., 'Moths of the Limberlost' (New York 1912).

**MOTH, Brown-tailed**, a moth (*Euproctis chrysorrhoea*) of the family *Liparidae*, accidentally imported from Europe in 1890 or 1891, and nearly related to the gypsy and tussock moths. Its color is white, with the hinder end of the abdomen brown. The caterpillars defoliate trees and have done much damage throughout the greater part of New England, as well as become an annoyance by their flying hairs which irritate the skin; but the insect is not so much feared as is the gypsy moth. This moth lays in midsummer about 250 eggs underneath the tip of a leaf, and covers them with its hairs. The larvæ appear in early autumn and begin to eat the green substance of leaves, skeletonizing them; they also feed on apples and pears. In mid-autumn they form cases of bits of leaves, attach them to twigs by silken strands, pass the winter in them, complete their growth the following spring, feeding on foliage, flowers and fruit, and then pupate in June and emerge in midsummer. The larvæ may be killed by arsenical sprays. Another mode of control is the destruction of their cocoons in the winter. They are easily transported with twigs or Christmas trees or nursery stock and these should always be inspected. See GYPSY MOTH. Consult any work on agricultural entomology.

**MOTH, Gypsy, or Gipsy.** See GIPSY-MOTH.

**MOTH, Leopard.** See LEOPARD MOTH.

**MOTHER ANN.** See LEE, ANN; SHAKERS.

**MOTHER CAREY'S CHICKEN**, any of several small oceanic petrels (q.v.); specifically, in the Mediterranean and Atlantic, the storm-petrel (*Procellaria pelagica*) often seen about ships, especially in wild weather, and looked upon with superstitious dread by sailors. Its manner of paddling along the surface of the waves suggested the name petrel, namely, little Peter (the Apostle), afterward transferred to the whole group; and the "Mother Carey" is supposed to be a queer Anglicization of the Latin *Mater Cara* ("Dear Mother," an appellation of the Virgin). These little petrels are about six inches long, sooty black, with white rumps and a little white on the wings. They breed numerously on all northern coasts, as about Newfoundland, Labrador, North Greenland and the British Isles, wherever suitable places can be found, occupying holes in the face of earth banks, like bank-swallows, and

rarely approaching or leaving their nests, each with a single white egg, except at night.

**MOTHER OF CITIES**, the euphemistic local title for Balkh (q.v.), central Asia.

**MOTHER GOOSE'S MELODIES**, the well-known collection of nursery rhymes. In 1860 a story was started to the effect that "Mother Goose" was a Boston woman; and she was identified as Elizabeth Goose, widow of Isaac Vergoose, or Goose, and mother-in-law of Thomas Fleet, a Boston printer, who issued a collection of the 'Melodies' in 1719. It is now conceded that "Mother Goose" belongs to French folklore and not to English tradition. Charles Perrault (q.v.), b. Paris, 1628, was the first person to collect, reduce to writing and publish the 'Cortes de Ma Mère l'Oye,' or 'Tales of Mother Goose,' though he did not originate the name; and there is no reason to think that "Mother Goose" was a term ever used in English literature until it was translated from the French equivalent, "Mère l'Oye."

**MOTHER-OF-PEARL.** See PEARL.

**MOTHER OF PRESIDENTS**, in American history, a name given to Virginia because that State has given eight chief executives to the Union, namely: Washington, Jefferson, Madison, Monroe, Harrison, Taylor, Tyler and Wilson.

**MOTHER OF STATES**, in American history, a name given to Virginia, from the fact that out of the original colony of Virginia were formed the States of Kentucky, Ohio, Indiana, Illinois and West Virginia.

**MOTHERS' CLUBS**, organizations of women in various American cities designed to better the condition of the home and aiming to formulate improved methods for the moral training and education of children. They are active in promoting playgrounds, children's clubs, etc. The most prominent of these societies is the New York Mothers' Club. There is a New York State Federation of these societies which holds annual meetings.

**MOTHER'S DAY.** The honor of the origination of Mother's Day belongs to Miss Anna Jarvis of Philadelphia. Her mother died in 1906. On Sunday, 9 May 1907, she told a friend whom she had invited to remember with her the anniversary of the death of her mother of her desire to dedicate a day to all mothers. Before the next anniversary came she had interested many individuals and organizations in the observance of the second Sunday in May as Mother's Day. As a result of her efforts, Philadelphia observed the day, 10 May 1908. Miss Jarvis then became the missionary of the idea. She wrote thousands of letters to influential men in all walks of life. She interviewed many public men and pleaded for the observance of the day. Since 1912 the governor of Texas has observed the day by pardoning a number of prisoners on that day. State after State has adopted its observance. In May 1913 Pennsylvania made it a State holiday. On 10 May 1913 a resolution passed the Senate and the House of Representatives to make the second Sunday in May a national holiday, "dedicated to the memory of the best mother in the world, your mother."

MOTHS DESTRUCTIVE TO FOLIAGE

1. Gypsy Moth (*Porthetria dispar*), female; *a*, male; *b*, feeding caterpillar; *c*, pupa. 2. European Processionary Moth; *a*, feeding caterpillar. 3. Lackey Moth. 4. Tiger Moth and its "woolly bear" caterpillar. 5. Tussock Moth; *a*, caterpillar and cocoon with pupa. 6. Psilura Moth (*Psilura monacha*), female; *a*, male; *b*, eggs, young caterpillars and pupa, on the under side of a piece of bark; *c*, feeding caterpillar. 7. Pine Moth (*Gastropacha*), female: *a*, feeding caterpillar and cocoon; *b*, eggs.

Miss Jarvis has been the means of organizing a national and an international organization to further the promotion of the observance of the day. It began to be observed in England as early as 1913. The second Sunday in May is observed in all churches irrespective of creed, and the previous Friday is observed in all the public schools. The previous day is observed in business establishments. It is observed "through some distinct act of kindness, visit, letter, gift, or tribute to show remembrance of the mother to whom general affection is due." It is also observed as Father's Day, and "is designed to perpetuate all family ties." Its slogan is in honor of "the best mother who ever lived." The badge of the day is a white carnation.

**MOTHERWELL**, mut'h'er-wél, William, Scottish poet and antiquary: b. Glasgow, 13 Oct. 1797; d. there, 1 Nov. 1835. Educated at Edinburgh and Paisley, at 15 he was apprenticed to the sheriff-clerk of the latter town, and in 1819-29 was sheriff-clerk depute. It was while in this situation that he did his best work both as poet and ballad-collector. He was precocious, and planned his ballad, 'Jeanie Morrison,' at the age of 13. After editing the collection of songs called the 'Harp of Renfrewshire' (1819), he compiled the more important collection of ballads published in 1827, under the title of 'Minstrelsy: Ancient and Modern,' with a historical introduction and notes. This brought him to the notice of Scott. He became editor first of the Paisley *Advertiser* (1828-30) and then (1830) of the *Glasgow Courier*. He published in 1832 original 'Poems: Narrative and Lyrical.' In 1835 he collaborated with Hogg in an edition of Burns. In the same year he was summoned to London to give information to a special Parliamentary committee; here his health broke down and he died not long after. Some of his lyrics are familiar in anthologies.

**MOTHERWELL**, Scotland, a police and municipal burgh and manufacturing town in the county of Lanark, 12 miles southeast of Glasgow. It is of comparatively recent origin, and takes its name from three farms called High, Low and North Motherwell, which again derived their names from an adjoining spring, which in Roman Catholic times was dedicated to the Virgin Mary, and called the *Well of our Lady*, or *Mother's Well*. The inhabitants are chiefly employed in the neighboring coal-mines, iron and steel works, foundries and engineering shops. Motherwell has several churches, a town-hall, public park, good water supply, electric light, etc. Pop. 40,380.

**MOTHERWORT**, a labiate plant (*Leonurus cardiaca*) with rigid branched stem about three feet high, flowers in crowded axillary whorls, white with a reddish tinge, upper lip of corolla shaggy, calyx with spreading teeth; leaves with long petioles, lower ones palmately cleft, upper ones three-lobed. The plant, with two or three related species, frequents waste places, and is not uncommon in North America, where it has been introduced from Europe. An infusion of it was formerly much employed in chest diseases.

**MOTIF**, mô-téf. See LEITMOTIV.

**MOTION**. See MECHANICS.

VOL. 19 — 33

**MOTION** (from the Latin *motio* and the verb *movere*, to move). In legal practice it means an application to a court by one party in a cause, or his counsel, seeking a rule he considers necessary in the case or to obtain relief in summary manner from an injustice. This may be made in a written application or orally. In cases where the object of the motion may be granted on request and without a hearing it is a motion of course, such as an *ex parte* application; if notice is required for other party it is a motion on notice. A motion made on matter of fact has to be supported by an affidavit that such facts are true. There are also motions for decree and for judgment, etc. See DECREE; JUDGMENT.

**MOTION**, in music, is a term used to express a change of pitch in successive sounds, when they are allotted to a single part or voice, or to groups of parts or voices which sound simultaneously. In a single part the motions are classified according to whether the successive steps do or do not exceed the limits of a degree of the scale at a time; in the former case it is called "disjunct" and in the latter "conjunct" motion. When motions of different parts sounding together are independent it constitutes counterpoint, in which cases, according to their relations, we get "contrary," "similar" and "oblique" motions. "Contrary" motions have their parts converge or diverge, one rising as the other falls. "Similar" motions either rise or fall together; while the "oblique" defines one part only moving up or down, the other standing still.

**MOTION PICTURES**. See MOVING PICTURES.

**MOTION PICTURES, Censorship of**. See MOVING PICTURES, CENSORSHIP OF.

**MOTLEY**, mô't'li, John Lothrop, American historian: b. Dorchester, Mass., 15 April 1814; d. near Dorchester, England, 29 May 1877. His education was obtained at Harvard, from which he was graduated in 1831, and at the universities of Berlin and Göttingen, between which he divided two years (1832-33). His first published writings were contributions to Willis' *American Monthly Magazine* and "verses in the corner of a paper called the *Anti-Masonic Mirror*." His first book, the two-volume, semi-autobiographical 'Morton's Hope' (1839), met with a generally unsatisfactory reception; and, according to Holmes, the *North American Review* "dropped a small-print extinguisher upon it." He went to Saint Petersburg in the autumn of 1841 as secretary to the American legation, but after a brief residence returned (1842). His first important attempt in history was a 50-page article, nominally a review but really a narrative, on Peter the Great, in the *North American* for October 1845 (in book-form in the 'Half-Hour' library). His further literary work during this period includes notable essays on Balzac (July 1847) and the 'Policy of the Puritans' (October 1849) in the *North American*; and a second effort of fiction, 'Merry Mount' (1849), certainly an advance on the first, and rewarded by a nearly 20-page notice in the *North American*, but clearly not a success. But so early as 1846 he had been gathering material for a history of Holland. Having learned that Prescott, then at the height of his reputation, was busy upon the 'History

of Philip II, Motley had a conference with Prescott, who urged him to continue, even though the two works would unavoidably cover the same ground. For the year 1849 he was a member of the Massachusetts house of representatives; and he often humorously referred to his experience when an extensive and, as he fancied, impregnable report prepared by him as chairman of the committee on education was triumphantly demolished by George S. Boutwell (q.v.), then a young representative from Groton. From 1851 until 1856, the year of the appearance of the 'Rise of the Dutch Republic,' he was in Europe, continuing his investigations at Berlin, Dresden, The Hague and Brussels. When, after 10 years' labor, the great work was at last ready for the press, it had to be published at the author's expense. It was received with almost universal praise by public and critics — Froude writing, "one of the earliest as well as one of the most important recognitions" — and definitely established Motley's fame. It was widely translated, Guizot superintending the French version and writing the introduction. Motley was in America in 1856-58, but then returned to Europe. In 1861 he wrote two letters, then of great timeliness and importance, to the London *Times*, setting forth to the English nation the structure of the United States government, the causes of the Civil War and the results involved. From 1861 until his resignation in 1867 he was United States Minister to Austria, and his official dispatches in this post were highly praised by John Jay, his successor. He returned to the United States in 1868, in 1869 was appointed Minister to England by Grant, but in 1870 was suddenly recalled. This action by the government was never explained with any degree of satisfaction. The correspondence between Motley and Fish, Secretary of State, is to be found in a publication of the State Department (1871). It would appear that Holmes' verdict that Motley was greatly wronged is the correct one. Sumner said: "How little Mr. Motley merited anything but respect and courtesy from the secretary is attested by all who know his eminent position in London and the service he rendered to his country." Motley continued writing until 1873, and in 1875 paid a visit to the United States. His other two famous works are the 'History of the United Netherlands, from the Death of William the Silent to the Twelve Years' Truce, 1609' (1860) and 'The Life and Death of John of Barneveld, Advocate of Holland: with a View of the Primary Causes of the Thirty Years' War' (1874). They confirmed his rank as a great historian; some of the best Dutch critics thought the 'Barneveld' his chief publication. His style is precise and brilliant; his narratives are full of movement, his portraitures vivid. Consult Holmes, O. W., 'John Lothrop Motley: A Memoir' (Boston 1898); Bassett, J. S., 'The Middle Group of American Historians' (New York 1916); Curtis, G. W. (ed.), 'Correspondence of John Lothrop Motley' (New York 1889); Mrs. S. St. J. Mildmay (Motley's daughter), 'John Lothrop Motley and his Family: Further Letters and Records' (New York 1910).

**MOTMOT**, a bird of the tropical American family *Momotidae*, allied to the kingfishers and todies, of which about 20 species are known, all

in the genus *Momotus*. They inhabit the forests, as a rule, and are usually solitary in the daytime, perching with the head drawn between the shoulders, solemn and still except for an occasional melancholy croak from the repetition of which they derive their name, originally French and pronounced *mo-mo*. They are most lively at early morning and in the dusk of evening, pursuing insects in short flights; they also eat fruits, lizards and snakes, which are tossed into the air from the point of the bill and swallowed; they sometimes devour the eggs of other birds. The nest is made in holes of trees or banks of earth. The motmots are birds of brilliant plumage, with one striking peculiarity. The two middle feathers of the long-tail are much prolonged and are always more or less denuded of vanes on both sides of the shaft except near the tip, giving a racket-like shape to the feathers. This seems to be the result of a habit in the bird of gnawing its feathers, which begins as soon as their growth outreaches the other rectrices. The best-known species is the Brazilian motmot (*M. brasiliensis*), about the size of a blackbird, of a deep rich green color, with bluish forehead, violet back of head and black crown. One of the Mexican species (*M. caroliniceps*) occasionally crosses the line into the United States. Consult Belt, 'Naturalist in Nicaragua' (London 1888) and *Zoologica* (Vol. I, No. 5, New York 1910).

**MOTOR**, a machine for utilizing some power, as gas expansion or an electric current, to do useful work. The meaning of the word "motor" is similar to the commonest meaning of "engine," but the application of the words is different. We have become habituated to reserve the word engine for a steam-engine or large stationary gas-engine. The word motor came into common use with the commercial development of electricity. The makers of the first electric machine that was marketed for delivering power chose to call it an electric motor, and since then a reversed dynamo has always been a motor. Then came Daimler's perfecting of the "petrol" engine, for use on bicycles, which is now technically called an internal combustion engine, but popularly called a motor. The developments of this are the automobile motor, the aviation motor, Liberty motor, etc. Motor is now being used as a verb, as "to motor into town." It has become fixed in the language.

**MOTOR AREAS**, those portions of the brain in which are located the cells that govern the voluntary muscles of the body. The motor areas are confined more distinctly to the cortex or outer surface of the brain on either side of the fissure of Rolando, making up the areas known as the anterior central and posterior central convolutions. In these areas are numerous motor cells, the stimulating of which results in bodily motion. From these motor cells the impulse passes inward through the substance of the brain. The motor cells may be isolated from adjoining surface area by excision, with no effect on the control of the specific motion. When these surface areas are removed or injured there follows an impaired function of the muscle corresponding to the cells or the fibres interfered with. The motor area in the right side of the brain controls the

voluntary muscles of the left side of the body and the right hand and leg are controlled by the left side of the brain. The tracts of fibres that come from one side pass the middle line at the lower level of the medulla, the decussation of the pyramids. The motor area itself is subdivided into irregular areas or centres as they are loosely called — an arm-centre, a leg-centre, etc. In these more or less clearly delimited areas the cells governing the voluntary muscles of a leg or an arm are grouped. In much the same manner the nerves of the muscles of the face and of the eyes, tongue, etc., have their locations of origin in certain portions of this general motor area. There is, however, no evident relation between the size of a cortical area and the size of the mass of muscle which is controlled thereby. Thus the cortical area for the face and head is much larger than for the leg area which controls the many times greater bulk of the leg muscles. Irritation of the motor area usually causes excessive muscular movements or convulsions and destruction results in loss of motor power or paralysis. The experiments from which these facts are drawn were performed upon rabbits, dogs and monkeys. Some few of them have been confirmed in the course of surgical practice upon human patients. (See BRAIN; CONVULSIONS; PARALYSIS). Consult Howell, W. H., 'American Text-Book of Physiology' (Philadelphia 1903).

**MOTOR BOATS**, power boats equipped with internal-combustion engines, as distinguished from boats propelled by steam power. They divide into several groups or types: (1)

or sets of engines varying from 50 to 300 or more horse power.

The hulls are built in several styles — round-bottom, flat-bottom, V-bottom, tunnel-bottom, etc., and with widely varying types of bow and stern. Of the former, the prevailing types are the straight, round, dory, spoon and clipper bows; of the latter, the square, round, transom, fantail and torpedo sterns. A straight bow has the most elegant appearance, but a round bow rides better and is preferable. A transom or V-shaped stern makes the fastest and driest boat. Open boats of the launch class have a few feet of deck forward and aft, with a narrow strip along the gunwales, and a five or six-inch coaming around the cockpit. They are often fitted with a spray shield of canvas or a "buggy-top" sun and rain shield. Larger boats are protected by an awning top carried on a frame overhead, or by a fixed "standing-roof" which is commonly fitted with side curtains of canvas, making a weather-tight inclosure, but dangerous in a high wind. Boats 25 to 30 (or more) feet in length usually have a cabin of some sort. This may be of the "raised deck" or "hunting cabin" type, inclosing the bow for several feet back, or a "glass cabin" inclosure toward the middle of the hull. The last is liable to make the boat top-heavy unless it has considerable width of beam.

At the Paris Exposition of 1889 there was exhibited a boat with a Daimler motor, this being among the first of the motor boats. As this form of motor was developed and improved for automobiles and aeroplanes, manu-

Six-cylinder Internal Combustion Engine for Motor Boat. M — Overhead view; B — Side view; A — Side; I — Intake; E — Exhaust; L — Lever; F — Fly-wheel; C — Cylinders; CC — Crank Casing.

the gasoline launch, commonly 20 to 30 feet long; (2) speed boats, sometimes called displacement speed boats, more or less decked over and with high-powered engines: they often run up to 40 feet in length; (3) hydroplane boats, having stepped planes in the hull and designed to slide on the water rather than through it; (4) cruisers, virtually pleasure yachts, using gasoline motor engines instead of steam engines and usually built with a view to speed. These last are commonly 60 to 100 or more feet in length, and they carry engines

facturers adapted it to boats, and the internal combustion or gasoline engines built for motor boats are quite as efficient as those constructed for automobiles and motor vehicles. Not having the same weight restrictions, they are usually of heavier construction, and they are built up to large sizes. As arranged for motor boats, the internal-combustion engine is simpler than for automobiles. No radiator is required to cool the cylinders, the water-jacket of the cylinders being supplied by a continual current of fresh water taken in from beneath the hull;

and no change-gear for various speeds nor differentials are needed. The engine may be direct-connected to the propeller-shaft. Motors of two to six cylinders are in common use. In small boats the gasoline or fuel tank is placed forward to get it high enough to feed the carburetter by gravity. The exhaust is carried to a water-cooled muffler and thence outboard. The crank-shaft is run fore and aft and is coupled to the propeller shaft. The latter has thrust-bearings with steel balls to relieve the friction. The propellers are made with two or three blades and special forms of spiral blades are made for shallow and weedy water. Some 20-foot motor boats are made to run in one foot of water, the propeller being placed in a tunnel in the hull. Some propellers have adjustable blades, which can be positioned so as to rotate either right-hand or left-hand, though the driving is in one direction. This adjustment therefore fits the boat for either forward or backward motion. The more common method, however, is to have the propeller-shaft geared to the engine by a lever-operated reversing gear.

A familiar type of six-cylinder internal-combustion engine for motor boats is shown, in the diagram. The cylinders are cast in pairs and placed upright, as in an automobile, with

the two-cylinder two-cycle motor having the same effective power as the four-cylinder four-cycle motor. For the ordinary motor boat no engine is better than the three-cylinder two-cycle motor. It runs with a minimum of vibration, and is of less dead weight for the power developed than any other. The ignition system is another fundamental feature upon which the motor boat operators and builders divide in opinion. The two systems in use are the make-and-break, and the jump-spark systems. Few who have had a serious amount of experience with both will hesitate to choose the make-and-break as the easiest to get along with in all circumstances. Most motor builders recognize this condition, and nearly every make of motor may be had with either system. Cabin motor boats, as a rule, are equipped with a storage battery, and a generator attached to the propeller shaft to keep it charged, thus providing the boat with a lighting system, and affording current for a searchlight to aid the pilot in making landings after dark.

Rowboats, canoes, dories and other small craft may be turned temporarily into motor boats by attaching to them a portable detachable motor made for such purpose. These little engines range from one horse power upward, and are provided with one or two cylinders, the

Diagram Illustrating the Principle of a Hydroplane Boat.

the inlet pipes on one side and the exhaust on the other. The crank-shaft is cased in below. At one end is the fly-wheel, the reversing lever at the other. A 12-horse-power engine in a 30-foot boat may drive it 10 miles an hour or more; with 20-horse-power, 16 to 18 miles may be attained. Racers with 30 to 60 horse-power motors make 30 to 35 miles an hour, meaning in each case statute miles. Over considerable distances the speed shown is much less. For instance, in the Philadelphia-Havana 1,200-mile ocean race in 1910 the winner averaged less than eight miles an hour.

The small open boats employ mostly engines with one or two, and occasionally three cylinders. In these small engines the bore and stroke are about the same. In the larger engines, the stroke usually exceeds the bore by 20 to 30 per cent. The displacement speed boats commonly employ four-cylinder to eight-cylinder engines, while hydroplanes are built with four- to six-cylinder engines, up to 65 horse power or more. The large cruisers commonly install several motors tandem to get the desired horse power. In small boats the usual motor is of the two-cycle type; in the larger boats the four-cycle type is common, but by no means universal. The four-cycle motor is more economical of gasoline, and from a mechanical point of view is superior as a machine, but it is much more complex than the two-cycle motor, and is nearly twice the weight—

latter type being more dependable. The motor is self-contained, and is simply clamped upon the stern board of the boat. It will drive an ordinary round-bottom rowboat six to seven miles an hour.

The hydroplane boat is of a distinct type, having a flat bottom or hull in the first instance, then a step being introduced in the hull, this being called a biplane hydroplane. This step construction involved a division in the bottom or hull, so that the forward half was a "step" lower than the aft half, this step being perhaps two inches high. This worked well, and the multiplane or multistep type was introduced and generally followed, as securing the best results. In its natural position the first plane of the hull is on the water level, and as the boat gathers speed the bow rises, and the entire boat is more or less lifted out of the water, tending to skim on top instead of to drag through the water, like other boats. But in order to rise upon the surface the speed must be very great; a slow boat will not "plane." The highest authentic record up to 1 Jan. 1918, is that of the *Whip-Po-Will* which averaged 69.39 miles per hour for six one-mile spurts on Lake George, 6 Nov. 1917; and made its fastest mile in 51.55 seconds—a rate of 70.15 miles per hour. Other fast records for 1917 were by *Miss Detroit II*, 61.72 miles per hour; and *Miss Minneapolis*, 49.27 miles per hour.

Motor boat races are held regularly at

Monaco and many European water resorts; also in the United States, on the Hudson, off Marblehead, off Block Island, on the Mississippi and the Great Lakes. In the 1917 motor-boat race from New York to Albany and return, a distance of 235 miles, the winner was *Luetta* with a record of 29 hours, 38 minutes, 26 seconds. In the Miami-to-Palm Beach, Fla., race in 1917, *Raven III* completed the 70 miles in 1 hour, 47 minutes, elapsed time. Consult Durand, W. F., 'Motor Boats' (London 1907); Hobbs, E. W., 'Model Power Boats' (London 1912); Russell, T. H., 'Motor Boats: Construction and Operation' (Chicago 1910); Verrill, A. H., 'Book of the Motor Boat' (New York 1916).

**MOTOR CAR.** See AUTOMOBILE.

**MOTOR FUELS.** See CHEMISTRY, PROCESS OF.

**MOTOR TRUCK,** a heavy type of automobile developed for carrying truck or freight. At first they were called auto-trucks, and were simply stout automobiles, with wagon bodies, suiting them to carry goods. Because of the great weight on the rear tires these were doubled literally, two tires being placed on each rear wheel. For a few years truck-builders gave their attention mainly to bodies, building them to suit all sorts of trades, but employing a cheap heavy automobile chassis and motor. As the automobile proper was improved for speed, it became less suited to use for a truck, where slow speed and large carrying capacity were demanded. Heavy, slow-running motors were then designed, but the old chain-drive for the rear wheels was adhered to. Though this chain was called "silent" it was a noisy affair, and the entire motor truck of that date (about 1910) looks very crude now. In 1914 and 1915 the war demand for motor trucks aroused American builders to construct more efficient models, and the result is that in 1918 there are on the American market well over 100 makes of motor trucks, that wholly outclass the older types. The great majority run from one to six tons. A light delivery wagon sells for \$885; stout 1½-ton trucks from \$1,400 up; 2- to 3-ton trucks for from \$1,775 to \$3,250; 5- to 6-ton trucks for \$3,750 to \$5,500. These figures are taken from the listings at the automobile show in New York city in 1918. A few 7- to 10-ton trucks are being built. For motors the four-cylinder is most common, though many six-cylinders are employed. There is no demand for a large number of cylinders, as in automobile and aviation motors. The typical motor-truck motor is often called an "engine" by the trade, because its design resembles small stationary and marine engines. Practice as to clutches varies, but the disc type predominates, this being well adapted to the slow speeds and heavy power transmission of the truck, though poorly adapted to a racing automobile. Roller-bearings are universal, Tinkum and Hyatt being the familiar types. The chain drive has almost wholly given way to the improved worm drive, described and illustrated under automobile (q.v.). The four-wheel drive is increasing in popularity and numbers. Wheel bases tend to grow greater. The shortest seen on any 1918 truck was 124 inches on a small truck and 135 on a 6-ton truck, while the larger trucks of the

best makes ran up to 163 to 180 inches wheel base.

The number of motor trucks in use in the United States in January 1918 was estimated by the editor of *Motor* to be 435,000. The number of commercial cars built in 1917 was 181,348, but these are not all properly designated as motor trucks, for many of them are light wagons for city express work. The light traffic is being taken care of in large measure by an attachment to the Ford car. A truck frame and rear wheels are arranged to be hitched on to the fore-wheels and motor of a Ford car; any sort of a wagon body can be placed on top. This combination has a carrying capacity of 1½ tons, utilizes heavy artillery wheels, 34 x 3½, including solid tires. The wheel base is 128, the loading space over nine feet long, and it sells for only \$390 ready to attach to any Ford. This cheap truck is rapidly driving out the horse, and the estimate is that 2,000,000 horses have at this date (1918) been released from servitude in the United States by the near half-million of motor trucks in use.

The wonderful tests to which motor trucks were subjected in the Great World War have been a prominent factor in the development of superior machines. Manufacturers have met the strain and built better than they ever built before, producing machines that stood amazing rough usage, on broken ground, in the rear of the Allied armies. The demands of the British and American governments for certain types developed the artillery type of truck, adapted to army conditions. Thousands of these machines were built in the West, and made their way to the Atlantic seaboard for shipment under their own power. On several occasions the great Lincoln highway witnessed processions of them miles in length, all going over to help win the war.

The motor truck having proved that it can compete advantageously with the railroad for short hauls is already in business. One concern in New York city does a truck and freight business to any point within 400 miles. It operates great trucks regularly to Boston, Baltimore and cities in central New York and Pennsylvania. The running time between New York and Philadelphia (100 miles by road) is 12 hours; and to Baltimore, 188 miles, 22 hours. The operating cost is said to be 18 cents per ton mile, as against 24 cents for same work by horses and wagons. While this is far higher than railroad cost, yet it saves handling, and as goods mostly have to be trucked at both ends of a railroad route, this item is a clear saving. It is thought that the system must prove permanent for haulage around large cities up to 150 miles.

A considerable number of electric motor trucks have been built, and they operate very satisfactorily. Their traveling range is limited to about 50 miles, after which the batteries have to be recharged. The electric light and power companies, which charge the batteries, have not generally cared to cater to this business, so the electric trucks are not common, though they have been adopted by some large concerns.

A large heavy road motor truck is a good deal like a locomotive to care for. Before starting on a tour the driver must look it all

over to make sure that everything is in working order. In making down grades he must remember that he has a great weight behind him and cannot lock the brakes and expect to stop. He must slow down his engine and use it as a resistance, and apply his brakes gradually. The use of heavy motor trucks involves trailers, which may be likened to small open freight cars designed to be drawn by the big truck, serving as a road locomotive. This combination gives us the long-sought independent train that can run on any fairly good road. It is beginning to be used, and will before many years be common on certain American highways given up mainly to trucking, for this heavy traffic surely means that the highways of the future must be separated, that fast driving automobiles and slow-moving heavy trucks with trains of trailers may not have to occupy the same route and interfere with each other.

**MOTORS IN WARFARE.** The various motors employed in military aeronautics, culminating in the "Liberty motor," and the various motor trucks produced under specifications approved by the War Department Motor Transport Board are so constructed that the various units entering into the construction, including the engine, transmission, axes, springs, universal joints, frame, radiator and fan, are interchangeable as far as possible. This interchangeability of parts led quickly to the standardization requirements of the government which put an end to the complicated engineering, purchasing and manufacturing problems, to say nothing of the enormous cost of the finished product, due to lack of uniform manufacturing limits and patterns.

The Liberty airplane engine and the war trucks are not examples of standardization in the commercial sense, but of military designs dictated by war needs. The standardization by the government of the necessary designs of all kinds of self-propelled vehicles operable on land, sea or in the air, is one of the chief factors in determining the outcome of war. Likewise the submarine problem may possibly be solved by the adoption of one of the designs of large seaplanes recently perfected. The seaplane is not the only type of craft for marine use in attacking the submarine. The so-called submarine chaser is another recent war product. The designs and construction of motors used in many of these submarine chasers constitute some of the most important problems of automotive engineers. The production of the boats by standardized processes has been a great achievement. The development of small stationary or semi-portable units for the operation of the wireless set, the searchlight, pumps, isolated electric lighting plants and machine tools in portable repair shops, is another of the matters handled by automotive engineers. These machines perform highly important functions in the great military organizations of modern times and those responsible for their design and operation deserve equal credit with those who have contributed to the more spectacular forms of modern warfare. The United States standard army truck is not a commercial 3-ton truck, but an excellent 5-tonner and its engine axles and transmission is commonly used for 5-ton assembled trucks. Its outstanding characteristics are exceptional power; good springing, making

the riding almost as good as that on a passenger car; reasonable economy of fuel; ability to handle cold air and poor fuel without the least difficulty in starting and ease of steering and control. The complete truck with body, top, and equipment weighs a trifle over 10,000 pounds, and the chassis with driver's seat and in running condition scales 8,600 pounds. The engines have detachable heads and complete pressure lubrication is used. The following is a summary of principal points: (1) the engine has four  $4\frac{3}{4}$  by 6 cylinders, cast in pairs, with detachable heads; (2) much attention has been paid to the cooling and lubrication problems; (3) force-feed lubrication is used throughout and the oil is doubly strained; (4) two entirely separate ignition systems, one battery, the other magneto, are used; (5) the crankcase, including the bell housing and the oil pan, is aluminum, three-point support being used; (6) the crankshaft is very rugged, and is notable for its large intermediate bearing, as long as the rear one; (7) the governor is the steel-ball type, and so enclosed and sealed that it cannot be tampered with; (8) there is a dry disc clutch, a four-speed horizontally arranged change gear, a work drive, a full floating rear axle and Hotchkiss drive.

There are two methods of transporting heavy artillery; one to pull the piece; the other, to carry it in one or two loads. Both have their advantages and disadvantages. It is naturally easier to pull the gun than to load it on the truck, but the pulling of the gun on the road behind a truck results in considerable wear and tear on the pieces. To reduce the latter, truck-pulling pieces do not go faster than from seven to eight kilometers per hour, and a great deal of care is taken to prevent injury to the recoil apparatus of the gun by collision, etc. Carrying the gun has the great advantage of permitting the truck to make from 10 to 15 kilometers speed. It is necessary to differentiate between these methods of movement and the movement of heavy tractor artillery. This latter artillery is actually formed in requirements and groups and includes all the necessary tractors and trucks for its complete unit and for the first supply of ammunition. The tractors of the group are all of the 4-wheel driven type instead of the 2-rear wheel driven, as is the case with all other tractors.

EDWARD S. FARROW,

*Consulting Military and Civil Engineer.*

**MOTRIL**, mō-trêl', Spain, town in the province of Granada, somewhat over a mile from the Mediterranean Sea. It is in itself a port but the anchorage harbor, Calahonda, to the southeast, is more important. The climate is very mild and its industries consist of sugar plantations, wine-culture, sugar mills; cotton also is grown to some extent. There are also iron foundries, soap works, etc. Pop 18,444.

**MOTT**, Alexander Brown, American surgeon: b. New York, 31 March 1826; d. Yonkers, N. Y., 12 Aug. 1889. He was educated privately by Professor Darling of the University Medical College and at Columbia College Grammar School, then (1836) went to Europe for five years continuing his education. Although a Quaker he entered West Point, resigning at his father's desire and became secretary of Commodore Morris in United States naval quarters on

the Mediterranean. He next took up commercial life (1845) visiting Turkey, Greece, Italy and Austria for a Marseilles firm. Continuing the study of medicine at Havre, he returned to New York and was graduated (1849) at New York Medical College, at the University of Pennsylvania (1850) and Castleton Medical College. In 1853 he became visiting surgeon at Saint Vincent's Hospital and was attending surgeon (1855-63) to the Jewish Hospital. He was one of the founders of Bellevue Medical College. During the Civil War he was medical director (1862-64) at New York and (1864-65) inspector of the department of Virginia and was mustered out of the service in 1866 with rank of brevet-colonel. From 1872 he was professor of clinical and operative surgery till his death at Bellevue Medical College. He wrote 'Surgical Operations' (1856-57); 'Advantages of Clinical Teaching' (1868), and other works.

**MOTT, James**, American abolitionist: b. Cowneck, L. I., 20 June 1788; d. Brooklyn, N. Y., 26 Jan. 1868. He was a teacher in a Friends' boarding school in Dutchess County, N. Y., at 19, where he later married Lucretia Coffin. In 1810 he went to Philadelphia, Pa., and engaged in mercantile business. He was a staunch friend of William Lloyd Garrison (q.v.), assisted in the organization of the Philadelphia Anti-Slavery Society in 1833 and attended as a delegate the World's Anti-Slavery convention in London in 1840. He was a determined supporter of the cause of woman's rights and in 1848 presided over the first woman's rights convention at Seneca Falls, N. Y. From 1865 till his death he became interested in the foundation of Swarthmore College.

**MOTT, John Raleigh**, American Y. M. C. A. leader: b. Livingston Manor, N. Y., 25 May 1865. He was graduated (1888) at Cornell University when he was made chairman of the executive committee of the Student Volunteer Movement. Since 1895 he has also been general secretary of the World's Student Christian Federation and is now chief executive of the National War Council of Y. M. C. A. associations. On the retirement of Woodrow Wilson from the presidency of Princeton College he was offered the position but did not accept it. In 1916 he was appointed by President Wilson member of the joint commission for settlement of differences between Mexico and the United States and he was a member of the mission to Russia, headed by Elihu Root, in 1917. He has written 'Strategic Points in the World's Conquest' (1897); 'Evangelization of the World in this Generation' (1900); 'Christians of Reality' (1902); 'The Pastor and Modern Missions' (1904); 'The Future Leadership of the Church' (1908); 'The Decisive Hour of Christian Missions' (1910); 'The Present World Situation' (1914). In 1910 he had conferred on him the degree LL.D. by the University of Edinburgh and in 1911 the same degree by Princeton University.

**MOTT, Lewis Freeman**, American educator: b. New York, 29 Sept. 1863. He was educated in his native city and was graduated (1883) at the College of the City of New York, where he became tutor (1884-94) of English and (1894-97) instructor, then assistant professor and professor. He was elected (1911)

president of the Modern Language Association. His profound studies of English and Romance literature and folk lore assisted him to the material of many lectures and he has written 'The System of Courtly Lore' (1896) and 'Provençal Lyrics' (1901). He has been editor of the *City College Quarterly* since 1906.

**MOTT, Lucretia Coffin**, American abolitionist and woman's rights advocate: b. Nantucket, 3 Jan 1793; d. near Philadelphia, 11 Nov. 1880. With her parents, Thomas and Anna Coffin, she removed to Boston in 1804, and two years later became a pupil in a Quaker boarding school at Nine Partners, N. Y., where James Mott (q.v.), whom she subsequently married was a teacher. In 1817 she opened a small school, but soon gave it up and became recognized as "an acknowledged minister." She joined the Hicksite branch of the Quakers upon the schism of 1827. In 1833 she joined in the formation of the American Anti-Slavery Society, as whose delegate she went to the London World Convention in 1840, from which all women were excluded. The result was the woman's rights movement, in which Mrs. Mott became a leader, taking a prominent part in establishing the convention held at Seneca Falls in 1848. Consult Hallowell, A. D., and 'Letters of Lucretia and James Mott' (1884).

**MOTT, Valentine**, American surgeon: b. Glen Cove, L. I., 20 Aug. 1785; d. New York, 26 April 1865. He was graduated (1807) at Columbia College when he went to England to continue his studies in medicine at the post-graduate courses of London and Edinburgh. In 1809 he returned to New York and was given the chair of surgery at Columbia College, continuing to hold the position when Columbia College was merged with the College of Physicians and Surgeons. In 1826 he with the entire body of his colleagues resigned on account of offensive actions of the trustees and they founded Rutgers College. The latter institution, in 1830, had to close from defects in its charter and he returned to the College of Physicians and Surgeons as professor of operative surgery and surgical and pathological anatomy. Ill health caused him (1835) to resign to visit Europe twice, finally returning in 1841, after having gained high honors for work done in the old country. He was elected president of the medical faculty of the University of the City of New York while still practising as surgeon in New York Hospital, till 1850 when he spent a year in Europe. In 1851 he was appointed professor of operative surgery and surgical anatomy again at the College of Physicians and Surgeons for a year when he resigned and was made emeritus professor for the rest of his life. On his death his fine library went to New York Academy of Medicine. He gave but little time to literary composition, one of his most extensive works being his 'Travels in Europe and the East' (1842). He supervised a translation of Velpeau's 'Operative Surgery,' writing its preface. In 'Transactions' of the New York Academy of Medicine were published numerous addresses and lectures. He also wrote a 'Sketch of the Life of Dr. Wright Post' and a 'Eulogy on his friend Dr. John Wakefield Francis' (1861). 'Mott's Cliniques' (1860) is an abstract of his later clinical lectures.

Consult Gross, S. D., 'Memoir of Valentine Mott' (Philadelphia 1868).

**MOTTIER**, môt'tyēr, **David Myers**, American botanist: b. Patriot, Ind., 4 Sept. 1864. He was graduated (1891) at Indiana University, then took the Ph.D. degree at the University of Bonn in 1897 and at Leipzig in 1898. He was (1891-93) instructor of botany at Indiana University and associate professor (1893-98), then professor from 1898. He was elected president of the Indiana Academy of Science in 1907. He has written 'The Practical Laboratory Guide for First Year in Botany' (1902); 'Fecundation in Plants' (1904), as well as a number of technical papers on botany.

**MOTTLED OWL**, a small horned owl (*Megascops*, formerly *Scops*, *asio*), which, in one or another geographical variety, occurs numerously all over the continent, except in the colder parts of Canada. Very similar species are known in Central America and in Japan. It is only 9 or 10 inches long, with large facial discs, two small erectile horns and a short rounded tail. Its plumage is a mottling of gray and rust-red. These little owls are nocturnal and are almost blinded by daylight glare. They come out in the dusk of evening, and from sunset to darkness, or all night when the moon is shining, is heard their low, musical, trilling cry—one of the pleasantest of bird voices; yet in some evil way the name *screech-owl* was long ago fastened upon this bird. Its eggs are five to seven, pure white. The food of the mottled owl is chiefly small rodents and insects, and occasionally, in spring, small birds; they destroy a vast number of insects and mice hurtful to the farmer and gardener. Books upon American birds abound in facts as to their habits.

**MOUCHEZ**, moo-shā, **Amédée Ernest Barthélemy**, French astronomer: b. Madrid, Spain, 24 Aug. 1821; d. Wissous, France, 25 June 1892. He was educated in the French Naval Academy and remained in the navy until 1878 when he was appointed chief of the National Observatory. He had previously shown himself a brilliant scientist and particularly distinguished himself in coast surveys of Algeria and Brazil as well as in the observation of the transit of Venus in 1874. He bent all his energies to the improvement of the observatory, introduced several innovations of value, and was the originator of the international photographic chart of the heavens. In 1880 he was appointed rear-admiral. He wrote 'Côtes du Brésil' (1869-76); 'La Photographie astronomique et la carte du ciel' (1877); 'Rio de la Plata' (1873; 3d ed., 1891).

**MOUFLON**, moof'lôn, or **MUSIMON**, a wild sheep (*Ovis musimon*) of Corsica and Sardinia, where it wanders about the summits of the mountain ranges in small flocks, and offers excellent sport. It is a question whether this species ever existed on the mainland, one opinion being that it arose in the isolation of the islands; but most naturalists believe that it formerly existed in Spain. The rams are about two and one-quarter feet tall at the withers, and have very large coiled horns, but the females are hornless. The long mane-like hair that covers the neck and chest of the rams is gray, but the remainder of the coat is mainly

rust-red above and white on the ventral surfaces. A similar "mouflon" inhabits Cyprus; and the Barbary aoudad (q.v.) is often called "ruffed mouflon." Consult Aflalo 'Sport in Europe' (London 1901).

**MOUKDEN**. See **MUKDEN**.

**MOULDING**. See **MOLDING**.

**MOULDS**. See **FUNGI**.

**MOULE**, mool, **Handley Carr Glynn**, English Anglican bishop: b. Dorchester, Dorsetshire, 1841. He was educated at Cambridge University, took orders in the Anglican Church, and was an assistant master at Marlborough College 1865-67. From 1873 to 1876 he was dean of Trinity College, Cambridge, and he was first principal of Ridley Hall, Cambridge, 1881-99. He was nine times select preacher at Cambridge and once at Oxford, was Norrisian professor of divinity at Cambridge 1899-1901 and in the last-named year was consecrated bishop of Durham, succeeding Bishop B. F. Westcott (q.v.). He has published many devotional and expository works, among which are a series of commentaries on the Epistles; 'Thoughts on Christian Sanctity'; 'Ephesian Studies' (1900); 'The Secret of the Presence' (1900); 'Thoughts for the Sundays of the Year' (1901); 'The School of Suffering' (1905); 'Christus Consolator' (1915); 'The Call of Lent' (1916).

**MOULIN**, an opening from top to bottom of a glacier, by means of which a stream flowing on the surface of the ice plunges to the bottom and flows on as a subglacial stream.

**MOULIN ROUGE**, moo'lân'roozh, Paris, the "Red Mill," noted dance-hall on the right bank of the Seine, the "students' quarter" (*Quartier Latin*). Since the notorious Jardin Mabille, in this section, went out of existence the Moulin Rouge has since been the favorite resort for can-can and other gay dances of the Parisians.

**MOULINS**, moo'lân', France, capital city of the department of Allier, on the right bank of a river of the same name, which is spanned here by a beautiful bridge, built in 1763. It is the junction of the Lyons and Orleans railways, and contains the old Gothic cathedral, built in 1465-1507 and finished by Viollet-le-Duc in 1861, and holding a triptych by Ghirlandajo among other art treasures. Here also are an ancient monastery church with monument of the executed (1632) Duke Henry II of Montmorency, a modern Gothic Sacred Heart (Jesus) Church, the 15th century clock-tower, ruins of the 14th century castle of the dukes of Bourbon, a palace of justice, town-hall, etc. Its industries include factories for woolens, tools, agricultural instruments, paper, bells, hats, oil and vinegar. It is the seat of a bishop and has a court of assizes, a chamber of commerce and two lycées, besides a seminary, two divinity colleges and museums of natural history, art and antiquities. There are also a large library and theatre. Pop. 21,990.

**MOULTON**, mōl'tôn, **Ellen Louise Chandler**, American poet: b. Pomfret, Conn., 10 April 1835; d. 10 Aug. 1908. She was married to William U. Moulton, a Boston publisher, in 1855 (d. 1898). She had a wide literary acquaintance both in this country and in Eng-

land where she spent a part of every year for many seasons. Her weekly receptions both in Boston and London were the resort of many literary and artistic persons. She published such books for children as 'Bedtime Stories' (1873-80), while her other writings include 'Some Women's Hearts' (1874); 'Miss Eyre from Boston' (1889); 'In the Garden of Dreams'; 'Lyrics and Sonnets' (1890); 'Lazy Tours in Spain and Elsewhere' (1896); 'At the Wind's Will,' verse (1899), etc. Her lyrics are extremely musical and as a sonneteer she ranks high.

**MOULTON, Forest Ray**, American astronomer: b. Le-Roy, Mich., 29 April 1872. He was graduated (1894) at Albion College and took (1899) the degree Ph.D. at the University of Chicago. He was appointed (1898) associate in astronomy of the University of Chicago, becoming (1900) instructor and (1903) assistant professor, associate professor of astronomy (1908) and professor (1912). He has been associate editor of *Transactions of the American Mathematical Society* since 1907 and research associate at Carnegie Institute since 1908. He has written 'Celestial Mechanics' (1902); 'Introduction to Astronomy' (1905); 'Descriptive Astronomy' (1911); 'Periodic Orbits' (1913), besides contributing numerous articles to the mathematical and astronomical periodicals.

**MOULTON, Richard Green**, Anglo-American educator: b. Preston, England, 5 May 1849. He was graduated from the University of London in 1869 and at Cambridge University in 1874, since when he has been associated with the university extension movement of various American and English universities. He has been connected with the University of Chicago since its foundation in 1892; and since 1901 has been professor of literary theory and interpretation and head of the department of general literature. He is author of the following works: 'Shakespeare as a Dramatic Artist' (1885); 'Shakespeare as a Dramatic Thinker' (1907); 'The Ancient Classical Drama' (1890); 'The Literary Study of the Bible' (1896); 'A Short Introduction to the Literature of the Bible' (1901); 'The Modern Reader's Bible' (1895-1907); 'World Literature' (1911); 'The Modern Study of Literature, an Introduction to Literary Theory and Interpretation' (1915).

**MOULTRIE, mōl'trī, John**, English poet and clergyman: b. London, 1799; d. 1874. He was educated at Eton and was graduated (1822) at Trinity College, Cambridge. He abandoned his law studies to be ordained (1825) in the church and went to Rugby (1828) as rector, while Thomas Arnold was head master of the school and with whom a close friendship grew up, as his poems testify. He wrote 'My Brother's Grave' (1820); 'Godiva' (1820), which is considered his best work. His collective works were published in 1876.

**MOULTRIE, William**, American soldier: b. South Carolina, 1731; d. Charleston, S. C., 27 Sept. 1805. He early allied himself with the military forces of the colonies and in the war with the Cherokees in 1761 the confidence of his fellow citizens in his ability was shown by his selection as captain of the body of troops raised to defend the frontier against the

Indians. At the outbreak of the American Revolution in 1775 he was appointed colonel of the 2d colonial regiment and he also served as member of the South Carolina provincial congress in that year. He was engaged in the seizure of the public arsenals and the construction of fortifications around Charleston, and in March 1776 was ordered to construct a fort on Sullivan's Island. This he made of the only material at hand, palmetto logs, and when General Lee made an inspection he expressed his disapproval of the work, considering it totally unfit for the purpose of defense and advised its abandonment. Moultrie, however, continued the work and when an attack was made by the British fleet under Sir Peter Parker the rude fort successfully withstood all assaults and was subsequently named for its brave commander. He was promoted to the rank of brigadier-general in recognition of his services and given command of the forces in South Carolina and Georgia. So complete had been the defeat of Parker, however, that Charleston was not again attacked until 1779 when the British availed themselves of the absence of a large share of the Continental force and attacked the town. The return of General Lincoln saved the city, but in the spring of 1780 a third attack by land and sea compelled capitulation. Moultrie was held a prisoner for two years and though offered rank and money to enter the British army remained loyal to the cause of the colonies. Release came in 1782, when he was exchanged for Burgoyne, and though promoted to the rank of major-general it was too late for him again to engage in active service. He was elected governor of South Carolina in 1785 and in 1794, and published in 1802 'Memoirs of the Revolution.'

**MOULTRIE, Fort.** See FORT MOULTRIE.

**MOUND BIRDS**, a group of Australasian gallinaceous birds remarkable for the large mounds which they build as incubators for the eggs. See MEGAPODES.

**MOUND BUILDERS AND MOUNDS.** Two terms that have been inseparably connected by investigators into the history of these early earthen pyramidal, terraced and mound structures of the North American Indians. In the broader sense, mounds, especially in their connection with mound builders, include not only pyramidal structures and mounds proper, but also walls, forts, embankments and like artificial structures especially those built of earth. Archæological investigators also include among the mounds the accumulations of debris which grew up near ancient centres of population through the gradual increase of dump heaps or other long continued deposits.

The ancient American mounds seem to have been destined for a variety of uses; some of them were burial places, others foundations for edifices, still others served as fortresses, while the most pretentious were used for sacrificial and other religious purposes. From the Canadian border to southern Peru stretch pyramids (generally truncated), terraces and tumuli of various forms, sizes and modes of structure. That the builders of the various sections of this vast chain of artificial structures were related ethnologically, racially or by political contact has never been clearly proved and may never be. At one time it was popular to main-

tain that the builders of the great American mounds were a people distinct from the Indians inhabiting the United States territory at the time of the first contact of the Europeans and the aboriginal Americans. Bryant sang of the mysterious lost race, and romances and sober scientific works were written about them. Now scientific criticism has swung to the opposite direction and not only is the existence of such a race denied but it is claimed that ancestors of the modern American Indian were the mysterious mound builders. But the last word has by no means been said upon the subject. The fact that Indian chiefs were found with their dwellings erected upon the summits of mounds is no proof that they built the mounds. Even if they did build small mounds as bases for their dwellings or as burial places for their dead, this again is no proof that their ancestors built vast structures like Cahokia, whose very existence presupposes politically organized society and the command of vast supplies of labor for long periods of time. As the Indian races of the North American continent seem to have been, for ages, given to migrations, the chances are rather against than for the modern theory that the ancestors of the modern United States Indians built the older and more monumental of the great mound structures, which must have served a race much further advanced in political and social organization than those to whom their construction has been attributed by those who hold the modern origin theory.

**Shapes and Sizes.**—The mounds are generally conical, hill-like structures, though some of them approach more or less closely to the true truncated pyramidal form and these vary, in the United States, from a few feet in height to over 100; and southward, throughout Mexico, Central and South America, very formally constructed pyramidal mounds exist that are over 100 feet in height and of vast proportions. The mounds of the United States which stretch from Canada to the Gulf of Mexico, down the Mississippi Valley and far across the plains on either side present a wide variety of forms. Conical, square-based, octagonal and other shapes add variety to the construction of the mounds proper; and forms of serpents and other reptiles, mammals and birds of gigantic size add to the impression of the civic culture of the races who conceived and constructed them. There can be little doubt that the more spectacular of these vast earthen structures were intimately connected with the religious beliefs of their builders. Eagles, panthers, serpents and other animal forms from 500 to 1,000 feet in length are among these mound structures, which include representations of many animals later known to have been totem signs among the American Indians over a very wide extent of territory. For this reason the theory has been advanced that these animal mounds were representations of tribal totems; and as such, probably served as emblems worshipped as protecting tribal deities.

**Great Serpent Mound.**—Of these animal form structures one of the largest and most noted is the Great Serpent Mound in Adams County, Ohio, which contains 1,350 feet of wall and is so constructed that it might, at one time, have formed a defensive work. The central folds of the serpent make two fort-like en-

losures open only at the back; while the coil of the tail, which is whorl-shape, is especially well arranged for defensive purposes, the swollen head and neck, the outline of which is formed of earthen walls, constitute a very extensive fort-like structure, divided in two parts by a wall similar to that of the rest of the structure. Within the larger of these two divisions is an oval enclosure of considerable extent formed by earthen walls similar to those of the rest of the edifice. In the outer wall of the head section is an opening leading into the larger subdivision; but the other sections and the oval enclosure are without openings of any kind. The whole structure is admirably laid out for defensive purposes. It may, and probably did have a three-fold purpose, defense, totemic representation and religious significance. The wall is now only five feet high, but it may have been originally somewhat higher.

**Situation of Chief Mounds.**—In the United States there are still a vast number of mounds; and in the State of Ohio there were, at one time, thousands. The smallest of these, however, have disappeared or are rapidly being leveled to the ground by the ploughman. Some groups of mounds, like those that formed the basis for a part of the city of Saint Louis, Mo., have been leveled and built up over. In Wisconsin are large numbers of mounds representing the forms of animals, while in Tennessee are smaller mounds which were used for burial purposes, as is clearly proved by the stone graves they contain. Some of these seem to have been either community, tribal or family burial places, as considerable numbers of graves have been found in a single mound. Burial tumuli were also erected in Illinois, Minnesota, Mississippi, Indiana, Florida, Wisconsin, Virginia, Kentucky and Missouri. The mountain ranges seem to have set a limit to the mound builder activity which did not extend to the east of the Alleghenies, North Tennessee and North Carolina. Some of the mounds of the mound-building regions were old when they first became known to the white explorers, but how old is not known. Indian races in various parts of America were still occupying mounds a century after the discovery of America and some of them were constructing them both for burial purposes and as foundations for buildings; but it seems to be uncertain whether any of these later constructions were used for religious purposes. Some tribes are also known to have built, in historical times, miniature mounds in their great council houses, apparently as a part of a religious ceremony. This calls to mind the fact that the Mixtecas and Zapotecas represented the sacred mound as the symbolical presentation of the "heart of heaven."

Among other tribes the custom obtained of collecting the bones of the dead, cleaning them carefully and burying them in a common grave over which a mound was erected.

It is evident from the great variety of mound structures that they could not have all been constructed by the same tribe or race and that the erection covered a very considerable period of time most of which was comprised in the later Stone Age of which some of the mounds show some beautiful workmanship; but nothing in metal except that introduced into them later of European make, and a few things

probably obtained by barter from southern races.

*Cahokia Mound* is the largest prehistoric artificial earthwork in the United States. It is in Madison County, not far from Saint Louis; it lies in the American bottoms and is surrounded by a number of smaller mounds which Brackenridge, who visited Cahokia and the complete mound neighborhood in 1811, asserts then numbered 45, exclusive of a great many smaller elevations. These probably did not include the mounds that existed at one time on the site of Saint Louis, Mo., and which gave that city the title of the "Mound City." The Cahokia truncated pyramid, for such it really is, measures about 1,000 feet from north to south, 725 from east to west, and 100 feet high at its greatest elevation. But the level top of the mound is not all at the same elevation. In fact one section of it is only 30 feet high, another is over 60 feet, while a third and fourth are slightly lower than the summit. The total Cahokia terrace measures about 200 feet by 500 feet. It thus affords considerable space, nearly two and one-half acres, which was probably used as a foundation for edifices. The base of Cahokia covers 17 acres, or over 40 per cent more than Cheops, the greatest of the Egyptian pyramids. Situated in the midst of a very populous district, and commanding the great "bottoms" from which rose scores of mounds of all sizes, Cahokia must have presented an inspiring sight in the days of its prosperity and might. The great pyramid was constructed of earth, which was taken from the country surrounding it, as is evident from the depressions in the soil. Cahokia is sometimes called *Monks' Mound* because it was occupied for a considerable time, from the beginning of the 19th century on, by Trappist monks, who had a vegetable garden on the top of the mound. Next to Cholula (q.v.), Cahokia is the largest based artificial pyramid in North America.

*Etowah Mound*, a large prehistoric mound three miles southeast of Cartersville, in Bartow County, Ga. Like the Cahokia mound it is situated on a river bottom and is surrounded by several smaller mounds of which it seems to have been the centre of community or civic life. Etowah is a quadrilateral, truncated pyramid much like Cahokia in form. It is over 60 feet high with a base length on one side of 380 feet. On the south side of the mound broad inclined roadway leads up to within 18 feet of the summit. This incline once was provided with wooden steps. The truncated top of the mound measures 170 by 176 feet. On the east side there is also a narrow slide reaching from the top to the bottom. The base of the pyramid covers nearly three acres. In excavations made in some of the surrounding mounds, stone images and copper plates have been encountered. Earthenware, copper, celts, pipes and stone objects suggestive of a fair degree of culture were also unearthed.

*Elephant Mound*, a well-known mound of massive form originally believed to represent some prehistoric animal probably an elephant. It is situated about four miles south of Wyalusing, Wis., on low ground a few feet above the level of the high-water mark of the Mississippi. The dimensions of this mound, which is badly disfigured through cultivation, is given as fol-

lows by the Bureau of American Ethnology; length 140 feet, height about four feet, width across the body to the lower end of the hind leg 72 feet. The bureau, upon careful examination, decided the mound was intended to represent a bear.

*Fort Ancient*, a prehistoric American mound fortification in Warren County, Ohio, and on a headland nearly 300 feet high overlooking the Miami River. The fortress itself is divided into two unequal portions known as the "Old Fort" and the "New Fort" and altogether it encloses a space of about 100 acres. The wall, for the most part, is constructed of clay but it is underlaid, in many places, with stone. This great wall is nearly 19,000 feet or more than three and one-half miles long and from 6 to 10 feet high and contains as much earth as the great pyramid of Etowah. Not far to the east of the "New Fort" are two mounds, and within the fort itself were other small mounds which evidently served as burial places. Most of the property covered by Fort Ancient has been secured by the State of Ohio by which it has been made a park and reservation placed in the care of the Ohio Archæological and Historical Society.

*Grave Creek Mound*, near Moundsville, W. Va., at the junction of Grave Creek and the Ohio River, is one of the best known of prehistoric Indian mounds. It is conical in shape with a base diameter of 320 feet, and a dish-shaped depression at the top. During excavations made in 1838 two burial vaults were uncovered, one at the base and the other 30 feet above. The lower contained two skeletons and the upper, one. Buried with the skeletons were several thousand shell beads, mica ornaments, stone objects and several copper bracelets.

*Newark Works*, near Newark, Ohio, an extensive group of prehistoric Indian constructions of a complicated nature. They are situated on an elevated plain from 30 to 50 feet above the river bottom and are composed of walls, circles, squares, an octagonal enclosure, ditches, mounds and avenues covering about four square miles. Two groups two miles apart are connected by avenues bordered by walls. The western group contains a large walled octagon and a square connected by a walled passage-way; and the eastern group contains another large circle connected with a large square by a wide walled avenue. While the square enclosures have, each, several entrances, the circles have only one each and that leading into the square. The larger circle has a diameter of over 1,000 feet, and embraces within its circuit the fair grounds of the Licking County Agricultural Society.

JOHN HUBERT CORNYN,  
Editorial Staff of *The Americana*.

**MOUND CITY, Ill.**, city, county-seat of Pulaski County, on the Ohio River, and on the Illinois Central and the Cleveland, Cincinnati, Chicago and Saint Louis railroads, about 200 miles south of Springfield and eight miles north of Cairo. It is in an agricultural section, but the principal industries are connected with manufacturing and trade. The chief manufactures are furniture, pumps, staves, headings and other lumber products, boxes, trunks, ice, foundry and machine-shop products. It has considerable trade in its own manufactures and in farm products, and has one of the largest preserving and canning factories in the United States. A National Cemetery, located here, contains 5,310 graves, of which 2,732 are unknown dead. Pop. 2,837.

**MOUND CITY, Mo.**, city in Holt County, on the Chicago, Burlington and Quincy Railroad, about 40 miles north by west of Saint Joseph. It is situated in a fertile agricultural region in which farming and stock raising are the chief occupations. Its principal manufactures are milling, canned fruits and vegetables and dairy products. Its trade is in farm products and live-stock. In the vicinity are numerous mounds belonging to the age of the Mound Builders (q.v.). Pop. 2,000.

**MOUNDVILLE, W. Va.**, city and county-seat of Marshall County, and the seat of the State Penitentiary, on the Ohio River and on the Baltimore and Ohio and Ohio River railroads, about 12 miles south of Wheeling. It is situated on a point of land, about three miles wide, at the confluence of the Big and the Little Grave creeks. It was once called Grave Creek Flats, and at first there were two small villages called Elizabethtown and Moundville. The present name is on account of the Mammoth Mound in the centre thereof, one of the largest ancient mounds in the United States. In the vicinity are other mounds classed as the Grave Creek group of mounds. The Mammoth Mound is connected with a series of earthworks of ancient construction and is 820 feet in circumference at the base, 63 feet in diameter at the summit and about 70 feet in height. It is now owned by the State and beautifully cared for. In the chambers have been found a stone tablet, the hieroglyphics thereon are yet undeciphered; the stone was sent to Europe for the purpose of determining the meaning of the marks and returned and is now in Smithsonian Institution, Washington, D. C. Shell beads, ornaments made of mica, others carved in stone, copper bracelets and other ancient articles have also been found. Moundville is in an agricultural and coal region and the industries are connected with farming and coal mining. It manufactures also glass, enameled ware, bricks, lamps, ceilings, brooms, whips, cigars, clothing, flour, feeds, leather, etc. Pop. 12,000.

**MOUNET, moo'na', (Jean) Paul**, French actor, brother of Jean Mounet-Sully: b. Bergerac, Dordogne, 1847. He studied medicine and received the degree of doctor of medicine; first appeared in 'Horace' at the Odéon in 1880. In 1889 he first played at the Comédie Française, of which he was made sociétaire in 1891. He also served as professor at the Conservatoire de Paris and was made a chevalier of the Legion of Honor. His reputation was made

in 'Les Erynnies,' 'L'Arlésienne,' 'Othello,' 'Patrie,' 'Hamlet,' 'La Furie,' 'Anthony,' 'Le Roi,' 'L'Enigme,' 'Le Dédale, and 'Œdipe Roi.'

**MOUNET-SULLY, moo'nā' sū-lā, Jean** (JEAN SULLY MOUNET), French tragedian: b. Bergerac, 1841; d. Paris, 2 March 1916. His precocious attraction to the theatre was resisted by his family and it was not until he became of age that he entered the Conservatoire, where he won the first prize for tragedy, and made a successful first appearance at the Odéon in 1868. During the Franco-Prussian War he was an officer in the Gardes-Mobiles. In 1874 he became a member of the Théâtre Française and remained in the company until he became its dean. Nature had endowed him with a most expressive face, a voice which had a convincing tone and a gift of gesture. He was made a chevalier of the Legion of Honor in 1889, and was decorated with the "Palme Académiques." His chief successes, although he essayed 'Hamlet,' were in the tragic rôles of French classic drama. His production of 'Œdipe Roi' at the old Roman theatre of Orange was his most notable achievement. It was repeated in Paris in 1888 and in New York some years later. With Barbier, he wrote 'La Vieillesse de Don Juan' (1906) in which he played the title rôle. Consult Brander Matthews 'The Theatres of Paris' (New York 1880).

**MOUNT, William Sidney**, American painter: b. Setauket, Long Island, 26 Nov. 1807; d. there, 19 Nov. 1868. He studied at the National Academy, N. Y., and became a member in 1832. His power as a genre painter was first proved by 'Corn Husking' although he had aroused interest by his 'Raising of the Daughter of Jairus' (1828) and a number of striking portraits, including a full-length of Bishop Onderdonk. He may be looked upon as the founder of the American school of genre, and is particularly happy in his treatment of negro characteristics. He has a genuine sense of humor and his 'Bargaining for a Horse' (New York Historical Society); 'Raffling a Goose' (Metropolitan Museum); 'A Long Story' (Corcoran Gallery, Washington); 'Coming to the Point' (New York Public Library) are real pictures of American life.

**MOUNT AUBURN**, a celebrated burial-place in Watertown, Mass., covering over 100 acres. Here are the graves of Longfellow, Lowell, Sumner, Phillips Brooks and other well-known men.

**MOUNT CARMEL, Ill.**, city, county-seat of Wabash County, on the Wabash River, and on the Cleveland, Cincinnati, Chicago and Saint Louis and the Southern railroads, about 35 miles northwest of Evansville, Ind. The place was settled in 1818 and in 1868 was chartered. It is in an agricultural section; but the good water-power has contributed toward making it a manufacturing city. The chief public buildings are the courthouse, public library and High School building. The chief manufactures are flour, paper, lumber, furniture, lumber products, strawboard, machinery supplies, shafting, pulleys and dairy products. It has the railroad shops of the "Big Four" railroad. There is considerable trade in manu-

factured articles, farm products and livestock. Pop. 6,934.

**MOUNT CARMEL**, Pa., borough in Northumberland County, on the Pennsylvania, the Philadelphia and Reading, and the Lehigh Valley railroads, about 45 miles north by east from Harrisburg. It is in a mountainous region in the midst of valuable coal fields, and nearby are a number of large anthracite mines. The manufactures are mining implements, miners' lamps, hats, caps, cement blocks, men's clothing, flour and cigars. There are also a planing mill, silk and knitting mills, foundries, meat packing plant and wagon works. The borough has an extensive trade in lumber and coal. Pop. 19,000.

**MOUNT CARROLL**, Ill., city, county-seat of Carroll County, on the Chicago, Milwaukee and Saint Paul Railroad, about 25 miles southwest of Freeport and 10 miles east of the Mississippi River. It is situated in an agricultural and stock-raising region, and in the vicinity are deposits of iron ore. It is the seat of the Frances Shimer School, and it has a high school and Carnegie library, Caroline Mark Home for Aged Ladies. The water-supply system is the property of the municipality. Pop. 1,759.

