## PARTIAL LIST OF CONTRIBUTORS TO VOLUME XIX

**ALDEN, RAYMOND M., Ph.D., Litt.D.**

Professor of English, Leland Stanford Junior University

NARRATIVE POETRY

**AUSTIN, O. P., M.A.**

Statistician of the National City Bank, New York City

NATIONAL DEBTS OF THE WORLD

**BABASINIAN, V. S., Ph.D.**

Professor of Chemistry, Lehigh University

MICHLER'S KETONE

**BALDWIN, CHARLES SEARS, Ph.D.**

Professor of Rhetoric and English Composition, Columbia University

MORTE D'ARTHUR

**BARNES, HARRY ELMER, Ph.D.**

Associate Professor of History, Clark University

NATIONALISM

**BERRY, GEORGE RICKER, Ph.D., D.D.**

Professor of Old Testament Interpretation and Semitic Languages, Colgate University

MICAH, BOOK OF

**BIEN, MORRIS, Ph.B., LL.B., LL.M.**

United States Reclamation Service, Washington, D. C.

MINERAL LAND LAWS OF THE UNITED STATES

**BOUCKE, EWALD A., Ph.D.**

Professor of German, University of Michigan

MEYER, CONRAD FERDINAND

**BREWSTER, WILLIAM T., A.M.**

Professor of English, Columbia University

MILL ON THE FLOSS, THE  
MR. MIDSHIPMAN EASY  
MYSTERIES OF UDOLPHO

**BROOKE, TUCKER, M.A., Litt.B.**

Professor of English, Yale University

MUCH ADO ABOUT NOTHING

**BROWN, ERNEST W., S.D., F.R.S.**

Professor of Mathematics, Yale University

MOON, THE

**BRUBACHER, A. R., Ph.D.**

President, State College for Teachers, Albany, N. Y.

MUNICIPAL COLLEGES AND UNIVERSITIES  
NATIONAL UNIVERSITY

**CAIRNS, WILLIAM B., Ph.D.**

Associate Professor of American Literature, University of Wisconsin

MOBY DICK

MODERN INSTANCE, A

**CAPPS, W. L.**

Chief Constructor, United States Navy; and

**TAYLOR, D. W.**

Chief Constructor, United States Navy

NAVAL ARCHITECTURE

**CARMAN, E. A.\***

Brigadier-General, United States Army

MIDDLEBURG, ALDIE AND UPPERVILLE, CAVALRY ENGAGEMENT AT  
MINE RUN, CAMPAIGN OF  
MONOCACY, BATTLE ON THE  
MORGAN'S RAID INTO INDIANA AND OHIO

**CHAMBERLAIN, CHARLES J., Ph.D.**

Professor of Morphology and Cytology, University of Chicago

MICROTOME

**CHANDLER, FRANK W., Ph.D.**

Professor of English and Comparative Literature, University of Cincinnati

MONNA VANNA

**CLARK, JOSEPH B., D.D.**

Secretary, Congregational Home Missionary Society

MISSIONS, PROTESTANT HOME

**CLEWELL, J. H., Ph.D., B.D.**

President of the Moravian Seminary and College, Bethlehem, Pa.

MORAVIAN CHURCH

**CORNYN, JOHN HUBERT, B.A., LL.B.**

Birmingham Southern College

MOUND BUILDERS AND MOUNDS  
MYTHOLOGY  
NATURE STUDY  
NATURE WORSHIP

**COUMBE, CLEMENT W.**

Technical Art Expert

MONASTIC ARCHITECTURE  
MONASTIC ART

**CUSHMAN, ROBERT EUGENE, Ph.D.**

Associate in Political Science, University of Illinois

MUNICIPAL DEBTS  
MUNICIPAL HOME RULE  
MUNICIPAL OWNERSHIP  
MUNICIPALITIES

\* Deceased.

## Contributors to Volume XIX—Continued

**DARTON, NELSON H.**

Geologist, United States Geological Survey

MINERAL PRODUCTIONS OF THE  
UNITED STATES

**DUTTON, GEORGE B., Ph.D.**

Department of English, Williams College, Williams-  
town, Mass.

MIDDLEMARCH

**DWIGHT, HENRY O., LL.D.**

Author of "Blue Book of Missions," etc.

MISSIONS, PROTESTANT FOREIGN

**EISERHARDT, EWALD, Ph.D.**

Professor of German, University of Rochester

MINNA VON BARNHELM

**ELROD, MORTON J., Ph.D.**

University of Montana

MONTANA

**ELSON, LOUIS C.**

Instructor at New England Conservatory of Music,  
Lecturer and Author

MUSIC

**FARROW, EDWARD S., C.E.**

Consulting Military and Civil Engineer

MILITARY COURTS MARTIAL  
MILITARY EDUCATION  
MILITARY ENGINEERING  
MILITARY RAILROADS  
MILITARY TERMS  
MILITARY TRANSPORTATION  
MINE PLANTERS

NAVAL EDUCATION  
NAVAL MILITIA  
NAVAL MINES

**FAY, ALBERT H.**

Mining Engineer, United States Bureau of Mines

MINE ACCIDENTS  
MINING

**FERRIS, RICHARD, C.E., Sc.D.**

Editorial Staff of The Americana

MOVING PICTURES

**FULLER, GEORGE N.**

Secretary Michigan Historical Commission

MICHIGAN

**GARNER, JAMES W., Ph.D.**

Professor of Political Science, University of Illinois

NATIONALITY

**GEARE, RANDOLPH I.\***

Formerly of the National Museum, Washington,  
D. C.

MOZART, JOHANNES CHRYSOSTOMUS  
WOLFGANGUS THEOPHILUS

**GEDDES, JAMES, JR., Ph.D.**

Professor of Romance Languages, Boston University

MY PRISONS ('LE MIE PRIGIONI')

**GEHRING, ALBERT, A.M.**

Author of 'The Appreciation of Music,' etc.

MUSIC, EDUCATION IN  
MUSIC, THE PSYCHOLOGY OF

**GILDER, JOSEPH B.**

Secretary of the Industrial Finance Corporation

MORRIS PLAN, THE

**GRAVES, REV. CHARLES**

Hartford, Conn.

MIRROR OF PERFECTION, THE

**GRAVES, MARK**

Director, Bureau of Municipal Accounts, State  
Comptroller's Office, Albany, N. Y.

MUNICIPAL ACCOUNTING IN THE  
UNITED STATES

**GREENE, EVARTS B., Ph.D.**

Professor of History, University of Illinois

NATIONAL IDEALS IN THE WAR

**HAMLIN, ALFRED D. F., A.M., L.H.D.**

Professor of History of Architecture, Columbia  
University

MURAL PAINTING

**HART, ALBERT BUSHNELL, Ph.D., LL.D.,  
Litt.D.**

Professor of Government, Harvard University

MONROE DOCTRINE, THE

**HARTMANN, JACOB WITTMER, Ph.D.**

Assistant Professor, Department of German Lan-  
guage and Literature, College of the City of New  
York

MINNESONG  
MÖRIKE, EDUARD

**HIBBEN, JOHN GRIER, Ph.D., LL.D., L.H.D.**

President, Princeton University

NATURALISM

**HODGE, FREDERICK W.**

Bureau of American Ethnology, Washington, D. C.

NAVAJO INDIANS

**HORNADAY, WILLIAM T., Sc.D.**

Director New York Zoological Park

MOOSE

\* Deceased.

## Contributors to Volume XIX—Continued

**HOWARD, WILLIAM G., A.M.**

Assistant Professor of German, Harvard University

**NATHAN THE WISE**

**INGERSOLL, ERNEST**

Zoologist

**MIGRATION  
MIMICRY IN ANIMALS  
MOUSE  
MYCORRIZA**

**ISAACS, ABRAM S., Ph.D.**

Professor of Semitic Languages and Literatures,  
New York University

**MOHAMMEDAN LITERATURE  
MOHAMMEDAN SECTS  
MOSES**

**JELLIFFE, SMITH ELY, M.D., Ph.D.**

Formerly Professor of Pharmacognosy, Columbia  
University

**MIGRAINE  
MUSCLES  
MUSCULAR SYSTEM**

**KENNEDY, BRUCE**

General Secretary, Montgomery Chamber of Com-  
merce

**MONTGOMERY, ALABAMA**

**KRAPP, GEORGE PHILIP, Ph.D.**

Professor of English, Columbia University

**MONTAIGNE'S ESSAYS**

**LAWRENCE, WILLIAM WITHERLE, Ph.D.,  
Litt.D.**

Professor of English, Columbia University

**MIRACLE PLAYS**

**LEONARD-STUART, C., B.A.**

Editorial Staff of The Americana

**MOSELEY COMMISSIONS  
MUSICAL ELEMENTS AND TERMS**

**LIVINGSTON, ARTHUR**

Professor of Romance Languages, Western Uni-  
versity, London, Ontario, Canada

**MORGANTE MAGGIORE**

**LUCAS, FREDERIC A., Sc.D.**

Director, American Museum of Natural History

**MUSEUMS**

**LYDECKER, CHARLES E.**

Brevet Lieutenant-Colonel, National Guard, New  
York (Retired)

**MILITIA**

**McGRANE, R. C., Ph.D.**

Assistant Professor of History, University of Cin-  
cinnati

**MONROE, JAMES**

**McLENEGAN, CHARLES E.**

Librarian of the Public Library, Milwaukee

**MILWAUKEE**

**MAYES, EDWARD C., LL.B.**

Author of "Educational History of Missi sippi"

**MISSISSIPPI**

**MIMS, EDWIN, Ph.D.**

Professor of English, Vanderbilt University

**MIDSUMMER NIGHT'S DREAM, A**

**MODELL, DAVID A., A.M.**

---	---

**MEYER, mi'ér, Adolf**, American pathologist and alienist: b. Niederweningen, near Zürich, Switzerland, 13 Sept. 1866. He was educated at Zürich, Paris, London, Edinburgh, Vienna and Berlin, and came to the United States in 1892. He was honorary Fellow and docent at the University of Chicago in 1892-95, and pathologist to the Illinois Eastern Hospital for the Insane at Kankakee in 1893-95. He was pathologist and later director of the clinical and laboratory work at the Worcester, Mass., Insane Hospital and docent in psychiatry at Clark University in 1895-1902. He was director of the Pathological Institute at the New York State Hospital in 1902-10; professor of psychiatry at the Cornell University Medical College in 1904-09; and since 1910 has been professor of psychiatry and director of the Henry Phipps Psychiatric Clinic at Johns Hopkins University. He is a member of the New York Academy of Sciences, served as president of the New York Psychiatric Society and has contributed to scientific periodicals.

**MEYER, Adolf Bernhard**, German zoologist and anthropologist: b. Hamburg, 11 Oct. 1840; d. Dresden, 22 Aug. 1911. He was educated at the universities of Göttingen, Vienna, Zürich and Berlin, later making explorations in the Malays and in the Philippines. He was director of the Royal Museum of Natural History at Dresden from 1874 until his retirement in 1905. Author of 'Abbildungen von Vogelskeletten' (1879-95); 'Publikationen des königlichenethnographischen museums zu Dresden' (1881-1903); 'Album von Philippinentypen' (1885-1904); 'Amerikanische Bibliotheken und ihre Bestrebungen' (1906); 'Römerstadt Agunt' (1908), etc.

**MEYER, Annie Nathan**, American dramatist, author and educationalist: b. New York, 19 Feb. 1867. She was educated at home and took examinations at Columbia University, women not then being admitted to the university. She was married to Dr. Alfred Meyer in 1887 and is known for her work as a founder of Barnard College, the women's department at Columbia. She has been active as an anti-suffragist. Author of 'Woman's Work in America' (1891); 'Helen Brent, M.D.' (1893); 'My Park Book' (1898); 'Robert Annys' (1901); 'The Dominant Sex' (1911); 'The Dreamer' (1912).

**MEYER, Balthasar Henry**, American railway economist: b. Mequon, Wis., 28 May 1866.

He was graduated at the University of Wisconsin in 1894 and later studied at Berlin. He was connected with the staff of the University of Wisconsin from 1895 and was professor of political economy there in 1900-10. He was appointed a member of the Railroad Commission of Wisconsin in 1905, and served as its chairman in 1907-11. President Taft appointed him to the Railroad Securities Commission in 1910 and to the Interstate Commerce Commission in 1911. Author of 'Railway Legislation in the United States' (1903); 'History of Transportation in the United States Before 1860' (1917).

**MEYER, Conrad Ferdinand**, Swiss novelist and poet: b. Zürich, 11 Oct. 1825; d. Kilchberg, near Zürich, 1898. He devoted himself in his earlier years chiefly to studies in history and art. The two historians who influenced Meyer particularly were Vulliemin at Lausanne and Jacob Burckhardt at Bâle whose book on the 'Culture of the Renaissance' stimulated his imagination and interest. From his travels in France and Italy (1857) Meyer derived likewise much inspiration for the settings and characters of his historical novels. His mind matured slowly and it was not until the Franco-Prussian War in 1870 that he found himself and his genius. In Meyer's novels a great crisis will often release latent energies and precipitate a catastrophe. In the same manner his own life which so far had been one of dreaming and experimenting, was stirred to the very depths by the events of 1870. Meyer identified himself with the German cause and as a manifesto of his sympathies published the little epic, 'Hutten's Last Days' in 1871. The following two decades from 1870 to 1890 were the years of harvesting and brought to light a number of historical novels and tales.

C. F. Meyer's works include six long and five shorter historical tales, two short epic poems and a volume of lyrics, among them some ballads of exceptional merit. The periods of the Renaissance and Counter Reformation furnished the subjects for most of his novels in which the æsthetic charm of a picturesque setting is combined with keen psychological analysis. 'Jürg Jenatsch' describes the political plots and intrigues in which the Swiss canton, Graubünden, became involved during the Thirty Years' War through the conflict between Spain-Austria and France. The hero is a Protestant minister and fanatic patriot who, in his determination to preserve the independence of his little country, does not shrink from murder and

treason and in whom noble and base motives are strangely blended. 'The Saint' tells the story of Thomas à Becket of Canterbury who, from being a devoted servant of his worldly lord, King Henry II, turns against him when he is made archbishop of Canterbury and henceforth serves the interest of a higher lord or his representative, the Church of Rome. In the 'Monk's Wedding' Dante himself is introduced at the court of Cangrande in Verona as narrator of the strange adventure of a monk who, after the death of his brother, is forced by his father to break his vows but who, instead of marrying the widow, falls in love with another young girl and runs blindly to his fate. 'Die Richterin,' a more sombre tale, introduces Charlemagne and his palace school; 'The Tempting of Pescara' tells of the great crisis in the life of Pescara, general of Charles V and husband of Victoria Colonna. Among his shorter stories may be singled out 'Gustav Adolf's Page,' 'Plautus in a Nunnery' and 'The Shot from the Pulpit' as three gems of his inimitable art. Most of his plots spring from the deeper conflict between freedom and fate and culminate in a dramatic crisis in which the hero, in the face of a great temptation, loses his moral freedom and is forced to fulfill the higher law of destiny. As a psychologist and interpreter of enigmatic characters Meyer has not his equal in the field of the historical novel. See SAINT, THE.

**Bibliography.**—C. F. Meyer's works are published by H. Haessel, Leipzig, in 9 volumes. The most recent and complete biography is by D'Harcourt, R., 'C. F. Meyer: Sa vie son œuvre' (Paris 1913). Two older biographies by Langmesser, A. (Berlin 1905), and Frey, A. (Stuttgart 1909). Other monographs: Taylor, M. L., 'A Study of the Technique of C. F. Meyer's Novellen' (Chicago 1909); Blaser, O., 'C. F. Meyer's Renaissance-novellen' (Berne 1905); Korrodi, E., 'C. F. Meyer: Studien' (Leipzig 1912). Several novels are accessible in annotated American editions, but only two, so far, in translations: 'The Monk's Wedding' (Boston 1887); and 'The Tempting of Pescara' (New York 1890). Consult also, 'German Classics of the Nineteenth Century,' Vol. 14.

EWALD A. BOUCKE,

*Professor of German, University of Michigan.*

**MEYER, Eduard,** German historian: b. Hamburg, 25 Jan. 1855. He was educated at the universities of Bonn and Leipzig, and after completing his studies spent one year in Constantinople. In 1879 he went to the University of Leipzig as privatdozent; in 1885 became professor of ancient history at Breslau and in 1889 at Halle. He has written 'Geschichte der Alten Ägypter' (1877); 'Geschichte des Altertums' (1884-1902), his largest work; 'Forschungen zur Alten Geschichte' (1892-99); 'Untersuchungen zur Geschichte der Gracchen' (History of Greece) (1894); 'Wirtschaftliche Entwicklung des Altertums' (1895); and 'Die Entstehung des Judentums' (1896); 'Zur Theorie und Methodik der Geschichte' (1902); 'Der Israeliten und ihre Nachbarstämme' (1906).

**MEYER, George von Lengerke,** American Cabinet officer and diplomat: b. Boston, 24 June 1858; d. 9 March 1918. He was graduated at Harvard in 1879, and engaged in business as

merchant and trustee in 1879-99. He was a director of various trust companies, banks, manufacturing companies, and public utilities concerns, and was a member of the Boston common council in 1889-90. He served in the Massachusetts house of representatives in 1892-97, acting as speaker in 1894-97, and was a member of the Republican National Committee in 1898-1904. He was ambassador extraordinary and plenipotentiary to Italy in 1900-05, and to Russia in 1905-07. He served as Postmaster-General under President Roosevelt in 1907-09, and in the Taft Administration he was Secretary of the Navy. He has been an overseer of Harvard University since 1911.

**MEYER, Hans,** German explorer and publisher: b. Hildburghausen, 22 March 1858. He was educated at Leipzig, Berlin and Strassburg, afterward traveling in India, North America and South Africa. Subsequently he visited East Africa and South America. He entered the publishing house of his father, the Bibliographisches Institut at Leipzig, in 1884, and in the following year became one of the directors of the firm; but at intervals he continued his exploring expeditions. Among his explorations are the ascent and survey of the summit of Kilbo Peak in East Africa in 1889 and 1898; and the Ecuadorian Cordilleras in 1903. Author of 'Zum Schneedom des Kilimandscharo' (1888); 'Der Kilimandjoro' (1900); 'Die Eisenbahnen im tropischen Africa' (1902); 'In den Hoch Anden von Ecuador' (1907), etc.

**MEYER, Heinrich August Wilhelm,** German biblical commentator: b. Gotha, 10 Jan. 1800; d. Hanover, 21 June 1873. He studied at Jena, was pastor at Harste, Hoya and Neustadt, and upon his retirement in 1848, settled in Hanover. He is remembered for his 'Commentaries on the New Testament,' begun 1832 and completed 1859. Since his death this work has been continued by Weiss, Wendt, Beyschlag and others. The English translation in Clark's series is in 20 volumes (1873-82), and there is an American edition in 11 volumes (1884-88).

**MEYER, Henry Herman,** American Methodist Episcopal clergyman and editor: b. Champaign, Ill., 21 Nov. 1874. He was educated at German Wallace College, Ohio; the Drew Theological Seminary; Teachers' College, Columbia; and at Jena. He was ordained in the ministry in 1900 and filled pastorates in Wilmington, Cal., and Mount Vernon, N. Y. He was professor of Saint Paul's College, Minnesota, in 1900-01; and in 1903 became assistant editor of the Methodist Episcopal Sunday School publications, becoming editor in 1914. Author of 'The Lesson Handbook' (annual 1904-); 'The Graded Sunday School in Principle and Practice' (1910), etc.

**MEYER, Hugo Richard,** American author and economist: b. Cincinnati, Ohio, 1 April 1866. He was graduated at Harvard in 1892, and attended the Harvard Graduate School in 1892-96. He was instructor in political economy at Harvard in 1897-1903, and was assistant professor in that subject at the University of Chicago in 1904-05. Since 1907 he has been engaged at Melbourne in writing a history of State Ownership in Victoria, Australia. Author of 'Government Regulation of Railroad Rates' (1905); 'Municipal Ownership in Great Britain' (1906); 'The British State Telegraphs' (1907);

'Public Ownership and the Telephone in Great Britain' (1907).

**MEYER, Johann Georg**, commonly known as "Meyer von Bremen," German painter: b. Bremen, 28 Oct. 1813; d. Berlin, 4 Dec. 1886. In his 21st year he went to Düsseldorf and began his studies under Sohn and Schadow; in 1841 he opened a studio of his own but removed to Berlin as his fame increased (1853). While scenes from the Bible were first the subjects of his brush, he later turned his attention to incidents of popular life, especially among the Hessian peasantry, and finally to the portrayal of family life in its pathetic aspect. Such pictures as 'The Jubilee of a Hessian Pastor' (1843); 'Christmas Eve'; 'Blindman's Buff'; 'The Soldier's Return'; 'The Inundation' (1846); 'The Repentant Daughter' (1852, in the gallery at Bremen), are full of intense sympathy with the "simple annals of the poor." After taking up his residence at Berlin, he chose especially scenes from child life, which he rendered with spirited humor. Among his pictures of this kind are 'The Fairy Tale'; 'Children Playing Blindman's Buff'; 'Grandfather and Grandchild,' etc. A third group of his pictures includes those of young women, as single figures or in groups. Such are 'The Tryst'; 'The Love Letter.' An excellent example of his work, 'The Letter' (1873), is in the Metropolitan Museum, New York. All his works are distinguished by true human feeling, truthfulness and thoroughness of execution.

**MEYER, Joseph**, German publisher: b. Gotha, 9 May 1796; d. 27 June 1856. He organized various industrial undertakings, founded a publishing business at Gotha, which soon attained large proportions, was removed by him to Hildburghausen (1828), and in 1874 was transferred to Leipzig. The best known of his publications is the 'Meyers Konversationslexikon,' the rival of Brockhaus in the encyclopædia field, which has been brought down to date by constant revisions and supplements. He published also a series of the German Classics, a 'Historical Library,' and a 'Library of Natural Philosophy.'

**MEYER, Kuno**, German Celtic scholar: b. Hamburg, 20 Dec. 1858. He was educated at the Gelehrtenschule of the Johanneum, Hamburg, and at the University of Leipzig. In 1884-95 he was lecturer, and in 1895-1915, professor of Teutonic languages at University College, Liverpool; and from 1911 he was professor of Celtic at the University of Berlin. He founded the *Zeitschrift für Celtische Philologie* in 1895, and with Whitley Stokes founded the *Archiv für Celtische Lexikographie* in 1898. He founded the School of Irish Learning at Dublin in 1903. He is a member of the Royal Prussian Academy. His pro-German sympathies brought him into disfavor in England and Ireland after the outbreak of the European War. Author of 'Eine irische Version der Alexandersage' (1883); 'The Irish Odyssey' (1885); 'The Vision of MacConglinne' (1892); 'Early Relations of the Brython and Gael' (1896); 'Liadain and Curithir' (1902); 'Ancient Irish Poetry' (1911), etc.

**MEYER, Lothar Julius**, German chemist: b. Varel, Oldenburg, 19 Aug. 1830; d. Tübingen, 11 April 1895. He studied medicine at Zürich

and Würzburg and later specialized in physiological chemistry at Heidelberg, and in mathematical physics at Königsberg. He became privatdocent in physics and chemistry at Breslau in 1859, taught in the School of Forestry at Neustadt-Eberswalde in 1866-68, and at the Karlsruhe Polytechnic in 1868-76; and from 1876 he was professor of chemistry at Tübingen. He is known for his theory of the action of carbon monoxide on the blood; and for his work in the periodic classification of the elements. Author of 'Die modernen Theorien der Chemie' (1896); 'Die Stomgewichte der Elemente aus den Originalzahlen neu berechnet' (1883); 'Grundzüge der theoretischen Chemie' (1902).

**MEYER, [Marie] Paul Hyacinthe**, French philologist: b. Paris, 17 Jan. 1840; d. 19 March 1917. He was educated at the Lycée Louis le Grand and at the École des Chartes, specializing in the Romance languages. He was attached to the manuscript department of the Bibliothèque Nationale in 1863-65, and in 1865 founded the *Revue Critique*. He was keeper of the national archives in 1866-72 and in 1872 founded *Romania*, to which he was the leading contributor. He was appointed professor of the languages and literatures of southern Europe at the College of France in 1876, and from 1882 he was a director of the École Nationale des Chartes. He became honorary professor at the College of France in 1906. His work in connection with romance literature is of exceptional value and he is considered the leading modern authority on the French language. He was a member of the Institute of France, a commander in the Legion of Honor and an associate of the British Academy. He edited a large number of old French texts, many of which were for the Société de l'histoire de France and the Société des anciens textes français. Among them are 'Aye d'Avignon' (1861); 'Flamença' (1865); 'Histoire Guillaume le Marechal, comte de Striguil et de Pembroke' (3 vols., 1891-1901); 'Fragments d'une vie de Saint Thomas de Cantorbéry' (1885), etc. Author of 'Rapports sur les documents manuscrits de l'ancienne littérature de la France conservés dans les bibliothèques de la Grande Bretagne' (1871); 'Recueil d'anciens textes bas-Latins, provençaux et français' (2 parts, 1874-76); 'Alexandre le Grand dans la littérature française du moyen âge' (2 vols., 1886); 'Histoire des relations de la France avec Venise' (1896); 'Documents linguistiques du midi de la France' (1909), etc.

**MEYER, Victor**, German chemist: b. Berlin, 8 Sept. 1848; d. Heidelberg, 8 Aug. 1897. He studied at the University of Berlin and under Bunsen at Heidelberg. In 1868 he entered the laboratory of Baeyer at Berlin, and in 1871 he became professor at the Stuttgart Polytechnic. He was professor of chemistry and director of the laboratory at Zürich in 1872-85, professor at Göttingen in 1885-89, and from 1889 until his death he occupied the chair of his former master, Bunsen, at Heidelberg. He is famous for his experiments establishing a method of determining vapor densities and for the discovery of thiophen. He was awarded the Davy medal of the Royal Society in 1891. Author of 'Die Thiophengruppe' (1888); 'Chemische Probleme der Gegenwart' (1890);

'Lehrbuch der organischen Chemie' (2 vols., 1891-92); 'Märztage im Kanarischen Archipel' (1893), etc.

**MEYER-HELMUND, Erik**, Russian-German composer: b. Petrograd, 25 April 1861. He studied in Berlin and became known as a composer of appealing songs, for many of which he wrote both words and music. Author of the operas 'Margitta' (1889); 'Der Liebeskampf' (1892); 'Heines' Traumbilder' (1912); the burlesques 'Trischka' (1894); 'Lucullus' (1905), and the light opera 'Taglioni' (1912).

**MEYER-LÜBKE, Wilhelm**, German-Swiss philologist: b. Dübendorf, Switzerland, 30 Jan. 1861. He was educated at the universities of Zürich and Berlin, and in 1887 became professor at Jena. He was appointed professor of Romance philology at Vienna in 1890, serving as rector in 1906-07. Author of 'Grammatik der romanischen Sprachen' (4 vols., 1890-1905); 'Italienische Grammatik' (1891); 'Einführung in das Studium der romanischen Sprachwissenschaft' (1901); 'Historische Grammatik der französischen Sprache' (1908); 'Romanisches Wörterbuch' (1912), etc.

**MEYERBEER, mi'ë-bär, Giacomo** (Italianized form of Jakob Meyer Beer), German composer: b. Berlin, 5 Sept. 1791; d. Paris, 2 May 1864. His father, Jakob Beer, was a rich banker of Jewish descent, and of high reputation in the commercial world. The son gave early proof of his devotion to the art of music, and at nine was regarded as a masterly pianist in a city famous for its excellent musicians. After studying composition under Bernhard Anselm Weber, he entered in 1810 the school of the Abbé Vogler at Darmstadt, where for three years he had the companionship of Karl Maria von Weber (q.v.). An intimate friendship sprang up between them, which was only interrupted by the death of the latter. While at Darmstadt Meyerbeer composed a cantata, 'Gott und die Natur,' which brought him the appointment of court musician to the grand-duke. In 1811 his opera 'Jephthas Gelübde' was produced at Munich, but failed to please the audience, though highly praised by Weber, Vogler and other musical authorities. Discouraged by its public reception, Meyerbeer went to Vienna, where he made his début as a pianist with such success that he seemed destined to eclipse the fame of all contemporary artists. Commissioned by the court of Vienna he produced 'Alimelek, oder die beiden Kalifen,' which was no more successful than his former effort. He was induced to visit Italy, and became a convert to the new musical school of that country. He rapidly composed in this style a series of operas, which were generally well received: 'Romilda e Costanza' (1818); 'Semiramide riconosciuta' (1819); 'Emma di Resburgo' (1819); 'Margherita d'Anjo' (1820); 'L'Esule di Granata' (1822); and 'Il crociato in Egitto' (1824). The success of the last-mentioned opera traveled beyond the Alps, and the composer was invited to Paris to superintend the preparations for the production of the 'Crociato' at the Grand Opéra, where it met with an enthusiastic reception. In 1831 his 'Robert le Diable' was produced for the first time, and the excitement it caused was perhaps unparalleled on the Parisian stage. Meyerbeer had ceased to be a

pupil of Rossini, and 'Robert' combined in a singular degree oriental gorgeoussness, German massiveness, French vivacity and Italian brilliancy, which the preceding works of the composer had not prepared the world to expect. He reached the climax of his fame by his next opera, 'Les Huguenots' (1836). He was appointed Royal music director at Berlin in 1842, and returned to Paris in 1849. 'Les Huguenots' was followed at long intervals by 'Le Prophete' (1849); 'Pierre le Grand' ('L'Etoile du Nord' 1854); 'Le Pardon de Ploërmel' ('Dinorah' 1858); and 'L'Africaine' (1865). The composer did not live to see the production of his last work. Besides his operas he wrote many songs, an oratorio, cantatas, a Te Deum, music for the tragedy of 'Struensee' by his brother, and other works. Consult De Curzon, H., 'Meyerbeer: biographie critique' (1910); De Bury, 'Meyerbeer, savie, ses œuvres et son temps' (1865); Hervey, A., 'Meyerbeer' (1913); Mendel, 'Giacomo Meyerbeer, eine biographie' (1868); Pougin, 'Meyerbeer' (1864).