**MOUNT CLEMENS**, Mich., city, county-seat of Macomb County, on the Clinton River, and on the Grand Trunk Railroad, about 22 miles northeast of Detroit. Electric railroad lines connect the city with Detroit and the towns along the coast. The first settlement was made in 1802; and the original plan of the village was made in 1818 by Christian Clemens. This first plat consisted of 60 lots now in the business centre of the city. The cooperage business was most important in the early days; the staves and heads for oil casks and barrels being made in Mount Clemens and shipped to large oil firms in New Bedford, Mass. Then Mount Clemens was considered the most important place in Michigan; but with the decay of whaling and whale-oil industries, the cooperage business declined and the town was at a standstill for several years. In 1865 a company prospecting for oil sank a well at Mount Clemens. After going to a depth of about 1,300 feet they abandoned all hope of oil, but found salt instead. Soon a new company was formed for the purpose of manufacturing salt, but the enterprise did not prove a success because of the quality of the salt. In 1868, apparently by accident, the discovery was made that the water from the salt wells possessed remarkable medicinal properties and since then the place has had a steady growth which is increasing each year. Large sanatoriums, hotels and bathing places have been built to accommodate the thousands of people who annually visit the place seeking health. The mineral waters, classed as sulpho-iodo-chromo-salines, as they come from the wells are about 50° F., and very rich in mineral salts, chiefly chloride of sodium and chloride of magnesium. About 30 different chemical ingredients constitute their make up. The beautiful residences, broad, well-kept streets and grounds, the long lines of shade trees, the parks, the drives, all make the place most attractive. Gratiot avenue is virtually a continuation of the avenue of the same name in Detroit. Both avenues are parts of

what was once the government road made in 1840 and extending from the fort in Detroit to the fort at Port Huron. The churches and schools compare favorably with others in the State. Mount Clemens has considerable manufacturing and commercial interests. Some of the manufacturing establishments of the city are a carriage and wagon factory, agricultural implement works, beet-sugar factory, machine-shops, a large pottery, an automobile spring factory, a bath tub factory and a cooperage works. The government of the city is administered under the law of the State for the cities of the fourth class. The water-supply system is the property of, and is operated by the municipality. Pop. 7,707.

**MOUNT COOK**, or **AORANGI**, New Zealand. See **COOK**, MOUNT.

**MOUNT DESERT**, *dë-zert'* or *dëz-ért*, an island off the coast of Maine, the largest belonging to the State, part of Hancock County. It is separated from the mainland by Western Bay, Mount Desert Narrows and Frenchman's Bay. It is about 15 miles long and 12 miles wide; area, about 100 square miles. The coast-line is very irregular; the chief indentations are on the north, Eastern Bay; on the south, Somes Sound, a fiord which extends into the centre of the island, and Southwest Harbor. On the west are Seal Cove and Western Bay. Bartlett's Narrows on the west separates Bartlett and Mount Desert Islands. On the south Cranberry Passage separates Great Cranberry Island from Mount Desert. The irregularity and nature of the coast-line, and the separation of the island from the mainland is due to submergence of the land and weathering. The surface is mountainous, along the northern coast is a line of rugged cliffs, and Green Mount, in the interior, is over 1,000 feet in height. Several fresh-water lakes beautify the island and add to its attractiveness. Long Pond, Eagle Lake, Jordan's Pond, Echo Lake and Seal Cove Pond are the principal bodies of water lying wholly within the interior.

The principal harbors are Bar Harbor, Southwest and Northeast harbors. Bar Harbor in Eden township is a popular summer resort and connected by a ferry to the Maine Central Railroad and by steamboat lines with Rockland, Portland, Boston and other Atlantic ports. There is a naval coaling station on the north shore of Eastern Bay. In Frenchman's Bay are five rocky islands called the Porcupines, and about 20 miles south, in the open ocean, is Mount Desert rock, on which is built a lighthouse.

The first authentic account of this island was given by Champlain (q.v.), who gave it the present name. In 1608 M. De la Saussaye and the Jesuit Fathers Lallemand, Masse, Quentin and Biard, together with 25 colonists from France, established on Somes Sound a colony which they called Saint Sauveur. Eight years later the colony was destroyed by a party of Englishmen from Virginia. The first permanent settlement was made by Abraham Somes, who, in 1761, built a house at the head of the sound which still bears his name. The town of Mount Desert was incorporated in 1789; Eden, in 1796; Cranberry Isles, in 1830, and Tremont, in 1848. The population of the several towns is about as follows: Mount Desert, 1,569;

Eden, 4,441; Cranberry Isles, 399; Tremont, 1,116. Consult Fairfax, 'At Mount Desert'; Street, 'Mount Desert, a History' (Boston 1905).

**MOUNT ETNA.** See **ETNA**, or **ÆTNA**.

**MOUNT EVEREST.** See **EVEREST**, **MOUNT**.

**MOUNT FOREST**, Canada, a town in Wellington County, Ontario, on the south branch of the Saugeen River, on the Canadian Pacific and Grand Trunk railways, 40 miles northwest of Guelph. Its industrial establishments include flour, grist, saw and woolen mills, and it has manufactures of iron, agricultural implements, carriages, leather, pottery and bricks. Pop. 1,839.

**MOUNT GILEAD**, Ohio, village, county-seat of Morrow County, on the Whetstone River, and on the Cleveland, Cincinnati, Chicago and Saint Louis and the Toledo and Ohio Central railroads, about 40 miles north by east of Columbus. It has considerable trade in farm and dairy products, and it is a distributing centre for quite a section of the country. The industries comprise hydraulic machinery works and a concrete sewer-pipe plant. The three local banks have combined resources amounting to \$1,310,000. The value of taxable property is \$2,500,000. The chief buildings are the opera house, fire house, mayor's office and the high and grammar schools. The government's receipts and expenses amount to \$20,000. There are an electric-lighting plant, water-supply system, sewer system and disposal plant. Pop. 1,700.

**MOUNT HOLLY**, N. J., town, county-seat of Burlington County, on Rancocas Creek, and on the Pennsylvania Railroad, seven miles south of Burlington City and 18 miles east of Philadelphia. It is in an agricultural section but its industries are chiefly manufacturing. The industrial establishments are foundries, large shoe factories, shirt-waist factories, a hammock factory, machine-shops, hosiery and tapestry mills, leathergoods works and canneries. There are two banks and two trust companies. The value of the town's taxable property is \$2,300,000. The government's receipts and expenses amount to \$26,000 approximately, annually balancing the account, excepting bond issues. The town has improved and well-lighted streets and sidewalks. It has the Children's Home, the Burlington County Hospital and the Burlington County Lyceum of History and Natural Science, founded in 1876. The library connected with the lyceum contains about 7,000 volumes. Some of the other prominent buildings are the churches, schools and county buildings. Pop. 5,900.

**MOUNT HOLYOKE** (hō'lyōk) **COLLEGE**, a college for women at South Hadley, Mass. It was founded by Mary Lyon (q.v.); chartered in 1836 and opened in 1837 under the name of Mount Holyoke Female Seminary. From the first it has had a reputation for thorough scholarship; the curriculum was gradually enlarged and the entrance requirements raised until a full college course was given and the old seminary course entirely superseded. In 1888 the name was changed to Mount Holyoke Seminary and College, and in 1893 to Mount Holyoke College. Formerly three de-

grees were given, A.B., B.S. and B.L.; but A.B. is now the only degree conferred. The course is arranged in two years of required and two years of elective work; the curriculum in addition to other subjects may include courses in education, biblical history and literature, music and art; a limited amount of technical work in the two latter courses may count toward the degree. Provision is also made for graduate work leading to the degree of A.M., and for special work for teachers. Graduates are entitled to fellowships in the American School of Classical Studies at Athens, and in the similar school at Rome; also to the advantages of the Zoological Station at Naples and the Marine Biological Station at Wood's Hole, Mass. Entrance to the college is by examination, or by certificate from approved schools. The campus now includes over 150 acres; the principal buildings are Mary Lyon Hall, which occupies the site of the original building destroyed by fire in 1896, the Dwight Memorial Art building, Lydia Shattuck Hall for the physics and chemistry departments, the Lyman Winston Hall for the other sciences, the Skinner Recitation Hall, the observatory, the gymnasium, the Student-Alumnae Hall which contains a large auditorium and offices for the college organizations and publications and for the alumnae secretary, seven large and four small residence halls, and the library which contained in 1915, 58,200 volumes; there are also plant houses and botanical gardens. Full attention is given to physical training; regular gymnasium work is required for the first three years of the course, and there is provision for basket ball and tennis. In 1915 the productive funds of the college amounted to \$1,390,219.15, the income for the year was \$372,939.39; the students numbered 791, the faculty 93 with a staff of 27 assistants, and the total number of graduates, 4,870.

**MOUNT OF OLIVES.** See **OLIVES**, **MOUNT OF**.

**MOUNT PLEASANT**, Iowa, city, county-seat of Henry County, on the Chicago, Burlington and Quincy Railroad, about 120 miles east by south of Des Moines and about 28 miles west of the Mississippi River. It is in an agricultural region in which considerable attention is given to raising horses and livestock. Large limestone quarries are in the vicinity. It was settled in 1834 by Pressley Saunders; incorporated in 1838, and chartered in 1851. The chief industrial establishments are flour and lumber mills, planing mills, brick and tile yards, potteries, wagon and carriage factories, grain elevators, repair shops and machine shops. It has considerable trade in grain, limestone, horses and livestock. It is the seat of the Iowa Wesleyan University (M.E.), founded in 1844, and until 1911 of the German Theological College (M.E.), founded in 1873. It has 13 churches, a conservatory of music, a high school, public and parish schools, and a Carnegie free public library. The State Hospital for the Insane is located here. The government is vested in a mayor and council of eight members, all of whom hold office two years. The city owns and operates the electric-light plant and the waterworks. Pop. 4,078.

**MOUNT PLEASANT**, Mich., city, county-seat of Isabella County, on the Chippewa

Copyright, 1909, by Detroit Photographic Co.

**MOUNT VERNON**

River, and on the Pere Marquette and the Ann Arbor railroads, about 70 miles north by west of Lansing. It is in an agricultural and lumbering region, but the city has considerable manufacturing. The principal industrial establishments are brick and tile works, condensed milk factory, chemical works, lumber and flour mills, foundry, machine shops, woolen goods factory and furniture works. A Government Indian School and the Central State Normal School are in this city. Pop. 5,500.

#### MOUNT RAINIER NATIONAL PARK.

See RAINIER, MOUNT.

**MOUNT SAINT ELIAS.** See SAINT ELIAS, MOUNT.

**MOUNT SAINT MARY'S COLLEGE,** a Roman Catholic school, founded Emmitsburg, Md., in 1808. It was chartered by the legislature of Maryland, and the charter was amplified in 1916, to enable the college to carry on its work more efficiently. There are 360 students in the scientific and classical courses. The faculty consists of 37 professors and instructors. The institution is under the direction of the secular clergy, who also have charge of a theological seminary, in which 75 seminarists, belonging to various dioceses, are prepared for the priesthood. The library has 30,000 volumes. The property is valued at \$400,000, approximately.

**MOUNT-STEPHEN, George Stephen,** BARON, Canadian financier: b. Dufftown, Banffshire, Scotland, 5 June 1829. He removed to Canada in 1850 where he engaged in mercantile business and became wealthy. He was afterward president of the Bank of Montreal and was conspicuous in promoting the completion of the Canadian Pacific Railway for which service he was knighted by the queen in 1886. He returned in 1888 to Great Britain and in 1891 was created Baron Mount-Stephen after a mountain in Canada which had been named after him. In 1887 he gave \$500,000 for the founding of the Royal Victoria Hospital of Montreal; Sir Donald Smith (later Lord Stratcona) contributing an equal sum.

**MOUNT STERLING,** Ill., town, county-seat of Brown County, on the Wabash Railroad, about 70 miles west by north from Springfield. A fertile agricultural region surrounds the town, and coal and clay deposits are in the vicinity. The chief manufactures are tile, brick, flour, wagons and dairy products. The town owns and operates the waterworks. Pop. 1,986.

**MOUNT STERLING,** Ky., city, county-seat of Montgomery County, on the Chesapeake and Ohio Railroad, about 31 miles east of Lexington. It is in an agricultural region, and has considerable manufacturing. Its chief industrial establishments are flour and planing mills, a distillery, machine shops, a glove factory and furniture works. It has several private schools, good public schools and a public library. Pop. 3,932.

**MOUNT UNION COLLEGE,** in Alliance, Ohio, coeducational, founded in 1846 under the auspices of the Methodist Episcopal Church as Mount Union Seminary, and chartered as Mount Union College in 1858. It was the first consistently coeducational college in the United States. In 1911 Scio College, of Scio, Ohio, was amalgamated with it. Its

courses lead to the degrees of A.B., B.S., Ph.B. and B.L. In 1919 there were connected with the school 20 professors and instructors and 316 students. Summer courses are provided for the long vacation.

**MOUNT VERNON,** the estate of George Washington, in Fairfax County, Va., on the right bank of the Potomac, 15 miles below Washington, D. C. The original name of the estate was Hunting Creek, and it contained about 800 acres. When it came into possession of Lawrence Washington, the brother of George, he changed the name to Mount Vernon, in honor of Admiral Vernon of the British navy. The house is of wood, erected on a bluff 200 feet above the river. It is a two-story house, 96 feet long and 30 feet deep. The main part was built by Lawrence Washington in 1743 and the wings were added by George Washington; the estate came into possession of George Washington in 1752 after the death of his brother. In 1859 the house and 200 acres of land around it was bought by the Mount Vernon Ladies' Association; the purchase money was \$200,000, raised in great part by Edward Everett. Since then the Association has restored the house as nearly as possible to what it was in the lifetime of George Washington. A high piazza extends along the front of the house, and the six rooms on the ground floor contain many objects of historical interest connected with the life and times of Washington. The key of the French Bastille, the furniture used by the family, in the piazza the tiles which were brought from the Isle of Wight, and many other relics are objects of attraction to visitors. In the garden are a number of trees planted by Washington, and in the coach-house is his carriage. The room at the south end of the first floor is the one in which Washington died. In 1831 the body of Washington was removed from the old family vault to a tomb, a plain brick structure, which is near a wooded ravine, a short distance from the house. Behind an iron grating may be seen the two sarcophagi which contain the remains of George Washington and his wife, Martha.

The estate was willed by George Washington to Bushrod Washington, and at the death of the latter it came into possession of John A. Washington, from whom the Ladies' Association purchased the house and adjacent grounds. Consult Lossing, 'The Home of Washington' (New York 1865); Page, T. N., 'Mount Vernon and its Preservation' (New York 1910); Wiltsch, P., 'Mount Vernon, Washington's Home and the Nation's Shrine' (New York 1916); Wineberger, 'Home of Washington at Mount Vernon' (Washington 1866).

**MOUNT VERNON,** Ill., city, county-seat of Jefferson County, on the Southern, Wabash, Chester and Western, Chicago and Eastern Illinois, and the Louisville and Nashville railroads, about 115 miles south by east from Springfield, 76 miles east of Saint Louis. The site for a city was first marked in 1819, and city lots laid out in 1840, and incorporated as a city in 1872. It lies in the north edge of the great Southern Illinois coal field, having one mine and is surrounded by splendid agricultural country, producing corn, oats, wheat, hay, fruit and vegetables. It has a plant for producing 22 wooden and 18 steel freight cars per day,

its chief manufacturing, constantly operating to near full capacity. Its other manufactures are cut-glass, cotton hoisery, ice-cream, railroad cross-ties, preserving, concrete, brick, flour, bread and pastry, mattresses. Dairying is fast becoming the chief industry on the farm. Its chief public buildings are the county courthouse, State appellate courthouse, Federal post office, six grammar schools employing 52 teachers and a high school employing nine teachers. The city spends on school maintenance annually \$48,000. There are 12 principal churches, some of them very excellent edifices. The government is under a charter under the general statute of the State, with mayor and 12 councilmen who hold office for two years. Pop. 10,124.

**MOUNT VERNON, Ind.**, city and county-seat of Posey County, on the Ohio River near the mouth of the Wabash, and on the Chicago and Eastern Illinois and the Louisville and Nashville railroads. It is in a rich agricultural region in which principal crops are corn, wheat and hay. Coal is plentiful in the near vicinity and the city is underlaid with two good veins of bituminous coal. It lies on a large flat top bluff of over four miles frontage, one of the very few places on the Ohio River never endangered by high waters. The principal industries are flour mills, hominy mill, straw board plant, foundry and machine shop and products, lumber and lumber products. It has seven churches, five public schools, including an accredited high school, and one parochial school, a modern courthouse and a Carnegie-Alexandrian free public library. The three banks have a combined capital of \$200,000 and a surplus of \$100,000, do an annual business of \$10,000,000 and annual clearings are \$1,000,000. The government is vested in a mayor and a council of six members, each of whom holds office four years. Pop. 5,563.

**MOUNT VERNON, N. Y.**, city in Westchester County, on the Bronx River and Hutchinson River, an arm of Pelham Bay, and on the New York, New Haven and Hartford, and the New York Central and Hudson River and New York, Westchester and Boston railroads, adjoining New York city on the north, and about 13 miles from the Grand Central station in New York. Electric lines connect Mount Vernon with New Rochelle, Yonkers and a number of the villages and cities in the vicinity. Rapid transit lines from New York city extend almost to Mount Vernon (1903) and the present plans provide for the extension of the lines into the heart of the city. Mount Vernon is really a residential suburb of New York; a large part of the city is restricted for residential purposes. It was founded in 1852 and in 1892 was chartered. It has several industrial establishments and considerable trade, chiefly in the products of market-gardens and as a distributing centre for the nearby sections of county. The Westchester Lighting Company is located here. It has about 1,000 employees, and furnishes for many places in Westchester County, light, power and heat for public and private uses. The streets and avenues are well-paved and well-kept. The handsome lawns and gardens and the great number of shade trees make the city most attractive. Some of the prominent buildings are the Mount Vernon Hos-

pital, the Lucas Building, Proctor's Theatre, new high school, new police building, new post office, fine church and school buildings. It has a public library founded in 1896, and the building donated by Andrew Carnegie, at a cost of \$50,000, was begun in 1903. The water, electric-light and sewer systems are all well organized and are being improved and extended to meet the needs of a growing city. The government is administered under the original charter, which provides for a mayor who holds office two years and a council. The mayor appoints, subject to approval by the council, all the administrative officers except the board of education, comptroller, assessors and receiver of taxes, who are elected by the people. Pop. 37,623.

**MOUNT VERNON, Ohio**, city, county-seat of Knox County, on the Kokosing River, and on the Cleveland, Akron and Cincinnati and the Baltimore and Ohio railroads, about 40 miles northeast of Columbus and 85 miles southwest of Cleveland. It is in an agricultural region and near the natural gas belt. The chief industrial establishments are a foundry, the Corliss engine-works, flour and lumber mills, bottle works, large glass plants, Pennsylvania Railroad repair shops and bridge works. It has considerable trade in manufactured articles and in farm and dairy products. The Hiawatha Park, the courthouse, the library and fine church and school buildings; all contribute to the attractive features of the place. The city owns and operates the waterworks. Pop. 12,000.

**MOUNT WASHINGTON.** See WASHINGTON, MOUNT.

**MOUNTAIN ASH, Wales**, a coal and iron-mining town of Glamorganshire, five miles south of Merthyr-Tydfil. The principal buildings comprise the parish church of Saint Margaret, the Workman's Hall, a library and reading-room, etc. Pop. 42,246.

**MOUNTAIN ASH, QUICKEN TREE, or ROWAN TREE**, popular names for a small European tree (*Sorbus aucuparia*) of the order *Rosaceae*, and, by extension, for two American species. The European species is an erect, graceful tree about 30 feet tall; bears ash-like, odd-pinnate leaves; corymbs of small yellowish-white flowers followed by globular orange colored acid fruits. (pomes). It is frequently planted for ornament and seems to thrive upon any soil except that which is very heavy or very light, or poorly drained. It does well in the cold north beyond the range of most fruit trees, and there the fruits are often made into preserves. The hard, compact wood is used for turning, cabinet work, etc. In Europe its twigs are highly prized by the superstitious as charms and as guardians against evil sorites.

The American species (*S. americana*), which resembles the preceding, ranges from Labrador to the mountains of North Carolina and from there irregularly northwestward to Manitoba. With the exception of its wood, which is light and inferior, it is used like the first species. The elder-leaved species (*S. scopulina*) ranges from Pennsylvania and Michigan to Labrador and an allied species extends in eastern Asia as far south as Japan. Its flowers and fruits are larger than those of the previous species

and its leaves are more like those of the elder. In the southern part of its range it is only occasional; in the northern, common. Both American species are frequently reduced to shrubs.

**MOUNTAIN BEAVER.** See SEWELLEL.

**MOUNTAIN BLACKSNAKE, MOCKING BIRD; PLOVER, SHEEP,** etc. See BLACKSNAKE; MOCKING-BIRD; PLOVER; SHEEP, etc.

**MOUNTAIN CLIMBING,** formerly regarded as exploration or adventure, now recognized as one of the harder outdoor sports. At first regarded as extremely perilous, mountain climbing or mountaineering now claims hundreds of thousands among its devotees. The effort, endurance and skill required by the sport are in themselves physical virtues which carry their own rewards. Far beyond this is the profound mental invigoration from association with nature in her most majestic phases and awe-inspiring moods. Mountain climbing may be properly viewed as of two distinct classes, according to the goal to be attained—the low mountains, or the high mountains. The ascent of the lower mountains like the White Mountains, the Adirondacks, or the Carolina mountains is a very common amusement for summer visitors in such regions, and demands no special adaptability. The slight rarefaction of the air at the elevation to which these summits reach do not seriously affect the untrained climber. But for elevations higher than 10,000 feet above the sea-level a special type of physical development is required, and as a rule a long and persistent cultivation becomes necessary. There are a few individuals who are naturally fit, possessing the requisite qualifications without preliminary training. They are of the class who have at sea-level a pulse beat below the normal—about 60 beats to the minute. This slow pulse will have risen to not more than 70 or 75 beats per minute at 10,000 feet elevation, while a normal pulse beat of 70 at sea-level will rise to 90 or 95 at 10,000 feet, with the consequent distress, requiring frequent and prolonged rests. But aside from this peculiar physical disposition other qualifications are needed to make a successful and exultant mountaineer—a delicate sense of balance, cool-headedness, fearlessness, imperturbability, besides superabundant muscular strength. The course of training to which an ambitious member of the British Alpine Club submits himself begins with rock and crag climbing among his home mountains; and then follow progressively the Swiss mountains, the Caucasus, the Southern Alps of New Zealand, the Siberian Atlas or the mountains of Chinese Turkestan, and last, the Himalayas. It is a fact, however, that several of the high Himalayas do not demand as much real climbing as mountains much lower, for in not a few cases mules may be taken in the Himalayas to heights of 18,000 to 20,000 feet, leaving comparatively little toil to the mountaineer. On the more rugged mountains the ascent of 3,000 feet elevation is regarded as a full day's work.

While there are several rumored ascents of mountains which have gained through repetition a certain historical position, it is generally accepted that the pioneer of mountaineering as it is understood to-day was Jacques Balmat, who, with Michel Paccard, at the instigation of

the scientist de Saussure, made the ascent of Mont Blanc in 1786. The following season Balmat piloted Professor de Saussure and a party safely to the same summit. Ascents of other Alpine peaks were soon recorded, but they were almost exclusively by explorers for scientific information. Amateurs began to become interested in the sport soon after 1850, and a party of English tourists succeeded in ascending Mont Blanc without a native guide in 1856. But the systematic and scientific climbing of mountains had its growth from the formation in 1857 of the first Alpine Club in London, which was organized to enlarge "the community of feeling among those who in the life of the High Alps have shared the same enjoyments, the same labors and the same dangers."

**Alpine Clubs.**—Alpine clubs and mountain-climbing societies have since been organized in nearly all continental countries. The European clubs and societies have an aggregate membership of over 120,000; the consolidated German and Austrian clubs having 75,000; Italian, 14,000; French, 6,000; and Swiss, 12,000.

**Climbing Records.**—The records of mountain climbers cover all nationalities and various years from Balmat (1787) to Dr. Stuck (1912). The highest point thus far climbed in foreign lands was 24,583 feet by the Duc d'Abruzzi in 1909 in his climb of Mount Bride in the Himalayas. He did not reach the summit, some 600 feet higher. Previous to this feat the record had been held by W. W. Graham, who in 1883 reached a height of 24,015 feet. In North America, the Duke of Abruzzi and his party reached a height of 18,024 feet on Mount Saint Elias in 1897. In South America, S. Vines climbed 22,860 feet to the summit of Aconcagua in the Andes in the same year. In 1903 Mrs. Workman accompanied her husband, Dr. W. H. Workman, to the summit of Lungma in the Himalayas, a height of 22,868 feet. In the United States the more recent notable ascents have been that of the South Peak of Mount McKinley on 7 June 1912 by Dr. Hudson Stuck and H. P. Karstens—a height of 20,300 feet; and that of Mount Blackburn (16,140 feet) by Miss Dora Keen on 19 May 1912.

The Bureau of Associated Mountaineering Clubs of North America was organized in May 1916 by nine clubs and societies. Seven more clubs joined the association during the year, and in 1917 the combined membership was about 12,000. The societies included in the association were:

The American Alpine Club, of Philadelphia and New York; the American Civic Association, of Washington, D. C.; Appalachian Mountain Club, of Boston and New York; British Columbia Mountaineering Club, of Vancouver; Colorado Mountain Club, of Denver; Explorers' Club, of New York; Fresh Air Club, of New York; Geographic Society, of Chicago; Geographical Society, of Philadelphia; Green Mountain Club, Inc., of Rutland, Vt.; Hawaiian Trail and Mountain Club, of Honolulu; The Mazamas, of Portland, Ore.; The Mountaineers, of Seattle; Prairie Club, of Chicago; Sierra Club, of San Francisco and Los Angeles; and the United States National Parks Service Club, of Washington, D. C. The Alpine Club, of Canada, while not a member, is affiliated with the association.

The object of the association is declared to

be to unify effort in the preservation of natural scenery, including also bird and animal life, trees and flowers; the creation and development of national parks and reservations; and the opening of mountainous regions with trails and shelters.

**Accidents.**—In the Alpine countries, thousands of Swiss, Italians and Tyrolese have become professional guides, and their skill exceeds that of the most scientific of learned Alpine club members. Hundreds of lives among both visitors and guides have been lost in the Alps, but this fact does not appear to deter thousands of others from making ascents each year. Accidents in mountain climbing rarely occur when guides are employed and reasonable precautions are taken. Occasionally a foothold seemingly secure gives way; but more frequently the fall occurs because the climber is overtired, or has started too quickly, without the necessary training. Over-exertion of either body or mind is always to be avoided. The use of the alpenstock and the ice-axe in mountain climbing, as well as general directions for making an ascent and descent, are fully set forth in a manual prepared under the auspices of the London Alpine Club, entitled 'Dent's Mountaineering.'

The bibliography of mountain climbing is very voluminous, and is eagerly sought after by a large number of persons debarred by physical inability from engaging in the rigorous exercise, but who are none the less ardent mountaineers at heart. The following named volumes are only the more prominent of those published in recent years. The extensive library of the American Alpine Club was recently placed in the custody of the New York Public Library, which compiled and printed a complete list of the books and pamphlets, to be had upon application.

**MOUNTAIN EBONY.** See BAUHINIA.

**MOUNTAIN-FEVER, or MOUNTAIN-SICKNESS.** The term mountain-fever was applied formerly to a fever accompanied by debility, diarrhea, etc., which occurred quite frequently (and now occurs occasionally) in the mountains, especially those in the western part of the United States. It is now generally conceded that this form of fever is essentially typhoid, modified by the effects of extreme altitude. The term mountain-sickness (sometimes used synonymously with mountain-fever) means a condition produced by the action of rarefied air upon organic functions, especially in persons who exercise considerably. The fact that the same symptoms are caused in persons who climb mountains to the height of several thousand feet and in those who ascend in balloons to twice as great a height is accounted for by the exhaustion caused by the climbing. The intake of oxygen is diminished in high altitudes; the pulse is quickened, and the body-temperature raised to 100°-101° F. Difficulty in breathing, headache, vertigo, nausea and vomiting are likely to occur. Hemoptysis is rare, although it is found in tuberculous patients who have sought health in the mountains. Rest and acclimatization are the remedies and oxygen has been given to offset the diminution of it in the air. It is also administered through the stomach in the shape of chlorate of potash, the aim being to keep up the normal constitution of the blood which at high altitudes is not so readily freed from carbon dioxide on account of the inadequacy of the lungs to exhale it.

**MOUNTAIN GOAT.** See ROCKY MOUNTAIN GOAT.

**MOUNTAIN LAUREL, or AMERICAN LAUREL,** a shrub of the genus *Kalmia* of the order *Ericaceæ*. The few species which are natives of North America and Cuba are mostly shrubby, evergreen and highly ornamental, especially when in flower, the blossoms being usually in terminals corymbs or axillary umbels, individually of medium size, white, pink or purple. On account of their beauty and

hardiness most of the species are very popular for planting in parks and private grounds even in the northern States and southern Canada. They do well in ordinary garden soil if not too clayey, but thrive best in peaty or sandy soil, particularly in partial shade. They require plenty of moisture and will do well even in marshy soil. The best known species is probably *K. latifolia*, most frequently known by the above names and also as calico-bush and rhododendron. It ranges from New Brunswick to Ohio and southward to Florida. Sheep-laurel (*K. angustifolia*), also known as wicky and lambkill, extends from Labrador southward to Georgia. These two species are the most conspicuous flowers in the Alleghany Mountains during the early summer. *K. polifolia*, also found in the East, is common in the Rocky Mountain region from Alaska to California. The deciduous species *K. hirsuta* and *cuneata* range southward from North Carolina. They are less planted in the north than the first two species.

**MOUNTAIN LIMESTONE**, a term commonly used in England of the stratum in southern England and Wales at the base of the carboniferous deposits. The phrase was also used for a time of the subcarboniferous limestones of American plains, but has now been dropped. It contains many fossils, especially crinoids and some important fossil fish. Its commercial value, apart from its being a bearer of lead and zinc ores, lies in its use as building stone, since it is capable of a high polish, and for the preparation of lime.

**MOUNTAIN LION.** See COUGAR.

**MOUNTAIN MAHOGANY**, the sweet or black birch. See BIRCH.

**MOUNTAIN MEADOWS MASSACRE**, in American history, a massacre of Western emigrants, near Mountain Meadows, Utah, in September 1857. The emigrants numbering 140 souls were on the way from Arkansas and Missouri to Southern California. While in camp in the valley of Mountain Meadows, in Washington County, they were attacked by Indians and it is alleged by Mormons disguised as Indians. They held their ground for three days, when under promise of protection by John D. Lee, a Mormon and Indian agent, they left their barricade of wagons; whereupon the attack was renewed and every person of the 140 slaughtered excepting 17 young children. These were distributed among Mormon families but were afterward restored to their relatives by the United States government. The Mormons have always been blamed for the massacre. Lee was executed for the order in 1877, but a number of his codefendants were acquitted. Lee in his confession asserted that the massacre was ordered by Brigham Young and other Mormons high in authority, but the facts are not certain. Consult 'Confessions of John D. Lee' (Saint Louis 1891); Bancroft, H. H., 'History of Utah' (San Francisco 1889); Linn, 'Story of the Mormons' (New York 1902).

**MOUNTAIN TEA.** See GAULTHERIA.

**MOUNTAINS.** A high elevation of land is called a mountain; a low elevation, a hill. The application of the term "mountain" varies in different localities. In the low lands, where

the elevations are not numerous, and do not reach a great height, a rise of ground of about 100 or 200 feet is called a mountain; while in a mountainous country an elevation of 1,000 feet, or less than 2,000 feet, is often called a hill. Prominent parts of mountains or isolated mountains are called *peaks*. Some of the common names applied to the parts of a peak, or mountain, are summit, base, slope, crest, pinnacle, needle, knob. A series of connected mountains form a *ridge, range* or *chain*; if the mountains extend a considerable length, the whole is called a range or chain; if short, a ridge. A group of parallel ridges or ranges, or of ridges or ranges near together, usually resultants from similar causes, is called a *mountain system*; and several systems combined form a *cordillera*. An elevation with a level-topped area of considerable extent is called a plateau and is usually associated with mountains. Many of the highest mountains of the world rise thousands of feet above the basal platform of the plateau. The *mesa* is a large level-topped section of the plateau; the *butte* is a small section. Valleys, lower land than plateaus, exist between the ridges, ranges or systems. A wide valley is often an *interior basin*. The interior basin area of Australia is over 51 per cent of the whole area; of Africa, 31 per cent; of North America, 32 per cent, and of Eurasia, 28 per cent. (See GREAT BASIN; VALLEYS). Low, narrow places in mountain ridges and chains are called *passes*. The depressions among the mountains contribute in a great measure to a solution of the causes which have determined the kind and location of the vast elevated land masses of the earth.

Mountains have been variously classified, but the following outline embraces most of the important classes which have been described.

1. **Folded Mountains.**—These make up the great mountain systems of the world, and usually consist of very thick sedimentary rocks which by lateral compression have been thrown into more or less closely compressed series of folds or flexures. When first folded, the up arches or anticlines constitute mountains, the troughs or synclines form valleys. Such a situation is found in the Jura Mountains, in Switzerland. In other cases the folds may have been completely worn away to a plain and uplifted. Erosion has then etched out the softer rocks, leaving the edges of the harder rock layers projecting. In such cases the ridges may be the syncline, the flanks of the fold, or the anticline, wherever the hard layer of rock may happen to be. This latter is the history of the Appalachian Mountains. Mountains are frequently regions of intense igneous activity, and the cores of ranges are often occupied by enormous bodies of granitic rock which have melted their way into the sediments, as in the case of the large batholith core of the Sierra Nevada Mountains, in California. The cause of the compression which produces such folds is by no means clear. By some it is attributed to the fact that the supposed molten interior of the earth cools and contracts and that as a result the crust, in accommodating itself to the smaller nucleus is forced to crumple. Others believe that great wedge shaped blocks of the earth's crust settle toward the centre, and so crowd one another that crumpling is produced

at the borders of the blocks. Whatever may be the cause, the fact remains that some enormous force causes lateral thrust, throwing the rocks into great folds and producing thus all the great mountain systems of the world. See FOLDS.

**2. Fault Mountains.**— Sometimes great breaks occur in the earth's crust, one side of the fracture dropping hundreds of feet, and leaving the elevated block as a mountain. Many of the ranges of western Utah and Nevada are of this origin. See FAULTS.

**3. Volcanic Mountains.**— Mountain ranges are rarely formed by volcanic action alone, but isolated peaks are often of this origin. Volcanic cones, great piles of lava and ash, form one type, of which Mount Shasta is one of our best-known examples. Recently formed cones are often beautifully symmetrical, as are those of Hood and Shasta. But as soon as activity ceases, denudation sets in, the cone becomes gashed with valleys, and in course of time only the harder central plug is left as a volcanic neck. Such plugs are common in the Puy region of central France, and the Mount Taylor region of New Mexico. Sometimes masses of igneous rock are intruded under sedimentary beds in the form of laccoliths (q.v.), arching up the beds to form elevations such as the Henry Mountains in Utah. Many regions of folded mountains also have numerous volcanic peaks, as in the case of Mount Hood and other cones on the folded Cascade Range. See BATHOLITHS; CONE; LACCOLITH; VOLCANO.

**4. Residual Mountains.**— When great areas are uplifted bodily without folding, they form plateaus. When such a plateau is greatly dissected, it becomes mountainous in topography, merely because some parts are not worn away as fast as others. These are residual mountains, or mountains of circumdenudation. The Allegheny plateau is a region of this type.

Whatever may be the cause which makes the uplift on the earth's surface, denudation begins as soon as the peak appears, and formation and destruction are conjoint agents in making the mountains what they are on the surface of the earth. Before the process of folding is completed the elements have begun their work of shaping and sculpturing, but the destructive agents at first work more slowly than the constructive. The chief agents of changes after formation are frost, wind and water. The position of a mountain gives some idea of its rock structure, and its rock structure and form tell something of its age. The presence of hard rock in a mountain is often shown by the upright peak whose faces may be comparatively bare, but which points up, resisting wind and water. Pike's Peak is granite rock. The White Mountains, N. H., have many hard rocky peaks; the Matterhorn, in the Alps, is a hard crystalline rock, and some of the Alaska peaks are examples of almost unyielding formations that appear to defy the ages. Remarkable examples of the sculpturing of the mountains by water are shown in the gorges in the Rocky Mountains, the removal of soft layers leaving the hard rocks standing like gigantic castellated ruins. The high, sharp pointed peaks and the irregular rugged surfaces indicate that the mountains are not among the oldest of the earth. The Adirondacks, with their low,

rounded tops, their comparatively uniform slopes, show that long periods have passed since their formation; erosion and weathering have removed much of the ruggedness and sharp angularities that once existed. Along the Atlantic Coast east of the Appalachian Mountains the low round hills are remnants of what were once high mountains. If given sufficient time, erosion will reduce the highest mountains to low featureless plains.

The mountains of the world are distributed with remarkable uniformity. The longest and highest ranges of North and South America face the Pacific Ocean, and extend almost due north and south. The longest and highest ranges of Eurasia extend nearly east and west. Starting from the highest plateau in the world, Pamir, in Asia, there are extending west, mountain ranges which are continuous through Europe to the Atlantic, and, also, with but few low depressions, along the eastern coast of Africa to Cape of Good Hope. Passing east from the plateau of Pamir are lofty mountain ranges extending to the northeastern part of Asia, which crossing to Alaska, unite with the great ranges which skirt the western coast of the Americas. The highest mountains in the world are the Himalayas; the highest peak, Mount Everest, is fully 29,000 feet high.

High mountains exist on the bed of the ocean. A number belonging to the submerged Atlantic continent have been located, and their elevation determined. Some of the most prominent are Mount Chaucer, located in 1850, in lat. 42° 50', long. 28° 50', crest 284 feet from the surface; Mount Sainthill, in lat. 42° 50', long. 42° 20', discovered in 1832, height about 11,000 feet. Another important submarine mountain is the Laura Ethel, discovered in 1878, its crest about 216 feet below the surface. A group of submarine mountains, in lat. 43°, long. 22° 30', has been named Edward the Seventh Range. Other Atlantic peaks are Tillotston, Bright, Placentia and some in lat. 45° and long. 48°. Mount Placentia is only about 30 feet below the surface.

The mountains of the world are the great depositaries for the world's mineral wealth. The large proportion of the valuable metals in general use in the world have been obtained from the mountains. This is probably due to the close relation between mountains and igneous activity. (See ORE DEPOSITS). Mountains affect the climate by protecting from cold winds or by preventing the ocean breezes from cooling the interior of countries in tropical regions, and by controlling in a great measure the rainfall. (See CONDENSATION). The flora and the fauna, so dependent upon climate, are modified greatly by the mountains. The elevations are the great water-reservoirs of the world; they store almost the whole supply of water which falls on the earth's solid surface and distribute it in channels throughout the land. Lakes and springs are common in mountains. These elevated land masses of the earth have been most important in determining the history of the world. They are natural boundaries, they have protected the weak from the strong, the civilized from the savage, and many sturdy, powerful races of to-day owe their early preservation in a great degree to the mighty natural barriers which stood between

them and a stronger and more ferocious race. The mountains of the world have affected the literature and art of the world, and these influences are still felt wherever a mountain uplifts its crest.

**MOUNTAINS OF THE MOON.** See MOON, MOUNTAINS OF THE.

**MOUNTED POLICE.** See POLICE.

**MOURNING.** In most nations from the earliest ages it has been the custom of bereaved persons to testify their grief for the loss of friends or relatives by some external change of dress and deportment. The eastern nations and the Greeks cut off their hair, the Romans allowed the beard and hair to grow, in mourning. Different colors have been adopted as badges of grief; the ancient Egyptians wore yellow; the Ethiopians, gray; the Roman and Spartan women, white, which is still the color of grief in China, Japan and Siam; in Turkey, blue and violet; and in the other European countries, black is used for this purpose. Some have attempted to trace the associations by which the colors acquired their character to natural causes; but it must be allowed, with little success. The Jews, in sign of grief at the loss of their relatives, rent their garments, tore out their hair and wore coarse garments of a dark color; they went barefoot, neglected their persons and performed other acts of penance. The term of mourning with them was from 7 to 30 days. Among the Greeks and Romans it was the custom to lay aside all ornaments of dress, to abstain from the bath and all indulgences. The kings of France mourned in violet. Among the ancients, as among the moderns, public mournings were common on the death of the sovereign or of a distinguished public benefactor. The period of mourning differs in different countries, but in all is generally regulated by the nearness of relationship between the survivors and the deceased. In Scotch law a widow has a claim to mournings for her husband where his estate or rank requires mourning in point of decency. Mournings for such of the deceased's children as are to be present at the funeral also form a privileged debt. In the United States the customary period of mourning for widows is one year.

**MOURNING-CLOAK.** A butterfly. See CAMBERWELL BEAUTY.

**MOURNING-DOVE.** See DOVE.

**MOUSCRON**, moos'krôn, Belgium, town in the province of West Flanders on the French border and located on the Ghent-Tournai and the Oudenarde-Mouscron railways, 32 miles distant from Ghent. It has a customs station, episcopal college, cotton and woolen goods factories, a brewery, etc. In 1910 it had 22,122 inhabitants.

**MOUSE**, a small rodent mammal of the family *Muridæ*, the larger members of which are called rats, hamsters, lemmings, voles (q.v.), etc.; specifically, the house-mouse (*Mus musculus*), originally Asiatic, but universally domesticated. The family is an extremely large one, embracing some 300 well-established species, and is distributed over the whole world except the islands of the Pacific. A mouse is the only native mammal of Australia besides the dingo (q.v.) not a marsupial. The members of this family vary in size from some smaller than a house-mouse to the bigness of the American muskrat (q.v.); and exhibit much diversity in form, especially in respect to the limbs, which in woodland and aquatic species are usually of nearly equal size, but in those that dwell on prairies and deserts are far from it, the hind-legs there becoming immensely enlarged and serving as almost the only means of safety (by leaps), while the fore-legs are of little use except as hands in holding the food. It is a characteristic of mice, as of squirrels, to lift the food to the mouth and gnaw it while the animal sits up on its haunches. The pollex (thumb) on the fore feet is a mere wart-like rudiment; but the hind feet have five full toes, and in some aquatic species these are connected by webs forming swimming feet. The skull is shapely, the nose is long, pointed, hairy, keenly sensitive to odors, and protected by remarkably long tactile hairs (whiskers); the eyes and ears are usually large, for these animals are mainly nocturnal in habits; and the teeth are peculiar in that the lower incisors are compressed and pointed, and the molars (usually three on each side) are rootless. The tail in nearly all rats and mice is long, always thinly haired, often naked or scaly, and in such aquatic species as the muskrat is compressed into a powerful sculling oar. Most species burrow or make their homes in holes; a few are arboreal. The nearest relatives of the group are the dormice, mole-rats, jerboas and pouched rats or gophers, a list which shows that the word "mouse" and "rat" is popularly applied to many small rodents outside the *Muridæ*. This family is divisible into 10 sections — *Murina*, or typical Old-World mice; *Hydromyina*; *Phyncomyina*; *Gerbillina*; *Otomyina*; *Dendromyina*; *Lophomyina*; *Microtina*, or voles; *Sigmodontina*, or hamsters; and *Neotomina*.

The first sub-family contains the various rats (q.v.), the house-mouse, the delicate harvest-mouse and more than 100 other species of Europe and Asia, which agree in having wide upper molars marked by three series of tubercles and in other distinctive peculiarities. The house-mouse has been a denizen of men's habitations probably ever since housekeeping began, finding there safety from many natural enemies, opportunities and materials for nest-making, and plentiful daily food. It accompanies mankind wherever he goes, and soon replaces in frontier houses the local wild mice which for a time attempt to imitate its domestic habits. These mice are about three inches long, the tail measuring one and one-half inches more. The general color is bluish or dusky brown, but is subject to variation and influenced by climate, food and other external conditions. Albino or "white" mice, with pink eyes, are kept as pets, also black and piebald ones; and these breeds

are easily maintained by selective breeding. Such pets are readily tamed and taught simple tricks. Certain individuals, known as "singing mice," make, especially at night, a pleasing whistling noise, like feeble chirpings of a canary-bird. The same sound has been heard from wild-mice, and is believed to result from an asthmatic condition rather than to be a normal musical utterance. The fecundity of mice is excessive. From six to ten young are produced in a litter, and this species brings forth several times in the year. In about a fortnight the young are able to shift for themselves, although born in a helpless condition. This illustrates how sometimes, under especially favorable conditions, mice may multiply far beyond normal numbers and overrun the country as a devastating plague, instances of which are mentioned under FIELD MOUSE. The two most common European types, the long-tailed brown field-mouse (*M. sylvaticus*) and the diminutive harvest-mouse (*M. minutus*) are farmers' pests, destroying large quantities of grain. The harvest-mouse is one of the smallest of mammals and constructs a beautiful and elegant little nest of the blades of grass or corn, entwined round and supported by the stalks of the corn or wheat. A similar smaller species in South Africa weighs only a quarter of an ounce. These out-door species hibernate during winter and lay up an autumnal store of grain in their nests and burrows—a matter in which great diversity of habit exists elsewhere in the family.

American native mice are all of one or the other of the remaining sub-families, or else do not belong to the *Muridæ* at all. The short-tailed meadow-mice (see FIELD-MOUSE), the neotomas (see WOOD-RAT), lemmings (q.v.), and their allies are elsewhere described. The most of our smaller mice belong to the sub-family *Sigmodontina*, characterized prominently by having cheek-pouches, and represented in the Old World by the hamsters. Five genera and about 75 so-called species have been catalogued, but probably further study will greatly reduce the number. *Onychomys* is a rather short-tailed, fossorial genus of the plains region and northern Mexico. *Sigmodon* is another genus of Florida and the Southwest, taking its name from the sigmoid form of the cusps of the molars; *Reithrodontomys* embraces several very small burrowing brown mice of the same region; and *Oryzomys* includes the large, handsome "rice-field mouse" of the Southern States (*O. palustris*). The fifth genus, *Peromyscus*, contains the most numerous and familiar of the long-tailed field-mice. These are the "wood-mice," "deer-mice" and "cotton-mice," more familiar under the old name *Hesperomys*, and commonly represented by the white-footed mouse (*P. americanus*, or *H. leucopus*), which occurs all over the more temperate parts of the continent. This species is somewhat larger than the house-mouse, and is yellowish brown above, darker on the back, the lower parts of the body and tail and the upper surface of the feet white; the young are dark slaty; the eyes and ears are large, and the fur long and soft. It is nocturnal in its habits, as active as a squirrel, nesting in trees, in the fields, in barns and houses, and making a dwelling resembling a covered bird's nest; it feeds principally on grain, seeds, nuts and insects; and in newly

settled districts comes into dwellings and granaries and is as mischievous as the house-mouse. Species with similar habits are a beautiful golden-haired southern one (*P. aureolus*); the large, dark-brown, gray-bellied cotton-mouse (*P. gossypinus*), very numerous in the South Atlantic States; the "red-backed" or Michigan mouse (*P. michiganensis*) of the North Central States, and several others.

ERNEST INGERSOLL.

**MOUSE-BIRDS**, a group of peculiar birds of central Africa, constituting the family *Coliidae* and the suborder *Colii*, and also known as colies. They are of small size, grayish colors, marked with darker tints and in some species with touches of brighter colors; have finchlike beaks, crests, short, weak wings, very long tails and remarkably strong feet. They are active, but fly little, spending their lives mostly in creeping about the branches of trees in a way that with their dun colors strongly suggests the behavior of mice. They are fond of hanging head downward, and at night gather in bands that roost together in hanging postures as closely as they can crowd. Their food consists mainly of fruit; and they place their cup-shaped nests in low trees and bushes.

**MOUSE-DEER.** See CHEVROTAIN.

**MOUSE-EAR**, the name of various small plants, suggested by the shape and appearance of the leaves: (1) a borage of the genus *Myosotis*, more generally known in the United States as "forget-me-not" or sometimes "scorpion-grass," small furry herbs, growing in damp and shady places through the temperate regions and bearing clusters of minute blue and white, "yellow-eyed" flowers. (2) The marsh cudweed or wartwort (*Gnaphalium uliginosum*). (See CUDWEED). (3) One of the wound-worts (*Stachys germanica*). (4) Any of several chickweeds (q.v.), especially the widely scattered *Cerastium viscosum*. (5) The cats-foot, or plaitain-leaved everlasting (*Antennaria plantaginifolia*). (6) A European hawkweed (*Hieracium pilosella*). (7) The cruciferous plant *Sisymbrium Thaliana*.

**MOUSE-LEMURS.** See CHIROGALE; LEMUR.

**MOUSTERIAN STAGE**, a period in the history of Paleolithic man in southwestern Europe when men had made considerable advancement in the arts of working in flint and other stones, and in the graphic arts. See STONE AGE.

**MOUTH** (oral or buccal cavity), primarily the nearly oval cavity at the commencement of the alimentary canal or digestive tract, into which food is taken, and from which the voice issues. In humans the mouth is the source of much gratification of the unconscious libido (q.v.) in children, a remnant of the nursing days; and in adults for this reason, the habit

MICE

4 Jerboas  
5 House Mouse  
6 Brown Rat

of taking into the mouth, or chewing anything not food is to be regarded as a survival into later days of a characteristically infantile trait. A possible exception to this is kissing which is customarily retained in most civilized races as an expression of affection.

**MOUTH, Diseases of the.** The principal diseases of the mouth may be classified as follows: Inflammation of the mucous membrane and its results; epulis, gumboil, ranula, salivary calculus and salivary fistula.

**Inflammation of the Mouth (Stomatitis).**—This disorder is usually caused by local irritants, such as scalding drinks, corrosive substances, jagged teeth or tartar. Suitable remedies are: Cooling and demulcent washes, soft food, building up of the strength and removal of tartar or other sources of irritation. Inflammation invading the mucous follicles, usually in debilitated children or from the irritation of teeth or as the result of an eruption (herpes) is follicular stomatitis. It is attended with thin spots of white exudation, but there is no breach in the surface of the mucous membrane. The patient swallows with difficulty; the mouth is hot and tender; the submaxillary glands may be swollen. The remedies are as above given, with the addition of a disinfectant to the mouth-washes. The terms aphthæ and thrush (q.v.) are given to a stomatitis, usually follicular, attended by curd-like exudations with ulceration beneath the exudates (ulcerative stomatitis). The disease may be conveyed to the nipples of the nursing woman. In true aphthæ the exudations are due to a microscopic fungus, the *Oidium albicans*. In treatment the child is to be carefully fed, its mouth kept clean and disinfected and the bowels regulated. Borax or tincture of myrrh, well diluted, is a good mouth-wash. Do not use honey. Canker refers to isolated superficial ulcerations of the mucous membrane, usually the result of debility and dyspepsia. Remedy these two conditions and touch the spots occasionally with nitrate of silver. Gangrenous stomatitis (noma) or cancrum oris means a more or less sloughing ulceration, usually upon the gums or cheeks. The breath is fetid; there is great swelling with soreness, high fever, marked debility, etc. It may follow measles or some other debilitating blood-disease. The treatment requires a physician.

**Epulis.**—This is a smooth round or lobular tumor springing from some portion of the alveolar processes and the periosteum covering them, usually from the lower jaw. It is more frequent in women, and may be caused by irritation from decayed teeth.

**Gumboil.**—The gum-disease so named is a circumscribed inflammation of the mucous membrane or of the periosteum covering a portion of an alveolar process, caused usually by a decayed tooth. Wash the mouth frequently with hot water, have the boil lanced or cause it to discharge by applications of hot figs (boiled in milk) and have sources of irritation removed.

**Ranula.**—This term denotes a cystic formation in the mucous membrane beneath the tongue, sometimes originating in the duct of a sub-lingual or submaxillary gland. It is either congenital or acquired. Treatment consists in the excision of the cyst, generally through the

mouth and rarely through an incision under the jaw.

**Salivary Calculus.**—Such is the name given to a concretion, mainly of phosphate of lime, formed in the duct of one of the salivary glands, but rarely in the glands themselves. Sometimes it forms around a foreign body, such as a seed or a bit of food or tartar, and sometimes produces a ranula.

**Salivary Fistula.**—A fistula of this character is an abnormal canal opening upon the cheek, and arising from the duct of the parotid gland as the result of ulceration.

**MOUTON**, moo-tōn', Alexander, American politician: b. Bayou Carencro, La., 19 Nov. 1804; d. near Lafayette, La., 12 Feb. 1885. He was graduated from Georgetown College, District of Columbia, and in 1825 was admitted to the bar. He was elected to the State legislature in 1826 and in 1831–32 he was speaker. He was presidential elector in 1828, 1832 and 1836, and was elected to the United States Senate in 1837. He was governor of Louisiana in 1843–46, and later presided over various conventions, but retired to plantation life at the outbreak of the Rebellion in 1861, upon failing to be elected to the Confederate senate.

**MOVABLE BRIDGES.** See BRIDGE CONSTRUCTION, MODERN METHODS OF.

**MOVEMENT-CURE.** See SWEDISH MOVEMENT CURE.

**MOVILLE**, Ireland, town and seaport in the county of Donegal, at the mouth of Loch Foyle. It is a port of call for the Glasgow-New York steamers of the Anchor and Allan lines, as well as a favorite bathing resort. Pop. 1,016.

**MOVING PICTURES** are produced by lantern projection on a screen, of a series of pictures in such rapid succession that the eye sees them as one continuous representation. The possibility of such pictures depends upon what might be considered a defect of the human eye, known as the "persistence of vision"—the technical name for the lingering on the retina of an impression received, after the excitation which produced the impression has passed. This lingering of the impression is sufficiently long to tide over the gap of one-sixtieth to one-eightieth of a second during which there is no picture on the screen. So that if the mechanism of human vision was perfect the illusion of the moving picture would be impossible.

It has been determined by experiment that the duration of the persistence of vision averages one-fiftieth of a second and it was calculated that 14 pictures per second would be needed to produce a continuous impression upon the eye—assuming each picture to occupy the screen for three-fourths of its allotted share of the second, the other fourth being the gap of darkness while the film was moving forward to the next picture. With the improvement of the exhibiting mechanism, however, the number of pictures per second was increased to 16, the length of time each is on the screen being one-twentieth of a second, and the dark gap between being reduced to one-eighth of a second. In this way the presentation has been made much smoother and the former unpleasant flickering eliminated.

The fact that moving pictures are projected on a screen by means of an optical lantern (q.v.) has already been referred to. This lantern with the film moving mechanism is called the kinetoscope or kinetograph (and numerous other names). The lantern part is of the same general type as the magic lantern, being equipped with a brilliant light (usually the electric arc) and a projection lens by which the image is enlarged upon a screen. The moving-picture lantern, however, is a very highly complicated apparatus as compared with the magic lantern, for, instead of the simple lantern-slide pushed into place in the field of the lens of the latter and left there as long as desired, the kinetograph mechanism must bring its long series of thousands of pictures one by one into place with the most exquisite accuracy, opening the shutter when the picture is ready and closing it while another is being moved into place, and all at a speed so rapid that the human eye is unable to follow the motion.

One of the requirements arising from this great rapidity of movement is that the individual pictures must be very small—a large picture could not be moved fast enough without the destruction of the film on which the pictures are carried. These physical conditions have resulted in fixing the workable size of the kinematograph pictures at one inch in length by three-fourths of an inch in height. The magnification of this little picture on the screen is therefore about 10,000 times its original area—which suggests the extreme perfection in the picture itself as well as in the projection apparatus. These little pictures are arranged continuously one above another on a strip of perfectly transparent horny material resembling celluloid. The strip is one and three-sixteenths of an inch in width and may be any length desired—generally ranging from 120 feet to 1,000 feet. The pictures occupy the centre of the strip and in the margins on both sides are square-cut perforations by which the movement of the strip in the lantern is accomplished through sprocket wheels and hooks.

The pictures themselves are produced by photography, on a coating of sensitized gelatine spread upon the strip of film, and the pictures are photographic positives printed from negatives on a similar strip made in a special moving-picture camera which will be briefly described farther on in this article. For exhibition with the lantern the film is rolled on a spool or reel and fed in a loose loop by a series of sprocket wheels and idlers to the "gate," as it is called, through which the light passes to the screen. The gate carries a mask which cuts down the size of the picture actually illuminated and projected to fifteen-sixteenths of an inch in length and eleven-sixteenths of an inch in width. The film is pressed against this mask firmly but gently by delicately acting springs. The movement of the film is downward through the gate and is accomplished by a pair of hooks just below the gate, framed together so that they will accurately engage the perforations in the margin of the film, one hook of the pair on each edge of the film. These hooks are operated by a revolving cam which causes them to move forward into the perforations; then to move downward, pulling the film with them

just the height of one picture; then to move backward out of the perforations, and then upward to their first position. The cam is so fixed that the pull downward on the film occupies about one-fifth of the complete cycle of the movement of the hooks. During that period of one-fifth of the time allotted to one picture—one-sixteenth of a second—the shutter which revolves in front of the projection lens shuts off the light from the screen for the eightieth of a second; when, the next picture being in position, the shutter allows the light to pass to the screen for four-eighths of a second—the entire operation being repeated for the next picture. And thus the operation goes on, 16 times per second until the film has all been run. As the pictures run 16 to the foot of film, a short film of 120 feet, containing 1,920 individual pictures, will be run off in two minutes. A 1,000-foot film, with 16,000 individual pictures, will occupy nearly 17 minutes. As the film which has been shown passes the hooks it is gathered by sprocket wheels and passed to a receiving reel on which it is wound for storage and from which it must be rewound before it is in proper order for another exhibition. The entire mechanism of the lantern is operated by the handle turned by the operator. In some instances electricity has been used in place of hand power, but the latter is relied on in the great majority of cases. Fig. 1 shows the relative arrangement of the carbons, the condensing system of lenses, the gate with the film passing downward through it from the full reel box to the empty one, propelled by the sprocket wheels. The projecting lens is shown between the reels. The drawing is skeletonized in order to show simply the essentials of the moving picture lantern.

FIG. 1.—Sectional Diagram of the Film Moving Mechanism and the Lens Systems of the Moving Picture Lantern.

A comparatively recent contribution to the steadiness of the picture on the screen is the narrow, transparent violet vane placed on the shutter frame opposite the opaque sector. In spite of the brevity of the dark gap there was a certain letting down of brilliancy noticeable to the eye toward the close of the dark gap which was emphasized when the light came on again in full force, and these closely following contrasts proved very tiring to the sight. The violet vane, by cutting into the high brilliancy,

**POWER'S CAMERAGRAPH, WITH MOTOR DRIVE**

reduces the representation to a slightly lower but more uniform illumination. Other important accessories of the lantern are the heat screens, which stop a large proportion of the intense heat rays inherent in the condensed light from reaching the film and injuring the pictures. One ingenious device provides for the complete intercepting of the light and its contained heat unless the film is passing through the gate at a speed sufficient to protect it. Another closes this "fire shutter," as it is called, instantly in case the film breaks.

When all is said, however, the exhibition of moving pictures is simplicity itself as compared

seem to vie one with another to thwart the design of the camera man.

The camera which has been designed to overcome all these external difficulties and many others peculiar to moving-picture work is a marvel of ingenious adaptation and mechanical skill.

Of supreme importance in the kinetograph camera is the lens, which is so designed as to admit the largest amount of light consistent with sharpness of definition and with the shortest practicable focus. The factors of the lenses usually employed in taking moving pictures are for the focal length, 2 to 3 inches and for the

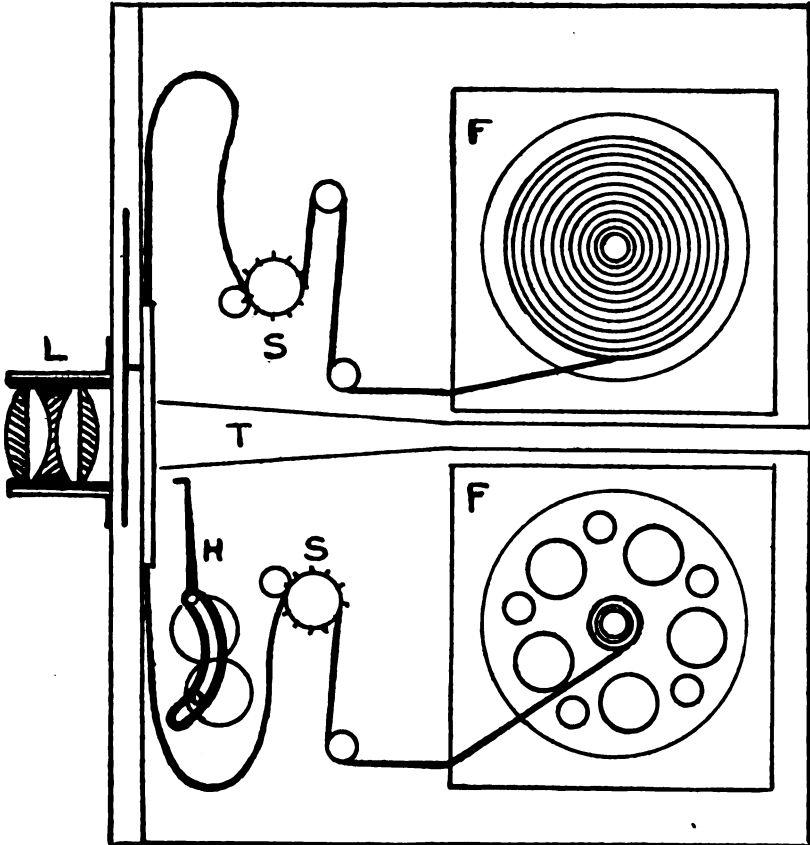

FIG. 2. — Sectional Diagram of the Moving Picture Camera.

with the intricacies of making them in the first place. The processes of photography in any case require for success an extreme nicety of adjustment of many factors. It is a praiseworthy feat to secure a single excellent "snapshot." The task of the moving-picture photographer is to take thousands of pictures of such uniformity as to appear one continuous view, and of such excellence in definition and depth of focus as to be capable of magnification 10,000 times and still be satisfactorily sharp and clear. And all this is to be done often where the lighting is beyond control, where the only available position for the camera is one that no photographer would willingly choose, and where swarming crowds of bystanders

working aperture  $f/3.8$  to  $f/3.1$ . One prominent lens house has produced a lens of  $3\frac{3}{4}$ -inch focus and a working aperture of  $f/1.9$ , with which have been made some very successful films under the most adverse conditions of lighting. It is not to be understood that the lens is habitually used at its full aperture. This is the rule only in extreme cases of under-lighting. The usual aperture employed in good light is  $f/16$ . Next in importance to the lens is the shutter which must be capable of adjustment with the utmost nicety to control the length of time the light transmitted by the lens is to act on the sensitive film. The shutter makes one revolution for each picture taken, that is, ordinarily, one-sixteenth of a second.

The larger part of the disc of the shutter is opaque, one section being cut away to admit the light to the film as it passes the gate. This cut-away sector is adjustable in size of opening, so that for quickly-moving subjects the actual time of exposure may be reduced to a very small fraction of a second. With moving pictures, however, extreme sharpness of the subjects in motion is not a necessity, a slight blurring being rather an aid to the general optical illusion.

The interior of the camera otherwise resembles in fittings the exhibition lantern, except that everything about it is in light-tight compartments. A large reel carries the sensitive film before it is exposed and another takes it up afterward. The hook contrivance for moving the film at the gate and the arrangement of sprocket wheels and idlers to keep it in motion are practically the same, and the entire mechanism is worked by the crank turned by the camera man. Fig. 2 shows the actuating mechanism which operates the film, without the gear-wheels which connect it with the driving crank. F, F, represent the film cases, the upper one full of new film. The sprocket wheels, S, S, turn so as to keep the film in loops with no strain on the hook H. L is the lens with the pivoted shutter behind it and T is the focusing tube. Other devices, however, are attached to the head of the heavy tripod which carries the camera while it is being operated. There is a gearing which swings the camera around slowly on a horizontal plane, and so enables the camera man to make a panoramic view or to follow a moving subject with his lens. A finder at the side of the camera gives him continually the exact view which is being impressed upon his moving film. For a view which lies above or below the plane on which the camera is standing there is a tilting device by which the horizon of the picture is kept in a level position. Both of these movements are made by cranks at the left of the operator and turned with his left hand.

In making usual exposures the exposing crank is turned steadily and with skilled uniformity 120 times a minute, each turn of the crank making eight exposures on the film. The exposed film is removed from the camera in the dark room and wound upon a "pin frame." This is a square frame, generally of brass, with diagonal and semi-diagonal spokes radiating from the centre, each studded with pins slightly longer than the width of the film. Starting at the centre of the frame the film is wound around and around in an ever-widening spiral which offers free play between the coils for the developer. Before compounding the developer a test is made upon a few inches of film clipped from one end, and according to this test the developer is prepared with such developing agents as promise the best results. The developing agents usually employed are metol and hydroquinone in combination. Glycin and eikonogen are also used. The pin frames with their coils of film are immersed edgewise in an upright bath. The development aimed at is one that will give the widest contrast of highest light and deepest shadow, with a full range of intermediate values in soft gradations. Hydroquinone is depended on to give the first quality and metol the second. When thoroughly fixed

and washed the negative is wound upon a large revolving drum to dry.

The positive film used in the exhibiting lantern is made from the negative by a photographic printing process. This positive film is perforated exactly like the negative film, but is coated with a much slower emulsion and contains a larger proportion of silver chloride salts, so that the development of the positive produces blacks of greater opacity, yielding pictures of more contrast and brilliancy. The negative and the unexposed positive film are placed face to face, the perforations matching, in the printing camera and are pulled downward together by the hook mechanism through a gate, in front of which is an artificial light, commonly an incandescent electric lamp. A revolving shutter at the gate cuts out the light while the film is being moved and makes the exposure while it is stationary, at the rate of from five to eight exposures per second; and this is kept up until the negative film has all been printed. Another reel of positive film may then be attached and another printing made—and so on for as many positives of that subject as are required. It is to be noted in passing that no two negatives can be relied on to require exactly the same amount of light in printing. Skilled judgment must determine the speed and opening of the shutter which will produce the best results.

The development of the positive film is conducted in exactly the same fashion as with the negative film, but the light used is much stronger. An orange light is perfectly safe with a positive film. The progress of the development is closely watched by examination before the light, and the process is stopped when the necessary density is obtained—a matter to be determined by the trained judgment of the operator. The film is then rinsed, fixed and hardened and washed absolutely free of hypo before drying. There may be, if desired, further treatment by tinting or toning to produce certain scenic effects. In tinting the whole film is passed bodily through a bath of some dye which imparts its color to the gelatine pellicle, but does not alter the black of the silver deposit. For example, a blue hue is given for a moonlight effect, pink for sunrise; yellow-brown for lamplight; red for firelight, etc. In toning the silver deposit itself is chemically changed in color, the clear part of the film remaining unchanged. Some beautiful effects in sepia, green, indigo, etc., are thus produced.

The greater part of the films produced and exhibited at the present time are those which along with a large number of comic and delineate what might be called picture-stories. farcical subjects there are pretentious pantomimic plays—of the type known as "photoplays" (q.v.). Some of these have engaged the talents of actors and actresses in the front rank of their profession. In addition to these presentations of theatrical proportions, vast imaginative and historical pageantries have been "staged" out of doors, with thousands of performers and a wealth of artificial scenic accessories running in value to many thousands of dollars—all to produce the one master negative. In not a few cases whole companies of performers have been transported to some far-distant locality in order to secure the appro-

priate "local color" for the film-play. The moving-picture mechanism lends itself readily to an endless variety of trick pictures, through the facility with which a film may be cut and joined to another set of pictures, showing no break on the screen. For example, a magician may be seen to touch the "villian" with his wand, and instantly he becomes a mammoth wriggling caterpillar—through the simple joining of the two distinct films. As films may be run backward as well as forward the most remarkable extravaganzas may be produced. A wall may be seen to build itself from a pile of bricks—the picture actually taken having been the demolition of the wall. A picture of a man climbing down a fire-escape rope may be shown on the screen as one climbing up the rope.

While the majority of films are made for purposes of entertainment, the moving picture has an extensive use in the commercial world by salesmen of machinery and mechanical appliances, who are thus enabled to show their products at work in any part of the country where they may fill a need. Much educational work has been done with the aid of the films; manufacturers have used them to display fashions in dress; social organizations for the spread of their peculiar propagandas; and charitable institutions to arouse interest in their work. In scientific research it has also played a large part. The combination of the microscope and the moving picture camera has revealed an entirely new field of interest in the invisible world. The growth of plants has been studied by a series of exposures lasting over several weeks in the opening of a flower, and covering months in the growth of a stalk of corn. In securing these films the exposures are not made continuously as in ordinary camera work. In the case of the corn, which may take 90 days to mature, the separate exposures are made at such intervals as to give a film of perhaps 2,880 pictures in all, which will occupy the screen for just three minutes in its exhibition. The telephoto lens has also been combined with the moving picture apparatus, permitting pictures to be taken at a distance from the subject. Thus the actions of wild birds and animals have been recorded. Some of the most interesting films have shown the emerging of the butterfly from its chrysalis; the silkworm spinning its cocoon; a snake shedding its skin; a war of enemy tribes of ants; and many such incidents.

A very important application of the moving picture idea is the study of the movements of highly skilled mechanics at their work, particularly in factories. A tiny electric light is attached to the hand, or other moving part, and its trace on the moving picture film affords a diagram from which wire forms or guides are constructed. Unskilled workmen are taught by these forms to learn the motion which gives greatest efficiency in production. The introduction of a clock into the picture permits the measurement of the actual time consumed in making each movement or part of a movement, with the accuracy of one-millionth part of an hour. The moving picture camera has also been used to study the movements of expert typewriters and piano players. In surgery it is used to observe defective or abnormal motions after operations; and the makers of artificial limbs

use it to secure the nearest possible counterfeit of the normal movements of sound members.

The moving picture business has settled into a triplex organization: (1) the producers of the picture films; (2) the exchanges, or distributing middlemen; (3) the exhibitors. In the United States in 1915 there were 248 firms and studios registered as film producers; 1,364 exchanges; and 15,046 exhibiting houses of all types. The recent tendencies have been toward the combinations of the larger producing companies, and the establishment of the new combines of branch houses throughout the country, acting as distribution centres. And many of the former middlemen have become producers on a small scale.

Figures as to the attendance at the moving picture theatres cannot be given with any degree of accuracy. The number of the smaller houses, those seating about 300, is constantly diminishing, but the continued building of larger houses keeps the seating capacity about the same as in the days of the multitudinous "nickelodeon." It is officially reported (for purposes of taxation) that the gross annual income of the moving picture theatres aggregates \$275,000,000.

A considerable factor in the business of producing films is the large export trade. In spite of the many difficulties in such traffic on account of the war, the high-water mark in film exportation was reached in 1916, when 136,141,137 feet of film pictures, valued at \$6,051,031, were sent abroad.

RICHARD FERRIS,

*Editorial Staff of The Americana.*

#### MOVING PICTURES, Censorship of.

Since the beginning of the 20th century the development of the film-drama, or moving picture, has revolutionized amusements in America. With low prices, the attendance has become enormous, and the influence upon society is more portentous than either that of the church or the spoken drama. For millions of people the moving-picture supplies the place of sermons, books, pictures and travel. In the early years of its development the selection of subjects for presentation was made by the proprietors, who were not averse to presenting horrible crimes and indecent scenes.

The early film dramas were very simple and very crude from a dramatic viewpoint. They were followed by plays of some depth dealing with the questions of the day. These were followed in turn by plays showing the features and ramifications of the white-slave traffic, drug addicts, robberies, etc. Many of these failed utterly to teach the moral lesson which could be the only excuse offered for their presenta-

tion; on the contrary, competent authorities pointed out the grave dangers inherent in such crude, bold presentations of depravity and crime. The evil became so great that a private society in New York looked into the matter and after consultation with the producers of films persuaded them that the approval of a board of censors would enhance the demand for a film.

In 1909, therefore, was organized the National Board of Censorship (now the National Board of Review) in New York City at the demand of many exhibitors of films. This board was a voluntary group from the Peoples' Institute. No member had any financial or other connection with the moving-picture business, being drawn instead from professional and business men and women, social workers and others interested in civic and social betterment. The members serve without compensation; there is, however, a paid secretary and clerical staff. Over 100 members serve on the censoring committee, and on an average review 25 films, averaging 5,000 feet, each day, and requiring, if exhibited successively on one machine, 41 hours and 40 minutes for presentation. The film is viewed by one or more members of the censoring committee of the board in the producer's studio, after which the film is approved *in toto* or recommendations are made in regard to certain scenes, which are thereafter eliminated altogether or revised so as to remove the objectionable features pointed out by the reviewers. At the end of every film so reviewed there is attached the legend "Passed by the National Board of Review." Its work in the years following its organization proved so successful that exhibitors the country over highly appreciated it and the board increased its scope, soon becoming national in extent, increasing its control over the film output in all parts of the United States and co-operating with small local boards in various cities. Its work at present is so organized that it passes upon over 95 per cent of all films produced, and of this amount about 90 per cent receive the board's immediate approval. The board is unofficial and merely recommends changes or alterations deemed desirable in a film, but it possesses no legal power to enforce its recommendations. The necessity for a board with broader powers has influenced several States to pass legislation to this end, but in every case the constitutionality of such legislation has been questioned, its opponents maintaining that censorship is un-American, and the aims of such legislation are secured by the ordinary police power governing public morals, etc.

The work of the national board, however, has given fairly satisfactory results, its uniform system of passing upon photo-dramas giving it a decided advantage over local boards or State commissions, the latter seldom working in harmony. The need for a Federal board with broad powers has been emphasized in recent years, and certain parties have carried on an agitation with a view of securing Federal legislation for its creation. An attempt of this kind in 1915 met with signal failure. Producers and exhibitors have maintained a firm front of opposition against censorship of any kind, on the ground, as stated above for the local bodies, that the police and municipal authorities are already possessed of

adequate powers to deal with questionable or immoral plays. Among the churches, the Roman Catholic has instituted a board which publishes regularly a list of approved photo-plays, condemning the baser kind by silence. In many cities ordinances are in force requiring the license of moving-picture houses and empowering the police or municipal authorities to close such houses as continue to exhibit pictures which have been condemned by the board of censors. On 31 July 1912 an act of Congress was passed prohibiting the interstate transportation of films representing prize fights. The license plan has so far proved inadequate to protect public morals and many cities are following the example of Chicago, where the chief of police appoints a committee which passes on all films shown in that city.

**MOVING PLANT**, an East Indian leguminous plant (*Desmodium gyrans*), remarkable for the motions of its pinnate leaves. The large terminal leaflet becomes more or less horizontal under the influence of light and heat, and is depressed during darkness or cold. Besides the movement of rising and falling, it has also a lateral oscillatory motion with a period of two to four minutes, so as to occupy an oblique position relative to the leaf-stalk. The smaller lateral leaflets, of which there are one or two pairs, also exhibit jerking movements, approaching and retiring from each other, and these motions proceed to a limited extent during darkness. Gray describes 20 species of *Desmodium* in the flora of the United States, without mentioning that any of them exhibit such movements.

**MOWAT**, Sir Oliver, Canadian statesman: b. Kingston, Ontario, 22 July 1820; d. Toronto, 19 April 1903. He was educated in Kingston and Toronto, studied law in Kingston and began practice in that city, afterward moving to Toronto. He took high rank in his profession, especially as an equity lawyer. In 1856 he was appointed Queen's Counsel, and from that date until 1859 he served as a member of a commission appointed to revise and consolidate the statutes of Canada and Upper Canada. From 1857 to 1864 he was in the legislative assembly of United Canada, and in 1858 was provincial secretary. In 1863-64 he was postmaster-general, and in the latter year he served in the Quebec Conference, as one of the Fathers of Confederation from Upper Canada. From 1864 to 1872 he was vice-chancellor of Upper Canada, in the latter year, on the urgent solicitation of the Liberal leaders in the province, retiring from the bench to re-enter political life. From that date until 1896 he was premier of Ontario, holding office with conspicuous ability for 24 consecutive years. In his first session (1873) he passed the Municipal Loan Fund Act, which put an end to the financial muddle caused by frenzied municipal aids to railway construction at an earlier period. To him is largely due the credit of the revision and codification of the provincial laws, embodied in 'The Revised Statutes of Ontario, 1877.' He was brought into conflict with Sir John A. Macdonald on the question of provincial autonomy, Mowat regarding the provincial legislature as sovereign within its own sphere, and his reading of the British North America Act was in this connection borne out on repeated occasions by the

Imperial Privy Council, notably in the Ontario boundary dispute. In 1896 he entered the Laurier ministry as Minister of Justice, and was president of the senate. In 1897 he was appointed lieutenant-governor of Ontario. Altogether, Mowat gave 45 years to the public service. He was created K.C.M.G. in 1892. Consult Biggar's 'Life of Sir Oliver Mowat' (2 vols., Toronto 1905).

**MOWATT, Anna Cora.** See RITCHIE, ANNA CORA OGDEN MOWATT.

**MOWBRAY, mō'brā, George W.,** American inventor: b. Lewes, England, 1815; d. North Adams, Mass., 21 June 1891. He studied chemistry in England, came to America in 1853, worked in the California gold-mines until 1858, in the Pennsylvania oil-country until 1868, and then at North Adams, where he perfected the commercial use of nitroglycerin, and invented a smokeless powder. He was consulting chemist to the Maxim and Nordenfelt Arms Company.

**MOWBRAY, Henry Siddons,** American artist: b. Alexandria, Egypt, 1858. He was brought to the United States in early childhood and educated in North Adams, Mass. He studied one year at West Point. In 1878 he entered the studio of Bonnat, Paris, and subsequently settled in New York as a figure painter and decorator. He is a member of the Society of American Artists, was the first director of the American Academy at Rome, and was elected a National Academician in 1891. He is especially noted for his mural decorations in the library of the University Club, New York, and elsewhere. He was awarded the Clark prize by the National Academy in 1888.

**MOWBRAY, J. P.,** a pseudonym of Andrew Carpenter Wheeler. See WHEELER, A. C.

**MOWER, Charles Drown,** naval architect: b. Lynn, Mass., 5 Oct. 1875; educated in the Lynn public schools. After serving for four years in the offices of Arthur Bundy and R. B. Crownshield, naval architects, at Boston, he went to New York to take the position of designing editor of *The Rudder*, the yachting magazine. In the seasons of 1903-04 he was official measurer of the New York Yacht Club, measuring the yachts *Shamrock III* and *Reliance* for the American cup races of 1903. Is a member of the Society of Naval Architects and Marine Engineers, and of many yacht clubs. Among his works are 'How to Build a Motor Launch' (1900); 'How to Build a Knockabout' (1901); 'How to Build a Racing Sloop' (1901); 'How to Build a Cruiser' (1903).

**MOWER, mō'er, Joseph Anthony,** American soldier: b. Woodstock, Vt., 22 Aug. 1827; d. New Orleans, 6 Jan. 1870. He was educated in the common schools and Norwich University, enlisted as a private in the Mexican War and in 1855 was commissioned 2d lieutenant. He was promoted captain in 1861 and for bravery in action was made major in 1862. He soon passed through all the ranks up to that of brigadier-general, and in 1863 commanded a brigade at Vicksburg. In 1864 he was in charge of a division under General Banks in Louisiana and he accompanied General Sherman in his Georgia and Carolina campaigns and received promotion to the rank of major-general. He

remained in the army after the war with the permanent rank of colonel, and was in command of the department of Louisiana at his death.

**MOWRER, Frank Roger,** ex-consul-general; b. Xenia, Ohio, 7 July 1870. He received the title of LL.B. at Cornell in 1894 and was admitted to the bar the following year. In 1897 he decided to enter the consular service, in which he continued for 12 years, holding many important posts in that period of time. The record of his service is as follows: Marshal of the consular court at Yokohama 1897-99, from which he retired by operation of the treaty; marshal at Canton, 1899-1900; consul at Antigua, from January to October 1901; at Ghent, Belgium, 1901-06; consul-general at Abis Ababa, Abyssinia, 1906-07; consul at Leghorn, Italy, from April to June 1907; consul-general at Copenhagen, Denmark, 1907-09, from which he resigned in the latter year and returned to the United States.

**MOWRY, mō'ri, William Augustus,** American educator and author: b. Uxbridge, Mass., 13 Aug. 1829; d. 22 May 1917. He was educated at Brown University and in 1862-63 was a captain in the Federal army. He was principal of the English and Classical school in Providence in 1864-84 and in 1884-85 edited the *Journal of Education*. In 1886-91 he was editor of *Education*, and from 1887 to 1905 was president of the Martha's Vineyard Summer Institute. Among his writings may be mentioned 'Nathaniel Mowry and His Descendants' (1878); 'Richard Mowry: His Ancestors and Descendants' (1878); 'Studies in Civil Government' (1887); 'Elements of Civil Government' (1890); 'Talks with My Boys' (1892); 'A History of the United States' (1896); 'The Uxbridge Academy: a Brief History' (1897); 'First Steps in the History of Our Country' (1898); 'American Inventions and Inventors' (1900); 'Marcus Whitman and Early Oregon' (1901); 'The Territorial Growth of the United States' (1902); 'American Heroes and Heroism' (1903); 'American Pioneers' (1905); 'Essentials of United States History' (1906); 'Recollections of a New England Educator' (1908); 'Descendants of John Mowry of Rhode Island' (1909); 'Camp Life' (1914), also many papers, addresses, magazine, book and encyclopedia articles.

**MOKOM, Philip Stafford,** American Congregationalist clergyman: b. Markham, Canada, 10 Aug. 1848. During the Civil War he served as "captain's boy" (1862), then enlisted in the Illinois cavalry in 1863, and served till 1865. At the close of the war he entered upon a course of study at Kalamazoo College, Mich., and later studied at Shurtleff College, Ill. (1868-70). Being ordained to the Baptist ministry in 1871, he studied at Rochester Theological Seminary from 1875 to 1878, and was graduated from Rochester University in 1879, with the degree of A.B. From 1879 to 1885 he was pastor of the First Baptist Church of Cleveland, Ohio; and from 1885 to 1893 at First Baptist Church of Boston, where he gained a reputation as a preacher of marked power. In 1894 he joined the Congregationalists and became pastor of the South Congregational Church at Springfield, Mass. In November 1915 he

resigned and became pastor emeritus. From 1894 to 1897 he was university preacher at Harvard, and has preached frequently at other universities and colleges. He delivered the centennial address on the 100th anniversary of the birth of Browning, in the Brooklyn Institute, 7 May 1912. He was at the World's Parliament of Religions, and presented a paper on 'Immortality'; he was also at the World's Peace Congress, and has been delegate to several international peace congresses. He attended the first Ecumenical Council in the interest of international amity at Constance, Baden, in August 1914, which was broken up by the war, but reassembled in London. He has written 'The Aim of Life' (1894); 'From Jerusalem to Nicæa, the Church in the First Three Centuries' (1895); 'The Religion of Hope' (1896).

**MOXON**, mök'sön, Edward, English publisher and verse-writer: b. Wakefield, 1801; d. 3 June 1858. Going to London (1817) he entered (1821) the service of the Longmans, publishers. A volume of his verses appeared in 1826, and he started as a publisher in 1830, bringing out Lamb's 'Album Verses' as his first publication. He became publisher for Barry Cornwall, Southey, Wordsworth, Tennyson, Monckton, Milnes, Landor, Browning, etc. His second volume of poems appeared in 1837 and both were published together in 1843 and 1871.

**MOYOBAMBA**, mö-yō-bām'ba, or **MOYABAMBA**, Peru, capital of the department of Loreto, on the Mayo River, 50 miles northwest of Chachapoyas. It is noted for its manufactures of Panama hats. It occupies an isolated position on a gravelly plateau intersected by deep ravines. Its chief communication is by river with Brazil, the Mayo as an affluent of the Huallaga connecting with the Amazon. Pop. 2,000.

**MOZAMBIQUE**, mö-zām-bék', South Africa, formerly the entire colony of Portuguese East Africa (q.v.); now one of its provinces and its capital town. The town of Mozambique is situated upon a small coral island near the coast. It contains the governor's palace, a cathedral, a hospital, a prison, warehouses, etc. The harbor is secure. Pop. 8,000. The population of the province in 1910 was about 362,000.

**MOZAMBIQUE CHANNEL**, the passage between the east coast of Africa and the island of Madagascar, about 1,050 miles long from northeast to southwest, 530 miles wide at its southern entrance, about 250 miles wide in the centre and nearly 600 miles wide at the northern entrance, where lie the Comoro Islands. The harbors of Mozambique and Beira are on its west shore.

**MOZARABIC LITURGY**, the liturgy used by the Mozarabs, or "spurious Arabs," that is, the Christians who submitted to the Moorish government, in Spain, while retaining their own religion. This office is sometimes styled "Officium Gothicum" or "Isidori Missale," because it was in vogue during the Gothic domination and was first revised by the great and learned Isidore of Seville in the 6th century. In Toledo after the gradual adoption of the Roman missal throughout Spain during the 11th and 12th centuries, Ximenes, cardinal arch-

bishop of the see, revised in the 16th century the ancient office and built the beautiful chapel at the west end of the cathedral where the old Gothic ritual is still observed. It is supposed from the Greek affinities of its form, that the original liturgy was brought from Asia Minor by the Goths who dwelt south of the Bosphorus in the 5th century. Consult editions by Lesley (Rome 1755); Lorenzana (Rome 1804); Migne, 'Patrologia Latina' (Vol. LXXXV and Vol. LXXXVI); also a new edition (Toledo 1875). Consult also Hammond, C. E., 'Ancient Liturgies' (Oxford 1879) and Neale, J. M., 'Essays in Liturgiology and Church History' (London 1863).

**MOZART**, mö'zärt (Ger. mö'tsärt), **Johannes Chrysostomus Wolfgangus Theophilus**, Austrian composer: b. Salzburg, Austria, 27 Jan. 1756; d. Vienna, 5 Dec. 1791. With this somewhat harsh combination of names Mozart was baptized on the day following his birth. His parents were Johannes Georg Leopold Mozart, and his wife, Anna Maria.

Until 24 years of age Mozart led a wandering life, being taken on several tours by his father, who, while himself fully appreciating the child's genius, chafed under the continuous disappointments resulting from the fact that it was not productive either of the appreciation or financial returns which it so richly deserved. But later the musical world recognized his powers, nor has there since his death been any stint of praise for his marvelous achievements. Mozart's genius was not merely the brilliant flash of a meteor, dazzling the world for a brief moment and then gradually flickering out. He did not earn his title of "musician of musicians" through one sublime effort in early life. Of him, perhaps more than of any of the other great composers, it may be truly said that his powers steadily increased as he grew older, a statement borne out by the fact that three of his greatest works were composed during the last year of his life.

Nor is this high estimate of his worth confined to those of the laity who since his time have been capable of appreciating his wonderful genius. All men, including his fellow artists, paid sincere homage to him as supreme in several of the departments of the musical art. Thus Rossini, on being asked who was the greatest musician, first replied "Beethoven"; but when the question was put "What of Mozart?" he answered "Mozart is not the greatest, he is the only musician in the world." Again, Gounod in an address before the Académie des Beaux Arts in 1882 expressed his deep admiration for Mozart in the following words: "Oh, divine Mozart, . . . bounteous nature had given thee every gift; grace and strength, fulness and sobriety, bright spontaneity and burning tenderness, all in that perfect balance which makes up the irresistible power of thy charm, and which makes of thee the musician of musicians, greater than the greatest, the only one of all."

This sounds like high praise, and that was what Gounod meant it to be. And so throughout the ages men will continue to recognize the genuine fire of genius which animated his compositions and which found its expression not only in his inimitable perception of the relation between the human feelings and the realm of

tones, or in his inexhaustible power of interpreting widely different types of character, but above all in the superb beauty of proportion and balance which pervades his creations. Mozart was not only a brilliant composer, however, for he was also a remarkable performer on the piano, organ and violin. Haydn said that he could never forget Mozart's playing, for "it went to the heart."

The number of separate published works ascribed to Mozart is 626, while he is also said to have written 294 compositions which were unfinished or unpublished. When only three years old Mozart showed evidences of his musical genius, perceiving which his father taught him minuets on the harpsichord and at four years he commenced composing. His first appearance in public was in September 1761, as a chorister in some theatricals held at the University of Salzburg. In his 6th year he composed his first published work—a 'sonata pour clavecin.' When seven years old the Mozart family visited Paris, Wolfgang playing the violin and organ at several churches *en route*. Here he composed a Kyrie, his first sacred piece. Later in the year they went to London, where the boy's playing, and especially his power of improvising, excited the greatest admiration. In 1764, while in London, he produced 10 sonatas for the clavier and violin, six of which, dedicated to the queen, were brought out early in the following year. In January 1766, Wolfgang gave two concerts in Amsterdam, at which all the instrumental work was of his own composition. Later, on the occasion of the installation of the Prince of Orange as stadtholder, he composed a concerto named 'Galimathias musicum.' After several months of travel the family returned to Salzburg in November. Here they remained till September 1767, Wolfgang devoting himself to study and composition. He composed a part of a sacred cantata for the archbishop of Salzburg, a Passion-cantata, his first concertos for the piano, and a Latin comedy, 'Apollo et Hyacinthus.' In September he was again in Vienna, his father being attracted there by the approaching betrothal of the Archduchess Josepha to King Ferdinand of Naples. Here much jealousy and intrigue was displayed, and although Mozart composed an opera, 'La Finta Semplice,' at the request of the emperor, it was not given a performance. Mozart, however, had the satisfaction of producing privately his operetta entitled 'Bastien und Bastienne.' He also composed an offertorium and a trumpet concerto to be used at the consecration of a new church at the Waisenhaus.

After the return of the family to Salzburg Mozart was in 1769 appointed concertmeister, and a performance of 'La Finta Semplice' was then arranged. He next composed two masses, and the Johannes Offertorium for a priest in the monastery at Seon. Preparations were now made for a tour of Italy, the family arriving at Milan at the end of January 1770. While in Rome he visited the Sistine Chapel to hear Allegri's 'Miserere.' On his return he wrote down the entire work from memory, a feat which did much to spread his fame abroad. They next visited Naples where his concerts were brilliantly attended. In Bologna he was honored by election to the 'Accademia dei Filarmonici,' his test piece being an antiphon for

four voices, which he composed in about half an hour.

His first opera 'Mitridate Rè di Ponto' was composed and produced in Milan, where it was performed 20 times. In Padua, on his way home, Mozart was commissioned to compose an oratorio, perhaps 'Betulia Liberata,' which was first performed in Lent, 1772. His stay at home was brief, for his friend Count Firmian, who had met him when in Milan, commissioned him to write a dramatic serenata to celebrate the nuptials of Archduke Ferdinand with Princess Maria of Modena. On 17 Oct. 1771, the performance of 'Ascanio in Alba' was given with very gratifying results. The next month saw Mozart in Milan again and hard at work on his opera 'Lucio Silla,' which was at length produced at the Milan opera house with great success. On reaching home Mozart composed four symphonies, three divertimenti for a wind orchestra, a grand concerto for two violins and a mass, and in the following year two masses, a grand litany, two vesper psalms, an offertorium, a bassoon-concerto, four symphonies, two serenatas, etc. The next visit was to Munich where young Mozart was engaged to compose an opera for the carnival of 1775, and on 13 January 'La Finta Giardiniera' was produced. From that time to September 1777 Mozart, now a young man of 21, devoted himself to composing and the list of his pieces is very extensive. Later in the year he visited Mannheim with his mother, and while there had his first love affair, the young lady being Aloysia, second daughter of Fridolin Weber, a prompter and copyist. His father, on hearing of it, ordered them away to Paris, where they arrived in March 1778. Here he composed several pieces, including a gavotte, a quartette for flute and strings, and some parts of a 'Miserere,' which were produced without even the mention of his name. On 3 July of this year his mother died. Again we find him in Salzburg in mid-June 1779, during which year he wrote the music to Gebler's drama 'König Thamos,' the operetta 'Zaidé,' several sonatas dedicated to the Electress of Bavaria, an aria for Aloysia Weber, whose love for Mozart had, however, grown cold, and a number of minor pieces, for which he had received commissions. His first great opportunity came in 1780 when he received orders to furnish an opera for the Munich carnival. It was entitled 'Idomeneo, Rè di Creta,' and had its first performance on 29 Jan. 1781. Mozart now received a summons to Vienna from the archbishop, who, however, seems to have treated him as a menial. Finally severing his official relations, he took lodgings with the Webers. During the summer he wrote an opera for the National Singspiel (German) founded by the emperor in 1778, and in spite of many obstacles 'Entführung aus dem Serai' was produced by the emperor's express order on 16 July 1782. A month later he made Constance Weber his wife.

Mozart's marriage seems to have brought with it a succession of difficulties. Constance was a poor manager and Mozart was as yet without any fixed appointment. He gave a series of subscription concerts which were well attended, and during six weeks played at 17 concerts besides five of his own arranging. In July 1783 he took his wife to Salzburg to present her to his father, and in August produced

a mass in the Peters Kirche, which he had composed in honor of his wife, who sang the soprano part on that occasion. During the latter part of 1785 Mozart was engaged on one of his masterpieces, an opera based on Beaumarchais' comedy entitled 'Le Mariage de Figaro.' The first public performance of the opera ('Le Nozze de Figaro') took place on 1 May 1786, and the triumph of the composer was complete. In 1785 Mozart wrote 'Davidde Penitente' for the Society of Musicians and some music for the vaudeville piece 'Der Schauspiel-Direktor' was also produced. In 1787 Mozart and his wife visited Prague in response to an invitation from Count Thun. Here it was decided that he should compose another opera, which he did for the small sum of 100 ducats. 'Don Giovanni' was the result and its first performance was given on 29 Oct. 1787. Returning to Vienna in November, he was appointed Kammer-compositor with a salary of 800 gulden.

The year 1788 was a very busy one for Mozart. In six weeks he wrote his three last and finest symphonies (in C, E flat and G minor), as well as several pieces for the piano, arranged five fugues from Bach's 'Wohl-temperirte Clavier' for string quartette, and added wind parts to Handel's 'Acis and Galatea,' 'Messiah,' 'Ode to St. Cecilia's Day' and 'Alexander's Feast.' In 1789 Mozart was offered the post of kapellmeister at the Prussian court. The salary was 3,000 thalers, but in spite of the comforts which this comparatively large income would have insured, Mozart declined rather than forsake his "good Kaiser." Arriving in Vienna on 4 June, and being in much trouble, partly on account of his wife's constant illness, he informed the emperor of the offer of the King of Prussia, and tendered his resignation. The emperor exclaimed: "What, Mozart, are you going to leave me?" Mozart replied, "Majesty, I throw myself upon your kindness—I remain." The emperor then ordered him to compose a new opera, which under the title 'Cosi fan tutte,' was produced on 26 Jan. 1790.

During the last year of Mozart's life, as already stated, he composed three of his greatest works, two of which must be always reckoned among the highest of musical creations, namely, the opera 'Die Zauberflöte' and the 'Requiem,' which latter he was commissioned to compose under very mysterious circumstances. Mozart's health had now become much impaired and he was greatly depressed. He believed that he was writing this 'Requiem' for himself. The third notable composition of this year was the opera 'La Clemenza di Tito,' composed for the coronation of Leopold II at Prague, which took place 6 September, the opera being performed on the same evening. His recent exertions and excitement proved too much, however, for his remaining strength, and on 5 Dec. 1791, he died of malignant typhus fever. He was buried in a pauper's grave in the churchyard of Saint Marx.

R. I. GEARE,

*National Museum, Washington, D. C.*

**MOZART**, mö'tsärt or mö'zärt, Leopold, German composer: b. Augsburg, Bavaria, 14 Nov. 1719; d. Salzburg, 28 May 1787. He became kapellmeister to the archbishop of Salzburg. He wrote voluminous amounts of music, and published a justly famous 'Violin School' (1756), the first theoretical and practical guide to that instrument and long the only one. It passed into numerous editions. He was the father of Wolfgang Amadeus Mozart (q.v.).

**MOZDOK**, möz-dök', Russia, town in the province of Terek in the government of the Caucasus, located on the left bank of the river Terek. Its manufactures are candles, soap, leather, tiles, brandy, etc., and it has a good trade in coarse woolen and cotton goods, sheep, horses, silks, etc. In the neighborhood are vineyards, silk-growers, vegetable gardens, etc. It holds agricultural markets twice yearly, with a considerable cattle exchange. In 1911 it had a population of 17,068, made up of Kabardines, Tchetchens, Georgians, Armenians, etc., besides Russians.

**MOZIER**, mö'zhēr, Joseph, American sculptor: b. Burlington, Vt., 1812; d. Faids, Switzerland, 1870. He was a merchant in New York from 1831 till 1845, when he retired and went to Rome to open a studio to practice as sculptor. He produced quite a number of figures, the best known being 'Pocahontas,' 'The Wept of Wish-ton Wish,' 'Rizpah,' in

Metropolitan Museum; 'Rebecca at the Well,' 'Jepthah's Daughter,' 'Undine,' 'Queen Esther,' 'Truth,' 'Silence,' 'The Prodigal Son,' etc. The latter, his most ambitious work, is in the Pennsylvania Academy of Fine Arts, and his 'Il Penseroso' is in Horticultural Hall, Fairmount Park, Philadelphia.

**MOZLEY, James Bowling**, English clergyman: b. Gainsborough, Lincolnshire, 15 Sept. 1813; d. 1878. He was educated at Grantham and was graduated (1838) at Oriel College, where he became a close acquaintance of Newman, Pusey, Froude, etc. He participated in the "Oxford Movement," but could not accept the Roman communion and some other features. He was elected (1840) a Fellow of Magdalen and became joint editor of the *Christian Remembrancer*, resigning in disagreement with the Gorham decision. He was one of the *Guardian's* first adherents and became vicar of Shoreham in 1856. In 1869 he was made canon of Worcester and was created regius professor of divinity at Oxford in 1871. He wrote 'A Treatise on the Augustinian Doctrine of Predestination' (1855); 'The Primitive Doctrine of Baptismal Regeneration' (1856); 'A Review of the Baptismal Controversy' (1862); 'Lectures on Miracles' (1865), the Bampton Lectures. His 'Essays, Historical and Theological' (1878), were published in two volumes, and his sister's biographical comment in the preface.

**MOZOOMDAR, mō-zoom'dār, Pratap Chandra**, Hindu reformer: b. Calcutta, India, about 1840; d. 1905. He joined the association of the Brahmo-Somaj (q.v.) organized for the purification of Brahmanism, and edited at Calcutta the *Theistic Quarterly Review* and *The Interpreter*, published by that organization. In 1874 he visited England and in 1883 the United States, being received with honor by leading men of both nations. In 1893 he made a second visit to the United States to attend the World's Parliament of Religions, before which he read a paper on the Brahmo-Somaj. He wrote 'The Faith and Progress of the Brahmo-Somaj' (1882); 'The Oriental Christ' (1883); 'Life and Teachings of Keshub Chunder Sen' (1887), and articles for English and American periodicals. His influence in India was never great despite his great acclaim outside his native land.

**MOZYR, mō-zēr**, Russia, a town in the government of Minsk, on the Pripet River and on the Brjansk-Brest Railway. It has three orthodox and one Roman Catholic Church, also a synagogue. It has suffered much from depredations of the Tartars and was consumed by fire in 1609 and 1864. It has manufactures of hardware and leather and considerable trade in lumber and cattle. Pop. 10,729.

**MR. MIDSHIPMAN EASY**, published in 1836, is probably the best known of the many sea novels by Capt. Frederick Marryat. This spirited and entertaining story deals with the life of John, otherwise known as Jack Easy, from the time of his birth to his settlement in life by marriage and inheritance of an important estate. A youth of fine qualities, he is spoiled at home by his mother and educated in ideas of equality by his father. Much against

their will he is sent to sea as midshipman at an early age and at the end of four years returns quite cured of odd ideas and with a fine record for bravery. His exciting and humorous adventures in the service of the royal navy make up the bulk of the book, which gives a lively picture of sea actions and a sailor's life on shore and on board ship. The galaxy of characters, part serious, part comic — Captain Wilson, Sawbridge, Mesty, Biggs, Oxbelly and many others — is an especially good one. The deeper purpose of the novel is to show the more humane and chivalrous side of naval warfare and to set forth the finer traditions of the service.

WILLIAM T. BREWSTER.

**MUCH ADO ABOUT NOTHING**. 'Much Ado about Nothing' is first mentioned in August 1600 and was printed in the same year. It is not referred to in Meres's famous list of Shakespeare's plays in 1598, unless indeed it is to be identified with the mysterious comedy, 'Love's Labour's Won,' which Meres includes among Shakespeare's works. That 'Much Ado,' in some less finished form than we now have, had been staged as early as 1598 under the title of 'Love's Labour's Won,' is a bare possibility which hardly warrants speculation, but there is this to be said in its favor: it occupies among the comedies of Shakespeare's full maturity a position very analogous to that which 'Love's Labour's Lost,' has among the early comedies. Each of these plays, when compared with others of the same period (with 'The Two Gentlemen of Verona' and 'A Midsummer Night's Dream' or with 'As You Like It,' 'Twelfth Night,' and 'All's Well that Ends Well') impresses the reader as a drama of the intellect rather than of the heart. Intrigue and wit overbalance romance in both, and personal planning largely takes the place of delectable chance. Benedick and Beatrice are finished studies which seem to have developed out of the sketches of Biron and Rosaline in 'Love's Labour's Lost.' It goes with what has been said that this is a play of prose rather than poetry, of epigram rather than sentiment. Only a quarter of the lines are in verse, and this verse is seldom notable. The unflinching charm of the comedy lies in the infinitely brilliant superficiality of Beatrice and Benedick, the two arch-enemies of romance — in the unemotional cut and thrust of their badinage; and, next, in the ludicrous realism of the constables, Dogberry and Verges. All testimonies agree that this comedy is one of Shakespeare's most complete successes. It is also a remarkable evidence of the author's versatility, for it proves that he could execute with unsurpassed spirit and skill a type of play for which his other greater works would indicate that he had little natural inclination. 'Much Ado about Nothing' is the only one of Shakespeare's major dramas which one can imagine that Congreve or Sheridan might have written. On the stage it has always been triumphant. When compared with its special corrivals among Shakespeare's comedies — the more romantic 'As You Like It' and 'Twelfth Night' — it impresses one as suited rather more to the theatre and rather less to the study. About a quarter-century after the poet's death, it was selected by

Leonard Digges among the special examples of Shakespeare's drawing power:

"Let but Beatrice  
And Benedick be seen, lo, in a trice  
The Cockpit, Galleries, Boxes, all are full." (1640)

David Garrick was a famous Benedick, and nearly all the greatest actresses have found opportunities for added laurels in Beatrice. The source of this play is relatively unimportant, for the greatest parts of it—the clownery of the constables and the figures of Beatrice and Benedick—seem to have sprung spontaneously from Shakespeare's brain. That part of the plot, however, which concerns Hero, Claudio and Don John is paralleled in several earlier works, in Spenser's 'Faerie Queene' (Bk. IV, ii), in Ariosto's 'Orlando Furioso' (Bk. V), and particularly in the 20th tale of Bandello's Italian *novelle* (printed 1554). It appears to have been from the last (possibly in the French or in some now unknown English version) that Shakespeare drew his hints; but the dramatist, besides altering the material in details, so subordinates it to the newer themes that it is likely to impress modern taste as either repellent or uninteresting.

TUCKER BROOKE.

**MUCIC ACID**,  $C_6H_{10}O_8$ , an organic acid formed by oxidizing milk sugar, or galactose, gum arabic and certain other substances, by the action of dilute nitric acid. It crystallizes in colorless tablets which are insoluble in alcohol, slightly soluble in cold water, and rather freely soluble in boiling water; though when boiled with water it becomes converted into an isomeric substance known as "paramucic acid." Mucic acid melts at about  $410^\circ$  F., does not reduce Fehling's solution, and combines with ammonia and with metallic and organic bases to form an extensive series of salts.

**MUCILAGE**, a solution of gum in water, in chemistry, the gum of seeds and roots. The name is also given to commercial adhesive gum made from gum arabic or dextrin. Mucilages, in pharmacy, are water preparations of substances dissolved in water, used to suspend insoluble ingredients or to bind them together in a mass.

**MUCIN**, an albuminous proteid substance, which is an important constituent of the connective tissue of the animal body, and which gives to the mucous membranes their characteristic sliminess. It may be isolated by extraction with lime water (or with pure water), and subsequent precipitation with acetic acid, in excess of which mucin is insoluble. Mucin is not precipitated by heat nor by tannic acid. It is, however, precipitated by alcohol, or by saturating its solution with common salt, or with magnesium sulphate. When boiled with strong sulphuric acid, mucin yields leucine and tyrosine.

**MUCIUS SCÆVOLA**. See SCÆVOLA.

**MUCKER**, nickname of certain mystic fanatics who were thus popularly derided as "canting hypocrites." The adjective is of ancient origin and did not connote a specific sect until it was applied to the followers of Johann Heinrich Schönherr and later Johann Wilhelm Ebel in Königsberg. Schönherr, who was the son of a Prussian non-commissioned officer, and was educated under the theological faculty

of the University of Königsberg, combined odd ends of the Kantian philosophy with gleanings from the Bible into a dualistic neo-Gnosticism. Ebel, a Lutheran pastor, was a convert of his, and in 1826 was joined by Johann Diestel, another pastor. The doctrine, which involved peculiar views as to the sexual relations, spread among fashionable circles in Königsberg. In 1835 Count Finckenstein, a former convert, accused Ebel and Diestel of immorality. They were unfrocked, but were not convicted of actual immorality. Consult Mombert, J. I., 'Faith Victorious' (New York 1882); Dixon, W. H., 'Spiritual Wives' (London 1868). See EBELIANS.

**MUCORACEÆ**, the molds. See FUNGI.

**MUCOUS MEMBRANE**. The mucous membranes line passages and cavities which communicate with the exterior of the body, where they become continuous with the skin. They constitute the lining of the alimentary canal or tract, which begins at the mouth and ends at the anus, a distance of about 27 feet, and is the passage through which the food for nutrition of the body is introduced, digested and taken up for the preservation and health of the body. They also form the lining of the nose, the throat, the middle ear, the various sinuses communicating with these cavities, the eyes, and of the respiratory apparatus, which comprises the lungs, the windpipe or trachea, and the larynx. The kidneys, the ureter, the bladder, the testes and the urethra in the male, and the Fallopian tubes, womb, vagina and vulva of the female are all lined with mucous membrane, together with the membrane of the ducts of glands which open upon it. In the female it becomes continuous with the peritoneum at the fimbriæ of the Fallopian tubes. The surface of the mucous membranes of the body is subjected to the contact of various matters, such as the food, the air, and the different glandular secretions and excretions. They are protected from undue irritation by a viscid liquid called mucus (q.v.), which constantly bathes their surface, and are also well supplied with blood-vessels and nerves. The mucous membranes are not of a single origin, but may be derived from ectoderm, as is the case with the lining of the mouth, entoderm, as with the greater part of the digestive tract, or mesothelium, as in the urogenital ducts. A mucous membrane consists of an epithelium, or layer of lining cells; a connective-tissue basement-membrane, which may be hyaline and apparently homogeneous; and a further connective-tissue support or *tunica propria*. It usually is invaginated into glands, and may be evaginated into villæ, as in the case of the stomach and intestine. For the diseases of the mucous membrane, see the respective organs or systems concerned.

**MUCUS**, a semi-fluid substance, of a viscid, tenacious character, produced by the various mucous membranes of animals, and found covering the exposed surface of such membranes. Thus it is produced in the mucous membrane lining the nose, the mouth and throat, the gullet, stomach, large and small bowel, the air-tubes of the lungs, the kidneys, ureter, and bladder, the gall-bladder, the ducts of glands, the bile-ducts, etc. In all these situations it serves to lubricate

the membrane over the surface of which it is spread, and to protect the delicate surface from the action of irritating agents. Its viscid character prevents it being readily removed, and thus enables it more effectually to discharge its protective function. It is to be noticed that many of the mucous membranes have special glandular structures embedded in them, which produce special secretions, not mucus, such as the mucous membrane of the stomach and bowels, whose secretions have special properties connected with the digestion of the food. The saliva from the mouth is a mixture of mucus and the special secretion from the salivary glands, which acts on the starchy elements of food. Other mucous membranes have no such special structures, and only mucus is secreted by them, such as the mucous membrane of the nasal passages. Mucus is secreted by glands situated deep in the mucous membrane, and such glands are found in the mucous membrane of the nose; similar glands of very minute form are found scattered thickly in the mucous membrane of the mouth, and are found of considerable size in the back part of the tongue, in the gullet, and other situations. But mucus is also produced by single epithelial cells, lining mucous membranes. The form of epithelial cell called the "goblet cell" is believed to be a mucous-secreting cell, and it is found in large numbers lining the mucous membrane of the air-passages, the stomach and bowels. So that by their agency the special digestive secretions of stomach and intestines contain a large admixture of mucous material. Pure mucus is transparent, but it is usually turbid from the presence of foreign materials, and epithelial cells from the secreting membrane. Its chief ingredient is mucin, a derivative from albuminous bodies, consisting of carbon, hydrogen, oxygen and nitrogen, but, unlike albumin, containing no sulphur. It is held in suspension by water, forming an opaque liquid, but is not dissolved by it. Besides mucin, mucus contains small quantities of proteid substances and salts, chiefly common salt. Water constitutes nearly 94 per cent of its bulk. From fluids containing it in suspension, such as bile, it may be precipitated in a flocculent stringy mass by alcohol. Heat does not coagulate it; and it is dissolved by weak solutions of alkalies and alkaline earths.

**MUD (or PEAT) BATH**, in which the body is immersed in mud or peat. At Eger, Bohemia, black mud is heated to a temperature of 100°. It contains sulphate of soda, iron, lime, alumina and ulmic acid. The body is immersed for 15 minutes, after which the patient goes into water to remove the mud. Such a bath may be of use in chronic skin diseases, rheumatism, gout, etc.

**MUD-BUFFALO**, a name, in the leather trade, for the Indian buffalo (*Bos bubalus*) as found in a wild or semi-wild condition in the Malay Peninsula, where they frequent swamps and are shot for the sake of their hides. These hides are not tanned, but are sent green to India, Europe and America to be used in the making of loom-pickers, mallets, gears and other tools used in cotton-milling. They become harder than wood, and are tougher and more elastic.

**MUD-CAT**. See **CATFISH**.

**MUD CRACKS**, cracks formed in mud surfaces by shrinkage due to drying. The surface of the mud flat is usually broken up into polygonal blocks, by cracks varying from a few inches to several feet in depth. These are also known as sun cracks, and are commonly formed in the muds of flood plains and deltas, and on playa (q.v.) surfaces. They are often filled with drifting sand and preserved in the sediment as the rock solidifies. For a discussion of their geological significance, see the section on *Structure*, in the article on **GEOLOGY**.

**MUD-EEL**, the amphibian *Siren lacertina*, which has persistent gills but no hind legs. It resembles the *Proteidæ* (q.v.) in many ways. See **SIRENIDÆ**.

**MUD-FISH**, the name of various fishes found in muddy water, or fond of burrowing in the ooze of swamps. The Nile bichir and its relatives, the reed-fishes of the sluggish African rivers, are so called; also the lepidosiren and other dipnoans, which grovel on muddy bottoms. In the United States, the name belongs to some small mud-minnows (q.v.), and to a curious fish (*Amia calva*) of the Mississippi Valley, known as dogfish, bowfin and by various other names. This, like the bichir and the reed-fish, is a ganoid (q.v.). It is a rather shapeless, dark-colored, exceedingly hardy fish, reaching a length of two feet and a dozen pounds in weight. It is carnivorous, feeding voraciously upon crayfish, small mollusks and anything it is able to seize and swallow; and it greedily seizes a baited hook and then fights gamely for its life, so that it is a favorite with anglers, though hardly fit to eat.

**MUD-HEN**, or **MARSH-HEN**, a sportsman's name for any of several rails, gallinules, coots and similar birds which make their home in marshes; it is most often given in the North to the Gallinule (*Gallinula galeata*), a bird of the rail family, much like the British water-hen (*G. chloropus*), and common in the marshes about the Great Lakes and Mississippi Valley, where its cluckings resound in summer from every reedy marsh. It is about a foot in length, olive-brown on the back, dull black on the under parts and with a red bill. It is migratory; but the Southern States have a smaller and more handsome mud-hen in the resident purple gallinule (*Ionornis martinica*).

**MUD-MINNOW**, or **DOGFISH**, one of the smaller fresh-water carnivorous fishes of the pike family, the *Esocidæ* and the genus *Umbra* related to the Alaskan blackfish (*Dallia*). It lives in muddy bayous, and among weeds at the bottom of clear but sluggish streams, often burrowing in loose mud. There are two North American species: *Umbra limi* of the interior, and *U. pygmaea* of the eastern coast; and one in Austria. Such a distribution increases the probability that this is of "an archaic type, characteristic of some earlier fish-fauna." The mud-minnows reach a length of about four inches and are valued as live bait, since they will long endure with vigor impaled on the hook.

**MUD-PUPPY**, or **WATER-DOG**, a member of the *Proteidæ* (q.v.). In this country usually *Necturus maculatus*, a large newt common in the eastern Mississippi Basin. For its

development and metamorphoses, see EMBRYOLOGY.

**MUD-SHAD** (*Dorosoma cepedianum*), the hickory or gizzard shad. This fish grows to a length of about 15 inches, is silvery blue in color, and occurs throughout the Mississippi Valley and in great abundance from Cape Cod to Mexico.

**MUD-SKIPPER**, a minute tropical fish of the goby family and genus *Periophthalmus*, which is accustomed to go ashore and skip about the space between tide-marks, exploring the rocks, roots of trees, etc., for food, and skipping about like grasshoppers. Some curious qualities distinguish these little creatures, which are found from West Africa to Japan, and make them highly interesting to naturalists. Consult Day's 'Fishes of India' (1878) and other works on the natural history of the Eastern seas.

**MUD-TURTLE**, or **MUD-TORTOISE**, any fresh-water turtle usually found in muddy places. In the United States, the ordinary mud-turtle is *Cinosternon pennsylvanicum*, which has a grayish-brown smooth shell, and a dark-colored head, with light dots. See **BOX-TURTLE**.

**MUD-WASP**, one of the many kinds of solitary wasps which fabricate out of wet clay cell-like receptacles, variously shaped and placed, in which to store their eggs and the provision for the larvæ. See **WASP**.

**MUDDOCK**, **Joyce Emmerson**, English journalist and author: b. Southampton, England, 28 May 1843. He has been connected with several London journals and beside publishing some 52 volumes under the *nom de guerre* of "DICK DONOVAN" is the author of many other works, among which are 'Basile the Jester'; 'The Great White Hand'; 'Fair Rosalind,' and 'Pages from an Adventurous Life.'

**MUDGE**, **Enoch**, American Methodist clergyman: b. Lynn, Mass., 28 June 1776; d. 2 April 1850; the first Methodist clergyman reared in New England. He became an itinerant clergyman of the Methodist Church in 1793, and in 1793-99 traveled on his duties about Maine until hardships affected his health, and he was settled at Orrington (1799-1816). During this period he was twice elected to the legislature, where he obtained the repeal of a law imposing a tax on other denominations for the benefit of the Congregationalists. Having resumed itineracy in 1816, he was stationed at Boston, Lynn, Portsmouth, Newport and other places. From 1832 until his retirement from active life in 1844, he was pastor of the Seamen's Chapel at New Bedford. He was a member of the Massachusetts Constitutional Convention in 1819. He contributed much to the press, and published in bookform 'Camp-Meeting Hymn-Book' (1818); 'Notes on the Parables' (1828); 'Lynn, in verse (1830), and 'Lectures to Seamen' (1836).

**MUDIR**, moo-dër', the title of a Turkish or Egyptian official; the governor of a province.

**MUEZZIN**, mü-ëz'in, in Mohammedan countries the beadle of the mosque, whose duty it is to summon the faithful to prayer at the assigned periods by public proclamation from the minaret (q.v.). His call is the *azan*, and

is sounded five times each day. The call is "God is most great [four times]! I bear witness that there is no god but one God [twice]! I bear witness Mohammed is the apostle of God [twice]! Come to prayer [twice]! Come to salvation [twice]! God is most great [twice]! There is no god but God [twice]!" In the morning call the words "Come to salvation!" "Prayer is better than sleep!" are repeated twice.

**MUFTI**, the title of a high Turkish official: who assists the judge or *cadi* by interpreting the law of the Koran, of Moslem tradition and of other legal sources. The Grand Mufti or Sheikh-ul-Islam (see **SHEIK**) is one of the interpreters of the Koran, by whose decisions the *cadis* have to judge. The phrase, "in mufti" meaning, "not in uniform; in civilian dress," is an Anglo-Indian expression, referring to the loose robes of the Moslem mufti.

**MUGGER**. See **MARSH-CROCODILE**.

**MUGGLETONIANS**, a religious sect founded (1610) by Lodowicke Muggleton in London. He claimed that he and his cousin John Reeve, a tailor like himself, were the two witnesses who should "prophesy a thousand two hundred and three score days, clothed in sack-cloth" (Rev. xi, 3). He was 40 years old when he received this commission through visions and mysterious voices. 'The Divine Looking Glass' (1656) contains an exposition of the teachings of the Muggletonians who deny the doctrine of the Trinity and believe in a material God, who suffered on the cross. Penn's 'The New Witnesses proved old Heretics' (1672) was a reply to the attacks of Muggleton. This Muggletonian bible was republished 1846 by a few remaining adherents of the sect. Consult Jessopp, A., 'The Coming of the Friars' (1888).

**MUGWORT**, an ornamental and culinary herb. See **ARTEMISIA**.

**MUGWUMP**, in *American politics*, a term originating during the Presidential campaign of 1884 between Grover Cleveland and James G. Blaine. It was applied by a New York newspaper to such members of the Republican party as refused to support their party nominee, James G. Blaine, and advocated the election of Grover Cleveland in the interest, they claimed, of civil service reform. The word belongs to the Algonquin dialect of the Indian languages and is used by John Eliot in his translation of the Bible to translate the Hebrew word *Alluph*, a "leader." Eliot used it in the sense of "big chief," a term more comprehensible to the Indian mind than that which appears in the King James' version—"duke." The word was spelled "Mugquomp" in the singular, and "Mugquompaog" in the plural. It appears in many places throughout the Algonquin translation of the Old Testament.

**MUHARRAM**, (Ar. *muharram*, sacred, from *horama*, to forbid), moo-här'am, the first month in the Mohammedan year. The tenth day is known as the day of Ashura, and was originally made by Mohammed the great fast of the year, in imitation of the Jewish Day of Atonement, which is celebrated on the tenth day after New Year's Day. Later on this came to be replaced by the fast-month of Ramadan. Nowadays among the Sunnites the day of Ashura is only a voluntary

fast. The Shutes mourn on this day in memory of the martyrdom of Husein (q.v.) at Kerbela.

**MÜHLBACH**, mül'bah, Luise. See **MUNDT, KLARA**.

**MÜHLBERG**, mül'berk, Prussia, town in the government circuit Merseburg, and the district Liebenwerda. It is located on the Elbe, has two Evangelical churches, court of justice, inland-revenue office, etc. Its industries consist of a sugar factory, saw-mills, brick kilns, besides commerce in lumber and grain and shipping. It is noted in history through the victory of Emperor Charles V over John Frederick, Elector of Saxony, in 1547. Pop. 3,345.

**MUHLEMAN**, mül'man, Maurice Louis, American author: b. near Alton, Ill., 27 Nov. 1852; d. 12 June 1913. He was graduated from the law school of Columbia University in 1879 and was appointed to the United States treasury service in 1872. In 1888-1901 he was deputy assistant treasurer of the United States. He has published 'The Money of the United States' (1894); 'Monetary Systems of the World' (1896); 'Treasury System of the United States' (1907); 'Banking Systems of the World' (1908); 'A Plan for a Central Bank' (1910); 'Governmental Supervision of Banks' (1911).

**MUHLENBERG**, mü'lën-berg, Frederick Augustus Conrad, American Lutheran clergyman and politician; son of Heinrich Melchior Muhlenberg (q.v.): b. Trappe, Pa., 1 Jan. 1750; d. Lancaster, Pa., 4 June 1801. He was educated in Halle, Germany, and returning in 1770 was ordained to the Lutheran ministry. In 1773-76 he had charge of a Lutheran church in New York and then removed to Pennsylvania where he held several pastoral charges. He was a hearty sympathizer with the cause of the colonies and though not participating in the war aided his countrymen politically and ultimately abandoned his pastoral work for a political life. He served in the Continental Congress and was speaker of the first House of Representatives under Washington, and in 1795 his was the deciding vote which rescued the Jay treaty from defeat.

**MUHLENBERG, Gotthilf Henry Ernst**, American Lutheran clergyman and botanist: b. Trappe, Pa., 17 Nov. 1753; d. Lancaster, Pa., 23 May 1815. He was a brother of F. A. C. Muhlenberg and son of Heinrich Melchior Muhlenberg (qq.v.), and was educated with him in Halle, Germany. He returned to America in 1770, was ordained to the ministry and became an assistant to his father who was in charge of a Lutheran church in Philadelphia. He served in various charges until 1779 when he accepted a call to Lancaster where he remained until his death. In addition to his pastoral duties he distinguished himself as a scientist and took first rank as a botanist. He published 'Catalogus Plantarum Americae Septentrionalis' (1813); 'Descriptio Ueberior Graminum' (1817), etc.

**MUHLENBERG, Heinrich Melchior**, German-American clergyman, organizer of the Evangelical Lutheran Church in America: b. Eimbeck, Hanover, 6 Sept. 1711; d. New Providence (now Trappe), Montgomery County, Pa., 7 Oct. 1787. He was educated at the University of Göttingen (1735-37), studied theology

there (1737-38) and at Halle (1738-39), was ordained in 1739, and from 1739 to 1741 was deacon of the church at Grosshennersdorf, Upper Lusatia. On 6 Sept. 1741 he was called as missionary to the Lutheran congregations of Pennsylvania, located at Philadelphia, New Providence (now Trappe), and New Hanover. At that time there was a large number of Lutherans in America; but they were unorganized and without pastors, and such religious meetings as they had were conducted by laymen. Muhlenberg, who arrived at Charleston, S. C., 22 Sept. 1742 and at Philadelphia, 25 November, was well qualified for the work of effecting union and order. He at once entered on the duties of his charge, and preached his first sermon in Pennsylvania in an unfinished log-building at New Hanover, 28 November. Though Muhlenberg's local pastorate was largely restricted to the three congregations which had summoned him, his activities were really those of a bishop. He traveled over a wide extent of territory, preached at Lancaster, York and other places in Pennsylvania, in New York, and also occasionally in New Jersey, Maryland and among the Salzburger Lutherans of Georgia. "There was probably," thinks Stoever, "not a Lutheran church, in his day, in this country in which he had not officiated." He was at first looked upon as an intruder by Zinzendorf and other Moravians, with whom he was for a time involved in conflict. But so successful was he in his labors that by 1745 there was real need for the reinforcement from Halle, consisting of the Rev. Peter Brunnholtz and the catechists Kurtz and Schaum. The first church edifice at Philadelphia, Saint Michael's, was completed in 1743, and on 25 June 1769 Zion's Church, then considered the largest and finest in the United States, was dedicated there. On 14 Aug. 1748 the first Lutheran synod in America was organized under the direction of Muhlenberg, who became its president. In 1754 Muhlenberg prepared the 'Kirchen Agende,' a directory for public worship, and in 1762 reorganized the Philadelphia congregation under a constitution which became the basis of that of most congregations later established. He identified himself with the American cause in the Revolution, and was in consequence subjected to many annoyances, particularly when Pennsylvania was the scene of war (1777-78). He was a linguist of high rank, versed in Hebrew, Greek and Latin (in which he made an address at the synod of 1750), and proficient in English, Dutch, French, Bohemian and Swedish. His large foreign correspondence appeared at Halle in 1787. Consult 'Die erlaubte Klage über den Abschied treuer Knechte Gottes' (1788), a memorial sermon by J. H. C. Helmuth (with biographical sketch); Stoever, 'Mémorial of the Life and Times of Muhlenberg' (1856); Mann, 'Life and Times' (1887), considered the best.

**MUHLENBERG, John Peter Gabriel**, American patriot: b. Trappe (then New Providence), Montgomery County, Pa., 1 Oct. 1746; d. near Philadelphia, 1 Oct. 1807. He was the son of H. M. Muhlenberg (q.v.), the founder of the German Lutheran Church in America. He was educated for the ministry, was for a time pastor of German Lutheran churches at New Germantown, N. J., and Bedminster, N. J. In 1772 he went to Woodstock, Va., and

finding that in order to enforce the payment of tithes he must be ordained in the Episcopal Church, he was ordained priest in England. He was chairman of the Shenandoah County committee of safety, and 1774 a member of the Virginia house of burgesses. At Washington's request he became a colonel in the Continental army. His last sermon was upon the duties men owe their country; and saying, "There is a time for all things — a time to preach and a time to fight — and now is the time to fight," he stripped off his gown after the service, appeared in full uniform, called for recruits and enrolled about 300 of the parishioners. He participated in several battles, was made brigadier-general in 1777, and major-general at the close of the Revolution. After the war he removed to Pennsylvania, where he was elected a member of the supreme executive council, and in 1785 became its vice-president. He served as representative in Congress from 1789 to 1795, and from 1799 to 1801. In 1801 he was elected United States senator, but soon resigned and was appointed supervisor of the revenue for the district of Pennsylvania. From 1803 till his death he held the office of collector of the port of Philadelphia. Consult Muhlenberg (H. A.), 'Life' (1849).

**MUHLENBERG, William Augustus**, American clergyman: b. Philadelphia, 16 Sept. 1796; d. New York, 8 April 1877. He was graduated (1814) at the University of Pennsylvania and was ordained deacon (1817) of the Episcopal church and priest three years later, becoming assistant to the rector, Bishop White, of Saint Peters and Saint James parishes. In 1821 he went to Lancaster, Pa., becoming rector of Saint James Church and established there the first public school in the State outside of Philadelphia. He went to Flushing, L. I. (1828), and founded a Christian high school (later Saint Paul's College), he remaining principal till 1846, when he was appointed rector of the church of the Holy Communion, New York City, erected by his sister. He started collecting a fund for the erection of a church hospital out of which Saint Luke's Hospital was built (1858) on 54th street between Fifth and Sixth avenues and he became its first pastor and superintendent, which positions he held till his death. His last very useful work was in founding Saint Johnland Christian industrial community on the north shore of Long Island. In 1843 he organized the first Protestant sisterhood in the United States. He wrote several well-known hymns including 'I Would Not Live Alway': 'Like Noah's Weary Dove'; 'Shout the Glad Tidings.' His chief works published are 'Evangelical Catholic Papers' (1875-77, 2 vols.); 'Christian Education' (1831). Consult Ayres, Sister Anne, 'Life and Work of William Augustus Muhlenberg' (1880).

**MUHLENBERG COLLEGE**, in Allentown, Pa.; founded in 1867 under the auspices of the Lutheran Church. In 1915 there were connected with the college 16 professors and instructors, and about 354 pupils. There were in the library 20,741 volumes. The courses of study lead to the degrees of A.B., B.S. and Ph.B.

**MÜHLHAUSEN**, mül'how-zën, Germany, a town of Alsace-Lorraine. See MÜLHAUSEN.

**MÜHLHAUSEN**, Prussia, town of Saxony, in a fertile district on the Unstrut, 29 miles northwest of Erfurt. It has two interesting old churches, an old town-house, a gymnasium, various technical, commercial and other schools, hospitals, an orphanage, etc. It manufactures woolen and cotton or mixed goods, hosiery, cigars, leather, cycles, sewing-machines, wooden wares, furniture; and carries on tanning, dyeing, malting, brewing, etc. The Anabaptist Münzer, a leader in the Peasants' War, had his headquarters here, and was executed near by in 1525. The town became part of the Kingdom of Prussia in 1815.

**MUHLHEIM**, mül'him. See MÜLHEIM.

**MUIR**, mür, **John**, Scottish Sanskrit scholar: b. Glasgow, 5 Feb. 1810; d. Edinburgh, 7 March 1882. He was educated at Glasgow University and at Haileybury College, whence he passed into the Bengal Civil Service in 1828. He remained in India 25 years, filling various offices in the revenue, educational and judicial departments. His fame will rest on his 'Original Sanskrit Texts on the Origin and History of the People of India, their Religion and Institutions,' illustrated (1858-70). The first volume discusses the legendary accounts of the origin of caste; the second, the primitive homes of the Hindu; the third, the opinions of Hindu writers on the Vedas; the fourth, the contrast between Vedic and later Hindu theology; and the last the cosmological and mythological conceptions of the Indians in the Vedic age. In 1862 he founded a chair of Sanskrit and comparative philology in the University of Edinburgh, following out the plans of the Association for the Better Endowment of Edinburgh University, of which he was the main originator.

**MUIR, John**, American naturalist and explorer: b. Dunbar, Scotland, 21 April 1838; d. Los Angeles, 24 December 1914. He came to America in 1849 with his father, who settled near Fox River, Wis.; entered the University of Wisconsin when 22; and after a special course of four years commenced his lonely journeys through Canada, Eastern and Western United States, the West, and the South, that made him a botanist and a geologist. In 1868 after visiting the Yosemite Valley, he made it his main central camp for 10 years while studying the forests, glaciers, etc., of the Sierra Nevada. He discovered in the High Sierra 65 residual glaciers. He made his first trip to Alaska in 1879, discovered Glacier Bay, and Muir Glacier, named after him, and explored some of the upper courses of the Yukon and Mackenzie rivers; in 1880 accompanied the DeLong search expedition to the Arctic, and in 1903-04 traveled in the Caucasus, Siberia, Manchuria, Japan, India, Egypt, Australia and New Zealand. He has written much for newspapers and periodicals, urging the formation of national parks — both the Sequoia and Yosemite are in great part due to his efforts — and has published 'The Mountains of California' (1894), and 'Our National Parks' (1901). He was a member of the American Academy of Arts and Letters, and received honorary degrees at Yale and the universities of Wisconsin and California. Among his works are 'Stickeen' (1909); 'My First Summer in the Sierra' (1911); 'The Yosemite' (1912); 'Story of my Boyhood and Youth' (1913); and the

posthumous 'Letters to a Friend' and 'Unpublished Prose and Letters' (1915).

**MUIR, Sir William**, Scottish administrator and Arabic scholar: b. Glasgow, 1819; d. 11 July 1905. He attended lectures at the universities of Edinburgh and Glasgow and at 18 entered the Bengal civil service, where he attained distinction. He became secretary of the government of the Northwest provinces and member of the Revenue Board, and during the mutiny was in charge of the Intelligence Department at Agra. He was lieutenant-governor of the Northwest provinces 1868-74, and financial minister to the government of India 1874-76. Returning to England he sat on the Council of India, 1876-85, was elected principal of the University of Edinburgh, 1885-1900. He has published 'Life of Mahomet' (1858-61; abridged ed. 1877); 'Annals of the Early Caliphate' (1883); 'The Koran, Its Composition and Teachings, and the Testimony it Bears to the Holy Scriptures' (1877); 'Extracts from the Koran' (1880); 'The Early Caliphate and Rise of Islam' (1881); 'The Mohammedan Controversy' (1897).

**MUKDEN**, mook'dén, **MOUKDEN**, or **FUNG-TIEN-FU**, capital of Manchuria and of the province of Shinking, situated on the Hun, a tributary of the Liao Rivér, about 500 miles northeast of Peking. Its port is Newchwang, about 120 miles distant, near the Gulf of Liao-Tong. It is the cradle of the Manchu race, and until recently was known by its old Chinese name of Sin-Yang, its Manchu name of Mukden—or "Flourishing Capital"—given to it by its conqueror nearly 200 years ago, being used only in official documents. It is a station on the Russo-Chinese Railroad, and is surrounded by walls laid out in regular parallelograms between one and two miles each way, and built of squared stone or brick, thick and massive at the base and tapering gradually to the top. These walls are 40 feet in height, 21 feet in width, and are protected at the top by an eight-foot crenelated parapet. Outside these walls there is a wide moat, and then come the suburbs, which extend for a mile or more on all sides. These again are enclosed by walls, which are constructed of mud. In the heart of the town is an inner wall, three miles in circuit, enclosing the emperor's residence, the government offices, courts and other buildings connected with them, which are arranged on a plan similar to those of Peking. In 1631 the Manchu monarchs made Mukden the seat of government, and succeeding emperors have done much to enlarge and beautify it. At Mukden are the tombs of the Manchu emperors, and the royal burying ground is ornamented with stone images of elephants as ponderous as some of the carved shapes that mark the graves of Egyptian kings. Other interesting relics of the past in the environs of the city are the Temple of Heaven and the Temple of Earth, both of which were built by Tai Tsung, and the remains of which are still to be seen.

Like all the cities of Manchuria, Mukden is laid out on a regular plan not unlike American towns. The main street runs due north and south, and the second best crosses it at right angles, while parallel to these run a series of alleys teeming with an industrious population.

The city suffered greatly during the uprising of the Boxers in 1900, and was used by the Russian army under Kuropatkin as a base of supplies during the Russo-Japanese War. It was captured (March 1905) by the Japanese army in one of the greatest and most remarkable battles of modern history. Pop. about 250,000. See MANCHURIA.