**MEYERHEIM, Friedrich Eduard, fréd'rîh ed'oo-ard mi'ë-him**, German artist: b. Dantzig, 7 Jan. 1808; d. Berlin, 18 Jan. 1879. He studied landscape painting in his native town, and in his 22d year went to Berlin, where he attended the Academy and fell under the influence of Schadow. He became a member of the Berlin Academy in 1838, and a professor there in 1850. Ten lithographic views of Dantzig, published by him in 1832, were included in his 'Architektonische Denkmäler der Altmark Brandenburg,' which appeared the following year. Between 1833 and 1841 he produced a number of genres with a romantic motif as illustrative of peasant and bourgeoisie life. Of such a character is 'The Champion Shot' (1836) in the Berlin National Gallery. In his search for character, costume, scenery and incident he traveled, studied and sketched over a wide area of territory, which included Westphalia, Altenburg, Thuringia, Hesse and the Harz district. His admirable genres are distinguished by a clear enamel-like coloring. Amongst the most notable are 'Leaving Church in Altenburg'; 'In an Altenburg Cornfield'; 'The Little Kid' (1842); 'Bedfellows' (1844); his masterpiece, 'Waiting' (1845); and 'Good Morning, Dear Father' (1858). Consult his 'Autobiography' (1880).

**MEYERHEIM, Paul**, German painter: b. Berlin, 13 July 1842. He was a son of Friedrich Eduard Meyerheim and was taught by his father, and afterward studied at the Berlin Academy. Travel through Belgium and Holland enlarged his artistic experience and knowledge, and he afterward spent a year at Paris. He then returned to Berlin, where he applied himself to animal painting, but also did some portrait, genre of common life, humorous scenes, still life, interior decoration of buildings, etc. He executed works both in oil and watercolors, and his versatility is only equaled by his delicate sense of color and brilliant technique. Considering all these qualities his fertility must be called extraordinary. Some of his best works are 'History of the Locomotive in Seven Pictures on Copper' (Villa Borsig, Berlin); 'An Antiquary of Amsterdam' (1869); 'Four Seasons in the Life of a Bird';

'In the Menagerie' (1891); 'Portrait of his Father and D. Chodowiecki' (1887); 'The Theatre of Monkeys'; 'The Hare and the Frog'; 'Tourists in the Mountains Meeting a Herd of Cattle'; etc. In 1863 he undertook a journey into Egypt, from which he brought back many landscape and figure studies. He is a Royal professor, and has been awarded the grand gold medal at the Berlin Exhibition.

**MEYERSDALE**, Pa., borough in Somerset County, on the Casselman River, 37 miles northwest of Cumberland, Md., and on the Baltimore and Ohio Railroad. The borough is located in a coal mining district, which forms its principal industry. There are also manufacturing of bricks, machinery and cigars. Pop. 3,741.

**MEYNELL**, mī'nēl, Alice Thompson, English poet and essayist: b. London, England 1850. She is the daughter of T. J. Thompson, a friend of Dickens, spent much of her childhood in Italy, became a convert to Roman Catholicism, and was married in 1877 to Wilfrid Meynell, a London journalist. She has published 'Preludes,' a collection of poems (1875), illustrated by her sister Elizabeth, Lady Butler; 'Rhythm of Life' (1893); 'The Color of Life' (1896); 'The Children' (1896); 'The Spirit of Place' (1898); 'John Ruskin' (1900); 'Later Poems' (1901). Consult Archer, 'Poets of the Younger Generation' (New York 1902); 'Ceres' Runaway' (1910); 'Mary, Mother of Jesus' (1912); 'Collected Poems' (1913); 'Essays' (1914). The quality of her work stands very high, but her output in poetry has been small—her 'Collected Poems' contain only 76 pieces. She is regarded as the best of contemporary English poetesses, and her sister, Lady Butler, was the best woman artist of her time.

**MEYRICK**, mī'rīk, Frederick, English Anglican clergyman and controversialist: b. Ramsbury vicarage, Wiltshire, 28 Jan. 1827; d. Blicking, 3 Jan. 1906. He was educated at Oxford, where he was tutor (1851-59) and he was ordained to the priesthood in 1852. Since 1868 he has been rector of Blicking, Norfolk, and a canon non-residential of Lincoln from 1869. He was moderately evangelical in his views and strongly anti-Roman, and labored for the establishment of a union between the Anglican and the old Catholic churches on the Continent. Among his many works, some of which are controversial books in Latin, Spanish, etc., may be cited 'The Practical Working of the Church in Spain' (1857); 'University and Whitehall Sermons' (1859); 'Kingsley and Newman' (1864); 'Justin Martyr' (1896); 'Scriptural and Catholic Truth and Worship' (1901); 'Memories' (1905).

**MEZEN**, mēz-āny', or **MESEN**, a river in the northern part of Russia in Europe. It rises in the Timan Mountains, flows north and south, forming two loops, then its course changes to the northwest through the government of Archangel and enters the White Sea through Mezen Bay. It is about 510 miles in length. It is navigable for some distance from the mouth; but is ice-locked about six months in the year.

**MEZEREON**, mē-zē'rē-ōn, or **MEZEREUM**, the dried bark of *Daphne mezereum* Linné, *Daphne gnidium* Linné, or *Daphne*

*laureola* Linné, of the family *Thymeleaceæ*. All are hardy, low shrubs. *Daphne Mezereum* has a smooth, dark-gray bark easily separated from the wood. The flowers precede the leaves and are of a purplish rose-color, or very rarely, white, and are fragrant. The fruit is oval, bright red, or yellow from the white-flowered variety, fleshy and contains a single round seed. It is native to Europe and western Asia and has escaped cultivation in eastern United States and Canada. *Daphne gnidium* has a deep purplish-brown bark and white flowers, the bark being equally active medicinally with *Daphne mezereum*. It is native to the dry, uncultivated portions of southern Europe. *Daphne laureola* or *Spurge laurel* has a purplish-gray bark and is used commercially, but its medicinal value is inferior. The bark of both stem and root is used, although that of the root was formerly thought superior. The dried bark of the *Daphne mezereum* is olive-brown; of *Daphne gnidium* purplish-brown; of *Daphne laureola* purplish-gray. The taste is at first slight but is of increasing acidity and pungency. The bark is almost odorless. The berries and leaves of the plant are also active and have been known to prove fatal to children. The berries are used in Russia as a purgative; and a tincture is used in Germany as an external remedy for neuralgia. The application of the bark to the skin causes inflammation followed by vesication, and it has long been used as an epispastic in southern Europe. A small piece of the bark is moistened with vinegar and is applied and renewed twice daily until a blister is formed, and occasionally longer to insure discharge. Its action is slow, requiring 24 to 48 hours to vesicate. An ointment was formerly prepared to maintain discharge from blistered surfaces. It is of value in cases of obstinate ulcers, but valueless as an internal remedy. Overdoses produce nausea, vomiting and purging; and it has been known to act as a narcotic. It is used in combination with sarsaparilla in preparing the beverage of that name. See DAPHNE.

**MEZES**, Sidney Edward, American educator: b. Belmont, Cal., 23 Sept. 1863. He was graduated from the University of California in 1884 and received his doctor's degree from Harvard University in 1893. From 1892 to 1914 he was engaged in teaching, principally at the University of Texas, where he was professor of philosophy and dean of the college. In 1908 he was elected president of that university, and in 1914 he succeeded John H. Finley as president of the College of the City of New York. Dr. Mezes is ex-president of the Texas Academy of Science and has contributed many articles on ethical and philosophical subjects for reviews. His published works are 'The Conception of God' (1897); 'Ethics, Descriptive and Explanatory' (1901), and articles in reviews on education, ethics and philosophy.

**MÉZIÈRES**, Alfred Jean François, älf-rä zhōn frän-swä mē-zē-är, French critic and politician: b. Rehón, 19 Nov. 1826; d. October 1915. He studied at the École Normale and in Athens; was professor of literature at Nancy (1854-61) and at the Sorbonne (1863); became an Academician in 1874; in politics is a member of the moderate Opportunists, and

was deputy from 1881 to 1900, when he was elected senator for Meurthe-et-Moselle. Besides contributions to the *Revue des Deux Mondes* and *Temps*, he wrote 'Shakespeare' (1861); 'Shakespeare's Predecessors and Contemporaries' (1863); 'Shakespeare's Contemporaries and Successors' (1864); 'Dante' (1865); 'Petrarch' (1867); 'Goethe' (1872-73); 'In France' (1883); 'Outside of France' (1883); 'Mirabeau' (1891); 'Petrarch' (1895); 'Dead and Living' (1898); 'The Passing Time' (1906); 'Portraits of Soldiers' (1907); 'Ulбина Verba' (1914).

**MÉZIÈRES**, mă'zyār, Philippe de, French soldier, religious pilgrim and author: b. Chateau de Mézières, Picardy, about 1327; d. Paris, 29 May 1405. While still very young he served under Lucchino Visconti in Lombardy and shortly afterward under Andrew, king of Naples. He served with the French army in Smyrna in 1346, was knighted and afterward went to Jerusalem where he endeavored to found an order of knighthood to be maintained in the holy city for its protection against the Mohammedans. He visited Cyprus in 1347 and made a convert of Peter, the son of King Hugo IV; and after the accession of Peter to the throne, in 1358, he returned to the island and became his chancellor, probably in 1360. He was associated here with the legate Peter Thomas, who became patriarch of Constantinople in 1364. Mézières traveled with King Peter to the courts of western Europe, seeking support for a new crusade, and was with him at the capture of Alexandria in 1365. One-third of the booty was awarded Mézières for the creation of his order, the plan of which was laid forth in his 'Nova religio passionis' (1367-68), and which he extended in 1386 and 1396. Finding the Crusaders unwilling to aid him in realizing his dream Mézières was commissioned to visit Venice, Avignon and western Europe to enlist their aid for the kingdom of Cyprus against the sultan. Failing in his efforts he again sought converts for his order, but in 1368 returned to Cyprus, where he remained until the assassination of King Peter in 1369. In 1372 he was attached to the court of Pope Gregory XI, and in 1373 he became a counsellor of Charles V, at Paris. He enjoyed the king's full confidence and was tutor to his son, who became Charles VI. After the accession of Charles VI, however, Mézières retired to the Convent of the Celestines. He never lost touch with public affairs, but devoted himself chiefly to literature and the endeavor to establish his order at Jerusalem. His writings are of great historical value. His life of his friend and confrere, Peter Thomas, 'Vita S. Petri Thomasi' (Antwerp 1659), contains a highly valuable account of the Alexandrian expedition. Most of his writings concerned his project for the founding of his Order of the Passion, among them being 'Songe du vieil pélerin' (1389) and the autobiographical 'Oratio tragédica.' He was an earnest worker for friendship between England and France, and greatly desired the marriage of Richard II and Isabella of France, believing that it would ensure peace between the two countries and that his crusade could then be successfully inaugurated. His 'Épitre lamentable et consolatoire' (1397) was written after the disaster

which overtook the Crusade of 1396, which he had not thought well advised. Consult Jorga, N., 'Philippe de Mézières et la croisade au xiv siècle' (1896).

**MÉZIÈRES**, France, capital city of the Department of Ardennes, on the neck of a peninsula formed by the Meuse, 55 miles north-east of Rheims, on the Eastern Railway. It is connected by a bridge with Charleville on the opposite bank of the Meuse, which, together with Arches, Pierre and Mahon, forms practically one city with Mézières. It was formerly a fortified town but its forts were dismantled in 1886. It was successfully defended by Bayard against Emperor Charles in 1521, but was besieged and taken by the Germans in 1815 and in 1871. It fell into German hands early in the European War in 1914 and remained in the enemy's hands until after the signing of the armistice, 11 Nov. 1918. See WAR, EUROPEAN. Its parish church is a fine Gothic edifice dating from the 16th century. Together with Charleville it forms an important manufacturing centre in the metallurgical industries. Pop. about 10,403.

**MEZŐTUR**, mēzō-tēr, Hungary, city in the County Jász-Nagykun-Szolnok, on the Berettyo, an affluent of the Tisza, 88 miles east of Budapest. It is situated in a rich agricultural district for which it furnishes a trade centre, and there are extensive communal pastoral lands upon which large herds of cattle are grazed. There are several large fairs held annually and the town has important potteries. Pop. 25,835.

**MEZZA-MAJOLICA**. See POTTERY MANUFACTURE.

**MEZZANINE**, in architecture, a low window occurring in attics and entresols. Sometimes applied to an entresol. A mezzanine story is a half story; one lower than the stories above and below. In theatres it is usually a floor between the stage and the bottom of the deep cellars of large theatres, from which floor the short scenes and traps are worked, the large scenes going down through openings into the cellar; hence the name, from being midway between the stage and cellar floor.

**MEZZOFANTI**, Giuseppe Gaspardo, joo-sēp'pē gās-pār'dō mēd-zō-fān'tē, Italian linguist: b. Bologna, 17 Sept. 1774; d. Rome, 15 March 1849. He studied at the seminary of Bologna, and took priest's orders in 1797. He was appointed librarian and professor of Oriental languages at the university; in 1831 went to Rome, there succeeded Angelo Mai as keeper of the Vatican Library (1833), and in 1838 was made cardinal. It is said that he was familiar with over fifty languages, and even with the provincialisms of these various tongues. Byron called him "a monster of languages, the Briareus of parts of speech." His library and his papers came into the possession of the University of Bologna. His attainments were not entirely limited to proficiency in languages, but only one printed work of his, a eulogy of Emmanuele da Ponte, a Spanish Jesuit who had taught him Greek, is in existence. Consult the 'Lives' by Russell (1858; 2d ed. 1863) and Bellesheim (1880); Manavit, 'Esquisse Historique sur le Cardinal Mezzofanti' (1854); 'Quarterly Review,' Vol. CI.

**MEZZOTINT**, met'sō-, a process of engraving on copper which dates from the 17th century. The smooth plate of the metal is abraded with a file-like tool, and tiny points are raised over the surface. These points catch and hold the ink, and an impression taken from a plate in this condition would give a soft velvety mass of black without variety of light and shade. A burnisher is next used to get rid of the raised points where half tones and lights are wanted. Sometimes where very brilliant high lights are required, they are cut away so as to ensure a smooth surface of copper. By means of this burnishing process, all gradations of light and shade are obtained from the white of the smooth copper to the black of the roughened plate. See ENGRAVINGS.

**MHOW**, m-how', India, town and British cantonment, in the Rajput state of Indore, 13 miles southwest of Indore. The town, situated on an eminence 1,800 feet high above the Gumber, is European in its appearance, having a church with a conspicuous steeple, a well-furnished library, a spacious lecture-room and a theatre. The cantonment is situated half a mile southeast of the town, and, in virtue of the Treaty of Mandsaur, is occupied by a considerable force. Mhow was one of the centres of the Sepoy mutiny of 1857. Pop. about 29,820.

**MIACIDÆ**, one of the most recent and most important families of creodonts, distinguished by a single pair of carnassial teeth, and by a larger brain-case and more advanced brain than other creodonts. The feet were five-toed, and spreading, and their claws were small, sharp and partly retractile. In general the structure was a composite of characters that seems to have led by specialization to the various families of fissipede carnivores of more modern times. This development becomes very apparent in the Carnivora of the Eocene, especially in the direction of the dog-type. It may be said that the Miacidæ represent the stock that in the Upper Eocene "passed imperceptibly into the Fissipedia, more obviously into the dog family," which naturalists consider stands in the central line of fissipede development.

**MIAGAO**, mē-ā-gā'ō, Philippines, a pueblo of the province of Iloilo, Panay, on the southern coast of the island on Iloilo Strait, 22 miles west of Iloilo, the provincial capital. Pop. 20,656.

**MIAKO**, mē-ā'kō. See KIOTO.

**MIALL**, mi'al, Edward, English non-conformist politician: b. Portsmouth, 8 May 1809; d. Sevenoaks, Kent, 29 April 1881. He studied at Wymondley Theological Seminary, Hertfordshire; was pastor of independent chapels in Ware, 1831-34, and in Leicester, 1834-41; then removed to London, where he founded the *Nonconformist*, a weekly devoted to church disestablishment. From 1852-57 and again from 1869-74, he was a member of the House of Commons. He was one of the founders of the Liberation Society, and in 1858 was appointed to represent Non-conformity on the Education Commission. He urged the disestablishment of the Irish Church in 1856, and repeatedly moved for the formation of committee on English disestablishment. He was twice the recipient of valuable public testimonials. He wrote 'The

Nonconformist Sketch Book' (1845), 'The British Churches in Relation to the British People' (1849), 'Wayside Musings' (1865), and 'Social Influences of the State Church' (1867). Consult the 'Life' by his son Arthur (1867).

**MIALL**, Louis C., English naturalist: b. Bradford, 1842. He was made curator of the Leeds Literary Society in 1871 and professor of biology in the University of Leeds, 1876-1907 and was Fullerian professor of physiology the Royal Institution, 1904-05. He has written 'Object Lessons from Nature' (1891); 'Anatomy of the Indian Elephant' (1878); 'Natural History of Aquatic Insects' (1895); 'Round the Year' (1896); 'Thirty Years of Teaching' (1897); 'Injurious and Useful Insects' (1902); 'House, Garden and Field' (1904); and 'The Early Naturalists' (1912).

**MIAMI**, mi-ām'ē, Ariz., town in Gila County, in the Pina Mountains, 10 miles west of Globe and 60 miles east of Phoenix, on the Arizona Eastern Railway. The town owes its existence to the rich copper mines in its vicinity and dates from 1909, being incorporated in 1914. It is growing rapidly and the buildings are largely of concrete. Its light and power are supplied from the Roosevelt Dam, 40 miles to the northwest. Pop. 10,000.

**MIAMI**, Fla., town and county-seat of Dade County, at the mouth of Miami River on Biscayne Bay, and on the Florida East Coast Railroad. It has steamship connection with Havana, Nassau and San Juan. It is situated in an important citrus fruit and trucking district and is a shipping centre for great quantities of fruit and winter vegetables for the northern market. It has also a considerable fishing industry; and sponge fishing also is carried on in Biscayne Bay. The town dates from its selection as the southern terminal of the Florida East Coast Railway in 1896, at which time it was practically non-existent. The railroad was later extended to Key West, and the erection of the Royal Palm Hotel formed the inauguration of the town as a winter resort. The United States subtropical laboratory is located here, and it is the site of the now abandoned Fort Dallas, famous in the Seminole War. Pop. 5,471.

**MIAMI**, Okla., village and county-seat of Ottawa County, 16 miles southwest of Baxter Springs, Kan., on the Saint Louis and San Francisco, the Missouri, Oklahoma and Gulf, and the Oklahoma, Kansas and Missouri Inter-urban railroads. It is situated in a rich grain-growing district and there is a considerable industry in lumber, as well as the mining of lead and zinc. Pop. 2,907.

**MIAMI**, a river of Ohio, which rises in Hardin County and flowing south and southwest for a distance estimated at 150 miles, passing Troy, Dayton and Hamilton, enters the Ohio River at the southwest corner of the State, 20 miles west of Cincinnati. It is a rapid stream, passing through a picturesque and fertile country, and admits of navigation for only a portion of its length. Its principal branches are the West Branch, the Mad and the Whitewater rivers. The Miami Canal runs along the river for about 70 miles, and together they furnish extensive power for manufacturing

purposes. This river is sometimes called the Great Miami, in distinction from the Little Miami, which rises in Madison County, and after a southwest course of about 100 miles, nearly parallel to the former, enters the Ohio six miles east of Cincinnati. It is skirted for the greater part of its course by the Little Miami Railroad, connecting Xenia and Cincinnati.

**MIAMI INDIANS**, an American tribe of the Algonquian family, and first known to French explorers in 1658 and then located near Green Bay, Wis. In 1700 they removed to Illinois, Indiana, and Ohio, and later separated into two distinct tribes Wea and Piankshaw. In the Colonial wars the Miamis figured with both combatants, but eventually joined Pontiac's alliance in 1764, opposing the Americans. After their defeat by General Wayne they signed a treaty at Greenville in 1795. They again joined the British against the Americans in 1812, fighting under Tecumseh (q.v.). In 1827 they sold most of their lands and removed to Kansas. Disease killed off the majority of them, and the remnant of the tribe located in Wabash County, Ind., until 1872, when they moved to the Quapaw Reserve in Indian Territory. In 1905 their numbers—which probably never at any time exceeded 1,700—in Indian Territory were 124, and in Indiana 243, all of mixed blood.

**MIAMI UNIVERSITY**, in Oxford, Butler County, Ohio, is a coeducational institution. In 1788 J. C. Symmes purchased from the United States 1,000,000 acres of land, bounded south by the Ohio River, east by the Little Miami, and west by the Great Miami. One condition of this purchase was, that a full township, six miles square, should be set apart "for the endowment of an academy and other seminaries of learning." This condition was not complied with; but as the prospect of the establishment of a university within the bounds of Symmes' purchase had induced many to settle there, in 1803 Congress ceded to the State of Ohio the township of Oxford, to be held in trust for educational purposes. The university was incorporated in 1809. The lands are leased for 99 years (renewable forever, without re-valuation), subject to an annual quitrent of 6 per cent on the purchase money. The government is vested in a board of 27 trustees appointed by the governor of the State, nine of whom retire every third year. A grammar school was established in 1818, and in November 1824 the college department proper was opened. The school has normal and college departments, the courses leading to the degrees of B.A. and B.S. In 1916 there were connected with the institution 55 professors and instructors and 789 students in the regular year, 1,154 in the summer school. The grounds and buildings were valued at \$900,000. There were over 46,000 volumes in the library. The State aid amounted to about 205,652, and the total income from tuition, productive fund and State was \$250,000. The first class, consisting of 12 members, was graduated in 1826.

**MIAMISBURGH**, mī-ām'iz-bērg, Ohio, city, in Montgomery County; on the Miami River and the Miami and Erie Canal, and on the Cleveland, Cincinnati, Chicago and Saint Louis and on the Cincinnati, Hamilton and Dayton railroads; about 45 miles north by east of

Cincinnati. It is an agricultural region, where abundant water power has made it an important manufacturing place. It has large shipments of tobacco, manufactures and cereals. One of the largest Indian mounds in the State is just outside the city. In March 1913 the city suffered severely from a river flood, the damage being estimated at \$1,500,000. Pop. about 4,300.

**MIANABUG**, a Persian tick of the genus *Argas*, greatly dreaded by travelers in former times; but its reputed powers of poisoning and otherwise harming humanity have been greatly exaggerated.

**MIANTONOMOH**, mī-ān-tō-nō'mō, an American Indian chief, a sachem of the Narragansetts, who succeeded his uncle, Canonicus, in 1636. In 1637 he assisted the early settlers of Massachusetts in the Pequot War. In 1643 he attacked Uncas, his bitter rival, was captured and turned over to the commissioners of the United Colonies at Boston. He was placed on trial before an ecclesiastical court, found guilty, condemned to death, and Uncas was commissioned to carry out the sentence. A brother of Uncas, however, assassinated the captive before the sentence could be executed. He was buried where he fell, and a monument was erected over the spot in 1841.

**MIAO-TSE**, mē-ā'ō-tse, or **MIAU-TSI**, general name of numerous aboriginal Chinese tribes dwelling in the provinces of Yunnan, Kweichow, Hunan, Kwangsi and Kwangtung, China. They are hillmen and number some 80 tribes, with a population running into millions, although their numbers are decreasing. While nominally under Chinese rule they are practically independent, maintaining their own government, customs and dress; the authority of the Empire extending only so far as to keep them within the hill districts and prevent their attacking their neighbors. They speak several dialects and the customs of the different tribes vary considerably. The last serious uprising was in 1832, since when they have in the main kept to themselves. They are of low stature and more angular in feature than the Chinese, and somewhat darker of complexion. Consult Bridgman, E. C., 'Sketches of the Miao-tsi'; Williams, S. W., 'The Middle Kingdom' (1883); Edkins, 'The Miao-tsi Tribes' (1870); Boulger, D. C., 'The History of China' (1898).

**MIAS**. See **ORANG-UTAN**.

**MIASMA**, or **MIASM** (Gr., "pollution"), an ancient term, now obsolete, which meant a disease-producing emanation in the atmosphere, from decaying animal or vegetable material; malaria; malarial poison. Diseases at one time supposed to be thereby produced were classified as miasmata—such as intermittent and remittent fever, typhus and typhoid fever. The term is used infrequently at the present day, as micro-organisms (bacteria-germs) are believed to be responsible for the spread of most of these diseases, and do not exist in the form of a miasm. While some of these organisms are carried by the atmosphere, and are inhaled, others are conveyed by insects to articles of food, and are taken into the body when such food is eaten. Others, still, are elaborated in a kind of mosquito (*Anopheles*) and injected into the blood.

**MIASSKY ZAVOD**, mē-ās'kē zā-vōd, or **MIAS**, **MIYASS**, or **MIYASK**, eastern Russia, city in the government of Orenburg, in the Ural Mountains, 35 miles west of Cheliabinsk, near the Trans-Siberian Railway. It has important gold mines. Pop. 25,479.

**MIAULIS**, mē-ow'lēs, **Andreas Vohos**, or **Bokos**, Greek admiral: b. Negropont, about 1768; d. Athens, 24 June 1835. His family name was Vokos or Bokos, his surname Miaulis being derived from the Turkish word for a felucca. He was a wealthy merchant captain living on the Island of Hydra at the outbreak of the Greek war of independence in 1821, and was appointed to the command of the Greek fleet. He assisted at the relief of besieged Missolonghi in 1822-23, and succeeded in blocking the Turks' further advances after their capture of Psara in 1824. He was able to supply troops and stores to Missolonghi in the second siege of 1825, although he could not prevent the fall of the town. He was outnumbered by the Egyptian naval forces, but succeeded in hampering their movements. He was superseded in the command of the Greek naval forces by Lord Dundonald in 1827, and thereafter ably supported his successor, the representative of the powers intervening in behalf of Greece. After the establishment of Greek independence he was a vigorous antagonist of Capodistrias and the Russian party, and again commanded the fleet in the insurrection of 1831. He was one of the deputation commissioned to offer the Greek crown to King Otho, and he remained his staunch supporter. He was named by King Otho rear-admiral, and later, vice-admiral.

**MICA** (Lat. *mīco*, flash), a mineral group, marked by high basal cleavage, and laminae which may be made very thin by a process of continued separation. The micas are silicates; muscovite, the commonest, is a silicate of potassium and aluminum, and is often styled potassium mica; paragonite, or sodium mica, corresponds closely to muscovite, but has sodium instead of potassium; biotite, a silicate of magnesium, potassium and iron, is marked by its darker tints, and is commonly called magnesium iron mica; lepidolite is a lithium mica, with fluorine, potassium and aluminum in its composition, and a rose tint. Mica is widely scattered in North America and Asia, especially India. Ruby colored mica, no matter what its provenance, is now called "Indian." Europe has no commercial supply. Deposits are most frequently found in pegmatite (q.v.) dikes, varying in thickness from a few inches to several hundred feet, and correspondingly in length. Many other minerals accompany it, especially quartz and feldspar, and the mica is scattered through the dike, or vein, as the miners call it. Moreover, scarcely more than 10 per cent, and sometimes as little as 2 per cent, is commercially useful. Mica was well known in prehistoric America, traces of its use being widespread. A great shaft near Mount Mitchell, in North Carolina, was discovered in 1869. This not merely solved the question as to the origin of the early supply, but gave the first impulse to the mining of mica in the United States. Mica lands in North Carolina became tremendously valuable. This boom was quickly followed by the development of the industry in southern New Hampshire; and this

in turn by important discoveries, in the 80's, in Canada and India. In Quebec, Ottawa and Perth and Renfrew counties, Ontario, the supply is of excellent quality, and hence is easily mined and cheap. Hindu labor and an excellent grade of mica make the output of Bengal, Bombay and the Madras presidency even cheaper. To classify the various sources of supply roughly, it may be said that India gives the world one-half, and Canada and the United States each about one-fourth of the entire supply. Everywhere the "veins" start near the surface; hence mining is simple. In New Hampshire there has been a break from the primitive methods, but in North Carolina, apparently the richest field in the United States, the mining is still unorganized, being done almost entirely by farmers, with the simplest of tools, between crops. In this region, mica is largely used as a medium of exchange between farmers and storekeepers.