**MUKHTAR PASHA**, mookh-tär' pash'a (GHAZEE AHMED), Turkish general: b. Brusa, Turkey, 1832. He was educated in the military schools in Brusa and in Constantinople and entered upon a military career. He served in the Crimean War, taught at the military school, became the military instructor of Prince Yusuf Iseddin, the favorite son of Sultan Abd-ul-Aziz, and was second in command of the expedition to Yemen in 1870, receiving the full command and the rank of field-marshal in 1871. In the campaign of 1860 in Montenegro he played a conspicuous part and thereafter received steady and rapid promotion. He became a full general in 1870 and in 1873 was appointed minister of public works. In the wars of Bosnia, Herzegovina and Montenegro in which he commanded he displayed great generalship, gaining 20 victories and never suffering defeat. The campaign of Kars-Erzurum in 1877 went against him and he was defeated by the Russian general Melikoff after a brilliant engagement for which he received the highest Turkish military title, "Ghazee." In 1878 he was made grand master of the Turkish artillery, in which capacity he subdued the Cretan insurrection in that year, and in 1885 was designated to the post of Turkish High Commissioner in Egypt. He remained there about 10 years, and then returned to Constantinople. He was one of the commissioners in 1912 to arrange for a peace with Italy and to pacify Albania. In July 1912 he became Grand Vizier, but resigned in October.

**MULA**, moo'la, Spain, town in the province of Murcia, on a branch of the Segura. It has ancient castle ruins, but is chiefly known on account of its iron and sulphur natural hot baths. Pop. about 11,922.

**MULBERRY**, a genus (*Morus*) of trees of the order *Moraceæ* (q.v.), of which 100 species have been described, but only five are now recognized. The mulberries are characterized by the possession of leaves variable in form even upon the same twigs; monoecious flowers in axillary catkins; and multiple blackberry-like fruits formed by the coherence of the pistillate flowers which became fleshy as they swell. They are natives of the mild parts of Asia, Europe and America, whence they have been taken by man to similar regions throughout the world. In the Old World various species are of economic importance, principally because their foliage supplies the food of the silkworm, and their fruit a dessert and a wine. The wood of most species is of inferior quality, but that of one species, the red mulberry (*M. rubra*), is fine-grained, strong and useful for ship-building. The trees are readily propagated by means of seeds, layers, cuttings or by graftage. They thrive upon almost any soil; even on rocky hillsides and gravelly lands, but succeed best upon arable soil in which they may be planted from 20 to 40 feet apart, and cultivated like other orchard fruits until they have full possession of the ground. The fruits,

which are borne in great profusion, are too soft for market purposes, and usually too sweet for preserving alone. They are generally shaken from the trees upon sheets. Pigs are very fond of them.

The following are the most important species. The white mulberry (*M. alba*) is the silkworm mulberry, and has produced most of the named American varieties valued for their fruit, but not those esteemed in Europe. The black mulberry (*M. nigra*) is the European "dessert" species, and is little used for the feeding of silkworms. The red mulberry (*M. rubra*) is a native American tree to be found from Massachusetts to Nebraska and southward to the Gulf States. It has produced several good dessert varieties, the fruits, of which are characterized by greater acidity than those of the Old World sorts. It seems to be ill adapted to the feeding of silkworms. The so-called Russian mulberry is a variety of the white. It produces inferior fruits but is valued in the Plains States for wind-breaks, for which purpose its ability to resist extremes of drouth, cold and neglect specially fit it. All the above species have produced horticultural varieties, some variegated, others weeping, which are planted more for ornamental purposes than for fruit.

Another important species is the Indian (*M. indica*) which is used in silk culture and for its fruit, which is of fine flavor. It is cultivated in India, China and other countries of the East.

The allied paper-mulberry (*Broussonetia papyrifera*) is a native of Eastern Asia. This tree is of a moderate size, bearing leaves which are either simple or divided into lobes, more or less deep, rough above and hairy beneath. It was originally from India and Japan, but is now very commonly cultivated in Europe, and succeeds even in the more northern parts. The islanders of the Pacific make a kind of clothing from the bark of this tree in the following manner: Twigs of about an inch in diameter are cut and deprived of their bark, which is divided into strips, and left to macerate for some time in running water. After the epidermis has been scraped off, and while yet moist, the strips are laid out upon a plank in such a manner that they touch at the edges, and two or three layers of the same are then placed upon them, taking care to preserve an equal thickness throughout. At the end of 24 hours the whole mass is adherent, when it is removed to a large, flat and perfectly smooth table, and is beaten with little wooden clubs till it has attained the requisite thinness. This kind of cloth is easily torn, and requires to be washed and beaten many times before it acquires its full suppleness and whiteness. The natives dye it red and yellow, and also make a similar cloth from the bread-fruit tree, an allied plant; but that from the mulberry is preferred. The paper which is used in Japan and many other countries in the East Indies is made from this plant. For this purpose the annual shoots are cut after the fall of the leaves, tied in bundles, and boiled in water mixed with ashes; after which the bark is stripped off by longitudinal incisions, and deprived of the brown epidermis. The mark of the more tender shoots is separated from the rest, as it furnishes a white paper for writing, while that produced by the

remainder is coarse and gray, and serves for wrapping or similar purposes.

**MULCH**, any material kept in a loose condition at the surface of the soil for the purpose of checking evaporation, conserving moisture, protecting plant-roots or low-growing plants from frost or heat, preventing puddling and washing of the soil, retarding growth in spring, keeping the surface soil open, supplying plant-food, protecting fruit or flowers from dirt, and keeping down weeds. The materials most frequently applied are straw, marsh-hay, leaves, litter and brush; but the most widely important mulch is the surface soil itself, kept powdery by frequent tillage, given especially after rains when it is desirable to break the crust formed upon the surface. Since mulches keep the soil beneath them moist by breaking the capillary, they are of particular advantage in dry climates; but since the vegetable mulches, such as straw and leaves, cannot be used in summer where the land must be cultivated and since they supply hiding places for insects, they can rarely be used advantageously in fruit plantations, in which they are often also a positive detriment because they encourage the growth of roots near the surface. In climates liable to extremes of temperature this position of the feeding roots is often disastrous to the crop if not to the plants themselves. Except, therefore, for winter protection, when such seems to be necessary, the soil itself is generally best. But the depth of the powdery layer will depend largely upon the climate, character of the soil, and kind of crop; in arid regions, with light soils, and with deep-rooted plants, the soil-mulches are usually deeper than with the reverse conditions.

**MULDER**, mool'dër, **Gerardus Johannes**, Dutch chemist and physician: b. Utrecht, Holland, 27 Dec. 1802; d. there, April 1880. He was educated at the University of Utrecht and became professor of botany and chemistry there (1840-68), but first practised medicine in Amsterdam for some years. He was also for a short time professor of chemistry at Rotterdam. He became known chiefly through his researches on the proteids, and advanced the belief in a hypothetical substance which he called protein. This he believed to be the essential nitrogenous constituent of food, existing in animals, and derived ready-formed from plants and vegetables. The publication of this theory involved Mulder in a controversy with Liebig, who from the first doubted the existence of protein as an independent chemical compound. The whole theory has been abandoned, and the word protein is now used to indicate the first element in compounds. His principal work 'Chemistry of Vegetable and Animal Physiology' has been translated into English by Fromberg, and his 'Chemistry of Wine,' by Bence Jones. He also wrote 'Chemical Researches'; 'De Voeding in Nederland'; 'De Voeding van den Neger in Suriname,' and his posthumous autobiography 'Levensschets' (1881; 2d ed. 1883).

**MULE**, in zoology, a term loosely used as synonymous with hybrid, more usually applied to the produce of a male ass with a mare, the mule proper, and to the hinny, the offspring of a stallion and a she-ass. The mule does not

attain maturity as soon as the horse, but is useful a much longer period. As a beast of burden it is in some respects preferable to the horse; it is easily fed, is equally good for carrying and drawing, its less sensitive skin enables it to support exposure to the weather; like the ass, it enjoys comparative immunity from disease, and it is as surefooted as a goat. Mules have been known from the earliest ages; there are frequent references to them in Scripture and in Greek and Latin literature. Kentucky, Missouri and Kansas take the lead in mule-raising in the United States, and the small Mexican mule is a very useful animal. France is the most important mule-raising country in Europe; then come Italy, Spain and Portugal, where they are used for pack and draft. They are largely employed as draft animals in warfare. Fecundation of the hybrid-female by the male ass or the stallion is not very rare, though she rarely throws a living foal. Consult Fegetmeier, 'Horses, Asses and Zebras' (London, 1895), and publications of the United States Department of Agriculture. (See HYBRIDITY). In 1910 there were 4,480,140 mules in the United States, valued at \$564,766,397. The average value per head was \$126.06. For further statistics see LIVESTOCK, AMERICAN.

**MULE DEER, or BLACKTAIL**, a deer of the western United States (*Odocoileus hemionus*), remarkable for its disproportionately large ears. Its common name "blacktail" among the hunters is due to the black color of the terminal part of the tail, distinguishing it from the "whitetail" or eastern deer (q.v.); but is better reserved for the Pacific Coast species. (See BLACKTAIL). This deer is rather larger than the eastern one and is a deer of the rocky plains, and especially of the mountains, which it climbs in summer as high as it can go, pasturing upon alpine slopes and resting upon the summits of cliffs and ledges where it has a wide outlook. Its gait is very distinctive, also, consisting of a series of jerking bounds very effective on declivities, but looking strange on a level plain. The character of the sport afforded by this deer depends much upon the kind of country in which it is hunted, the method of pursuit being very different in the chaparral of southern California from that followed among the broken plains of Montana. When hiding in summer it will often wait until almost touched before starting off. In winter it gathers into herds and wanders among sheltering hills and vales. It is therefore the characteristic deer of the Rocky Mountain region and was formerly exceedingly numerous and one of the principal sources of food and clothing for the Indians. Originally the species occurred commonly as far east as the plains and prairies extended; but was early exterminated in the central Mississippi Valley; and from about 1875 to 1895 was the object of persistent slaughter by hide hunters. At the beginning of the present century, therefore, it had nearly disappeared from the plains south of the upper Missouri, was scarce in the central Rockies and numerous only in the less frequented parts of the Northwestern States and adjoining provinces of Canada. Its hide makes the best tanned deer-leather (buckskin) and its flesh is excellent. The mule deer is not much taller than the Virginian deer, standing about

three feet four inches high at the shoulder, but is heavier and of coarser build. The ears are very large and thickly haired, the tail roundish and white with black tip. The coat is dull yellowish in summer, palest in the southern desert varieties, but becomes bluish gray with the autumnal molt; face between the eyes dusky, elsewhere white; throat, abdomen and inside of the legs white; antlers forking equally and each prong again bifurcating. Consult Baillie-Grohman, 'Fifteen Years' Sport and Life in the Hunting Grounds of Western America' (1900); Caton, 'Antelope and Deer of America' (1877); Lydekker, 'Deer of all Lands' (1898); Roosevelt (and others), 'The Deer Family' (1902).

**MULE-KILLER.** See MANTIS.

**MULE MACHINE**, a spinning-machine in which the rovings are delivered from a series of sets of drawing rollers to spindles placed on a carriage, which travels away from the rollers while the thread is being twisted and returns toward the rollers while the thread is being wound. It was invented by Samuel Crompton, of Bolton, England, and perfected in 1779. The combination which gave rise to the term mule was the junction of the drawing rollers of Arkwright with the spinning jenny of Hargreaves. The object of the machine is to deliver the roving with the required degree of attenuation and twist it as delivered. For this purpose the spindles, instead of being stationary, are placed on a movable carriage which is wheeled out to twist the threads and wheeled in again to wind on the spindles.

**MULE AS A WORK ANIMAL, The.** The use of mules for doing the work of the world is almost as old as history. The historical records that have come down to us recounting the exploits and industrial achievements of the more civilized peoples of the earth have all mentioned the mule. The impression which one gathers from reading the opinions of the earlier peoples is that the mule was highly regarded, particularly as a burden bearer.

So far as the writer has been able to determine, there are no unfavorable reports of the work of mules. On the other hand the unanimous opinion of those who have had most to do with the utilization of mules is that they are in many respects the most efficient and satisfactory work animals employed by mankind.

In more modern history the evidence of the value of mules is still more thoroughly recognized. The number of mules in the United States has increased rapidly. One hundred years ago the mule was not generally used as a draft animal except in a few Southern States. At the present time the mule is used to a greater or less extent in every State of the Union. He is particularly valued in the South, in the Middle West and the West. In these great agricultural regions the mule has won a place in competition with horses and he will not be replaced unless we should ultimately come to a type of farm practice which will make it possible to employ mechanical motors exclusively for agricultural production.

The favorable opinion of mules as work animals is not due to any accident nor indeed to any peculiar psychology of those who have used the mule largely in their industrial occu-

pations. There are certain outstanding qualities characteristic of the mule which single him out from among other types of draft animals and have made him what he is to-day—undoubtedly one of the most popular and economical of draft animals.

The mule is recognized as possessing unusual endurance, exceptional courage, sure-footedness, steadiness and is exceptionally free from excitability and harmful nervousness. The mule is also given credit for the possession of an unusual amount of instinctive wisdom which protects him against many of the dangers and accidents to which horses are subject.

No draft animal so far developed has the endurance of the mule under all kinds of hard working conditions. In the excessive hot climate of the tropics mules will work steadily day after day without injury to themselves and will accomplish an astonishingly large amount of productive labor. Under similar conditions horses are far less efficient and indeed it is plain that under many such conditions horses are entirely unable to accomplish the work. On the arid plains and in the desert regions of the world the endurance of the mule has been recognized and particularly where the trails are rocky the mule outlasts any other draft animal.

A part of the endurance of the mule is due to his temperament, a part to his sound, thoroughly good feet and a part to his instinctive food habits. The mule is not so well adapted to the sandy stretches of the arid regions because his small, somewhat pointed foot causes him to sink more deeply into the sand than flat-footed horses. The mule is sure-footed. Over the dangerous trails of the mountains the mule rarely meets with an accident. He is wise in selecting his foothold and will carry the rider or pack safely along precipitous trails where under similar conditions horses would be unsatisfactory.

On the farms, particularly of the Middle West and the South, the mule is more economical. The statement is frequently made that the mule requires less food for the performance of a given amount of work than the horse. This is the general opinion among farmers experienced in the use of mules. Investigations on this point are not numerous and are not thoroughly convincing, but in the main the conclusion that mules will consume less food than horses is probably true. It is certainly true that mules will thrive on a coarser character of fodder. They will thrive under conditions which would be impossible for horses.

The mule will rarely if ever injure himself by over-heating, over-eating or drinking when he is too hot. Under similar conditions horses are frequently injured and their usefulness greatly diminished.

This interesting hybrid, descended from the ancient wild ass of the deserts, has inherited a certain type of wisdom which protects him from the dangers incident to civilization. The mule avoids accidents. On the farms of Missouri where mules attain their highest development the risk from rearing young mules, so far as acquiring blemishes is concerned, is much smaller than the risks from similar accidents among young horses. This is an economic factor which is clearly recognized and one which constitutes an argument for the increased profit

in the raising of mules. In the earlier use of mules in this country the small, active, hardy mule of good quality was universally favored. In more recent years with the larger use of heavy farm machinery, larger mules have been in demand. At the present time (1919) the large draft mule of good quality sells for the highest price on the market. The draft mules are not only used in the cities for heavy hauling but farmers also now more often demand the heavy mule than in former years. The smaller mules, known on the market as "cotton" mules, are more generally sold in the South. The draft mules are sold in the mining regions, for city drayage and on larger farms of the Middle West. The "sugar" mule is a larger mule than the "cotton" mule and is demanded in the cane-growing regions of the South. The demand for large draft mules has caused the breeders of jacks and jennets to produce a large jack of good quality. This animal mated to the mares belonging to the principal draft breeds of the United States is the source of the draft mules of America. These draft mules may perhaps lack somewhat in quality as compared with the smaller, more active mules of earlier history but they do possess a power and efficiency in the hauling of heavy loads which is comparable to the similar power of great draft horses so long used on the city streets.

This brief article on the value of the mule as a work animal would not be complete without recognizing the great value of the mule in war. During the great European War the Allies made large use of the mule in transporting artillery and supplies, particularly in carrying supplies to the front. The mule because of his courage and steady, reliable subservience was dependable under fire and could be used where horses could not be employed.

The rearing of mules has come to be as much an art based upon scientific principles of breeding as has the production of any other class of domestic animals. While it is true that the mule is a hybrid and always sterile, the principles of breeding which may be applied in his production are more complicated and involve the successful breeding of two distinct species, it is nevertheless true that the value of the mule for industrial purposes is to-day as largely dependent upon the skill of the breeder as is the breeding of cattle, horses, sheep or swine.

FREDERICK B. MUMFORD,  
*Dean and Director of the College of Agriculture, University of Missouri.*

**MULFORD, Elisha**, American Episcopal clergyman and philosophical writer: b. Montrose, Pa., 10 Nov. 1833; d. Cambridge, Mass., 9 Dec. 1885. He was graduated from Yale in 1855 and subsequently studied theology, law and philosophy. He entered the Episcopal ministry and held several rectorates, but from 1881 lived in Cambridge, Mass. He wrote 'The Nation' (1870), a treatise on the philosophy of the State, and 'The Republic of God' (1881), relating to the philosophy of religion. From 1881 till his death he taught at the Episcopal Theological School at Cambridge, Mass.

**MULHALL, Michael George**, Irish statistician: b. Dublin, Ireland, 1836; d. Killiney, Ireland, 12 Dec. 1900. He was educated in the

Irish College at Rome, and in 1861 went to Buenos Aires, where he founded the *Standard*, the first English daily paper in South America. He gained a wide reputation as a statistician, and in 1880 made a calculation of the census of the United States for 1900 which came within 95,000 of the number given by the census report in that year. He was a frequent contributor to the *Contemporary Review*, and published 'Rio Grande do Sul and Its German Colonies' (1873); 'A Dictionary of Statistics' (1883); 'Fifty Years of National Progress, 1837-87' (1887); 'Industries and Wealth of Nations' (1896), etc. His wife, MRS. MARION MULHALL, wrote 'Between the Amazon and the Andes' (1883); 'Celtic Sources of Dante's Divine Comedy.'

**MULHAUSEN**, mül'how-zën, or **MUHLHAUSEN** (French, *Mulhouse*), Germany, a town of Alsace-Lorraine, on the Unstrut River and the Rhône Canal, 66 miles by rail southwest of Strassburg, and 18 miles northwest of Basel, Switzerland. It is an important commercial and manufacturing centre, the principal seat of cotton spinning in western Germany, and carries on calico printing, dyeing, the spinning of woolen and worsted yarn, the manufacture of machinery, railway material and numerous other industries. Its industrial importance dates from 1746, when a cotton-factory was established. It is noted for its model dwellings for the working classes in the "cité ouvrière," workingmen's colony, on the northwest, founded by Mayor Dollfus in 1853. A migration to the suburbs, however, left the artisan colony in the occupation of small tradesmen. Mülhausen is first mentioned in 717; it became an imperial free city in 1273, and in the 15th century entered into an alliance with the Swiss, which lasted till 1798, when it became French. It was included in the cession of Alsace to Germany in 1871. In the great European War (q.v.) it was the scene of considerable military activity. Pop. about 95,000.

**MÜLHEIM**, mül'him, or **MÜHLHEIM**, Prussia, two towns of the Rhine province: (1) Mülheim-on-the-Rhine, with a bridge spanning the river, is almost opposite Cologne. The town has manufactures of machinery, cables, wire ropes, wagons, velvet, silk, chemicals, etc. From 1914, the town with Cologne suffered from the operations of Allied aviators during the great European War. Pop. 53,500. (2) Mülheim-on-the-Ruhr, 14 miles north of Düsseldorf, has coal and iron mines, iron foundries, manufactures of iron-ware, machinery, glass, woolen and cotton goods, and a considerable trade in sandstone, building materials and coal. The Ruhr is crossed here by a chain bridge and a railway bridge. Pop. about 112,500.

**MULHOLLAND**, mül'höl'änd, William, American hydraulic engineer: b. Belfast, Ireland, 11 Sept. 1855. He was educated at the Christian Brothers' School, Dublin. Coming to the United States, he became superintendent and chief engineer of the waterworks of Los Angeles, Cal., from 1886. He devised the plans and estimates, then superintended the construction of the Los Angeles aqueduct to bring to the city water from the Sierra Nevada Mountains, a distance of about 250 miles, at a cost of \$24,500,000. He has been consulting

engineer on many projected water supply and irrigation plants.

**MULITA**, a small armadillo, with head and ears like those of a mule, native to southern South America.

**MULL**, Scotland, an island of Argyllshire, the largest of the Inner Hebrides next to Skye. Its length is 35 miles; greatest breadth, 30; superficial area, 347 square miles. It is irregular in shape, and the large bay on the west side contains a number of islands, including Ulva and Staffa. Iona lies off its southwest extremity. The island is rugged and mountainous; Benmore, the highest mountain, is over 3,000 feet above the level of the sea. The principal village is Tobermory; pop. about 1,000. Between the island and the mainland, on the northeast, is the Sound of Mull, from one to three miles wide.

**MULLANY**, mül-lä'ní, James Robert Madison, American naval officer: b. New York, 26 Oct. 1818; d. Bryn Mawr, Pa., 17 Sept. 1887. He was appointed to the navy as midshipman in 1832 and received steady promotion, becoming lieutenant in 1844. He served with distinction in the Mexican War, and at the outbreak of the Civil War in 1861 was promoted commander. He commanded the *Oneida* in the battle of Mobile Bay and performed valiant service with her on that occasion, losing his left arm. He was commissioned commodore in 1870 and rear-admiral in 1874, and until 1876 was in command of the North Atlantic squadron, and in conjunction with General Emory and General Sheridan at New Orleans protected American interests on the Isthmus of Panama. From 1876 until 1879, when he was retired from active service, he was governor of the naval station at Philadelphia.

**MULLANY**, Patrick Francis. See AZARIAS, BROTHER.

**MULLEIN**, a genus of biennial and perennial herbs (*Verbascum*) of the natural order *Scrophulariaceæ*. The species, of which more than 100 have been described and more than 30 are cultivated, have tap roots, woolly foliage in rosettes during the first year, and terminal spikes or racemes of small, usually yellow, flowers which appear from midsummer until late autumn. Some species were formerly reputed medicinal. In America they are usually considered as weeds, but in Europe they are valued as ornamental plants, particularly for mixing with shrubbery and planting in the rear of flower borders. Though natives of the Mediterranean region, some species are known in England as American flannel or velvet plant. The best-known species in the United States are probably the moth mullein (*V. blattaria*), the common mullein (*V. thapsus*), the white mullein (*V. lychnitis*), and *V. phlomoides*, which are all common in pastures and uncultivated fields.

**MÜLLER**, mü'lër, Adam Heinrich, German economist: b. Berlin; 1779; d. 1829. In his 19th year he went to the University of Göttingen, where he at first occupied himself with theology and then became a student of jurisprudence, in which he was a pupil of Hugo. He afterward sought to complete his education by the private study of the natural sciences, which he had previously neglected,

He early formed a close intimacy with Friedrich Gentz, his elder by 15 years; and this connection exercised an important influence both on his material circumstances and his mental development in after life. The two men differed widely in character and in their fundamental principles, but agreed, at least in their later period, in their practical political aims, and the friendship was only terminated by death. Müller's relations with the Junker party and his co-operation with them in their opposition to Hardenberg's reforms made any public employment in Prussia impossible for him. In 1805 he was in Vienna, where he became a convert to Roman Catholicism, and through Gentz was brought into relations with Metternich, to whom he was useful in the preparation of state papers. In 1806-09 he was in Dresden, being occupied in the political education of Prince Bernhard of Saxe-Weimar. In 1813 he entered the Austrian service, and in 1815 accompanied the Allies to Paris. He was enabled by the emperor in 1820. In 1827 he settled a second time in Vienna, and was employed in the state chancellery. He was one of the principal literary instruments of the reaction and took part in framing the Carlsbad resolutions. He was distinguished as a writer not only on politics and economics, but on literature and æsthetics. His principal work is his 'Elemente der Staatskunst' (1809), which contains the substance of a course of lectures delivered at Dresden to statesmen and diplomats. In political economy he represents a reaction against the doctrines of Adam Smith, whom, while he highly commends him in certain respects, he censures as presenting a one-sidedly material and individualistic conception of society, and as being too exclusively English in his views. Müller's leading idea is that of the organic unity and continuity of the state and of social institutions in general. Some of his higher tendencies, freed from much of their alloy, are reproduced in the writings of the historical school of German economists. Other works by Müller are 'Die Theorie der Staats-haushaltung und ihre Fortschritte in Deutschland und England seit Adam Smith' (1812); 'Versuch einer neuen Theorie des Geldes' (1816); 'Vermischte Schriften über Staat Philosophie und Kunst' (2 vols., Vienna 1817); and 'Von der Nothwendigkeit einer theologischen Grundlage der gesammten Staatswissenschaften und der Staatswirthschaft insbesondere' (1819). Consult biographical notice of Mischler in 'Allgemeine Deutsche Biographie.'

**MÜLLER, Charles Louis**, French painter: b. Paris, 22 Dec. 1815; d. there, 10 Jan. 1892. He was the pupil of L. Cogniet, Baron Gros and others in the Ecole des Beaux-Arts, and in 1850 was made director of the manufactory of Gobelins tapestries. His fertility in the production of historic pictures and portraits was amazing. Among them are 'Heliogabalus' (1841); 'Primavera' (1846); 'May-day'; 'Lady Macbeth'; and his masterpiece, 'The Last Victims to the Reign of Terror'; the last two being in the Luxembourg; 'Vive l'Empereur' (1855); 'Marie Antoinette' (1857); 'A Mass During the Reign of Terror' (1863); 'The Madness of King Lear' (1875); 'Mater Dolorosa' (1877). He executed the frescoes of the Salle d'Etat in the Louvre, and

as a painter is more to be commended for clever drawing and composition than for his somewhat flat and mediocre coloring. In 1864 he became a member of the Institute.

**MÜLLER, Friedrich**, called "Maler Müller," or "Müller the Painter," German artist and poet: b. Kreuznach, 13 Jan. 1749; d. Rome, 23 April 1825. Some of his etchings, animals, compositions in the Flemish style, pastoral scenes, etc., were remarkable for their originality and freedom. He deserves more credit as a poet, for at a time when German poetry had degenerated, Müller helped to give a new impulse to German literature. His best works, 'Nible,' 'Faust' and 'Genevieve,' are characterized by richness, warmth and elevated delineation of character, though sometimes wild and disconnected.

**MÜLLER, Friedrich Max** (known as Max Müller), English philologist: b. Dessau, Germany, 6 Dec. 1823; d. Oxford, 28 Oct. 1900. His father was Wilhelm Müller (q.v.), a famous German lyricist, and his maternal great-grandfather Basedow, the educational reformer. His bringing up was in his mother's hands, as his father died when the boy was four. He studied in Leipzig, at the Nicolaischule; had some thoughts of becoming a musician, but entered the University of Leipzig in 1841, and there, under the leadership of Hermann Brochhaus, devoted himself to Sanskrit, publishing a German version of the 'Hitopadēśa' in 1844; worked under Bopp in philology and Schelling in philosophy at Berlin for a year; in 1845 went to Paris, where Burnouf suggested to him an edition of the 'Rig Veda'; and in 1846 went to England and interested the East India Company in this work, which he undertook at the expense of the company. He was in Paris in 1848, and brought to Palmerston, in London, the first news of Louis Philippe's flight from Paris. In the same year he settled in Oxford, where the 'Rig Veda' appeared, with Sāyana's commentary, 1849-74. He became deputy Taylorian professor in 1850, and Fellow of All Souls' in 1858; but in 1860 was defeated in his candidacy for the chair of Sanskrit by Monier Williams, after a fierce fight on the part of his opponents, who objected partly to his foreign birth and partly to his very free and unorthodox religious views. The result for linguistic science was unfortunate, as it turned Max Müller from the narrow field of Sanskrit, in which he easily outranked his contemporaries, to comparative philology and the science of religion, in which his achievements were less exact and scholarly, to say the least. In 1868 he became professor of comparative philology at Oxford. He was made a privy councillor in 1896. His greatest single work was as editor of the 'Sacred Books of the East,' a series of English versions of Oriental scriptures, to which he contributed three volumes, and which was begun in 1879 and is not yet complete. He is possibly even better known as a popularizer of the first principles of linguistic science, so that he became in the lay mind the main exponent of this science, whereas his grasp of its detail was inadequate, and many of the etymologies he advanced showed that he was not conversant with the strict rules of phonetics. But the charm of his style, his general grasp of so large a subject, and his admitted pre-eminence in San-

skrit, make interesting and valuable, if not absolutely authoritative, reading of 'The Science of Language' (1861-63); 'Essays on Language and Literature,' and 'Biographies of Words' (1888), all of which have passed through new editions. Max Müller's works on mythology and religion also have a higher repute among general readers than with the specialist, but it cannot be denied that they did much good in stimulating research, as the 'Sacred Books' did in supplying a field for such research. In this class of writings mention should be made of the 'Essay on Comparative Mythology' (1856); 'Introduction to the Science of Religion' (1873); 'The Origin and Growth of Religion' (1878); 'Natural Religion' (1889); 'Physical Religion' (1891); 'Anthropological Religion' (1892); 'Theosophy, or Psychological Religion' (1893); the 'Essays on Mythology and Folklore' in the 4th volume of 'Chips from a German Workshop'; and 'Contributions to the Science of Mythology' (1897). His versions from the Sanskrit and the Pāli have been alluded to; 'A History of Ancient Sanskrit Literature' (1859), and a 'Sanskrit Grammar' also should be mentioned, and it should be borne in mind that it is in this field that the scholar spoke with authority. From his youth Max Müller was interested in philosophy; he wrote an excellent version of Kant's 'Critique of Pure Reason' (1881); also 'The Science of Thought' (1887), urging that thought was inconceivable without language, and the Oriental studies, 'Three Lectures on the Vedānta Philosophy' (1894), and 'The Six Systems of Indian Philosophy' (1899). An entirely different side of the man is disclosed by 'My Indian Friends' (1899), which shows much of his broad and charming personality; or by 'Deutsche Liebe' (1857), a romantic and popular story translated into French, Italian and Russian, and appearing in English in two versions, one American, unauthorized and very successful, and a later one (1873) by Mrs. Max Müller. He also edited his father's poems (1868), and Scherer's 'History of German Literature.' His collected works, including the four volumes of 'Chips from a German Workshop' (1867-75), appeared 1898 et seq. Consult his own 'Auld Lang Syne' (1898), and 'My Autobiography' (1901); his wife's 'Life and Letters of Max Müller (1902); and Whitney, W. D., 'Max Müller and the Science of Language' (New York 1892).

**MÜLLER, Georg Friedrich**, German-English philanthropist: b. Kroppenstädt, Prussia, 27 Sept. 1805; d. Bristol, England, 10 March 1898. Entering the University of Halle as a student of theology in 1825, although he had fallen into irregularities of life, he was converted before the end of that year, and in the following year began to preach and teach. In 1829 he went to London, whither the Society for Promoting Christianity Among the Jews had invited him, settled at Teignmouth as pastor of Ebenezer Chapel, where he gave up pew-rents and substituted box-collections, finally refusing a salary and depending on voluntary gifts. In 1832 he joined Henry Craik, a prominent member of the sect of Plymouth Brethren, in ministerial work at Bristol. In 1835 he published a proposal for the establishment of an orphan home, which took shape in 1836 at Bristol. The ex-

periment was successful, the work grew from year to year, and by 1875 no less than 2,000 children were lodged, fed and educated without other financial maintenance than that received in donations from all parts of the world. The orphanage was moved in 1849 to Ashley Down, a suburb of Bristol. With his wife Müller made evangelistic tours in Europe, America and Asia. He published 'A Narrative of Some of the Lord's Dealings with Georg Müller' (1837). Consult biographies by Pierson (New York 1899); by Warne (New York 1911).

**MÜLLER, Johann Friedrich Theodor**, yō hān fréd'rīh tā'ō-dōr (better known as **Fritz Müller**, and also known as **MÜLLER-DESTERRO**), German naturalist: b. near Erfurt, 31 March 1821; d. 1897. After studying at the universities of Greifswald and Berlin, he went to South America in 1848, and settled on the island of Santa Catharina, Brazil, living there the ordinary pioneer's life until appointed (1856) to teach natural history and mathematics in the Desterro gymnasium. From 1874 he was engaged for a time as collector for the museum at Rio de Janeiro. His published papers on crustaceans, insects, worms, jelly-fishes, etc., were many, most of them appearing in the 'Annals' of the Rio de Janeiro Museum, Wiegmann's 'Archiv für Naturgeschichte,' and similar publications. In his 'Facts for Darwin' (1864), a book written under the stimulus of Darwin's 'Origin of Species,' he made valuable applications of Darwinianism in new fields, and won reputation among men of science for the originality and fertility of his observations and deductions. Among the more important pieces of work which he did were researches on mimicry (q.v.) and the first clear statement of the theory of recapitulation (q.v.).

**MÜLLER, Johann Gotthard von**, German engraver: b. Bernhausen, near Stuttgart, 4 May 1747; d. Stuttgart, 14 March 1830. After studying under Guibal, the painter, he turned to engraving, and in 1770 went to Paris, where, under Willie, he studied for six years, and after winning several prizes was elected to membership in the French Academy. Returning in 1776 to Stuttgart, he taught there for nine years. While there he was called to Paris to engrave a portrait of Louis XVI. This is regarded as his most important work, next to which may be ranked his 'Battle of Bunker Hill,' after Trumbull; 'Madonna della Seggiola,' after Raphael, etc. He was knighted in 1818.

**MÜLLER, Johannes**, German physiologist: b. Coblenz, Prussia, 14 July 1801; d. Berlin, 28 April 1858. He studied, from 1819, at Bonn and Berlin, started service (1824) as private dozent of physiology and comparative anatomy at Bonn, and became assistant professor (1830), then (1833) professor of anatomy and physiology at Berlin. His first important works, 'Zur vergleichenden Physiologie des Gesichtsinns' (Leipzig 1826) and 'Über die phantastischen Gesichterscheinungen' (Coblenz 1826), are of a subjective philosophical tendency, the first concerning the most important facts as to human and animal sight; the second sounds depths of difficult psychological problems. He soon became the leader in the science of the morphological treatment of zoology as well as

of experimental physiology. To his active researches (1830) are due the foundation of the Bell law concerning the work of the roots of the nerves of the spinal marrow, the settlement of the theory of reflex action, the more exact knowledge of the blood's constitution, lymph, chyle, etc. He even investigated the vocal organs and sound expression, producing fundamental work on the sense of hearing. He finished his great work 'Handbuch der Physiologie des Menschen' (Coblenz 1833-40; 4th ed., 1841-44) in Berlin. It has been translated into English under the title 'Elements of Physiology' (1837-43). The work discloses an entire knowledge of physiology, including comparative organology and medical histology from their microscopical and chemical viewpoints. The work was epoch-making. From 1833 he issued numerous treatises on comparative and pathological anatomy and systematic zoology. Of such should be cited 'Der vergleichende Anatomie der Myxinoiden' (Berlin 1835-41); 'Beschreibung der Plagiostomen' (ib. 1838-41), in collaboration with Jacob Henle; 'Ueber den Bau und die Grenzen der Ganoiden und das natürliche System der Fische' (ib. 1844); 'Ueber die Larven und die Metamorphose der Echino-dermen' (ib. 1849). His 'Ueber den feineren Bau der krankhaften Geschwülste' (ib. 1838), which was never finished, was a pioneer for microscopical research in pathological anatomy. From then on he worked almost exclusively in the realm of comparative anatomy and brought forth numerous researches concerning the lower animals. He took 19 trips to the Baltic and North Sea, the Adriatic and the Mediterranean to investigate salt-water life. It is declared of him that he was the most versatile, fruitful, genial and lucky investigator of modern days, and he maintained his vitality till the end. He never questioned the rights of philosophy or even faith nor positive religion, but no single being has done more toward placing physics and chemistry in their correct place in physiology and establishing the true method in contrast with the errors of natural philosophy, spiritualism and orthodoxy, for all time. From 1834 he published *Archiv für Anatomie, Physiologie und wissenschaftliche Medizin*. In 1899 a bronze statue was erected in his memory at Coblenz. Consult his biographies by Virchow (Berlin 1858) and De Bois-Reymond (ib. 1860).

**MÜLLER, Johannes von**, German-Swiss historian: b. Schaffhausen, 3 Jan. 1752; d. Cassel, 29 May 1809. He studied at Göttingen, and in 1772 became professor of Greek at the gymnasium at Schaffhausen, and published 'Bellum Cimbricum,' his first work. He lived and taught in Geneva 1774-80, where he began his 'Allgemeine Geschichte' (3 vols., 1810), and published the first volume of his 'Geschichte der Schweizer.' From 1781 to 1786 he taught history and statistics at the Collegium Carolinum at Cassel. In 1786 he became librarian and councillor of state to the Elector of Mainz. Here he wrote his 'Geschichte der schweizerischen Eidgenossenschaft' and several other works. In 1792, when Mainz was taken by the French, he went to Vienna, where the Emperor Leopold nominated him a member of the Privy Council. In 1804 he left Vienna for

Berlin, where he was appointed historiographer of the Hohenzollern family. He also published 'Ueber die Geschichte Friedrich I'; 'Ueber den Untergang der Freiheit der Alten Völker'; 'Versuch über die Zeitrechnungen der Vorwelt.' After the battle of Jena, he was appointed by Napoleon (1807) Secretary of State in the new kingdom of Westphalia. His 'Sämmtliche Werke' appeared in 27 volumes (1800-17); (new ed., 40 vols., 1831-35). Consult lives by Heeren (1820); Döring (1835); Monnard, in French (1839), and Thiersch (1881).

**MÜLLER, Julius**, German theologian: b. Brieg, Prussia, 10 April 1801; d. Halle, Germany, 27 Sept. 1878. He was educated at Breslau and Göttingen, and abandoned the study of law for theology. He was opposed to the Rationalists, and in 1825-31 was in charge of several small parishes. In 1831 he was preacher at Göttingen University, and in 1834 was elected professor of theology there. From 1835-39 he was professor in Marburg, and for the remainder of his life filled the chair of theology at Halle. His greatest work is 'Die christliche Lehre von der Sünde' (1829; trans. Edinburgh 1868), and among his other books are 'The Evangelical Union' (1854); 'Dogmatische Abhandlungen' (1870), etc.

**MÜLLER, Karl Otfried**, German archaeologist and philologist: b. Brieg, Silesia, 1797; d. Athens, 1 Aug. 1840. The son of a field preacher, his education began at the gymnasium of his native town. He was then sent to Breslau, and afterward went to Berlin, where, as a pupil of Böckh, he devoted himself to the study of the life and art of the ancients. After publishing the 'Ægineticorum Liber' (1817) he was appointed instructor in the Magdalum at Breslau. Here he made an elaborate analysis of Greek mythology, separating allegorical inventions from true history. In 1819 he was made professor of philology and in 1823 became professor ordinarius at Göttingen. He was a great traveler, and his writings embrace the whole circle of antiquity. His intention was undoubtedly to concentrate the results of his whole life of scholarly activity in his great work, 'Geschichte helenischer Stämme und Städte.' He only completed two volumes, however: Vol. I, 'Orchomenos und die Minyer' (1820), and Vol. II, 'Die Dorier' (1824). One of his best-known works, 'A History of the Literature of Ancient Greece,' a translation by Lewis and Donaldson from the author's manuscript, was published in London in 1840, and the continuator, Donaldson, published another edition in 1858. His 'Kunstarchäologische Werke,' in five volumes (1872-73), is a valuable work. Müller's 'Æschylus's Eumenides' (Göttingen 1833) was the object of a profound controversy in which Gottfried Hermann and his followers attacked him with great bitterness. Karl Müller was also prominent as an editor. Consult the biography by F. Ranke (1870).

**MÜLLER, Morten.** See MORTEN-MÜLLER.

**MÜLLER, Victor**, German historical painter: b. Frankfurt, 29 March 1829; d. Munich, 21 Dec. 1871. Beginning his artistic career at the Frankfort art school, he continued it at Antwerp and ultimately went to Paris (1849), where he stayed for 11 years, dili-

gently studying the methods and manner of Couture, Delacroix and Courbet. He settled in Munich in 1865, and for the castle of Kronberg in the Taunus painted a series of scenes from the history of Baron Hartmuth von Kronberg. He also produced his famous 'Hero and Leander.' Following these works came 'Hamlet with Horatio in the Churchyard'; 'Ophelia'; 'Romeo and Juliet,' and his last and unfinished work, 'Faust on a Stroll.' Among his other works are 'Wood Nymph'; 'Tannhäuser in Venusberg'; 'A Scene from Les Misérables.' His last finished picture was a 'Flower Girl.' All of his works are distinguished by a certain literary or poetic character which appeals to the fancy like a strain of lyric music, although the coloring sometimes runs in its vividness to the verge of extravagance.

**MÜLLER, Wilhelm**, German poet: b. Dessau, 7 Oct. 1794; d. there, 30 Sept. 1827. He studied at Berlin, but the war of 1813 called him from his books, and he was present as a volunteer in the Prussian army at the battles of Lützen, Bautzen, Hanau and Kulm. In 1814 he returned to his studies at Berlin. His journey to Italy (1819) produced his ingenious work 'Rom, Römer und Römerinnen' (1820), and on his return to Germany he became teacher of Latin and Greek in the newly-established school at Dessau, where he was also appointed ducal librarian. In 1824 appeared his 'Gedichte aus den hinterlassenen Papieren eines reisenden Waldhornisten.' His 'Lieder der Griechen' (1821-24) celebrate the awakening of an oppressed nation, its struggle and its victory. His 'Lyrische Spaziergänge' (Leipzig 1827) displays the same truth to nature, freshness and fire and the same harmony of language which characterizes his other poems. Many of his poems imitate with utmost perfection the true German Volkslied. Several of the 'Müllerlieder' are familiar through Franz Schubert's remarkable musical settings. His 'Bibliothek deutscher Dichter des 17. Jahrhunderts' (1822-27) is a valuable collection of the best lyric poems of that period. His works were collected in five volumes (1830). He was the father of Prof. Max Müller, the well-known philologist. A critical edition of his works appeared at Berlin in 1906. Consult Hako, B., 'W. Müller, Leben und Dichten' (Berlin 1908).

**MÜLLER, Wilhelm Max**, American Orientalist: b. Gleissemberg, Germany, 15 May 1862. He studied at the universities of Erlangen, Leipzig, Berlin and Munich, obtaining the degree Ph.D. at Leipzig. Since 1888 he has been a resident of the United States, but has undertaken researches repeatedly in Egypt (1904, 1906 and 1910) under the auspices of the Carnegie Institution. He has been professor in the Reformed Episcopal Seminary at Philadelphia since 1890 and assistant professor of Egyptology at the University of Pennsylvania. He has written 'Asia and Europe after the Egyptian Monuments' (1893); 'The Love Poetry of the Ancient Egyptians' (1899), both of which are in German; 'Egyptological Researches' (1906-10); 'Mythology of the Ancient Egyptians' (in 'Mythology of all Races,' 1918). He is also a contributor to the 'Encyclopædia Biblica,' 'Jewish Encyclopædia' and joint

editor of 'Gesenius Hebrew Dictionary' (1905).

**MULLER, mül'ler, William James**, English painter: b. Bristol, 28 June 1812; d. there, 8 Sept. 1845. He studied painting under J. B. Pyne, and first exhibited in the Royal Academy in 1833, his picture being entitled 'The Destruction of Old London Bridge—Morning.' In 1833-34 he visited Germany, Switzerland and Italy, and in 1838 Greece and Egypt; while in 1843 he accompanied the Lycian expedition under Sir Charles Fellowes, bringing back many sketches and pictures of Oriental life and scenery. He lived for some time in London, but returned to Bristol in later life. His pictures, though not numerous, are of exceptional power and merit, among the more notable being the 'Baggage Wagon'; 'Dredging on the Medway'; 'The Slave Market'; and the 'Salmonweir.' He painted both in water-color and in oils, and was remarkable as a colorist. Consult the 'Memoir' by Solly (London 1875).

**MULLER-URY, Adolfo**, Swiss-American portrait painter: b. Airolo, Switzerland, 28 March 1864. He was educated at the public schools and at Sarnen and became a pupil of Deschwanden at Stans, Switzerland, after which he entered the Munich Academy and then went to Paris to study under (1881-83) Cabanel. From 1883-85 he worked at Rome and came to the United States in 1886. He has done numerous canvases on religious subjects but his paintings are mostly portraits, among which figure Pope Pius X, several cardinals, Bishop Kennedy (1907), some English nobility and other European personages. In this country he has painted among other portraits those of President McKinley, General Grant, Senator and Mrs. Depew, Senator Hanna, J. Pierpont Morgan, J. J. Hill, Mrs. Woodrow Wilson (1916), President Wilson (1917), etc.

**MULLET**, the name of several distinct kinds of fishes having external similarities. (1) The red mullets or surmullets are a group of elongate marine fishes of moderate size, renowned for the delicacy of their flesh, and the esteem in which they were held by the ancients. They with the goat fishes (*Upeneus*) and others form a family *Mullida*, with five genera and about 40 species, found in all tropical seas, and some species straying northward. Jordan, who classifies them in the suborder *Berycoidei*, remarks: "The family is a very natural one and not closely related to any other." It resembles the barracudas (*Polymixuda*) in having two long unbranched erectile barbels at the throat, which are of service in exploring the muddy bottom along which these fishes creep and search for animal food, mainly small crustaceans. The best-known species is that of the Mediterranean (*Mullus barbatus*), which is a small fish, rarely exceeding six inches in length, and is carmine red on the upper parts and silvery white on the lower surface. This is the fish held in so high esteem by Roman epicures, and reared in ponds where they were attended and caressed by their owners, and taught to come to be fed at the sound of the voice or bell of the keeper. Specimens were sometimes sold for their weight in silver. Pliny instances a case in which the sum of about £60 sterling was

paid for a single fish; and an extraordinary expenditure of time was lavished and wasted upon these slow-learning pets. Juvenal and other satirists descanted upon the height to which the pursuit of this luxury was carried as a type of foolish extravagance. Hortensius, the rival of Cicero, we are told, had a canal of water constructed below the festive table, in which the mullets were allowed to swim, and from which they might be carried to table, and thence to the fire to be cooked and dressed. Apicius invented a mode of drowning or suffocating these fishes in a certain sauce or pickle, which process was said to add highly to their flavor. A similar fashion prevailed of old in England with regard to lampreys, which were drowned in wine previously to being cooked and eaten. This mullet is still esteemed as an article of food, the flesh being white, fat and nutritious. They are caught mainly in nets and are hawked about the streets of Italian cities, not under the old Latin name "mugli," but by one from the Greek, "trigle." The roes are preserved as condiment called *botargo* and resembling caviare.

A closely related fish, the striped red mullet or surmullet (*M. cephalus*), is caught abundantly about the British Islands and along the continental coast, and is seen sparingly in the local markets. By some naturalists these mullets are thought to be only the females of the Mediterranean species. A smaller form of the same species is frequently taken on the eastern coast of the United States. Another genus (*Mullolides*) is represented in the Gulf of California by a single species.

(2) The gray mullets are a group of spiny-rayed marine fishes forming a family (*Mugilidae*) of the suborder *Percesoces*, allied to the silversides and barracudas. They are oblong fishes of moderate size, without a lateral line, very numerous in species common in all warm parts of the world, and often appearing in vast schools, so that they may be captured by wholesale in large nets. Though the flesh is not so good as that of the red mullets it is nutritious, and many species are economically important. These mullets are short-finned, small-mouthed, bottom-feeding fishes, subsisting chiefly upon the little animals or organic matter found in sand and mud; and they have a special straining apparatus in the pharynx for the purpose of preventing objects of too large size from entering the stomach, or foreign substances getting into the gill-chamber; after grinding a mouthful between the pharyngeal bones (for teeth are absent or feeble) the mineral matter is rejected. Another peculiarity of the mullets is to be found in the structure of the oesophagus and stomach, the former being lined with long thread-like papillæ, while the latter has its second portion furnished with muscular walls like the gizzard of a bird, but not divided. The common species is the striped or liza (*Mugil cephalus*) which seems to be almost cosmopolitan, as it is known not only on both Atlantic shores but abundantly from California to Chile. It is one to two feet long, dark bluish above, sides silvery, with conspicuous dark stripes along each row of scales. A smaller, more thoroughly marine species, dark olive and without streaks, is the white mullet or liza blanca (*M. Curema*), numerous on both American

coasts. Several other species are taken in the Gulf of Mexico and southward, one of which (*M. gyrans*) has the curious habit of swimming round and round at the surface in schools, and is called whirligig mullet.

(3) In the Mississippi Valley, several suckers (q.v.) of the family *Catostomidae* are called mullets in reference to their mullet-like appearance and behavior.

Consult Günther, 'Study of Fishes' (1880); Goode, 'Fishery Industries,' sec. 1 (1883); 'American Fishes' (1888); Jordan and Evermann, 'American Food and Game Fishes' (1902).

**MULLIGAN LETTERS**, in American political history, a series of letters written by James G. Blaine (q.v.) to Warren Fisher, a business associate, which it was alleged proved legislative corruption upon the part of Blaine in the matter of bills in Congress concerning the Little Rock and Fort Smith and the Northern Pacific railroads. The letters were obtained by one James Mulligan, a clerk of Fisher, who appeared as a witness before a Congressional committee appointed to investigate Blaine. On 5 June 1876 Blaine secured these letters and read them before the House, after defying the committee to compel him to surrender them. The letters were freely used as campaign documents in the Presidential contests of 1876 and of 1884, by Blaine's enemies. Consult Peck, 'Twenty Years of the Republic' (New York 1906).

**MULLINGER**, mül'ling-gér, James Bass, English historian: b. Bishop Stortford, England, 1834. He was graduated from Saint John's College, Cambridge, in 1866 and in 1881-83 was lecturer at Bedford College, London. In 1885-95 he was lecturer on history of education to the Teachers' Training Syndicate at Cambridge and in 1890-94 lecturer on ecclesiastical history at Trinity College, Cambridge, since when he has been librarian and lecturer in history in Saint John's College. He has published, among other works, 'Cambridge Characteristics in the 17th Century' (1867); 'The Schools of Charles the Great' (1876); 'The Age of Milton' (1897); 'History of Saint John's College, Cambridge' (1901); and wrote the article 'Popedom' for the ninth edition of the 'Encyclopædia Britannica.'

**MULLION**, in architecture, a vertical division between the lights of windows, screens, etc. The term is also applied to the division between the panels in wainscoting.

**MULLOCK**, mü'lök, Dinah Maria. See CRAIK, DINAH MARIA.

**MULLOCK**, mü'lök, Sir William, Canadian educator and politician: b. Bond Head, Ontario, 19 Jan. 1844. He was graduated from the University of Toronto in 1863 and 1868 was admitted to the bar. He was first elected to the Parliament of Canada in 1882 and was vice-chancellor of the University of Toronto from 1881 until 1900 when he resigned. He was Postmaster-General of Canada from 1896 to 1905 and was instrumental in establishing the penny postal rate with other parts of the empire. He was Minister of Labor 1900-05. Besides his public duties he is connected with many large financial interests.

**MULREADY**, mŭl'rĕd-i, **William**, Irish genre painter: b. Ennis, County Clare, 1 April 1786; d. London, 7 July 1863. He went to London while yet a child, and there his talent for art came under the notice of Banks, the sculptor, who assisted him in his education, and in 1800 he became a student of the Royal Academy, where he first exhibited in 1804. In 1806 appeared his 'Hampstead Heath' and in 1809 'Returning from the Ale House' and 'The Carpenter's Shop.' He was elected an associate of the Royal Academy in 1815, and to full membership in the following year, an honor won by 'The Fight Interrupted.' Although purely English in his education, subjects and general treatment, Mulready's pictures, in color and characteristic care of detail, have often suggested comparisons of him with the Dutch painters. While popular in character, his work never descends to the merely vulgar or sensational, his representations of common life being properly dignified by the fidelity and thoroughness of his art. Besides those already mentioned, his best known works include 'Giving a Bite' (1836); 'Snow Scene' (1842); 'Choosing the Wedding Gown' (1846); 'The Bathers' (1857); and 'The Wolf and the Lamb.' His illustrations to 'The Vicar of Wakefield' were very successful. Mulready became most widely known through the ornamental design which he furnished in 1840 for the postal envelope devised by Rowland Hill (q.v.). Nearly all of Mulready's best pictures are now the property of the English nation. Consult Stephens, 'Memorials of Mulready' (London 1867).

**MULTAN**, mool-tān', or **MOOLTAN**, India, an ancient city of the Panjab, capital of a district, 190 miles southwest of Lahore, and four miles from the present left bank of the Chenab. It is surrounded by a dilapidated wall, upward of three miles in circumference. It is an important railway centre. The principal manufactures are silks and fine cotton fabrics, while coarse cotton cloth is also produced for home consumption. Multan has an extensive foreign trade with the countries west of the Indus, and a large banking business is carried on by its merchants. The fortress built in 1640 stands to the north on a mound of earth on the site of the old city. The vicinity is covered with a vast quantity of the ruins of tombs, mosques and shrines. Many of these have been substantial edifices. The tombs of Bhawal Hakk, Shams i Tabriz and Rukn ul Alam and the Hindu temple of the Narasingh Avatar of Vishnu are the most important. There is an important cantonment one and one-half miles east of the city. Multan is one of the most ancient cities in India. It was taken by Mahmud of Ghazna in 1005; by Pir Mohammed for Tamerlane in 1398. After many vicissitudes it fell into the hands of the Sikhs, from whom it was taken by the British in 1849. Pop. 99,243.

**MULTIPLE SERIES.** See **SERIES**.

**MULTIPLE STARS.** See **DOUBLE STARS**.

**MULTIPLICATION.** See **ALGEBRA**, **DEFINITIONS AND FUNDAMENTAL CONCEPTS**; **ARITHMETIC**; **MATHEMATICS**.

**MULTITUBERCULATA**, a group of fossil mammals of small size, first appearing early in the Mesozoic and disappearing with the Paleo-

cene. They were so called from the many tuberculated surfaces developed upon the molar teeth. They were reptilian and are considered the earliest of the mammals, and were probably egg layers. Little is known of the structure of these animals except as to the lower jaws and teeth. The character of these last had suggested that these forms belong near the Monotremata (q.v.) in the sub-class Prototheria (q.v.). The propriety of the term and the characteristics of the group are discussed by Beddard, in 'Mammalia' (1902).

**MUMBO JUMBO**, an African (Mandingo) superstition; a bogie, hideous and malignant, who is the terror of negro women and children.

**MUMFORD**, **James Gregory**, American physician: b. Rochester, N. Y., 2 Dec. 1863; d. 1914. He was educated at Saint Paul's School, Concord, N. H., and was graduated (1885) at Harvard and received the M.D. diploma (1890) from the Harvard Medical School. He started medicine and surgery practice at Boston in 1890, was appointed (1892) surgeon to Carney Hospital and (1894) to out-patients of the Massachusetts General Hospital. He served successively as assistant in surgery (1895) and instructor in surgery (1902) at Harvard Medical School, and became (1905) visiting surgeon of the Massachusetts General Hospital. He wrote 'Narrative of Medicine in America' (1903); 'Clinical Talks on Minor Surgery' (1903); 'Surgical Aspects of Digestive Disorders' (1905), besides contributing numerous articles to the surgical and medical periodicals. He wrote the introductory article on 'History of Surgery' for Dr. W. W. Keen's 'System of Surgery.'

**MUMMICHOG.** See **KILLIFISH**.

**MUMMIUS**, mŭm'i-ŭs, **Lucius**, Roman consul: flourished about 185-130 B.C. He served as prætor in Spain in 146 B.C., conquered Greece, where he burned and pillaged her finest cities, sending the art treasures of Corinth to Rome. According to Cicero, he did not retain any of the plunder. He was made governor of Achaia with the surname Achaicus, and a triumph was held in his honor. In 141 he was re-elected consul. He later became a censor, but of his last years and death little is clearly known.

**MUMMY** (Arab. *mumia*), specifically a dead body preserved from putrefaction by embalming with bitumen or other asphaltic substances. The wider use of the term includes bodies preserved in a dry state by any process. The custom of thus preserving the bodies of the dead has prevailed in several countries. Humboldt found mummies in Mexico, and in Peru the bodies of the Incas were rudely embalmed and dried. The Guanches, or aboriginal inhabitants of the Canaries, removed the entrails of the dead, dried the corpse in the air, covered it with aromatic varnish and, wrapping it in goat skins, kept it in a wooden case. These mummies, of which thousands have been found, are light in weight, of a yellow color and have a strong aromatic odor. But it was among the ancient Egyptians that the art and practice of embalming the dead were carried to the greatest extent and highest perfection. From Egypt the practice spread southward along both coasts of Africa and to India, Malaya, Polynesia, Australia and Arabia. On the Western Con-

tinient it reached Peru, Colombia and Mexico and also Alaska. In the last-named country it may have been sporadic for it was first in vogue there about 1720. All the dead of Egypt, including many animals, were embalmed in some manner, partly, it is supposed, from religious motives and partly for sanitary reasons. The notion formerly prevalent that the Egyptians preserved the body in order to keep it in a fit state to receive the soul when it should have passed through its allotted transmigrations is inconsistent with the facts that tombs were sometimes sold to later occupants. The origin of embalming among the Egyptians has been attributed to their first merely burying in the sand, impregnated with natron and other salts, which dried and preserved the body, which natural process they afterward imitated, drugs and bitumen being later improvements. Comparatively few mummies of children have been discovered in Egypt, though even those just born were embalmed. Embalming was practised by the Hebrews to some extent. Joseph commanded the physicians to embalm his father and in the time of Christ it was "the manner of the Jews" to bury the body "wound in linen cloths with spices." The practice continued in Egypt from 4500 B.C. till the 7th century, and was common among the Greeks there, and even among the early Christians. It seems to have fallen gradually into disuse. See also EMBALMING; EGYPT. Consult Meany, E. S., 'Alaskan Mummies' (Seattle 1906); Pettigrew, J. J., 'A History of Egyptian Mummies' (London 1834); Smith, G. E., 'The Migration of Early Culture' (Manchester, England, 1915).

**MUMMY WHEAT**, a variety of wheat said to have been produced from grains found in an Egyptian mummy, but there is no good reason to believe the legend. It has long been in general cultivation in Egypt and neighboring countries in Africa. The spike is compound

**MUMPS**, a popular name for a contagious epidemic inflammation and enlargement of one or both parotid salivary glands, occurring usually in youth, males being more frequently affected than females. In some localities it disappears for years, in other places it is endemic. Epidemics usually occur in the spring or fall. One attack generally gives immunity. The period of incubation is from 7 to 20 days. The disease is sometimes preceded for a few days by malaise, loss of appetite, irritability and feverishness. Its onset is marked by stiffness and pain about the jaws, followed by heat, pain and swelling about the lobe of the ear, earache and tinnitus aurium, fever (100°-104° F.), more or less rigidity of the neck, with distortion of the side of the head and difficulty in chewing, swallowing and talking. The inflammation is usually at its height by the third day of the disease, and the disease has subsided generally by the 7th or 10th day. Very seldom is there any suppuration of the affected gland. In some cases the subsidence of the gland inflammation is followed by pain and swelling of the testes of the male, and of the ovaries, vulva and breasts of the female, the complication being more common in males than in females. Occasionally a meningitis supervenes. Not infrequently a middle ear catarrh follows, leading to total deafness. The term mumps is sometimes applied to a parotiditis

following a local injury, diseases of the mouth, diphtheria, occlusion of the salivary duct by a foreign body, etc. There is a secondary symptomatic or metastatic form of mumps which sometimes follows dysentery, scarlet fever, small-pox, measles, etc. The parotid gland in this form of mumps tends to suppurate. The best treatment for mumps consists in rest, preferably in bed, the giving of saline laxatives and soft food, relieving the fever, and securing sleep by mild remedies and keeping the face warm with flannel or some other agreeable application. In cases of slow convalescence tonics should be given.

**MUN, mēn, Albert, COUNT DE**, French politician: b. Lumigny, Seine et Marne, 23 Feb. 1841; d. 1914. He was graduated (1862) at Saint Cyr, and entered the army and fought in the Franco-Prussian War (1870-71), to become a captain and ordnance officer of the governor of Paris. He devoted himself to the Ultramontaine party and founded the Catholic Labor Circles. Owing to the complaints of the Liberals concerning such activities on the part of an officer he resigned (1875) his commission and, with the aid of the Clerical party, was elected (1876) as deputy. He took his place among the extreme "Rights," representing both Church and monarchy. He led mass-meetings to agitate for the union of Church and State and social reform in the Catholic sense. In 1897 he was made member of the Academy. In 1913 he advocated the abolition of the Three-Year Military Law, but when war broke out next year his eloquent oratory was exerted exhorting his fellow-citizens to show courage and persistence. His speeches were issued in collective form (Paris 1888-1904) in seven volumes. He wrote 'Les congrégations religieuses devant la Chambre' (1903); 'Contre la séparation' (1905); 'L'heure décisive' (1913).

**MUN, Thomas**, English merchant and political economist: b. London, England, June 1571; d. there, July 1641. He engaged in mercantile business when very young, was interested in the Mediterranean trade and in 1615 was a director of the East India Company. As a writer on economics he presents really the first clear and systematic treatment on the subject and his is admitted to have been of great influence. He published 'A Discourse of Trade, from England into the East Indies,' in 1621, and his greatest work, 'England's Treasure by Foreign Trade,' was published posthumously in 1664.

**MUNBY, Arthur Joseph**, English poet: b. Bulmer, Yorkshire, England, 22 Aug. 1828; d. Ripley, Surrey, 29 Jan. 1910. He was graduated at Trinity College, Cambridge, in 1851, and was admitted to the bar of Lincoln's Inn in 1855. He was the author of 'Verses Old and New,' which contains the much admired pastoral poem 'Doris' (1865); 'Dorothy' (1880), which has been widely circulated in the poet's own country and in America; 'Vestigia Retrorsum' ('Steps Backward,' 1891); 'Vulgar Verses, by Jones Brown' (1891), mostly in dialect; 'Susan' (1893); 'Ann Morgan's Love' (1896); 'Poems, Chiefly Lyric and Elegiac' (1901); 'Relecta' (1909).

**MUNCH, moonh, Peter Andreas**, Scandinavian historian: b. Christiania, Norway, 15

CASE AND MUMMY IN ITS CEREMENTS

Dec. 1810; d. Rome, 25 May 1863. He was educated at the University of Christiania and studied deeply the old Norse language and antiquities. In 1841 he was appointed professor of history at the University of Christiania. He was accorded the unusual privilege of access to the papal archives in Rome, where he spent much time in study. His principal work is 'History of the Norwegian People' (1852-63). Munch published several works of a linguistic character, and, repudiating the term "Icelandic," maintained that the so-called Icelandic literature was really Old Norse. He also translated several of the Old Norse sagas. A collection of his essays was edited by Gustav Storm (1873-76).

**MUNCH, Peter Andreas**, Norwegian poet: b. Christiania, 19 Oct. 1811; d. near Copenhagen, 27 June 1884. He was originally a student of law, but became an editor (1841-46) and professor in the university (1866) at Christiania. Among his writings are 'Sorg og Trost' ('Grief and Consolation'), of which seven editions have been printed; 'Ephemera' (1836); 'King Sverre's Youth' (1837), a drama; 'The Singer' (1838); 'Poems Old and New' (1848); 'Pictures from North and South' (1848), in prose; 'New Poems' (1850); 'Lord William Russell' (3d ed., 1888), a tragedy, and 'An Evening at Giske' (1855), a historical drama. Munch translated into Norwegian many works from such authors as Tennyson and Walter Scott, and wrote some popular Norwegian songs.

**MÜNCH-BELLINGHAUSEN**, münk-běl'ling-how'zën, **Eligius Franz Joseph**, FREIHERR VON, also known under the pseudonym FRIEDRICH HALM, Austrian dramatist and short-story writer: b. Krakau (Cracow), 2 April 1806; d. Vienna, 22 May 1871. He came to Vienna in 1811 and began studying law there in 1822, making the acquaintance while a young student of such prominent literary men as Bauernfeld, Lenau, Seidl, etc. In 1826 he entered the employ of the Austrian government as a lower official and remained in the bureaucracy from that time until his death, his chief positions being custodian (later director) of the court library and general superintendent of the Vienna Hofburgtheatre. As a dramatist, Halm's position in German literature is that of a constructor of correct dramatic outlines, often banal in their conventionality, which are always surrounded with resounding rhetoric and a peculiar union of romanticism and pessimism, together with occasional real feeling. His first play, 'Griseldis' (1835) had a great stage success and passed over most of the stages of Germany. There followed a number of less successful productions: 'Camoens' (1837); 'Adept,' tragedy (1838); 'Imelda Lambertazzi,' tragedy (1842). His greatest success and his best-known play is 'Der Sohn der Wildnis' (1842; known on the English stage as 'Ingomar'), although 'Der Fechter von Ravenna' (1857) also was very popular. Of his short stories the best are 'Die Marzipanliese' and 'Das Haus an der Veronabrücke.' His works have been published: 'Werke' (8 vols., Vienna 1856-64; 4 additional vols., 1872); 'Ausgewählte Werke' (4 vols., Leipzig 1904; another ed. by Bong, Berlin 1910). Consult Schneider, 'Friedrich Halm und das spanische

Drama' (Berlin 1909); Schachinger, R., 'Briefwechsel zwischen M. Enk und Halm' (Wien 1890); Pachler, F., 'Die Jugendjahre Halms' (Wien 1877).

**MÜNCHEN** (mün'hën) **GLADBACH**. A town in the Prussian Rhine province.

**MÜNCHHAUSEN**, münch'how-zën, **Hieronymus Karl Friedrich**, **BARON**: b. Bodenwerder, Hanover, 1720; d. there, 1797. He was a German soldier and served in his youth as a cavalry officer in the Russian army. He was possessed of an adventurous and dare-devil spirit and an imagination that knew no bounds. He told the most wonderful stories of his adventures in the Turkish campaign of 1737-39, and soon became famous as the most unique exaggerator that ever lived. The tradition of the baron's story-telling is supported by the evidence of a clergyman, who says that in his old days the officer used to relate his most surprising adventures "in a cavalier manner, with a military emphasis, but without any passion and with the easy humor of a man of the world, as things which required no explanation or proof." His tales are thought to have been first compiled by Rudolf Erich Raspe, a man of letters, who, being compelled to flee from his position as curator of the museum at Cassel to England on account of a charge of embezzlement, was engaged in London in literary pursuits, and is generally believed to have published anonymously an English edition of the stories under the title of 'Baron Münchhausen's Narrative of his Marvelous Travels and Campaigns in Russia' (1785). A second edition, enlarged and ornamented, was published at Oxford in 1786 under the title of 'The Singular Travels, Campaigns, Voyages and Sporting Adventures of Baron Munnikhouson, commonly pronounced Munchausen; as he relates them over a bottle when surrounded by his friends.' A third edition, published by Kearsley in London the same year, bore the title of 'Gulliver Revived.' The story passed through many editions by different hands, gaining more and more accretions each time, whether in form of borrowings from Lucian or of topical "hits" on Baron de Tolt, Montgolfier, the first balloonist, or Bruce, the explorer of the Nile. One of the best editions is that by Shore (1872), illustrated by Doré, with additions by Theodore Gautier. It is said a large proportion of the hunting tales are derived from Henry Bebel's 'Facetiæ' (1508), while other incidents are borrowed from Castiglione's 'Cortegiano' and Bidermann's 'Utopia,' which are included in Lange's 'Deliciæ Academicæ' (1765). Consult Müller-Fraureuth, 'Die deutschen Lügendichtungen auf Münchhausen' (1881). See ADVENTURES OF BARON MÜNCHHAUSEN, THE.