In 1870 mica waste was first utilized by Frederick Beck, who introduced the use of "mica-flour," or ground mica, as a coating for cheap wall-papers. Scrap-mica, formerly worthless, rose to \$17 a ton, and then gradually fell to \$6 or \$7. This branch of the business is confined to the United States. Since 1895 there has been a fresh and most important use for mica, namely, as an insulator. For this purpose the sheets are split very thin and glued to cloth, then wound into rings for armatures. As a result of this variation of the uses of mica, only the colorless sorts, notably muscovite, are largely used for lamp chimneys and stove doors. Mica is also valuable as a lubricant, as an absorbent of glycerine in making dynamite, and, in the case of the lithium silicates, such as lepidolite, in the manufacture of lithium salts. See MINERAL PRODUCTION OF THE UNITED STATES.

**MICA SCHIST**, schist, a schistose rock, metamorphic in nature, containing mica and quartz. The origin of most of the mica schists is uncertain; the sericite variety seems to be the result of mountain-building forces acting upon igneous rocks; other sorts are almost as certainly due to the same force acting upon sedimentary rocks. Mica occurring in schist is usually muscovite, that is, the colorless sort; biotite, or dark mica, is less frequent. Various embedded minerals occur, notably garnets.

**MICAH**, mī'kā, the sixth of the minor prophets, dwelt in Moresheth, a little town, once a dependency of the Philistine city of Gath, but by the conquests of Uzziah reduced with the whole of western Judah, including the city of Gath, to Hebrew domination. His main public work was accomplished during the reign of Hezekiah. He dwelt on the great international highway between Egypt and Assyria and was led to take a wide view of the political movements in Western Asia in their effect upon his own people. He lived in the 8th century B.C. and he witnessed the ending of the northern kingdom, and the invasion of Palestine by Sargon and Sennacherib. He witnessed also the corruption of morals which Hezekiah only partially corrected. His prophecy is directed against Samaria and Jerusalem, whose sufferings for their sins and irreligion he declares shall be greater than those of Babylon and the other Gentile cities. His style is pure and correct, his images bold, his denunciations full of strength and severity.

**MICAH, Book of.** The title of the book, i, 1, describes it as "the word of Yahweh that came to Micah the Morashtite in the days of Jotham, Ahaz, and Hezekiah, kings of Judah." In Jeremiah xxvi, 18, is a quotation from the words of the elders: "Micah the Morashtite prophesied in the days of Hezekiah king of Judah." The chronology of this period is somewhat uncertain. The probable dates, however, are Jotham, 740-736; Ahaz, 736-727; Hezekiah, 727-695. The title, like most similar titles, is doubtless a later editorial addition. Hence the evidence indicates most definitely the activity of Micah during the reign of Hezekiah. The most probable period is shortly before the capture of Samaria, i, 5-6, perhaps about 724 B.C., although this might refer to a later period, inasmuch as Samaria was not entirely destroyed at that time and, according to the Assyrian records, was active again not long after that event.

It is now quite generally agreed that Micah was not the author of the whole of the book. But there is much difference of opinion concerning the details of authorship. The most of chapters i-iii is a unity, with the exception principally of ii, 12-13, and was doubtless written by Micah. This is throughout a message of condemnation with a prediction of punishment upon Judah, and to a minor degree upon Israel, for their sins. The remainder of the book contains some portions of a tenor similar to this, but consists for the most part of messages of blessing and restoration. There are two parts, chapters iv-v, and vi-vii. It seems reasonably certain that Micah was not the author of all of iv-vii, especially because of obvious inconsistencies, both within these chapters and as compared with i-iii: v, 2-4, e.g., is out of harmony with v, 5-6; iv, 11-13 is inconsistent with iii, 12. The connection of thought in iv-vii is not close so that evidently either the original order has been changed, or it was originally a composite of miscellaneous portions. The following portions in iv-vii are similar, as messages of punishment, to i-iii, and were probably written by Micah: v, 1, 10-13; vi, 9-16; vii, 1-6. Most of the remainder of iv-vii together with ii, 12-13 contains messages of hope and restoration after disaster. It is a possibility that most of this may have been written by Micah. But, if so, it must have been at a different period, presumably much later, as Isaiah probably gave some messages that were distinctly of hope at the latter end of his ministry. The strong probability remains, however, that these portions were not written by Micah but consist of various later fragments, mostly of the time of the exile and after the exile. The change of tone is less probable for Micah than for Isaiah, because Micah's original message had in it no real hope, while that of Isaiah did, at least from an early period in his ministry.

Micah is described as the Morashtite, meaning probably an inhabitant of Moresheth-gath, Micah i, 14. This place is not mentioned outside of this verse. It probably was a town named Moresheth, a dependency of the well-known Philistine city Gath. He was thus of the country, and shows a corresponding type of message, differing markedly from that of his contemporary Isaiah who was a city-dweller, an inhabitant of Jerusalem. Micah's denuncia-

tion of the sins of the people and threats of punishment are similar to those of Amos. His most characteristic specific addition to the prophetic message is the prediction, first given by him, that Jerusalem shall be destroyed for the sins of the people, iii, 12. The later additions to Micah for the most part contain no specially notable message. vi, 6-8 give, however, a clear statement of the high prophetic ideal of life.

GEORGE RICKER BERRY,  
*Professor of Old Testament Interpretation and Semitic Languages, Colgate University.*

**MICAH CLARKE**, a novel by Sir Arthur Conan Doyle, published in 1888. It presents in the form of fiction a graphic and vivid picture of the political condition in England during the Monmouth Rebellion (1685).

**MICAWBER**, mī-kā'bēr, Mr. Wilkins, a shiftless, unsuccessful optimist, always in trouble, but always sure "something will turn up," one of the secondary characters in Dickens' 'David Copperfield' (1849). He is a portrait of the novelist's father, not only in character but in the principal incidents in his career, and Mrs. Micawber, who has great faith in her husband, was patterned after Dickens' mother.

**MICELLAR THEORY**, in botany, the theory, proposed in 1862 by the Swiss botanist K. W. Nageli (q.v.), that the accretion of starch-grains and similar bodies within cells in a living plant, and the formation and growth of the walls of cells, was by means of molecules, each an aggregation of lesser molecules, to which he gave the name *micellæ*. They are invisible to even the highest powers of a microscope. Two or more having united, the growth of the grain to be composed, or the cell-wall to be broadened, is accomplished by more micellæ crowding into crevices between those already in place. Some important plant-physiologists have always refused to accept this hypothesis, which is now generally distrusted.

**MICHAEL**, mī'kēl or mī'kā-ēl (Hebrew, "who is Godlike"), is spoken of in Daniel (x, 13, 21; xii, 1) as one of the "chief princes," and the "great prince." In Jude (verse 9) he is called the archangel who disputed with the devil about the body of Moses. In the Revelation (xii, 7) it is said "there was war in heaven: Michael and his angels fought against the dragon." From this expression it has been inferred that he was the chief of the celestial hierarchy. Milton calls him "of celestial armies prince," and "prince of angels," and attributes to him the command of the heavenly forces. He was ranked by Thomas Aquinas, followed by Dante, as the first of the seven archangels, a character in which he first appears in the Ethiopian Enoch, in which he is represented as executing the commands of God at Judgment Day, or presenting the prayers of the saints before the throne of God. In France especially churches dedicated to this saint, whose day in the Western Church is 29 September, are often built on the loftiest hill tops, to afford the

warrior angel a vantage ground in warring against the evil "powers of the air" and driving off plague, drought and murrain.

**MICHAEL I, RHANGABE, or RHAG-ABE**, Byzantine emperor: d. about 845. He succeeded Stauracius in 811 and after carrying on war with the Bulgarians was deposed in 813 by Leo V, an Armenian general in his service, and spent the rest of his life in a convent.

**MICHAEL II Balbus (THE STAMMERER)**, Byzantine emperor: d. 829. He came of an obscure Phrygian family, but was ennobled by Leo V. The latter, however, suspecting Michael of conspiracy against him, ordered the Phrygian to be put to death. Michael saved himself by the assassination of Leo and became emperor in 820. During his reign Sicily and Crete were lost to the Western empire.

**MICHAEL III (THE DRUNKARD)**, Byzantine emperor: d. 867. He was a grandson of Michael II, and in 842 succeeded his father, Theophilus, though his mother Theodora continued regent till 856. With his uncle, Bardas, he made an expedition against the Bulgarians in 861 and converted the king of Bulgaria. In 866 he associated Basilus the Macedonian with himself in the government and was assassinated by him the next year.

**MICHAEL IV (THE PAPHLAGONIAN)**, Byzantine emperor: d. 1041. He received his surname from the place of his nativity, and became chamberlain to Zœe, wife of the Emperor Romanus III. On the death of Romanus in 1034 he became emperor and the husband of Zœe, who is presumed to have murdered Romanus because of her love for Michael.

**MICHAEL V, Calaphates (THE CALKER)**, Byzantine emperor. He was a nephew of Michael IV, whom he succeeded on the throne. His banishment of the Empress Zœe led to a revolt in Constantinople, in which he was overthrown and compelled to retire to a convent.

**MICHAEL VI (THE WARRIOR)**, Byzantine emperor. He succeeded the Empress Theodora in 1056, but after the expiration of a year was deposed by Isaac Comnenus and spent the rest of his life in a convent. He was the last of the Macedonian dynasty.

**MICHAEL VII, Ducas or Parapinaces**, Byzantine emperor. He was the son of Constantine XI, and came to the throne in 1071. He was a weak monarch, the prey of unscrupulous favorites, and an insurrection in 1078 drove him from the throne and into a monastery.

**MICHAEL VIII, Palæologus**, Byzantine emperor: b. 1234; d. 1282. After having commanded the French mercenaries employed by the emperor of Nicæa he became one of the guardians of the Emperor John Lasçaris in 1259. The next year he was proclaimed joint emperor of Nicæa in 1260, and the next year, after deposing his colleague Lascaris, became sole monarch. In the same year he wrested Constantinople from the Latins and was shortly afterward crowned emperor of the Byzantine empire. He made an unsuccessful attempt to effect the union of the Western and Eastern Churches.

**MICHAEL IX, Palæologus**, Byzantine emperor: d. 1320. He was the son of Andro-

nicus II, with whom he was associated in the government after 1295, but died before his father.

**MICHAEL**, Tsar of Russia. See **ROMAN-OFF**.

**MICHAEL, Arthur**, American chemist: b. Buffalo, N. Y., 7 Aug. 1853. He was educated at the universities of Berlin and Heidelberg, and at the École de Médecine de Paris. He was professor of chemistry at Tufts College in 1882-89 and in 1894-1907, and was professor emeritus there in 1907-12. Since 1912 he has been professor of organic chemistry at Harvard University. He is a member of the National Academy of Sciences. He has made extensive researches in pure chemistry and published reports of his investigations in the 'Proceedings' of the National Academy of Sciences; the *American Chemical Journal*; and the 'Berichte der deutschen hemischen Gesellschaft.'

**MICHAEL, Attaliates**, Byzantine jurist: lived in 11th century. He wrote a history of the years 1034-79; and published a succinct and methodic abridgment of the *Basilicæ* (1073).

**MICHAEL**, a pastoral narrative in 482 lines of blank verse, by William Wordsworth, was composed and published in 1800. In a letter to Fox, 14 Jan. 1801, Wordsworth writes: "In the two poems, 'The Brothers' and 'Michael,' I have attempted to draw a picture of the domestic affections, as I know they exist among a class of men who are now almost confined to the north of England. They are small independent proprietors of land, here called statesmen, men of respectable education, who daily labor on their little properties. . . . Their little tract of land serves as a rallying-point for their domestic feelings, as a tablet upon which they are written, which makes them objects of memory in a thousand instances, when they would otherwise be forgotten." The theme of Michael, as suggested in Wordsworth's letter, has two phases: the love of a "statesman" for his little landed property in the hills, and of a father for his son. The story of the poem is founded upon fact. To Michael and his wife in their old age is born a son, Luke, whom his father cherishes both as a companion and as his heir. When Luke is 18 years old, Michael, through the fault of another, loses a portion of his property. Luke must go to the city and there earn enough to redeem the land. Before the boy leaves, he lays the corner-stone of the sheepfold which he and his father were to build together, now left for the old man to build alone. Far away in the city, Luke is finally led away by bad companions and is heard from no more. The old father's heart is broken; the sheepfold, symbol of his faith and love, is never finished.

'Michael' is an illustration of Wordsworth's theory that the emotions find their best soil in common life, where they "are incorporated with the beautiful and permanent forms of nature." Michael himself is perhaps Wordsworth's ideal man, and, possibly because he was the type best known to the poet, is more clearly portrayed and more highly individualized than any other of Wordsworth's characters. He has the ruggedness, strength

and majesty of the Westmoreland hills among which he lives. The setting, the characters and the story of the poem are too interdependent, too integrally fused, to be separately analyzed. The style, classical in its simplicity and restraint, and stripped of all extraneous ornament almost to severity, is merely a crystal medium through which appears the essential poetry of the subject. The magical suggestiveness of such lines as

"Hence had he learned the meaning of all winds,"

and

"..... he had been alone  
"Amid the heart of many thousand mists,"

are far surpassed both in suggestiveness and essential poetry by the simple passage which states that the old broken-hearted father often tried to complete the sheepfold, and that

"many and many a time he thither went  
"And never lifted up a single stone."

MARION TUCKER.

### MICHAEL AND HIS LOST ANGEL.

Mr. Henry Arthur Jones during his long career as a playwright wrote more than half a hundred plays which may be roughly divided into three categories,—melodramas, comedies of manners and serious plays. Of the latter group 'Michael and His Lost Angel' is generally regarded by writers on modern drama as the most notable. This consensus of opinion is the more interesting in view of the fact that although on 15 Jan. 1896 the play received the rare distinction of a simultaneous production in London and New York, with Forbes-Robertson and Marion Terry in the principal rôles in London and Henry Miller and Viola Allen in New York. It failed in both places, was withdrawn in its second week and has never been revived. The two chief characters are familiar ones on the stage and especial favorites with Jones, namely, the priestly ascetic and the worldly siren. The opening scene is thoroughly effective. Michael Feversham, an austere young clergyman, has forced the erring daughter of his secretary to public confession of her sin in the church before all the townspeople. When Audrie Lesden, a mysterious and charming new parishioner, presently appears on the scene we are left in no doubt from the moment of her entrance that she is the temptress; her tempting, indeed, is so obvious, the fall of Michael so predestined, and the expiation of his guilt by public confession so plainly foreshadowed in the first scene, that there are no surprises. A more serious defect is that the author fails to enlist the sympathy of his audience for either of his main characters. Michael remains a "holier than thou" prig with what the Freudians would call an "impurity complex," and Audrie is so patently selfish and frivolous that only an actress of very great personal charm could make Michael's infatuation convincing.

**MICHAEL KOHLHAAS.** This story by Heinrich von Kleist was published as the first of his *Erzählungen*, "Stories" (1810), after a fragment of the story had been issued in a periodical, *Phæbus*, two years before. Michael Kohlhaas, an upright and highly respected horse-dealer, is wantonly wronged by a young nobleman; after fruitless efforts to obtain justice from the legally constituted authorities, he

resolves to take matters into his own hands, even in rebellion against the social order which has failed to afford him protection. With pathetic obstinacy he still insists upon the simple terms of his original claim, even after the forces which he has gathered about him have engaged in a kind of civil war. Ultimately he gains his contention, recompense for his loss and the punishment of the privileged offender, but he himself suffers death as a penalty for crimes committed while seeking justice in his own way. The outlines of the story Kleist took from the career of Hans Köhlhase (executed in 1540), which was probably familiar to him both by oral tradition and through the chronicles of Haftitz and Leutinger. But Kleist used the artist's prerogative and altered the material at will, creating the characters anew, and supplying the substance with an ethical problem. Through a sense of personal wrong, following his own conception of justice, a man of spotless integrity becomes a criminal and an outlaw. The problem of so-called folk-justice, which is here illustrated, has been notably treated elsewhere in German literature, conspicuously in Ludwig's 'Erbförster.' Kleist followed his historical source in introducing Martin Luther into the story of his hero, and presents a firmly drawn portrait of the German reformer. The story is a masterpiece of narrative skill; it is all narrative, without description of people or of places, without comment or sentiment; it moves forward with the simplicity of a chronicle, one event following another in tragic and inevitable succession. 'Michael Köhlhaas' is one of the most powerful stories in the whole range of German fiction. It was translated into English by Frances H. King in 'The German Classics' (Vol. IV).

HARVEY W. THAYER.

**MICHAEL OBRENOVITCH III**, *đ-brěn'-đ-vich*, Prince of Serbia: b. Kragujevatz, 4 Sept. 1823; d. near Belgrade, 29 May 1868. He was the youngest son of Prince Milosh, and after the abdication of his father, in 1839, and the death of his brother Milan Obrenovitch II, in 1840, he succeeded to the throne of Serbia. His effort to continue the policy of his father, which was to free Serbia and the Christian peoples of the Balkans generally from Turkish rule, met with the support of Russia and the determined opposition of Turkey and Austria, together with that of the party which had deposed his father. A revolt in 1842 resulted in the election of Alexander Karageorgevich as Prince of Serbia, and Prince Michael was forced to leave the country. In 1858 his father, Prince Milosh Obrenovitch II, was recalled to the throne and upon his death in 1860 Michael succeeded him. He at once set about securing the emancipation of Serbia's internal affairs from Turkish domination, secured an understanding with Montenegro, Greece, Austria and the Bulgarian, Bosnian and Albanian leaders for either support or non-intervention in case of war with Turkey, and demanded the withdrawal of Turkish troops from Serbian fortresses. He was supported in his demands by the influence of Great Britain, Russia and Austria, and Turkey yielded, the forts being surrendered 26 April 1867. He largely reorgan-

ized the administration of public affairs, strengthened the military organization, and placed his country in the ranks of civilized European states. A plot against him was organized by the followers of the deposed Karageorgevich dynasty and resulted in his assassination. He was succeeded by a cousin, Michael Obrenovitch IV.

**MICHAELIS**, *mē-ka-ā'lis*, **Adolf**, German archaeologist: b. Kiel, 22 June 1835; d. Strassburg, 10 Aug. 1910. He was educated at the universities of Berlin, Leipzig and Kiel, and in 1862 became professor at Griefswald. He was appointed professor of classical philology and archaeology at Tübingen in 1865, and from 1872 he was professor of archaeology at Strassburg. He became a member of the German Central Archaeological Institute at Rome in 1874 and published a history of its activities (Berlin 1879). He edited O. Jahn's 'Bilderchroniken' (1873) and Springer's 'Handbuch der Kunstgeschichte' (1898, 1901, 1904, 1907). His chief publication was his critical edition of Tacitus' 'Dialogus de Oratoribus' (1868). He was also author of the archaeological treatises 'Der Parthenon' (1871); 'Ancient Marbles in Great Britain' (trans. by Fennell, 1882); 'Strassburger Antiken' (1901); 'A Century of Archaeological Discoveries' (trans. by Kahnweiler, 1908), etc.

**MICHAELIS**, **Georg**, German statesman: b. 1857. After entering the civil service he acted as a teacher in the German school at Tokio from 1885 to 1889. On his return to Germany he served in various provincial posts as a state attorney. He was appointed director of the Churches and Schools Administration in 1897 and after a period of office in Breslau he became under-secretary in the Prussian ministry of finance. Early in the European War Herr Michaelis, while retaining his post in the ministry, was selected as director of the "War Corn Office," one of the first establishments set up to deal with the food problem. On the fall of Bethmann-Hollweg in July 1917 Dr. Michaelis, then an almost unknown bureaucrat, was appointed Imperial Chancellor by the Kaiser. The appointment occasioned much surprise and speculation; the only one of the eight imperial chancellors of the German Empire from Bismarck to the end of the European War who was not a member of the nobility, Dr. Michaelis was destined to a short and inglorious tenure of that high office. After little more than three months he was dismissed. The charges against him were somewhat obscure and can only be described as a general accusation of incompetence—inability to procure peace or to satisfy any political party in Germany. The Socialist organ, *Vorwärts*, declared that "the remaining of this man in office constitutes a paralysis of all political functions of the empire abroad and at home." Count Hertling (q.v.) was appointed Chancellor on 1 Nov. 1917 and Michaelis retired from the stage decorated with the Chain of the Grand Cross of the Red Eagle.

**MICHAELIS**, **Johann David**, *yō'hān dā'vėd mē'hā-ā'lis*, German biblical scholar: b. Halle, Prussia, 27 Feb. 1717; d. Göttingen, 22 Aug. 1791. He studied at the University of Halle, traveled in Great Britain and Holland, became professor of philosophy at Göttingen in

1746, and professor of Oriental languages there in 1750. He was one of the editors (1753-70) of the *Göttingen gelehrte Anzeigen*, and served for a time as librarian to the university. Modern biblical criticism in Germany sees in Michaelis one of its forerunners, whose works are of interest in the history of its development. They include his 'Hebräische Grammatik' (1778); 'Einleitung in die göttlichen Schriften des neuen Bundes'; 'Mosaisches Recht'; 'Moral' (1792-1823); 'Orientalische und exegetische Bibliothek' (1786-93). Consult his 'Lebensbeschreibung von ihm selbst abgefasst,' ed. by Hassencamp (1793), and his letters (1794-96). Consult the 'Life' by Smend (1896).

**MICHAËLIS**, **Karin** (MRS. CHARLES EMIL STANGELAND), Danish author: b. Randers, 20 March 1872. Her maiden name was Beck-Brøndum, and she was married in 1895 to Sophus Michaëlis (q.v.), from whom she later separated. She was married to Charles Emil Stangeland, an American, in 1912. Author of 'Hoit Spil' (1898); 'Hellig Enfold' (1903); 'Den Farlige Alder' (1910); 'Grev Sylvanus Høvn' (1911).

**MICHAËLIS**, **Karoline**. See VASCONCELLOS, KAROLINE MICHAËLIS.

**MICHAËLIS**, *mī-kā-ā'lis*, **Sophus**, Danish author: b. Odense, 14 May 1865. He was educated at the University of Copenhagen and afterward engaged in extensive foreign travel. He is known as a novelist, poet and dramatist, and also made translations of Flaubert's 'Salammbô'; 'Succassin et Nicolle'; and 'Tentation de Saint Antoine.' He edited *Kunst* in 1900-06. Author of 'Solblomster' verse (1893); 'Æbelo,' romance (1895); 'Livets Fest' (1900); 'Palmerne' (1904); the novels 'Dødedansen' (1900); 'Giovanna' (1901); and the dramas 'Revolutionsbrølup' (1906); 'Den Evige Søvn' (1912), etc.

**MICHAELIUS**, *mē-kā'lē-oos*, **Jonas**, first Dutch Reformed minister in America: b. in the north of Holland, 1577; d. Holland, after 1637. He studied at Leyden, had a country church in Holland from 1612 to 1616; was sent to San Salvador, Brazil, in 1624; was transferred thence to Guinea in 1626; and in 1628 went to Manhattan, where he organized a consistory after the Dutch Reformed government, remaining probably until 1633. His last years were spent in Holland. A letter written by him in 1628, and now preserved in the New York Public Library, describes the condition of the New York Indians, urging work among the children; it is published in the New York Historical Society's 'Collections' (1880).

**MICHAELMAS**, *mik'el-mas*, the feast of Saint Michael and All Angels, 29 September. The festival was first appointed by Pope Felix III, 480. In the Greek Church it did not originate earlier than the 12th century. It was an old custom in England to mark the day by electing civil magistrates, perhaps in allusion to the analogy between the superintendence of magistrates and that of guardian angels, of whom Saint Michael was reported the prince. A more famous custom is that of eating roast goose, the origin of which has long exercised the wisdom of antiquaries. The traditional Michaelmas goose has been traced at least as

far back as the 10th year of Edward IV; and it is said that one of the strongest objections of the English commonalty to the reformation of the calendar was based on the confusion which would follow if Michaelmas day was not celebrated when stubble geese are in their highest perfection. There is an old proverb "If you eat goose on Michaelmas day, you will never want money all the year round." Consult Chambers's 'Book of Days.'

**MICHAL**, wife of King David and younger daughter of King Saul. After David was driven away from court and his life saved by Michal, who favored his escape, her father married her to Phalti, from whom David eventually recovered her, but was permanently alienated from her by her levity and want of sympathy with his enthusiastic joy over the return of the ark to Jerusalem.

**MICHALOWSKI BLASTING POWDER.** See EXPLOSIVES.

**MICHAUD, Joseph François**, zhō-zěf frān-swā, French historian: b. Albens, Savoy, 19 June 1767; d. Passy, 30 Sept. 1839. He became a journalist at Paris, where he wrote for Royalist papers and stoutly upheld the monarchy; and in 1794 established the *Quotidienne*. His opposition to the Revolution brought upon him sentence of death (27 Oct. 1795), and though the sentence was later revoked, he was finally exiled by the Directory and went into hiding in the Juras. He was allowed to return under the consulate, but remained an apologist of the Bourbons, and at the Restoration took up the publication of the *Quotidienne*. The well-known 'Biographie moderne' was published under his direction and part of the 'Biographie universelle' He was elected to the Academy in 1823. Among his more important works are 'Histoire de l'Empire de Mysore' (1801); 'Histoire de Croisades' (1812-22); 'Dernier règne de Buonaparte' (1815); and 'Collection de mémoires pour servir à l'histoire de France depuis le XIII<sup>e</sup>me Siècle' (1836-39).

**MICHAUT, mē-shō, Gustave Marie Abel**, French literary critic and educator: b. Perrigny, 20 Feb. 1870. He was educated at the École Normale Supérieure, was professor at the University of Fribourg, Switzerland, in 1894-1904, and has since been lecturer at the University of Paris. He lectured in the United States in 1911. He was laureate of the French Academy in 1896, 1901, 1903, 1907. Author of 'Edition des Pensées de Pascal' (1896); 'Des Discours sur le passions de l'amour de B. Pascal' (1900); 'Les Pensées Marc-Aurèle' (1901); 'Etude sur le livre d'amour de Sainte-Beuve' (1905); 'De la poésie française jusqu'au regne Henri quatrième' (1908); 'Honoré d'Urfé,' poems (1909); 'Pages de critique et d'histoire littéraire' (1910); 'Anatole France; etude psychologique' (1914), etc.

**MICHAUX, André**, ān-drā mē-shō, French botanist: b. Satory, Versailles, 7 March 1746; d. Madagascar, 16 Nov. 1802. His father, a rich farmer, took him into partnership, but the death of his wife soon after their marriage drove him to the study of botany and to travel. He traveled through France and England in 1779-81; then through Persia and to the borders of Tibet (1782-85); and in 1785 to North

America, where he made an exhaustive study of the flora of the Atlantic Coast, and near Charleston, S. C., and in Bergen County, N. J., established large nurseries. In 1800 he set out to investigate the flora of Madagascar, where he died. He wrote a 'History of the Oaks of North America' (1801) and 'Flora Boreali-Americana' (1803).

**MICHAUX, François André**, French botanist: son of André Michaux (q.v.): b. Versailles, 1770; d. Vauréal, 23 Oct. 1855. He was his father's assistant, and in 1802 and 1806 was sent to North America by the French government. He wrote a 'Journal' of his travels, translated into English (1805); 'The Naturalization of American Forest Trees' (1805); and the important 'North American Sylva' (3 vols., 1810-13), translated by Hillhouse (1817-19) and completed, for western America, by Nuttall (1842-50).

**MICHEL, mē'shēl', Claude (Clodion)**, French sculptor: b. Nancy, 20 Dec. 1738; d. Paris, 29 March 1814. He went to Paris in 1755 and studied sculpture under his uncle, Lambert Sigisbert Adam, and later under Pigalle. He was awarded the grand prize for sculpture at the Académie Royale in 1759, and in 1761 the first silver medal for studies from life. He lived in Rome in 1762-71, studying and working, the years 1767-71 being especially productive. He was invited to Petrograd by Catherine II, his fame being widespread by this time, but eventually decided upon his return to Paris. He rapidly gained a large patronage, executing orders for the Chapter of Rouen, the Direction Générale and the States of Languedoc. His work ranged from serious groups and statues of splendid line and noble conception, to delicate statuettes, usually of terra cotta, and portraying cupids, fauns, nymphs and similar subjects. During the Revolution he returned to his birthplace, Nancy, where most of his time until 1798 was spent in modeling decorations for houses. He is perhaps best known for his statuettes, which are treasured in both private and public collections. Among his work may be mentioned the statue of Montesquieu; the 'Dying Cleopatra'; 'Vestal Crowned with Flowers'; a mantelpiece in the South Kensington Museum; and the statue and relief of Saint Cecelia in the Cathedral at Rouen. In New York his work is represented at the Metropolitan Museum by statuettes in the Morgan and Altman collections. Consult Thirion, 'Les Adam et Clodion' (1885); Jacquot, 'Les Adam et les Michel et Clodion' (1898).

**MICHEL, Dan** (Dominus or Master), or **MICHEL OF NORTHGATE**, English translator and brother in the cloister of Saint Augustine of Canterbury: lived 1340. He is known only through his translation of a French moral treatise written in 1279 by Frère Laurens (Latin name Laurentius Gallus), for Philip III, of France. The French manuscript is entitled 'Le Somme des Vices et des vertus'; and Dan Michel's translation into the Kentish dialect is known as 'The Syenbite of Inwit,' i.e., 'The Again-biting of the Inner Wit,' or 'The Remorse of Conscience.' The manuscript is autographed by Dan Michel and dated 1340. It is preserved in the Arundel manuscript 57, and is of high philological value as an authentic and dated specimen of the Kent dialect of the 14th

century. Consult editions by Stevenson for the Roxburghe Club (1855); Morris for the Early English Text Society (1876).

**MICHEL, Francisque Xavier**, French archæologist; b. Lyons, 18 Jan. 1809; d. Paris, 18 May 1887. He was educated at Lyons and became known for his work in editing French manuscripts of the Middle Ages. He was sent to England in 1833 and to Scotland in 1837 for the purpose of making researches for the French government. He was appointed professor of foreign literature at the Faculté des lettres at Bordeaux in 1839. He edited numerous manuscripts written between the 11th and 14th centuries, among them 'Chanson de Roland' and 'Roman de la Rose.' He later translated into French many works of Goldsmith, Shakespeare, Sterne and Tennyson; and he was author of 'Histoire des races naudites de la France et de l'Espagne' (2 vols., 1847); 'Recherches sur le Commerce pendant le moyen-âge' (2 vols., 1852-54); 'Études de Philologie comparée sur l'argot' (1856); 'Histoire du commerce et de la navigation à Bordeaux' (2 vols., 1867-71), etc.

**MICHEL, François Emile**, frāñ-swā ā-mēl mē-shēl, French painter and art critic; b. Metz, 19 July 1828; d. 24 May 1909. After studying under Migette and Marechal, he made his début in the Salon in 1853, since which he has produced 'Summer Nights' (1872); 'Sowing in Autumn' (1873); 'The Harlem Sound' (1885); the two latter being now in the Luxembourg. He was elected to the Institute in 1892. Among his works are 'Rembrandt' (1886); 'Jacob van Ruysdael et les paysagistes de l'école de Haarlem' (1890); 'Le maitres du paysage' (1906); 'Nouvelles études sur l'histoire de l'art' (1908); 'La forêt de Fontainebleau' (1909).

**MICHEL, Louise**, French anarchist; b. Vroncourt, Upper Marne, France, 29 May 1830; d. Paris, 9 Jan. 1905. When very young she wrote verses of unusual power and in 1860 opened a school in Paris. In the Franco-German War she tended the sick and wounded and took part in the sorties from Paris; and during the government of the Commune in 1871 she fought at the barricades, was made prisoner, sentenced to deportation for life, and spent some years in New Caledonia, but was pardoned by the amnesty of 1880 and returned to Paris, where she edited 'La Révolution sociale' and continued her anarchistic teachings. She was imprisoned in 1883 and in 1886, later made her home in London, where she continued her work and returned to Paris in 1895. Her sobriquet, 'The Red Virgin of Montmartre,' was a tribute to the purity of her life. She published 'Le Coq Rouge'; 'Les Méprisées'; 'Ses Mémoires'; 'L'Ere Nouvelle.' Consult Gerault, E., 'La bonne Louise' (1906).

**MICHELANGELO, Buonarroti**, mi-kēl-ān'jē-lō or mē-kēl-ān'jā-lō, boo-ō-nār-rō'tē, whose name during his lifetime was written as Michelagnolo (or Michelangiolo) di Ludovico di Buonarroti-Simoni; Italian sculptor, painter and architect; b. Caprese, Tuscany, 6 March 1475; d. Rome, 18 Feb. 1564. The family was well established as a family of citizens in Florence; but had been allowed heraldic bearings, a custom not unusual in relation to the controlling families of the Italian cities.

At a very early age Michelangelo became a student of fine art, entering first the workshop of Domenico Bigordi, called Ghirlandajo, and studying also in a primitive kind of art school which had been formed in the palace and gardens of Lorenzo dei Medici. It appears that the extraordinary abilities of the boy were noticed by his patrons and also by the artists of the epoch from the first. Michelangelo thought of himself only as a sculptor, and he put his energies into the study of bas-relief and statuary; studying the remains of Græco-Roman antiquity which were accessible, and producing works of such importance as caused surprise to his contemporaries, although most of these very early works are either lost altogether or are uncertain—pieces which are usually ascribed to this epoch not having certain ascriptions. The earliest very important work which has remained to us is the Pietà, which is now in a chapel of Saint Peter's Church at Rome. The figures are slightly larger than life, the Madonna holding the body of Christ on her lap in a not unusual attitude; a belt passing over the left shoulder of the Virgin is inscribed with the name of Michelangelo the Florentine: which is for years the only case in which Michelangelo signed a piece with his name. The famous group of the Madonna and Child in the Church of Notre Dame at Bruges, in Belgium, is generally accepted as the work of Michelangelo, and if so, was of this early epoch. The reason for its transportation to Bruges is disputed. An entirely authentic piece of the time is a colossal David, which having been for three centuries in the open air at the portal of the Palazzo Vecchio at Florence, is now under shelter in the Accademia in the same city. This extraordinary work is a frank attempt to render the as yet imperfectly developed form of a very young man.

The only portable painting which can with certainty be ascribed to Michelangelo belongs to the closing years of the 15th century, when Michelangelo was approaching the age of 25 years. This is the circular picture, a Madonna with the Child and Saint Joseph, in the Uffizi Gallery. The fact of his producing this and several other small works of painting is not to be counted against his accepted position as a sculptor; for most of the artists of the time practised in the different arts, and it is probable that Michelangelo was at this time much less in the habit of painting than were other sculptors of well-known ability. His own continual occupation upon works of pure form in marble was a sufficient reason for his continued abstention from the sister arts.

With the election of Pope Julius II began the Roman life of Michelangelo, for he was called upon by the new Pope in 1505 to build a great monument which the Pope desired to finish within his own lifetime. This monument was never completed, however, and the controversies and other difficulties which arose continually with regard to it, embittered a large part of the great artist's life and consumed time which could but ill be spared from actual work. The great statue of Moses, which was executed at a somewhat later time (not to be exactly fixed), was the only very important piece of statuary completed for this tomb.

In 1506 Michelangelo returned to Florence,

and at that time there was a decided pause in the work upon the tomb, as other thoughts had taken up the mind of the Pope. Indeed, his return to Rome was followed immediately by the commencement of the painting upon the vault of the Sistine Chapel. This work as we have it is much the most important piece of mural painting of the modern world, for it occupies the whole vaulted room, 133 feet long and 45 feet wide, and is one continuous and unbroken composition containing hundreds of figures, life-size, of heroic size, and colossal, and done in pure fresco, except as it has been retouched in places, either by the artist himself or in later times, in what is called dry fresco—that is to say, the colors laid upon the dry plaster. There is this marked characteristic of the painting—that it has no landscape backgrounds except in the small compartments devoted to *The Deluge* and *The Temptation*, nor any other accessories as of costume, arms, buildings and the like, but is everywhere a simple architectural composition of painted pedestals and corbels seeming to carry figures which themselves are painted in the most abstract way—studies of the human form simply dressed and having no artistic interest other than that. It has generally been considered that the paintings draw their only importance from the astonishing power of the draughtsmanship and the great composition of abstract lines; but a more careful consideration of what they were before their partial defacement by the smoke of candles and the injuries and repairs which they have received, shows that the work is one of interest as to color composition as well. Michelangelo has never shown himself to be a colorist in the sense in which Correggio and the great Venetians were colorists, but then the medium in which he painted was fresco, that is, painting upon wet plaster, which does not lend itself to elaborate combinations of warm and profuse coloring—its tendency is always toward pale combinations and the expression of delicately modulated form rather than of chromatic splendor. It is not, however, intelligent criticism to say that these paintings are the work of a sculptor taken rudely from the practice of his own art. On the other hand, it is quite unreasonable to say, as some English critics have said, that the turning of Michelangelo to sculpture had been unfortunate, as depriving us of the greatest of Christian religious painters while giving us only a melodramatic sculptor. The truth is that this artist is the most perfect exemplar of that way of treating all fine art, of which form alone (pure and abstract and almost separated from its usual purpose, as that of description and narrative), is the subject studied and gives the effect sought. Everything else—truth of anatomy, expression of face, energy of pose and of apparent movement—is subordinated to the one important thing, the getting of form which would be splendid in the artist's eyes. If, then, we have to regret a frequent excessiveness and extravagance of design, it can only be said that the extraordinary energy and force of the man, driving him on to undertake more than mortal man could achieve even had he been (as Michelangelo was not) left to pursue his own course in peace, resulted as of necessity in frequent exaggeration in the very desire to give vigor and as yet untried combinations of form as

shown in the human body posed singly or in elaborate groups.

After 1513, when Julius II died, Michelangelo undertook a façade for the church of Saint Lorenzo in Florence. This front was never finished; but not long after he began the building of a new sacristy for this church, in which square room, very finely adorned with classical architectural forms, are the two remarkable tombs of the princes Lorenzo and Giuliano dei Medici. These monuments have each a seated statue of the prince in question, raised high above the sarcophagus; and on the lid of the sarcophagus two colossal reclining figures, in each case one man and one woman. The sculptures are not all completed. The extraordinary power of their modeling has made these monuments very famous in the modern world.

About 1535 Michelangelo settled finally in Rome, and from that time until his death was very much occupied as an architect in connection with the great church of Saint Peter. The building had been going on for many years, and different architects had successively changed the design, so that Michelangelo took up the work at that point where it became necessary to roof the central mass. This he did by means of the famous cupola which dominates the city of Rome and the country around, although he rounded the shell of stone itself was not erected during his lifetime.

As an architect Michelangelo was not, on the whole, beneficial to Italy or to the art of the 16th century, because he had never, as a youth, studied construction or the use of details, and because his almost exclusive devotion to more elaborate and organic forms than those possible to architectural masses, prevented his designing such features as frontons and consols with gravity and simplicity. The architecture inspired by him, and more especially that produced by his immediate successors, ran to extravagance; and the worst period of Italian decorative art was to follow upon his own epoch of work. The sculpture of his later years is much less important and much less in quantity than might have been expected; but the work upon the church occupied his energies, and in 1535 he was appointed by Pope Paul III, architect, sculptor and painter to the papal palace, and he began work immediately upon the east wall of the Sistine Chapel. Here he painted that prodigious 'Last Judgment' filling all the wall above the altar, including the lunette, and up to the nearly semi-circular vault. The picture is, like the ceiling paintings, entirely a study of the human body in vigorous action, and in highly studied pose. As a work of color, or even of light and shade, it is almost unrecognizable for what it was, as the smoke of the candles on the altar has caused very great changes in color, and has led to repainting, and because of certain painted additions made in the next century in order to disguise the complete nudity of the figures.

Throughout his life Michelangelo had been a writer of verse, and it is known that important sonnets of his were left by him. These, however, were edited in a destructive manner by his nephew, so much so that we have at the present day no certain knowledge, even, of what the poems were as they left Michelangelo's hand. This part of his intellectual life has been

**MICHELANGELO IN HIS STUDY**

Painting by Alexander Cabanel

**STATUE OF MOSES, BY MICHELANGELO**

treated with great thoroughness by John Addington Symonds in his life of the artist (1892); and on which Walter Pater writes fascinatingly in 'The Renaissance: Studies in Art and Poetry' (1912). The frescoes of the Sistine Chapel have been peculiarly the study of Heath Wilson who, about the middle of the 19th century, had a scaffolding erected in the chapel and studied the paintings inch by inch, and who recorded his observations in a valuable book (1876). Apart from these two books and the life by Harford (1857), the best book on Michelangelo is the volume of the ('Gazette de Beaux-Arts,' published in 1876. This volume contains papers by the sculptor, Eugène Guillaume, the architect, Charles Garnier, and the competent writers, Charles Blanc, Paul Mantz, A. Mézières and Anatole de Montaiglon. Karl Frey's 'Michaelagnolo Buonarroti' publication of which began in 1907, and Thode's 'Michelangelo und das Ende der Renaissance' (1902-12), are among recent authoritative studies.

RUSSELL STURGIS.

**MICHELANGELO**, Life of: Herman Grimm's Life of Michelangelo, apart from its value as the record of a notable life, is one of the masterpieces of German prose. Written at a time when photographic illustrations were unknown (it was published in 1860) and when the expense of travel barred Italy to most young artists, its purpose was to give them a vivid and realizable word-picture of the sculptures, paintings and architectural creations of the most universal of all artists, and at the same time to show how constructive a part art can play in the spiritual life of a nation when artists are large enough for leadership.

It is not only a biography; it is a history of the Italian Renaissance with Michelangelo as the central figure. During the 80 years of his life Italian art knew Donatello, Ghirlandajo, Leonardo da Vinci, Titian and Raphael; Savonarola lived and died praying for the soul of Florence; the Popes—Borghias, Farneses, Medicis—exerted their power for good and ill in the world of the sword as well as the world of the spirit; the Medicis fought for the temporal mastery of Florence and conquered, fought and lost again. In every part of this seething political, religious and artistic life Michelangelo had his share. His life and that of Florence ran parallel lines. The star of Florence had barely risen when Michelangelo sculptured his first marbles in the garden of the Medicis; it had set, never to rise again, before his body was brought back for burial from the Rome which had been his refuge when Florence deserted her tradition of freedom.

It is the achievement of Herman Grimm—that which places this biography with Boswell's Life of Johnson and the Autobiography of Benvenuto Cellini—that he has known how to make the city and the times live equally with the man whom he portrays, and how to give form and color to the figures of the lesser men and women in his picture. Fine illustrations heighten the value and the interest of new editions, both in the original and in the translation by Miss Bunnett.

**MICHELET**, Jules, zhül mēsh-lā. French historian: b. Paris, 21 Aug. 1798; d. Hyères, 9 Feb. 1874. His father was an unsuccessful

printer, and his boyhood was one of poverty and want. He was educated at the Lycée Charlemagne and in 1821 became a professor at the Collège Rollin. After the revolution of 1830 he was appointed chief of the historical section in the Archives, and in 1838 professor of history at the Collège de France. He lost his offices by his refusal to take the oath of allegiance to Napoleon III (1851) and thereafter devoted himself to his busy literary labors. His 'Histoire de France' (18 vols. 1833-67; new ed. 19 vols. 1879) is among the monumental productions of historical composition, and definitely established his fame. His 'Histoire de la Révolution' (1847-53; new ed. 1889) is a splendid specimen of eloquent writing, but hardly a great history. In all his historical writing Michelet has been criticized for unduly subordinating historical values to dramatic effect and for permitting his prejudices to destroy his perspective. But his descriptions are remarkably vivid, and his rendering of certain episodes is unsurpassed. Among his further writings are 'Précis de l'histoire moderne' (1827); 'Histoire romaine' (1831); several volumes of impressions of nature—'L'Oiseau' (1856), 'L'Insecte' (1857), 'Z'Amoue' (1859); 'La Mer' (1861); 'La Montagne' (1868); and several volumes of polemics. Consult 'Lives' or studies by brushes (1898); 'Corréard' (1886); 'Monot' (1905); and 'Jules Simon' (1886).

**MICHELET**, Karl Ludwig, kärl lood'vig mēshē-lā, German philosopher: b. Berlin, 4 Dec. 1801; d. 16 Dec. 1893. He was graduated from the University of Berlin in 1824, and in 1829 was appointed to the professorship of philology and philosophy in the French gymnasium, which he held for 25 years. In 1829 he also became professor of philosophy in the University of Berlin. He devoted himself especially to the doctrines of Aristotle and published 'Die Ethik des Aristoteles' (1827), an edition of the Nicomachean ethic with Latin commentary (1829-33), and a memoir entitled 'Examen critique du livre d'Aristotle, intitulé Métaphysique' (1836), which was crowned by the Academy of Moral and Political Sciences. From 1832 to 1842 he was engaged as one of the editors of Hegel's works, in illustration of whose system he wrote 'Geschichte der letzten Systeme der Philosophie in Deutschland von Kant bis Hegel' (1837-39); 'Entwicklungsgeschichte der neuesten Deutschen Philosophie' (1843); and a controversial dissertation, 'Schelling und Hegel' (1839). His own standpoint and tendency are most decisively shown in his 'Vorlesungen über die Persönlichkeit Gottes und die Unsterblichkeit der Seele, oder die ewige Persönlichkeit des Geistes' (1841); and 'Die Epiphanie der ewigen Persönlichkeit des Geistes' (1844-52).

**MICHELL**, mich'el, John, English physicist, geologist and astronomer: b. about 1724; d. Thornhill, Yorkshire, 29 April 1793. He was educated at Queen's College, Cambridge, became a Fellow there, and in 1762 was made professor of geology. From 1767 until his death he was rector at Thornhill. His invention of the torsion balance shortly before his death preceded that of Coulomb, and was used by Henry Cavendish in his famous experiment determining the mean density of the earth.

Michell also described a method of making magnets, 'A Treatise of Artificial Magnets, in which is shown an easy and expeditious method of making them superior to the best natural ones' (1750). He also made valuable contributions to the knowledge of astronomy. Author of 'Conjectures Concerning the Cause and Observations upon the Phenomena of Earthquakes' (1760); 'A Recommendation of Hadley's Quadrant for Surveying' (1765); 'Proposal of a Method for Measuring Degrees of Longitude upon the Parallels of the Equator' (1766); 'An Inquiry into the Probable Parallax and Magnitude of the Fixed Stars' (1767); 'On the Twinkling of Fixed Stars' (1767); 'On the Means of Discovering the Distance, Magnitude, etc., of the Fixed Stars' (1784); etc.

**MICHELL, John Henry**, Australian mathematician: b. 19th century. He was educated at Trinity College, Cambridge, and later became a Fellow there. He became assistant professor of mathematics at the University of Melbourne and is known for his researches in mathematical physics. He was made a Fellow of the Royal Society in 1902. Author of 'Theory of Free Stream Lines' (1890); 'The Highest Waves in Water' (1893); 'The Wave Resistance of a Ship' (1898); 'The Stress in the Web of a Plate Girder' (1900); 'Theory of Uniformly Loaded Beams' (1900); etc.

**MICHELOZZO, mē'kē-lōt'sō, Michelozzi**, Italian architect and sculptor: b. Florence, 1391 or 1396; d. there, 1472. He studied sculpture under Donatello and architecture under Brunelleschi, and was a protégé of Cosimo dei Medici. He worked in silver, bronze and marble as a sculptor and attained a high reputation for his work; but his fame rests principally upon his achievements as an architect, his name ranking among the foremost of the famous Florentine architects of the 15th century. He executed the silver statue of Saint John in the Duomo, Florence, and also the bronze statue of that saint in the Bargello, and the terra cotta figure of him in the court of the church of the Annunziata, Florence. Much of his work as a sculptor was done with Donatello and it is difficult to establish its identity. He designed the library of San Giorgio Maggiore at Venice, as well as other buildings there, during the period when he shared the exile of his patron, Cosimo dei Medici. He designed the Riccardi Palace in Florence for the Medici, and his skill as an engineer was attested by his repairing and partially rebuilding the Palazzo Vecchio, which was falling to ruin. He also undertook the repairs and remodeling of the monastery of San Marco at Florence when it was given to the Dominicans of Fiesole by the Medici. He designed the Medici summer villa at Careggi, the pilgrim's guest-house, Jerusalem, the Medici palace at Fiesole and many other buildings. His style effected a combination of early Italian Gothic and the classical type with marvelous simplicity and lightness, withal stateliness of line. Consult Müntz, E., 'Histoire de l'Art pendant in Renaissance, Italie' (1889); Wolf, F., 'Michelozzo di Bartolommeo' (1900).

**MICHELS, Robert**, German sociologist: b. Cologne, 9 Jan. 1876. He studied at the universities of Paris, Munich, Leipzig and Halle,

and in 1905 became docent at the University of Brussels. In 1907 he was appointed teacher of economics at the University of Turin, later becoming professor of that subject. He accepted the chair of economics and statistics at Bazel in 1913. He has specialized in Italian sociological problems and history and has written extensively, his work appearing in Hungarian, Dutch, German, French and Italian. Author of 'Brautstandsmoral' (1903); 'Borghesia e proletariato nel movimento Socialista italiano' (1907); 'Zur soziologie des Parteiwesens' (1910); 'Probleme der Sozial-philosophie' (1914), etc.

**MICHELSON, Albert Abraham**, American physicist: b. Strelno, Posen, Germany, 19 Dec. 1852. He came to the United States when a boy; was graduated at the United States Naval Academy in 1873; took graduate courses in physics in Berlin and Heidelberg and in Paris; and resigned from the navy in 1883 to become professor of physics at the Case School of Applied Science, Cleveland, Ohio. From 1889 to 1892 he was professor of physics at Clark University, and since 1892 has been head of the department of physics in the University of Chicago. He was president of the American Physical Society in 1901, and of the American Association for the Advancement of Science in 1910. His experiments at the Naval Academy in 1879 and at Cleveland in 1882 gave new figures for the velocity of light *in vacuo*. He made careful studies of the relative motion of ether and matter, and apparently proved that, though in general ether may have relative motion, within building walls, etc., it partakes of the motion of materials. About the same date (1886-87) his inferential refractometer made it possible to use wave-lengths of light as a measuring unit; this discovery was put to concrete use by his measuring a metre in terms of cadmium light wave-length; this was done for the Paris International Bureau of Weights and Measures, with the result that the metre is no longer an arbitrary unit, since the original metre-long bar so carefully preserved in Paris could easily be replaced at any time now that its length is known in terms of other units. This interferometer not only determines wave-lengths of red, green and blue cadmium light, but separates lines less than one thousandth metre apart, and hence is a very delicate dividing machine. The echelon spectroscope, an arrangement of glass plates of equal thickness, but of surface area varying in arithmetical progression, was invented by Michelson in 1898; it is valuable for the study of the Zeeman effect. In 1907 he was awarded the Nobel prize in physics. He is the author of 'Light Waves and their Uses' (1903).

**MICHIE, mīk'ī, Peter Smith**, American military engineer and author: b. Brechin, Scotland, 24 March 1839; d. West Point, N. Y., 16 Feb. 1901. He came to the United States when a child and lived in Cincinnati. He was graduated at West Point in 1863 and was assigned to the engineering corps with rank of first lieutenant. He served as assistant engineer in the operations around Charleston in 1863-64 and as chief engineer of the districts in the Department of the South. In 1864 he was transferred to the Army of the James, served in the operations against Richmond and was present at Ap-

pomattox in 1865. He was promoted brevet brigadier-general and later brevet lieutenant-colonel of volunteers in 1865, and was promoted captain in the regular army. He was appointed first assistant in the department of engineering and chemistry at West Point in 1867, and from 1871 until his death he was professor of natural and experimental philosophy there. He served on the board of overseers of the Thayer School of Civil Engineering at Dartmouth from 1871. He was a member of a government commission to Europe in June–November 1870 studying fortifications. Author of 'Wave Motion, relating to Sound and Light' (1882); 'Life and Letters of Emery Upton' (1885); 'Analytical Mechanics' (1886); 'Hydromechanics' (1887).

**MICHIGAN**, a State in the United States, lies in the region of the Great Lakes between lat. 41° 44' and 47° 30' N. and long. 82° 25' and 90° 31' W. It is composed of two peninsulas, a northern and a southern, between which pass the Straits of Mackinac, connecting Lakes Huron and Michigan. The State has an area of 57,480 square miles, ranking 18th in the Union. It is the largest except Georgia, east of the Mississippi. Of this area, 40,789 square miles are in the lower peninsula, and 16,691 in the upper; the upper peninsula being less than one-third the area of the State, is thus larger than any New England State, except Maine. The State's peninsular character is reflected in the legend on its seal: *Si Quæris Peninsulam Amœnam, Circumspice* (If you seek a beautiful peninsula, look about you).

Michigan's position has closely associated its development with Ohio, Indiana and Illinois, on the south; with Wisconsin, on the west; and with Canada, on the north and east. It determined that its population should come largely from New York, New England and Canada, and from Europe. Practically surrounded by lakes and rivers, it was naturally equipped to engage extensively in lake commerce and ship-building. It has water communication with seven other States and with the province of Ontario in Canada, embracing together a population of about 30,000,000 people. Its chief port is Detroit, whose position, in line with natural transportation facilities to the Atlantic seaboard through the Saint Lawrence Basin and the Mohawk Valley of New York, gives it rank, in relation to immigration and commerce, with Pittsburgh and Saint Louis.

**Climate.**—The position of the State in the midst of the Great Lakes gives it a climate sufficiently unique to invite comparisons. The mean annual temperature has a range of about 10° — from 39° in the north to 49° in the south; July temperature, from 65° to 72°; that of January, from 19° to 25°; extreme of lowest temperatures in different parts of the State, from 49° to 15° below zero; extreme of highest temperatures, from 96° to 108°. For the year, in the State as a whole, the mean range of temperature is 50° and the extreme range 120°. The longest growing season, 170 days, is in the vicinity of Lake Erie; while the shortest growing season, 100 days, is in the west end of the upper peninsula.

The amount of rainfall varies from 29 inches in the northwest to 40 inches in the southeast; about 60 per cent of the annual rainfall is re-

ceived in the crop season. The heaviest snowfall is in the region of Traverse City and in the "Copper Country" on Lake Superior. In relative humidity, Michigan is similar to the Atlantic seaboard States, but has a larger number of sunny days in summer. The annual humidity is about 75 per cent. In general, Michigan weather is extremely variable, being in the track of the largest number of low pressure areas, but the constant westerly winds and the Great Lakes tend to modify extremes.

**Geology and Physiography.**—The oldest part of Michigan is the western half of the upper peninsula, where are found outcrops of Archean rocks—granites, gneisses and schists—as old as any on the continent of North America and similar in age to the highlands of Scotland and Norway. The highest point in the State, in the Porcupine Mountains near Lake Superior, is an outcrop of these rocks, about 1,400 feet above the level of the lake. The whole of this part of the peninsula is broken and rocky, though the drift in the valleys affords a good soil for agriculture. The region is noted chiefly for its minerals. From Keweenaw Point southwestward, across the peninsula, lie copper deposits of exceeding richness, second to none in the world. To the south and east of the copper deposits lie four rich belts of iron ore. Other economic minerals are slate, building stone, graphite, mineral paints, mica, asbestos, oil stone, gypsum, lead and manganese. East of the longitude of Marquette, the peninsula is markedly different, being a rolling, drift-covered hill country, rising scarcely 400 feet above lake level and forming the agricultural section. Along the northern shore of this portion of the peninsula, the Cambrian sandstone, formed in the ancient seas that covered the Michigan basin, has been cut by wave action into fantastic shapes, known as the "Pictured Rocks" of Lake Superior.

In the lower peninsula the arrangement of the bed rocks is simple, being like a nest of basins, one within the other. At the centre the coal basin covers about one-fifth of the area. The minerals of the other basins are various and widely distributed, among which are salt, clay, sand and gravels, limestone and gypsum. At several points are found mineral springs, where popular resorts have grown up to profit by the medicinal value of the waters; chief among these is Mount Clemens, near Detroit. The waters of four mineral springs are marketed. The surface of the lower peninsula lends itself easily to agriculture, grazing, lumbering and manufacture. In general, it is slightly undulating and but little raised above lake level. The peninsula is divided into two portions, which have a few topographical differences; the dividing line is the Grand-Maple-Saginaw Valley, which, extending across it diagonally from the head of Saginaw Bay to Lake Michigan, is nowhere above 100 feet high. North of this central plain rises a plateau, between 700 and 800 feet above the lakes, forming the watershed between Lakes Michigan and Huron. At a point near Otsego Lake, this plateau reaches a height of 1,100 feet. On the north and northeast, outcrops of bed rock give the coast an abrupt and somewhat forbidding appearance. The portion of the peninsula south of the central plain rises rarely above 200 feet,

broken by low conical hills, whose fertile intervening dales form the courses of small streams. At the east, a morainal elevation, forming two watersheds, rises in Hillsdale County, 600 feet above the lakes, the highest point in this part of the State. The southeastern shore is low and comparatively level. Along a large part of the entire western shore of the peninsula, wind-blown sand dunes reach, in places, a height of 200 and 300 feet.

Off the shores of the two peninsulas lie some 200 islands within the State boundaries, the largest of which is Isle Royale, in Lake Superior. Others of the largest islands are: In Lake Superior—Grand Isle; in Lake Michigan—Beaver, Fox and Manitou; and in Lake Huron—Sugar Island, Encampment Island, Drummond Island, Bois Blanc and Mackinac. The coolness of the summer climate of the upper Great Lakes has made of that region a delightful watering place, particularly in the vicinity of the Straits of Mackinac. Of the island resorts the most widely known is the picturesque Mackinac Island.