**MÜNCHHAUSEN: A Story in Arabesques**: a satirical romance by Karl L. Immermann (q.v.) originally published in four volumes in Düsseldorf during 1838-39. The eponymous hero is presented as the nephew of the famous prevaricator, while the author has also taken at least a part of his ideas from 'Don Quixote' in attaching to the hero a droll serviteur who closely resembles the materialistic Sancho Panza. Other influences are traceable in the work, notably of Rückert's translation of Hariri's 'Makamen,' Swift's 'Gulliver's

Travels' and 'Gil Blas.' The story may be described as a formless mass of episodes played in Westphalian villages. The "New Münchhausen" is a traveller like Humboldt; like Gulliver, he sojourns among and converses with animals; like Gil Blas he serves as kitchen boy; like Cagliostro he lives indefinitely on rejuvenating medicine. He appears in different rôles, and in each character successfully exploits the credulity of his audiences. As a disinterested financier and company promoter he is eminently and humorously successful.

**MUNCIE**, mün'si, Ind., city, county-seat of Delaware County, on the White River, and on the Central Indiana, the Lake Erie and Western, the Cleveland, Cincinnati, Chicago and Saint Louis, the Chesapeake and Ohio of Indiana, Fort Wayne, Cincinnati and Louisville and other railroads, about 56 miles northeast of Indianapolis. There are six interurban lines. A belt railway encircles the city and furnishes intercommunication among the lines which enter the city. Muncie is situated in an agricultural region and in a natural-gas belt. The chief manufacturing industries are iron and steel works, glass works, machine shops, canneries, pulp and paper mills, manufactories for silver and silver-plated goods, wagon and carriage works and flour mills, automobiles and automobiles parts, motors, pianos, toys and gloves. Other articles manufactured are gas-engines and gas fixtures, knit underwear, glass-jars, lawn mowers, silverware, wheels, boilers, iron bedsteads, caskets and undertakers' supplies. There is a large trade in the manufactures of the city, and in coal, farm products and livestock. The city is the seat of the Eastern branch Indiana State Normal Institute. The city has good public and parish schools, good modern high school, a public library which has over 35,000 volumes, a city hospital, courthouse and a number of fine churches. The government building cost over \$80,000 and the public library building \$50,000. The present form of city government is on the Federal plan, consisting of a Mayor and aldermen elected under the ward system and with the usual executive branches. Pop. 35,000.

**MUNDE**, mün'dé, Paul Fortunatus, American gynecologist: b. Dresden, Saxony, 7 Sept. 1846; d. New York, 7 Feb. 1902. After coming to the United States in 1849 he attended the Boston Latin School and then studied medicine at Yale. He left before completing his course, entering the Union army as medical cadet in 1864. He was afterward graduated from the Harvard Medical School in 1866 and went to Germany, where he enlisted in the Bavarian army. He was decorated by the emperor with the Iron Cross for heroism in saving the lives of patients from a burning hospital near Paris. After devoting himself to study and practice in hospitals in Berlin, Heidelberg, Paris, London and Edinburgh he took up his residence in New York in 1873, and practised obstetrics and gynecology. He was appointed professor at Dartmouth Medical College and in the New York Polyclinic in 1882. He edited (1874-92) the *American Journal of Obstetrics*, and was president of the American Gynecological Society in 1897-98. Among his works are 'Minor Surgical Gynecology' (1880); 'Appendix to

the Midwifery of Cazeaux and Tamier' (1884); 'Pregnancy and the Puerperal State' (1887), and 'Diseases of Women' (1891).

**MUNDELEIN**, George William, American Roman Catholic archbishop: b. New York, 2 July 1872. He studied first at the De La Salle Institute and later at Manhattan College, after which he began his theological course at Saint Vincent's Seminary, Beatty, Pa., completing it at the Urban College of the Propaganda in Rome. Ordained to the priesthood in Rome 8 June 1895, he became assistant secretary to Bishop McDonnell of Brooklyn, N. Y., being appointed diocesan chancellor in 1897, which office he held for 12 years. In 1903 Father Mundelein was named censor of the Liturgical Academy; in 1906 was elevated to the rank of domestic prelate and in 1908 received from the Propaganda the degrees of licentiate of sacred theology and doctor of divinity. Monsignor Mundelein was consecrated titular bishop of Loryma and auxiliary bishop of Brooklyn 21 Sept. 1909 and on 15 Dec. 1915 was promoted to the archiepiscopal see of Chicago, receiving the pallium at the hands of Archbishop John Bonzano, Apostolic Delegate to the United States, 9 Feb. 1916. Archbishop Mundelein is a distinguished liturgist and theologian and a linguist of marked ability and as metropolitan of the ecclesiastical province of Chicago is shepherd of over 1,150,000 souls.

**MÜNDE**n, mün'dén, Prussia, town in the government district Hildesheim, located on the confluence of the Werra and Fulda with the Weser. It is the junction of the Hanover-Elze-Cassel and the Nordhausen-Münden state railways. The neighborhood has romantic forests and contains two Lutheran churches, the Blasikirche dating from 1263 has a monument to Erich II of Brunswick, besides a Catholic, a Reformed church and a synagogue. There are also an ancient castle with a museum, an Imperial academy of forestry, a gymnasium, a realprogymnasium, etc. Its industries include rubber works, wooden and lead ware, leather, tobacco and cigar factories, also factories producing cellulose, artificial manures, glass-paper, a sugar refinery, boiler factory, etc. Considerable commerce is carried on in lumber and shipping. In 1910 it had 10,991 inhabitants.

**MUNDT**, moont, Klara Müller ("MÜHLBACH, LUISE"), German novelist: b. Neubrandenburg, January 1814; d. Berlin, 26 Sept. 1873. She was married to Theodor Mundt (q.v.) in 1839. She was an extremely prolific writer of popular historical novels, which though quite without merit in point of style are by no means wanting in descriptive excellence. They were all published under the pen name of "LUISE MÜHLBACH" and have had as many eager readers in this country and England as in the writer's own land. Among them are 'Queen Hortense' (5th ed., 1861); 'Emperor Joseph II and his Court' (9th ed., 1866); 'Marie Antoinette and her Son' (1867); 'Emperor Alexander and his Court' (1868); 'Mohammed Ali and his House' (1871); 'Frederick the Great and his Court' (8th ed., 1882).

**MUNDT**, Theodor, German author: b. Potsdam, Prussia, 19 Sept. 1808; d. Berlin, 30 Nov. 1861. He was the husband of Luise Mühlbach. He studied at the University of

Berlin, and in 1842 became privat docent there. In 1848 he was appointed professor of literature and history at the University of Breslau, and in 1850 was recalled to Berlin as university librarian and professor. He belonged to the "Young German" school, was a Radical in politics and favored the emancipation of women. His writings include 'Madonna, Unterhaltung mit einer Heiligen' (1846), a memoir of Charlotte Stieglitz; the novels, 'Thomas Münzer,' 'Carmela' (1844); 'Mendoza, der Vater der Schelme' (1847); 'Die Matadore' (1850); the critical and historical works, 'Kunst der Deutschen Prosa' (1837); 'Geschichte der Gesellschaft'; 'Geschichte der Weltliteratur'; 'Geschichte der Literatur der Gegenwart' (1852); and political sketches included in 'Pariser Kaiserskizzen' (1856); 'Paris und Louis Napoleon' (1858); 'Italienische Zustände' (1859-60). He also published Luther's 'Politische Schriften,' and with Varnhagen von Ense edited Knebel's letters and posthumous works.

**MUNGER, Theodore Thornton, American Congregational clergyman:** b. Bainbridge, N. Y., 5 March 1830; d. 12 Jan. 1910. He was graduated at Yale in 1851, and at Yale Theological School in 1855. He held pastorates at Dorchester, Mass., 1856-60; Haverhill, Mass., 1862-70; Lawrence, Mass., 1871-75; San José, Cal., 1875-76. He was for several years pastor at North Adams, Mass., resigning in 1885 to become pastor of the United Church, New Haven, Conn. He was prominent in his denomination as well as an active supporter of municipal reform. He published 'On the Threshold' (1880); 'The Freedom of Faith' (1883); 'Lamps and Paths' (1883); 'The Appeal to Life' (1887); 'Horace Bushnell' (1899); 'Character Through Inspiration,' etc. Consult Bacon, B. W., 'Theodore Thornton Munger, New England Minister' (New Haven 1913).

**MUNGO, Saint, or KENTIGERN, the patron saint of Glasgow:** b. Culross, about 518; d. Glasgow, 13 Jan. 603. He was baptized and brought up by Saint Serf, the head of a monastery at Culross. His name, Kentigern or Cyndegyrn (from *ken* and *tigearna*), means head lord, and it is said that it was exchanged by the brethren of the monastery for Mungo, the beloved, on account of the affection they bore him. On leaving Culross Kentigern took up his abode as a missionary priest near the site of the present Glasgow. Here he was chosen bishop, but having troubles with the king of the Strathclyde Britons afterward took refuge at Saint David's in Wales, and while in that region founded a religious establishment under a follower named Asaph, which afterward became the seat of the bishopric of Saint Asaph. Redderech, king of the Strathclyde Britons, recalled him to Glasgow, where he acquired a character of great sanctity. The city arms of Glasgow are associated with various legends concerning Saint Mungo, and the cathedral is supposed to be built on the site of his monastery. The parish of Saint Enoch, in Glasgow, is so called from a corruption of his mother's name (The-neu). A life, written by Jocelyn of Furness about 1180, was published in Pinkerton's 'Vitæ Antiquæ Sanctorum Scotiæ.' Consult Rhyr, J., 'Celtic Britain' (London 1904); Skene, 'Celtic Scotland' (Edinburgh 1877).

**MUNGOOS, or MONGOOSE, an ichneumon (*Herpestes griseus*),** common in many parts of India, and closely akin to the Egyptian species ichneumon (q.v.). The mungoos is a burrowing, nocturnal, weasel-like animal, tawny yellowish-gray, 16 or 17 inches long, and with a long thick terete tail. It kills numerous birds, sucking their blood and leaving the body uneaten. It also with great adroitness seizes and kills many snakes, the formidable cobra included, usually avoiding the serpent's stroke by its quickness. Its excitement and ferocity in these encounters is almost indescribable. It is, however, commonly domesticated as a mouser in the Orient, and has been colonized in various parts of the world to destroy vermin, usually with sad results; hence the bringing of a living one into the United States has been forbidden by law since 1902. This animal was introduced into Jamaica and some other islands of the West Indies about 1872, and later in Hawaii, in the expectation that it would overcome the plague of rats in the sugar plantations. It did so, but it multiplied excessively, killed off poultry and insect-eating birds, reptiles and mammals, which were useful. Many of these animals changed their habits somewhat to accommodate themselves to the novel enemy, and the mungoos does not now multiply so rapidly as at first, and does less damage. The same experience was had elsewhere, and has warned other countries to avoid a repetition of it. Consult Blanford, 'Fauna of British India; Mammals' (1889); Morris, 'The Mungoos on Sugar Estates in the West Indies' (London 1884); and *The Field* (London, 13 July 1895); Lydeker, Richard, 'Royal Natural History' (London 1896); 'Cambridge Natural History' (New York 1904 et seq.).

**MUNICH, mü'nik, or MÜNCHEN, mün'hēn,** Germany, the capital of Bavaria, one of the most beautiful cities in Europe, lies on an extensive but uninteresting plateau, about 1,700 feet above sea-level, on the left bank of the Isar, with suburbs on the right, the river being crossed by nine bridges. The original nucleus of the town was at one time surrounded by walls and ditches, and entered by lofty turreted gates. The ditches have been filled up and the walls removed, but three of the old gates, with their loopholed and embattled flanking towers, still remain. In the older part of the town there are many old houses, irregular both in size and form, and of quaint but not unpicturesque architecture. This quarter, though it contains the government offices and many public edifices, is surpassed, both in extent and magnificence, by the new town, which has risen chiefly to the north and west, with almost unexampled rapidity and splendor, due to the art-loving proclivities of King Ludwig I and his successors, who spent over 7,000,000 thalers in beautifying the city, and adorning it with buildings of almost every style of architecture, wide and handsome streets, and squares and gardens decorated with statues and other monuments. Near the centre of the city, between the Max-Joseph-Platz and the palace gardens, is the royal palace, consisting of an old central building of vast extent and two modern wings. From this great pile run at right angles to each other the two finest streets in Munich — the Maximilianstrasse and the Ludwigstrasse. The chief pub-

lic buildings are the old town-house and the new, the latter in the Gothic style, considerably enlarged in 1899; the old palace and the Herzog Max Burg, now used as public offices; the post office; the central station (1880); the chief customs house (1876-79); and the new palace of justice (1897). Buildings connected with art embrace the gallery of sculpture, or Glyptothek, an edifice of the Ionic order, containing a series of the finest ancient and modern sculptures; the Old Pinakothek or picture-gallery (1826-36) another beautiful edifice, containing one of the richest collections of pictures in the world; the New Pinakothek, adorned externally with frescoes and containing only paintings by recent masters; the academy of arts, an imposing building in the renaissance style; the academy of the plastic arts (1885); the Schack Gallery of paintings (1894), named from its donor; the Schwanthaler and Kaulbach museums, etc. The Crystal Palace (1854) is used for the annual art exhibitions. Other collections are the Hof-und-Staats Bibliothek, with 1,100,000 printed volumes and over 50,000 MSS.; the old Bavarian national museum, now used for art collections; the new Bavarian national museum (1899), etc. The German Museum is in all probability the finest museum of technology and the physical sciences in the world. The chief theatre is the Royal and National Theatre, with a lofty Corinthian portico. Munich is rich in monuments, which adorn its squares, gardens and public promenades. Among the chief are the monument of Maximilian II, with his statue 26 feet high, and the colossal bronze statue of "Bavaria," 65 feet high. It is a hollow female figure, designed by Schwanthaler and cast from foreign cannon. From the head a fine view of the city and the Alps is obtained. It stands on a low eminence in front of the "Hall of Fame," a Doric building of horse-shoe shape, containing busts of notable Bavarians. The "Gate of Victory," in imitation of the arch of Constantine at Rome, and the Propylæa, in imitation of that at Athens, should also be mentioned. There is a fine statue of Maximilian I by Thorwaldsen, and statues of Schiller, Gluck, Schelling, Fraunhofer and Gärtner, a bronze monument to the Bavarian soldiers who died in the war with Russia and a monument to the chemist Liebig. The Hofgarten is a garden near the palace, finely planted, and surrounded by an open and richly ornamented arcade; the so-called English Garden is an extensive and beautiful park. The cemeteries of Munich are noteworthy for their artistic tombs, probably the most beautiful in Europe. The ecclesiastical buildings, include the cathedral or Frauenkirche, founded in 1488, a vast pile, entirely of brick, with two lofty towers, terminating in domes 333 feet high; Saint Michael's or the Jesuits' Church (1583), a handsome Italian structure; the church of the Theatines, another Italian structure, beneath which are the burial vaults of the royal family; the church of Saint Louis, a modern building of brick, faced with white marble, decorated externally with statues by Schwanthaler, and internally by the finest frescoes of Cornelius; the church of All Saints; the basilica or church of Saint Boniface; the Mariahilf church on the right side of the river; the three Protestant churches; and the Jewish synagogue. At the head of the educational institutions is the university. (See MUNICH,

UNIVERSITY OF). Closely associated with it are the university library with 600,000 volumes and 2,500 manuscripts, together with 3,000 incunabula; the Collegium Georgianum (1494), a priests' seminary; the Maximilianeum (1852), etc. There is also a high school of technology and numerous other high class institutions for educational purposes. The industrial development of Munich lags behind its aesthetic development. Its stained-glass works, iron, brass and bell foundries, lithographing and engraving works and manufactories of optical and mathematical instruments and various artistic articles, are, however, deservedly noted. Still more famous are the enormous breweries of Bavarian beer, which annually produce about 49,000,000 gallons, of which 37,000,000 are consumed in the city itself. The brew-houses and beer-gardens are world famous. Munich carries on a large trade in grain and in objects of art.

In 1158 Henry the Lion raised the *Villa Munichen* from its previous obscurity by establishing a mint and a salt-emporium within its precincts, the name (also appearing as *Forum ad Monachos*) being derived from the monks who owned the site. In the 13th century the dukes of the Wittelsbach dynasty selected Munich for their residence and fortified the town. In 1327 the old town was nearly destroyed by fire, and was rebuilt by the Emperor Louis the Bavarian; it was not until the fortifications were razed at the close of the 18th century that the limits of the town were enlarged to any extent. The true history of modern Munich is the account of its artistic development in the 19th century, closely identified with which are Klenze and Gärtner the architects, Schwanthaler the sculptor, Cornelius and Kaulbach, the painters, and Wagner the composer. The modern Munich school of painting, headed by K. von Piloty, W. Diez and Grützner, is characterized by marked realism in color and detail, in contrast to the romanticism of the older masters. The elevated site of the city and the neighborhood of the Alps render it liable to sudden changes of temperature, sometimes ranging over 20° in 24 hours. The population in 1801 was only 48,885; in 1915 it was 630,000; from 30.4 per thousand in 1871 the deathrate fell to 20.5 in 1904.

The university, the Academy of Fine Arts, and the Conservatory of Music, under the leadership of men of world-wide reputation, and the splendid facilities of the city in its theatres, museums and galleries, its handsome buildings and healthful location, attract thousands of visitors to Munich every year.

The municipal budget of Munich is about \$4,500,000. The debt is not far from \$40,000,000, but the city has almost twice the sum invested in public property. The city is governed by 2 burgomeisters, 40 magistrates and about 70 councilmen.

**MUNICH, University of, German university,** located in Munich, Bavaria. It had its beginning in the Studium Generale of Ingolstadt, founded by the Emperor Ludwig, with a special bull of approval by the Pope, Pius II, in 1459. The University of Ingolstadt opened its doors in 1472; and after more than three centuries of continuous struggle and growth, and during which time it remained in the faith and under the influence of the Church of Rome,

it was removed by Ludwig Maximilian in 1800 to Landshut. In 1826 it was reorganized and transferred to Munich, where with increased facilities it has grown steadily in attendance and influence. The university has faculties of theology, law, medicine, philosophy, political science, etc., and numerous seminars and clinics, a botanical garden, museums, laboratories and an observatory; and has access to the libraries, museums and art treasures of the city. The university library contains 600,000 odd volumes, besides many manuscripts, pamphlets and records. The professors and instructors number more than 200 and more than 7,500 students are in average attendance. The annual income averages \$250,000, in large part contributed by the government. Affiliated with the university are the Collegium Georgianum, for the education of Roman Catholic priests, founded in 1494, and the Maximilianum, a secondary school, founded in 1852.

**MUNICIPAL ACCOUNTING IN THE UNITED STATES. Definitions.**—The term "municipality," when used herein, is a generic designation of all public corporations formed by or for a community with powers of local government, by whatever name or designation known in the several States of the Union. Chief Justice Marshall defined a municipal corporation as "such only as is founded by the government for public purposes where the whole interests belong to the government." "Municipal accounting" is the adaptation or application of generally recognized principles and methods of accounting to the conditions, business and requirements of municipalities—the art or science of analyzing, classifying, recording, summarizing and elucidating facts relative to financial transactions.

**Objects of Municipal Accounting.**—Its function or purpose is to make possible the production, from the accounts of a municipality, of complete, accurate and prompt information and statements of the financial results of its operations for any given period and of its financial condition at any given time, and to supply all other information which accounts can supply for the orderly and prosperous administration of municipal affairs.

Like accounts of private affairs, a municipality's accounts should provide the data for thinking about the business at hand, the development of plans, the determination of policies and the judgment of results. If a municipality's accounts comply with these requirements, two aims will be satisfied: (a) administrative officers will be aided in performing their duties and in executing the trust imposed upon them, and (b) the public can pass intelligent judgment as to the fidelity, efficiency and economy of their chosen officials.

**Similarity between Private and Municipal Accounts.**—The thought is not infrequently expressed that municipal accounting differs widely from private accounting; that each in itself constitutes a separate science bearing little or no relation to the other. That thought is a fallacy. There is no difference in purpose, method or principle between private and public accounting. The distinguishing features of each, which are sometimes thought to be fundamental differences, relate only to the subjects concerning which information is needed. For instance, municipalities seldom, if ever, engage in busi-

ness for profit. They exist to render service at cost. Hence profit and loss accounts are uncommon. On the other hand, individuals, partnerships and private corporations are not subject to the special limitations placed upon the administrative action of municipal officers by the terms of appropriation acts and legislation generally, and, hence, they seldom maintain appropriation accounts. But these variations should not conceal or obscure the fact that the principles and rules of municipal and private accounting are identical. Furthermore, since municipal business may be administered economically or improvidently, or efficiently or inefficiently, and thereby affect the interests of its proprietors directly by limiting the service rendered or increasing service cost, there is as much necessity of applying accounting principles to municipal business transactions as to private affairs of the same nature.

**History.**—It is not known just when and where municipal accounting originated. Reliable authorities disclose that the Athenians maintained a rather well-developed system. Rome's plan was based upon and adhered closely to the system employed in private business of the time. Great Britain, from which municipal accounting methods in this country were very largely borrowed, copied or adopted, is said to have had a system as early as the 12th century.

Prior to the 16th century, little if any thought or attention was given to the permanency of accounting records. That was true of private as well as of public accounts. When a transaction was concluded and the account closed, the record was thought of no value and was destroyed. The history of municipal accounting in the United States may, for the purpose of discussion, be divided in three eras. Naturally, no sharp line of demarcation separates them; nevertheless, they stand out with sufficient clarity and are as follows:

(1) The period from the settlement of the country to and including the decade immediately following the close of the Civil War. Within that epoch, accounts of municipalities were maintained, with few, if any, exceptions, merely to show the flow of cash into and out of the municipal treasury. It may with propriety be characterized as the age of "receipt and disbursement" accounting.

(2) The last quarter of the 18th century. Within that series of years public thought in relation to better processes of accounting for municipalities quickened. Serious consideration was by no means universal. The efforts were sporadic rather than general, but at the close of the century sentiments had, to a considerable degree, crystallized and in a general way the movement assumed measurable success and tangible form. It is, for the lack of a better term, characterized as the period of "awakening."

(3) The third epoch comprises the first 18 years of the 20th century. Within those years rapid and substantial progress was made in securing, in a great number of municipalities, decided and materially improved methods of accounting developed along comprehensive, logical lines. The period of "accomplishment" is a suitable designation for that time.

**Development.**—In England, no impetus characterized the action toward municipal accounting reform until at or near the middle of

the 19th century, and it was some years later before energetic thought and attention was addressed to the subject by or on behalf of American municipalities. And then the movement was tardy, inactive, sluggish. The principal reasons which contributed to the attitude of indifference and retarded the development of the work in this country are as follows:

(a) The country was relatively new, the population very largely rural, the form of organization comparatively simple, the scope of municipal activity exceedingly narrow, the tax rates insignificant when compared with present-day standards and accounts matters of indifference.

(b) Absolute necessity — the mother of invention and progress — did not force attention to the desirability of better methods. Improvement in private accounting methods did not develop of its own volition nor was it prompted by the unstimulated energy of those engaged in keeping private business accounts. It was forced on them. Competition and strife in every line of business endeavor made it imperative that the head of a business enterprise should have available every essential financial fact concerning the business. To fail to have it resulted in the loss of funds or, frequently, the bankruptcy of the concern. The compelling need which business experienced did not affect municipalities in the same way. They could not become insolvent. If their officers were wasteful, extravagant or inefficient and the treasury was emptied, the matter could be remedied by raising more taxes. If the same governmental service cost twice as much in one place as in another, that fact was not known, and, if known, it would have mattered little because actual competition was non-existent.

(c) The prevailing form of government usually provided for the election of the chief fiscal and accounting officers by popular vote, and, as was to be expected, they were more frequently selected by reason of their popularity and vote-getting ability rather than for their talent in and knowledge of municipal finance and accounting. More often than otherwise, those officials entertained something akin to contempt for new, advanced or improved accounting ideas. Where such feelings were absent, they displayed a complacent attitude toward established methods, due, no doubt, to the thoughts that tenure of office was insecure; that the holding of public office was a reward for political service; that to attempt to revise the accounts would entail a tremendous amount of hard work; that no money compensation or reward in the form of thanks or praise would be forthcoming; and, in short, that the easiest course was to let matters drift as they had in the past, take the compensation and honor incident of the position and at the end of the term deliver the office to the successor in much the same condition as it was received.

(d) And, finally, the taxpayers — the stockholders in the corporation — demanded no better methods, no more accurate, detailed and scientific statement of financial facts showing sources of revenue, objects of expenditure and the financial condition of their common business. The business man of capacity and affairs had been too busy with his personal matters to devote time and thought to the con-

cerns and activities of government. That was left to the officers selected by the political organizations and their recognized heads.

Viewed in the perspective, it seems that in this era accounts were kept with one principal or primary object in mind — that of showing whether or not the fiscal officer had stolen money. In form, they indicated the liability of that officer to the municipality and appear to have been predicated on the assumption that the municipality would keep its own accounts. They utterly failed to display essential financial facts relative to revenues and expenses, what was owned, due or owed, or to tell any of the material stories concerning fiscal transactions which accounts should relate.

During the second period, very material changes are observed. The country grew in population and wealth. The population commenced to drift from rural to urban. Tax rates mounted higher and higher. The activities of municipalities were increased in variety and magnitude and, correspondingly, the financial transactions assumed proportions and importance which necessarily called for careful and accurate accounting. It was realized that to the old use of accounts as a means of testing the honesty of fiscal officers must be added their employment as a means of testing and measuring the efficiency of the work of all officers. There developed a general demand for municipal reform. Business men were chosen to fill important posts in municipal governments and, as was to be expected, they sought more comprehensive financial statements which would disclose more clearly the financial condition of their respective municipalities. Furthermore, civic organizations, of which the National Municipal League was one of the pioneers, sprang into existence, and they in conjunction with accountants employed in municipal work consistently and persistently advocated better accounting methods.

However, little was actually accomplished by way of changes within the period, but much was achieved in awakening and quickening thought. While the need was real, the response was not immediate, for, as has been seen, the municipal corporation, unlike a private business concern, could not enter the bankruptcy courts even though it possessed all the elements of insolvency. As in the previous period, municipal accounts were little more than cash-book entries and treasury statements. But the foundation upon which to build more substantial and appropriate systems was laid and the way paved for the rapid development in the period which followed.

It remained for the years intervening since the commencement of the 20th century to witness actual changes in accounting procedure. The demand for better accounting and the necessity of providing a system which would furnish exact knowledge of details and summaries of results in aid of better administrative direction and control induced some of the larger cities (Chicago, New York, Boston, Philadelphia and others), and a number of the smaller and other municipal corporations, to employ professional accountants to install improved accounting systems and to audit their accounts periodically. The accountants aimed, and to a measurable extent succeeded, to make

the accounts disclose (a) the current cost of government, (b) the revenue provisions to meet that cost, (c) the property (other than cash) owned and (d) a complete statement of debt obligations. The plans worked out in each municipality were studied by officers and accountants having to do with the affairs of others. The movement was contagious. At the beginning of the year 1919 there was scarcely a city having a population of more than 30,000, in which some improvement in accounting procedure had not been made.

In a very considerable number of municipalities, centralized financial control and accounting are facts. Unit cost records, monthly departmental reports, uniform classification of receipts and expenditures, established fund accounts and subsidiary records and ledgers are actually being maintained or produced.

However, great as the improvement has been, there are relatively few municipalities in this country which are able to compile a complete financial statement, including a balance sheet, revenue and expense statement, records of city property and equipment, accurate and scientific sinking-fund records and other data, comparable to those obtained by up-to-date private business. (Consult *National Municipal Review*, Vol. VI, p. 715).

Some indication of the backwardness of cities is gleaned from the 1913 report of the auditor of the city of Cleveland. He said: "I have the honor to present for the first time in the city's history, a general and detailed balance sheet from our general ledger." Cleveland was at that time, in population, the sixth city of the United States. What was true of Cleveland prior to 1913 is equally true of many sizable American municipalities at this writing.

**Uniform Accounting.**—Coincident with the actual betterments made in the methods of keeping municipal accounts, there developed the movement for securing reasonable uniformity. The origin or development of the movement may be attributed to no one person, group of persons or association but interest in the whole subject was intensified as well as extended through the discussions and recommendations of numerous associations, national, State and local, of which the following are some of the more important: National Municipal League, League of American Municipalities, American Society of Municipal Improvement, United States Census Bureau, Bureau of Municipal Research, various State bureaus organized expressly for the purpose and an army of city clubs, business organizations, citizens' and taxpayers' associations, civic organizations and public-spirited individuals.

In this relation it is worthy of mention that the uniform accounting idea was not of American origin. In 1871, by act of the English Parliament, a "local government board" was created for the express purpose of establishing in counties, municipal corporations and towns, uniform systems of accounts, of complete audits of accounts and of uniform reports to the government of the financial operations and condition of local governmental units. The larger German cities, although not compelled by any statute, had for years maintained substantial uniformity of accounting methods which afforded excellent facilities for comparing costs of administration, maintenance, etc.

**State Supervision.**—The first step in this country toward State supervision of municipal accounts and accounting appears to have been taken by Minnesota in 1878, when an act was passed creating the office of public examiner, with power to audit the accounts of State and county officers and to enforce a correct and uniform system of bookkeeping in counties.

Minnesota's action was followed by Massachusetts in 1879, when it placed the accounts of certain county officers under the supervision of the savings bank commissioner. Later, in 1887, there was established the office of comptroller of county accounts. Without following the various amendments to the Massachusetts statute, it may be said that it does not confer power on State authorities to force or compel the establishment of uniform accounting methods. It does require the State to install such systems when invited or requested by municipal authorities to do so. Substantial progress and valuable and constructive work has been done in that State without finding it necessary to enact mandatory legislation. The power of suggestion and moral suasion has met with remarkable success.

The Wyoming constitution of 1892 made the office of State examiner of county accounts constitutional. That official has the general supervision over such accounts and a well-organized bureau has been in existence since Wyoming first became a State.

Other States which have enacted similar legislation are North Dakota, South Dakota, Ohio, New York, Iowa, Washington, West Virginia, Wisconsin, Rhode Island, Idaho, North Carolina, Nebraska, New Hampshire and New Jersey. In but few of the States has State supervision been completely inaugurated and established. In some of them the authority is to examine accounts; in others, to establish uniform accounting practices and, in some few, the measure of supervision is limited to certain classes of accounts, as is the case in New Jersey where the commissioner of accounts exercises jurisdiction in respect to sinking fund accounts only. Perhaps the most comprehensive statutes are those enacted in Ohio and New York.

The Ohio law was passed in 1902. It confers upon the auditor of the State jurisdiction to establish a uniform system of accounting, auditing and reporting for all counties, cities and towns in the State.

The New York act confers upon the comptroller of the State, except in respect of first-class cities and counties wholly contained within such a city, authority (a) to cause the accounts of each county, city, town and village to be inspected and examined periodically, as he may deem necessary; (b) to formulate, prescribe and install uniform systems of accounting in several groups of municipalities; (c) to require of fiscal officers of municipal corporations annual reports upon blanks prepared and furnished by him, and (d) to tabulate the substance of such reports in comparative statistical form so arranged as to reflect the financial condition of each corporation, its sources of revenue and the purposes and objects for which its funds have been expended.

Although these States have assumed supervision over municipal accounting, it does not follow that each municipality is keeping its

accounts according to a uniform plan. Perhaps the situation in New York is typical of that existing in other States. No municipality of any considerable size in New York remains uninfluenced by the work undertaken by the State comptroller. Nevertheless, of 1,500 municipalities in the State, uniform systems are being successfully operated in no more than 300 of them. The work moves slowly because of the limited number of men employed and for the further reason that in smaller municipalities the officers are reluctant to have their accounting methods revised.

**Who Should Keep Accounts.**—Generally speaking, every office and department of a municipal corporation which collects or receives money or which is authorized to expend or authorize the expenditure of public funds should keep accounts thereof. In every municipality there is a chief fiscal officer. He may be called comptroller, auditor, accountant, treasurer, chamberlain, commissioner of finance, commissioner of accounts or any one of a number of names. Just what official is the chief fiscal officer depends entirely upon the provisions of the governing law and in that respect it is to be deplored that such laws do not always outline with clarity who the principal fiscal functionary is. But that official, by whatever designation known, keeps or should keep complete records of all fiscal transactions of the corporation. It is frequently found that the elements of authority or duty necessary to vest in a single office power adequate to constitute the incumbent thereof the chief fiscal officer of the governmental unit are distributed between two or more offices.

Municipal governing laws are by no means perfect, particularly the older ones. They are especially deficient along accounting lines and in relation to the formulation of financial plans (budgets). It is not so many years since laws were prepared by members of the legal profession, who, as a rule, had little knowledge of and less patience with accounting requirements and orderly financial planning.

It is at this point that the fiscal officer encounters the first serious obstacle if he is desirous of modernizing his accounting methods. In private enterprise it is comparatively simple to obtain authority to make changes in methods or even to reorganize the accounts completely. The situation is different in a municipality. It has no sovereign power. What authority it possesses is derived from enactments of the State legislature. Frequently it is found that the law requires certain specific procedure which is not the best course or method to follow, or that well-nigh insurmountable legal provisions prevent doing in a direct, orderly, business-like manner that which accounting principles require. In fact, in very many cases the obstacles encountered have the effect of discouraging officials, impairing their enthusiasm and retarding the development of better accounting systems.

The first step in reorganizing the accounts of a municipality is to study its laws and ordinances, and sometimes that discloses the impracticability of undertaking the task until changes are made in the applicable laws and ordinances. It is evident that from time to time municipal laws must be changed by amend-

ment and repeal until sound accounting principles shall be matters of law as well as of necessary business procedure.

**Rudiments of an Adequate System.**—Accountants are quite generally in accord respecting the goal or aim to be attained in municipal accounting, but they are not in agreement as to all details or methods of reaching results. In a measure, that is because of the different conditions existing in the various classes of municipalities or in municipalities of the same class operating under different laws. Nevertheless, it is possible to state with assurance that an appropriate system of municipal accounts must embrace certain elements. While it is not possible in limited space to make the outline inclusive of all features the following is believed to include the important characteristics.

**Bookkeeping.**—That the accounts, summaries, schedules and reports supply the information necessary to intelligent judgment and appraisal of results the accounts should be kept according to the double entry plan of bookkeeping. The single entry system is the more primitive but it exhibits in the form of a final statement one relation only—that of asset and liability. The double entry system discloses not only that relation but presents a classified summary of operations. The final summaries under a single entry system exhibit proprietary conditions. Under the double entry plan it is convenient and practicable to show whether or no the municipality has rendered the best service of which it is capable at the least cost, and whether its proprietary interests have been protected against the misuse and infidelity of its officers.

**Terminology.**—It is of vital importance that correct terminology be employed. It should be uniform in all departments of a municipality, and, if uniform terms be used by all municipal corporations, that greatly adds to the usefulness of final summaries, statements and reports. The terms to be employed should be selected with care. The Federal Census Bureau early realized the importance of establishing proper accounting terminology and for years has incorporated in its report of the statistics of cities what is believed to be the best accounting terminology obtainable.

**Centralisation and Co-ordination.**—To have a complete system of accounts requires that every transaction be recorded. That should be done in the bureau where the transaction arises and, if possible, by the person in charge thereof. To utilize this record and to adapt it to the purposes of control, the various transactions must be classified and summarized and finally brought into statements of account in a central office. That should be the office of the chief fiscal officer of the corporation. When that plan is followed, reports and statements from the general ledger will reflect the operations and the condition of the municipality as a whole in such manner as to serve the purposes of officials and the public.

Not infrequently it is found difficult, if not impossible, to procure central accounting and to obtain co-ordination between the accounts of the chief fiscal officer and those of municipal departments. Usually that is caused by one or both of two conditions: (a) The governing law may not require centralized control; and

(b) departmental officers may not be in sympathy or harmony with the plan and execute it with indifference. In such cases a campaign of education may be necessary in order to procure a change of condition.

*Annual Budget.*—The arrangement of current accounts by the fiscal officer necessarily follows the budget classification. A properly constructed annual budget usually reflects more of the business side of a municipal government than any other single document. It should be the financial program. Appropriations for expenditures are in the nature of allowances or drawing accounts. Expenditure appropriations should be correlated with the revenues intended to meet expenditures. From an accounting point of view, the annual budget affords the most satisfactory method yet found for gaining centralized control over municipal expenditures. Generally speaking, a proper system of municipal accounting can be obtained only when a well-arranged and properly constructed budget has been adopted.

The reorganization of a city's accounts should be undertaken at the time of the preparation of the annual budget.

*Revenue and Expenditure Accruals.*—True stories concerning the operations of a municipality cannot be told nor the effect of its fiscal activities accurately reflected unless the accounts show accruals of revenues and of expenditures as well as encumbrances of appropriations. The money actually received during a given period does not accurately measure revenue and the cash disbursed does not correctly state the cost of conducting the business of the corporation. The system should afford means of showing the financial condition of the municipality at all times. To accomplish this, there must be records which disclose not merely undisbursed balances of appropriations but, as well, the obligations incurred upon contracts and open market orders. In short, it should show what is owing the municipality as well as what the municipality owes.

*Grouping of Accounts.*—To secure correct information relating to the financial condition of a municipality, it is essential that the accounts, reports and balance sheets provide for a proper presentation of the facts by grouping the accounts; this for the reason that it is necessary to guard against the use of particular funds for purposes other than those intended. Otherwise, there is danger of having applied capital, trust or sinking funds to the payment of expenses incurred for current administration, operation or maintenance.

The grouping of accounts is not an arbitrary classification of them. All obligations entered into by a municipal corporation and all transactions recorded in its accounts pertain to some particular fund. Therefore, to assemble accounts in independent balancing groups is in formal recognition of the fact that every account naturally falls within one of several groups.

Into just what groups the accounts of a given municipality should be divided depends entirely upon the character of its business and the nature of the funds held. The comptroller of the State of New York, in a uniform system formulated for cities of the third class (those having a population of 50,000 or less), allocates the accounts to the following groups: (1) cur-

rent accounts; (2) assessment accounts; (3) capital and sinking fund accounts; (4) trust accounts.

The current group includes those in which are recorded transactions relating to budget expenditure appropriations and revenues applicable to meet them, together with the financing done respecting those transactions. It is intended primarily to keep the record of current operations separate and apart from all other transactions. The distinction between current operations and all others is regarded as important and one which should be maintained in order that the results of current activities may be reflected simply and intelligently.

The accounts forming this group are closed at the end of the year into a current surplus or deficit account, thereby indicating how the financial plan actually worked out. If there is an excess of revenue over expenditure, it will be shown by a credit balance in the current surplus account. If the expenditures on an accrual basis exceed revenue accruals, then a debit balance will result, reflecting what is in fact a current deficit.

The assessment group includes all accounts relating to assessment work, the levy and collection of assessments, the financing of cost and assessments remaining uncollected.

The capital group embraces the accounts pertaining to bond issues for construction purposes (excluding assessable work) and the expenditure of the proceeds of such issues. There is also included accounts showing the value, appraised or assessed, of the municipality's property.

While the accounts for sinking fund transactions are included in this group, that is because in cities of the third class sinking fund transactions are not numerous. If in any municipality those transactions are of volume, a separate group of accounts should be established.

The trust group contains the accounts of all funds or properties held in trust, including pension funds.

*Classification of Accounts.*—Having assembled the accounts of a municipality into logical groups, it then becomes necessary to further classify them to show the channels or sources from which money is received and the purposes and objects for which it is expended. In this, as in other matters, uniformity should prevail and uniform terminology be employed.

With reference to receipts, a classification is not difficult. The groups other than the current accounts group will be arranged according to the nature of the transactions occurring. In the current accounts division, receipts will be divided into two general classes: (a) revenue and (b) non-revenue.

The revenue receipts may then logically be classified as (1) General property taxes; (2) special property taxes; (3) interest and penalties on taxes; (4) licenses and permits; (5) fines and forfeits; (6) interest and rents; (7) gifts and donations; (8) sales of property; (9) departmental earnings, etc.

In the non-revenue class will be found current loans, transfers, refunds, advances and such other classes as may occur in the municipality.

Respecting expenditures in the current accounts group, the situation is more difficult. It

is very aptly stated in the January 1917 issue of the *Municipal Research Bureau*, that expenditures should be classified in as many different ways as there are stories to be told concerning costs. The following four methods are then indicated:

"1. Total cost incurred by organization units — to mark the lines of official responsibility and the jurisdiction of each spending officer.

"2. Total cost incurred, classified by *functions*—for determining questions of policy having to do with service rendered as well as to be rendered, and laying a foundation for appraisal of results.

"3. Cost of things classified by *objects* expended or used in carrying on the work; such as 'personal service,' 'supplies,' 'materials,' 'equipment,' etc.—to lay the foundation for considering the amounts to be appropriated to buy things needed.

"4. Total cost classified by *character*, that is with a view to determining what part is for current expenses, what part for capital outlays, etc.—to lay the foundation for considering financial policy."

It is not probable that any municipal corporation is grouping its expenditures in the four ways indicated. In many of them, a twofold classification is followed—that is, by governmental function and by purpose or object of expenditure.

In the New York State comptroller's system for third-class cities, arrangement by governmental function is as follows: (1) General government; (2) protection of person and property; (3) conservation of health; (4) sanitation and promotion of cleanliness; (5) highways; (6) charities and corrections; (7) education; (8) recreation; (9) public utilities—non-commercial; (10) miscellaneous; (11) municipal indebtedness; (12) construction and permanent improvements (financed from tax moneys or current revenues); (13) public utilities—commercial.

His classification by purpose or object of expenditure is as follows: (a) Salaries and wages; (b) traveling expenses; (c) office expenses; (d) printing and advertising; (e) purchase of equipment; (f) maintenance of equipment; (g) materials and supplies—(g-1) specify; (g-2) specify; (g-3) specify; (h) repairs by contract or open market order; (i) light, heat and power; (j) rent; (k) insurance; (l) pension fund contribution; (m) other expenses—(m-1) specify; (m-2) specify.

The foregoing are based upon the classification worked out by the National Municipal League (Proceedings of 1899, pp. 116-123), as modified and adopted by the Census Bureau in many municipalities.

*Stores' Accounts.*—In order to ascertain the precise cost of administration for a given period, it is necessary to take into account, as an offset to charges against appropriations, the cost of materials and supplies not used. The best method is that of keeping a running inventory account of materials and supplies. To do that necessitates keeping stores accounts, in which case requisitions are issued when stock is called for by a department, and then expense may be charged and the appropriate stores account credited with the supplies so furnished.

If accounting requirements only were to be considered, it would be advisable for each municipality to adopt this plan. However, the size and the experience of the personnel of accounting offices in average municipalities has thus far rendered it impracticable to adopt such a system.

Substantially the same result may be attained by taking an inventory of materials and supplies on hand at the end of a fiscal year and by placing their cost on the records. Of course, the fiscal officer should audit the inventories and open an account for materials and supplies by debiting "materials and supplies" and crediting "inventory surplus." The materials and supplies account will be temporary, to be opened at the end of the year and closed at the beginning of the next following year or as soon thereafter as the budget shall have been adopted, by reversing the entry or by charging against appropriations provided for the purchase of the particular class of materials and supplies shown by the inventories to be on hand. In the latter case, the charges against appropriations, less the inventory value of materials and supplies not consumed, will accurately reflect the total of actual expenses for the year. This plan corresponds with the practice prevailing in business concerns that do not keep running inventory accounts.

*Unit Costs.*—A noted railroad man, now deceased, will long be remembered for his advocacy of the principle of "ton mile cost." The application of that idea may well be extended to many municipal functions. It would be of great interest and value if officials and taxpayers might know the cost per unit of street paving, sewer construction, street lighting, water pumping and filtration, etc., and the per-capita cost of public education and of maintaining patients in public institutions per day, week or month. Unit costs are the most significant bases for comparison and of great administrative value.

*Commercial Public Utilities.*—Municipalities are more and more engaged in commercial enterprises. Municipal water and lighting systems are common. Others are being added yearly. It is thought that a municipal water plant should maintain its departmental accounts in substantial conformity with the system adopted by the American Water Works Association, and that other public utilities, when operated by a municipality, should conform their accounting methods with the requirements of public service commissions in those States having such commissions, or with systems employed in private business of like character, if State supervision has not been established.

Municipal accounting has a pronounced effect on municipal government. Improved administration is sure to result from better accounting. Efficient administration is impossible without an adequate accounting plan. A suitable, adequate system of accounts in a municipality will enable the authorities to judge results of past operations, and plan and administer future activities with the assurance that they are acting intelligently. It will permit the taxpayers to appraise the accomplishments of an administration and to form accurate conclusions respecting the ability, the efficiency and the economy of their chosen officials.

**MUNICIPAL APPROPRIATIONS.** See APPROPRIATIONS, AMERICAN SYSTEM OF; BUDGETS, AMERICAN.

**MUNICIPAL ART SOCIETIES,** organizations in the various large cities of the United States, devoted to the promotion of municipal art, and the making of the city beautiful. The ends of these associations are pursued by planting trees, restricting billboard advertising, establishing small parks and playgrounds in the congested districts, improving as far as possible the architecture of public buildings and in general making the city as artistic a unit as possible without hampering the commercial or utilitarian activities of the city. Among these organizations are the Municipal Art Societies of New York, Chicago, Cincinnati and Baltimore; the American Park and Out-Door Association; the Fairmount Park Association, etc. In several of the larger cities, as New York and Chicago, there are now official municipal art commissioners having supervision over public buildings, monuments, etc. (See ART, AMERICAN; CITY PLANNING; PARKS, PUBLIC). Consult Mawson, T. H., 'Civic Art' (London 1911); Robinson, C. M., 'Modern Civic Art' (New York 1903); id., 'The Improvement of Towns and Cities' (8th ed., ib. 1913); *Municipal Affairs* (Vol. II and III, ib. 1898-99).

**MUNICIPAL COLLEGES AND UNIVERSITIES.** The United States.—The passion for free public education in the United States has carried well beyond the original intention. At first only the elementary school was free; tuition was free, and the schools were maintained by public taxation. Secondary education was then conducted by private academies and higher education by privately endowed colleges and universities. But before the free elementary school had become universal, free high schools were opened and maintained in the more progressive communities and by the close of the 19th century the free public high school was practically the uniform policy

of public education in every State of the Union. Opposition to such free secondary education in tax-supported schools has almost entirely disappeared. The newer States have gone beyond this and have established universities, supported entirely by taxation and offering free tuition to residents of the State. This has strengthened the theory that all education in a free State should be at public expense, college, university and professional education.

The municipal college and university has grown out of the city high school in response to the public demand for higher education. High school work in modern languages, in mathematics and some of the sciences, overlap the college program in the freshman year. It is an easy step, therefore, to add college work to the high school program. Baltimore, Philadelphia, Charleston, Los Angeles, Cincinnati, Toledo, New York City, are cities where municipal colleges are now in operation. Cincinnati has developed a municipal university with the usual departments of medicine, law, dentistry, education and engineering, in addition to the College of Arts and Sciences. Toledo is developing a university along similar lines. New York City, on the other hand, has confined its efforts to the development of the college as distinct from the university idea. This is the municipal college in its perfect form since it is entirely supported by public taxation and admits as students only residents of the city of New York. Its equipment, costing upwards of \$5,000,000, was likewise provided out of municipal funds. Other municipal colleges and universities have received private endowments in addition to municipal appropriations. The University of Cincinnati received a large private gift and is less typical of public higher education for that reason. The public high schools, sometimes called the "Peoples' Universities," are fitted to develop into municipal colleges at the demand of the people. In the United States, colleges and universities frequently reflect local characteristics; for example, the University of Pittsburgh, the University of Chicago, the University of Denver, University of Buffalo, University of Rochester; but they must be carefully distinguished from municipal universities since they are not maintained by the cities where they happen to be located, nor is the student body wholly or even largely drawn from such city.

**England.**—England has developed a type of municipal college but they are not tax supported and therefore are not municipal institutions in the truest sense. Nevertheless, although on private foundations and maintenance, many of these English colleges are of local character, reflecting the local industries, local ideals, local pride. Thus the Sheffield College reflects the cutlery interests by its excellent "School of Metallurgy." The College of Leeds reflects the textile industries by its "School of Textiles." Birmingham, Liverpool and Manchester have local universities. The University of London has a long and honorable record.

**MUNICIPAL CONTRACTS.** See MUNICIPALITIES.

**MUNICIPAL DEBTS.** One of the most striking facts in modern American city development is the appalling increase in municipal

indebtedness. Startling figures upon this subject have been compiled by the United States Census Bureau. Municipal and country debts increased 76 per cent from 1890 to 1902. From 1902 to 1913 they had increased 113.2 per cent and had reached the enormous net total of \$3,475,954,353, or more than twice the combined indebtedness of the Federal and State governments. At the end of the fiscal year 1915 there were 146 of the cities in the United States which had a population of more than 30,000, whose total indebtedness exceeded that of the national government by \$1,155,758,406 or 106 per cent. In these cities the per capita debt had increased from \$44.71 in 1903 to \$77.86 in 1915. That this increase in indebtedness has not been uniformly rapid, however, is shown by the fact that in Rhode Island the debts of cities, towns and villages increased less than 1 per cent between 1902 and 1913, while in California there was an increase of 986.1 per cent during the same period.

An accurate statement of the causes of this increase in municipal indebtedness does not reflect credit upon the soundness of our municipal finance. After the Civil War American cities very generally embarked upon programs of reckless expenditures for various municipal services and utilities. These were paid for by the issuance of bonds. These bonds were too frequently issued for terms much longer than the life of the improvements or property for which they are to pay. Cities also entered upon the unwise policy of borrowing to meet the current expenses of the city. Inefficient methods of municipal accounting contributed to the general financial chaos. State supervision was too often inadequate to the task of preventing the floating of ill-advised municipal loans. To all these factors should be added the general recklessness and optimism of municipal administrators who were never depressed by the consciousness that money once borrowed must ultimately be repaid.

The conviction that municipalities cannot be trusted to borrow money without restraint while not new has in recent years grown stronger. This is clearly evidenced by the increasing number of restrictions placed upon the borrowing power of the American city which may be thus summarized:

**Restrictions upon Municipal Indebtedness.**

(1) A city must not incur debts beyond its delegated powers. The power to borrow must either be given in express words in the city charter or it must be implied from some power which is specifically granted. Without such positive authority debts incurred by the city are absolutely void.

(2) Municipal debts may be contracted only for public purposes and not for the benefit of private individuals or groups. This restriction is the logical result of the well-established rule of constitutional law that taxes may be levied only for purposes which are public, inasmuch as the city's debts must ultimately be paid by taxation.

(3) Limits upon the amount of municipal indebtedness which may be incurred are found in the statutes or constitutions of most States. These restrictions specify that city debts must not exceed a certain per cent of the value of all the taxable property, all the real property

or must not exceed the annual income of the city. These percentages vary greatly, running up to 18 per cent in the constitution of Virginia. The establishment of a debt limit in a State constitution does not confer upon cities any power to create an indebtedness up to that limit and the State legislature may, by statute, impose additional restrictions in its discretion. Any debts contracted by the city beyond the limits so set are void and persons who loan money to municipalities must learn at their peril whether the city, in issuing the bonds they buy, has exceeded its debt limit. Both constitutions and statutes sometimes provide that in determining whether the total indebtedness of a city exceeds the limits set, debts incurred for certain special purposes shall not be included. The debts so excluded are those contracted for the purchase or construction of public utilities such as waterworks or lighting plants from which the city expects to derive revenue. There is a difference of opinion as to the wisdom of this policy. It has been urged that bonds issued for these revenue-bearing projects should be counted in computing the city's debt unless such bonds are secured merely by liens or mortgages on the properties in which the money was invested and do not constitute general liabilities upon the credit of the city. In short if the bonds will be paid ultimately out of money derived from taxation they should be viewed in the same light as debts incurred for any other purpose.

(4) Statutory or constitutional provisions frequently require that bonded debts shall be contracted only after a vote of the people registered in a special election upon the question. Such a referendum may be required for the creation of any debt, or of such debts as would be in excess of a specified amount, or of debts which are to run for more than a certain length of time. In some cases two-thirds or more of the voters must approve the proposed debt; in other instances only taxpayers or property-owners are allowed to vote.

(5) Maximum period of years to constitute the life of the debt is often stipulated. These limits are frequently placed at from 20 to 30 years but in some cases the term will vary with the purpose for which the debt is incurred. By vote of the people, above mentioned, the length of the debt term may be extended in a few instances.

(6) One of the most common restrictions upon municipal indebtedness is that which compels the city when incurring a debt to levy a direct tax annually during the life of the debt for the purpose of paying the interest and of accumulating a fund out of which to pay the principal at maturity. Such a fund is known as a sinking fund. This fund must not lie idle but must be profitably invested by the city.

These restrictions upon the power of American cities to borrow money have been of some use in preventing financial recklessness on the part of cities, but in general the policy of setting up hard and fast restrictions of general application to all cities is unsatisfactory. There is an unfortunate lack of elasticity. Some cities cannot borrow as much as they need; others borrow more than they need. A debt limit based on assessed property values is an incentive to raise the assessments unduly. There are

no general legislative or constitutional restrictions upon the power of English, French or German cities to borrow. Instead municipal debts in those countries are supervised as to purpose, amount, interest-rate and methods of repayment by administrative authorities of the central government. This administrative control is exercised in England by the local government board, in France by the prefect, in Prussia by the provincial authorities. By this method the city's debts are adequately regulated but by a means elastic enough to meet the needs of the individual city.

**Kinds of Municipal Debts.**—Municipal debts may be classified in several ways. A debt may be *funded*, in which case it is represented by interest-bearing bonds issued for a definite period, and with some definite provision for repayment at maturity, or it may be a *floating* debt, not secured by bonds, usually small in amount, and with no special scheme provided for its repayment. The latter comprises usually the short-time obligations which the city incurs in special emergencies in connection with the current needs of administration. The floating debt is usually funded when it becomes large in amount. The bonds representing the funded debt of the city are usually negotiable and are sold in the financial market like the securities of private corporations. They usually bear recitals stating the authority under which they were issued and other facts tending to show their legality. If these recitals are false for the purpose of floating an illegal bond issue, the courts will refuse to allow the city to escape paying its just debts by setting up the falsity of its own statements. This is known as the doctrine of estoppel by recitals. The *gross* debt of the city is the sum total of all its funded and floating debts. The *net* debt is the amount of the gross less the amount of such sinking funds as have accumulated for the ultimate repayment of the funded debt.

**Methods of Borrowing.**—A city may follow one of two policies in borrowing money. *First*, it may issue *sinking-fund bonds*, all of which mature at the same time, and which are to be paid out of a fund gradually created for the purpose. This plan has thus far been most often used. It has, however, several disadvantages. It requires the setting aside of a certain part of the city's income each year and the investment of that money. Sometimes through miscalculations, carelessness or dishonesty the funds are not properly invested. Sometimes the annual stipend is not paid into the sinking fund as it should be. The second method of borrowing is by issuing *serial bonds*. These bonds mature at different times in such a way that a fixed proportion of the debt will fall due each year and must be retired. The advantage of this plan is that there is no necessity for a sinking fund with the problems it creates and there is no way for the city to escape its annual payment short of absolute default of the bonds which annually mature. The weight of opinion now favors this plan.

ROBERT EUGENE CUSHMAN,  
*Associate in Political Science, University of Illinois.*

**MUNICIPAL GOVERNMENT.** In March 1897, as a tribute to the growing public interest in the city problems, 'Bibliography of Municipal Administration and City Conditions' was published as the first number of the quarterly magazine, *Municipal Affairs*. Even at that time the list of books and articles dealing with the various aspects of city government drew its lengthening trail through no less than 224 octavo pages. It is well nigh beyond the power of the imagination to see to what length a similar bibliography of municipal administration prepared in 1916 would run. The extraordinary interest in municipal government exhibited during the past 20 years in this country has been the result of certain fundamental facts. America has been rapidly changing from a rural to an urban nation, so that the proportion of the people who are members of municipal corporations has greatly increased. Furthermore, the rapid development of facilities for transportation and communication has made the cities of the country assume an importance in the public interest even surpassing their importance on the basis of population. Finally, the older cities, having grown to be great with little conscious guidance and with no adequate recognition of the obligations imposed upon a municipal corporation by the very nature of urban life, or of its inherent privileges, have during this period made a virtue of necessity in beginning to take thought for the civic problems of the present and the future.

**1. Origin of Municipal Corporations.**—It is not possible to draw an exact line between rural and urban conditions, and it is a fact that municipal government in its more complex and commanding forms is the result of a gradual development from the simple military government of the army post or the simple rural government of the agricultural town. When a community has reached the stage where it is willing to organize a municipal government it is ready to take a long step away from the Anglo-Saxon individualism so well expressed by the old saying that "the Englishman's house is his castle." It is, of course, true that political government in any of its forms means a curtailment of individualism. But the phenomena of city government marks a distinct advanced stage in this process. Let the man who believes that he has an inalienable right to "do that which seemeth good in his own eyes" and to "do as he pleases with his own," beware of the city! The utmost development of social control to be found in the latest city planning scheme is inherent in the first formal recognition of the fact that the conditions of urban life make necessary a special form of government. People cannot live close together without submitting their individual whims and fancies to community control. In this fact the city has its origin.

**2. Relation of Municipal Corporations to State and National Government.**—It is the theory of American law that sovereignty, as manifested through the colonial and subsequently through the State governments, precedes both in time and authority the powers which are manifested in the operation of municipalities. In other words, the city, although it is a normal development of the economic and social needs of the people, acquires no governmental powers except as they are granted by the sovereign state. Thus the direct control of the States over the municipal corporations within their borders is theoretically complete, even to the point that municipal governments might be abolished altogether and their functions discontinued or transferred to central authorities of the State. This theoretically helpless position of the cities has subjected them to many abuses, particularly at the hands of the State legislatures, with the result that one of the most potent reform movements connected with city government has been the movement for municipal home rule. The purpose of the home rule movement is not to create *imperia in imperiis* or to remove the cities from the jurisdiction of the States in their sovereign capacity. It is rather to give the cities in each Commonwealth a constitutional status and to this extent to curtail the general governmental powers conferred upon the legislature. Municipal home rule in various forms has already been embodied in the constitutions of the following States: Missouri, 1875; California, 1879; Washington, 1889; New York, 1894; Minnesota, 1896; Colorado, 1902; Oregon, 1906; Oklahoma, 1907; Michigan, 1908; Arizona, 1912; Ohio, 1912; Nebraska, 1912; Texas, 1912. The chief purposes of municipal home rule are to enable cities (1) to frame their own charters and thus choose their own forms of government; (2) to prevent legislative interference with municipal affairs by means of local and special legislation; (3) to exercise police control over their inhabitants in accordance with the dictates of local public sentiment; and (4) to determine what co-operative functions shall be undertaken by the community. It is noteworthy that of the large cities of the country, Saint Louis, Cleveland, San Francisco, Kansas City (Mo.), Seattle, Portland (Ore.), Denver, Saint Paul and Toledo, are living under charters framed and adopted by their own people, subject in some cases to subsequent ratification by the legislature. Detroit, Cincinnati and Minneapolis are only deterred from having home rule charters by their inability thus far to devise any that are satisfactory to themselves. Many of the States not enumerated above have provisions in their constitutions forbidding the legislature to pass local or special acts amending city charters or interfering in the internal affairs of cities.

In theory the national government has no control whatever over the forms or functions of municipal government. In practice, however, the Federal government exercises considerable indirect control over cities through its control of interstate commerce and the use of the post roads, as well as through its control over navigable waters and the development of natural resources such as water powers. Still more

important in practical effect is the judicial control exercised by the Federal courts over the actions of municipal governments affecting contracts and property rights. The Federal government, of course, has complete control of the city of Washington, and at the beginning of President Wilson's administration it was suggested that an effort should be made to make Washington distinctively a model city to which all the other cities of the country could look for the latest and best developments in administrative machinery and municipal practices. In fact, the Federal government has for many years endeavored to co-operate with cities throughout the country, particularly in the development of a uniform system of accounts and the publication of uniform statistics and in the establishment of uniform standards for the testing and control of the gas supply. These activities, however, are purely advisory.

In the extra-legal aspects of the relations between municipal government and the State and national governments, the political issues which have their origin in municipal problems are becoming very important. In the early stages of the municipal reform movement in this country, it was thought necessary to separate municipal elections from State and national elections so that the voters would not be confused by political issues and by the exigencies of party strife in the selection of their local officials. Prof. Frank J. Goodnow, the eminent authority on administrative law, was a pioneer in trying to work out a proper delimitation of the spheres of local and State government in order to find a basis for an intelligent home rule program. This task, however, proved to be one of very great difficulty and in spite of the continued efforts of scholars in the universities, reformers in the National Municipal League and other organizations, and public officials in various associations for the promotion of home rule, no exact definition of the proper scope of municipal government thus far devised has yet met with general acceptance. In fact, while the sentiment for municipal home rule has been slowly finding expression in constitutional and statutory provisions, conditions have been growing up which make cities necessarily more and more dependent upon each other and upon the State and nation. A theory of home rule which might have been considered adequate 20 or 30 years ago would now be subject to important modification, in view of the fact that urban interests and urban problems have, as it were, overflowed the boundaries of the municipalities and have become, especially in the more densely populated Commonwealths of the East, closely identified with State interests and State problems. The old demand for the separation of State and local elections and politics has thus lost much of its force. With the election of United States senators by direct vote of the people the chief link that formerly tied the State government to national politics has been broken so that at the present time the more logical line of separation as to elections and political issues is between municipal and State on the one hand and national on the other, but even here a solidarity of interests is arising, notably in connection with the development of water power and the conservation of natural resources, which tends to make undesirable any

hard and fast separation of political organizations and issues among local, State and national.

**3. Relation of Cities to County and Township Government.**—Counties are in the main divisions of the State established for convenience in the administration of State laws through the agency of locally elected officials. The functions of the county usually include the prosecution of criminals, the keeping of records relating to the title of property, the administration of the Inheritance Law, the care of the poor, the supervision of public education and the planning and execution of certain major improvements such as important highways, bridges and drainage schemes. The primary functions performed by counties are universal ones, and the absence of any strict administrative control by the State government over county affairs, together with the original prevalence of the fee system through which many of the county officers have received their compensation, has made county government all but universally the football of politics, and county officials everywhere the main cogs in the machine of one or the other of the two principal parties, according to whether the one or the other has been in control in particular counties. These conditions tend to establish a situation very embarrassing to municipal government in those counties where, through urban development, the vast majority of the electors are also electors of one city. Side by side with the increase in the complexity of the activities of the city, the expensiveness and political importance of county government grow. The result is a duplicate system of local government, with extravagant expenses and no end of political interference. Under these circumstances, movements have taken place in many of the States for the consolidation of city and county governments wherever large cities have sprung up. Wherever this consolidation has been established the county functions have been taken over by the city government and thus the city, in a sense, has been taken out of the regular administrative organization applying to other portions of the State. The most notable instances in which this consolidation of city and county government has been partially or completely established are New York City (which includes five counties whose affairs are partly under the jurisdiction of the central board of estimate and apportionment and partly still conducted by county administrative officials), Philadelphia, Saint Louis, Baltimore, San Francisco and Denver. In Virginia all the cities, large and small, are separate from and independent of the counties within which they are located.

So far as township government is concerned, cities often remain subject to it until they become large enough to absorb all of one or more townships, when the functions of the several town governments included within the city limits are usually taken over by the city and the separate township organizations abolished. The infinite confusion and difficulty that results from the persistence of a multitude of different local governmental bodies occupying in whole or in part the same territory is perhaps best illustrated by the experience of Chicago, where until comparatively recent years even the assessments of property forming the

basis for municipal taxation were made by independent assessors elected by the different towns surviving within the city limits, with the result that all the assessors competed against each other to keep down the assessments of their particular towns. The result was that Chicago struggled along for many years trying to operate its municipal government under a constitutional limitation of its debt based upon a low percentage of its assessed valuation, although that valuation was in fact only 8 or 10 per cent of full value. The experience of cities points to the conclusion that in the interest of efficiency and economical government all local functions and all administrative functions performed by locally elected officials within the limits of the city should be consolidated with the city government.

**4. Relation of Cities to Each Other.**—Theoretically all cities, even those of the same State, are independent political units, having no formal relations with each other, and responsible either to their own people or to the people of the State as represented in the central government. However, with the enormous increase in urban population, particularly in the Eastern States, cities have in many cases begun to crowd each other. Sometimes two or more communities which started out as independent urban units have actually grown together as far as their industrial and social life is concerned without as yet being consolidated politically. In other cases, the extra-territorial needs of a great urban community for water supply, drainage, transportation and harbor facilities or electric power have brought cities into contact with the interests of other cities whose locations may be quite remote. For example, around the city of Boston has grown up a group of cities which, while politically independent of each other and of the metropolis, are all actually inter-dependent, so far as water supply, drainage and park development is concerned. The result in this case has been the establishment by State authority of metropolitan districts under the control of State commissions whose duties are to co-ordinate and promote the interests of all the constituent cities in the matters subject to their jurisdiction. This form of co-operation is in effect partial consolidation through State initiative. As another illustration we may take the city of Newark, N. J., which is closely surrounded by a group of overflow cities, all combined together so far as public utilities are concerned, by one semi-private agency, the Public Service Corporation of New Jersey, which operates the street railways, the gas plants and the electric light and power works in all of them. In this case the control over these utilities which the individual cities have necessarily in large measure lost is exercised not through a metropolitan district nor through a federation of the cities concerned, but through a State board of public utilities having jurisdiction throughout the limits of New Jersey. In Ohio a few years ago a group of cities centring around Akron and Canton, all served by the transit system of the Northern Ohio Traction and Light Company entered into what was called the "Inter-City Traction League" for the purpose of assembling their complaints against the traction company, co-ordinating their remedies and

uniting to present their demands to the public service commission of Ohio. In California a few years ago an act was passed by the legislature enabling cities to federate and establish districts coterminous with the areas served by particularly utilities for the purpose of acquiring and operating such utilities. Cities throughout the country have found it to their interest to combine informally in organizations for the study of municipal problems and the interchange of experience. Notable among these are the League of American Municipalities and The Utilities Bureau. In many States also leagues of municipalities have been formed which often have their nucleus in the municipal reference departments of the State universities and thus give to their constituent members the benefit of the research and constructive suggestions of modern applied scholarship.