**Soil.**—The three principal soil types of the two peninsulas are determined by the relative amount of sand, clay and lime. In the southern peninsula, the soils vary from the light sandy loam of the north central plateau to heavy blue clay, on the Huron shore, and to the dark clay loam of southern Michigan. The wide distribution of sand gives warmth to the soil, and its porosity prevents the drowning of crops; while the generous depth of the soil keeps it from drying out. There is little irreclaimable marshland. In general, the soil is easy to work, presenting but little stony land like New England and very few barrens due to outcrops. The mixture of clay and sand makes a soil not too adhesive for the plow and one not easily washed full of gullies. The limestone areas are specially fortified against deterioration through wasteful farming, and in many places there is an abundance of natural fertilizers. In the upper peninsula, in the west, the rocks are either barren or thinly covered, with an occasional fertile valley; in the east, the soil is of good depth and generally rich in a variety of mineral elements.

**Drainage and Water Power.**—Michigan has more than 5,000 interior lakes, mainly of glacial origin. Many of those near the shores, especially of Lake Michigan, were once a part of the Great Lakes. They vary in size from an acre to a thousand acres, covering in the aggregate an area of 712,864 acres. Generally they have a border of woodland and sandy or muddy margins, with more or less vegetable and animal life. Many of these lakes are beautiful pleasure resorts. Streams are fed by these lakes, which together with them form an equable system of drainage. The rivers, though numerous, are relatively short and shallow, owing to the peninsular character of the State. Some have cut deep enough to form rapids, especially in the north, furnishing water power. Of the large power they could develop, 250,000 horse power is now furnished, mainly by the Saint Mary's, the Au Sable, the Menominee, the Saint Joseph, the Muskegon, the Grand, the Kalamazoo, the Huron and the Thunder Bay. In lumbering days, the Saginaw, the Muskegon and the Menominee were chief among

the many rivers for transportation of logs to mill. Aside from the strait-like Saint Mary's, Saint Clair and Detroit rivers, Michigan streams are not navigable, except for the smallest of river craft. Worthy of mention, besides the rivers named, are, in the lower peninsula, the Clinton, the Raisin, the Rouge, the Black and the Manistee; in the upper peninsula, the Taquamenon, the Carp, the Sturgeon, the Manistique, the Rapid, the Whitefish, Falls River and Dead River. The waters of these rivers are received by numerous bays and inlets which indent the shores; of these, the largest along the upper peninsula are Keweenaw, White Fish and the Big and Little Noquette bays; along the lower peninsula, the Grand and Little Traverse, the Thunder and Saginaw bays.

**Agriculture.**—The chief industry of the State is farming, which engages about a third of the population. The value of farm property is double the capital in manufacturing and about one-half of the total assessed valuation of all property in the State. About one-half of the lands are in farms, of which about two-thirds are improved. Of the half not in farms, about one-half would make good farm land. Less than one-fifth of the upper peninsula is in farms, with about 12 per cent of the total farming population of the State. In the lower peninsula, nine-tenths of the farms and 70 per cent of the farm population is south of the latitude of the northern boundary of Midland County. In general, Michigan lands produce many kinds of crops on each farm, contributing about half of the total value. Corn is the leading crop, raised mainly in the southern part of the lower peninsula; only a few hundred acres are raised in the upper peninsula and in the northern third of the lower peninsula only about as much as in any one of the better southern counties. The wheat crop is second and has been decreasing since 1900, the yield is only about one-fifth that of Minnesota. Wheat raising tends to concentrate in the central part of the lower peninsula. Oats rank third in the

ESTIMATED CROP STATISTICS, 1918.

CROP	Acres	Quantities, bushels	Value
Corn .....	1,610,000	48,300,000	\$62,790,000
Wheat .....	754,000	10,716,000	22,397,000
Oats .....	1,658,000	66,320,000	45,761,000
Rye .....	472,000	6,750,000	10,125,000
Barley .....	275,000	8,332,000	8,332,000
Buckwheat .....	78,000	780,000	1,326,000
Total cereals..	4,847,000	141,198,000	\$159,731,000

State. The hay crop, chiefly clover and timothy, is widely distributed and yields about one-fourth of the total value of farm crops. A great variety of vegetables are raised, in large quantities. Michigan leads in beans and peas. The estimated output of beans in 1918 was 4,887,000 bushels, valued at \$24,435,000. Owosso is the centre of the bean area. The pea belt includes the northeast and east central parts of the lower peninsula. The west central part of

MICHIGAN.

Beans.....	350,768	3,264,187	9.31

On the muck lands are raised large quantities of celery, chicory and peppermint, in the production of which Michigan is the leading State. In the vicinity of Kalamazoo are the most famous celery beds in the Union. Southwestern Michigan is the chief source of peppermint for the world. Of Michigan farms, more than four-fifths are cultivated by the owners. Less than 5 per cent are operated by cash tenants and about 11 per cent by share tenants. The following table shows the general development of Michigan farming by decades since 1860:

YEAR	Number of farms	Acres in farms	Value of farm property	Value of farm products
1860	62,422	7,030,834	\$190,371,098	
1870	98,786	10,019,142	369,409,941	
1880	154,008	13,807,240	574,242,654	\$91,159,858
1890	172,344	14,785,636	647,938,255	83,651,390

\*Estimated.

**Fruit-growing.**—The principal orchard products are peaches and apples, but large quantities are raised of pears, plums, cherries and grapes. They are quite uniformly distributed over the southern half of the State. Of peaches and grapes, more delicate varieties are raised, in larger quantities, in the "fruit belt," extending along the Lake Michigan shore, north as far as the Grand Traverse region. There, more attention can be given, where the lighter soil makes the raising of more reliable crops less profitable; a strong demand is present in the markets of Chicago and Milwaukee, easily and quickly reached by lake steamers; the concentration of the industry favors better organization as to methods of culture and marketing; the presence of Lake Michigan, tempers "cold waves," diminishing danger from killing frosts, lengthens the growing season and increases the humidity. In this belt are raised large crops of strawberries, blackberries, raspberries and currants, in which Michigan ranks second among the States. In the production of peaches, Michigan ranks with Ohio, Pennsylvania and New York, and is a leading State in the production of cherries.

**Stock Farming and Dairying.**—Horses, dairy cows, sheep, swine and fowls are the chief domestic animals raised in Michigan. In the production of wool, the State ranks second only to Ohio, east of the Mississippi.

Estimate on farms  
1 Jan. 1919

Horses and mules.....	670,000	\$70,354,000
Milch cows.....	848,000	70,384,000
Other cattle.....	729,000	28,358,000
Sheep.....	2,119,000	26,488,000
Swine.....	1,355,000	31,978,000
<b>All live stock.....</b>	<b>5,721,000</b>	<b>\$227,562,000</b>

On 1 Jan. 1918 there were in Michigan 1,926,000 sheep, 680,000 horses, 874,000 milch cows, 752,000 other cattle and 1,372,000 hogs. The dairy interests are rapidly increasing. Of 1,497,823 cattle in 1910, about one-half were dairy cattle. This industry is mainly in southern Michigan, though the upper peninsula is well adapted to the raising of dairy herds. The industry supports 350 creameries, 8 condensaries and 150 cheese factories, located chiefly in rural centres. In butter and cheese making, the Hollanders have made Ottawa the leading county of the State. In general dairy products, Michigan ranks about equal with Wisconsin, Illinois, Indiana and Ohio. Cheese making is falling off in Michigan, with the increase of creameries and condensaries to supply the demand for milk and cream in rapidly-growing cities.

	Number
Milk produced on farms.....	352,858,180 gals.
Butter made on farms and in factories..	85,917,185 lbs.
Cheese made on farms and in factories..	13,673,336 lbs.

**Lumbering and Forestry.**—Of the products of the soil, Michigan's forests have been one of the most important sources of her material wealth. The great variety and abundance of both hard and soft woods has made it a leading State in lumber and in timber products. Roughly, the forests originally presented two strongly marked divisions, separated by the 43d parallel of latitude; the pine and soft

woods were north, the hard woods south. South of this latitude, the principal farming area, the vicissitudes of early settlement rapidly and permanently destroyed the forests, excepting woodlots, which now aggregate one or two townships per county. North of this latitude in the lower peninsula, the principal hard woods are above a line from Ludington to Oscoda, and very scattered. The hard wood forests of the upper peninsula are chiefly in the eastern part, on the rolling lands of the glacial moraines. Pine lumbering, which reached its climax in 1890, has cut most of the white pine from the State. The present stage of lumbering is taking the hard woods and the remaining pine, mainly in the upper peninsula. Lumbering has had exceptional advantages in Michigan; the timber was massed in large stands, making large scale operations possible; and it was located mainly on large streams, down which logs could be floated to mill, and the lumber thence to the Great Lakes, by which markets could be easily reached. The first great impulse in Michigan pine lumbering came with the opening of an eastern market, due to the exhaustion of eastern forests and the development of railroads; the growth of Chicago and the settlement of the prairie States furnished a stimulus from the West. In 1890 Michigan produced 4,245,717,000 feet of lumber; since then she has dropped from first place to tenth place. Out of the lumber industry have grown most of the cities of the State above the latitude of the Saginaw Valley, which was the first great centre of pine lumbering; exceptions are Sault Sainte Marie and cities in the mining districts. The cities have now found in manufacturing a basis for permanent growth, principally in the manufacture of timber products. The following table shows the development of lumbering in Michigan since 1850:

YEAR	Estab- lish- ments	Capital	Average number of wage earners	Wages	Value of products
1850					\$2,464,329
1860					7,040,190
1870	1,571	\$26,990,450	20,058	\$6,400,283	31,946,396
1880	1,649	39,260,428	24,235	6,967,905	52,449,928
1890	2,124	129,467,072	54,308	15,548,833	83,121,969
1900	1,705	67,379,698	26,199	11,122,030	54,290,520
1909	1,180	57,290,000	35,627	16,298,000	61,513,560

In 1903 the State set aside 34,000 acres of State lands and an annual appropriation of \$7,500 for forestry purposes, now increased to \$60,000 per annum, making possible extensive forest protection and reforestation. The State now holds 53 forest reserves aggregating about 235,000 acres, which is under the administration of the Public Domain Commission.

**Minerals and Mining.**—In the upper peninsula, whose copper and iron mines are among the most valuable in the world, the chief competitor of lumbering and agriculture is mining. Native copper was known and mined in the Lake Superior region by a primitive people hundreds of years ago. It is first mentioned in a book by Legardes published in 1836. Its commercial development was begun in 1842, by

Boston capital, in Keweenaw County; the beginning of well-organized mining began in 1846, with the discovery of the Calumet and Hecla conglomerate lode, in Houghton County; that county produces more than four-fifths of Michigan's output to-day, one-half of which is mined near Calumet. This copper averages about 20 pounds per ton of rock. The advantages for mining here are the relative purity of the copper; the concentration of abundant pay-rock in mines fairly dry and needing little timbering; the altitude of the mine mouths, permitting the use of a natural incline to stamp mills at lake level; and an all-water route for shipment to market. The total product from these mines aggregates approximately 5,345,000,000 pounds, which gives Michigan rank in total produce second only to Montana; in annual output the State is surpassed only by Montana and Arizona.

Iron was discovered in 1844, near Ishpeming. The first ore was mined and smelted in 1841, by capital from Jackson, Mich. In the period centring about the Civil War, more than 50 companies were organized, the great demand for war purposes having forced the improvement of the Marquette Railroad and the "Soo" Canal and led to a new period of settlement in the upper peninsula. The chief iron regions are the Marquette Range, the Menominee Range and the Gogebic Range. In all of these there are unusual advantages for mining; high grade ores, concentration in small area, down-grade short hauls from the mines, the proximity of timber and an all-water route to market. Most of the ore is shipped east for smelting; the first shipment, of 70 tons, from the Marquette Range, was smelted at Sharon, Pa. Michigan's share in building national industry has been largely through her iron supply to the markets of the East. The total production has been approximately 450,000,000 long tons. The annual output of these mines is equaled only by that of Minnesota, in the United States; it is twice that of Russia, nearly three times that of Sweden and more than that of either France or Spain.

Other minerals are salt, gypsum, clay, limestone, sandstone, granite, slate, marl, peat, coal and graphite. Michigan leads in salt, which is found chiefly in three belts, one extending from Wyandotte to Harbor Beach, a second in the Saginaw Valley and a third near Manistee and Ludington. The chief gypsum deposits are at Grand Rapids and Alabaster, the quarry at Alabaster being the largest in the world. Most of the limestone is buried too deep under glacial drift to be quarried. The most valuable outcrops of sandstone are on the south shore of Lake Superior. Peat bogs abound in the lower peninsula, but have not been worked, owing to the relative cheapness of other fuel. The coal basin covers about 8,000 square miles in the centre of the lower peninsula, estimated to contain about 80,000,000,000 tons, of which about half is in workable seams. This coal is mainly of a low bituminous variety; of the annual output of 1½ million tons, valued at about \$3,330,000, all but about 2 per cent is mined in Bay and Saginaw counties.

**Manufacturing.**—Michigan has over 9,000 manufacturing industries, employing about 300,000 men and a capital of over \$500,000,000.

Its annual output in 1909, valued at \$685,109,000, gave it seventh place in the United States. The following table gives a comparative view of progress by decades since 1850:

also for clothing and its accessories, particularly furs. It is also the chief centre for ship-building and for drugs and medicines. Michigan ranks first among the States in the manu-

YEAR	Number of establishments	Capital	Wage earners	Total wages	Cost of materials	Value of products
1850	2,023	\$6,563,660	9,344	\$2,717,124	\$6,136,328	\$11,169,002
1860	3,448	23,808,226	23,190	6,735,047	17,635,611	32,658,356
1870	9,455	71,712,283	63,694	21,205,355	68,142,515	118,394,676
1880	8,873	92,930,959	77,591	25,513,682	92,900,269	150,715,025
1890	12,127	262,412,240	148,674	54,982,906	154,521,918	277,896,706
1900	16,807	284,097,133	162,355	66,467,867	199,559,905	356,944,082
1909	9,159	583,946,965	262,111	153,838,044	368,612,022	685,109,169
1916*	9,070	600,000,000	285,000	188,000,000		

\* Estimated.

In the 10 years, 1899-1909, Michigan had a higher per cent of gain in value of manufactures than any State which surpassed it in total value of output. In 1909 it had 18 industries, each of which put out a total product valued above \$10,000,000. The bulk of the total product is produced in the southern 20 counties, where are employed over three-fourths of the men. Michigan's rapid growth in manufactures is due primarily to abundant resources in timber, iron and copper and cheap water transportation; its rapid growth in variety of manufactures since 1890 is due to the release of capital from lumbering and the development of the automobile industry, in which Michigan now leads all the States. Outside of Detroit, which is the centre, the leading Michigan cities in the manufacture of automobiles, are Flint, Lansing, Pontiac and Jackson. This industry has stimulated a great variety of associated manufactures. The manufacture of lumber and timber products is the chief industry of cities in the northern part of the lower peninsula and in the upper peninsula except in the mining centres. Of the timber products, the chief are paper pulp, shingles and lath, charcoal and chemicals, veneer, tanbark, turpentine and rosin, and a great variety of wooden-ware. Foundry and machine-shop products, which rank ahead of furniture, are made chiefly in the large cities in the southern part of the State. Flour and gristmill products rank next and are widely distributed. The food industry is confined chiefly to Detroit, Battle Creek and the west central part of the lower peninsula. Furniture ranks fifth; over 150 furniture plants are distributed in over 30 important centres, among which Grand Rapids and Detroit lead. Detroit has about one-third as much capital invested as Grand Rapids. The chief factors in Grand Rapids' supremacy have been the initial impulse from the abundance of pine timber, the investment of capital since the decline of lumbering, skilled labor, facilities for marketing and the early organization of the industry on modern business lines. The Furniture Fair held there twice a year is a centre of interest to all the States and to foreign countries. Supplies accessory to printing and publishing are an important industry. Leather goods and tobacco goods are also made in large quantities. Detroit is the chief centre for all kinds of structural materials, including stoves and furnaces,

facture of automobiles, salt, drugs and refrigerators; second in furniture and third in beet-sugar.

**Transportation and Commerce.**—The first means of transportation used, common wagon roads, have been the last to be thoroughly improved. The State now has about 70,000 miles of dirt roads, partly improved. The automobile has been most effective in strengthening the "good roads" movement. In 1905 was created the State highway department, which has expended about \$1,000,000 in money awards to encourage townships in their common road building. Among the most important improvements is a State road along the entire shore line of the lower peninsula, which is partly completed. At the spring election, 1919, Michigan voted to bond the State for \$50,000,000 for good roads. Railroad building began in Michigan shortly after Stevenson experimented with the "Rocket." The first road built, the Erie and Kalamazoo, from Toledo (then in Michigan) to Adrian, was the first west of the Appalachian Mountains. The first State constitution, adopted in 1835, provided for a system of internal improvements, in which three trans-peninsular railroads were included; of these, the Michigan Central was partly built by the State, but was completed to Chicago by private capital in 1852. The census of 1910 shows 10,584 miles of steam roads, and 1,400 miles of electric roads, with a total investment of \$141,875,000, employing about 80,000 men. Nine trunk lines cross the State from east to west and three from north to south. The chief railroad centres are Detroit, Jackson, Grand Rapids, Saginaw, Kalamazoo and Lansing. The topography of the lower peninsula has favored a general distribution of roads, through a system of intersecting morainal valleys. In the western end of the upper peninsula is the only portion of the railway system of the State with steep grades. The leading lines are the Michigan Central, the Chicago and Grand Trunk, the Grand Rapids and Indiana, the Lake Shore and Michigan Southern, the Père Marquette and the Duluth, South Shore and Atlantic. Connecting with these railroads are the several large steamship lines of the Great Lakes. In general, the lake traffic is confined to a few of the heaviest and bulkiest commodities—iron ore, copper, lumber, grain and coal. The tonnage of this traffic is one-third

the total tonnage of ships owned in the United States. The tonnage of the Detroit River is five times the foreign tonnage of New York Harbor and exceeds the combined tonnage of Hamburg, Liverpool and London. About four-fifths of the through freight on the Lakes passes through the "Soo" Canal. Vast sums have been spent by the State and by the National government, in improving the Great Lakes harbors, especially at Cheboygan, Alpena, Saginaw, Saint Joseph and Grand Haven, and the channels through the Saint Mary's River, the Detroit River and the Saint Clair Flats; 45 life-saving stations and 120 lighthouses and flag-signal stations are maintained.

**Government.**—Michigan has had three constitutions, adopted in 1835, 1850 and 1908. Constitutional development in Michigan has been in the direction of restricting and defining the powers conferred upon the State government. The last constitution, which went into effect 1 Jan. 1909, contains a declaration of rights in 21 sections. Amendments to it may be proposed in either house of the legislature and by a two-thirds vote may be referred to the people, who may adopt by majority vote; amendments may also be initiated by signature of at least 10 per cent of the electorate. At the general election in 1926 and in each 16th year thereafter the question of a general revision of the constitution is to be submitted to the electorate. The elective franchise is conferred upon every male citizen of the United States 21 years of age or over who has resided six months in the State and in the township or ward in which he offers to vote 20 days next preceding an election. Women who have the qualifications of male electors and who have property assessed for taxes in any part of the district or territory to be affected by the result of an election, may vote at such election on any question involving the direct expenditure of public money or the issue of bonds.

The seat of government is at Lansing. The legislative department consists of a senate of 32 members and a house of representatives of 100 members; the lower house may not consist of more than 100 nor less than 64 members. A newly elected legislature meets in every odd-numbered year, on the first Wednesday in January. Membership in both houses is reapportioned every 10 years—next in 1923—upon the basis of the preceding national census. All legislation is by bill, and every bill to become a law must receive the assent of a majority of the members elected to each house; a two-thirds vote is requisite for bills appropriating the public funds; by a two-thirds vote the legislature may pass a bill over the governor's veto; all other bills, to become law, require the governor's signature. At special sessions the legislature can consider only such subjects as are named either in the governor's proclamation or in his message. The constitution of 1909 reserves to the people the power of the initiative and the referendum.

The officers of the executive department are a governor, lieutenant-governor, secretary of state, treasurer, auditor-general and attorney-general. All are elected for two years. The governor, in whom is vested the chief executive power, must be at least 30 years of age, five years a citizen of the United States and a resident of the State two years next preceding

his election. His salary is fixed by the constitution at \$5,000 a year. In case of vacancy, the office is filled by the lieutenant-governor, who is ex officio president of the senate. The governor may veto any bill within 10 days (Sundays excepted) of its presentation by the legislature. The appointive power of the governor is limited to minor officials.

The judicial power is vested in a Supreme Court, Circuit Courts, probate courts, justices of the peace and inferior courts established by the legislature. The Supreme Court consists at present of one chief justice and seven associate justices, two members being elected every two years for a term of eight years, at a salary of \$7,000 a year. The court holds four terms a year in Lansing. Each of the 39 Circuit Courts holds four terms a year, respectively, in each county within its circuit; each Circuit Court has one judge, elected for a term of six years at a salary of \$3,500. In each county a probate judge is elected for a term of four years; probate courts have, in addition to usual duties, original jurisdiction in all cases of juvenile delinquents and dependents. Justices' courts are established in the townships, presided over by justices of the peace, four in each township, elected for a term of four years.

In each of the 84 counties, a board of supervisors is elected by townships and city wards. Other officers are elected annually in April, generally for a term of two years. Owing to the large number of cities and villages—nearly 100 cities and over 300 incorporated villages—township government is of minor importance; the cities are in general governed by special charters.

**Banking.**—The first bank in Michigan was a private bank, established in 1806, in Detroit. By the time Michigan was admitted to the Union (1837), there were 15 banks, with an aggregate actual capital of less than \$1,500,000. President Jackson's specie circular precipitated a national crisis, which was met in Michigan by a general banking law, of such a nature that the State was soon dotted with "wild-cat" banks, without capital paid in, with excessive issue of notes, and without, in most instances, either ability or intention to redeem them. In 1844, this banking law was declared unconstitutional and provision was made in the new constitution in 1850 that no general banking law could be enacted without first receiving the approval of a majority of the electors of the State. The constitution of 1909 provides that such law, to be valid, must receive a two-thirds vote in the legislature. Under the present law, a State bank must have a capital stock of at least \$20,000 in cities of 1,500 inhabitants, and not less than \$250,000 in all cities of over 110,000. At least 15 per cent of the deposits of commercial and savings banks must be kept on hand and every stockholder is liable. A State banking department, at the head of which is a commissioner appointed by the governor for a term of four years, exercises general supervision over all banks in the State.

**Finance and Taxation.**—In 1837 the first State legislature authorized a loan of over \$5,000,000 for public improvements, most of which was placed with eastern companies which soon afterward failed. In 1846 the State sold its improvements, realizing sufficient money to

**MICHIGAN**

**The State Capitol at Lansing**

maintain its credit; but of this debt there still remained at the beginning of the Civil War \$2,316,328. The war debt increased the amount to \$3,880,399. It was not wholly liquidated until a short time previous to 1900. A loan of \$500,000, made in 1898 on account of the war with Spain, has also been paid. The constitution of 1909 provides that no debt shall be contracted by the State in excess of \$250,000, except to suppress insurrection or repel invasion.

In 1899 the assessed valuation of the State was \$968,189,087; in the current year (1916), the State board of equalization placed the equalized value of the State at \$2,800,000,000, which was a cut of \$280,000,000 from the estimate of the State tax commission. Of this amount, 29 per cent is assessed to Wayne County (\$836,000,000). In addition to a property tax, the State levies certain indirect taxes, which yield about one-tenth of the total revenue. The direct tax is spread by the auditor-general among the various administrative districts, which levy and collect, at the same time with the State tax, the taxes for the counties, townships, villages, cities and highway labor. The moneys collected for the State are disbursed principally for the expenses of the State government and the maintenance of State institutions, including the State colleges and the University of Michigan. For the year ending 30 June 1916 the State's revenue and expenditures were as follows:

Balance 1 July 1916.....	\$12,578,230
Receipts, 1916-1917.....	20,061,320
<hr/>	
Total.....	\$32,639,550
Disbursements, 1916-1917.....	20,819,170
<hr/>	
Balance, 1 July 1917.....	\$11,820,380

**Corrections and Charities.**—State penal and charitable institutions are under the Michigan State board of corrections and charities, established in 1871. This is an unpaid board of five members, one of whom is the governor ex officio, who appoints the other four, for a term of eight years; one retires every two years. During the year ending 30 June 1916 the board held 20 meetings, 16 of which were at State institutions, in conference with the local board in immediate control; in general, the local boards consist each of three members appointed by the governor and are unpaid. The oldest penal institution is the State prison at Jackson, established in 1838. In 1885 a branch prison was established at Marquette, in the Upper Peninsula. Minor offenders are sent to the reformatory at Ionia, established in 1877. The total population of all of these is about 2,000. The cost of maintenance is about \$300,000 a year, which is about half defrayed by receipts from prison industries. Progress is being made in prison management; the indeterminate sentence has been adopted, and a pardon board of four members, appointed by the governor, reports to him upon all petitions for pardon. Allied to the prisons in nature, is the Industrial School for Boys at Lansing (estab. 1855), and the Industrial Home for Girls at Adrian (estab. 1879), containing together about 1,000 inmates. County superintendents of the poor are required to send all neglected dependent children to the State Public School at Coldwater (opened 1874). The Soldiers' Home at Grand Rapids (estab.

1885) cares for Michigan soldiers of recent wars. The Asylum for the Insane at Kalamazoo was opened in 1859; in 1877 a similar institution was established at Pontiac, and in 1893 at Newberry, in the upper peninsula; there is one also at Traverse City (estab. 1881). These four institutions contain over 4,000 patients. At Ionia was established in 1885 the Asylum for Dangerous and Criminal Insane. At Lapeer is the State Home and Training School for the feeble-minded, and at Wabjamega (Tuscola County) is the Farm Colony for Epileptics; the division between these two classes has been only recently made, both classes having been cared for at Lapeer since 1893. The School for the Deaf and Dumb is at Flint (estab. 1854); the School for the Blind is at Lansing (estab. 1879); these were formerly together at Flint. At Saginaw is maintained an employment institution for the blind (estab. 1903).

**Education.**—The constitution of 1909 contains (Art. XI, Sec. 1) the well-known clause from the Ordinance of 1787: "Religion, morality and knowledge being necessary to good government and the happiness of mankind, schools and the means of education shall forever be encouraged." At the head of Michigan's school system is the superintendent of public instruction, elected in April of odd-numbered years, for a term of two years; salary \$4,000 a year. He is ex officio member and secretary of the State board of education; three other members are elected, one at each biennial spring election, to hold office six years. The board has general supervision of the State normal schools, examines textbooks on the subject of physiology and hygiene offered for use in the public schools, and conducts examinations for teachers' life certificates. In its general outline, Michigan's educational system, which it owes to its first superintendent of public instruction, John D. Pierce (1836-41), has been used as a model in nearly all the western States. Its distinctive features are universal education in common free schools with compulsory attendance, training for teachers in normal schools, and higher education in colleges and a State university. These schools are supported partly from the interest derived from the sale of school and university lands, partly by legislative appropriations. Immediately under the superintendent of public instruction there is now elected in each county a county school commissioner, who, with two county examiners, examines and licenses teachers. In some counties there are townships organized as single school districts, which may support a high school in addition to a common school; but, in general, the townships are divided into districts, by a township board of three (two elected school inspectors and the township clerk), who also exercise general supervision; each district is under its own elected board of three members. Most villages and cities support high schools.

Teachers are trained in four normal schools: the State Normal College at Ypsilanti and three others at Mount Pleasant, Marquette and Kalamazoo. Higher and special education is provided at the Michigan Agricultural College at East Lansing; the Michigan College of Mines at Houghton; and the University of Michigan at Ann Arbor. The Agricultural Col-

lege is the oldest in the United States (estab. 1850) and is under control of an elected State board of agriculture. The College of Mines (estab. 1885) is under a board appointed by the governor. The University (estab. 1837) is under control of an elected board of regents. Besides the State educational system for higher education there are several denominational colleges, at Albion and Adrian (Methodist), at Hillsdale and Kalamazoo (Baptist), at Olivet (Congregational), at Holland (Dutch Reformed), at Alma (Presbyterian), and at Detroit (Catholic).

SCHOOL STATISTICS FOR YEAR ENDING  
JUNE 1918.

School population.....	919,664
School enrollment.....	655,941
Number of ungraded school districts.....	6,660
Number of graded school districts.....	669
Number of township school districts.....	169
Number of schoolhouses.....	8,943
Estimated value of school property.....	\$11,998,534.00
Average school year in months.....	8.5
Total number of teachers employed.....	23,051

**History.**—The Indians who originally occupied Michigan were principally the Ojibwas (Chippewas), the Ottawas and the Potawatomis; minor tribes were the Hurons (Wyandots), and the Sacs and Foxes. In historic times, the Ojibwas have been principally identified with the upper peninsula, the Ottawas and Potawatomis with the Lake Michigan shore of the lower peninsula, and the minor tribes with the region between Saginaw Bay and Detroit.

The first white men to visit Michigan were the missionaries and the explorers and traders, who came from the French settlements of the Saint Lawrence Valley in Canada. The route by which they came, and by which the traffic with the Indians was carried on until the discovery of the waters connecting Lakes Huron and Erie was over the Ottawa River, Lake Nipissing, the French River and the Georgian Bay. Jean Nicolet, in whose honor a bronze tablet was erected on Mackinac Island in 1915, was the first white man to pass through the Straits of Mackinac (1634). He was an agent of Champlain, then governor of Canada, who in the interests of trade sent him to find a passage to the South Sea. Nicolet apparently penetrated as far as central Wisconsin. The Jesuit missionaries followed close upon this lead. In 1641, Fathers Jogues and Raymbault preached to the Ojibwas at Sault Sainte Marie. The first permanent settlements were made by Fathers Dablon and Marquette, in 1668 and 1671, at Sault Sainte Marie and Michilimackinac (Saint Ignac). In 1701, Antoine de la Motte Cadillac (q.v.), who had been commandant of the French fort at Michilimackinac, founded

Detroit. The Treaty of Paris in 1763, closing the struggle between France and Great Britain for possession of the continent, all of Canada, with the Great Lakes region, passed from French dominion; the frontier posts had already been garrisoned with British troops, soon after the capitulation of Montreal, in 1760. The Indians, who were friends of the French, and who underestimated the power of the British, believed that a united and determined resistance could drive the British from the continent, and under the leadership of the great Ottawa chieftain, Pontiac, made a simultaneous attack in 1763 upon the British posts from the Straits of Mackinac to western New York. Fort Mackinac, on the south side of the Straits, was captured, and all but a few of the garrison massacred. Pontiac himself conducted the siege of Detroit, but unsuccessfully, and finally the Indians were everywhere defeated.

The British held possession of Michigan until the Jay Treaty of 1796, although the Treaty of Paris (1783), closing the War of the Revolution, had ceded it to the United States. Previous to that war the Quebec Act (q.v.) of 1774 applied to the government of Michigan as well as to Canada. The population increased but slightly; a few British merchants and traders came to Detroit, and a few families settled on the shore lands above and below that point. At the outbreak of the Revolution, Henry Hamilton was appointed lieutenant-governor at Detroit, by whom supplies of tomahawks and scalping knives were distributed liberally among the Indians, and whose reports to General Carleton of the success of scalping expeditions in the settlements sufficiently characterize his administration. The retention of the posts at the close of the war was alleged to be justified on several grounds; among the real reasons was the desire to retain control of the rich fur trade. The policy of giving presents to the Indians was long continued. In 1787 the military force at Detroit was increased by two full regiments, the fortifications were strengthened, and large supplies of presents were distributed among the Indians, which so increased their hostility against the American settlements that the United States Government had to send troops against them; first under General Harmer who was defeated in 1790; then under General St. Clair who was also defeated in 1791; and finally, under Gen. Anthony Wayne, whose force was of sufficient strength to insure victory. On 20 Aug. 1794 Wayne defeated the combined force of British and Indians at the Battle of Fallen Timbers. By the Treaty of Grenville, 3 Aug. 1795, the Indians ceded a large strip of Michigan land, six miles wide and extending from Lake Saint Clair to the Raisin River, also Mackinac Island, Bois Blanc Island, and other important lands. Following these successes came the treaty negotiated by John Jay with Great Britain in 1796, according to a stipulation in which the British garrison was withdrawn from Detroit, 16 June 1796; on 11 July a detachment of United States troops took possession.

One of the earliest acts of the new Federal Government was to organize a territorial government for the Great Lakes region. The "Ordinance of 1787," adopted for the Northwest Territory, provided a government in which

a governor and three judges made laws, to be enforced by these judges as the highest court. It contained a guarantee of religious liberty, a bill of rights, a provision for general education, a declaration against human slavery, and the means of erecting new States from these lands. In 1800 the Territory of Indiana was erected, which included the western half of the Territory of Michigan and the eastern end of the upper peninsula; the remainder of both peninsulas was added in 1802. On 30 June 1805 the whole was separated into two Territories, Indiana and Michigan (the lower peninsula), and the Ordinance of 1787 was made the law of Michigan Territory. In 1800, Michigan's white population was 3,206, which in 10 years increased to 4,762 people, of whom 1,650 were in Detroit. Detroit was the capital. President Jefferson had appointed as governor, William Hull, of Massachusetts, an officer of honorable service in the Revolution, but now of advanced age, and temperamentally unfitted to be the chief officer of a frontier settlement.

In 1807, by the Treaty of Detroit, Hull secured from the Indians the cession of a large area of land in southeastern Michigan; but by 1809 the Indians had begun to realize the serious meaning of the treaty, and to make trouble which he was unable to quiet. The battle of Tippecanoe, 7 Nov. 1811, in which Gen. William Henry Harrison defeated the Indians near Lafayette, Ind., drove them over to the British, and made Michigan the scene of the opening campaign of the War of 1812. In December 1811, Hull went personally to Washington, to beseech Congress to strengthen Michigan's defenses, but he unwisely accepted personal command of a force which was much too small for the purpose. In the following war, which was declared against Great Britain, 18 June 1812, Mackinac was captured by the British on 17 July, which Hull deemed decisive as to the control of the Great Lakes. The arrival of British reinforcements before Detroit, under the British General Brock, demanding surrender, together with the threatening possibility of an Indian massacre similar to that at Mackinac in 1763, decided Hull to comply with the British demands (16 Aug. 1812) to the indignation of his soldiers and of the nation. It is still believed that he might have been able to resist an immediate attack, and that he would have been speedily reinforced; at the time he was court-martialed, and sentenced to be shot, but was pardoned by President Jefferson on account of his honorable record in the Revolution. The immediate result of the surrender was to place the settlements at the mercy of the Indians. On 23 Aug. 1813, following the capture of General Winchester at Frenchtown on the Raisin River, the Indians, with scarcely any restraint from the British General Brock, foully massacred nearly the entire garrison (see FRENCHTOWN, BATTLE OF). The victory of Commodore Perry on Lake Erie (10 Sept. 1813) which made possible that of General Harrison on the river Thames (5 Oct. 1813) restored Michigan to the United States.

On 13 Oct. 1813, Lewis Cass, who had served as a brigadier-general under Harrison, was appointed governor of Michigan Territory, and until 1831, when he was appointed a member of Andrew Jackson's Cabinet, his exceptional talents were used for the upbuilding of the

commonwealth. His intimate knowledge of Indian character was specially useful in weaning the tribes from their British sympathies and gaining their respect for the United States government. By the Indian treaties of 1819 and 1821 he secured the cession of large areas of land adjacent to and including the Saginaw and Grand River valleys. In 1836 the Indians ceded practically all the remaining portion of the Lower Peninsula, and the eastern half of the Upper Peninsula; and before 1840 they had been removed to Western reservations. With the first public land sales at Detroit in 1818, the beginning of steam navigation on the Great Lakes, the opening of an all-water route to the Atlantic seaboard through the Erie Canal in 1825, the settlement of Michigan made rapid strides, especially in the closing years of the Territorial period, which brought the population from 31,639 in 1830 up to 87,273 in 1837.

The admission of Michigan to the Union was delayed by a dispute with Ohio about Michigan's southern boundary. In 1835 the people of Michigan adopted a State constitution, elected a complete set of State officers and later this constitution of 1835 was accepted by Congress without re-adoption; the original delegate was seated in Congress without re-election, and the original State officers continued to serve without re-election after the formal admission of the State by Congress (26 Jan. 1837). From 1 Nov. 1835 Michigan was *de facto* a State, though not technically a State in the Union. The boundary question was settled in 1837 in favor of Ohio, when Michigan acquired, as compensation for the loss on the south, the Upper Peninsula, then but little known. At the very outset, the State was seriously crippled by the financial panic of 1837, and the failure of Eastern companies with which the State had placed a \$5,000,000 loan for public improvements. The improvement scheme, which involved the building of three trans-peninsular railroads, had to be abandoned, and the debt was not entirely paid until long after the Civil War. The improvements made, mainly on the Michigan Central and the Michigan Southern railroads, were carried on however by private enterprise, the former road being completed to Chicago in 1852. In 1850 a new State constitution was adopted, prohibiting the State to engage in any similar undertaking. In accordance with a provision of the constitution of 1835, the question of the permanent situation of the State capital was taken up by the legislature in 1847, with the result that it was located at Lansing. During the Civil War, Michigan put into the field nearly 100,000 men; among the many who won distinction for service was Gen. George Armstrong Custer (q.v.), leader of the famous Michigan Cavalry Brigade. Michigan's "war governor" was Austin Blair. In this period began the career of Zachariah Chandler, who served three terms as United States senator (1857-75). While Mr. Chandler was in the National Senate, Michigan had seven governors, all but one of whom served two terms.

Since the Civil War, Michigan has gained rapidly in population, wealth and prosperity. Agriculture has continued to be the leading industry in the southern peninsula, and mining in the northern; pine lumbering, in the years immediately following the war, developed to

enormous proportions in lower Michigan, but is now carried on principally above the Straits. The conditions of labor have favored rapid immigration; only one serious strike has occurred in Michigan's history, in the Copper Country, in 1913. After the war there ensued a great activity in railroad building, aided by national and State land grants totaling nearly 6,000,000 acres. For the original Sault Sainte Marie Canal the national government granted 750,000 acres of land, and in 1881 assumed control on completion of the Weitzel lock, which it had constructed at a cost of more than \$2,000,000. The establishment of public institutions has kept pace with the State's growth in material wealth, coming rapidly into existence between 1870 and 1885. Many subordinate departments of government have been organized as the administration of the State's affair have become more complex. In 1879 a new capitol building at Lansing was completed and occupied. Legislation has been in the direction of a more equitable distribution of taxes, greater freedom in elections, and increased control of local government by municipalities. The system of "county option," with high license, is now in force, the State having repealed in 1876 the prohibition law of 1855. At various times the question of a general revision of the constitution has been submitted to the people, in 1867, 1874, 1892 and 1898, but defeated, until 1908, when a new constitution was adopted, which went into effect 1 Jan. 1909. In politics Michigan was strongly Democratic previous to the Civil War, until the formation of the Republican party in 1854, since which time Michigan has elected Republican governors, except in 1882, 1890, 1912 and 1914.

**Population.**—The first appreciable increase of Michigan's population came after 1818, when public lands came onto the market; but not

until about 1835 was the increase rapid. It was checked by the financial panic of 1837, but was again on the increase by 1840. The first foreign immigration, especially from Germany, came with the revolutions of 1830 and 1848 in Europe; economic depression in Ireland caused an Irish exodus in the early half of the 19th century. Religious oppression in Holland brought a Dutch colony to western Michigan in 1846. Overcrowding in the countries of southern Europe has stimulated the Italian, Hungarian and Greek immigrations of recent years. Nearness to Canada has facilitated the coming of many Canadians since 1850. The French-Canadians began coming as early as 1701 to the shore lands about Detroit. Direct immigration from France has not occurred to any extent. The Germans are most numerous in southeastern Michigan about Ann Arbor and Saginaw. The strongest Dutch centres are Holland, Grand Haven and Grand Rapids. Poles are especially numerous in the "Thumb" and about Detroit, Grand Rapids, Bay City and Saginaw. The largest Italian colony in the Lower Peninsula is in Detroit; and in the Upper Peninsula at Calumet and Iron Mountain. The most numerous foreign-born population in the Upper Peninsula are the Finns, mainly in the mining regions. The Swedes and Norwegians are most numerous in the counties of Houghton, Delta, Dickinson and Gogebic. In the Copper Country there are many Cornishmen. In 1910 Michigan's total foreign-born population was 597,550, or 21.3 per cent of the total population. Following are the number of foreign births by the principal countries represented (United States census):

Canada (French and others).....	419,968
Germany.....	424,753
England.....	130,323
Russia.....	60,023
Sweden.....	56,937
Scotland.....	25,477
Norway.....	16,774
Hungary.....	14,198

In total population Michigan ranks eighth in the Union; in density, 17th. This population is distributed in the two peninsulas as follows:

	Population	Urban population	Rural population
Upper Peninsula...	325,631	181,987	143,544
Lower Peninsula...	2,484,542	1,431,192	1,053,450

About one-third of the population of the Upper Peninsula is in the Copper Country, and another third in the vicinity of the iron mines. In the Lower Peninsula the population is largely in the southern counties, and densest in and about the largest cities—(1910) Detroit, Grand Rapids, Saginaw, Bay City, Jackson, Kalamazoo, Muskegon, Port Huron, Battle Creek, Lansing and Ann Arbor. In 1910 Detroit contained about one-sixth of the population of the State. Since then its rate of gain has been vastly greater than that of most other cities. Lansing and Flint have risen far above the rank allotted them in 1910. The trend of population is at present (1919), as it has been for over 20 years, away from the small villages and rural districts to the large cities, and, in general, there is a perceptible trend toward the northern and northwestern parts of the State. The general growth in popula-

tion by decades from 1810 to 1917 is given in the following table:

1810	4,762
1820	8,896
1830	31,639
1840	212,267
1850	397,654
1860	749,113
1870	1,184,039
1880	1,636,937
1890	2,093,890
1900	2,420,982
1910	2,819,173
1917 (estimated)	3,074,561

**Bibliography.**—State publications; the most important above used are the reports and bulletins of the Geological and Biological Survey, Public Domain Commission, Railroad Commission, Board of Agriculture, Highway Department, Department of Public Instruction and Board of Corrections and Charities (consult for others, Bowker, R. R., STATE PUBLICATIONS); United States Census, 1910; 'Michigan Historical Collections' (Lansing 1877-1915); 'Michigan Political Science Association Publications' (Ann Arbor 1893-1905); 'Legislative Manual' (Lansing 1915); Cooley, 'Michigan' (American Commonwealth series, rev. ed., Boston 1905); Shelden, 'The Early History of Michigan' (New York 1856); Lanman, 'History of Michigan' (New York 1839); Farmer, 'History of Detroit and Wayne County and Early Michigan' (Detroit 1890); Wood, 'Geography of Michigan' (Kalamazoo 1914); McLaughlin, 'Lewis Cass' (American Statesmen series, Boston 1892) and 'Higher Education in Michigan' (Circular of Bureau of Education, Washington 1891); Cook, 'Michigan, its History and Government' (New York 1905); Campbell, 'Outlines of the Political History of Michigan' (Detroit 1876); Dilla, 'The Politics of Michigan, 1865-1878' (New York 1912).

GEORGE N. FULLER.

*Secretary Michigan Historical Commission.*

**MICHIGAN, Lake**, in the northern part of the United States, the second in size of the Great Lakes (q.v.), and the largest body of fresh water lying wholly within the United States. It is bounded on the north and east by the State of Michigan, on the south by Indiana and on the west by Illinois and Wisconsin. Its outlet is Straits of Mackinac, through which its waters flow into Lake Huron (q.v.). The Mississippi is supposed to have been its outlet in ancient times; and now the lake is connected with this river by means of the Chicago Drainage Canal and the Illinois and Michigan Canal. Lake Michigan is a most important part of a great water system which furnishes transportation to the ocean for an extensive grain-growing and lumbering region. The lake is 581 feet above sea-level; its length from north to south is 316 miles; the average width 75 miles, the maximum depth, 875 feet and mean depth, 690 feet; area, 22,450 square miles; drainage area, 68,100 square miles. It is subject to violent storms, which are most destructive in the late autumn months. A lunar tidal wave shows itself in a slight degree. The shore-line of the southern part of the lake, east and west, is regular, but that of the northern part, east and west, has a number of indentations many of which form good harbors. At the mouths of rivers which

flow into the lake there are good harbors. Nearly the whole extent of coast is low, most of it sandy; the Michigan coast has some high bluffs and considerable rocky shore-line. Green Bay on the west, indenting Wisconsin, is the largest bay; and Grand Travers Bay, on the east indenting the coast of Michigan, is the next in size. Another important inlet on the east is Little Travers Bay. Big Noquet and Little Noquet are inlets from Green Bay. The chief harbors, which are formed by mouths of rivers, are Chicago, Milwaukee and Grand Haven. Escanaba and several other good harbors are on the shores of Green Bay (q.v.). There are few islands in the southern part of the lake, all small and near the coast. At the entrance to Green Bay there is a group of islands, the largest of which is Washington. The Manitou (q.v.) group, in the northern and northeastern part of the lake, has several good-sized islands; the largest, Beaver, is about 52 miles long.

The chief rivers which flow into the lake are the Ford, Escanaba and Manistique from the north; the Manistee, Père Marquette, Muskegon, Grand Kalamazoo and Saint Joseph from the east. The Fox and the Menominee enter the lake through Green Bay.

The chief cities on the lake are Chicago in Illinois and Milwaukee in Wisconsin. Other important cities are Kenosha, Racine and Manitowoc (Wis.), Manistee, Ludington and Grand Haven (Mich.), and Michigan City (Ind.). The navigation on Lake Michigan is most extensive and important. In the upper waters, or the southern part, navigation continues nearly all the year, but in the northern part navigation is closed about four months on account of the ice in the Straits of Mackinac. Large shipments of lumber are sent by way of the lake from northern Michigan and Wisconsin to Milwaukee and Chicago, and a vast amount of wheat and corn of the Mississippi Valley is sent east through Chicago and over Lake Michigan. Large mineral shipments are made. The fisheries of the lake are most important. The lake trout and whitefish of Lake Michigan are sent, fresh and canned, to all the large markets of the vicinity and to the Eastern markets.

The early missionaries and traders traversed the waters of this lake. In 1634 Jean Nicolet, an agent of Champlain (q.v.), visited the northern part of the lake, entered Greer Bay and partially explored the Fox River. Father Marquette (q.v.) visited this lake and established mission stations on its shores. La Salle (q.v.) and Father Hennepin (q.v.) in 1679 made their famous voyage on this lake, and La Salle built a fort at the mouth of the Saint Joseph River.

**MICHIGAN, University of**, chartered in 1837 and first opened at Ann Arbor in 1841. It is a part of the public educational system of the State and is under the control of a board of regents elected for eight years by popular vote. The law of 1837 establishing the university provided for three departments, namely, literature, science and the arts, law and medicine. The curriculum has since been enlarged till the organization now includes eight departments: (1) Literature, science and the arts; (2) engineering and architecture; (3) medicine and surgery; (4) law; (5) the College of Pharmacy; (6) the Homoeopathic Med-

ical School; (7) the College of Dental Surgery, and (8) the Graduate School. The College of Literature, Science and the Arts offers courses in language and literature, history, philosophy, science and the liberal arts, and includes special curricula in journalism, business administration, insurance and statistics, chemistry, forestry and landscape design, as well as combined curricula leading to degrees in letters and law, letters and medicine and letters and dental surgery: the degrees conferred are bachelor of arts and of science. The colleges of engineering and architecture offer courses in civil, chemical, mechanical, electrical and marine engineering, aeronautics, conservation engineering, naval architecture, architecture and architectural engineering, and confers the degrees of bachelor of engineering and of architecture. Other degrees conferred by the university are as follows: Doctor of medicine in the Medical School and in the Homeopathic Medical School; bachelor of laws, juris doctor and master of laws in the Law School; pharmaceutical chemist, and bachelor of science (in pharmacy), in the College of Pharmacy; and doctor of dental surgery and doctor of dental science in the College of Dental Surgery. Advanced work in all lines is carried on in the Graduate School, leading to the degrees of master and doctor of arts, of science and of public health, and civil, electrical, mechanical and marine engineer. There are summer sessions in the colleges of Literature, Science and the Arts, Engineering and Pharmacy, and in the Medical, Law and Graduate schools. A summer engineering camp and a biological station are maintained on lands owned by the university in northern Michigan. The regulation of the affairs of each department is in the hands of the faculty of that department; there is also a university senate which considers matters of common interest. The standard of scholarship at the university is high, and it has long ranked among the foremost of State universities. The system of inspecting and accrediting secondary schools and admitting their recommended graduates originated at this university in 1870 under the acting presidency of Henry Simmons Frieze, whence it has been universally adopted throughout the United States. The university is also distinguished as a pioneer in adopting the principle of coeducation, being opened to women in 1870, and giving them equal privileges in all respects; this system has proved very successful from the first, and has never incurred any adverse criticism. The dormitory system adopted at first was discarded early in the history of the institution, but has in recent years been revived for women students. In addition to cottage dormitories, three commodious and magnificently appointed halls of residence for women, given by friends of the university, were opened in 1915. The 1,700 women students are all required to live in approved houses. Besides the halls and laboratories of the different departments the important buildings are the Alumni Memorial Hall, the Hill Memorial Auditorium, seating 5,100, the library, the museum, the observatory and the two gymnasiums. The university has a number of valuable collections in natural history, archaeology, ethnology, materia medica, anatomy and the industrial and fine arts.

Among these are the Chinese government exhibit at the New Orleans Exposition, presented to the university in 1885, and the Stearns collection of musical instruments. This is one of the most complete and significant collections of the kind in existence, containing about 1,500 examples of every type of musical instrument, and is supplemented by a very inclusive collection of books bearing upon the subject. The Frieze memorial organ, first built for the Chicago Exposition of 1893 and presented to the university by friends, was completely rebuilt and much enlarged when recently transferred to Hill Auditorium. The musical festivals, held annually in May at the university, are of international repute. The general library in 1919 numbered over 308,000 volumes, not including pamphlets; special libraries also belonging to the university are the science library (15,000 volumes), the chemical library (10,000 volumes), the engineering library (15,000 volumes), the medical library (30,000 volumes), the law library (40,000 volumes), the homeopathic library (4,000 volumes) and the dental library (3,100 volumes). A large and splendidly equipped building will be occupied in 1919. The main observatory, erected by the citizens of Detroit and known as the Detroit Observatory, contains a meridian circle constructed by Pistor and Martins of Berlin, a refracting telescope with an object-glass of 13 inches diameter and a recently constructed reflecting telescope of 37½ inches aperture and a refractor of 24 inches aperture. The observatory also contains a complete set of seismographs. Two hospitals are connected with the university, one under the direction of the Medical School, the other under the charge of the Homeopathic Medical School; with each of these is connected a training school for nurses. A course in public health nursing has also been introduced. The University-hospital will be rebuilt at an expense of more than \$1,000,000 appropriated by the last two legislatures, and an appropriation of \$300,000 for a school of education. The State Psychopathic Hospital is connected with the former. Ample provision is made for physical culture and athletics; besides the two well-equipped gymnasiums, one for men and one for women, there is an athletic field of 75 acres for men and a sports field of seven and one-quarter acres for women; the general supervision of athletic sports is vested in a board of control of 11 members, on which the faculty is represented by five members chosen from the university senate, the Alumni Association by three members and the students by three members chosen by the directors of the Students' Athletic Association. Important among student organizations is the University Oratorical Association, established by the students of the College of Literature, Science and the Arts to foster an interest in oratory and debate; this association is affiliated with various oratorical and debating leagues composed of representatives of universities of the North-Central States. The total income in 1918 was \$2,378,556, including the regular State appropriation, together with an additional appropriation of \$200,000 for the new library building; the fees to students are small, being somewhat less for residents of the State than for non-residents. The faculty numbers 610; the average annual attendance of students is over 7,000. During the World War, 1914-18, 3,000 students were

enrolled with the colors. The total number of graduates to 1918 was 35,544. Tuition fees range from \$45 to \$130; living expenses \$500.

**MICHIGAN AGRICULTURAL COLLEGE**, chartered in 1855, and opened in 1857, situated at Lansing. It was the first institution for agricultural education established in the United States. The Michigan State constitution provided that "The legislature shall as soon as practicable provide for the establishment of an agricultural school." In 1850 the legislature petitioned Congress for a grant of land for an agricultural college within the State, but no attention was paid to this petition. In 1855, however, the legislature appropriated land and money for such a college and located it on a farm of 684 acres. From that time until 1862 the college was supported by State appropriations, and in that year received control of the Federal land grant. The courses offered in the college include full four-year courses in agriculture, engineering, home economics, forestry and veterinary medicine. Also short courses (varying from 8 to 16 weeks in length) in general agriculture, horticulture, poultry, creamery management and cheese-making. Graduate work is also provided for. The college holds each year, during the winter months, about 500 farmers' institutes throughout the State. The State Experimental Station is also connected with the college and receives a separate Federal appropriation annually. The extension work is carried on co-operatively with the United States Department of Agriculture under the terms of Act of Congress of 8 May 1914, known as the Smith-Lever Act. The farm consists of about 1,013 acres and the buildings are valued at about \$900,000. The library (1916) contains about 40,000 volumes. The total annual income is approximately \$750,000; the students number 2,000 and the faculty and assistants 140.

**MICHIGAN CITY, Ind.**, city in Laporte County, on Lake Michigan and on the Chicago, Indianapolis and Louisville, the Père Marquette, the Lake Erie and Western and the Michigan Central railroads, about 40 miles east of Chicago. The place was visited frequently in the 18th century by missionaries, explorers and traders, but the first permanent settlement was made in 1832. The incorporation was made in 1833. It has excellent transportation facilities which contribute to its commercial and industrial growth. Its chief manufactures are hosiery, knit underwear, chairs, lumber, railroad cars, furniture, bicycles, surgical instruments and clothing. It has a large trade in iron ore, salt, lumber and farm products. It has the Northern Indiana State Prison, a United States life-saving station and on the lake front a park. Its educational institutions are a high school, public and parish schools and a public library. The city is governed under a charter of 1867, since amended, which provides for a mayor, elected biennially, and a common council. The administrative officials are elected by the council or appointed by the mayor subject to the approval of the council. The waterworks are owned and operated by the city. Pop. about 19,100.

**MICHIGAN COLLEGE OF MINES**, at Houghton (q.v.), Mich., was founded in 1885 and opened in 1886. The school, a State-

supported institution, is located in the midst of the mining region of the State, thus giving the students exceptional opportunities for observation and study. Practical work in mine surveying and mining is carried on for five weeks, 45 hours each week. The first two weeks are devoted to surveying and mapping a mine in the "copper country" or in the iron mining district; the last three weeks are given to the examination of mining methods and to making sketches of mines in the vicinity. The courses of study lead to the degrees of bachelor of science and engineer of mines. The college is well equipped with all necessary apparatus. There are nine college buildings with a library of 30,000 volumes. The metallurgical and assay laboratory is a brick building, and the ore-dressing building or stamp mill is a wooden building. A reverberatory roasting furnace stands near the mill. There are 26 instructors and an average yearly attendance of 135 students.

**MICHIPICOTEN**, mish-ě-pě-kō'ten, a bay, island and river in the western part of the province of Ontario, in Canada. The bay is an arm of Lake Superior, on the northeast shore, about 100 miles north of Sault Sainte Marie. At the entrance to the bay is Michipicoten Island. The river has its source in lakes on the south side of the height of land dividing the waters of Hudson Bay and Lake Superior and falls into the bay 125 miles north of Sault Sainte Marie.

**MICHLER'S KETONE**, Tetramethyl-diaminobenzophenone (CH<sub>3</sub>)<sub>2</sub>N<sub>2</sub>C<sub>6</sub>H<sub>4</sub>CO(CH<sub>3</sub>)<sub>2</sub>, was first prepared in 1876 by W. Michler. He obtained the ketone by passing carbonyl chloride into cooled dimethyl aniline. The reaction mixture was then heated with water and the product was purified by treatment with hydrochloric acid and caustic soda. With slight modifications Michler's method is employed at the present time for the preparation of the compound. The ketone has also been prepared (1) by heating hexamethyl-triaminotriphenyl carbinol with hydrochloric acid, and (2) by heating a mixture of dimethyl-aminobenzanilide and dimethyl aniline in the presence of a small quantity of phosphorus oxychloride, and by decomposing the condensation product with an acid at slightly elevated temperatures. Michler's ketone forms bright grayish plates when crystallized from alcohol. It melts at 179° C. and boils with decomposition above 360° C. It has been used to a great extent in the manufacture of certain dyes. Thus heated with dimethyl aniline and phosphorus oxychloride it yields Crystal violet; with ammonium chloride in the presence of a dehydrating agent it forms Auramine; it condenses with phenyl-alpha-naphthylamine into Victoria Blue B; with methyl-phenyl-alpha-naphthylamine into Victoria Blue 4R, and with ethyl-alpha-naphthylamine into Victoria Blue R. It also forms dyes with dioxynaphthalenes and with pyrogallol acid.

V. S. BABASINIAN,

Professor of Chemistry, Lehigh University.

**MICHMASH**, mik'mash (modern Mukhmas), Palestine, seven miles northeast of Jerusalem. It occupies a highly important strategic position, commanding the north side of the Pass of Michmash on one of the two an-

cient caravan roads from Jerusalem to Mount Ephraim. Michmash lies on a plateau of rolling ground, but the road descends sharply into a rough valley at the bottom of which is the Pass of Michmash, a gorge with steep sides, which must be traversed by the caravans. It was here that the Philistines made their headquarters in their movements against the first uprising under Saul, and it was the scene of Jonathan's exploit related in 1 Samuel xiv. It was also Jonathan's headquarters in the time of the Hasmonæans (1 Macc. ix, 73). It was never a city, but was surrounded by wheatlands, and in the time of Eusebius it was a considerable village. The present village, Mukhmas, is small, and the road on which it stands is more or less abandoned in favor of the caravan road which keeps to the high ground and avoids the Pass of Michmash.