**5. Influence of Increase of Population upon the Development of Municipal Problems.**—While cities remain small and are surrounded by wide stretches of agricultural territory, it is only the simplest communal needs, such as water supply, drainage and police and fire protection, that go to make up the necessary functions of city government as distinguished from rural local government. As cities grow larger, however, and as more cities spring up primarily dependent upon the same outside areas for water and food supplies, the original city problems became more complex and their solution more difficult. Furthermore, cities as they grow not only spread over larger areas but become more congested at their centres. Wherever cities become so large or so crowded that the open spaces of the country are no longer readily accessible to children and that even play-spaces under the crowded conditions of urban life are at a premium, the nature of the problems of the city government undergoes a radical change. Size and congestion transform the environment of the home and thereby make necessary a whole series of municipal functions, centring in the problems of health, recreation and education. It is with relation to these problems that cities have been prone to neglect their duty and to postpone the expenditure of thought and money necessary if the inherent and fundamental disadvantage surrounding human life in large and congested cities is to be in any reasonable measure overcome. The trouble is increased by the fact that as cities grow bigger the value of land mounts high and only the few who are relatively rich can afford to own their own homes unless, indeed, their less well-to-do fellow citizens seek remote suburbs. In any case the vast majority of the down town population will be made up of renters. Also, as the city gets larger, the community life changes. It is no longer possible for every citizen to be acquainted with the majority of his fellow citizens. Instead, he maintains his acquaintance with the comparatively few who are associated with him in his work or in his social or religious activities, and such associations become less and less neighborhood affairs. The result is that the citizen gradually becomes more and more dependent upon the newspapers and upon the official party organizations for the knowledge and leadership by which his civic activities must be guided. Moreover, the increase in the

size of a city and the enormous changes in the value of the land upon which it is built and in the size and profitability of its industries tend to separate the population more and more into classes. The rich become very rich and for the most part live in the most beautiful and exclusive districts of the city, while the poor become very poor and live crowded together in the slums. There are abnormal contrasts between splendor and squalor and the public opinion of the community becomes more inert and less intelligent; it becomes less responsible to the ordinary demands of citizenship and reacts with greater passion and recklessness upon the extraordinary ones. Urban life creates enormous commercial, industrial and social values. Those who first flock to a city, eager for these economic and social advantages, overlook to a large extent the counter-vailing disadvantages inherent in social congestion and for a long time, through ignorance, carelessness or greed, refuse to pay the necessary costs of overcoming these disadvantages. As a result the problems of the city are cumulative, so that after it has reached a certain size and finds that it must try to remove these neglected disadvantages at whatever cost, it begins to feel the pinch of civic poverty and is never able fully to catch up with its work. The unpaid judgments of civilization that have been piling up against it can no longer be escaped, and this fact combines with many others to make municipal functions in large cities extremely complex and extremely expensive. The law diminishing returns as applied to agriculture may be considered to apply also to the activities of municipal government. Beyond a certain point, which is determined primarily by the size of the city, the community gets a diminishing return for every dollar spent, but since the necessity is increasing the number of dollars to be spent increases by a geometrical progression.

**6. The City Plan.**—The first conscious constructive act of a community organizing itself into a city logically should be the development and adoption of a city plan, to utilize to the greatest advantage the site occupied by the city and to guide the city's growth for the future. It would be an error to say that this fundamental duty has been universally and completely neglected by the cities of America; for in a number of cases, of which Washington and Detroit are notable examples, city plans have been laid down at the beginning and more or less closely adhered to in their larger outlines. Moreover, the laying out of a single street, the construction of a harbor, the development of a sewerage system or of a municipal water supply, is in itself an act of city planning. Where most cities have lamentably failed is in the fact that they did not at the beginning exercise wise prevision and lay out a comprehensive plan of development when it was possible to do so. The purpose of the city plan is fundamental and complex. Every city has certain advantages of site which account for its existence. Through its location it establishes its relations with the outside world, upon which it is absolutely dependent not only for its growth and riches, but for its very life. As the sites of cities are of infinite variety and as the city plan must be made in

every case with regard to the particular site, it is futile to attempt to work out a uniform city plan good for adoption by all cities. The plan must utilize the site by developing all its inherent physical advantages as a terminal for transportation and traffic, by removing so far as possible, even at great expense if need be, its inherent disadvantages and by opening convenient thoroughfares for all kinds of traffic. The importance of providing great radial highways reaching out into the surrounding country can scarcely be overestimated in the case of cities largely dependent upon direct communication with their agricultural environs. Where a city is situated upon navigable waters the development of the harbor and of the water front terminals in convenient relation to the distributing land arteries within the city or reaching out from it is one of the greatest factors in a good city plan. In this connection it may be noted that of the 28 largest cities in the United States, all but four or five have the advantage of navigable waterways and owe their greatness in considerable measure to them. Under modern conditions, since the railroads have become the great land highways of the civilized world, the provision of adequate rights of way and terminal facilities for them is perhaps the most important single factor in the city plan, at least so far as it relates to the industrial and commercial growth of the city. But the city plan has other functions besides establishing convenient means of communication with the outside world. It is also to provide for the internal convenience of city life. Upon it depends whether the streets shall be wide or narrow, straight or crooked; whether street railway lines shall be conveniently laid out for rapid and comfortable transit; whether swamps shall remain undrained and hills undeveloped; whether there shall be playgrounds for the children and parks for all; whether available lakes and beaches shall be developed to their maximum usefulness; whether there shall be civic centres adorned with beautiful and convenient structures, or whether public buildings shall be dropped hit and miss about the city without reference to dignity of approach or convenience of use; whether skyscrapers and hovels shall nestle against each other or through proper zoning and restriction of the heights of buildings, each section of the city shall be utilized to the maximum without the egregious inconsistencies so often characteristic of unregulated development; whether the homes of the people shall be constructed with reference merely to the rents that can be extorted from the unfortunate or with reference to comfort, sanitation and the provision of adequate sunshine and fresh air. City planning in its broadest meaning comprehends all the fundamental and permanent civic improvements which are ordinarily paid for out of bond issues or special assessments, as distinguished from the current operations of the city government, the expenses of which are paid out of taxes and other annual revenues. One of the most important and most difficult problems of the city plan is the adoption of adequate measures to control the development of suburban communities at the time outside of the city limits but which sooner or later will inevitably be brought in. This is an extra-territorial problem and the city

cannot solve it in any reasonable measure unless it receives from the State drastic extra-territorial powers, and in the exercise of such powers through a permanent agency brings all suburban land subdivisions and other basic improvements under strict control and into harmony with a plan which the city itself has worked out for the development of the larger community of which it is the centre.

**7. The Disposal of Wastes.**—The primitive method for the disposal of sewage and liquid wastes is based upon the fact that water runs down hill. Most cities, up to comparatively recent times, have drained off their surface waters and their sewage as best they could into the nearest available stream or body of water that would carry it away or absorb it, but the obviously disastrous results that come to a city from pouring its sewage into its own water supply early led to the taking of some precautions against this particular civic blunder. For a long time, however, every city was careless of the welfare of communities further down the stream which often were dependent upon the same river for their drinking water. At one time it was the theory that sewage-laden water would purify itself by running a few miles, so that the down-stream communities need not be afraid, but the immense increase in urban population and the consequent increase in the volume of sewage has compelled cities willingly or unwillingly to spend enormous sums of money to carry their sewage for away or to establish purification plants for treating it before the innocuous effluent is permitted to run into rivers or other bodies of water. The disposal of wastes, however, includes much more than sewerage. It includes the collection and final disposition of garbage, ashes and household wastes, the removal of dead animals and the provision of cemeteries or crematories for the disposal of the human dead. These problems are far from simple and their complexity multiplies as cities become large. Ashes and cinders, if not mixed with garbage or other household wastes, may be profitably used for filling in and even as material for the construction of certain improvements, such as roadways and sidewalks. Garbage is one of the most persistent nuisances of the city. The efficient handling of the garbage problem requires the close co-operation of the individual householder with the civic authorities. The health of the community, especially during the warm months, requires that the garbage should be kept isolated from the time of its production to the time of its final disposition. This means tight cans, covered wagons and prompt cremation or reduction. But the very process of cremating it or of reducing it is so offensive that cities often find difficulty in securing proper and convenient locations for the garbage works. Cemeteries and crematories are very often established and maintained by private organizations, but in every case the city must see to it that the cemetery is not located so as to endanger the public water supply or otherwise affect the community's health.

**8. The Public Water Supply.**—It is the custom in the country and in very small villages for each householder to develop his own domestic water supply by means of a well. But in some locations individual wells are extremely expensive and in any case villages do not be-

come very populous before the danger from the general use of well water is recognized on account of the possibilities of its contamination. No general sewerage system is possible until a public water supply under pressure has been developed and so the very inability of the young communities to dispose of their sewage increases the danger of their primitive water supply and hastens the time when a public supply must be developed. As cities grow larger and the volume of water required for domestic, industrial and public purposes becomes greater than any suitable supply available in the immediate vicinity, it becomes necessary to build aqueducts and pipe lines to distant watersheds and to spend enormous sums of money to protect the purity of the supply, to bring it to the city and to distribute it to the people for its various uses. If mountain water is available, it can generally be delivered by gravity and needs no special treatment for purification. If water has to be taken from rivers or lakes it requires expensive pumping machinery to lift it from its natural level and force it into the distributing mains under pressure. If the public water supply has to be taken from the ground it requires the construction of infiltration galleries or series of wells, often very deep and expensive, with elaborate collection works and often double sets of pumping machinery to make it available for use. If the only available water supply is in its natural state impure or otherwise unsuitable for domestic or industrial uses, it has to be treated by filtration or by the use of chemicals to render it safe and suitable for use. It is noteworthy that of all public utilities the water supply is the only one (if we except sewerage) which has come to be generally recognized in the United States as appropriate for municipal ownership and operation. Many cities, especially the small ones, are still served by private water companies; nevertheless, the public investment in water supply far outweighs the private investment. It is sometimes suggested that water, which, like air and sunshine, is provided by nature for the necessities of all living creatures, including man, should be as free as air and sunshine to the denizens of cities. While there is something to be said in favor of this proposal, nevertheless water differs from air and sunshine in that it has to be collected, stored and distributed and in some cases really manufactured by the purifying process in order that it may become available for use. It is, therefore, the general policy of those cities which furnish the water supply to sell it as a commodity to consumers, thus paying the expenses of the installation and operation of the waterworks. This practice involves the city in the difficult problem of rate-making and the establishment of rules and regulations for the curtailment of use and waste. Even if water were to be furnished free to the consumers it is obvious that they could not be permitted to use it extravagantly or to waste it without limitation. Such a policy might bankrupt in a little while the richest city in the world. As a means of distributing the costs of the water supply justly among the various consumers and as a means of curtailing waste, the metre system has been adopted in many cities. The administration of the metre system involves large expense for frequent inspection,

reading and testing of metres and for repairs and renewals. The city is thus confronted with all the difficult problems involved in the construction and operation of a public utility and the maintenance of amicable commercial relations with all its citizens. The water supply is vital, not only for the health and convenience of domestic and business consumers, but also for public purposes, particularly for use in the extinguishment of fires, for the flushing of sewers and the sprinkling of streets. Without an adequate water supply, fire protection is impossible. The double purpose for which water is provided involves the city in the question of the proper distribution of costs between the individual consumers and the city at large. In many cities all the expenses of the waterworks are charged against private consumers and no allowance is made the water department on account of the water and other facilities furnished for fire protection, street-sprinkling and other public purposes. Where this system prevails the consumers of water, a prime necessity of life, are in effect indirectly taxed for the benefit of the city at large. The adjustment of this problem involves one of the most important and difficult problems of municipal accounting. Certainly a city cannot afford not to keep its books in such a way as to enable the public to tell what the water supply costs, what its actual revenues are and what is the fair value of the services, if any, which it renders without charge.

**9. Protection Against Fire and Flood.**—To persons living in separate houses in the country, the danger of loss by fire is always present, but it is a danger that arises in most instances from the carelessness of the householder or his family. But when great numbers of houses are crowded together in a city, every man's home is endangered by the carelessness or misfortune of every other man. Nothing can be more terrible than a great conflagration such as the fires that at different times have swept Chicago, Boston, Baltimore and San Francisco. It is probably true that not a large city in the United States would escape such a conflagration for a month, certainly not for a year, if it were unprotected by elaborate fire-fighting machinery and facilities and a trained force of fire-fighters. The fire department is the most picturesque of all municipal departments. It appeals most to the imagination of the entire community, because city dwellers are more or less conscious all the time that it stands between them and disasters which are ready to spring upon them in any unguarded moment. Fire protection is primarily designed for the protection of property values, the accumulations of invested wealth making up the homes, the offices, the factories and other equipment, which together constitute the tools of city life. In order that fire protection may be adequate, the organization of the fire-fighting men and machinery has to be correlated with the right kind of a water supply. Not only must the total supply of water for the city be sufficient to meet all emergencies, but the distributing mains must be of such a size and be so correlated and fire hydrants must be so placed that the volume of water potentially necessary for the extinguishment of a large fire shall be available upon the instant at any point where

perishable buildings stand. In the smaller towns which cannot afford powerful fire engines, it is important that the water pressure in the mains should be sufficient to raise streams to the tops of the tallest buildings in the place. In places where powerful fire engines are provided, the most important thing is to have a sufficient supply of water available at every hydrant outlet. The engines will do the rest. In the very greatest cities it is sometimes deemed necessary to install a separate system of water mains designed exclusively for high-pressure fire service. However, the effectiveness of fire protection does not depend altogether upon the supply of water available for extinguishing fires after they get started. It is most necessary in cities that measures be taken to prevent fires. One of the first of these measures is the establishment of a central zone called the "fire limits," within which property owners are not permitted to erect buildings which are easily combustible. This control of structures becomes very drastic in some of the great cities and extends far beyond the mere question of the materials to be used in construction. It includes provisions for the supervision of electrical wiring and for the approval of the plans for the interior construction of buildings. Fire prevention also requires the prohibition of the storage of combustibles except in approved places and according to approved methods. The fire department, in order to be efficient, must be ready to give almost instantaneous service. For this purpose it is necessary to establish a complete system of fire signals with fire-alarm boxes scattered through the city. For the protection of life in connection with possible fires the city has to see that fire escapes are placed upon all non-fireproof buildings above a certain height in which people live or are employed. It also has to establish rules in regard to the location and opening of exits in public buildings, in regard to the operation of motion-picture shows and in regard to many other things which, if left to themselves, are likely to increase the fire hazard.

While the dangers of fire are constant, many cities are so situated with reference to the natural flow of waters that they are in periodic danger of destruction or serious damage from floods. The maximum flood may not come oftener than once in 50 years, but if it comes and no provision has been made to safeguard the city against it, its ravages may be so great as to more than justify the expenditure of the enormous sums necessary to protect the city against its recurrence. The flood danger does not generally affect cities situated on the sea-coasts or on the shore of a large lake. It is interior cities, wholly or partly built in river valleys, such as Dayton, Columbus, Cincinnati, Kansas City and New Orleans, that are most likely to be overwhelmed by uncontrolled freshets. To guard against flood dangers levees may have to be built, river channels blasted out and straightened, lowlands filled in or natural waters impounded in storage reservoirs. In fact, a city may find itself so situated that by its own unaided effort and expenditures it is wholly impossible to protect itself against flood dangers. It may be most economical and in some cases absolutely necessary, if a city is to be protected at all, for it to secure and exer-

cise extra-territorial powers, perhaps for the building of dams scores of miles away in the hills.

**10. Protection Against Crime and Vice.**—The crowding of a great many people together into a single urban community multiplies almost infinitely the number of points of social contact, every one of which is potentially a temptation to vice or crime. Both personal interests and property interests are constantly clashing in the swirl of city life. All the weak spots in human nature are tried out. Out of these conditions grows the necessity for the police department, the magistrates' courts, the juvenile courts and the city prisons.

**11. Protection Against Pestilence.**—City dwellers are not only subject to cumulative dangers from the uncontrolled outbreaks of the visible forces of nature, but through their close contacts become an easy prey to the ravages of contagious and infectious diseases, ranging from chicken-pox, measles and mumps through scarlet fever, typhoid fever and diphtheria to the most terrible diseases, such as smallpox, tuberculosis, syphilis, cholera, yellow fever, bubonic plague and infantile paralysis. Without the control established through the sanitary code, the sanitariums, the hospital facilities and medical attendance furnished by the city, and without the universal vigilance of an efficient health department in educating the people in hygienic methods of living and in protecting them from the nuisances created by the carelessness of others, a great city would become a mere charnel house. It is indeed the glory of efficient modern city government that in many instances it has transformed cities from the deadliest to the safest places of abode for human beings. In certain matters relating to physical health, city governments have overcome the natural disadvantages of city life and have turned them into positive advantages.

**12. Protection Against Poverty and Misfortune.**—City life raises the standard of living and also increases the cost of living. Rents for even modest homes mount high. Milk and meat, fruits and vegetables have to be brought from far and pay tribute to a complex distributing organization, which means high prices to the ultimate consumers even though the original producers received little for their products. The stress of city life tends to multiply misfortunes. Those who "lose out" in the game lose more heavily and become more helpless than they do in rural communities. The result is that one of the great functions of municipal government is to provide means for succoring the poor, shielding the unfortunate, caring for the aged and giving homeless children a start in life. The performance of this function requires the maintenance of a multiplicity of public institutions, including hospitals, lodging houses, children's homes, employment agencies, almshouses, etc. Even the employees of the municipality itself have to be protected from helpless poverty in old age by means of municipal pension systems.

**13. Control of Housing.**—At the beginning of this article it was pointed out that the very recognition of the necessity for the incorporation of a city is pregnant with the idea that unrestricted individualism must give way to social control invading what many regard as

the sacred domains of personal liberty and individual property rights. Perhaps there is no branch of municipal activity that illustrates this tendency so well as the control which comes to be more and more necessary as cities grow, over the character of the houses built for the people to live in. This control is embodied first in the building code; then in the tenement house law; then in the adoption of districting plans and limitations upon the height of buildings. The exercise of this control brings the city government, representing the public interest, into direct conflict with the most powerful individual motives. The passionate greed that seems to be developed most readily in the soul of the landlord class where the growth of a community is pouring riches into its lap, opposes with almost fanatical persistence the restrictions upon housing which are absolutely necessary to provide for every living apartment enough sunshine and fresh air, with safety from fire and disease and sufficient space for the children to play in.

**14. Education.**—Under whatever conditions people may live, their children in a democratic country have to be educated. The "little red schoolhouse" is one of the traditional symbols of the freedom and intelligence of America when it was a predominantly rural nation. Nevertheless, the characteristics of urban life are such as to place upon the public school system an infinitely greater burden than it has to bear in the country. With the curtailment of the opportunities for both work and play in and about the home, the functions of the public school system multiply. It is no longer sufficient for the school to teach the three R's, leaving the children to get all of their education other than book learning from other sources, but in addition to a much more complicated book learning than that deemed necessary in the little red schoolhouse of the past, the modern city school has to take care of the health of the children, to give them physical training, to control and direct their play and to teach them how to work. The school even has to assume the burden of teaching the girls how to sew and to cook and the boys how to drive nails and saw wood. Under the conditions of American city life, other educational functions are thrust upon the public schools by reason of the presence in the community of large numbers of foreign-born adults who need to be taught the English language. This involves the establishment of evening schools. Moreover, the absence of opportunity for the wholesome employment of children during the vacation periods leads to the establishment of school gardens and summer schools. Cities also have to provide great libraries with local branches and elaborate organization for the stimulation and direction of the reading tastes of the children and the young people. This multiplicity of activities comprised under the general term education places upon municipal government one of its heaviest financial burdens. The schools are always calling for more money and the importance of education, which may be termed the process of reproducing citizenship, assumes constantly a greater and greater place in the public mind. In fact, the school system in a great city becomes so overwhelmingly important through the accumulation of the subtle

influences which the conditions of city life bring to bear upon children that it is hard to give adequate expression to the significance of this function.

**15. Recreation.**—For children recreation is a necessary part of education and the playgrounds that become necessary under city conditions are often connected with the public schools. But the alchemy of congestion has such a strange and far-reaching effect upon human beings that it becomes necessary for the community as a whole to provide and regulate in large measure even the amusements of the adult population. All cities provide public parks; many provide open air concerts; many maintain public baths and bathing beaches; some maintain athletic fields and recreation centres, provide public auditoriums and operate municipal theatres. Museums, zoological and botanical gardens, aquariums and art galleries are frequently maintained at the expense of the municipality. City life is characteristically gay. The hours of labor are relatively short and the amount of available leisure relatively great. It is a common adage that "the Devil finds mischief for idle hands to do," and every urban community organized as a municipal corporation finds that it cannot afford to ignore the Devil's activities. Thus more and more the problem of the control of leisure presses in upon the great city for solution. The recent stupendous development of the "movies" as a means of recreation in cities and the obvious need for some community control over the character of the films exhibited, have led some advanced thinkers to propose the municipalization of recreation as the next most important step in the development of municipal functions. The advocates of this program maintain that recreation is a necessity of life for urban populations and that it should be provided as a community function and thus be removed from the realm of private greed and exploitation. Foremost among the specific measures proposed by this group of reformers is the intensive use of the public schoolhouses as meeting places and community centres.

**16. Franchises and Control of Public Utilities.**—Perhaps there is nothing more characteristic of urban life than the development of those co-operative services commonly called public utilities, such as water supply, gas and electric light, heat and power, street railways and telephones. The modern city as a great co-operative unit could not exist as it is without these utilities and these utilities themselves could not exist except through the use of the public streets, which are rightly regarded as the common property of all the people, the very symbols of democracy and civic freedom. In America the habit of individualism has been so strong and community life in cities has been so poorly organized and so devoid of initiative that the actual construction and operation of most of these great utilities has been left in private hands. Waterworks are an exception. Also a few cities own and operate gas plants and many of the smaller cities maintain municipal electric plants. New York and Boston have built rapid transit subways at public expense, but they are equipped and operated by private companies under long-term leases. San Francisco and Seattle have within the last few

years constructed certain street railway lines which are now being operated in partial competition with the privately owned street railway systems in these cities. Baltimore, Erie and one or two smaller cities have built systems of electrical conduits which are rented out to the public service corporations having wires in the streets. In so far as public utilities have been recognized as a direct municipal function, they involve the expenditure of enormous sums of money in the acquisition or construction of plants, the maintenance of great operating departments with multitudes of employees and the collection of vast revenues. By way of illustration, the department of water supply, gas and electricity of the city of New York operates a water plant representing a total investment of about \$350,000,000, employs over 2,000 persons in the operation of this plant and levies and for the most part collects over \$13,000,000 per annum of water rates. So far as public utilities are still regarded as a semi-private function, their presence imposes upon the city government the heavy responsibility of granting franchises and of attempting to regulate on behalf of the general public the rates at which the people shall be served and the character and extent of this service. It is in connection with these matters that many of the most important civic struggles take place, and more and more the issues involved in the ownership and regulation of public utilities tend to affect and even dominate the policies of municipal government.

**17. Municipal Revenues and Taxation.**—The multiplication of the functions of government necessarily results in a tremendous increase in the cost of government. The city of New York makes annual appropriations of about \$200,000,000, or nearly four times the amount appropriated each year by the state of New York. Municipal revenues are derived from many sources, but the one most important source is the taxation of land. Indeed, it is the great increase in the value of land arising as a city grows that enables it to meet the expenses incident to growth. It is the general practice in American cities to levy taxes on property, theoretically upon all property but practically for the most part upon real estate. Land cannot run away at all and buildings cannot do so without extreme difficulty. In most American cities personal property is subject to taxation but on account of the difficulty of detecting and appraising it the great bulk of personal property values escapes direct taxation. Another means of securing revenues for public improvements is the so-called special assessment or what in England is referred to as the "betterment tax."<sup>9</sup> It is the theory of special assessments that the particular improvements for which they are levied have a direct effect in increasing the land values in the vicinity and that therefore the owners of the land should pay for the improvements. Special assessments are most frequently levied for the opening, grading, paving and widening of streets and for the construction of sewers. Sometimes also they are levied to pay the cost of parks and water main extensions. Another source of revenue is the general business license tax, a form of tax quite prevalent among the cities of the South. Every city, however, collects some revenue from various kinds of li-

cense fees. In some of the States, cities get subventions from the State government, usually for the benefit of the schools. From waterworks or other utilities operated by the city, large revenues are obtained, and in some instances a city gets a great deal of money from the public service corporations through the form of franchise taxes.

**18. Municipal Debt and Debt Limits.**—A city's wants are never satisfied. Its needs outrun its income. Expensive improvements have to be constructed which are destined to last and be of service for many years. The citizens of a growing city hard bestead to get rich and at the same time pay the increasing cost of the government, generally feel that a portion of the burden of paying for such improvements should be passed on to the next generation, which, it is expected, will continue to have the benefit of their use. Therefore, it has been customary for cities to borrow the money required to make the so-called permanent improvements, and in times of rapid growth when the demand for additional investment is great and the expectation of future profit keen, a strong temptation arises to pile up municipal debts needlessly and to postpone the payment of expenses which in fact ought to be paid out of current revenues. The danger of municipal bankruptcy is regarded as so serious that the State seldom, even in the adoption of home rule amendments to the constitution, gives the city authorities power to incur debt without limitation. In fact, it is a well established, though not universal policy of the States, to limit municipal indebtedness by direct constitutional provisions, and where this is not the case the legislature is often given specific authority by the constitution to pass general laws limiting municipal indebtedness and sometimes limiting the tax rate. Frequently the issuance of municipal bonds is made subject to approval by a majority of the people at an election. The establishment of debt limits has in many cases proved embarrassing to cities. The exigencies of municipal development have seemed to require in many cases the borrowing of all the money that can be borrowed up to the debt limit. The real purpose of a debt limit is to keep within reasonable limits the tax burden upon property, for obviously the borrowing of money is merely the postponement of taxation. Bonds that are issued fall due after a while and have to be paid, and in the meantime interest charges add to the annual burden of the taxpayers. The fundamental purpose of debt limitation is served when bonds issued for self-sustaining activities of the city government, such as waterworks, docks, rapid transit subways, electric-light plants, etc., are exempted from the debt limit, for a city's financial strength and civic prosperity is not measured by the smallness of its debt, but by the excess of its assets over its indebtedness and of its revenues over its current obligations. A debt limit that is inflexible and gives no leeway to a city to embark upon public utility enterprises is one of the most effective means of tying the city's hands and hindering the full development of its functions. In fact, municipal ownership and operation of public utilities as an ultimate policy is quite generally recognized, but cities are prevented from entering upon the realization of this policy, or even preparing for it, by the

stringent financial limitations often placed upon them. In a few States, of which Michigan and Ohio are examples, cities are authorized to acquire public utilities and to issue bonds therefor, against the general credit of the city, if this is possible within the debt limit, and if this is not possible, then against the utility property itself. The State of Washington has gone even further and permitted the issuance of public utility certificates under ordinances pledging the utility revenues, not the utility plant, to the bondholders and thus making interest charges a first lien upon the gross earnings, so that if earnings are insufficient for all purposes the city will have to come to the rescue, not through the payment of interest on bonds, but through the payment of operating expenses of the utilities. The very great additional sums paid in the form of interest where long-term bonds are issued has led to the advocacy in some quarters of the "pay-as-you-go" policy, under which non-revenue producing public improvements, if not paid for through special assessments, will be paid for directly out of annual revenues. It is urged that by the adoption of a proper program of improvements so that the expense will be spread along quite evenly year by year the city will save a great deal of money by this policy. It has been generally customary for cities to establish sinking funds when bonds are issued for the purpose of accumulating a sufficient amount of money to pay these bonds when they fall due. The difficulties and dangers involved in the management of great trust funds like these have led to the adoption in some instances of the serial bond plan in accordance with which an issue of bonds to provide funds for a specific purpose will be divided into as many parts as the number of years which are reckoned to be the life of the improvement, and equal numbers of them are made to fall due each year up to the limit of such estimated life. In connection with special assessments it is customary, in order to make the payment of the assessments levied against benefited property easy, to allow the property owner a certain period of years for completing the payment of his assessment. Under this plan he is expected to pay an equal amount each year until the whole is paid, and in the meantime the city issues so-called assessment bonds to cover the cost of the improvement, these bonds to be payable out of the assessments as they are paid.

**19. Participation of Citizens in Municipal Government.**—As cities grow and their functions become complex and technical it is more and more necessary that there should be permanency in the municipal service. At the same time the city government requires more and more the co-operation of all the citizens. To secure efficiency in municipal administration and to encourage intelligent young men and women to enter the public service, the merit system has been devised by which the appointments to subordinate positions are made as a result of competitive examinations and city employees are protected from arbitrary removal for political or personal reasons. Where the merit system is in vogue a special commission is established to administer the civil service laws and regulations. This is one of the most difficult tasks of municipal administration and its difficulty increases as the functions of city government increase and the number of city

employees multiplies. The administrative and civic importance of the merit system becomes evident the moment we think of the vast number of men and women engaged in the city service as policemen, firemen, school teachers, clerks, inspectors and laborers. It is not sufficient, however, that the city government should be able to draw freely upon the business resources of the community for the permanent work of administration. The activities of the city touch all of its citizens in an infinite variety of ways and the success of municipal government depends upon the loyal interest and support of the community at large. Without civic intelligence and civic spirit a great city with a democratic political organization cannot maintain efficient government. Often citizens feel that the city government is a distant, unresponsive power over which they have no control. It is for the purpose of developing and maintaining active interest among the citizens themselves and of giving them the complete control over the policies of their government which democracy demands, that such devices as the direct primary, the preferential ballot, nomination by petition, the recall, the referendum and the initiative have been made use of in many American cities. The problem of how to facilitate the intelligent participation of all the citizens in municipal government remains the crucial problem of American democracy. See CITY MANAGER PLAN OF GOVERNMENT; EXECUTIVE.

**MUNICIPAL HOME RULE.**—Municipal home rule is the term applied to the power possessed by many American cities to frame and adopt their own charters. It is a power which must be conferred upon municipalities by a provision of the State constitution since the courts have held with practical unanimity that a grant of home rule by the State legislature would be an unconstitutional delegation of legislative power.

The constantly increasing demand for home rule which cities in the United States are making is due to the numerous and serious evils that seem to be the inevitable result of the practically complete supremacy over municipal affairs which the legislatures enjoy in three-fourths of our States. In the absence of restrictions in the Federal or State constitution the power of the legislature over the city is absolute. Legislatures have not hesitated to exercise this power. They have withheld from cities powers necessary to their development. They have interfered directly and unjustifiably in municipal matters. They have too often treated the revenues, contracts and offices of cities as the legitimate spoils of partisan politics. The problems of municipal government and administration have been left for solution to men competent neither in experience nor training to solve them. Furthermore, the necessity under which cities have labored of seeking continuously for extensions of power or other modifications of their charters has resulted in swamping the legislative calendars with an enormous mass of business, local in significance, to the exclusion of more important matters of State-wide concern.

It is these evils which municipal home rule

aims to abolish by allowing cities to deal without interference with their own affairs. It is also urged that a valuable political education is received by the citizens who assume the responsibilities of home rule, while at the same time the system tends to divorce State and local politics, a result greatly to be desired.

Municipal home rule does not, however, set the city free from all State control. A municipality is not only an agency of local self-government, but it is also a part of the administrative machinery of the State government. Complete freedom of action for the city is as undesirable in this latter capacity as it is desirable in the former. The city must serve as the unit through which must be secured the enforcement of State laws relating to health, safety and the suppression of crime, the efficient conduct of elections, the promotion of education and philanthropy, and in all these matters it must be subject to State control. The necessity for the steady flow of State revenue renders desirable restrictions upon municipal extravagance in matters of taxation and borrowing. Municipal home rule, therefore, means merely the right of the city to control its own destinies in matters municipal or local in significance and not the right to interfere with those problems which must concern the welfare of the State at large. To define accurately which functions of the city are municipal in character and which have this State-wide significance has been found to be a practical problem of great difficulty.

The home rule provisions of State constitutions vary in character. Sometimes home rule is given to all cities, sometimes only to those of a certain population. These provisions have usually been self-executing, but in a few cases the legislature has acted for the purpose of making the grant of home rule effective. Usually the home rule charter is framed by a popularly elected charter commission and becomes effective upon the approval of a majority of those voting upon it. There are, however, cases in which an extraordinary majority of the voters is required or even the subsequent approval of the governor or legislature. These special restrictions are exceptional. Home rule charters commonly provide for their own amendment by means of initiative petition. They are not subject to change at the hands of the State legislature.

In 1918, 12 States in the United States had constitutional provisions giving some or all of their cities municipal home rule. These States and the dates of the home rule grant in each are as follows: Missouri (1875); California (1879); Washington (1889); Minnesota (1896); Colorado (1902); Oregon (1906); Oklahoma (1908); Michigan (1908); Arizona (1912); Ohio (1912); Nebraska (1912); Texas (1912); Consult Arndt, 'The Emancipation of the American City' (1917); Beard, 'The American City' (1912); Fitzpatrick, E. A., 'Experts in Municipal Life' (1916); Goodnow, 'Municipal Home Rule' (1895); McBain, 'The Law and Practice of Municipal Home Rule' (1916); Munro, 'The Government of American Cities' (revised, 1916).

**MUNICIPAL HOUSING.** See TENEMENT HOUSE.

**MUNICIPAL LAW.** In England and America municipal law means the national law or the law of the land, both public and private, in contradistinction to external or international law. The municipal law of America is derived from that of England, which has had a continual development extending over 13 centuries. Largely influenced at times by Roman law, both civil and canon, it has retained somewhat the character of the Teutonic system in which it had its origin. By English colonists it reached all quarters of the earth and in the modern world it is the great rival of Roman law. For the first five centuries after Christ Britain was ruled by Roman imperial law after which it was banished by the invading hordes from the coast of the North Sea. With these came their tribal customs, which we find formulated in the "dooms" promulgated by the English kings from the 7th to the 11th century and by the Danish ruler of England, Canute. These laws, more properly "folk-laws," are largely made up of provisions for punishing breaches of the peace and setting fines as penalties for private wrongs. In the 8th and 9th centuries many of the Roman Church laws were introduced, especially the laws of marriage, deeds and wills, but even these were largely modified to conform to local usages and custom.

With William the Conqueror the law of the Franks, also Teutonic in origin, but highly developed in Normandy, was introduced to Saxon England. The two systems were now in practice — the Anglo-Saxon for the English and the Norman for the conquerors — while special enactments after the Norman spirit governed the interrelations of the two races. The two systems were gradually merged with the Norman law taking precedence because of its technical superiority. Down to the days of the Tudors the language of the laws was Norman-French. The common law was developed partly by legislation (royal charters, provisions, assizes, statutes), but mainly by judicial decisions. Ecclesiastical law still exerted considerable influence, having received independent jurisdiction from the Conqueror. This jurisdiction churchmen sought to extend, but were checked by several statutes. In family law, however, they remained supreme as also in the administration of estates, and from the canon law are mainly derived these branches of modern English law. Judicial law-making sprang up toward the close of the Middle Ages, some judges boldly overriding the common law by virtue of the powers they believed as inherent in the Crown. Since the 18th century, both in England and America, the courts have practically confined themselves to administering the law as established by previous decisions. On the Continent of Europe the term municipal law has been often employed to designate a local law, as of a city or province, in contrast to the national body of law; at present the term usually designates a city law in contrast to the national law. In the United States within recent decades a great body of legislation concerning cities has grown up, and the term municipal law has come to be the usual designation of such legislation. See EQUITY; COMMON LAW; CANON LAW; MUNICIPALITY; CITIES, GOVERNMENT OF; and

W., Jr., 'The Common Law' (ib. 1881); Carter, 'Codification of Our Common Law' (New York 1884); McQuillin, Eugene, 'Treatise on the Law of Municipal Ordinances' (Chicago 1904); Whitlock, Brand, 'On the Enforcement of Law in Cities' (Indianapolis 1913).

**MUNICIPAL LEAGUE, National**, an interstate organization, made up of individual members and affiliated with State and local associations for the purpose of promoting better government in cities. It was founded in New York in 1894; the league is non-partisan in politics, but seeks to promote its ends by the enactment of sound municipal laws, charters, etc., by the election of able and efficient men to public office, by correcting abuses in the existing administration of city departments, as police, vice control, etc. Its annual conferences are of great value in that it promotes the exchange of views between municipal workers and experts. At the 1915 meeting a model charter was issued, which has since been adopted by several municipalities. At present there are committees on franchises, State municipal leagues, city management, municipal information and county government. Consult 'Proceedings of the National Municipal League' (Philadelphia, annually, 1894-1910) and the *National Municipal Review* (Baltimore, bi-monthly).

**MUNICIPAL OWNERSHIP** is a term broad enough to include the ownership by a municipality of any form of property. Usage has limited its meaning, however, to the ownership by cities of certain well recognized types of public utilities or services such as water, gas, electricity and street railway transportation. Municipal ownership is usually thought of as including the municipal operation of the utilities owned, the ownership and operation being popularly regarded as inseparable. It is, however, not uncommon for municipally owned utilities to be leased and operated by private corporations. In the following paragraphs municipal ownership and operation will be discussed as a single policy and system.

In recent years the number and variety of enterprises to which municipal ownership has been extended throughout the world have greatly increased. This extension has been more striking in Europe than in the United States. A survey made in 1906 showed that in the towns and cities of Prussia 33 different kinds of undertakings were in public hands. Needless to say most of these were enterprises which are almost universally regarded in this country as improper fields for municipal activity. The following may be mentioned as examples: abattoirs and stockyards, warehouses, breweries, hotels, canning factories, mines, bakeries, mills, fisheries and livery stables. In the United States municipal ownership has usually been confined to undertakings which have some or all of the following characteristics: (1) those which are natural monopolies, in

which competition is either impossible, impracticable, or highly inconvenient, such as supplies of water, gas or electricity; (2) those which are dependent upon securing special privileges and rights from the public, such as the right of eminent domain and the right to occupy the streets with tracks, pipes, poles and wires; (3) those which produce commodities or services of which the city itself must necessarily be a heavy consumer, such as water for various municipal purposes and electricity or gas used for public lighting; (4) those which directly concern the health of the city or its general safety, as water, the purity of which directly affects the public health and which is also necessary for fire protection and street flushing; (5) those which subserve the public welfare directly but which private capital cannot always be relied upon to provide at sufficiently low cost, such as public recreational facilities of various kinds or commercially unprofitable transportation facilities such as some of the municipal ferries in New York. There is a marked tendency in this country to emulate the cities of Europe and enlarge the scope of municipal ownership. Recent years have witnessed experiments in the direction of the municipalization of ice plants, fuel yards, theatres and opera houses, although in none of these cases has the city made any effort to monopolize the field. It seems clear that we may expect a continued expansion in the field of municipal ownership. At present however, municipal ownership in the United States is confined in the main to the systems for supplying water, light, power and transportation.

Cities which have embarked upon municipal ownership ventures have almost always been led to do so by force of certain concrete facts existing in individual cases rather than by any dispassionate and logical analysis of conflicting arguments. It has required no argument to convince indignant citizens that under private ownership of the city's vital utilities rates were high, service was poor, equipment was out of date, stock was watered and that public utility corporations were an influence for evil in local government and politics. Efforts to correct these abuses by legislation or by administrative control have usually proved ineffective and municipal ownership has been resorted to, frequently without much examination of the arguments for or against it, on the assumption that it would succeed where all else had failed. And it may be said, whatever criticisms may be raised by persons looking on from the outside, that the cases in which municipal ownership has proved unsatisfactory to the cities which have adopted it are few indeed. It should not be inferred from the foregoing that there has been any dearth of arguments on either side of the question of municipal ownership. In spite of the extension of municipalization already alluded to it remains one of the most debatable and hotly contested issues in the whole field of municipal policy. The arguments in favor of municipal ownership may be summarized as follows: (1) A broadening of the scope of municipal activity will stimulate interest on the part of the citizens in civic affairs by giving them a direct and immediate concern in what the city is doing. Civic pride and interest will produce civic efficiency. At the

same time a higher grade of public officer will be attracted into the service of the city by the necessary creation under municipal ownership of places of dignity and importance. (2) The city will enjoy better service from publicly owned and operated utilities than from those privately owned. The primary motive of the public utility corporation is to make a large profit, frequently on watered capitalization. Expenditures made to improve the service rendered mean a reduction in these profits and are, therefore, not made when they can be postponed or avoided. Under municipal ownership the ambition to make profits is absent. The city could afford to invest the profits of the business in necessary improvements of service. It could make needed extensions of service into undeveloped parts of the city at a temporary loss which could be met from the proceeds from the rest of the system. It is untrue that the city would display less initiative than would private capital in the management of these enterprises. In fact the reverse would be true. Experience has shown that the desire to remain in the undisturbed possession of generous revenues has completely killed the business initiative of many public utility companies, which, secure in their monopolistic franchise rights, have shown little or no enterprise. (3) Municipal ownership has been shown by experience to be financially successful. It gives the city a substantial surplus or enables it materially to reduce rates and in many instances it has done both. The case of Glasgow, Scotland, is frequently cited. The city took over the horse car lines in 1894. The lines have been electrified and extended from 64 miles to 197 in 1913. The number of passengers has increased from 57,104,647 to 311,480,086 during the same period. The fares have been reduced. Under a system of zoning the average rate per mile is .44d under municipal management as against .89d under private control. The hours of labor of employees have been reduced and their wages raised. At the same time the enterprise has proved a source of income to the city and in 1913 after deductions for operating expenses, depreciation, interest on capital, sinking fund charges, etc., there was a balance of £33,000 to be turned over to the "Common Good." San Francisco embarked upon the municipal ownership and operation of about seven and one-half miles of street car line in 1913. The end of the first year showed a net profit of \$45,000 as well as better service, and improved conditions of labor. The mileage has since been increased and promises to keep on growing. Examples of this sort could be multiplied at length. (4) Municipal ownership would remove one of the most fruitful sources of corruption in municipal government. Bribery and dishonesty thrive where there are privileges to be dispensed and public service companies have not hesitated to resort to these methods in their efforts to ward off unfriendly control and regulation or to secure new franchises and concessions. Even when actual corruption has not been resorted to these private interests have felt the need of building up a political influence for the purpose of protecting themselves from all sorts of governmental interference. Municipal ownership would strike at the root of this evil by removing the incentive and opportunity for corruption. It is furthermore urged

that under an adequate civil service system municipal ownership would entail no danger of a political machine composed of the employees of the publicly owned enterprises. (5) The municipalization of public utilities would give the city the power to avert strikes and labor troubles which under private ownership occur so frequently and with such disastrous results to the public welfare and convenience. Lacking the motive of exorbitant profits the city would be able to meet the reasonable demands of its employees fairly and improve the conditions under which they work.

The following arguments are advanced by the opponents of municipal ownership: (1) It is a fundamental mistake for the government to engage in enterprises which can satisfactorily be carried on by private capital and management. The municipalization of public utilities is socialistic and subversive of sound economic doctrine. (2) The weakness, inefficiency and corruption which have been so prevalent in the government of American cities demonstrate conclusively the incompetence of municipalities to assume the burdens and responsibilities of municipal ownership. Under such a system, with numerous men to be employed and costly materials to be purchased the opportunities for dishonesty and mismanagement would be far more numerous and alluring than at present. (3) Even if cities could be kept free from corruption they would still be unequal to the problems of efficient administration of so complex an undertaking. The city would be assuming in relation to its public utilities the position of owner, consumer and public, and it is highly probable that the city's interests as proprietor of the enterprise would be sacrificed to its interests as consumer and as the public. The almost universal popular prejudice against paying high salaries to public officials would prevent the securing of thoroughly competent men to manage these businesses for the city. At the same time the pressure in the direction of securing sinecures in the public management of these systems coupled with the fact that people who work for the public are usually less industrious and efficient than those who work for private employers would tend to impede further the efficiency of municipally owned services. (4) Municipal ownership would so overburden the municipality with duties that not only would the operation of the public utilities be less satisfactory than under private control but also the efficient conduct of the other affairs of the city would suffer by being over-shadowed and crowded out. (5) Serious difficulties would arise from the creation of a large body of municipal employees who would enjoy an enormous potential political influence. They would be a ready-made nucleus for a powerful political machine of great solidarity. In European countries this problem has sometimes been met by the disfranchisement of the employees of the city but it will not be seriously argued that such a solution would be open to the American city. (6) Experience in many instances has shown conclusively that municipal ownership is a failure in operation. In this connection the experience of Philadelphia in the public ownership and operation of her gas plant is usually referred to. The city took over this utility in 1841 and retained it until 1897 when it leased the plant to a private cor-

poration. The history of the public ownership and control of this enterprise is a story of almost incredible corruption and mismanagement. Other less conspicuous instances are cited of cases in which, due to mismanagement or financial failure, municipally owned plants have been turned back again if not to private ownership at least to private operation. It is pointed out furthermore that not only has the success which has attended municipal ownership in Europe been greatly over-rated but that, even if admitted, it does not serve as an argument for municipal ownership in this country since the determining conditions surrounding such enterprises are strikingly different here from what they are abroad. It must not be assumed that the argument for or against municipal ownership is equally strong in the case of every type of public utility. There are special considerations in connection with certain enterprises which have a bearing upon the desirability of municipal ownership which may be briefly commented upon. The argument in favor of the municipalization of the city's water supply is stronger than for the municipal ownership of any other service or utility. Many critics who oppose the system generally favor its application to waterworks. There are several reasons why this is true. First, the health of the city is dependent upon an adequate supply of pure water. The city should control the conditions which relate so directly to its disease and death rate. Second, the city itself is the largest consumer of water, taking usually about 10 per cent of the entire supply. The city must have water for fire protection, sewers, street sprinkling and cleaning, public buildings, parks and fountains. Third, many social, industrial and business enterprises and interests depend upon the adequacy and cheapness of the water supply. The prosperity of the city may be deeply involved in the policy which controls the supply and price. As a result of these considerations a large majority of the waterworks plants here and abroad are under public management. In 1915, 156 of the 204 cities of the United States having a population of 30,000 or more had municipally owned water plants. Only seven of the 62 cities of 100,000 population or more and not a single city of 300,000 or over still allowed their waterworks to remain in private hands. The two most interesting cases of publicly managed water systems are, perhaps, those of New York City and Los Angeles. The new Ashokan reservoir and aqueduct opened in 1917, brings water for a distance of more than 100 miles to the city of New York and when entirely completed will have a capacity of 500,000,000 gallons per day. The Los Angeles system will bring water from the mountains 260 miles away. The administration of municipally owned waterworks seems to have been satisfactory. It should be remembered, however, that apart from the gigantic engineering projects just mentioned there are no serious technical problems connected with the systems to test severely the administrative capacity of the city.

The increase in the number of municipally owned lighting and power plants in the United States is much less marked than in the case of waterworks. Here private ownership is the rule and not the exception. Twenty-one of the 204 cities having a population of 30,000 or

more in 1915 had municipal ownership of commercial light and power. Some others supplied merely their own needs for public lighting. It has been estimated that of all the towns and cities of this country over 1,500 have electric lighting plants under municipal ownership and management but that more than twice that number still retained private ownership and control. It is usually in the smaller municipalities that public ownership is found. The most important exceptions are the cities of Chicago and Detroit. It will be noted that, with the exception of public street lighting, the supplying of electricity and power bears no intimate relation to public health or safety while at the same time the business itself is highly technical in character. These facts doubtless have some bearing upon the limited extent to which electric lighting has been municipalized. Municipal ownership is still less common in the United States in the field of municipal gas supply than in that of electric light and power. Wheeling, W. Va., seems to have had the first municipal gas plant, the policy of municipal ownership being instituted in 1851. At the present time the total number of such plants under municipal management is less than 40. Only five of the 204 cities having a population of 30,000 or more in 1915 have municipally owned gas plants. Of these Richmond, Va., is the largest. It is probable that municipalization in this field has been thus limited in extent because of the costly equipment necessary to the business as well as the difficult scientific problems incident to its conduct. In the field of municipal ownership of transportation facilities there have been no important ventures in this country. It has been noted above that San Francisco has recently undertaken the municipal ownership and operation of one of its street car lines. New York and Boston own their subways but they are operated by private corporations. There are provisions in many modern franchises which will make the acquisition of the street car lines by the city possible at some future time. It is highly probable that the next few decades will see considerable expansion of municipal ownership and operation in this field. Thus far American cities have been deterred from embarking upon such ventures not only by the difficulties and complexities of administration but also by the financial obstacles such as municipal debt limits which have made it impossible for municipalities to acquire the ownership of such costly properties.

The foregoing paragraphs point to the conclusion that the practicability and desirability of municipal ownership vary with the kind of public utility to which it is applied and that the relation of such services to the public health and safety, the inherent difficulty and complexity of their management, and the amount of capital investment needed for the enterprise are all factors which have a direct influence upon cities in determining the advisability of venturing into the field of municipal ownership. It has not yet become profitable nor illuminating to multiply statistics regarding municipal ownership in American cities for two reasons. The first is that the facts regarding private ownership which should be available for purposes of comparison are usually withheld by private corporations which do not encourage such intrusion into their private affairs. The second

reason is that municipal accounting in this country is so chaotic, confused and non-uniform as to render almost meaningless most of the comparative financial statements which have thus far been issued. There are few fields of inquiry in which less reliance may safely be placed upon published statistics. This situation will doubtless be remedied in time and even now some reliable facts regarding municipal ownership are being collected and published from time to time by the United States Census Bureau.

In Great Britain municipal ownership has been developed far more extensively than in the United States. The public ownership of waterworks is practically universal and, although profits are not primarily aimed at, these plants seem to be making a fair net return to the public treasury. There are a large number of municipally owned gas plants, between 200 and 300, including those in about half of the largest cities. The municipalization of electricity and power is even more common. These ventures have proved of some profit to the city and have at the same time frequently made possible reductions in the rates of service. The most striking facts regarding municipal ownership in Great Britain, however, are those regarding the tramways. In 1914, 171 of the 286 tramways in British cities were municipally owned and 115 remained in private hands. The public management was proving profitable in practically every case. The reason why municipal ownership should be so prevalent in the local transportation systems of Great Britain is found in the extreme rigor of governmental control exercised over the public utility corporations as well as the subsidies these private companies were obliged to pay into the public treasury. The result was so marked a reduction of monopoly profits that private corporations in many cases were not unwilling to dispose of their businesses at a fair figure.

Several striking facts may be noted regarding the municipal ownership of public utilities in Germany. First, the process of municipalization has gone further in that country than elsewhere in the world. This is true both as to the kinds of projects publicly owned and as to the extent of the public ownership of any one utility or service. In 1911 the statistical report upon German municipalities showed that of 87 towns having a population of over 50,000, 77 owned their waterworks, 72 gasworks, 67 electrical works and 47 tramways. There are upwards of 40 kinds of services which are in the hands of the municipality in some or all of the German cities. In the second place, the German cities systematically aim at profits in the management of publicly owned enterprises. Practically all German cities use their public utilities as a means of reducing taxes. In 1912 the gas plant in Berlin gave a surplus of over \$2,000,000 to be applied in this way. In the third place, there are some German towns in which the profits from publicly owned utilities and services are so large that they defray all the costs of government and pay yearly dividends to the individual citizens. Cases in point are the small towns of Klingenberg, Seeburg and Enkirch.

It may be said in conclusion that while municipal ownership will remain a debatable policy there seems to be an irresistible movement throughout the progressive countries of the

world in the direction of its adoption. While this movement may be less rapid in the United States than elsewhere it is worthy of note that in many instances the threat of municipal ownership has had the salutary effect of producing better conditions in the administration of privately owned public utilities.

ROBERT EUGENE CUSHMAN,  
*Associate in Political Science, University of Illinois.*

#### **MUNICIPAL REFORM ACTS, English.**

The body of laws passed by the English Parliament since 1833 dealing with municipal franchises, suffrage charters, etc. In the 14th and 15th centuries the municipal suffrage fell gradually more and more into the hands of restricted bodies of men. Notorious abuses crept into the system and the Parliamentary Reform Act of 1832 left the municipalities well nigh untouched as regarded charters, suffrage, etc. In 1833 a royal commission made an extended report on existing abuses, showing that most municipalities were ruled by venal cliques, funds were wasted or worse, public service was negligible, municipal courts were corrupt, etc. New legislation based on the commission's report was enacted in 1835 known as the Municipal Corporation Act, under which 178 boroughs were reformed and about 125 others created. The more flagrant abuses were corrected and means were provided by which other abuses might be eliminated. The franchise was extended to all property owners and occupiers of property of £10 (\$50) valuation or over and a uniform system of administration was provided under which an elected council of a size proportionate to the population of the borough was made into a bicameral body, the upper chamber to be composed of aldermen elected by the council. The mayor was to be chosen from among the councillors or aldermen by vote of both these bodies. In great part these features still constitute the municipal constitution of England, although various modifications have been made by subsequent act of Parliament. The Consolidated Municipal Code was passed in 1882 and six years later cities and towns with 50,000 or

over population were constituted distinct counties, with municipal councils discharging the functions ordinarily exercised by county councils. Consult Chalmers, M. D., 'Local Governments' (London 1883) and Shaw, 'Municipal Government in Great Britain' (New York 1901).

**MUNICIPAL SAVINGS BANKS.** See BANKS AND BANKING — WORLD'S SYSTEMS (Article 3).

**MUNICIPAL WATER SUPPLY.** See HYDRAULIC ENGINEERING; MUNICIPAL GOVERNMENT; WATER SUPPLY.

**MUNICIPALITIES.** Municipalities are as old as civilization itself. The story of the nations of antiquity that flourished in the valleys of the Nile, Tigris and Euphrates is in large part the narrative of what went on in the imposing cities of Thebes, Memphis, Babylon and Nineveh. History gives us little accurate knowledge of these populous centres of the ancient world and the student of municipal government gains little from a scrutiny of the autocratic systems by which they were ruled.

**Greece.**—Real city life may be said to have been born in Greece. Largely due to geographical and topographical conditions which made community isolation inevitable, ancient Greece never became a unified nation. It was merely a geographical term applied to a group of independent, usually self-governing cities with the areas of land adjacent to them. The Greek city-state was the sole unit of government. The city was the state and the state was the city. A man was a foreigner in any city but his own. There were no distinctions between the duties and functions which in modern times we call national or state and those which were municipal. It is therefore perfectly proper that we should derive our words "politics," "political," and the similar terms by which we describe our public policies, institutions and concerns from *polis*, the Greek word for city. The Greek cities differed widely in government. In Sparta the governing power remained consistently autocratic or oligarchical, while in other Greek cities, notably Athens, the form of government fluctuated between autocracy and democracy.

**Rome.**—Early Italian history, like that of Greece, is the record of the development and struggles of a large number of city-states. The history of Rome as a nation is the history of the conquest or establishment of numerous cities bound together into one gigantic, unified system by the dominating power of Rome. As in Greece, city life and national life tended to merge. The government of the city of Rome itself, beginning with monarchy, progressed through various stages of democracy and representative government which were never completely lost even under the autocratic forms of the empire. There was little in the government of the cities outside of Rome, however, which could be called truly popular, and such democratic features as existed in the earlier period tended to diminish or disappear as the empire became more centralized. The political and civil rights conferred by Rome upon these tributary cities were usually made the basis for the imposition of heavy taxation. It is from the word *municipium* applied by the Romans to

these dependent and partially self-governing cities that we derive our word municipality. In complexity of organization and in diversity of functions it may be safely said that municipal government and life at Rome at the height of its development rivaled that of the modern metropolis.

**Mediæval Cities.**—During the "dark ages" municipalities seem to drop out of sight for the time being. The remnant of their powers and functions which was not lost in the general chaos was taken over largely by the Church. The development of the feudal system in Europe, beginning with the 10th century, was destined to exert an important influence upon the life and position of municipalities. Its immediate result was a diminution of their already weakened power. The feudal lord who lived upon his estate in the country held the cities within his domain as vassals, exercising over them the same feudal prerogatives as over the individuals on his land. In spite of feudal oppression the mediæval cities prospered as centers of trade and commerce. With prosperity came wealth and with wealth came the power to bargain or to fight with the feudal barons. Many of the larger cities of Italy, i.e., Florence, Venice, and Pisa, were able to purchase something like independence, while the cities of northern Europe more frequently freed themselves by the sword. This was true of the powerful free cities of northern Germany, which during the 11th and 12th centuries cemented their commercial interests in the formation of the Hanseatic League. When the struggle for municipal rights was won either by barter or in battle the cities secured the fruits thereof in a written treaty of peace or bill of rights called a *charter*. These charters, limited as they frequently were in the scope of the municipal freedom they guaranteed, may be said to have laid the foundations for modern constitutional government.

**England.**—English municipalities were subjected to the same feudal oppression which the more prosperous towns on the Continent suffered. They were not at first incorporated and had few political or civil rights and little if any self-government. They were small in area and population. London which was the metropolis then as now had about 40,000 inhabitants at the beginning of the 15th century. As feudalism lost its grip these towns or boroughs became incorporated, and gained in power and independence usually because the extension of privileges made easier the collection of taxes by the feudal lord. It was for this mercenary reason that Edward I gave the English boroughs representation in the historic national parliament called in 1295. The political power which the cities thus acquired was of great potential value to the Crown in the struggle it was then waging with the nobles. The establishment of the rule that no corporation was lawful without royal sanction gave the Crown the chance it desired to dominate municipal affairs and control the selection of the borough representatives in Parliament. Finding that popular elections afforded an uncertain basis of control, the Crown finally built up a sufficiently subservient municipal organization by creating a mayor and council selected in the first instance by the king and endowed

with the power of self-perpetuation. It was not until the passage of the Municipal Corporations Reform Act of 1835, made necessary by the inefficiency and corruption in municipal life, that English city government ceased to be oligarchical and took on the general form it now bears — that of a representative governing body holding office for short terms and elected by popular vote.

**United States.**—American municipal history dates back to the chartered municipal corporations established in the English colonies in the 17th and 18th centuries. The oldest of these charters seems to have been the one given to New York in 1686. The charters were granted by the provincial governors and in the main the government consisted of a popularly elected board of councilmen and aldermen and a mayor appointed by the governor. Although not originally subject to the control of the colonial legislatures these municipalities finally became so and found itself under the necessity of applying to the legislatures for additional grants of power, especially in the matter of taxation. After the American Revolution the state legislatures assumed that position of complete supremacy over American cities which they have ever since held.

**Relation Between the City and the Central Government—England.**—While cities are the organs for local self-government their functions do not end there, and the modern municipality finds itself bound to the state or nation within which it lies by a complex web of political, legal and governmental ties. The place of the city in the English administrative system may be sketched as follows: The city is a corporation created by Parliament. The municipality which desires a charter petitions for it and its petition is granted or rejected in accordance with a procedure which assures a fair consideration of the merits of the case. Needed amendments to the charter must be secured in the same way. The charters thus granted are similar in general outline but vary widely in the details of municipal organization and power. Powers are usually conferred upon English cities which are broad in scope and which create a system of local legislative autonomy. While Parliament remains the ultimate source of all English municipal authority there has never been a disposition on its part wantonly to interfere in the affairs of single cities after the fashion of American legislatures. This is due partly to the control over and responsibility for legislation in Parliament which is centred in the cabinet, making "log-rolling" and "pork-barrel" legislation impossible; it is also due to the essential nature of English municipal organization, politics and traditions which have prevented the English city from becoming the prey of partisan exploitation. Not only does the English national government exercise legislative power over the English city in the manner described but it also exerts an administrative supervision over it. The most important agency for this central administrative control is the Local Government Board. In a wide range of matters connected with municipal debts, municipal ownership, poor relief, and health, it is necessary for the city to secure the approval of this board for its projects. Administrative supervision of English cities is not

centralized in one department however, but the Board of Education, the Board of Agriculture, the Board of Trade and the Home Office have varying degrees of authority over the municipal activities falling within their respective jurisdictions. The result of this central administrative control has been wholesome. There has been no serious infringement of municipal autonomy but a valuable check on municipal extravagance and inefficiency. The administrative agencies mentioned have been given wide powers and have been able to settle many of the questions of municipal administration and power which in the United States have been fertile sources of ill-advised interference by the legislature in municipal affairs. In short, the English system may be said to be one of legislative decentralization, in view of the whole legislative power given to English cities, and administrative centralization.

**United States.**—In this country the opposite principle prevails, that of legislative centralization and administrative decentralization. Many of the most serious abuses in American municipal life have been due to the practically unrestrained and frequently abused power of the State legislatures over cities. Only too frequently has the American city been the prey of legislative exploitation and corruption. State legislatures have interfered in all kinds of municipal affairs. They have destroyed, enlarged or abridged municipal charters; extended or narrowed boundary lines; abolished municipal offices in order that those created to replace them might be available as party spoils; imposed upon cities burdensome debts against their will; bartered away municipal franchise privileges; and in countless ways contributed to the depravity and inefficiency which have too frequently been the shame of American cities. Among the efforts which have been made from time to time to prevent the abuses of special legislation affecting our cities the following may be mentioned: First, a general prohibition of such special legislation. Practically every State now forbids the incorporation of cities except by general law. The criticism urged against forbidding all special legislation is that the prohibition, if broad enough to cover adequately the abuse of special legislation, does not leave power to deal with the peculiar problems of individual cities. Second, the classification of cities with the requirement that laws must apply to all the cities of the same class. It has been found easy to create classifications in which each important city was in a group by itself. Third, general municipal codes, like that of Ohio in 1902, under which all cities are governed in accordance with a general and uniform scheme. This plan has not been found elastic enough to meet the needs of cities of varying size. Fourth, the municipal veto, by which a city is given the right to ward off legislative interference. This veto may be absolute, as in the case of Chicago, or it may be merely suspensive, as in the case of the cities in the State of New York. Fifth, the optional charter plan. This creates a series of model charters providing different forms of city government suitable to varying municipal conditions. A city may select whichever form it chooses and be governed under it. Sixth, municipal home rule (q.v.), which is now com-

monly regarded as the only adequate remedy for the evils of State interference in municipal affairs. There is in the United States practically no State administrative control over cities. There are no State administrative agencies which supervise municipal activities and there seems to be little disposition to create them. In a few instances there has been some degree of administrative supervision in the matters of education, health, civil service, elections, public utilities, and liquor sales, but these cases are very rare. There have been instances in which the State has taken direct charge of various municipal functions, such as police protection, and operated them by state appointed officers, but this is very different from central administrative supervision over municipal activities. It is possible that some scheme comparable to the one in England already described would aid us in the solution of some of our problems of municipal administration.

**Municipal Charters.**—Allusion has already been made to the charter of the municipality which serves the purpose of a constitution. It is the document which the city receives from the State legislature setting forth the form of municipal organization, the measure and limits of the city's power. It is granted by the legislature either by special act or in accordance with general laws, or, in the case of cities enjoying home rule, it is framed by the city itself. There are at least two respects in which the charter of a municipality differs from that of a private corporation. A private corporation becomes such by its own volition and no group of citizens can be compelled to incorporate against its wish. The State, however, has power to organize a community into a municipal corporation against the protest of every inhabitant of the district involved. In the second place, a charter given by the State to a private corporation is a solemn and binding contract which without mutual consent cannot subsequently be revoked or altered by the State, the obligation of which cannot be impaired without violating the provisions of the Federal constitution. The charter of a municipality is not a contract and the legislature, unless restrained by special provisions of the State constitution, may amend it or abolish it at its discretion. It stands on the same footing as any other piece of legislation.

**Municipal Powers—Character and Construction.**—No rule of law is more firmly established in this country than that the powers of a municipality are not residuary but are delegated and limited. These powers may be found in the charter of the city, in the general laws of the State, or in the self-executing clauses of the constitution; but they must be found positively set forth somewhere. Not only are municipal powers delegated but they are also construed with utmost strictness. No clearer or more adequate statement of the character and extent of the powers of the American city can be found than the classic words of Judge Dillon: "It is a general and undisputed proposition of law that a municipal corporation possesses and can exercise the following powers and no others: First, those granted in express words; second, those necessarily or fairly implied in or incident to the powers expressly granted; third, those essential to the accomplishment of the declared objects and purposes of

the corporation—not simply convenient, but indispensable. Any fair, reasonable, substantial doubt concerning the existence of power is resolved by the courts against the corporation, and the power is denied."

**Ordinance Power.**—One of the powers which is invariably granted in a municipal charter is the power to pass ordinances which shall have the effect of law. The legislature may not, under our State constitutions, delegate its legislative power; but since a city is regarded as an administrative subdivision of the State the courts have uniformly held it to be proper to endow it with a share of the State's legislative power. The power to pass ordinances is hedged about by many limitations express or implied, which may be summarized as follows: First, where the procedure to be followed in passing an ordinance is set forth in the charter it must be rigidly adhered to or the ordinance will be held void. Second, ordinances must not be passed in excess of the power delegated to the city. Third, there must be no violation of the provisions of the National or State constitutions or statutes. Fourth, since every power is granted to a municipality under the implied condition that it will be reasonably exercised, any ordinance will be held void which is regarded as unreasonable by reason of its being oppressive, discriminatory, unduly restrictive of trade, in contravention of common right or public policy. The invalidity of part of an ordinance does not vitiate the entire ordinance if the valid and invalid portions are separable.

**Power of Taxation.**—The power of the American city to tax must be given either by express or implied grant. It is usually specifically conferred in the charter, but if not it will be implied from the grant of other powers for the exercise of which revenues are necessary. When not limited by the provisions of the State constitution the State legislature has complete control over the city's power of taxation. It may in its discretion extend, curtail or revoke it in general or with reference to special taxes. It is subject in the exercise of this power to one restriction. It may not take away the power of a city to tax when such taxing power is the only means of paying an existing debt. The amount of the taxes which a city may raise for municipal purposes may be left to its discretion, but very commonly the city tax rate is limited either by the statutes or constitution of the State. The city's power to tax, like that of the State, can be exercised only for public purposes, a limitation which does not interfere with the ordinary activities of the city but which has raised some difficult problems in connection with some of the newer commercial activities of American municipalities. The rules governing the procedure of assessment and collection of municipal taxes are usually set forth in the city charter and must be strictly followed. The courts will compel a city against its will to exercise its taxing power to satisfy the claims of its creditors.

**Police Power.**—The power to pass ordinances for the protection of the public health, safety, morals and general welfare of the municipality is commonly conferred upon cities by express grant. It may be implied, however, from a general grant of power to pass ordinances. It is under this authority that municipi-

palities make enactments relative to the preservation of peace and order, sanitation, fire protection, regulation of amusements and occupations and the control of vice. When exercised by the city the police power is subject to all the usual constitutional restraints against arbitrary and discriminatory enactments, and in addition police ordinances are held void if they are unreasonable even though they violate no constitutional clause. The city is incapable of parting with its police power by the making of any grant, concession, exemption or contract. Its police ordinances may deal with subjects already covered by State law provided the ordinance does not conflict with the statute. The power to pass police ordinances carried with it by implication the authority to establish and enforce reasonable penalties. Such ordinances may be enforced either by penalties inflicted upon individuals or by summary destruction of private property which is held to be a public nuisance.