**MICHOACAN**, mē-chō-ā-kān', Mexico, a state, on the Pacific Ocean, bounded on the north by the states of Guanajuato and Jalisco, on the east by Mexico, on the south by Guerro and the Pacific and on the west by the Pacific, Colima and Jalisco. Area, 22,874 square miles. Three railroad lines cross parts of the state. The surface generally is mountainous; in the north and south are some flat lands. The volcano of Jorullo is in the southwest. The largest drainage streams are Las Balsas and Lerma on the boundary, and the Tepalcatepec. There are a number of lakes within the state limits, the largest of which is Cuitzeo. Except where the lands are low, the climate is healthful. The soil is fertile; the principal crops are sugar, tobacco, vanilla, wheat, rice and tropical fruits. Considerable attention is given to stock-raising. The minerals are valuable: The Don Estrellas mine is the largest producer of gold and silver in the country. The capital is Morelia (q.v.). Pop. of state about 1,003,491.

**MICKIEWICZ**, mīts-kē-ēv'ih, Adam Bernard, Polish poet: b. Novogródek, Lithuania, 24 Dec. 1798; d. Constantinople, 26 Nov. 1855. He was educated at the University of Wilna, where he became affiliated with several of the leaders against Russian control. His first volume of poems appeared in 1822 and stamped him the greatest poet of his country. Implication in political affairs caused his banishment to Russia in 1824, but in 1828 permission to leave Russia was granted him and he traveled in Germany and Italy, and in 1834 he went to Paris, where, in 1840, he became professor of Slavonic languages and literature in the Collège de France, where his radical teaching led to his suspension in 1844. In 1848 he attempted to enlist Polish regiments for service in the Italian struggle with Austria. He became librarian at the Arsenal in Paris in 1852. His remains were interred (1890) at Cracow. (See PAN TADEUSZ). Among his works are 'Conrad Wallenrod' (1818); 'Crimean Sonnets' (1826); 'The Books of the Polish People and of the Polish Pilgrimage' (1832); 'Pan Tadeusz' (1834), etc. Consult L. de Loménie, 'Galerie des Contemporaines,' and Gardner, W. M., 'Adam Mickiewicz, National Poet of Poland' (1911).

**MICKLE**, mīk'l, William Julius, Scottish poet: b. Langholm, Dumfriesshire, Scotland, 28 Sept. 1735; d. Forest Hill, near Oxford, 28 Oct. 1788. He removed to London in 1764,

and in 1775 appeared his principal production, a translation of the 'Lusiad' of Camoens, with a historical and critical introduction, including a life of Camoens. His poetical works were published collectively, with memoir by Sim, in 1806. Among the best of Mickle's poems is the ballad of Cummor Hall, which has attained additional celebrity as having suggested to Sir Walter Scott the groundwork of his novel of 'Kenilworth.' The popular song, 'There's nae Luck about the Hoose,' has been claimed for him; other ascribe it to Jean Adams (1710-65), schoolmistress near Greenock.

**MICMACS**, mīk'māks, a tribe of American Indians. See ALGONQUIAN.

**MICROBE** (Greek μικρός, little; βίος, life), a microscopic organism; applied particularly to bacteria, and more especially to the forms that cause disease. See BACTERIA; PROTOZOA.

**MICROCEPHALUS**, in pathology, the condition of having an abnormally small head, further marked by a peculiarly shaped cranium. The forehead is small and receding and the vertex somewhat pointed. The various parts of the brain are unnaturally small. The condition results in mental deficiency, amounting in some cases to idiocy. Operative measures to restore or supply the ununited sutures and the spaces permitting the growth of the brain have been tried, but found unavailing.

**MICROCLINE**, a feldspar identical in composition with orthoclase, but crystallizing in the triclinic system. The name was given by A. Breithaupt in 1830, but the species was really first established by Des Cloizeaux in 1876. There is a green feldspar called Amazon stone which is really microcline, and much of the potash feldspar called orthoclase also is microcline. Thin sections examined in polarized light frequently show a grating-like structure, due to double twinning. The color varies from white to yellow and, occasionally, red or green.

**MICROCONODON**, a fossil animal of the Upper Trias in North America, doubtfully placed among the Protodonta, or most primitive of Mammalia, and of interest chiefly in reference to the structure of its teeth as indicating the subsequently developed mammalian type. Consult Osborn, 'Evolution of Mammalian Molar Teeth' (New York 1907).

**MICROCOSM AND MACROCOSM**. Among the ancients a belief prevailed that the world or cosmos was animated, or had a soul. This theory led to the notion that the parts and members of organic beings must have their counterparts in the members of the cosmos. The natural philosophers of the 16th century took up this theory in a somewhat modified shape, and considered the world as a human organism on the large scale, and man as a world, or cosmos, in miniature; hence they called man a microcosm (Greek, 'little world') and the universe itself the macrocosm ('great world'). Heylin gave the title 'Microcosmus' to a work on cosmography in 1621.

**MICROCOSMIC SALT**, used in blowpipe analysis; prepared by mixing concentrated solutions of phosphate of soda and chloride of ammonium. It has the composition  $\text{NaNH}_2\text{HPO}_4 \cdot 4 \text{H}_2\text{O}$ .

**MICROFARAD**. See FARAD

**MICROLESTES.** See *PLAGIAULACIDÆ*.

**MICROLITE** (Greek, "small"), a native pyrotantalate of calcium, containing fluorine and also niobium and various other bases. The formula has not yet been satisfactorily determined. Microlite crystallizes in octahedral forms belonging to the isometric system, and the crystals are often very small. It was first found at Chesterfield, Mass., where the crystals were so minute as to suggest the name "microlite." Excellent crystals as much as an inch in diameter have since been found in Amelia County, Va., as well as imperfect ones weighing as much as four pounds. The mineral is usually yellow or brown in color, with a resinous lustre, a hardness of 5.5 and a specific gravity of from 5.5 to 6.1.

**MICROMETER**, an instrument for measuring minute angles and distances. The "double-image micrometer" is of importance in measuring the diameter of a celestial object; it is an eye-piece containing two halves of a lens, each half being movable by a micrometer screw (q.v.) in a direction parallel to the common diameter. When the halves form one lens the heads of the screws indicate zero. In making an observation of the diameter of a heavenly body the half-lenses are so moved that the image formed by one of them of one limb of the body coincides with the image of the opposite limb formed by the other half-lens; the readings of the screw-heads determine the apparent diameter of the body.

**MICRON**, mī'kron (Greek, "very small"), a unit of length equal to the millionth part of a metre, or the 25,400th part of an inch. It is much used among physicists in connection with precise measurements, and has been officially sanctioned by the International Commission of Weights and Measures. The Greek letter  $\mu$  is used as its symbol. Thus "47  $\mu$ " is read "47 microns." The names "bicon" and "tricon" have been proposed, respectively, for the billionth and trillionth part of a metre, but they have not been generally adopted, and probably will not be. Etymologically, at least, they are monstrosities.

**MICRONESIA.** To the islands shortly north of the equator in the Pacific has been applied the designation "Micronesia" (Greek, *mikros*, small; *nēsos*, island). The designation aptly describes the physical appearance of the islands of this subdivision of Oceanica, for they are generally small and generally low, and the section contains a larger proportion of islands of the atoll type than any other subdivision of the globe. Listing the several archipelagoes from the east toward the west we find the Marshall group, with its two chains, the Ratak and Ralik; the Caroline group; the Palau, and the Marianas or Ladrões. In the order of their discovery all of these islands, with the exception of the Marshall group, came under the sovereignty of Spain in the 15th century, and with a single exception remained Spanish until the year after the Spanish War, in which they passed to the German Empire, by purchase, for 24,000,000 pesetas; they remained German until their capture by the naval forces of Japan in October 1914. The single exception to the German purchase from Spain is the island of Guam, which was captured by the United States in the Spanish War in 1898, and now re-

mains an important base of American naval strategy in the Pacific. This is the southernmost island of the Ladrões, possesses a good harbor and is 47 miles distant from the island of Rota, its nearest neighbor. Despite the infrequency of rain all of these islands may be regarded as fertile and abundantly productive. The staple product of such agriculture as is practised by the inhabitants is the cocoanut, whose dried meat, known commercially as copra, finds extensive use in the production of oil and feed-cake. In climate, conditions are found such as might be expected in low altitudes in immediate proximity to the equator, but the excessive temperature is very pleasantly moderated by the prevalence of ocean breezes. Lying in the region between the two trade winds precipitation is generally below the normal, and the supply of water is markedly deficient, in some islands the only potable water being that which is obtained by filtration through the beach sand into temporary wells which are dug above high water mark. The islands in general lie outside the hurricane belt, yet at rare intervals they have been visited by destructive gales of this type. The ethnological position of the islanders is as yet imperfectly known; physically and in language they differ from the other inhabitants of the Pacific, and in some particulars they seem to suggest a certain degree of derivation from the races of the southeastern corner of Asia, between Tibet and Cambodia. Within a historic period, the native race of Guam, the Chamoro, have been destroyed in a futile insurrection against the introduction of foreign culture.

In 1850 the greater part of Micronesia came under the influence of American missionaries, who in that year established a station on the island of Kusaie, in 1856 extended their work to the Marshall Islands, and later spread their efforts over all of the eastern Caroline Islands; in this latter field they came into conflict with the Spanish government, and were forced to withdraw. Micronesia, since the discovery period, has been but scantily subjected to scientific investigation, except upon the linguistic side. Consult Christian, F. W., 'The Caroline Islands' (London 1899); Furness, 'The Island of Stone Money' (Philadelphia 1910); Father Salesius, 'Die Karolinen-Insel Jap' (Stuttgart 1904); Bartolis, 'Las Carolinas' (Barcelona 1885); Cabeza Pereira, 'Estudios sobre las Carolinas' (Manila 1895).

**MICRO-ORGANISM.** See *BACTERIA*.

**MICROPHONE.** See *ELECTRICAL TERMS*.

**MICROPHOTOGRAPHY**, the art of photographing minute objects by combining a camera with a microscope in such a way as to obtain a picture of the object as enlarged by the lenses of the latter instrument; also, the art of making a photograph on a minute scale, by means of reducing lenses, of any object, as a page of print, which may afterward be enlarged by rephotographing it through a microscope. Also called *Photomicrography*. See *PHOTOGRAPHY*.

**MICROPYLE**, the minute opening in the integument of an animal egg-cell, or in the ovule of a plant, by which the spermatozoon in the case of an animal, or the pollen of the plant, enters the egg or ovule to make contact

with the germinating vesicle and effect fertilization.

**MICROSAURI**, an order of Prosauria. See HERPETOLOGY.

**MICROSCOPE**, an optical instrument by which images of objects are so magnified that details invisible or indistinct to the naked eye are clearly observed. In the ordinary microscope the magnifying power is interposed directly between the eye and the object, in the manner of a magnifying glass; and although the power may consist of several lenses, they combine as one. See LENS.

FIG. 1.

Microscopes are of two types — simple and compound, the former being used for low magnifications, rarely exceeding 20 diameters, whereas the latter may give as high as 4,000 diameters magnification. In the simple form the eye views the object directly (Fig. 1), whereas in the compound form an enlarged image is formed by one lens, which image is magnified by another lens or pair of lenses, at the same time reversing it so that what is at the right hand in the object is at the left hand in the image. (Fig. 2.) A short focus positive lens becomes a simple microscope when used for directly viewing an object; its usual form is that of the Pocket Magnifier, and although generally consisting of a combination of two or more lenses with the view of improving its quality, it always remains optically simple. The most simple forms are one or several convex lenses mounted separately and offering a variety of foci, and hence of magnifying power. These lenses have two defects, one, chromatic aberration, which fringes the images with the colors of the spectrum, most noticeably red or yellow, and blue; the other, spherical aberration, which is most noticeable by the lack of distinctness increasing toward the edge of the field. Improved forms are constructed to overcome these defects. The most simple of these is the Coddington lens, originally a section of a sphere, but, as generally made, a thick double convex lens with a circular groove which acts as a diaphragm. The achromatic lens when composed of three lenses, two concavo-convex flint glass lenses enclosing and cemented to a double convex crown glass lens, is the best form. These are usually placed in a folding mounting for pocket use. The simple microscope is also made in more complex form for dissecting purposes, a mechanical construction, more or less elaborate, being added, which provides adjustment for the lens in relation to the object, a platform or stage for the latter, and a mirror for reflecting light to illuminate the object. (Fig. 3).

In the compound microscope the lens which

gives the first magnified image is the one nearest the object, and therefore called object-glass or objective. The optical part which magnifies the image formed by the objective is the one to which the eye is applied and is called the eye-piece or ocular. This latter, in its common

FIG. 2.

form, is called a Huyghenian, eye-piece, after Huyghens, who used it in the earliest and most primitive telescope construction. It consists of two plano-convex lenses (Fig. 2), suitably mounted in brass, the lower lens, *il*, being called the field lens, the upper one, *op*, the eye lens. It is a negative eye-piece, as its

FIG. 3.—Dissecting Microscope.

focus lies within itself, a diaphragm *cd* which limits the field of vision being placed at this point. The action of the compound microscope is plainly shown in Fig. 2. The image of the object *ab* is carried through the objective *gh* to the field lens *il* of the eye-piece, and thence

to a focus at the diaphragm *cd*. At this point it is viewed by the eye lens of the eye-piece and magnified to the size *ef*. Fig. 4 shows the appearance of the working instrument in which the principles exhibited in the diagram, Fig. 2, are applied. The particular instrument shown is fitted with three objectives of different focus set on a pivot, so that any one of them may be brought into the axis of the tube. There is a rack and pinion for adjusting the focus and micrometric attachments for moving the object on the stage. The tube and stage are pivoted on the two pillars to incline at any convenient angle. The magnification of the compound microscope depends upon three conditions: (1) The power of the object-glass, (2) the power of the eye-piece, (3) the amount of

FIG. 4.—Compound Microscope.

separation of these two optical parts. If the focus of the object-glass is reduced, the power is increased, and the same holds true with the eye-piece. The more the objective and eye-piece are separated, the greater will be the power. It will appear from this statement, therefore, that the magnification of the microscope is unlimited, but the mere magnification of an object is less sought after and is of less value in the modern microscope than its definition or power to disclose detail and structure. The length of tube which connects the eye-piece and objective is limited to from six to eight inches, for the sake of convenience in use. A draw-tube permits the length to be extended to 12 or 13 inches for the highest powers. The standard length of the microscope tube must be closely adhered to or else the optical capacity (correction) of the objective will be disturbed. The power of the eye-piece rarely exceeds 15 diameters and that of

the objective 150 diameters. A convex lens of one inch focus gives a magnification of about 10 diameters at a distance of 10 inches, and this holds true of a combination of lenses of this equivalent focus as in the eye-piece. If therefore a one-inch focus eye-piece is 10 inches distant from a one-inch objective, the magnifying power is  $10 \times 10 = 100$  diameters; or, if 5 inches distant, is one-half as great, or 50 diameters. The designation of power is according to the focus of a single lens having the same magnifying power as the series or combination of lenses which make up the objective as well as eye-piece. As the image of the objective is magnified by the eye-piece, it is evident that any defect in the objective is magnified to the same extent, and unless eliminated would seriously interfere with obtaining a distinct image. The main problem, therefore, remains to convey through the objective as many image-giving rays, free from defects, as possible. As a matter of fact, objectives, whatever their power, are composed of a series of lenses whose purpose it is to correct errors which would exist if single lenses alone were used, and the greater the power of the objec-

FIG. 5.—A low power (1") microscope objective of two systems.

FIG. 6.—A high power (1-12") microscope objective of four systems.

tive, the larger the number of lenses required. In the low powers there are generally two systems of lenses, each of which is an achromatic doublet; in the medium powers the principal magnification is obtained by a single front or hemispherical lens and two systems of cemented and corrected lenses; in the high powers it is usual to employ two superposed hemispherical lenses, adding thereto two corrected combinations. As may be supposed, the production of these lenses and setting them in mountings involves the most accurate processes. First of all the various kinds of glass must have fixed and previously calculated properties and be of absolute homogeneity and freedom from blemishes. The production of such glass is in itself a laborious and delicate process. The lenses must be accurately ground and polished to absolutely correct spherical surfaces, truly centred and cemented, then set in suitable mountings without strain at absolutely correct distance and the axes of all in alignment. The efficiency of an objective to gather up rays emanating from an object and form a perfect image depends upon its angular aperture—in other words, upon the angle at a point in the axis of the microscope subtended by the diameter of the object in its normal horizontal plane; and this really determines

the visibility of detail (correction for chromatic and spherical aberration being presupposed). On account of the loss of light and inability to obtain sufficient angular aperture in the ordinary way in the very high powers, it is necessary to construct them for immersion contact with the object, and they are then termed "immersion objectives." The immersion medium commonly used is a drop of cedar oil, which has the same refractive index as glass. The connection of the objective with the object by the globule of oil prevents the light rays from scattering. The highest power in general use is the 1/12-inch focus, giving a magnification up to 3,000 diameters, the medium powers are  $\frac{1}{6}$  to  $\frac{1}{8}$  inch, and the low powers from 1 to  $\frac{2}{3}$  inch.

Having reached the practical limits in the reduction of the focal length of microscope objectives the lens makers turned to the problem of increasing the "numerical aperture"—that is, an arbitrary numeral representing the product of one-half of the angular aperture of the objective by the refractive index of the medium between the cover glass of the slide and the outer lens of the objective. A high degree of success has been attained, so that dry lenses of 0.9, water immersion lenses of 1.2 and oil immersion lenses of 1.4 are available (against theoretical calculations respectively of 1.0, 1.4 and 1.53).

To properly adjust the optical parts which have a fixed relation to one another by means of a tube (body) and to hold the object in its proper position in relation to them involves certain mechanical appliances which provide stability, convenience of adjustment and illumination: a rack and pinion provides coarse adjustment and a micrometer screw fine adjustment; both are extremely delicate; the stage or platform for placing the object, and mirror beneath the stage for reflecting abundant light and a base for stability. This aggregate of mechanical parts is called the "stand." The collar at the end of the tube to which the object glass is applied is the nose-piece; double and triple nose-pieces are also made to take two and three objectives, which may be rotated and focused on the object in turn. A mechanical stage provides delicate means of adjusting the object in place of the hands. The high powers require more than the usual amount of light for illumination and a condenser gathers it from the mirror and concentrates it upon the object. Micrometers are provided to determine the amount of magnification and measure the actual size of an object. A camera lucida attachment is made to project the magnified image upon a sheet of paper on the table to facilitate its drawing. Beside the microscope with single tube, there is another in which the rays from the objective are bisected and diverted into a second tube, so that the object may be viewed with both eyes. This is the binocular microscope. A special form of microscope known as the "micro-metallograph" is used for the examination of cold metals. The stage is above, with the objective below it and looking upward. The eye-piece is at the end of a horizontal tube, the light rays being carried into it by means of a prism. Another prism on a lower plane is used to illuminate the lower side of

the object. The so-called "thermal microscope" is so modified from the usual model as to have a water-jacket around the objective to keep it cool while examinations are being made of heated objects in the small electric furnace provided as an accessory with the metallurgist's microscope. So far as our knowledge of the action of light and the constitution of visual images goes, the best microscopes now made realize about the limit to which the seeing powers of the instrument can be brought, although experiments with especially controlled illumination, now in progress, may result in advancement in this direction. Nevertheless the field of research and discovery into which the microscope has as yet not penetrated, and which are within its powers, are almost unlimited.

The microscope is used as a necessary accessory in a large number of the sciences and in many industries. It is, primarily, the assistant of the teacher of biology, botany, bacteriology, histology, pathology and the allied branches of science. The medical profession employs it in the examination of the urine, blood and of cancerous and tumorous growths, as well as in searching for the parasites of the body, fungi which infest the hair and skin and for diagnosing febrile diseases. For the examination of steel, iron and other metals to determine their intimate structure, the microscope is extensively used. Its use for the detection of adulterations in foods, drugs, paints, earths, starches and many other substances is often the only effective method of working. The Bureau of Animal Industry of the United States government depends wholly on the microscope for the detection of living parasites in the flesh of animals slaughtered for food. The microscope is used in many industries for counting fine lines, threads and fibres, and for determining the physical structure of cements, emulsions and other substances. The finest possible measurements of space are made with the microscope to which a filar micrometer is applied, and with it the rate of growth in plants is determined.

The use of the microscope for photography also embraces an extremely wide and useful field. Photographs of minute objects enlarged as much as 5,000 diameters (25,000,000 areas) can be produced in this manner, and a permanent record made which can also be used for reproduction by the usual printing processes for the illustration of books, etc. Recently the movements of insects and other small creatures have been reproduced by a biographic microscope, and moving pictures of the unseen world are now presented to audiences as a means of amusement and education.

The microscope was invented between 1590 and 1609—the honors being divided between Hans and Zacharias Janssen, two Hollanders, and that greatest of early opticians, Galileo. From its early form, consisting simply of a double or plano-convex object lens with an eye-piece of a single convex lens to magnify the image, it developed by gradual stages until the latter part of the 18th century, without becoming much more than a toy for the amusement of dilettante. As a matter of fact nearly every form of accessory which is in use at the present time was devised and used in some form,

but the desire for the ornamental and extraordinary rather than the practical was everywhere manifest. With the awakening of general interest in scientific investigation, the microscope began to be used as a tool to accomplish heretofore impossible results. This led to more practical forms of construction, and at last to their production in large quantities and at a cost which placed them within the reach of laboratories and individuals. In 1820 Fraunhofer invented a complete system of computation for telescope lenses, and Seidel and Steinheil soon followed with formulas for photographic lenses. In 1840 the Gauss theory was introduced and workers in optics applied this theory to computing lenses for the microscope. In the early 70's Professor Abbe of the Zeiss optical works at Jena produced computations for microscope lenses which placed them in the front rank of scientific appliances. Among the early American pioneers in the optical improvement of the microscope, the names of Robert Tolles and the two Spencers stand prominent. By their extraordinary manual skill and knowledge of optical principles, they succeeded in producing lenses which, in the case of one by Tolles, had a focal length of 1/75 inch, the highest power objective which has ever been constructed. It was found in practice, however, that, through inability to increase the angle of aperture, these lenses gave no advantage over those of longer focus, and it is now rare to find an objective of less than 1/16 inch focus. With the introduction of the new optical glasses by the Jena works in 1886-92, new corrections were possible with microscopic systems, and the phosphoric acid and boric acid glasses were especially useful to the microscope makers. But the greatest advance was made by the discovery of fluorite as a lens material, permitting the flat curvatures necessary in the correction of spherical aberration. The resolving power of microscope lenses was greatly increased and the problems of their manufacture materially simplified by the invention by Tolles of his "duplex front" objective, a construction which was voted impractical by the experts of the time, but which has since superseded all others in the construction of high-power lenses. By the application of Tolles' correction formulas to the Jena glass lenses a new series of very superior microscopic systems was produced in 1911 by Winkel of Göttingen, notable particularly for brightness and sharpness of the image. See **MICROSCOPY, CLINICAL; ULTRAMICROSCOPY.**

Y., 1911); Hovestadt, H., 'Jena Glass and Its Scientific and Industrial Applications' (London 1902); Spitta, E. J., 'Microscopy: The Construction, Theory and Use of the Microscope' (New York 1907); Zeiss, K., 'Microscopes and Microscopical Accessories' (Jena, Germany, 1906).

**MICROSCOPE, Solar**, a form of microscope in which the illumination is gained from the condensed rays of direct sunlight. It is used for projection purposes where a very powerful light is needed to exhibit the microscopic images upon a screen.

**MICROSCOPIUM**, in astronomy, one of the 14 constellations which Lacaille added to

the heavens in connection with his work at the Cape of Good Hope. It is a very inconspicuous constellation, its brightest star being of only 5.1 magnitude.

**MICROSCOPY, Clinical**, the use of the microscope in the diagnosis of disease. The microscope, ever since its first construction, has been used in the study of disease processes, but only within comparatively recent years has it attained its present importance as an adjunct in the clinical diagnosis of many different types of disease. Owing to the development of knowledge of parasitic and infectious diseases, the physician of to-day is better able to make an accurate diagnosis by means of the microscope than were his forefathers. The microscope may be used not only to confirm a diagnosis which has been made by ordinary clinical methods, but it may abbreviate such clinical examination, or by it a diagnosis may be made without such preliminary examination. Thus at the present time consumption of the lungs may be microscopically diagnosed by an examination of the sputum, though the patient be 1,000 miles away, and in the same manner a number of diseases of allied forms may be recognized by certain minute evidences interpretable by the microscope.

The most important of the intestinal parasites that can be thus identified are the tapeworm, roundworm, hook-worm, fluke-worm and pin-worm. In all of these the physician of the present time, by a microscopical examination of the feces, can detect the presence of the eggs of the different kinds of worms and make a definite diagnosis. It is not necessary for parents to guess at the presence of worms and to treat their children "on suspicion." The presence or absence of worms can be accurately and definitely determined by a competent microscopist. Not only can a diagnosis of worms in general be made, but the precise kind of worm can be known by the characteristic configuration of the eggs. Examination of the feces by the microscope can further detect various forms of indigestion and various kinds of inflammation in the intestinal tract.

As already indicated, tuberculosis can be told by an examination of the sputum, and the bacillus of tuberculosis can also be identified if it invades other organs of the body, notably the skin, bladder, kidneys, etc. The presence of tuberculosis in milk can also be demonstrated by the microscope. The influenza bacillus, the bacillus of diphtheria, the organism of cholera, of dysentery, of malignant pustule, of blood-poisoning, of pneumonia, of actinomycosis, etc., can all be identified by a microscopical examination, as also can a number of diseases due to animal parasites in the body, other than intestinal worms. Thus there is no excuse for the general diagnosis of malaria unless the exact confirmatory evidence of the malarial parasite is found in the blood. The presence of *Trichina* in the body can also be learned by the peculiar changes that take place in the blood, and the blood-parasite *Filaria* (see **FILARIASIS**), which causes a variety of conditions in the tropics, is recognizable under the microscope. Further, the microscopical examination of the blood itself offers a large field for clinical microscopy; a field which is very rapidly widening and offering increasing evidence of the value of this class of exam-

ination. There are many blood-diseases, *per se*, which can be diagnosed by simple examination. Anæmia and pernicious anæmia are important examples. Moreover, most of the acute infectious diseases cause certain changes in the blood which may be utilized in microscopical work for diagnostic purposes. The Widal agglutination reaction in typhoid fever is an important development in this line. Other agglutinating reactions are of immense importance in medico-legal work. These blood-changes are of a very definite character and have been studied by physicians the world over. Because of their peculiar technical nature they lend themselves to charlatan misinterpretation and serve as a basis for many quackish advertisers.

Microscopical examination of the urine has long been practised. By its various forms of disorder of the bladder and of the kidney can be told, and both renal disease and bladder-disease can be detected long before such troubles become chronic and dangerous. In much the same manner the microscope can be used to examine other secretions and excretions of the human body—the secretions from the nose, the vomit, the exudates in pleurisy, exudates in meningitis and peritonitis, etc.—and in the study of drinking-water, milk and food-stuffs. In fact there is no branch of medicine in which definite and far-reaching results have not been obtained by means of the microscope. Consult von Jaksch, 'Clinical Diagnosis'; Simon, 'Clinical Diagnosis'; Ewing, 'Pathology of the Blood'; and Cabot, 'The Blood.'

**MICROSOME**, one of the minute corpuscles that exist in great number in the interior layers of the protoplasm within a cell, giving to that protoplasm its characteristic granular appearance. See PROTOPLASM.

**MICROSPORANGIUM**, in botany, the pollen-sac which produces the tiny microspores in quantity, as distinguished from the megasporangium, the pollen-sac which produces but one large spore or megaspore. Both kinds of pollen-sacs are found in certain members of the Pteridophyta and the Phanerogams. In the former group are the aquatic cryptogams belonging to the families *Marsileaceæ*, or pepperworts, and *Salviniaceæ*, known as "floating moss," and the *Selaginellaceæ*, closely akin to the "club mosses."

**MICROTASIMETER**, an instrument invented by Thomas A. Edison in 1878. He uses the principle of the carbon microphone to measure infinitesimal pressure, or for detecting very slight pressure.