**Municipal Contracts.**—The power to make contracts is given to all municipalities by express grant or by implication. Such contracts have the same general legal character as contracts between individuals but the city must be exceedingly cautious not to exceed its power. If the procedural requirements in the city charter are not complied with the contract is void. Where cities enter into contracts for the securing of services or goods it is commonly required that the city must call for sealed bids based upon plans and specifications and that the contract must be let to the lowest responsible bidder. If it can be clearly shown that a city did not have the requisite authority to make a given contract such a contract is completely void. Cities are, however, bound by the principles of common honesty and in cases where its contracts are illegal because of hidden defects of procedure or non-compliance with other formal requirements the city may still be bound. It may elect to ratify such contracts and ignore the irregularities, or, under what is known as the doctrine of estoppel, it may be prevented by the courts from setting up its own illegal acts for the purpose of freeing itself from its just obligations. The contracts of a municipality are enforceable in court like other contracts and neither the city nor the State legislature may by ordinance or statute impair their obligation.

**Miscellaneous Powers.**—The American municipality enjoys several powers which do not call for elaborate discussion. It may appropriate and spend money for purposes within its authority and in accordance with the procedure outlined in its charter. It may, within these same limits, acquire, manage and dispose of property. It may construct public improvements and in so doing may use the power of eminent domain and levy special assessments. Its power to incur debts, own and operate public utilities and services and grant franchises are treated in separate articles. See MUNICIPAL DEBTS; FRANCHISES; PUBLIC UTILITIES; ASSESSMENTS.

**Liability of Municipalities.**—Since a municipality is not a government possessing sovereign powers it is not, like the State, immune from suit without its consent. On the other hand, since in the performance of many functions it is an agent of the State its legal lia-

bility is not as wide as that of a private corporation. The rules governing the civil liability of the city are, accordingly, complex. In the first place, its liability upon all contracts which it has legally made is absolute and may be enforced in the usual ways. Secondly, the city is not liable in damages for the torts or legal wrongs resulting from the performance of its governmental powers and functions. This immunity rests partly on the theory that the city performs these functions as an agent of the State which is immune from suit, and partly on the theory that it is contrary to public policy to expose the revenues of the city to the heavy drain which an unrestricted liability would entail. This immunity extends to the injuries resulting from the negligence or misconduct of the city's officers and agents, or from the faulty construction, repair or maintenance of its property when used for governmental purposes. By governmental functions or powers are meant those pertaining to the protection of public peace, health, safety, education, charity, etc., in contrast to the commercial or quasi-private enterprises on which modern cities may embark. The municipality is never liable, furthermore, for the tortious acts of its officers when they have exceeded their legal authority. In such a case the injured person may sue the officer individually and recover damages. The State legislature may create by statute municipal liability which would not otherwise exist. In the third place, the municipality is liable in tort for the injuries resulting from the performance of non-governmental or commercial functions, i.e., the operation of revenue-earning utilities, as well as from the use of property not used for governmental purposes. Furthermore, a legal obligation rests on the city to exercise reasonable care in keeping its streets, highways, bridges, viaducts, etc., safe for ordinary use and it is accordingly liable for the injuries resulting from a breach or neglect of this duty. On the whole the modern tendency seems to be to broaden rather than to curtail the civil liability of the municipality.

ROBERT EUGENE CUSHMAN,  
*Associate in Political Science, University of Illinois.*

**MUNJISTIN** (purpuroxanthin carboxylic acid), an orange-coloring matter closely allied to purpurin and to alizarin, which occurs in munjeet (East Indian madder), and has the formula  $C_{14}H_8(OH)_2O_2COOH$ . It may be changed into purpuroxanthin by boiling with alkalis; also by heating it above 448° F., its melting point. It dissolves in boiling alcohol, separating again, upon cooling, in the form of brilliant golden flakes. Munjistin gives an orange-yellow color when used as a dye with aluminum mordants, which, however, is not fast either as to light or soap. With iron mordants it gives a brownish purple, which is fairly permanent. Muajistin is one of the compo-

nents of commercial "purpurine," also known as "Kopp's purpurine."

**MUNKÁCS**, mún'käch, Hungary, town in the county of Bereg, located on the Latorcza River and on the Bályu-Munkács-Lavoczne-Strj state railway. Its industries consist of vineyards, coarse cloth making, spirit distilleries, petroleum refining, lumber, cattle and grain trade. In the vicinity the noted "Hungarian diamonds" (rock crystal) are mined. Close by are productive alum and iron mines. Built on a high rock in the plain is the historic fortress, usually utilized as a state prison, that was first built in 1359. It was surrendered (1688) to the Austrians after withstanding a siege of three years under the brave leadership of Helen Zriny, wife of the patriot Emmerich Thököly. Franz Rákóczi II (1703) was defeated here by the Austrians under Nigrelli and the place was surrendered (1708) to the latter. Alexander Ypsilanti was imprisoned here from 1821-23, and the famous painter Munkacsy was born here. Pop. about 17,240.

**MUNKÁCSY**, moon'käché, **Michael**, Hungarian painter: b. Munkács, Bereg County, Hungary, 10 Oct. 1846; d. Endenich, near Bonn, 1 May 1900. His real name was Lieb, but he is known only under the assumed name derived from that of his birthplace. Beginning life as a carpenter, he met the strolling portrait painter, Szamosy, in Gyula, who was so much struck by the artisan's interest in art that he gave him painting lessons. Munkácsy proceeded to paint portraits and genre pictures, taking his subjects from common country life. One of these early canvases, 'A Country Idyll,' was purchased by the Art Union of Pesth. He eventually put himself under the instruction of the battle-painter, Franz Adam, at Munich. He made rapid progress and the Hungarian government awarded him the first prize for genre paintings thrice in succession and he was thus enabled to take up his residence at Düsseldorf and to study under Knaus and Vautier. The first great picture he painted was 'The Last Day of a Condemned Man,' (in the collection of Mrs. W. P. Wiltach, Philadelphia) exhibited in the Paris Salon in 1870. This was followed in 1871 by 'Wartime' (an episode in the Hungarian war. The succeeding year he made Paris his home and his pictures began to attract growing attention. He painted many small genres of singular power and character, such as 'Going to School'; 'The Kitchen Politician'; 'The Butter Woman'; 'The Pawn Shop' (1874) (Metropolitan Museum, New York); 'The Workshop' (1875); but as his strength and mastery of his art grew he rose to loftier subjects, religious and historical. In 1877 he painted 'Milton in his Blindness Dictating Paradise Lost,' to which was awarded the gold medal at the Paris Exposition. It is now in the Public Library, New York. Great as was the sensation created by this picture, a historic genre of remarkable coloring in gray and black and of profound insight and power of characterization, an even deeper impression was produced by his 'Christ Before Pilate' (1882), which some critics consider the greatest religious picture of its century. This vast canvas is startling in its freshness of conception, its living action, the mingled grandeur and pathos which the artist has infused into his

treatment of the central figure, as well as its masterly composition and technique. It has been exhibited in all quarters of the civilized world and was bought by John Wanamaker of Philadelphia for \$120,000. It was followed by his dramatic 'Christ on Calvary,' the religious intensity of which is heightened by the accurate fidelity to differing national types with which the spectators of the Crucifixion are portrayed; a piece of realism whose suggestiveness is obvious. In 1886, he produced 'The Last Moments of Mozart,' now in the collection of Gen. Russell Alger, Detroit, Mich. The present owner paid \$50,000 for this pathetic picture, in which the composer is listening to his still uncompleted requiem, sung at his bedside by his favorite singers, the night before his death. The last three years of his life this painter suffered from mental alienation and closed his days in a sanitarium. In addition to the works already mentioned, 'The Music Room' and 'The Two Families' are in the Metropolitan Museum in New York; 'The Prowlers of the Night' is in the Pennsylvania Academy, Philadelphia, and 'The Story of the Battle' is in the Walters Gallery, Baltimore. Consult Tait, T. R., 'Michael Munkácsy' (in *American Art Review*, Vol. II, Boston 1881).

**MUNKAR**. See MOHAMMEDANISM.

**MUNN, Charles Clark**, American novelist: b. Southington, Conn., 1848; d. 8 July 1917. Bred on a farm which he left at 17, for 30 years he was engaged as a commercial traveler. From 1910 he was editor of the *Commercial Travelers' Magazine*. He was the author of several popular novels, including 'Pecket Island' (1900); 'Uncle Terry: a Story of the Maine Coast' (1900); 'Rockhaven' (1902); 'The Hermit' (1904); 'The Girl from Tim's Place' (1906); 'Boyhood Days on the Farm' (1907); 'Myrtle Baldwin' (1908); 'The Castle Builders' (1910); 'The Spice of Life' (1911); 'The Heart of Uncle Terry' (1915); 'Camp Castaway' (1916).

**MUNN, George Frederic**, American artist: b. Utica, N. Y., 1852. He began his early studies in art under Charles Calverly, the sculptor and also in the National Academy of Design, New York. Afterward he entered the art schools at South Kensington, England, and there won a gold medal, the first award of the kind to an American. His clay model of the Farnese Hercules won the award. He also was the winner of a silver medal at the Royal Academy for life drawing, and in 1876 entered the studio of George F. Watts. He traveled in Brittany, where he painted and sketched and was a frequent exhibitor at the Dudley Gallery, London, and elsewhere. Among his best-known works are 'Wild Flowers,' 'Roses,' 'Meadow Sweet' and 'A Sunny Day in Brittany.' Consult Munn, Margaret Crosby and Cabot, Mary R., 'The Art of George Frederic Munn,' with an Introduction by Sir Johnston Forbes-Robertson (New York 1916).

**MUNN, Orson Desaix**, American publisher: b. Monson, Hampden County, Mass., 11 June 1824; d. New York, 28 Feb. 1907. He was educated at the academy in Monson, was a clerk and country storekeeper there until 1846, and then bought the *Scientific American*, which he made one of the leading scientific papers of the

country. Other periodicals owned by him were the *Scientific American Supplement* (1876- ) and *Architects' and Builders' Edition* (1885- ), now *American Homes and Gardens*. He was also head of Munn and Company, patent solicitors.

**MUÑOZ**, mu-ñoth, **Juan Bautista**, Spanish historian: b. near Valencia, Spain, 1745; d. Madrid, Spain, 1799. He was graduated from the University of Valencia in philosophy, being influenced more by the views of the enlightenment than by the official scholasticism and was appointed in 1779 historiographer of the Indies and was instructed by the king to write a history of America. This work was published under the title 'Historia del Nuevo Mundo' in 1793, and though completed only to 1500 is highly valued. Its publication was forbidden by the Council of the Indies, but permitted by Charles IV, notwithstanding its exposition of the barbarity of the Spaniards to the natives. Of his manuscripts many are now in the Academy of History at Madrid, but unfortunately many others are scattered.

**MUNRO**, mün-rō, **Neil**, Scottish novelist: b. Inverary, Scotland, 3 June 1864. He has published 'The Lost Pibroch: Celtic Tales and Sketches' (1896); 'John Splendid,' a Highland romance (1898); 'Gilian the Dreamer' (1899); 'Doom Castle' (1901); 'The Shoes of Fortune' (1901); 'Children of the Tempest' (1903); 'The Clyde' (1907); 'Fancy Farm' (1910); 'Ayrshire Idylls' (1913); 'The New Road' (1914).

**MUNRO**, Robert, Scottish archæologist: b. Ross-shire, 21 July 1835. He was educated at the University of Edinburgh and was a physician at Kilmarnock till 1886 when he turned his whole attention to archæological researches. He is a member of many learned societies at home and abroad, and has published 'Ancient Scottish Lake Dwellings' (1882); 'The Lake Dwellings of Europe' (1890); 'Rambles and Studies in Bosnia, Herzegovina and Dalmatia' (1895); 'Prehistoric Problems' (1897); 'Prehistoric Scotland and its Place in European Civilization' (1899); 'Man as Artist and Sportsman in the Palæolithic Period' (1904); 'Archæology and False Antiquities' (1905); 'Palæolithic Man and Terremare' (Munro Lectures, 1912); 'Prehistoric Britain' (1914); and with others, 'The Glastonbury Lake Village.'

**MUNRO**, Wilfred Harold, American historian: b. Bristol, R. I., 20 Aug. 1849. He was graduated (1870) at Brown University, receiving (1873) the A.M. degree. He served (1870-71) as master at De Veaux College, Niagara Falls, as associate principal of Saint Mark's School, Salt Lake City (1871), and spent 1873 in South and Central America. From 1875-79 he was principal at Le Roy (N.Y.) Academic Institute and was president of De Veaux College from 1881-89. He studied at the universities of Freiburg and Heidelberg (1890-91), when (1891-99) he became associate professor of history and director of university extension at Brown University, to be made professor of European history (1899-1911), then emeritus professor. He has written 'The Story of Mount Hope Lands, a History of Bristol, R. I.' (1880); 'The Most Successful American Privateer' (1913); 'Legends of

Mount Hope' (1915); 'Tales of an Old Seaport' (1917). He was editor of the 'Works of W. H. Prescott' (22 vols., 1905-06), and of the 'Record Book of the Rhode Island Society of Mayflower Descendants' (1911).

**MUNRO**, William Bennett, American political economist: b. Almonte, Ontario, Canada, 5 Jan. 1875. He was graduated (1895) at Queen's University, Canada, receiving the degrees M. A. (1896) there, LL.D. at Edinburgh (1898), Ph.D. at Harvard (1900). He studied (1900-01) at the University of Berlin and was (1901-04) instructor of history and political science at Williams College, then, successively, instructor in government (1904-06), assistant professor (1906) and since has served as professor of municipal government at Harvard University. He has been president of the Harvard Co-operative Society, university editor of *Harvard Graduates' Magazine*, and director of the Cambridge Trust Company. He has written 'Canada and British North America' (1904); 'The Seigniorial System in Canada' (1907); 'Documents Relating to the Seigniorial Tenure' (1907); 'The Government of European Cities' (1909); 'Initiative, Referendum and Recall' (1911); 'Government of American Cities' (1912); 'Bibliography of Municipal Government' (1914); 'Principles and Methods of Municipal Administration' (1916).

**MUNROE**, mün'rō', **Charles Edward**, American chemist and expert on explosives: b. Cambridge, Mass., 24 May 1849. He was graduated at Harvard (1871); was assistant in chemistry there for three years; professor of chemistry United States Naval Academy (1874-86); chemist to United States Naval Torpedo Station (1886-92); and since the last date professor of chemistry and dean of faculty of graduate studies of George Washington (formerly Columbian) University, Washington, D. C. He was expert special agent on chemical industries for the United States Census of 1900, 1905 and 1910; consulting explosives expert United States Bureau of Mines since 1907; president of the American Chemical Society (1898); president Cosmos Club (1913 and 1914); received the decoration of the Order of the Medjidje from the Sultan of Turkey (1901); has invented a smokeless powder; and is the author of various monographs on chemistry, notably of explosives.

**MUNROE**, Henry Smith, American mining engineer: b. Brooklyn, N. Y., 25 March 1850. He was graduated (1869) at Columbia and received (1877) the degree Ph.D. He was (1870-71) assistant geologist of the Ohio State Geological Survey; assistant chemist, United States Department of Agriculture (1870-72); assistant geologist and mining engineer of the Geological Survey of Yesso, Japan (1872-75). In 1875-76 he was professor of mining and geology at the University of Tokio; then successively adjunct professor of surveying and practical mining (1877-91); professor of mining (1891-1915), and emeritus professor in 1915 at Columbia University. He was also dean of the faculty of applied sciences (1897-99) and member of the university council (1895-1915). He was manager (1881-84), then vice-president (1890-92) of the American Institute of Mining Engineers, and was (1908-09) president of the Mining and Metallurgical Society of America

and (1909) president of the Society for the Promotion of Engineering Education.

**MUNROE, Kirk**, American writer of juvenile stories: b. Prairie du Chien, Wis., 15 Sept. 1850. He was educated at the public schools, then studied at Cambridge, Mass., and Harvard. He became the first editor of *Harper's Round Table* (1879-82) and is editor of *Eminent Men of Our Time*. Of the large number of juvenile works from his pen might be selected: 'The Flamingo Feather'; 'Derrick Sterling'; 'The Golden Days of '49'; 'Dory-mates'; 'With Crockett and Bowie'; 'Cab and Caboose'; 'Big Cypress'; 'The Fur Seal's Tooth'; 'Campmates'; 'Canoemates'; 'Raft-mates'; 'At War with Pontiac'; 'Under the Great Bear'; 'Forward March'; 'The Belt of Seven Totems'; 'The Outcast Warrior'; 'The Mikado.'

**MUNSEE INDIANS**, an American tribe of the Delaware family, originally one of the three great divisions of that race. They were sometimes called the Wolf tribe of the Delawares. They resided along the Delaware River, and in New York, Pennsylvania and New Jersey. During the Revolution many of the Munsees removed to Canada, where at Thames, Ontario, there are some survivors. At Green Bay, Wis., is another tribal remnant and a third remnant is found in Kansas; in all, less than 100 in the United States. See DELAWARE INDIANS.

**MUNSELL, Joel**, American printer: b. Northfield, Mass., 14 April 1808; d. Albany, N. Y., 15 Jan. 1880. He established himself in Albany in 1827, and was publisher and editor of the *New York State Mechanic* from 1841 to 1843. At various times he was the publisher of the *Unionist*, the *Albany Daily State Register*, *Morning Express* and *Statesman*, and other journals. Munsell made a close study of the art of printing, in its history and application, and his collection of works on the subject, the largest in America, was in part purchased by the State for the New York State Library. He contributed papers to the 'Transactions' of the Albany Institute, of which he was a founder, and published 'Outlines of the History of Printing' (1839); 'Annals of Albany' (1849-59); 'Every-Day Book of History and Chronology' (1856); 'Chronology of Paper and Paper-Making' (1857; enlarged 1870); and 'Manual of the First Lutheran Church of Albany, 1670-1870' (1871).

**MUNSEY, mun-si, Frank Andrew**, American publisher: b. Mercer, Me., 21 Aug. 1854. After receiving a common school education he became manager of a telegraph office in Augusta, Me. He went to New York in 1882 to become editor and publisher of *The Golden Argosy*, a juvenile weekly, which he afterward changed into a monthly for adults under the style of *The Argosy*. *Munsey's Weekly* appeared in 1889 and after issuing this for one year he transformed it also into a monthly, calling it *Munsey's Magazine*. He now owns *The Argosy*, *The Railroad Man's Magazine*, and the *All-Story Weekly* and the daily newspapers *New York Sun* and *Baltimore News*. He was a pioneer in the publication of cheap illustrated magazines, *Munsey's* being the first magazine to be sold at ten cents

a copy. He is a member of many clubs in New York City and elsewhere and is the author of several books: 'Afloat in a Great City' (1887); 'The Boy Broker' (1888); 'A Tragedy of Errors' (1889); 'Under Fire' (1890); and 'Der-ringforth' (1894).

**MUNSON, James Eugene**, American inventor: b. Paris, N. Y., 12 May 1825; d. 1906. He was educated at Amherst College and in 1857 removed to New York, where he was court stenographer for 30 years. He invented the "Munson System" of shorthand, a machine for operating the typewriter by telegraph and a type-setting machine. He published 'The Complete Phonographer' (1866); 'Dictionary of Practical Phonography' (1874; 2d ed. 1906); 'The Phrase-Book of Practical Phonography' (1889); 'A Shorter Course in Munson Phonography' (1901; 2d ed. 1912); 'Phonographic Dictation Book' (1904), etc.

**MUNSON, Thomas Volney**, American horticulturist and plant breeder: b. on a farm near Astoria, Ill., 26 Sept. 1843; d. Denison, Tex., 21 Jan. 1913. His early education was obtained in the rural district schools, followed by a course in an academy at Lewiston. He subsequently took a course in a commercial college after which he entered the University of Kentucky, whence he was graduated in 1870. Shortly after completing his education he married and removed to the vicinity of Lincoln, Neb. In 1873 he became interested in the improvement of the various species of the native American grapes and planned to do systematic work in the way of developing new varieties by cross-pollination and hybridization. The experiments thus undertaken were doomed to failure because of climatic rigors and a visitation of the Rocky Mountain locusts. Undismayed, he sought a new location, settling at Denison, Tex., in 1876. There climatic conditions were much more favorable to the prosecution of such experiments and, moreover, wild grapes were much more abundant and more profuse in variety than in Nebraska. He engaged in the nursery business and in the breeding new varieties of grapes and also growing them upon a commercial scale. During the ensuing 25-year period, he produced and experimentally fruited no less than 150,000 new varieties of grapes, many of which were far superior to those hitherto in common cultivation. Only the very best of these were selected for propagation and dissemination and so rigid and exacting was the process of elimination that but 50 varieties were retained for introduction and cultivation as a permanent addition to American viticulture. He became recognized as a botanist as well as a viticulturist, a volume entitled 'Native Trees of the Southwest' having been prepared under the direction of the United States Department of Agriculture and a similar thesis being submitted in 1883 for the master's degree at the Kentucky Agricultural College. But his specialty was the grape and he became the recognized authority on the native wild grapes of North America. His horticultural and scientific work in hybridizing and perfecting the American grapes won recognition abroad as well as at home. In appreciation of his service in producing and introducing resistant stocks with which to re-

store the phylloxera infested vineyards of France, the French government conferred upon him the diploma and decoration of the Legion of Honor, with the title of "Chevalier du Merit Agricole," in 1888. He wrote 'Classification and Generic Synopsis of the Wild Grapes of North America' (issued as Bulletin No. 3 of the Division of Pomology, United States Department of Agriculture, Washington, 1890). The most complete botanical display of the whole grape genus ever made was prepared by Mr. Munson and exhibited at the World's Columbian Exhibition at Chicago in 1893 and has since been preserved by the United States Department of Agriculture at Washington. He was the founder and for many years the president of the Texas Horticultural Society and was a member of a number of learned societies, including the American Horticultural Society, the National Agricultural Association of France, the American Pomological Society, the American Breeders' Association and the American Association for the Advancement of Science. His volume 'Foundations of American Grape Culture' (1909), embodied the practical results of more than 30 years of patient, painstaking investigation, experimentation and observation and must long remain the leading treatise of its class. His work, which may be justly said to have been monumental in its significance and beneficence, was continued until his death.

**MUNSTER**, Ireland, the southwest and largest of the four provinces of that country, bounded on the north by Connaught, on the east by Leinster, and on the west and south by the Atlantic Ocean. It has an area of 9,532 square miles and is divided into the counties of Clare, Cork, Kerry, Limerick, Tipperary and Waterford. Pop. 1,035,495, 94 per cent Roman Catholics.

**MÜNSTER**, mün'stër, Prussia, the capital of Westphalia, a city and episcopal see, in a plain on the Aa, at the junction of several railways and on the Dortmund-Ems canal, 78 miles northeast of Cologne. The site of its mediæval ramparts has been converted into promenades. The principal edifices are the 13th century cathedral, the church of Saint Lambert, the Rathaus, exchange, museum, theatre, the Pauline Library, several educational, benevolent and charitable institutions, etc. The manufactures include woolen, linen and cotton goods, leather, sugar, starch, beer, etc. Münster originated in a monastery around which a settlement arose in the 12th century; it was long governed by martial bishops. The most notable event in its long history occurred in 1532-35 when the city fell into the hands of the Anabaptists (q.v.). Pop. about 90,000.

**MÜNSTERBERG**, mün'ster-bërg, Hugo, German-American psychologist: b. Dantzig, Germany, 1 June 1863; d. Cambridge, Mass., 16 Dec. 1916. He was graduated at the Dantzig Gymnasium in 1882, and pursued post-graduate studies in physiology, philosophy, natural sciences and medicine until 1887. He received the degree of Ph. D. at Leipzig in 1885 and that of M.D. at Heidelberg in 1887. After this he was instructor and assistant professor of psychology in the University of Freiburg at Baden, Germany. In 1892 he came to America at the

invitation of Harvard University, Cambridge, Mass. He was professor of experimental psychology and director of the Psychological Laboratory in Harvard from that time until his death. His scholarly work was partly psychological, partly philosophical. After 1900 he gave special attention to the new field of applied psychology, in particular to the application of psychology to education, medicine, law, commerce and industry. He was a member of the Psychological Association (president 1898), of the Philosophical Association (president 1908), the Washington Academy, of the American Academy of Arts and Sciences, etc. He was organizer and vice-president of the International Congress of Arts and Sciences at the Saint Louis World's Fair 1904, vice-president of the International Psychological Congress in Paris 1900, vice-president of the International Philosophical Congress at Heidelberg 1907, etc. In 1910-11 he was Harvard exchange professor at the University of Berlin and during that year founded the Amerika-Institut in Berlin. During the whole period of his American stay he worked for the improvement of the relations between the United States and Germany, writing in America for a better understanding of Germany and in Germany for a higher appreciation of America. The outspoken views of Professor Münsterberg on the issue of the War of 1914 raised storms of controversy about his head. He appeared as probably the most eminent supporter of German policies in America, and as such was most bitterly condemned by the Entente Allies and their friends, while to the pro-Germans he appeared almost an idol. While supporting German policies, Professor Münsterberg denounced many of the activities of the Teutonic hyphenates in this country. He condemned the forming of an alien party within the United States as "a crime against the spirit of true Americanism," and said that its results would reach far beyond the time of the war. Professor Münsterberg's early writings in Germany were exclusively devoted to experimental psychology. During his sojourn in America he published the following works, some of which have been translated into many languages: 'Psychology and Life' (1899); 'Grundzüge der Psychologie' (1900); 'American Traits' (1902); 'Die Amerikaner' (1904; revised 1912); 'Principles of Art Education' (1905); 'The Eternal Life' (1905); 'Science and Idealism' (1906); 'Philosophie der Werte' (1907); 'On the Witness Stand' (1908); 'Aus Deutschland Amerika' (1909); 'The Eternal Values' (1909); 'Psychotherapy' (1909); 'Psychology and the Teacher' (1910); 'American Problems' (1910); 'Psychologie und Wirtschaftsleben' (1912); 'Vocation and Learning' (1912); 'Psychology and Industrial Efficiency' (1913); 'American Patriotism' (1913); 'Grundzüge der Psychotechnik' (1914); 'Psychology and Social Sanity' (1914); 'Psychology, General and Applied' (1914); 'The War and America' (1914); 'The Peace and America' (1915); 'The Photoplay, A Psychological Study' (1916). He was also a large contributor of psychological and philosophical articles in the scientific magazines and of social, political and practical psychological articles in the popular periodicals.

**MUNTJAC**, a small East Indian deer representing the genus *Cervulus*, which resembles

the musk-deer in many points, especially in having, in the male, long sharp upper canine teeth, or tusks, which are effective weapons. These little deer, only 20 to 22 inches in height inhabit hilly jungles, and have lyrate, single-pronged antlers, mounted upon remarkably tall pedicels. The females have no antlers. Several species are known, of which the most familiar is the Kakar or barking-deer (*C. muntjac*) of Indian sportsmen, whose loud resonant cries may be heard at a surprising distance, and which is a favorite not only because it exercises skill in its pursuit, but gives excellent venison. Allied species are found in China and the Malay archipelago, and fossil related genera existed in Europe in Tertiary times. Consult Kinloch, 'Large Game Shooting' (1885).

**MÜNTZ**, münts, Eugène, French art critic: b. Sulz, Alsace, 1845; d. Paris, 30 Oct. 1902. He studied at the Lycée Bonaparte, Paris, and then went (1873-76) to the French School at Rome, when he was appointed librarian at the École des Beaux Arts, Paris, to become (1880) curator of the library, archives and of the Museum. He made a number of trips to Germany, England and Italy for research. Among the most important of his many works are 'Les arts à la cour des Papes pendant le XV et le XVI siècle' (1878-98, 4 vols., awarded prize of the Academy of Fine Arts); 'Raphaël, sa vie, son œuvre et son temps' (1881, 3d ed., 1899), also a short biography of Raphaël (1901); 'La tapisserie' (1882; 5th ed., 1903); 'La Renaissance en Italie et en France à l'époque de Charles VIII' (1885); 'Tapisserie, broderies et dentelles' (1890); 'La mosaïque chrétienne pendant les premiers siècles' (1893); 'Florence et la Toscane' (1897; new ed. 1901); 'Léonard de Vinci' (1898). Under the title 'Bibliothèque internationale de l'art' undertaken in collaboration with foreign critics and published since 1881, he brought out a number of monographs which he called 'Les précurseurs de la Renaissance,' which were followed by 'Les collections des Medicis' (1887) and later 'Les historiens et les critiques de Raphaël' (1884) and 'Études sur l'histoire de la peinture et de l'iconographie' (2d ed. 1885). He also collaborated with Guiffrey in 'Histoire générale de la tapisserie.' He was made a member of the Institut de France. Consult Girodie, 'Eugène Müntz' (Strassburg 1902).

**MUNZER**, münt'sër, Thomas, German religious fanatic: b. Stolberg, about 1490; d. Frankenhausen, 15 May 1525. He claimed that he was in direct communion with the Holy Spirit, and advocated communism, denouncing all existing governments. His violence brought him into conflict with Luther as well as with the Catholics. He preached at Zwickau in 1520, and at Prague in 1521, promulgated his doctrines at Allstedt in Thuringia in 1523, and excited the people to revolt against the authorities. In Mühlhausen (1524) he gained the unqualified support of the populace, deposed the city council and appointed a new one, suffered the monasteries and houses of the wealthy to be sacked, and proclaimed a community of goods. He was now joined by another fanatic named Pfeifer, with his troop of rapacious followers, and this circumstance with the news that 40,000 peasants had assembled in Franconia, and plundered and burned 150 castles of the nobles

and 23 monasteries, inflamed his zeal, and he joined in what was termed the "Peasants' War," intending to exterminate "the godless princes and priests." Leaving Pfeifer governor in Mühlhausen, he proceeded to Frankenhausen, and rekindled the ardor of the townspeople. The dukes of Saxony, Philip and Brunswick, and other rulers sent a force against the insurgents; Münzer was totally defeated after an obstinate struggle, was taken and executed. (See PEASANTS' WAR). Consult Merx, 'Thomas Münzer und Heinrich Pfeiffer' (Göttingen 1889); Seidemann, 'Thomas Münzer' (Leipzig 1842); Strobel, G. T., 'Leben, Schriften und Lehren Thomä Müntzers' (Nürnberg 1795); Wolfram, G., 'Thomas Münzer in Allstedt' (Jena 1852).

**MUNZINGER**, moont'sing-ër, Werner, Swiss explorer: b. Olten, Switzerland, 4 April 1832; d. Africa, 14 Nov. 1875. He was educated at Bern, Munich and Paris. He engaged in mercantile life at Alexandria, Egypt, in 1852-53. He participated in several expeditions of exploration into Abyssinia, and later became British and then French consul, and finally governor under the Khedive at Massowah in Egyptian Abyssinia. In 1870 he made an expedition into southern Arabia. In 1872 he became Pasha and governor-general of the eastern Sudan. He was killed in 1875 while leading an expedition against Abyssinia. Among his works are 'Ostafrikanische Studien' (1864); 'Vocabulaire de la Langue Tigré' (1865).

**MURADABAD**, moo-rä-dä-bäd', India, city and capital of the district of Muradabad in the United Provinces, on the Ramganga River, situated 50 miles north by west of Bareilly. The city has an extensive commerce in rice, sugar, wheat and other products of the surrounding district and has cotton factories, printing establishments and manufactories of engraved brass ware. Its most notable architectural feature is the great mosque erected in 1631. There are also Saint Paul's Church (Church of England), and the American Methodist Church founded in 1874. Rustam Khan founded Muradabad in 1625; the ruins of his early fortifications are still visible. The city is governed by a council of 23 members, of whom five are appointive and the remainder elected. A cantonment is located on the outskirts of the city to the northwest. Pop. 81,168.

**MURÆNA**, a very large marine eel or moray of the family *Muranida*. (See MORAYS). There can be little doubt that the *muræna* of the Roman feasts often translated "lamprey," was one of the true eels. It was held in the highest esteem. Pliny tells of the enormous sums of money and the great care which were spent on the cultivation of the *muræna*. The artificial fish-pond of Lucullus was said to have been sold for about \$200,000; and one Hirrius is said to have furnished Cæsar with 6,000 *murænas* alone for a regal entertainment given to the people. These fishes were kept as pets by the Roman nobility. See MULLET.

**MURAL CIRCLE**, in astronomy, an instrument consisting of a circle carrying a telescope and mounted against a wall; whence its name. The telescope revolved in the plane of a meridian. It was formerly employed in observatories to measure the zenith distances of stars,

and thus their declination. The mural circle is now superseded by the *Meridian Circle*.

**MURAL PAINTING**, that branch of interior decoration which has for its object the adornment of the walls of buildings by painting, as distinguished from mosaic, wainscoting, sculpture, tapestry and all other kinds and means of adornment. By extension the term includes also the painting of vaults and ceilings. It is not commonly used of mere painting with uniform flat color, but only of such painting as involves systematic decorative design, whether pictorial or by means of conventional patterns and ornament. In its highest development it is the most exalted, spiritual and imaginative form of decorative art, and indeed of painting in general, and has enlisted the genius of the most gifted painters of all time.

**General Purpose and Principles.**—Mural painting is not an independent art, like the painting of easel pictures, but an art intimately allied with architecture. Its function being that of enhancing the beauty of the structure to which it is applied, the decorator must subordinate his invention to the architectural conditions and character of the building and of the spaces he is to adorn. He must consider the size, scale and proportions of the room; its architectural style, features and divisions; its conditions as to lighting; the distance from the spectator's eye of the various surfaces he is to paint; and thus to make his paintings contribute to the dignity and effectiveness of the completed structure. This requires a knowledge of architecture and a sympathetic attitude toward the architect's purpose, and the best results are secured when the architect and painter have collaborated from the beginning. Usually, however, the building is "turned over" to the decorator only when completed, and the artist must do his best with the conditions thus created for him in advance. He is least hampered when the interior surfaces assigned him (for nearly all mural painting is of interiors) are broad and simple, as in the Arena Chapel at Padua by Giotto and the Sistine Chapel at Rome by Michelangelo and others; but the truly great artist can triumph over such architectural complexities as the great ceilings in the Ducal Palace at Venice and the richly paneled vault of the Camera della Signatura at Rome.

In general, the mural painter has to deal with two distinct elements of design: the pictures which form the chief part of most decorative schemes, and the framework, borders and other adjuncts of conventional ornament by which they are both related to and separated from the architectural members and features of the structure. There are many subordinate spaces too small for pictures, which may be enriched with arabesques and patterning in color and thus harmonized with the greater decorations. There are, indeed, many interiors which offer little opportunity for pictorial decoration but abundant scope for painted ornament, as in many French Renaissance buildings of the 16th-18th centuries. Such decoration requires a thorough mastery of ornament in the various historic styles and calls for decorative fancy rather than for the higher forms of artistic inspiration.

The subjects treated by the mural painter may be broadly divided into the historical, the

allegorical and the fanciful, varying according to the purpose of the building or room to be decorated. In the first class may be included not only actual historical events, but scenes from legendary lore and such Scriptural scenes as are narrated in the Bible as actually occurring, without regard to questions of scientific historicity. In the second class we may include all allegorical and symbolic representations and such Scriptural subjects as are prophetic, apocalyptic or abstract. Subjects of the third class belong to the lighter phases of the art as applied to houses, ball-rooms, theatres, etc., and may include fanciful landscapes, pastorals, genre subjects and the like. The highest reach of the art is attained when a great master handles such tremendous "allegories" as 'Paradise,' the 'Last Judgment,' 'The Redemption,' 'The Triumph of Christianity,' as in the frescoes by Michelangelo in the Sistine Chapel, or the extraordinary paintings by Sargent in the Boston Public Library. Even maps have been used as mural painting, e.g., those covering the walls of the famous Gallery of Maps in the Vatican (1581), and those painted on the upper part of the walls of the great waiting-room of the Pennsylvania Terminal in New York.

Whatever the subject and whatever the surface on which it is painted, it may be handled in either of two ways: either so as to recognize the hard and impenetrable wall or vault which it adorns, or so as to ignore it and, as it were, make the spectator forget its existence or at least its impenetrability. In the first kind, the colors are more or less flat, the figures are formally disposed and appear to be as nearly as possible in one plane, and there is little effect of light-and-shade (*chiaroscuro*) or perspective. Such are the engraved paintings on Egyptian temple-walls and columns, nearly all mediæval paintings and, in a measure, some of those of the modern Puvis de Chavannes (q.v.). One feels that these are paintings on a wall. To the second class belong many Pompeiian paintings and nearly all those of Renaissance and modern times, in which perspective, both geometric and aerial, and all the resources of realistic representation, of distance and the third dimension, combine to create an illusion of actuality and space; to "break through the wall" as the painters say. But even in such paintings a certain formality of composition and an evident recognition of the shape of the space occupied may serve to distinguish them as real mural decorations rather than easel pictures framed and hoisted into their places on wall or ceiling.

**Methods and Technic.**—Four processes or methods of producing mural paintings have predominated in the history of the art: Fresco, Tempera (or painting in distemper), Encaustic and Oil painting.

*Fresco* was the process most generally employed in the Early Renaissance, in the Middle Ages and to some extent in antiquity. In fresco painting the pigment, mixed with water, is applied to a specially prepared surface of wet plaster, which it penetrates so that when the plaster sets the picture is incorporated in its substance and to some extent encased in a thin coating of carbonate of lime. Only so much of the picture can be painted at a time as will cover the plaster before it hardens, after which the unpainted remainder of the

plaster must be cut away. Thus each day's work must be complete in itself, there can be no retouching or correction on that portion except in distemper, which is less permanent. "Buon fresco" is pure fresco, untouched with tempera, and such are the greatest works of the later masters in fresco. The mediæval and early Renaissance painters (and probably also the Greco-Romans) used tempera retouching quite freely. But even with tempera retouching fresco-painting is a difficult process; and the work must be done in place, not in the studio, and to paint a damp ceiling while lying on one's back is no easy task. Oil painting has almost completely driven out this most permanent and monumental style of painting, in which most of the greatest works of the Italian Renaissance were executed. See PAINTING.

*Tempera*, or painting in distemper, is a process of painting on dry plaster with pigments carried by some slightly glutinous medium, like white of egg or honey, or gum, mixed with water. The work must be done in place, like fresco, but is easier of execution and permits of retouching and correction *ad libitum*. It is far less permanent than fresco, being likely to scale, peel or powder off. It was, however, much used in antiquity, and the so-called "frescoing" or painted decoration on walls and ceilings of ordinary modern houses and apartments is done in distemper.

*Encaustic* is painting on a surface prepared with wax, and employs either distemper pigments which after painting are covered with a coat of melted wax, or pigments mixed with melted wax on a hot palette. It is a difficult and meticulous process, which was used by the Romans for certain details of their mural a coat of melted wax, or pigments mixed with occasionally by modern artists, F. C. Crowninshield among them, but has no decided advantage over oils sufficient to counterbalance its difficulties.

*Oil painting*, which employs linseed oil as the carrying medium of the pigment and turpentine as a dryer, appears to have been first developed in Flanders in the 15th century and thence to have been carried to Italy, where it finally supplanted all other processes, first for easel pictures and altar-pieces, and later, in the hands of the great Venetian painters, for mural decorations of the greatest magnificence. Oil painting has many advantages; it can be executed in the studio, upon wood, copper or canvas, the latter being usually employed; it is the most brilliant of all kinds of painting and lends itself to the greatest variety of technic, and can be indefinitely corrected and retouched. For these reasons it is the preferred process of nearly all modern muralists. Its disadvantages are that it cannot be executed directly on plaster, even specially prepared for it, with any prospect of permanence; and execution in the studio often leads to disappointing results when the work is in place; moreover it is liable to darken with age and to suffer from deterioration of the canvas. Yet many of the great Venetian masterpieces are as brilliant to-day—or nearly so—as when painted over 300 years ago. Sometimes the painted canvas, instead of being mounted on a stretcher, is "glued" to the wall by the use of thick white lead and oil. This method is called "marouflage" by the

French. It can only be used upon walls absolutely protected from dampness.

Two other processes deserve mention, having been used with some success in Germany and England respectively: *water-glass* and *spirit fresco*. The first requires special preparation of the wall-plastering, which is then primed with a thin coat of lime mixed with a special preparation made in Germany, and when dry is successively treated with ferrosilicic acid and two coats of water-glass (potassium silicate). The colors, specially made for this process, are laid on with water, and the finished painting when dry is sprayed with a fixative. It is said to be ill adapted to very damp climates, but has been successfully used, even for out-door wall-paintings, in Paris as well as in Germany. The "spirit fresco" process invented by Gambier Parry and employed by him in the House of Parliament, makes use of wax and certain gums, melted and dissolved in turpentine, as a medium both for sizing the plaster and for carrying the pigment. The wall, thus sized, is primed with white lead and gilder's whitening, and when dry can be painted upon with colors mixed with the medium, as if with oils. The painting can thus be corrected and touched up without danger, and the result appears to be satisfactory as to permanence.

**Exterior Mural Painting.**—The Egyptians, Greeks and Pompeiians, all executed painted decorations on walls exposed to the weather. In dry climates like those of Egypt, Greece and southern Italy, tempera painting upon carefully prepared stucco is fairly durable. Modern efforts to produce such durable out-of-doors paintings on plastered walls have rarely been successful. Hittorff's decorative paintings on the façade of Saint Vincent de Paule in Paris (1846), quickly faded and peeled, although sheltered by a portico. Kaulbach's great exterior "frescoes" on the New Pinacothek at Munich have fared better; they were presumably executed in water-glass. The danger to such paintings lies not merely in alternations of dry and damp, heat and frost, but also in the acid fumes from factories, coal-smoke and gas-works in modern cities, so that ceramic tiles and mosaic are now generally preferred as the means for color and pictorial effects on the exteriors of buildings. The Germans, it is true, frequently paint ornamental designs on their stuccoed façades, but these decorations have to be periodically renewed. No really successful process has ever been devised for painting directly on stone or marble, exposed to the weather. The ancients always covered even marble surfaces with a thin coating of very fine lime stucco, sometimes called "mastic," before applying their polychromatic decorations.

**Historical Summary.**—The articles INTERIOR DECORATION and PAINTING summarize briefly from different points of view the general history of which that of mural painting is a part. From these the reader may gather some idea of its progress from the prehistoric cave paintings through the Egyptian and Greek civilizations, the brilliant and fantastic Pompeian and Roman developments, and the solemn religious representations of the early Christian and Byzantine churches, to its partial

eclipse, outside of Italy, in the Gothic period. It was largely displaced in Byzantine art by the more brilliant art of mosaic, and in the Gothic period by that of stained glass, although the painting of conventional patterns on walls, columns and vaults never entirely ceased. It was in Italy, pre-eminently the land of color-decoration, that mural painting was revived in the 13th century by Cimabue, and carried to a marvelous perfection in the 14th century by Giotto and his followers, in the church of Saint Francis at Assisi, the Arena Chapel at Padua and the churches of Santa Croce and Santa Maria Novella at Florence. Another school was early developed in Sienna, and the Tuscan artists were widely employed even in distant cities. In these works, which were anticipatory of the Renaissance, an effort after realism took the place of the Byzantine character of conventional formality of the earlier artists. With the 15th century other "schools" (i.e., styles of painting led by one or more great artists and their followers) developed in northern Italy, in Umbria, Rome and later in Venice. The human body was studied; artists painted from models; an increasing mastery of light-and-shade and of perspective made possible a corresponding increase in realism. The earlier pictures symbolized or suggested facts and events; the later ones show the artists' effort to picture a scene as he imagined it would have appeared to an actual spectator. This completely changed the character of all mural painting; the flat wall or ceiling or curved vault was more and more ignored, and the distinction between mural decoration, in its strictest sense, and easel pictures painted merely to fit a given space, was less and less insisted on. Distance, perspective, relief and living action were more and more perfectly represented. But the decorative sense was never lost and the grandeur of the composition, its harmony of line and of color, and the absolute beauty of the result, are in many cases so admirable that one cares not at all to think about the wall or the vault. The highest development of this art in fresco was reached in Rome in the first half of the 16th century, especially in the Vatican. For majesty and solemn significance the paintings in the Sistine Chapel are unapproached; for richness and splendor those of Raphael in the Stanze, especially the Camera della Segnatura, are unsurpassed. For decorations of a lighter sort, Raphael in the Vatican Loggie, and with his pupils in the Farnesina Palace and the Villa Madama and Giulio Romano at Mantua, revived the old Roman practice of combining mural painting with delicate stucco-relief. In Venice the art of painting in oils received its most brilliant development as applied to the decoration of walls and ceilings at the hands of Titian, Paolo Veronese and Tintoretto in the Ducal Palace. Churches throughout Italy were made splendid with frescoed vaults and painted ceilings. The art declined after 1600, but many brilliant works in both mediums were still executed, and Tiepolo (1693-1770) in Venice, Würzburg and Madrid, temporarily revived the art with paintings of a marvelous *bravura* of conception and execution.

In modern times the French have led in mural painting; no considerable public building is erected without providing for interior

mural paintings by the greatest artists (Opera House by Baudry; Hôtel de Ville by various artists; Sorbonne and Panthéon by Puvis de Chavannes and others). In England there has also been a notable revival in the last 50 years; men like Gambier Parry, Cope, Dice, Lord Leighton, Sir E. J. Poynter, and of late especially Frank Brangwyn, have executed notable decorations in fresco, spirit fresco and oils in both public and private buildings.

In the United States previous to 1876 there was no mural painting worthy of the name, though in the National Capitol a group of second-rate Italian painters had for years been employed in decorating the dome. In 1876 Mr. John LaFarge was commissioned to decorate the interior of Trinity Church, Boston, and gathered about him a group of young artists to assist him, many of whom later reached distinction. This was the first work of American artists in this field, and for many years thereafter it remained almost alone. But in 1891-93 for the Columbian Exhibition at Chicago a number of artists, now well known, were employed to paint decorative compositions in the various buildings, and a few years later, in the Boston Public Library and the Congressional Library at Washington, more inspiring opportunities were given to artists like E. A. Abbey, J. S. Sargent, E. H. Blashfield, Kenyon Cox, Elihu Vedder, Gari Melchers, W. deL. Dodge, W. H. Low, H. Walker, E. Simmons and others, for permanent and monumentally important works. Since then such opportunities have been multiplied tenfold in State capitols, courthouses, libraries, theatres, hotels and private houses, and the number and the skill of American mural painters have both increased greatly. See articles INTERIOR DECORATION and PAINTING, also those on particular phases or styles of art and on particular artists, e.g., GIOTTO, MICHELANGELO, PERUGINO, RAPHAEL, TIEPOLO, TITIAN, etc.

**Bibliography.**—The best general accounts of the art of mural painting are by F. Crowninshield, 'Mural Painting' (Boston 1887), and A. L. Baldry, 'Modern Mural Decoration' (London 1902). For original documents on historic methods and processes, Mrs. Merrifield, 'The Arts of Painting' (London 1849). For early mediæval painting, N. H. J. Westlake, 'History of Design in Mural Painting . . . to the 12th Century' (London 1915). Consult also W. and G. Audsley, 'La Peinture murale décorative dans le style du moyen-âge' (Paris 1881); J. D. Crace, 'The Art of Colour Decoration' (London 1912); P. Gélis-Didot, 'La Peinture décorative en France' (Paris, n.d.); L. Gruner, 'Fresco Decorations and Stuccoes of the 15th and 16th Centuries in Italy' (London 1854); J. I. Hittorff, 'Le Temple d'Empédoce . . . ou l'architecture polychrome' (Paris 1851), and for American work, E. H. Blashfield, 'Mural Painting in America' (New York 1913), and in S. Isham, 'The History of American Painting' (chapter XXV, an excellent brief account of mural painting in America). See also the bibliographies under INTERIOR DECORATION and PAINTING.

ALFRED D. F. HAMLIN,  
*Professor History of Architecture, Columbia University.*

**MURANO**, moo-rā'nō, Italy, town in the province Venice and situated on an island in its

lagoons, one and a half miles north of Venice. It contains the very ancient basilica, San Donato Cathedral, which was repaired as early as the 12th century; a 16th century Renaissance church (San Pietro Martire) with its altar painting by Bellini. The town has for centuries been world-renowned for its glass industry (see GLASS), the wonderfully artistic delicate blown-glass ware being highly valued in the collections of connoisseurs. It also has a glass-industries museum. The noted Venetian pearls also are manufactured here. Consult Molmenti, 'Le isole della Laguna Veneta' (Venice 1895).

**MURAT**, mü-rä, **Joachim**, French marshal and some-time king of Naples: b. Bastide, Lot, France, 25 March 1771; d. Pizzo, Calabria, Italy, 13 Oct. 1815. He was the son of a prosperous innkeeper of La-Bastide-Fortunière, near Cahors, France, and had a remarkable career. While studying for the priesthood at Toulouse he enlisted in a cavalry regiment but was soon dismissed for insubordination. He served in the constitutional guard of Louis XVI; then entered the 12th regiment of mounted chasseurs and rose by his zealous Jacobinism to the rank of lieutenant-colonel. He attached himself to Napoleon in 1795, and followed him to Italy and to Egypt. In these campaigns he frequently distinguished himself, and in 1799 Napoleon appointed him general of division. He clung close to the great leader and returned to France with him from the disastrous Egyptian campaign. At a time when everything depended on prompt action he rendered Napoleon most valuable service by dispersing the Council of Five Hundred at Saint Cloud, on the memorable 18th Brumaire. In gratitude and as a reward Napoleon entrusted him with the command of the Consular Guard, and shortly after (20 Jan. 1800) gave him his youngest sister, Caroline, in marriage.

Murat had command of the cavalry at the battle of Marengo and expelled the Neapolitans from the Papal States. In 1803 he was made a member of the *Corps Legislatif*, and in 1804 was the governor of Paris. On the establishment of the Empire Murat became one of the popular idols, and was showered with honors. He was made marshal of the empire, grand-admiral, and prince of the imperial house. His services in the campaign of 1805 against Austria, in which he entered Vienna at the head of the army, were rewarded in 1806 with the grand-duchy of Cleves and Berg. He participated in the battles of Austerlitz, Jena, Eylau and Friedland. In the war of 1806 with Prussia, and of 1807 with Russia, he commanded the cavalry, and in 1808 he commanded the French army which occupied Madrid, and quelled the insurrection there in May. He expected to receive the crown of Spain, as Charles IV had invested him with royal authority; but Napoleon, who destined Spain for his brother Joseph, placed him on the throne of Naples, 15 July 1808. He then took the title of Joachim I. Ferdinand IV (q.v.), however, continued to rule in Sicily under English protection. Murat proved a beneficent king and instituted some reforms, but he was, after all, but the tool of Napoleon. He shared the hardships and reverses in the disastrous Russian campaign of 1812, and returned to Naples discouraged and discontented. In 1813 he again fought for Na-

oleon, whose cause he deserted after the battle of Leipzig. He entered into a treaty with England and Austria in 1814 which guaranteed him his throne on condition that he would join the coalition against Napoleon. He pretended to keep this treaty by attacking Eugène Beauharnais in a half-hearted manner. He took up arms again in 1815 for Napoleon; but being defeated by Generals Neipperg and Bianchi he was forced to leave Italy, and took refuge in Toulon. His offers of aid were spurned by Napoleon. After the overthrow of Napoleon he escaped to Corsica, declining the offer of an asylum in Austria which was made to him by Metternich, and set sail for the Neapolitan territory with a view to the recovery of his kingdom. He foolhardily landed at Pizzo on 8 October, but was immediately captured, tried by court-martial, condemned and shot. Murat was vain, unstable and full of ambition. As a cavalry leader his dashing bravery inspired his men with almost superhuman courage. As king, he proved himself sincerely eager to initiate genuine reforms, and did much to abolish banditry. Consult Attridge, A. H., 'Joachim Murat' (New York 1911); Espitalier, A., 'Napoleon and King Murat, 1808-15' (New York 1911); Helfert, 'Joachim Murat, seine letzten Kämpfe und seine Ende' (Vienna 1878); Johnston, C. H. L., 'Famous Cavalry Leaders' (Boston 1908); Johnston, R. M., 'Napoleonic Empire in Southern Italy' (2 vols., New York 1904); Lumbroso, A., 'Correspondance de Joachim Murat' (Milan 1899); Murat, Count, 'Murat, lieutenant de l'empereur en Espagne' (Paris 1897); Romano, G., 'Ricordi muratiani' (Pavia 1890); Sorel, A., 'L'Europe et la révolution française' (8 vols., Paris 1885-92).

**MURAT**, Napoleon Achille, French American author: b. Paris, 21 Jan. 1801; d. Wasceissa, Leon County, Fla., 15 April 1847. He was the son of Joachim Murat, king of Naples, and before his father's overthrow bore the title of Prince of the Two Sicilies. When his father lost the throne he sought refuge in Austria, where he received his education. In 1821 he came to the United States, and after an extended tour through the country bought a large estate and settled near Tallahassee, Fla., where he devoted himself to farming and literary work; he also gave largely to and was active in philanthropic enterprises. He became a United States citizen, and in 1824 was made alderman of the city of Tallahassee, in 1825 mayor and in 1826 postmaster. He accompanied Lafayette during most of his visit to the United States, and at that time was introduced to Catharina Dudley, a grandniece of Washington, whom he afterward married. He refused many offers of political advancement, and lived quietly on his estate. In 1828 he published in the Paris *Revue Trimestrielle* a series of letters on political parties in the United States, which were later published as 'Lettres d'un Citoyen des Etats Unis à ses Amis d'Europe'; in 1838 he published 'Esquisses morales et politiques sur les Etats Unis d'Amérique'; and 'Exposition des Principes du Gouvernement républicain tel qu'il a été perfectionné en Amérique' (Exposition of the Principles of Republican Government as Perfected in America). This latter work was very popular

among those of republican sympathies in Europe, was translated into several different languages and passed through over 50 editions. Consult MacConnell, 'The Prince and Princess Achille Murat in Florida' (*Century Magazine*, New York 1893).

**MURAT, Napoléon Lucien Charles**, PRINCE OF PONTE CORVO, French politician, second son of Joachim Murat: b. Milan, 16 May 1803; d. Paris, 10 April 1878. He left Italy for Austria with his mother in 1815; started for the United States in 1824 to join his uncle Joseph, but was shipwrecked on the Spanish coast, and held prisoner for a time; arrived in Boston in 1825; and in 1827 married an heiress of Bordentown, N. J., Georgina Fraser, who was soon afterward reduced to school teaching for her living. Murat returned to Paris in 1848, sat in the Constitutional Assembly and in the Legislative Assembly (1849), was Minister to Turin (1849-50), had his debts paid and received a pension of \$30,000 a year under Napoleon III, and in 1859-60 made a feeble claim to the crown of Naples, but received no support from France. His vote in the Senate, where he sat from 1852 to 1870, for the temporal power of the Pope, alienated from him the French Freemasons, whose grandmaster he had formerly been. He retired to private life after the revolution of 4 Sept. 1870.

**MURATORIAN FRAGMENT**, or **CANON OF MURATORI**, a fragment from an ancient Bible treatise discovered in the Ambrosian Library at Milan by Lodovico A. Muratori and published (1740) in his 'Antiquitates italicæ.' It contains an imperfect list of the books in the New Testament, and is considered highly important as testimony of at least a list of some of the works considered canonical at the time of writing, which is supposed to be late in the 2d century. The much-damaged documentary fragment is in barbaric Latin, probably translated from the Greek. The books are named in their order and start with mention of the Gospel of Saint Mark on its first line which is broken and probably contained mention of Matthew as Saint Luke's Gospel is mentioned as third. Saint John, the Acts, 13 epistles of Saint Paul are cited (omitting Epistle to the Hebrews), the Revelation of John, Jude, two epistles of John (James is omitted, also Peter), but the Apocalypse part of John and that of Peter are accepted, as is also Wisdom of Solomon as being written by his friends. A translation is to be found in H. W. Gwatkins, 'Selections from Early Christian Writers' (New York 1893) and Lietzmann's 'Kleine Texte für theologische Vorlesungen, No 1' (Bonn 1902). Consult Kuhn, 'Das muratorische Fragment' (Zürich 1892); Tregelles, 'Canon Muritorianus' (Oxford 1867).

**MURAVIEFF**, moo-rä-vē-ěf', Russian noble family, originally settled in the grand-duchy of Moscow, but in 1488 receiving from Ivan Vassilievitch holdings in Novgorod. Its chief members are NIKOLAI JEROFEYEVITCH, d. Montpellier 1770, governor of Livonia and author of the first Russian algebra. MIKHAIL NIKITICH, b. Smolensk, 25 Oct. 1757; d. Saint Petersburg, 29 July 1807; was chosen tutor to the grand-dukes Alexander and Konstantin in 1785, rector of the University of Moscow

(1796), and Secretary of State to the Ministry of Public Instruction (1801); and wrote a manual of ethics, which is classic in Russia (1810, 1815). NIKOLAI NIKOLAIEVITCH, son of the governor of Livonia: b. Riga, 1768; d. Moscow, 1 Sept. 1840; was educated at Strassburg; entered the navy 1788; was captured in 1790; was transferred to the army in 1796; and from 1797 to 1823, with the exception of service against Napoleon in 1812-14, he was at the head of a private military school near Moscow, which was bought by the government in 1816. His son, ALEXANDER NIKOLAIEVITCH, b. 1792; d. Moscow, 1864; was sent to Siberia for his part in the conspiracy of 1825; was pardoned; served in the Crimean War and became major-general; and as governor of Nijni Novgorod did much for the abolition of serfdom. Another son, NIKOLAI NIKOLAIEVITCH, b. Saint Petersburg, 1793; d. there, 4 Nov. 1866; entered the army at 17; served in the Caucasus; was sent to Khiva 1819; distinguished himself in the war with Turkey, 1828-29, and in the Polish campaign, 1831; in 1832 treated with Mehemet Ali; was disgraced and retired in 1838, but reinstated in 1848; and in 1855 commanded the army in the Caucasus, taking Kars. He wrote a valuable book about his travels in Khiva (1822), and on the campaign in the Caucasus in 1855 (1876). His brother, MIKHAIL NIKOLAIEVITCH, b. 1795; d. Syrez, near Luga, 10 Sept. 1866; fought against France (1812-13); took part in Decembrist uprising and was jailed for five months; became major-general in 1830; was military governor of Grodno; was a member of the Council of State, 1850-62; opposed the emancipation of the serfs; used such cruelty in putting down a student rising in 1861 that he was forced to resign; but in 1863 was sent to Wilna as governor-general, and won from the Poles the name of the Hanger or Executioner by his pitiless severity; and in 1866 was president of the commission which examined Karakasoff, who attempted to assassinate Alexander II. His memoirs were published by his grandson, MIKHAIL NIKOLAIEVITCH, b. 7 April 1845; d. 21 June 1900; Ambassador to Berlin (1885), to Copenhagen (1893); and from 1897 to his death Foreign Minister. He did much to solve the Cretan question, published the invitation to The Hague Peace Conference (1898), and forwarded Russia's interests in China. Another NIKOLAI NIKOLAIEVITCH, COUNT MURAVIEFF AMURSKY, b. Saint Petersburg, 1809; d. Paris, 19 Nov. 1881; fought in the war with Turkey, 1828-29; became governor-general of eastern Siberia in 1847; in 1858 concluded the Treaty of Aigun with China, by which Amur was ceded to Russia, and thus won the title Amursky; and in 1859 arranged a treaty with Japan at Yeddo. The last 20 years of his life were spent in Paris. The Muravieff-Apostol branch of the family, so called because of its intermarriage with that of Apostol, a Cossack hetman, is most prominently represented by IVAN (1769-1851), who translated Aristophanes, Horace, Sheridan, etc., into Russian; and by his son SERGEI (1796-1826), who took part in the conspiracy of 1825 and was executed in Saint Petersburg.

**MURCHISON**, mēr'ki-sōn, SIR Roderick Impey, Scottish geologist: b. Tarradale, Ross,

Scotland, 19 Feb. 1792; d. London, 22 Oct. 1871. He was educated at the military college in Great Marlow and at the University of Edinburgh; entered the army in 1807 and served under Wellington in the Peninsular campaign, but retired from the army with the rank of captain of dragoons in 1815. He then took up the study of science at the advice of Sir Humphry Davy and spent years in scientific investigations, particularly in that of geology. In 1825 he became a member of the Geological Society of London, of which he was president in 1831-32 and in 1842-43. His investigations extended through France, England and Wales and he reclassified Palæozoic rocks, giving to his new system the name Silurian in 1835. He also identified the Devonian system. In 1841 he was commissioned by Emperor Nicholas to make a geological survey of Russia and was engaged in that work until 1844, making discoveries which enabled him to present to the scientific world the Permian system. He was one of the founders of the British Association for the Advancement of Science and presided over it in 1846. He was several times elected president of the Royal Geographical Society and from 1862 until his death was continuously re-elected. In 1855 he was appointed director of the British Geological Survey. He was knighted in 1846, became a knight commander of the bath in 1853 and a baronet in 1863. The Emperor of Russia conferred on him the grand crosses of Saint Anna and of Saint Stanislaus. He published 'Geology of Cheltenham' (1834); 'The Silurian System' (1839); 'Geology of Russia in Europe and in the Ural Mountains' (1845); 'Geological Atlas of Europe' (1856), etc. Consult Geikie, 'Memoir of Sir Frederick Murchison' (1875).

**MURCHISONITE**, a flesh-red variety of the mineral orthoclase, which exhibits golden-yellow reflections when viewed from certain directions. It occurs at Dawlish and Exeter, England, and is named for its discoverer, Sir Roderick I. Murchison.

**MURCIA**, mēr'shī-ā (Sp. moor'thē-ā), Spain, the capital of the ancient kingdom and modern province of same name, 30 miles northwest of Cartagena, on the Segura, which divides the town into two unequal portions, connected by a handsome bridge. The city is surrounded by a brick wall and is entered by three principal gates. The streets are generally broad, straight and well paved. Among the public buildings the most important is the cathedral, its principal façade a fine combination of Corinthian and composite architecture. It was begun in 1353. In the plaza stands the capacious episcopal palace, built in 1752, one of the finest edifices of its class in Spain, and in close proximity to it the colleges of Saint Fulgentius and Saint Isidore, which form one range of buildings. The bishop takes his title from Cartagena, from which town the see was transferred. The other public edifices and institutions consist of the College of Saint Leander, which is an academy of music connected with the cathedral; the hospital of Saint John, with which is connected a hospital for convalescents; a house of refuge, a foundling hospital, the town-house, an institute for advanced education, a school of design, an ecclesiastical seminary, several nunneries, a bullring, two theatres,

an old Moorish granary and a good botanical garden. There are manufactures of coarse cloths and baize of different colors; of silk-stuffs, especially taffeta and plush; linens, hats, gloves, saltpeter; also silk spinning-mills, dye-works, potteries, tanneries, soap-works and about 30 flour-mills. Considerable commerce is carried on in silks and other manufactures, as well as in grain, etc. Pop. about 125,000.

**MURDER**. See HOMICIDE.

**MURDOCH**, mēr'dōk, James Edward, American actor: b. Philadelphia, Pa., 25 June 1811; d. Cincinnati, Ohio, 19 May 1893. He made his début as an actor in Philadelphia in 1829, playing Frederick in 'The Lover's Vow,' and in 1833 acted with Fanny Kemble during her American tour. In 1838 he appeared in New York as Benedick in 'Much Ado About Nothing.' He played Pythias to Edwin Forrest's Damon and in 1842 retired from the stage to study. He reappeared in New York in 1845 as Hamlet and for 15 years played with considerable success in the United States and England. During the Civil War he devoted himself to caring for the wounded soldiers and in giving entertainments for their benefit. Later he became professor of elocution at the Cincinnati College of Music. His best rôles were Hamlet, Mercutio, Benedick and Claude Melnotte, in which he had few equals. He published with William Russell 'Orthophony' (1845) and 'The Stage' (1885).

**MURDOCK**, Joseph Ballard, American rear-admiral: b. Hartford, Conn., 13 Feb. 1851. He was graduated (1870) at the United States Naval Academy, then served (1870-74) on the North and South Atlantic stations and was carrying out coast surveys from 1875-79. From 1880-1903 he was instructor of physics at the naval academy. During the Spanish-American War he was executive officer of the *Panther* and became a commander in 1901, captain in 1906, rear-admiral 1909. He commanded the *Rhode Island* in the cruise of the fleet (1907-09) around the world and was commandant at the navy yard, New York, from 1909-10, having command of the second division Atlantic fleet (1910-11), and was commander-in-chief, United States Asiatic fleet (1911-12), retiring 1913. He wrote 'Notes on Electricity and Magnetism' (1884) and contributed articles on the same subject to *Proceedings of the United States Naval Institute* and for *Van Nostrand's Magazine*, etc.

**MURDOCK**, Victor, American legislator: b. Burlingame, Kan., 18 March 1871. He was educated at the common schools and at Lewis Academy, Wichita, and became managing editor of the *Wichita Daily Eagle* (1894-1903). He was elected a Republican to the 58th Congress in 1903, re-elected for 59th to 63d Congresses (1905-15) for the 8th Kansas district and has been a member of the Federal Trade Commission since 1917. In 1918 he was appointed member of the Meat Commission of the United States government. He became an insurgent in his party and joined the Progressives and was chairman of the Progressive National Committee from 1914-16.

**MURDOCK**, William, Scottish inventor: b. Bellow Mill, near Old Cumnock, 21 Aug. 1754; d. Sycamore Hill, near Soho, 15 Nov.

**MUREX**

1 *Calcar triumphans*  
2 *Conus imperialis*  
3 *Harpa ventricosa*  
4 *Murex tenuispinus*

5 *Murex inflatus*  
6 *Fusus longicauda*  
7, 8 *Australium imperiale*

1839. He went in 1777 to Birmingham, where he obtained employment in the famous engineering establishment of Boulton and Watt, at Soho, near that town. A demand for Watt's pumping engines came from the Cornish mines and Murdock was soon sent thither to superintend the erection and fitting of these engines. In 1800 he was made manager of the works of Boulton and Watt, being afterward admitted as a partner. He retired in 1830. His invention of coal-gas lighting remains his most conspicuous achievement. He began in 1792 his experiments regarding the illuminating properties of gases produced by distilling wood, peat and coal. In 1800 he had an experimental gas apparatus in operation at Soho and in 1802 gas was employed when Soho, London, was illuminated upon the news of the Peace of Amiens. In 1803 the Boulton and Watt foundry was regularly lighted by that means. In February 1808 Murdock read before the Royal Society a paper detailing his investigations. Gas-lighting fell into the hands of promoters and in 1809 Murdock was compelled to publish a vindication of his claims in 'Letter to a Member of Parliament.' It has been asserted that he invented the steam locomotive but the three engines he made came to nothing.

**MUREX**, a genus of gasteropod mollusks typical of the family *Muricidae*, resembling the whelk; shell spiral, rough, with three or more ranges of spines simple or branched. Murices are remarkable for the beauty and variety of their spines. They were in high esteem from the earliest ages on account of the purple dye that some of them yielded. *M. pomum*, which is not so spiny as some of its congeners, is found on our coasts from Cape Hatteras to Texas. It is two to three inches long. The oyster-drill (*Urosalpinx cinerea*), which uses its buccal ribbon to bore into oyster shells, is closely allied to Murex. See PURPLE SHELL.

**MUREXIDE**, in chemistry, the hydrogen-ammonium salt of a hypothetical acid called "purpuric acid," the acid itself not being known in the free state. Murexide has the chemical formula  $C_8H_4N_2O_6(NH_4)_2$ ,  $H_2O$ , and about 1855 it was largely used as a dye. The colors that it gives are fast so far as light is concerned, and are quite brilliant; but they tarnish quickly when exposed to sulphur dioxide gas, and hence are more or less fugitive in houses where coal gas is burned. As a dye, murexide has now been replaced by coal-tar colors (q.v.). It may be prepared by oxidizing a mixture of uric acid with nitric acid, evaporating to dryness and moistening the reddish residue with ammonia or ammonium carbonate. The beautiful purple red of murexide is at once developed. (This reaction is used in urine analysis as a test for uric acid). Murexide crystallizes in short four-sided prisms, brownish red in color with green and yellow iridescence, dissolves in water to a beautiful purple solution, the color changing to blue upon the addition of potash. The commercial supply of murexide, when it was used as a dye, was prepared from the uric acid of guano. A dye similar to murexide, and perhaps identical with it, was obtained by the ancients from a gland of the murex, or "purplefish," whence the name "murexide."

**MURFREE**, mèr'frê, Mary Noailles ("CHARLES EGBERT CRADDOCK"), American novelist: b. Murfreesboro, Tenn., 24 Jan. 1850. Her early years were spent in Murfreesboro to which after some years in Saint Louis she returned in 1890 and her careful studies of life in the mountains of Tennessee, where her summers have usually been passed, are reflected in nearly all of her books. Her earliest short story appeared in the *Atlantic Monthly* in 1878 and was followed by others over the signature "Charles Egbert Craddock." Until her identity was revealed in 1885 they were supposed to be the work of a masculine writer. She has published 'In the Tennessee Mountains' (1884); 'The Prophet of the Great Smoky Mountains' (1885); 'Down the Ravine' (1885); 'The Story of Keedon Bluffs' (1887); 'His Vanished Star' (1894); 'The Phantoms of the Footbridge' (1895); 'The Mystery of Witchface Mountain' (1895); 'The Young Mountaineers' (1897); 'The Story of Old Fort Loudon' (1899); 'A Sceptre of Power' (1903); 'Storm Centre' (1905); 'The Windfall' (1907); 'The Fair Mississippian' (1908); 'The Story of Duciehurst' (1914). See IN THE TENNESSEE MOUNTAINS.

**MURFREESBORO**, mèr'frêz-bür-ò, Tenn., city, county-seat of Rutherford County, on the Nashville, Cincinnati and Saint Louis Railroad, about 33 miles southeast of Nashville. The first settlement was made in 1811 and in 1817 it was incorporated. It was the capital of the State from 1819 to 1826. It has had a commission government since 1915. In Murfreesboro are the Middle Tennessee State Normal School and the Tennessee College for Young Ladies (Baptist), founded in 1906. It is in an agricultural section in which cotton is one of the principal products. The city has a number of manufacturing establishments, chief of which are flour and lumber mills, tanneries cotton gins, cotton compresses, machine-shops, red cedar ware factories and carriage factories. On the site of the Stone River battlefield, near the city, is a national cemetery which contains the graves of 6,150 soldiers, 2,333 of unknown dead. (See STONE RIVER, BATTLE OF). It is the birthplace of the author, Mary Noailles Murfree (q.v.). Pop. about 4,679.

**MURGER**, Henri, òn-rê mür-zhâr, French poet and novelist: b. Paris, 24 March 1822; d. there, 28 Jan. 1861. He entered a lawyer's office, but left it and was for a time secretary to the Russian Count Tolstoi. Of his career in 1838-48 almost nothing is known. He was a member of an informal club or clique of unconventional and impecunious young artists and authors, which was named "Bohemia" and the associates "Bohemians"—a name famous in general literary history. He contributed a great mass of "copy" to numerous periodicals, and at last made a reputation by his 'Scènes de la vie de bohème' in which he appears as Rodolphe (1848). This was dramatized in 1849, in collaboration with Théodore Barrière, and served as the basis of Puccini's opera, 'La Bohème' (1898). He then found sufficient to do, wrote dramas for the Luxembourg Theatre and articles for the *Revue des Deux Mondes*. Other works are 'Scènes de la vie de jeunesse' (1851); 'Le Pays Latin' (1852); 'Le dernier

rendezvous' (1852); and 'Les buveurs d'eau' (1854). Many of his lyrics are very beautiful and have been translated by Andrew Lang in 'Ballads and Lyrics of Old France' (London 1872), and his prose works, especially his masterpiece, are characterized by rare humor and pathos. His general influence, however, was unhealthy, and he personally sank into the depths of dissipation and died in a charity hospital. When a monument was lately erected to his memory there was a considerable amount of protest. Consult the appreciation in Saintsbury's 'Essays on French Novelists' (1891) and that by his fellow Bohemians in 'Les nuits d'hiver' (Paris 1862). See **BOHEME**, LA.

**MURGHAB**, moor-gäb', a river of central Asia, which rises on the northern frontier of Afghanistan, in the Paropamisus Mountains, and after a northwestward course of nearly 400 miles loses itself in the desert sands surrounding the oasis of Merv.

**MURIACITE**. Same as **ANHYDRITE** (q.v.).

**MURIATIC ACID**. See **HYDROCHLORIC ACID**.

**MURICHI**, or **MORICHI**, a South American palm of the genus *Mauritia* (*M. flexuosa*), also known as ita-palm; it is nearly related to the *buriti* (q.v.) or wine-palm. These palms reach a height of 100 to 150 feet and grow along the Orinoco River, forming great forests near its mouth. It furnishes to the Indians of that region almost everything; and during much of the year, when the lowlands adjacent to the river are flooded, they dwell among its branches, like monkeys, for want of dry land upon which to rest or travel. "At the time of the inundations," says Humboldt, "the tufts of the fanleaved murichi present the appearance of a forest issuing from the bosom of the waters. The navigator, traversing at night the branches of the Orinoco delta, sees with surprise the crowns of these palms lighted up by large fires. These are the habitations of the Guaranis suspended from the trunks of the trees. These people stretch mats in the air, fill them with earth and on this bed of wet clay light what fires they require for household purposes. For ages they have owed their liberty and political independence to the treacherous and miry nature of their soil, which they traverse in seasons of drought and over which they alone know how to pass in safety; to their isolation in the delta of the Orinoco, and to their living in the trees." Consult von Humboldt, 'Voyage aux Régions Equinoxiales,' Vol. VIII (1807-27).

**MURIDÆ**, the family of mice and rats (qq.v.).

**MURILLO**, mü-ril'ō (Sp. moo-rēl'yō), **Bartolomé Estéban**, bār-tō'lō-mā ās-tā'bān, Spanish painter: b. Seville, 31 Dec. 1617; d. there, 3 April 1682. He began his art education under Juan del Castillo, and in 1642 sought wider experience in Madrid, where his townsman Velasquez was enjoying a brilliant career. By the latter he was dissuaded from a contemplated visit to Rome and secured facilities for studying in the Royal Galleries and in the Escorial. Here he placed himself for three years under the inspiration of Ribera, Titian, Rubens, Vandyke and Velasquez himself. In 1645 he returned to Seville where he undertook

to paint 11 separate pictures for the cloister of Saint Francis in illustration of Franciscan history. These works proved the foundation of his renown. The principal pieces of this series are 'Saint James Distributing Alms' (now in the Academy Fernando, Madrid); the so-called 'Angel Piece' (in the Louvre); 'The Death of Saint Clara' (in the Dresden Gallery). These strike the note of the early Seville school, being warm in tone, and exhibit Murillo as drawing his types of beauty from the lower orders of the Spanish people. Of even more transparent coloring are his 'Saint Leander and Isidore' in the sacristy of the cathedral at Madrid; 'The Birth of Mary' (in the Louvre); and the 'Vision of Saint Anthony' (in Seville Cathedral, 1656); both of these latter belong to the middle period of his artistic development. In 1665 he began his four pictures for the church of Santa Maria pa Blanca, among them being his 'Church Triumphant'; 'The Immaculate Conception' (in the Louvre); and 'The Foundation of the Church of Santa Maria Maggiore at Rome' (in the Madrid Academy). In 1668 he painted his 'Madonna Hovering in the Clouds Surrounded by Eight Saints of Seville' (in the chapter-house of Seville Cathedral); and about 1670 his 'Holy Family with Elizabeth and The Infant Baptist' (in the Louvre). His most brilliant period was between 1670 and 1680; and in 1674 he had completed the eight vast pictures illustrating the 'Corporal Works of Mercy.' These were intended for the church of the Caridad Hospital, and are remarkable for splendor of coloring and strength of design; the faces are lifelike in expression and the composition and perspective faultless. His 'Saint Elizabeth of Hungary Nursing the Sick' (in the Madrid Museum) belongs to this period. In 1676 he executed 20 pictures for the Capuchin monastery at Seville, 17 of which are now in the local museum. It was at this time he painted the famous 'Immaculate Conception' which Maréchal Soult took to France and sold to the nation for 615,000 francs. It is now in the Louvre, and is the work by which this painter is most popularly known. While Murillo was engaged at Cadiz in painting 'The Betrothal of Saint Catherine' for the high altar of the Capuchin Church, he fell from the scaffolding and died as the result of his injuries. The work was completed by his pupil Osorio with no particular success.

Murillo left about 400 pictures, including his devotional paintings and the many representations of the 'Immaculate Conception,' one of his favorite and characteristic subjects. His most important works in the United States are the altar-piece in the cathedral of Saint Peter's at Cincinnati and 'Gallegas at the Window' in the Widener collection, Philadelphia. He was the greatest of Spanish religious painters because his Madonnas are real Spanish women and only raised by the magic of his brush into sainthood or apotheosis. But he was a great genre painter also. He knew the gypsies and beggars of Spain as well as he knew the saints. He could paint landscape and portrait, flowers and fruit, maidens and children of that Seville which he loved so well and never left for France or Italy. Unswayed by the influence of the dazzling schools of Tuscany or Flanders

he has confined himself to Spanish faces, to Spanish atmosphere and scenery, and has realized a manner and color of his own. If he sacrificed in this way anything of vigor or variety he gained far more in originality, sincerity, verisimilitude and an individuality which is truly national.

Consult Calvert, A. F., 'Murillo, a biography and appreciation' (New York 1907); Hurl, E. M., 'Murillo' (Boston 1901); Tubino, F. M., 'Murillo, su epoca, su vida, sus quadros' (Seville 1864); Lefort, P., 'Murillo et ses élèves' (Paris 1892).

**MURLIN, Lemuel Herbert**, American clergyman: b. Mercer County, Ohio, 16 Nov. 1861. He was graduated (1891) at De Pauw University and studied (1896) at the University of Pennsylvania and (1897) at Clark University, then in Europe (1898). He received the degree B.D. at Garrett Biblical Institute (1899). He was teacher at the public schools and in Fort Wayne College (1877-86), pastor of churches in Fort Wayne, Knightsville and Vincennes, Ind. (1886-94). From 1894-1911 he was president of Baker University, Baldwin, Kan., and president of Boston, Mass., University from 1911. During 1909 and 1911 he was acting pastor of the American Church at Berlin. He has been a member of the General Conferences of the Methodist Episcopal Church in 1900, 1904 and 1916 and of the Ecumenical Conferences at London (1901) and Toronto (1911).

**MURMANSK**, a new town in the extreme northwest of Russia, on the Kola Peninsula and the northern terminus of the Kola-Petrograd Railroad. Situated on a sheltered, ice-free harbor on the Murman Coast, the town has sprung into existence and importance during the European War. In appearance it resembles a Klondike mining camp; its position, 150 miles north of the Arctic Circle, gives it a severe winter temperature of 30° below zero. The population, stated to be about 7,000 (1918), live in roughly-built frame shacks and are largely composed of refugees from Finland as well as Russia. With the defection of Russia as an active participant in the war, the Allies ceased using Archangel as a port for unloading provisions and war materials and as the only line of communication with the former Russian government. To this circumstance is due the rise of Murmansk. With the spreading anarchy promoted by the Bolsheviks and the German encroachments on Russian territory during 1917 and 1918, the town grew in importance and value as a strategical point to the Allies. In the absence of an effective government in Russia, the isolated position of Murmansk and its long distance from the centres of turmoil enabled the Allies to keep in unofficial communication with the country. According to an American correspondent, the Murmansk Bolsheviks lived on excellent terms with the Allied naval and military men, owing to the fact that they derived nearly all their supplies from British and American vessels. Money was stated to be of little value; food, shoes, clothing and tobacco could purchase any local product, such as furs and live reindeer. See RUSSIA; WAR, EUROPEAN.

**MURNER**, moor'nēr, Thomas, German satirist and opponent of the Reformation: b.

Strassburg, 24 Dec. 1475; d. about 1536. He studied at the principal universities of Europe, devoting himself particularly to theology and philosophy, and early gained a reputation for ability, marred however by a quarrelsome disposition. He led an unsteady life, preaching for some time at Frankfort-on-the-Main and other places, but incurring generally the displeasure of his congregations by the coarse personalities of his sermons, and was successively expelled from Freiburg, Treve and Venice. He became one of the most virulent opponents of the Reformation. Some of his writings against the Reformation were burned by order of the Diet of Worms; and he was compelled to flee to Switzerland, whence he was in time likewise expelled. The latter part of his history is not known. In 1506 he had been crowned as poet laureate by the Emperor Maximilian; and his 'Narrenbeschwörung' (1512), of which his 'Der Schelmenzunft' (1516) may be regarded as a continuation, is one of the most remarkable imitations of Sebastian Brant's celebrated satirical poem entitled 'Narrenschiff.' He wrote 'Chartiludium logice,' etc. (1507), and other Latin works; prepared a German version of Virgil and other translations; and was also regarded as the editor of 'Eulenspiegel.' But he is chiefly remembered by his writings against Luther and the Reformation. His most celebrated satirical work is entitled 'Von dem grossen Lutherischen Narren' (1522; new ed., 1848). Consult Goedeke, 'Murners Narrenbeschwörung' (1879); Kawerau, 'Thomas Murner und die Kirche des Mittelalters' (1890); Lappenburg, 'Murners Eulenspiegel' (1854); Ries, W., 'Quellenstudien zu Murners satirisch-didaktischen Dichtungen' (Berlin 1890); Schatz, H., 'Stemmungen und Effekte in Murners Dichtungen' (Kiel 1909).

**MUROM**, moo'róm, Russia, town in the government of Vladimir, located on the Oka and Kovrov-Murom Rai.way. It has a cathedral, theatre, city bank, high school, etc. Among its industries are large linen weaving factories and trade in grain. This was a very important trading town in the 10th century. Its population is about 18,616.

**MURPHEY, Archibald De Bow**, American jurist: b. Caswell County, N. C., 1777; d. Hillsboro, N. C., 3 Feb. 1832. He was graduated from the University of North Carolina in 1799 and was for the three succeeding years professor of ancient languages there. He studied law and was admitted to the bar in 1802 and established a large practice. He was a member of the State senate in 1812-18 and proved himself an able legislator, advocating internal improvements and working earnestly to enlarge and improve the educational system of the State. In 1818 he was a judge of the Superior Court and in 1819-20 was a justice of the Supreme Court of North Carolina. He published 'Memoir of Improvements Contemplated and the Resources and Finances of the State' (1819); 'Reports of Cases in the Supreme Court of North Carolina in 1804-13 and 1818-19' (1821-26), etc.

**MURPHY, Arthur**, British dramatist: b. Clooniquin, near Elpin, County Roscommon, Ireland, 27 Dec. 1727; d. 18 June 1805. He was educated at the Roman Catholic College of

Saint Omer, France, and was subsequently employed in a London banking house. His first drama, which appeared in 1756, was entitled 'The Apprentice.' In 1758 appeared 'The Upholsterer,' a farce directed against politicians, which proved very successful, followed by 'The Orphan of China'; 'The Way to Keep Him'; 'All in the Wrong'; 'The Citizen'; 'The Old Maid'; 'Three Weeks after Marriage'; 'Zenobia'; 'The Grecian Daughter,' etc. At various times in his life he engaged in political controversies, and edited journals opposing Mr. Fox, the first Lord Holland and Wilkes' *North Briton*. He also edited the works of Fielding, wrote an essay on Dr. Johnson, translated Tacitus, and wrote a 'Life' of Garrick. His plays are his best performances, and some of them, including 'The Way to Keep Him' and 'Three Weeks after Marriage,' long kept the stage.

**MURPHY, Charles Francis**, American politician: b. New York, 20 June 1858. He received a public school education, and early in life began to take an interest in politics. As organizer and member of the Sylvian Club and through his fame as an athlete he gained a wide personal acquaintance. He opened a series of saloons which he held to be practically poor men's clubs. He showed decided talents as a political organizer and in 1891 became the Tammany leader of his assembly district. In 1897-1901 he was a commissioner of docks and ferries in New York, served for a time as chairman of Tammany Hall and on the retirement of Richard Croker in 1902 succeeded him as chief. In 1903 and 1905 he led his party to victory in the mayoralty campaigns, which elected George B. McClellan as mayor. In 1904 Murphy opposed the nomination of Alton B. Parker for the Presidency and in 1906 supported William R. Hearst for governor, the latter's defeat being regarded as a severe defeat for Murphy. In 1909 the Tammany Hall nominee for mayor, W. J. Gaynor, was the only successful candidate on the Democratic ticket, the Fusionists having captured the remaining offices. Many thought that this reverse would compel Murphy's retirement, but to the despair of the political prophets he continued as chief. In 1910 the election of John A. Dix to the governorship was supposed to be due to Murphy's influence with the up-State Democrats and that as a result his power had become paramount in the Democratic party throughout the State. The succeeding years brought sharp criticism to Tammany and its leader because of several scandals regarding highway and canal contracts. Boss rule now became a State issue and his opponents held up Murphy as an example of everything vicious in the boss system. This, however, came with a bad grace from Republicans, themselves the most notorious upholders of the system. In 1912 Murphy supported Wilson after the nomination of the latter although he favored Harmon and Clark in the early stages of the convention. He was a presidential elector the same year. In State politics it appears that Murphy took little part in the nomination of Sulzer; friction developed after election and Tammany was by many believed to have been the real factor in the impeachment and removal of Sulzer in 1913. The mayoralty campaign of 1913, in which Edward E. McCall was the Tammany nominee, was ex-

ceedingly bitter, and Murphy was violently assailed by the Fusionists. He remained imperturbable, however, and retained the position of chief despite the defeat that year and that in the gubernatorial contest of 1914. In 1917 the Tammany candidate for mayor, Judge Hylan, was elected by a great majority and Murphy's leadership continued unimpaired. Mr. Murphy's philanthropies are extensive, but he refuses to have his charitable activities advertised, and this side of his character is known to comparatively few persons.

**MURPHY, Francis**, American temperance evangelist: b. Wexford, Ireland, 24 April 1836; d. Los Angeles, 30 June 1907. During the Civil War he served in the Union army. In 1870, at Portland, Me., he began the organization of temperance reform clubs, which were established in all parts of the State, and of which he was the first president. He made his headquarters in Pittsburgh, Pa., where, after his first address, in 1876, the pledge was signed by 45,000 people; and before long the signatures secured throughout the United States in response to his endeavors numbered as many as 10,000,000. His labors were also carried into England with noteworthy results. During the Spanish-American War he served as chaplain in the United States army.

**MURPHY, Franklin**, American manufacturer and politician: b. Jersey City, N. J., 3 Jan. 1846. In 1856 the family removed to Newark where his father was born and which had been the home of his ancestors from its original settlement in 1656. He enlisted in the Federal army in 1862 at the age of 16 as a member of Company A, 13th New Jersey Volunteers. This regiment was assigned to the 12th, afterward the 20th, corps, which constituted a part of the Army of the Potomac and which was afterward transferred to the west, becoming part of Sherman's army in his march to Atlanta and the sea. At the close of the war he established at Newark a varnish business which has since become widely known. He began his political career in the early '80's, occupying various minor city and State offices until 1901, when he was elected governor of New Jersey for three years. His term as governor was noted for the passage of the first State primary law (not the open primary as invented later), improvement in the child labor laws and general improvement in labor legislation, a tenement-house law and a law requiring banks to pay interest on deposits of State moneys. He was chairman of the Republican State Committee for 20 years, beginning with 1892, has been a delegate to many Republican national conventions, has been member of the National Committee since 1900. He was commissioner to Paris Exposition of 1900. Mr. Murphy is a member of the Society of the Cincinnati, of the Colonial Wars and the Sons of the American Revolution, of which latter he was president-general. He was a member of the board of managers of the National Soldiers' Home, and at one time president of the board. In the National Republican Convention of 1908 he received 158 votes for Vice-President. He has been a member of the Essex County, N. J., Park Commission for 20 years, and continues actively interested in the affairs of his home city of Newark and his State.

**MURPHY, Henry Cruse**, American politician and historian: b. Brooklyn, N. Y., 5 July 1810; d. there, 1 Dec. 1882. He was graduated at Columbia in 1830, studied law, was admitted to the bar in Brooklyn, became city attorney there and in 1842 was elected mayor. In 1843 he was elected to Congress; was a delegate to the New York Constitutional Convention in 1846; and in 1847 re-entered Congress. In 1852 he was a candidate for the Democratic nomination for President. From 1857 to 1861 he served as United States Minister to Holland. He became well known as a journalist, being for some time editor of the *Brooklyn Eagle*; and through the publication of his studies in the colonial history of New York valuable documents were brought to light. He translated from the Dutch De Vries' 'Voyages from Holland to America, 1632 to 1644' (1853), and his other publications include 'Henry Hudson in Holland: Origin and Objects of the Voyage which Led to the Discovery of the Hudson River' (1859); 'Jacob Steendam, Noch Vasater' (1861); 'Anthology of the New Netherlands' (1865), and 'The Voyage of Verrazzano' (1875).

**MURPHY, John Benjamin**, American surgeon: b. Appleton, Wis., 21 Dec. 1857; d. 11 Aug. 1916. He graduated (1879) at Rush Medical College, Chicago, and practised medicine (1879-82) at Chicago, then studied (1882-84) in Germany, to resume his practice in Chicago. He was head of the department of surgery and clinical surgery at Northwestern University Medical College and chief surgeon to Mercy Hospital, but (1908) joined the United States medical corps as 1st lieutenant. He invented the anastomosis button which simplifies the technique in abdominal operations and reduces the fatalities. He has written 'Gunshot Wounds of the Abdomen'; 'Actinomyces Hominis,' he was the first in America to recognize the disease; 'Original Experimental and Clinical Research,' which illustrates the use of his anastomosis button; 'Surgery of the Stomach.' For his great services he was decorated with many honors, such as LL.D., University of Illinois. (1905). and Catholic University of America, Washington; M.Sc., University of Sheffield. England (1908), etc. He edited 'General Surgery' for the "Practical Medicine Series" from 1901.

**MURPHY, John Francis**, American painter: b. Oswego, N. Y., 11 Dec. 1853. He came to New York in 1875 and educated himself in art, giving especial attention to landscape painting. His first picture to appear in the National Academy of Design was exhibited in 1876, and since 1887 he has been a National Academician. His painting 'Tints of a Vanished Past' gained the Haligarten prize (1885). In 1887 he was awarded the Webb prize by the Society of American Artists, of which he is a member. He also received a gold medal at Charleston (1902), and in 1910 the Inness medal.

**MURPHYSBORO**, Ill., city, county-seat of Jackson County, on the Big Muddy River, and on the Mobile and Ohio, the Saint Louis Valley and the Illinois Central railroads, about 140 miles south of Springfield. It is situated in an agricultural section, and nearby are coal-fields, timber and building stone. The chief industrial establishments are foundries,

machine-shops, flour and lumber mills and brick and tile yards. There is a large trade in farm and dairy products, coal and lumber. Murphysboro has a commission form of government. Pop. 8,000.

**MURRAIN**, loosely, any widely prevailing and contagious disease among domestic animals. The term is applied to various specific disorders in different localities, but more particularly to the epizootic diseases, especially those of cattle. Still more strictly it is limited to the plague commonly known as the foot-and-mouth disease (aphthous fever), which attacks cattle and other animals, causing loss of appetite, febrile disturbance, lameness, vesicular eruptions on the feet and in the mouth, etc., with frequent complications. See ANTHRAX; CATTLE-PLAGUE; RINDERPEST.

**MURRAL**, one of the snake-headed, or walking, fishes of India (*Ophiocephalus marulius*), regarded as one of the best fresh-water table-fishes of the East. It abounds in rivers and inland waters, especially the "tanks" so numerous in Madras, and may reach a weight of 20 pounds, although usually far smaller than that. It is caught with live bait, not rising readily to a fly, and affords excellent sport to skilled anglers.

**MURRAY**, mūr'ā, Alexander, American naval officer: b. Chestertown, Md., 1765; d. Philadelphia, 6 Oct. 1821. In 1776 he received a commission in the then half-organized navy, and while waiting for sea duty entered the army, serving (1776-77) as lieutenant and captain in the 1st Maryland regiment, and participating in the actions and operations near New York. Toward the end of 1777 he was given command of the *Revenge*, with letters of marque; was captured by the British, exchanged, served with distinction on the *Trumbull*; was again captured and exchanged; then took command of a privateer, and served later on the *Alliance*. In 1798, on the reorganization of the navy, he was appointed captain and during the difficulties with France commanded the *Montezuma*. Transferred to the *Constellation*, he served in the Mediterranean during the war with Tripoli, in which he initiated actual hostilities by attacking a flotilla of the enemy. After that war he was mainly engaged in shore duty at Philadelphia until his death.

**MURRAY**, George Gilbert Aimé, British classical scholar: b. Sydney, New South Wales, 2 Jan. 1866. He was taken to England in 1877 and educated at Merchant Taylors' School, London, then studied at Saint John's College, Oxford. He was made (1888) a Fellow of New College, Oxford, and was professor of Greek at Glasgow University 1889-99. Since 1908 he has been regius professor of Greek at Oxford University. Numerous degrees have been conferred on him, as LL.D., Glasgow, D. Litt., Birmingham, D. Litt., Oxford, F.R.S.L., etc. In 1914 he was appointed trustee of the British Museum. He has written 'History of Ancient Greek Literature' (1897); 'The Foreign Policy of Sir Edward Grey' (1915); 'Rise of the Greek Epic' (1907-11); 'Four Stages of Greek Religion' (1913); 'The Rhesus of Euripides' (1913); 'The Alcestis of Euripides' (1914). He was part author of 'Liberalism and the Empire' (1900). His plays 'Carlyon

Sahib' (1899) and Andromache' (1900) have been successfully performed on the stage. Of his verse translations for which he is noted are 'Hippolytus,' 'Bacchæ,' 'Trojan Women,' 'Electra,' 'Medea.' For 'Iphigenia in Tauris,' which appeared at the Court Theatre, London, the highest comment of the critics was worthily gained. 'Trojan Women' and 'Iphigenia' have been played on the boards of American colleges and also *al fresco*.

**MURRAY, George Henry**, Canadian politician: b. Grand Narrows, Nova Scotia, 7 June 1861. He was educated in Grand Narrows and in Boston University and was admitted to the bar in 1883. He was appointed to the legislative council of Nova Scotia in 1889, but resigned in 1891, and in the same year became a member of the provincial cabinet without portfolio, under the Hon. W. S. Fielding, and in 1896 became premier and provincial secretary of Nova Scotia under a Liberal administration. He was elected to the Dominion Parliament in 1897, where he still (1917) sits.

**MURRAY, Grenville**, ("EUSTACE CLARE"), English journalist: b. 1824; d. Passy, France, 20 Dec. 1881. He was a natural son of Richard Grenville, second Duke of Buckingham. He was in the diplomatic service from 1851 to 1868, but was guilty of irregular practices, and was generally in discord with his superiors or with British residents. From 1869 he lived in France, where he was Paris correspondent of the *Fall Mall Gazette* and the *Daily News*, and an early contributor to the *Cornhill*. He was one of the ablest journalists of his time and the initiator of "yellow" methods in English newspapers, being horsewhipped by Lord Carrington in 1869 for a libel that appeared in *The Queen's Messenger*, a paper he conducted. He lived in Paris as the Comte de Rethel d'Aragon, using the title of his wife, a Spanish woman. A voluminous writer, among his works were 'The Roving Englishman,' chapters of travel (1854); 'Embassies and Foreign Courts' (1855); 'The Member for Paris' (1871); 'Young Brown' (1874); 'Turkey' (1877); 'The Russians of To-Day' (1878); 'Under the Lens: Social Photographs' (1885).

**MURRAY, James**, Scottish soldier: b. about 1725; d. 1794. He was a son of the fourth Lord Elibank, and about 1740 entered the army; came with his regiment to America in 1757; at the siege of Louisburg (1758) commanded a brigade; and in the battle on the Heights of Abraham (13 Sept. 1759) led the left wing of the army under Wolfe. In 1760 he held Quebec against superior numbers of the French, in the same year served with Amherst in the reduction of Montreal and was made governor of Quebec. From 1763 to 1766 he was governor of Canada; in 1774 became governor of Minorca; was compelled to surrender Fort Saint Philip to the French, in 1782, after a heavy siege, and upon returning to England was court-martialed and acquitted. In 1783 he was made a full general in the British army. Consult Parkman, 'Montcalm and Wolfe' (1884, 1898).

**MURRAY, James Augustus Henry**, Scottish philologist and lexicographer: b. Denholm, near Hawick, Roxburghshire, 1837; d. 26 July 1915. He was graduated B.A. of London Uni-

versity, from 1855 till 1858 was an assistant master in Hawick Grammar School, becoming in the latter year master of Hawick Academy, for a few years was foreign correspondent to the Oriental Bank in London, and from 1870 till his removal to Oxford in 1885 a master at Mill Hill School. Meantime he had become well known as a philologist. He was president of the Philological Society in 1878-80 and 1882-84. On the death of Dr. Furnival, Dr. Murray became in 1879 general editor of the 'New English Dictionary on Historical Principles,' the great work issued under the auspices of the Philological Society from the Clarendon Press, Oxford. He was assisted by a staff of from 20 to 30 editors, and thousands of volunteer assistants, who read every book published before 1500 A.D. and the principal books since that date, thus obtaining many millions of illustrative references for use in the work. He had almost completed the tenth and last volume, T to Z, when he died. His aims in connection with this vast undertaking are embodied in an address to the Philological Society in 1879. Other works by him are 'A Week among the Antiquities of Orkney' (1861); 'Dialects of the Southern Counties of Scotland' (1873); 'Synopsis of Paley's *Horæ Paulinæ*' (1872); 'The Romance and Prophecies of Thomas of Erceildoune' (1875); the article 'English Language' in the 'Encyclopædia Britannica' (9th ed.), and many papers on the archæology, natural history, geology and language of the border counties of Scotland. In 1884 he was awarded a civil list pension of £270 per annum. In 1900 he was appointed Romanes lecturer at Oxford and he was knighted in 1908.

**MURRAY, or MORAY, James Stuart**, EARL OF. See STUART, JAMES.

**MURRAY, Sir James Wolfe**, British lieutenant-general: b. 13 March 1853. He was educated at Harrow, then entered military service at Woolwich and joined (1872) the Royal Artillery. He became colonel in 1899, served (1895) in the Ashanti campaign and in Natal (1899-1900), to become (1903-04) quartermaster-general in India. He was master-general of the Ordnance from 1904-07, commanded the 9th division in India from 1907-11, then commanded in South Africa in 1914. He was created K.C.B. in 1900. From 1914-15 he was 1st Military Member of the Army Council.

**MURRAY, John**, American clergyman, founder of American Universalism: b. Alton, Hampshire, England, 10 Dec. 1741; d. Boston, Mass., 3 Sept. 1815. He was brought up in Ireland, where he joined the Methodist congregation and did some preaching, but in 1760 went to England, came under the influence of James Rely and was excommunicated by Whitefield. He came to America in 1770; preached in Newport, Boston and Portsmouth his peculiar doctrines, which agree with modern Universalism only in the belief of universal salvation, but otherwise held to the dogma of the Trinity, of personal devil and of the incarnation; and at the outbreak of the Revolution was chaplain of a Rhode Island brigade for a short time, during which his resignation was demanded by the orthodox chaplains in the army. He formed a Universalist church in Gloucester, and in 1783 recovered property be-

longing to his parishioners which had been seized by the parish authorities, who acted on the ground that the Universalists had no corporate existence; the success of this suit was a distinct advance in congregational freedom in New England. At his death he was in charge of the Universalist Society of Boston. He wrote 'Letters and Sketches' (1812) and an 'Autobiography,' continued and edited by his wife (1816).

**MURRAY, John**, English publisher: b. London, 27 Nov. 1778; d. there, 27 June 1843. **JOHN MURRAY** the second was the son of John MacMurray (1745-93), a descendant of the Murrays of Atholl, who commenced business as a publisher in London in 1768, dropping the prefix to his name. He began business in 1799, early attained success and became the friend of, as well as publisher for, some of the chief writers of the day, including Byron, Moore, Rogers, Campbell, Crabbe, Washington Irving, George Borrow and Benjamin Disraeli. He started the *Quarterly Review* in February 1809 in opposition to the Whig *Edinburgh Review*, of which Gifford, S. T. Coleridge and Lockhart were editors, and Scott and Southey contributors. By 1817 the *Quarterly* was a great success. In 1824 Murray was involved in the controversy with Moore regarding the destruction of Byron's 'Memoirs'; and in 1826 undertook the publication of the *Representative*, a daily newspaper, which, after running six months was discontinued at a loss of \$130,000. Consult Moore, 'Life of Byron' (1830), and Smiles, 'A Publisher and his Friends' (1891). The third **JOHN MURRAY** (1808-92) was the projector of the famous series of guidebooks that bears the firm's name. He was present at the Theatrical Fund banquet at Edinburgh in 1827 when Scott avowed himself the author of 'Waverley.' The fourth **JOHN MURRAY** (b. 1851) is the present head of the firm.

**MURRAY, Sir John**, Canadian scientist: b. Coburg, Ontario, 3 March 1841; d. Kirkliston, near Edinburgh, 31 March 1914. He was educated at Edinburgh University. In 1867 he accompanied for biological purposes an expedition to Spitzbergen and Greenland, and from 1871 to 1876 he served under Sir Wyville Thomson as one of the scientific staff of the *Challenger* expedition. From 1876 till 1882 he was chief assistant editor of the scientific reports published in connection with that voyage, and in the latter year became editor-in-chief, liberally supporting the work out of his own means. He defrayed the expenses and accompanied the Michael Sars expedition to the north Atlantic (1910), the literary fruits of which were 'The Depths of the Ocean' (1912) and 'The Ocean: a General Account of the Science of the Sea' (1913). He was killed in an automobile accident. He was knighted in 1898. Besides editing the *Challenger* reports he wrote a large number of papers on geographical, oceanographical and biological subjects, and at his own expense established oceanographical laboratories in Scotland.

**MURRAY, John Clark**, Canadian educator: b. Paisley, Scotland, 19 March 1836. He was educated in the universities of Edinburgh and Göttingen, and in 1862 accepted the chair of philosophy in Queen's University, Kingston, Canada. Since 1872 he has been professor of

moral philosophy in McGill University, Montreal. He has published 'Outlines of Sir W. Hamilton's Philosophy' (1870); 'The Ballads and Songs of Scotland' (1874); 'A Handbook of Psychology' (1885); 'An Introduction to Ethics' (1901), etc.

**MURRAY, John O'Kane**, American historian: b. Glenariffe, Ireland, 12 Dec. 1847; d. Chicago, Ill., 30 July 1885. He removed to the United States where he became a physician and author of some repute. His most important work was a 'Popular History of the Catholic Church in America' (1876), and among his other books are 'The Catholic Heroes and Heroines of America' (1878); 'Lessons in English Literature' (1883), etc.

**MURRAY, Lindley**, American grammarian, son of M. L. Murray (q.v.): b. Swatara, Lancaster County, Pa., 22 April 1745; d. Holgate, near York, England, 16 Feb. 1826. He studied law (1761-65) and practised as a barrister; but after the Revolution quitted the bar for a commercial speculation, and having realized a fortune went, in 1784, to England for reasons of health and settled at Holgate, near York. His 'English Grammar' (1795) met with a truly enormous success, being almost universally introduced as a textbook in England and the United States, and for years was regarded as the standard authority. It passed through nearly 50 editions in its original form. A corrected edition by the author was published in 1816, and his abridgment (1818) of this went through 150 editions, each of 10,000 copies. His work was far from accurate, however, and was soon superseded; but it freed a difficult subject from chaos. He wrote 'English Exercises,' the 'Key' and 'English Reader' (1799), and a 'Spelling Book' (1804) which went through 50 editions. He was also a botanist and his gardens were renowned. In 1787 he published 'Power of Religion on the Mind.' Consult Egle, 'Life' (New York 1885), and an autobiography edited and continued by Frank (1826).

**MURRAY, Mary Lindley**, American heroine: b. Pennsylvania; d. New York, 25 Dec. 1782 (O. S.). She is known through an incident of the Revolution. On 15 Sept. 1776 the British line of march passed her residence, 'The Grange,' a small country-seat at Murray Hill, New York. Putnam, having evacuated New York, was at the same time marching along the Bloomingdale road near the North River, intending to join Washington at Harlem Heights. Howe thought by marching across the island to cut off the American retreat. He was, however, invited, with his officers, to luncheon at 'The Grange' by Mrs. Murray, accepted and remained more than two hours, during which time Putnam escaped. A bronze tablet in commemoration was placed in the parked enclosure on Park avenue below 37th street on Evacuation day (25 Nov.) 1903.

**MURRAY, William**, EARL OF MANSFIELD. See MANSFIELD, WILLIAM MURRAY, EARL OF.

**MURRAY, William Vans**, American diplomat: b. Maryland, about 1762; d. Cambridge, Md., 11 Dec. 1803. He received a classical education and after peace was declared in 1783 he went to London and studied law. He returned to the United States in 1785 and estab-

lished a law practice in Maryland. In 1791-97 he served in Congress where he gained a reputation as a learned and skilful legislator, and in 1797 was appointed by Washington Minister to the Netherlands. He was envoy to France in 1800 and was chiefly instrumental in concluding the treaty between the United States and that country. He then returned to the Ministry at The Hague and remained there until 1801, when he retired from public life. He published 'The Constitutions and Laws of the United States.'

**MURRAY**, the largest river of Australia, rising in the Australian Alps, its sources being partly in New South Wales, partly in Victoria. It flows for a long distance westward, forming the boundary between these two colonies, then passes into South Australia, where it takes a southern direction and falls into the Indian Ocean at Encounter Bay, 39 miles southeast of Adelaide, after passing through a large shallow sheet of water called Lake Alexandrina. Its total length is about 1,300 miles. Its chief affluents are the Murrumbidgee and Darling. It is navigable by light draft steamers in the wet season for the greater part of its course to Albury, 190 miles northeast of Melbourne.

**MURRAY BAY**, or **MALBAIE**, Canada, the county town of Charlevoix County, Quebec, on a bay of the Murray estuary, near the north bank of the Saint Lawrence River, 90 miles east of Quebec. It has lumber industries and its dependent suburbs, Pointe à Pic and Cap à l'Aigle, at each end of the bay, are popular summer resorts, the surrounding country being very attractive and affording angling, rowing, bathing and other facilities. Steamboats connect with Quebec. During the Revolutionary War Murray Bay was a station for United States prisoners of war. Pop. about 1,500.

**MURRAY'S TRANSLATIONS OF EURIPIDES.** George Gilbert Murray, since 1908 regius professor of Greek at Oxford University, was born in Sydney, N. S. W., in 1866, went to England in 1877 and became professor of Greek at Glasgow in 1889. Besides his work as a translator, he has edited a critical edition of Euripides, and is the author of 'A History of Greek Literature,' 'Four Stages of Greek Religion,' 'Euripides and His Age' and many essays on ancient and modern subjects. His translations of Euripides include the 'Hippolytus,' the 'Bacchæ,' the 'Trojan Women,' the 'Electra,' the 'Medea,' the 'Iphigenia in Tauris,' the 'Rhesus' and the 'Alcestis.' Like Browning's version of the 'Alcestis' in Balaustion's Adventure (1871), Way's translation of Euripides entire (1894-98), revised and republished in the 'Loeb Classical Library' (1912), and Verrall's editions and essays in the "rehabilitation" of Euripides, begun in 1881 and continued for 30 years, Murray's work in Euripides is at the same time a manifestation of revived interest in the ancient dramatist and a factor in his reinstatement as a great artist. His translations are distinguished (1) by the rendering of the iambic trimeter of the episodes into English rhymed heroics instead of the traditional blank verse; (2) by variety and grace of metre in the choral parts; (3) by the use of stage directions which contribute remarkably to the reader's imagination; (4) by a poetic fancy which so suffuses

the whole with color and spirit as to give it a creative quality rare in translation, and (5) by flowing and harmonious language of great charm. The employment of rhymed heroics instead of blank verse, which is the natural vehicle of drama in English as the iambic trimeter is of drama in Greek, may be criticised as interfering with spontaneity and accuracy, and it may be said also that the use of rhyme in both episode and chorus lessens the distinctness of separation between the two in the original; but the loss in these respects is not great, and is more than compensated by the richness of fancy resulting from the translator's ingenious conquests of the difficulties presented by rhyme. Murray is at once poet, scholar and dramatist, and his translation is in marked contrast with that of uninspired scholarship alone.

GRANT SHOWERMAN.

**MURRE**, mèr, or **MURRELET**, an auk (q.v.) of the genera *Uria cephus*, and related groups; a guillemot. They are small, black-and-white, web-footed, diving, fish-eating birds, which abound on all rocky northern coasts, breeding on sea-fronting ledges, where each pair produces a single, large, pyriform, variously colored egg, which is not placed in a nest but incubated in turn by the parents, who lift it from the ground upon their webbed toes and warm it between their downy legs. Several diminutive and handsomely ornamented species of the coasts of the north Pacific are called murrelets. Consult Baird, Brewer and Ridgway, 'North American Water-Birds' (1884); and the writings on Arctic ornithology of Fielden, Nelson, Turner, Murdock, etc.

**MURRINE VASES** are antique vessels, distinguished for costliness of material and beauty of execution. They were brought by Pompey from Asia to Rome, and bore an immense price. Some antiquarians have supposed them to have been made of a mineral of the class of sardonyx or agate, or of a kind of porcelain or glass.

**MURRUMBIDGEE**, mür-üm-bid'jē, Australia, a large river of New South Wales, rising in the Gourcock Range above Numeralla, about 40 miles from the Pacific Ocean. It flows at first northward, but the greater part of its course is westerly; and after receiving the Lachlan from the north, near Nap Nap, it turns toward the south to join the Murray below Balranald. It is navigable only in the wet season for 500 miles by light-draft steamers. Length about 1,300 miles.

**MURSHIDABAD**, moor-shē-dā-bād', India, the administrative town of a district of Bengal, 116 miles north of Calcutta, on the Bhaghirathi, a branch of the Ganges. It is a straggling collection chiefly of mud houses occupying an extensive area, but has several substantial brick buildings, chief of which are the beautiful Nawab's palace dating from 1837, the imambara and a Moslem mosque. Two miles south of the city is Motijihl or Pearl Lake and the site of the historic palace of Suraj-ud-Dowlah. On the opposite bank of the river connected by a ferry is Azimaganj containing the old cemetery of the Nawabs, a mausoleum, mosque, etc. The city is noted for its ivory carving, its embroidery in gold and silver lace, silk weaving, and

the manufacture of hookah pipes and musical instruments. It is still a busy centre of trade but less so than during the 18th century when it was the capital of Bengal and a very populous city, the rise of Calcutta causing its decline. Pop. about 16,000; with Azimganj 30,000.

**MUSA, Ibn Nusair**, moo'sā ib'n noo-sir', Arabian general: b. 640 A.D.; d. 716 or 717. He became (704) governor of North Africa which he conquered in its entirety as far as the ocean between 706-709. He sent (711) Tarik to Spain but the expedition was so successful he became jealous of his assistant officers and hindered the expedition while he started himself (712) with an army which carried everything before it. He was recalled and had a most brilliant triumphal procession through Africa to Damascus, where the caliph, Suleiman, accused him of great embezzlements, deprived him of his command, and he was either condemned to pay a heavy money indemnity, or, as other writers say, was put to death. Consult Burke, 'History of Spain' (Vol. I, 1895); 'Cambridge Medieval History' (Vol. II, New York 1913).

**MUSACEÆ**, the banana family, a group in the Order *Scitamineæ*, comprising the largest of herbaceous plants, generally destitute or almost destitute of true stems, yet resembling trees in appearance, and sometimes rivaling palms in stateliness, the long sheathing bases of the leafstalks combining to form a false stem. The blade of the leaf has many fine parallel veins proceeding from the mid-rib to the margin. The flowers are congregated on spadices, which are protected by spathes. The fruit is either a three-valved capsule or fleshy. The species are not numerous; they are natives of warm climates, in which they are widely distributed, and are of great value to the inhabitants of tropical countries; the fruit of some, particularly of the genus *Musa*, being much used for food, while the fibres of the leaves are employed for cordage and for textile purposes. See BANANA; FIBRE.

**MUSÆUS**, mū-sē'ūs, in Greek mythology, a poet, seer and priest, said to have been the son of Eumolpus and Selene, or, according to others, the son and pupil of Orpheus. He was the reputed author of a number of poems, oracles, purificatory verses, hymns, etc., of which we possess but a few fragments, and those of doubtful authenticity. A later Musæus, who flourished about the end of the 5th century A.D., was the author of a beautiful little poem in Greek, entitled 'Hero and Leander.' See HERO; HERO AND LEANDER.

**MUSCARDINE**. The common European dormouse (q.v.).

**MUSCARINE**, a coal tar color introduced by Durand and Hugenin, and having the empirical formula  $C_{12}H_{10}N_2O_2Cl$ . It is a brownish violet powder, slightly soluble in cold water, but dissolving readily in hot water with the formation of a violet-blue solution. Powdered zinc decolorizes its aqueous solution, but the color returns on exposure to air. Muscarine produces a blue color upon cotton that has been mordanted with tannin and tartar emetic.

**MUSCARINE**, an alkaloid having the chemical formula  $C_8H_{10}NO_2$ , and occurring in certain mushrooms, notably in the "fly agaric" (*Agaricus muscarius*). It is also formed in

the putrefactive decay of flesh. It may be obtained in the form of deliquescent crystals which are without taste, and insoluble in ether, though readily soluble in water and in alcohol. Solutions of the alkaloid are strongly alkaline, and precipitate ferric and cupric salts in the form of hydrates. Muscarine is exceedingly poisonous. It contracts the pupil of the eye, slows the pulse by prolonging the diastolic state of the heart, and induces salivation, vomiting, intestinal spasms and general muscular weakness, followed by death. Atropine acts as an antidote to muscarine by producing antagonistic physiological processes. The "fly agaric" takes its name from the fact that flies that alight upon it are killed, either by the muscarine or by another alkaloid, neurine, which the fungus also contains.

**MUSCAT**, müs-kät', **MUSKAT**, or **MASKAT**, Arabia, the capital of Oman, on the Gulf of Oman, commanding the entrance to the Persian Gulf. It is a fortified seaport of considerable commercial and strategical importance; the seat of the Imam or Sultan of Muscat; by arrangement it has a British political resident and since 1898 is used as a coaling station by France. Its appearance by no means corresponds with its wealth and importance. Large buildings are few, and the sultan's palace (a plain edifice), the governor's house, and a few minarets, alone rise above the mass of flat-roofed huts or houses. The streets are extremely narrow and its situation at the foot of high cliffs, and nearly surrounded by bare rocks, renders it one of the hottest places in the world. A sufficient supply of water is obtained from wells about 40 feet deep. About three miles distant is the town of Matrah with docks for building and repairing shipping. As it stands in an open plain, exposed to the sea-breeze, it is cooler than Muscat, so that many of the wealthier merchants of the latter place have their dwellings at Matrah, and spend only the hours of business in the neighboring city. The combined population of Muscat, Matrah and intervening villages has been variously estimated at 25,000 and at 60,000.

Muscat was occupied by the Portuguese under Albuquerque in 1507. In 1651 it fell again under a Mohammedan ruler. In the latter half of the 18th century it attained, under a ruler who bore the religious title of Imam, considerable importance as a seaport. In 1808 Seid Saïd succeeded to the sovereignty, having assassinated his cousin, Bedr. His sovereignty embraced also a stretch on the east coast of Africa, extending from the neighborhood of Cape Delgado northward as far as the equator. In like manner a large portion of the coast of the Persian Gulf acknowledged his sway, so that, including Oman and the African islands Zanzibar, Monfia or Mafia, and Pemba, the coasts ruled by him, for the most part only commercially, could not have had an extent of less than 3,000 miles. In 1840 Seid Saïd removed the court and seat of government from Muscat to Zanzibar, and in 1856 died on the return voyage from the former place. His son Mejed succeeded him as Sultan of Zanzibar and ruler of the African territory, and another son acquired Muscat. Sevid Turki became ruler of Muscat in 1871, and on his death in 1888 a son succeeded him.

**MUSCATEL**, a name given to certain sweet and strong French and Italian wines, white or red. The white Riveralt and red Bagnol wines from Roussillon, the Carigliano and Lacryma Christi of Naples, and the Lunel from the Pyrenees are among the most famous.

**MUSCATINE**, müs-ka-tên, Iowa, city, county-seat of Muscatine County, on the Mississippi River, and on the Iowa Central, the Chicago, Rock Island and Pacific and the Chicago, Milwaukee and Saint Paul railroads, about 30 miles below Davenport and 140 miles east by south of Des Moines. It is at a bend in the river where the waters change from a westward to a southward current. As usual along the west bank of the Mississippi, the city is on high bluffs which command an extended view of the river. It was first settled in 1833, and in 1839 was incorporated. It is situated in a fertile agricultural region in which there is considerable wood land. Muscatine Island, just below the city, is noted for its watermelons. The chief industries of the city are connected with the manufacturing of foundry and machine-shop products, oatmeal, flour, pickles, brick, tile, boxes, canneries, buttons, sheet-iron, boilers, engines, packing cases, wagons, carriages, pottery, rolling-mill products, canned goods, lead works and lumber. It has considerable trade in its manufactured articles, farm and dairy products, hogs, lumber and fruit. Muscatine has good public and parish schools and several private schools. It has the public Musser Library. It has also several charitable institutions. The government is vested in a mayor, who holds office two years, and a council. The school board, police judge, treasurer, assessor and wharfmaster are chosen at a popular election by the people. The waterworks are owned and operated by the city. Pop. about 17,074. Consult Richman, I. B., (ed.), 'History of Muscatine County' (2 vols., Chicago 1911).

**MUSCHELKALK**, müsh'el-kalk, a German name, signifying shell lime, applied to geological beds of middle Triassic or New Red Sandstone period, occurring in the Alps, in northwestern Germany, Alsace and Lorraine, Swabia, Franconia, Hesse, Thuringia and upper Silesia. The name is due to the many fossil remains of Cephalopods, Encrinites and Mollusca in general found in the limestone mass of these beds. The Muschelkalk is divided into lower, middle and upper. The beds contain valuable minerals such as salt, marl and gypsum.

**MUSCIDÆ**, müs-ci'di, family of flies from the Latin *musca*, a fly. The most familiar examples are the house-fly and the blow-fly. They belong to the order diptera and their wings have the characteristics of the family, being naked, furnished with a single pair; the proboscis is used for sucking, ending in two fleshy lobes. The flagellum of the antennæ is generally plumed with hairs on both sides (the tsetse, however, on one side only). Upper surface of thorax has a transverse suture and the feet have a pair of adhesive pads. Their presence is almost universal, as they thrive in the cold northern latitudes as well as in tropical climes. The eggs are laid and hatched in filth. The species reaches a large and varied assortment.

**MUSCLE-READING**, a form of observation whereby one who is specially trained may, by careful study of muscular movements, interpret many wishes that are present in others. This is possible because all wishes, to be expressed, primarily involve muscular or glandular activity. Even though the wish, when conscious, is repressed, muscular reactions registering such repressions are always present and can be detected by a keen and practised observer. Thus a person who is told to think steadily, bearing in mind a certain number, unconsciously says that number over and over to himself, making thereby very minute muscular formations of the lips and muscles of the face. These can be seen and read by a skilled person, and thus is explained the common trick of many so-called clairvoyants. This tendency of motor expression of mental images is very pronounced in some people. They involuntarily go toward or away from a hidden object, and a blindfold person can often find these objects by carefully noting the degree of muscular resistance or acquiescence in their search for such objects. This parlor trick takes much practice, a quick sense and much concentration, but does not involve any "thought-transference," or "mind-reading." Some people become very skilful in this type of observation, and all may acquire a certain amount of skill by careful watching. Much of the so-called intuition of women is in reality muscle-reading. They are on the lookout for certain forms of muscular reaction, and can thus guess at what is going on in the minds of others. Their constant contact with small children, who characteristically show what they are thinking about, through their muscles of expression, is a school of experience for them. Man oozes his secrets at his finger tips. The popular song which says "Every little feeling has a movement of its own" contains more truth than fiction. (See EMOTION). Consult Jastrow, *American Journal of Psychology* (Vol. IV, p. 398); Preyer, 'Die Erklärung des Gedankenlesens' (1886), and 'Fact and Fancy in Psychology' (1900); Kempf, 'Autonomic Functions of the Personality' (1919); Freud, 'Psychopathology of Everv-Dav Life.'

**MUSCLE-SENSATION**, a loose and vague phrase, otherwise muscle-sense, to express the sum of sensations that come from the joints, skin, muscles and tendons in the act of making muscular movements. It is also applied to a generalized dull sensation which results from the stimulation of a muscle, either from electrical discharge or from fatigue following the long-continued stimulation of either a voluntary or involuntary muscle. The perceptions of muscular sense are usually grouped under (1) those of posture, the sensations occurring while standing, sitting or maintaining some unusual position being characteristic and recognizably different for each relative position of limbs; (2) those of the passive movement, in which a limb is moved by another person; (3) those of the active movement; (4) those of resistance to movement. The case of passive muscular sense is not to be confused with that of the so-called static sense, which is a sensation of change of direction, which one gets while being transported through space, or turned or inverted, and is mediated through the

semi-circular canals of the ear. The muscle-sense is of much importance in imparting information concerning the relative position of the different members of the body, and its loss in this particular (asterognosis) constitutes a valuable symptom in the diagnosis of certain nerve disorders. The muscle-sense is all-important in maintaining bodily equilibrium. Each joint in the body possesses a varying degree of delicacy in this function of equilibrium. Thus the shoulder-joint is considered to be 40 times as delicate in this respect as the joints of the fingers. Angle of bending and speed of movement are both important in the interpretation of these joint-sensations. Muscle-sense in all its bearings has close relations to accuracy and skill in all limb-movements, as seen in musical performances, marksmanship, ball-playing, billiards, golf, etc., in all sports and games requiring delicate muscular adaptations. The muscle-sensations may become a seat of a great deal of autoerotic pleasure, even exclusive of merely genital masturbation, as may be seen in certain forms of dancing. In persons who take an undue interest in athletics there is frequently in addition to the exhibitionistic motive a large factor of gratification of the libido (q.v.) through merely muscular contractions, the development of muscular strength feeding the unconscious desire for power and superiority in a sphere which frequently excludes real social aims. Consult Henri, 'Année Psychologique' (Vol. V, 1899, with full bibliography); Baldwin, 'Dictionary of Philosophy and Psychology'; Schäfer, 'Physiology' (1900); Kempf, 'The Autonomic System and the Personality' (New York 1919).

**MUSCLES.** The organs called muscles are made up of a collection of muscle-cells, which have for their function the accomplishment of bodily movements. These movements may be gross, as in walking, or very minute, such as take place in the contracting movements of the arteries or veins; they may be voluntary, brought into action by wishes and called "willed" impulses made possible by the brain structures, or they may be involuntary and brought about by acting through the vegetative nervous system (q.v.). The muscular movements necessary in writing are illustrative of the voluntary type; the heart-beat, of the involuntary variety. In point of evolutionary development the involuntary movements may be said to have preceded the voluntary, and hence in regard to complexity of structure the involuntary muscle-cells are simpler than the muscle-cells that perform voluntary movements, and to these two types of cells students of minute anatomy have given the names of unstriped or involuntary muscle, and striped or voluntary muscle. The muscular tissue of the heart is of intermediary character. It is a striped involuntary muscle. Muscle-tissue, like protoplasm, is strongly contractile, but unlike ordinary protoplasm, which can contract in all directions, muscle-substance can contract in only one direction. The simplest type of muscle-substance is seen in many lower animals. In these the muscle-cells are elongated spindles with sharpened points and with a single elliptical to rod-shaped nucleus, situated about the middle of the fibre. They show a faint longitudinal striation, vary in length from 40 to 500 microns (1-600,

1-50 of an inch) in length, and 3 to 8 microns (1-8000, 1-3000 inch) in diameter. These muscle-cells in man correspond to the unstriped muscle-cells, are bound together in bundles or flattened plates by an inter-cellular cement-substance and are found more particularly in the walls of the intestine, the trachea, bronchi, blood-vessels, bladder, ureter, uterus, in many of the organs of the body, and in glandular structures. They have a rich blood-supply and a nervous network of sensory terminal filaments, as well as fibres from the vegetative (old term was sympathetic) nervous system. The pains of an intestinal colic, of a gall-stone, of childbirth, are all due to forcible contractions of these involuntary muscle-cells in the respective organs. The more prominent muscles of the body, such as those that move the various bones, the muscles proper and such as are eaten as roast beef are of the striped variety. These are a modification of the simple spindle-cells. In man they originate in the mesoderm, muscle-substance commences to form in the interior of some of the cells; these elongate, many nuclei are formed and the final result is a bundle of much elongated cylindrical cells 12 centimeters (2 inches) long and from 10 to 100 microns (1-2500 to 1-250 inch) broad. Each cell is covered by a special sheath, the sarcolemma, and within is made up of very intricate and minutely structured protoplasm, the most striking feature of which is its banded or striated appearance; hence the name striated. Just within the sarcolemma a number of flattened elliptical muscle-nuclei are found. In insects striped muscle-tissue can be studied to best advantage. Occasionally branched forms of striated muscle are found. Blood-vessels are numerous in striped muscle and lymphatics and nerves are also abundant. Special types of nerve-endings and muscle-plates, are characteristic of voluntary muscle. Striped muscle is probably a combination of types of muscle. The sarcoplasmic substance is thought of as of unstriped muscular origin, and it is probably innervated by the vegetative nervous system. This type of innervation is that which keeps its metabolism in order, and also contributes to what is known as muscle-tonus. The emotions act through this part of the muscle probably. The other part of the muscle, called the anisotropic disc, is probably innervated by the sensori-motor system and is that part of the muscle which carries out willed or wished actions.

Heart-muscle differs from ordinary striped muscle by having shorter oblong cells, which are branched. There is no sarcodermis and the cells contain but one or two nuclei, which are situated in the centre of the muscle-substance. Blood-vessels, lymphatics and nerves are plentiful in the heart-muscle.

Groups of these muscle-cells, with connective tissues, tendons and fat, make up the gross muscles of the human body. The voluntary muscles are all attached to bony structures; the involuntary muscles are found in the softer parts. Contraction and expansion are the expressions of their functions, each set of muscles being provided with antagonists, and it is characteristic that in response to pleasure-giving stimuli movements of expansion result, whereas under painful stimuli contraction is marked. Modern psychological theories have been

founded on this fundamental principle, emotional states being interpreted as being founded on visceral muscular activities. The forms of external stimuli that can cause muscular action are usually classed as mechanical, chemical, thermal and electrical. Excess of stimulus brings about a condition of fatigue in muscle. This is accompanied by diminished muscular power, by pain or discomfort, by diminished reflex excitability and by vague symptoms in the body indicative of some perversion of metabolism.

Muscles are classified in various ways, according to structure or according to their function, or by their positions and situations in the body. For example, some muscles are attached to bones, which they move after the fashion of levers. Such muscles are said to arise or take origin from definite points of bones and are generally inserted into bones by tendinous prolongation of the muscular substance. The insertion is the moving point, and the origin the fixed point of the muscle. The tendons of muscles vary in length and breadth. They represent inelastic bands of fibrous tissue, the fibres of which insensibly merge into and become continuous with their attached muscular fibres. When the tendinous fibres of muscles become greatly broadened out, so as to form fibrous webs or membranes, which separate or enclose muscles, or which afford extensive surfaces for their attachments, the term aponeuroses is then applied to them. Such aponeurotic expansions are seen in the terminations of the muscles of the abdominal wall, in the scalp and in other situations. The limit or extent of the action of a muscle is determined by the length of its fibres, whilst its degree of force or strength depends on the number of the fibres. Other muscles are not attached to bones as levers, but on the contrary surround and enclose cavities, which they limit or expand as required. Such hollow muscles are exemplified in the heart and uterus, in the muscular fibres of blood-vessels, in the muscles of the digestive tract, in the iris of the eye, etc.

The nature, mode and effects of muscular action may be briefly considered in connection with the present subject. The muscles which have the most active functions are those most abundantly nourished. Every action on the part of a living being results in the production of a certain amount of waste material, evinced by perceptible differences in the chemical composition of the tissue. And when it is remembered that the nervous and vascular supply of muscle is also concerned in muscular work and waste, the entire question is seen to assume aspects of a very intricate and complicated nature. Increased exercise of muscles—as seen in gymnastic exercises, or in the exercise of certain trades (for example, the arms of the blacksmith and the lower limbs of the ballet-dancer)—demanding increased nutrition, results in the increased growth of the muscle and in the formation of new tissue. This result, it is evident, can take place only when the nutrition of the tissue keeps pace with or slightly outstrips its waste and wear.

The property of contractility distinctive of muscular tissue, and through which its functions are manifested, is generally, though not always or invariably, brought into action through the stimulus of the nervous system, or

more widely speaking, through stimuli conveyed to the muscular fibres through the nerves. The subject of the various kinds of muscular actions involves both physiological and mechanical considerations. The voluntary muscles thus constitute moving powers for the bones as levers; and in the living body examples of the three kinds of levers which mechanical science distinguishes are found. In the familiar action of the biceps muscle, which flexes or bends the fore upon the upper arm, is seen an instance of a lever of the third kind, in which the power (represented by the insertion of the muscle on the radius or bone of the fore-arm) is placed between the fulcrum (at the elbow-joint) and the weight (in the hand). The lever of the second order may be illustrated by the raising of the body upon the toes, as in the act of making a step forward in walking. Here the weight (represented by the body pressing on the ankle) is placed between the fulcrum (formed by the fixed toes) and the power represented by the muscles of the calf. The head moving on the spine illustrates a lever of the first order; the fulcrum being represented by the atlas vertebræ, the power by the muscles of the neck and the weight by the heavier portion of the skull situated in front of the spine. See ANATOMY.

SMITH ELY JELLIFFE, M.D.,

Editor *Journal of Nervous and Mental Disease.*

**MUSCLES, Diseases of.** Very little is known of the diseases of muscles themselves. Muscle-tissue, in common with other types of tissue, undergoes certain forms of degeneration, fatty, mucoid, gelatinous, calcareous, etc., but of the diseases of the muscular tissues themselves there are few well-defined types. The reason for this lack of definite information bearing on diseases of the muscles is largely due to the close relationship that the nervous system bears to the muscular system. This renders it almost impossible to distinguish between a disease of the muscle and a disease of the nerve structures which are distributed to that muscle. Thus, at the present time, it is held that many of the forms of muscular atrophy and some of the forms of muscular dystrophy are forms of the diseases of the nervous mechanism of the muscle rather than disease of the muscle itself. In former times these were classed as diseases of muscle.

Myositis, simple inflammation of the voluntary muscles, is a form of acute or subacute inflammation in the muscle, due probably to some infectious organism. It is characterized by stiffness of the muscles and with swelling in the muscle-substance. It is usually progressive, the muscles of the body becoming stiff, hard and fragile, and undergoing fatty degeneration. Myositis is probably a very rare affection, and it is not yet known whether it is a primary or a secondary condition. Ordinary muscular spasms or muscular cramps are in reality localized neuralgias in the muscle, and should be considered as of nervous rather than muscular origin. Lumbago is one of the conspicuous examples of a neuromuscular affection. It is probably located in the sarcoplasm of the muscle, and results from disturbance of the vegetative nervous system control of the muscle. It may be a result of emotional upsets,

or follow undue exercise. Myoclonia or Friedrich's disease, and myotonia, or Thomsen's disease, are two forms of disease affecting the muscular system that have certain superficial resemblances to hysterical affections, and although regarded by many as of purely muscular origin, there are many reasons for believing that these diseases are of the neuromuscular type. In myotonia the disease usually comes on in childhood; the muscles become stiff, and the children are noted for being clumsy in their movements. The contractions, as in the hand, for instance, commence very slowly and are performed almost automatically, and when the patient desires to loosen his grasp of an object the muscular response is slow, the contraction often persists or the patient may be scarcely able to open his hand. In much the same manner walking is affected; the patient starts with difficulty; one leg seems to be stiff and halts; but after a few moments of limbering up, as it were, the patient may be able to walk more or less briskly. The disease is chronic, and is probably related to a defect in the vegetative reflex arc mechanisms acting chiefly through the sarcoplasmic elements. It may be emotional but is probably related to faulty muscle metabolism of endocrinous bases.

Myoclonia occurs chiefly in patients of bad nervous condition, and consists in clonic contractions of the muscles of the extremities. These contractions somewhat resemble chorea. Associated muscle-groups seem to be involved in myoclonia, whereas in chorea the contractions are extremely irregular. The disease is probably most closely associated with the convulsive tics and is probably due to some affection of the motor cortex. Treatment is difficult but the psychogenic element may be reached by psychoanalysis.

Myositis ossificans is a very rare chronic affection of muscles, during which the muscles become harder and harder, and finally develop bone-like transformations, so that the patient becomes like the ossified man of the circus. As a matter of fact most of these cases drift into museums and circuses. Very little is known as to the cause of the disease, and treatment is unavailing. Consult Jelliffe and White, 'Diseases of the Nervous System' (3d ed., 1919).