**MICROTOME**. The microtome is an instrument used by botanists and zoologists for cutting thin sections of plant or animal tissues. A sharp and highly tempered knife is held in a rigid clamp, while the object to be sectioned, also firmly held in a clamp, is moved up, a little at a time, as successive sections are cut. To one unacquainted with modern microscopical technic, the results obtained with the latest microtomes seem almost miraculous. The pollen grain of a lily is so small that it is barely visible to the naked eye, but it can be cut into 50 sections, which can be mounted in order without the loss of a single section. A photomicrograph of such a section can be made, and lantern slide made from the photomicrograph,

and the section of the pollen grain may be projected so as to cover a 15-foot screen, its thousands of starch grains appearing as large as walnuts and its two nuclei as large as footballs. Sections as thin as 25,000 to the inch have been cut successfully. Such thin sections, however, are hardly necessary in practical work. Most sections are cut at about 10 times that thickness, or 2,500 to the inch. Before such thin sections can be cut, material must undergo a rather complicated treatment. A root tip, for instance, may be treated as follows: It is killed and somewhat hardened in chromic acid; the acid is washed out in water; the root tips are then placed in weak alcohol, then in stronger and stronger alcohol, several hours in each solution; then in absolute alcohol which not only completes the hardening but removes the last traces of water; then some oil, like xylol, is mixed with the absolute alcohol in successively stronger solutions until pure xylol is reached; paraffin is then added gradually for several days; the material is then placed in a paraffin oven and thoroughly infiltrated with paraffin, after which it is poured out and cooled, so that the root tips are now embedded in a matrix of paraffin. A rectangular block containing a root tip is now fastened in the microtome and sections are cut. As each successive section is cut, it sticks to the preceding section, so that a ribbon, often several feet in length, may be obtained. Thus the sections are in perfect series. The sections are then mounted on glass slides, the paraffin is dissolved away, various stains are applied and finally a drop of balsam and a thin glass cover complete the preparation, and it is ready for use. Investigations upon the structure of tissues and cells are dependent upon the microtome and microscope and histological technic. Consult Chamberlain, C. J., 'Methods in Plant Histology'; Guyer, M. F., 'Animal Micrology.'

CHARLES J. CHAMBERLAIN.

**MID-EUROPEAN UNION**, an organization formed in the United States in 1918 under the presidency of Prof. T. G. Masaryk, leader of the Czecho-Slovak Committee. An offspring of the European War, the Union was composed of the nationals, descendants, emigrants from and sympathizers with the "subject races" of central Europe, with the object of promoting the liberation and independence of those countries from the political ties which bound them to Austria, Germany and Russia. The nationals or states claiming self-determination were from Russia, Poland, Finland, Ukraine, Lithuania, Livonia, Courland and Esthonia; from Germany, the Polish region of East Prussia (Posen); from Austria-Hungary, Austrian Poland, Galicia, Czecho-Slovakia (including Bohemia), Jugoslavia (including Serbia, Montenegro, Albania, Croatia and Slavonia) and the Rumanians of Transylvania; Italian and Greek "irredentists," Albanians and Zionists. All these are dealt with elsewhere under their respective headings. The total of the populations involved was given as 65,000,000. On 26 Oct. 1918 the Union issued a "declaration of independence" at Independence Hall, Philadelphia, pledging the people they represented and all their resources to the support of the Allies "against our common enemy." The dec-

laration condemned secret diplomacy and approved the formation of a league of nations. It was the defection of the Slav nationalities in Austria-Hungary that was mainly responsible for the collapse of the Dual Monarchy in the war.

**MIDAS**, mī'das, in Greek myth, a king of Phrygia, proverbial for his golden touch and for his ass's ears. The gift of the golden touch came from Bacchus, whose follower, Silenus, Midas rescued and treated kindly; in return Bacchus offered him any wish he would name and Midas asked that all that he touched should be turned into gold. When he found that food and drink became gold at the touch of his lips, Midas besought Bacchus to take back the gift; some stories say he was sent to bathe in the river Pactolus, which ever after was full of gold-bearing sand. His ass's ears were given Midas by Apollo to punish the king for declaring Pan's pipe more musical than Apollo's lyre. Hence "ears of Midas" is a phrase used of ignorant critics. Midas' barber discovered the king's secret deformity; and whispered it into a hole in the ground, when reeds grew up whispering the story in the wind.

**MIDAS**, a genus of marmosets, of the family *Mididae*. The name is given to more than 20 species, among which are the lion-marmoset, marikina, pinche and tamarin. The name is most commonly applied to the marikina.

**MIDAS MONKEY**, a marmoset (q.v.).

**MIDDELBURG**, mid'del-boorg, Netherlands, capital of the province of Zeeland, on the island of Walcheren, 4½ miles northeast of Flushing. Middelburg was a mediæval Hanse town, and one of the leading mercantile cities of the United Provinces, sending many ships to the East and West Indies, and the Levant. Its former commercial importance, however, has declined, being now confined chiefly to a coasting and domestic trade.

**MIDDLE AGES**, Democracy in. See DEMOCRACY, HISTORY OF.

**MIDDLE AGES**, The, a period of history supposed to extend from the fall of the Roman Empire to about the year 1550, covering from 10 to 11 centuries. The Middle Ages embrace that period of history in which the feudal system was established and developed, down to the most prominent events which necessarily led to its overthrow, though its consequences and influences are still very observable in the states of Europe. The first centuries of the Middle Ages are often termed the Dark Ages (q.v.). Still, the destruction of Roman institutions by the irruption of barbarous tribes is often unduly lamented, and the beneficial consequences attending it overlooked. True it is that many of the acquisitions which had cost mankind ages of toil and labor were lost in the general wreck, and only regained by the efforts of many successive generations; the flowers of civilization were trampled underfoot by barbarous warriors; the civil development of society suffered a most severe shock; those nations to which Roman civilization had extended previous to the great invasion of the Teutonic tribes were thrown back in a great measure to their primæval barbarism, and the unruly passion for individual independence

greatly retarded the development of public and private law, and in some countries has entirely prevented a regular civil constitution. So also the most remarkable institution of that time, its characteristic production—chivalry—exhibited all the peculiarities of the corporations. War was the profession of the nobles. No one of their order who was not a knight could bear a lance or command cavalry. The weak side of the Middle Ages is the scientific. Physical science was still in a very crude state, and the lack of the proper apparatus necessary for its accurate pursuit was a serious handicap. Considering, however, the inefficient means then at hand, the knowledge attained, though of course rude, inaccurate and often mere guessing, was greater than is popularly supposed. The efforts of Charlemagne in the 8th century to encourage science and instruct the people laid the foundations for a more thorough and systematic training, which culminated in the great schools of Scholasticism of the 12th and 13th centuries. The process was slow and often retarded by the unsettled social and political conditions that prevailed through this period. The 14th and 15th centuries witnessed a rapid and brilliant development finding its apogee in the Renaissance movement. See HISTORY, MEDIAEVAL.

**MIDDLE C**, in music, the note C', on the first ledger line above the base or below the treble staff. It is the usual starting point of both keys, tones and notes, and is also known as Alto C. The pitch is from 250 to 265 vibrations a second. It was set at about 240 in 1700 and has been as high as 275. The French set it at 251, the English at 256 and the Germans at 264.

**MIDDLE EAR**, Inflammation of. See OTITIS MEDIA.

**MIDDLE ENGLISH**. See ENGLISH LITERATURE.

**MIDDLE EUROPE**, in German, MITTEL-EUROPA, is the name applied to one of the avowed policies that were to be pursued by Germany in the process of carrying out the Pan-German program of "World Empire or Downfall." Briefly stated, the scheme consisted of absorbing a number of European states into a German confederation either by treaty agreements or conquest. Thus, Norway and Sweden were to be absorbed; Holland with her colonial possessions was to become an ally of Germany; in order to establish Germany's position as a naval power, naval stations would be necessary at Dover and Malta; the western portion of Russia down to the Black Sea was to be conquered; according to Bernhardt, Denmark was "of great military importance to us"; the command of the Straits leading to the Baltic would be imperative for operations against England; according to some exponents, Holland, Belgium, Luxemburg and Switzerland were to be annexed and all foreign influence eliminated; while Livonia, Trieste, Venice and the north of France from the Somme to the Loire were to be included. Germany, Austria-Hungary and Italy were to be firmly united by an economic union. The items represent the Mittel-Europa plan, beyond which lay other necessary acquisitions, such as Egypt, central Africa, Asia Minor, India and sundry South

American republics. See PAN-GERMANISM. Consult Naumann, 'Central Europe' (New York 1916).

— **MIDDLE KINGDOM** (Chinese, CHUNG KWOH), or the **MIDDLE FLOWERY KINGDOM**, a native name for China dating from the establishment of the Chau dynasty, about 1150 B.C., and originally applied to the special state of the imperial family, which was in Honan and was surrounded by the others. As the empire grew the name was retained and applied to the entire country and popular belief interprets it as meaning that the empire is the centre of the earth.

**MIDDLE TEMPLE.** See **TEMPLE**, London; **INNS OF COURT**.

**MIDDLE TOWN INDIANS.** See **Mt-WOK STOCK**.

**MIDDLEBORO**, mid'l-bür-ō, Mass., town in Plymouth County, on the Nemasket River, and on branches of the New York, New Haven and Hartford Railroad, about 30 miles south of Boston and 18 miles northeast of Fall River. It is one of the oldest towns in the county, having been incorporated 1 June 1669. It includes the villages of Nemasket, North Middleboro, South Middleboro, Four Corners, Pudding-shire, Waterville, Tack Factory, Eddyville, Rock, the Green and Thomastown. It has excellent water power, obtained from three falls. The chief manufactures are woolen goods, shoes, stove polish, lumber, dressed marble, grates, foundry and machine-shop products. It has several well-built churches, good schools and a public library. It is a favorite summer resort, on account of its attractive scenery and the temperature being modified by the sea breezes. Pop. 8,300. Consult Barber, 'Historical Collections of Massachusetts.'

**MIDDLEBURG**, mid'l-berg, **Aldie** and **Upperville**, **Cavalry Engagements at.** On 16 June 1863 General Stuart, with three brigades of his cavalry division, moved north from the Rappahannock to screen the movement of the Confederate army toward the Potomac. Stuart's orders were to keep along the eastern base of the Blue Ridge, occupy the passes of Bull Run Mountain, and cover the front of Longstreet's corps. On the 17th Fitzhugh Lee's brigade, under Colonel Munford, was sent from Piedmont, by way of Middleburg, to Aldie, to hold the gap in the mountain as a screen to Longstreet's movements, while W. H. F. Lee's brigade reconnoitred toward Thoroughfare Gap. Robertson's brigade was posted at Rectortown. Stuart, with his staff and a few pickets, made his headquarters at Middleburg. General Pleasonton was near Manassas Junction and scouting in the direction of Bull Run Mountain, and at 2.30 P.M. of the 17th Kilpatrick's brigade of cavalry ran into Munford's pickets, driving them back to Aldie, where, west of the village, he found Munford strongly posted on a hill covering the road to Snicker's Gap. A severe engagement ensued, lasting until dark, when Munford withdrew toward Middleburg, under orders from Stuart, who had been attacked. The Union loss was 50 killed, 131 wounded and 124 missing. Munford's loss was 119 killed, wounded and missing. While Kilpatrick was engaged at Aldie Colonel Duffié, with the First Rhode Island Cavalry 300 strong, having passed

through Hopewell Gap, reached Middleburg about 4 P.M., drove in Stuart's pickets, and occupied the town, Stuart narrowly escaping to Rector's Cross Roads, and sending orders for Munford to withdraw from Aldie, the other two brigades to move upon Middleburg, and all to concentrate against Duffié. Robertson's brigade arrived at 7 P.M. and attacked Duffié, who made a good fight behind stone walls and barricades, repelling several assaults; but was finally driven from town, with severe loss, and compelled to retreat by the road upon which he had come until he had crossed Little River, where he halted, and where during the night he was entirely surrounded by W. H. F. Lee's brigade. Duffié endeavored to cut his way out, but was met by heavy fire, and a great part of his command captured, Duffié escaping with a few men and making his way back to Hopewell Gap and Centreville. His total loss, killed, wounded and prisoners, was over 200. On the 18th Stuart took position outside of Middleburg with Robertson's brigade. Munford was on the left at Union and Jones' brigade was ordered up as a reserve. Pleasonton moved forward with all his available force, and occupied Middleburg and Philemont on the road to Snicker's Gap. On the 19th Gregg, with two brigades of his own division and one of Buford's, advanced and steadily drove Stuart in the direction of Upperville, losing 99 in killed, wounded and missing. During the day Hooker advanced and occupied Aldie Gap with infantry. On the 20th Stuart concentrated his five brigades about three miles west of Middleburg. Pleasonton remaining at Middleburg. On the morning of the 21st Pleasonton moved out of Middleburg, Buford's division by the road through Union, to turn Stuart's left, Gregg's division, supported by Vincent's infantry brigade on the main road to Upperville. Buford encountered W. H. F. Lee's and Jones' brigades and drove them back, and Gregg met Hampton's and Robertson's brigades, driving them steadily to Goose Creek, where they remained several hours, when they again fell back to effect a junction at Upperville with Jones and W. H. F. Lee, who were falling back before Buford. As Pleasonton neared Upperville the fight increased in severity, and Stuart was driven through the town to Ashby's Gap. The Union loss during the day was 12 killed, 130 wounded and 67 missing. On the 22d Pleasonton fell back to Middleburg and Aldie. The Union loss June 17-21 was 883 killed, wounded and missing; the Confederate loss was 65 killed, 279 wounded and 166 missing, an aggregate of 510. Consult 'Official Records' (Vol. XXVII); Doubleday, 'Chancellorsville and Gettysburg'; McClellan, 'Life of Maj.-Gen. J. E. B. Stuart.'

E. A. CARMAN.

**MIDDLEBURY**, mid'l-bür-ī, Vt., village, county-seat of Addison County, on the Otter Creek, and on the Rutland Railroad, about 40 miles in direct line southwest of Montpelier, the capital of the State, and 35 miles south of Burlington. It is on the eastern slope of the Green Mountains, near the foot-hills in an agricultural and stock-raising region, with large marble quarries in the vicinity. It was settled in 1773, but was abandoned during the Revolutionary War, because it was on the route traversed by many of the British and Indian soldiers, and the lives of the people were con-

stantly in danger. It was incorporated as a borough in 1813 and as a village in 1832. The chief manufactures are lumber and lumber products, wood pulp, foundry products, flour, lime, dressed marble and dairy products. The village is the seat of Middlebury College (q.v.), and has two libraries and the Sheldon Art Museum. Some of the principal buildings, besides the college, libraries and museum, are the opera house, courthouse, several churches and the public and parish schools. The water power is valuable, and sufficient for more manufacturing establishments. Since 1877 a revised charter vests the government in a board of trustees elected annually; the subordinate officials are chosen by the trustees. Pop. about 2,000. Consult Swift, 'History of the town of Middlebury' (Middlebury 1859).

**MIDDLEBURY COLLEGE**, in Middlebury, Vt., was chartered by act of the Vermont legislature 1 Nov. 1800. The charter has never been amended. The institution is governed by a self-perpetuating board known as "The President and Fellows of Middlebury College." There are no denominational restrictions and the college has always been non-sectarian. It is the oldest college in Vermont in point of service, beginning its work as a college 5 Nov. 1800 and graduating its first class in 1802, at which time the first academic degrees conferred in Vermont were bestowed. The founders were prominent citizens of Vermont, several of whom lived in Middlebury and adjacent towns. They were counseled by President Timothy Dwight of Yale College and the first president, Jeremiah Atwater, was a Yale graduate. The first building of the college was shared with the Addison County Grammar School and it was 1815 before the college acquired its first permanent structure, Painter Hall. This building was named for Gamaliel Painter, a generous benefactor. The college had a steady growth for half a century and during its first 40 years was easily the first institution in Vermont. Dissensions over the slavery question, followed by the depletion of students during the Civil War, weakened the institution seriously. In recent years there has been complete recovery and rapid growth. The college has now a campus of 140 acres, beautifully situated with commanding views of the Green Mountains and Adirondacks. There are 13 permanent buildings, valued at \$708,455. The endowment is \$570,941. There has been a net gain in student attendance annually since 1904, the attendance now being 468, or exclusive of the summer session 351. The college gives the degrees of A.B. and B.S. The curriculum is organized in 20 departments. Special attention is given to the training of high school teachers and district superintendents, which is supported by an annual State appropriation. The State of Vermont also supports 60 scholarships. There are no technical or professional courses. The faculty numbers 32, of whom 10 are full professors. The institution was on the first list of the accepted institutions of the Carnegie Foundation and has received the co-operation of the General Education Board. The latest additions to the buildings are a memorial chapel, the gift of ex-Gov. John A. Mead, '64, and a boys' dormitory and commons, the gift of A. Barton Hepburn, '71. Since 1883 the college has admitted women; in 1902 the

legislature of the State granted a charter authorizing the establishment of a co-ordinate college for women.

**MIDDLEMARCH**. To many critics 'Middlemarch' (1871-72) is the greatest novel George Eliot ever wrote. Its scope, its variety, its maturity and insight, are indubitable. Yet to others it lacks something of the charm and spontaneity of the author's earlier works, and its very inclusiveness and scope lead to a certain confusion of plan and blurring of outline that mark it as artistically imperfect. Whichever view is correct, the novel is admittedly great. Written late in George Eliot's career, it is at once weighty with her considered evaluation of the essential factors in life and rich in her observation and experience of human nature. The plot is the most involved of any that the author has presented, and the characters are numerous even for a Victorian "three-decker." In general there are two main groups of characters, not, it must be confessed, as closely inter-related as artistically they should be. Dorothea Brooke may be regarded as the centre of one group, and Dr. Lydgate of the other. Both represent the tragedy of high aims that fail to take fully into account the actualities of life. Dorothea sentimentally pines to be the helpmate of a genius; but as the wife of the Rev. Edward Casaubon, who is writing a 'Key to All Mythologies,' she is disillusioned, and her misery is ended only by the death of her husband. Dr. Lydgate comes to Middlemarch with excellent training, determined to push forward in biological research. However, he marries the attractive but unpractical Rosamond Vincy, is overwhelmed in debts and his possible career fades into nothingness. But George Eliot's view of life is not distortedly pessimistic. Over against the sombre recognition of the inadequacies and weaknesses of humanity must be placed her portrayal of the fine and strong elements. Dorothea herself is genuine and charming fundamentally; the Garths are sterling, and full of vitality. For all its wavering and crowded plot, 'Middlemarch' is permanently valuable because it represents a realism that endeavors to reflect in just proportions the good and bad in life; a realism, moreover, that does not content itself merely with presenting life, but shrinks not from the task of interpretation and evaluation. Consult Stephen, Sir Leslie, 'Life of George Eliot' (Chap. 12, New York 1902), and Cross, J. W., 'George Eliot's Life' (Chap. 16, 3 vols., London 1885).

GEORGE B. DUTTON.

**MIDDLESBORO**, Ky., town in Bell County, near the Tennessee boundary line, 48 miles north of Knoxville, Tenn., on the Louisville and Nashville and the Southern railroads. It is situated between the Pine and Cumberland mountains and is patronized as a summer resort. It has iron and coal mining interests and its industrial establishments include iron and coke works. Pop. 7,305.

**MIDDLESBROUGH**, mīd'lz-brō (not Middleborough), England, a river port, municipal county, parliamentary borough and market town, in the North Riding of Yorkshire, seven miles from the mouth of the Tees, 44 miles north of York. Middlesbrough dates from about 1830, and the development of the coal and iron mines of the neighboring Cleveland Hills and Durham

fields. It is distinguished for its municipal enterprises; has wide and regular streets, handsome public buildings, including a fine Roman Catholic cathedral; and extensive and commodious docks. Its chief industries are connected with iron manufactures, producing annually over 2,500,000 tons of pig-iron, of which it is the principal seat in England. It has numerous blast-furnaces and rolling-mills, foundries, engineering works, potteries, chemical works, ship-yards, etc.; and salt is extensively worked, there being a thick bed of rock salt at a depth of 1,300 feet. The borough was incorporated in 1853 and received a county charter in 1888. The borough returns one member to the House of Commons. The chief public utilities are municipally owned. Pop. about 104,767. Consult Reid, 'Middlebrough and Its Jubilee' (1881).

**MIDDLESEX** (mid'l-sĕks) **FELLS**, Boston, Mass., a picturesque hill, wood and lake reservation of the metropolitan park system of "Greater Boston," enclosing Mystic Lakes; area from 3,000 to 3,200 acres. The Fells are part of the suburban townships of Malden, Melrose and Stoneham north of Boston.

**MIDDLETON**, mid'l-tŏn, **Arthur**, American colonist: b. South Carolina, 1681; d. 1737. He was conspicuously engaged in public affairs as a member of the council as early as 1712; and exerted his political influence in favor of popular claims, opposing the lords proprietors, and finally heading the revolution which threw off the whole proprietary government and placed the colony under the immediate protection of the Crown (1719). In 1725 he succeeded Nicholson as acting governor of the colony, which office he held till 1731, when the royal governor arrived; he then retained his position in the governor's council. His administration as governor was partly occupied by war and negotiations with the Spaniards of Florida and the French of Louisiana.

**MIDDLETON**, **Arthur**, American patriot, signer of the Declaration of Independence, grandson of the preceding: b. Middletown Place, Ashley River, S. C., 26 June 1742; d. Goose Creek, S. C., 1 Jan. 1787. He was educated in-England at the University of Cambridge, then returned to South Carolina for a time and was a member of the legislature, but went abroad again for two years' travel on the Continent. On his final return to America, he established himself as a planter, and soon became one of the leaders of the Revolutionary party. He was one of the most efficient members of the first council of safety, and in 1775 was sent to the Provincial Congress. In 1776 he was sent as a delegate of the State to the Continental Congress, and as such affixed his signature to the Declaration of Independence. He held his seat in Congress until 1777, declined the governorship of South Carolina in 1778 and took the field for the defense of Charleston in 1779. His plantation was devastated by the British and he was made a prisoner after the fall of Charleston in 1780, and was one of the leading citizens who were kept in confinement as hostages. His estate was sequestered, and he was shipped to the castle of Saint Augustine, and thence transferred to the *Jersey* prison ship. Exchanged in the latter part of 1780, he served till the close of the war as a delegate in the Continental Congress, and was afterward elected

to the State senate. He was a skilful stenographer, and reported many of the debates in which he participated. He also wrote effective political essays under the signature of "Andrew Marvell."

**MIDDLETON**, **Conyers**, English divine: b. York, or Richmond, Yorkshire, 27 Dec. 1683; d. Hildersham, near Cambridge, 28 July 1750. He was educated at Cambridge and was elected a fellow there in 1706. He married soon afterward, thus losing his fellowship, and for a short time was rector of Coveney in the Isle of Ely, a rectory in the gift of his wealthy wife. He received his D.D. at Cambridge in 1717. He was appointed university librarian in 1721, and was in Italy in 1724-25. His 'Letter from Rome' (1729) dealt at some length upon the adaptation of pagan beliefs and ceremonies in the Roman Catholic Church and was highly praised by the orthodox English clergy, and occasioned great indignation among the Catholics. His controversy with Waterland, in which he urged the then heretical theory that theologians should not attempt to maintain the historical accuracy of the Bible in all instances, brought a storm of criticism and he was obliged to make some qualifications regarding his statements in order to retain his Cambridge degrees. He next engaged upon a life of Cicero, which to a great extent was related in the statesman's own words, and which gained a high reputation as a model of style, but was later found to be largely a plagiarism from a rare book of William Bellenden's 'De Tribus Luminibus Romanorum.' He then returned to the field of theological controversy, publishing his 'Introductory Discourse' (1747), and his 'Free Inquiry' (1748), attacking the miraculous powers supposed to have been inherent in the Church from early times. While this controversy was in progress Middleton died. He attained a high reputation as a master of prose style, Pope, in particular, considering him an authority upon the language; while Parr ranked him next to Addison. His modern rating, however, depends upon his strength as a controversialist; wherein, although he was extremely bitter, he exhibited keenness of perception and contempt for superstition, while in many respects his opinions antedated those later accepted by modern students of religious history. His collected writings, with the exception of the 'Life of Cicero' (2 vols., 1741), were published (4 vols., 1752; 5 vols., 1755). Consult Stephen, L., 'English Thought in the Eighteenth Century' (Chap. 6, 1786).

**MIDDLETON**, **George**, American playwright: b. Paterson, N. J., 27 Oct. 1880; d. 25 Nov. 1916. He was graduated at Columbia University in 1902 and engaged in literary work. He was a frequent contributor to magazines; in 1912 became literary editor of *La Follette's Weekly*; and was author of the plays 'The Cavalier' with Paul Kester (produced by Julia Marlowe, 1902); 'The Wife's Strategy' (produced by Margaret Anglin, 1905); 'The Sinner' with L. Westervelt (produced by Robert Edeson, 1907); 'Rosalind at Red Gate' (1910); 'The Prodigal Judge' (1913); 'Hit-the-Trail-Holiday' with George M. Cohan and Guy Bolton (1915). His books include 'Embers' (1911); 'Nowadays' (1914); 'Possession' (1915).

**MIDDLETON, Henry**, American patriot, son of Arthur Middleton, 1681-1737 (q.v.): b. South Carolina, 1717; d. Charleston, S. C., 13 June 1784. He was elected to the South Carolina House of Commons and in 1745-47 was its speaker. He was appointed commissioner of Indian affairs in 1755 and served as a member of the council in 1755-70. He was elected a delegate to the Continental Congress in 1774, serving as its president from October 1774 to May 1775. He was president of the Provincial Congress of South Carolina in 1775-76. He was re-elected to the Continental Congress in 1776, but owing to failing health was replaced by his son Arthur, 1742-87 (q.v.), who became a signer of the Declaration of Independence. He was a man of great wealth and wide influence, and was an earnest worker for the independence of the colonies.

**MIDDLETON, Henry**, American politician and diplomat: b. Middleton Place, S. C., 1771; d. Charleston, S. C., 14 June 1846. He was elected to the State legislature in 1801, serving till 1810. He was soon recognized as a leader, and in 1810-12 was governor of the State. He supported the war policy in 1812, and in 1815 he was elected to Congress, where he served four years. In 1820 he was appointed Minister to Russia, in which capacity he negotiated a treaty regulating trade and fisheries in the Pacific (1824). He returned to the United States in 1830, and retired from public life.

**MIDDLETON, Thomas**, English dramatist: b. probably in London about 1570; d. Newington Butts, July 1627. Little is known of his life, but his writings testify to the excellence of his education before his entry at Gray's Inn in 1593 (or 1596). Several minor prose works preceded what seems to be his first play, 'Old Law,' written with Rowley in 1599. From that time on he wrote constantly for the stage, now alone, now with Rowley, Massinger or Dekker. Among these works are several masques, of which the best and most dramatic is 'The World Lost at Tennis.' Middleton's 'Witch' is his best known work because of the claim often made since its publication in 1778, that it must have furnished hints for the song of the witches in Shakespeare's 'Macbeth'; but Middleton's verse, which is particularly reminiscent of 'Romeo and Juliet,' and his imitation of Shakespeare, as, for example, of 'Hamlet' and 'Tempest,' possibly of 'Pericles,' too, in 'The Mayor of Quinborough,' make such a view untenable. It is more likely that the songs were taken from Middleton's play and inserted into the acting edition of 'Macbeth.' The most successful play by Middleton was 'A Game of Chess,' which satirized the wooing of the Spanish Infanta and was stopped by Privy Council; it packed the playhouses because of its political and Protestant tone. Among his other plays are 'Michaelmas Term' (1607), a story of city intrigue; 'A Trick to Catch the Old One' (1608), his best comedy of intrigue; 'The Roaring Girl'; 'The Spanish Gipsy,' which, like the 'Mayor of Quinborough' and 'A Mad World,' has the Hamlet-like trick of a play within a play; and 'Women Beware Women,' his best single play. As a rule Middleton is erratic and ill-sustained, and his characters low and coarse, but sometimes wonderfully analyzed. Consult the editions by Dyce

(1840) and Bullen (1886), and Swinburne's essay in the *Nineteenth Century* for January 1866. Middleton's best plays appear in a volume of the 'Mermaid Series' (1887).

**MIDDLETON**, Canada, a town of Annapolis County, Nova Scotia, 102 miles northwest of Halifax, at the junction of the Dominion-Atlantic and the Canadian-Northern railroads. There are granite quarries in the neighborhood. Concrete products are manufactured. There are medicinal springs, and the vicinity has numerous orchards. Pop. 1,000.

**MIDDLETON**, England, market town, municipal borough, in Lancashire, six miles northeast of Manchester. Its industrial establishments include cotton and silk factories, dye and print works, ironworks, chemical works, etc., and coal is extensively mined in the vicinity. The church dates from the 12th to the 16th century; the grammar school was founded in 1572; there is a handsome town-hall and free libraries and reading-rooms, parks and a handsome market-place. Gas and electric lighting plants are municipally owned. Pop. 27,980.

**MIDDLETOWN**, mid'l-town, Conn., city, county-seat of Middlesex County, on the Connecticut River, and on the New York, New Haven and Hartford Railroad, about 18 miles south of Hartford. It is opposite Portland, where are valuable brownstone quarries. The places are connected by a long drawbridge. The city was founded in 1650 and the next year was incorporated as a town under the name of Mattabeseck. Two years later the name was changed to Middletown. It was granted a city charter in 1784. For a number of years there was considerable trade with the West Indies, and until 1886 Middletown was the port of entry. In that year the custom-house business was removed to Hartford. Middletown is in an agricultural region in which tobacco is one of the principal products. Abundant water-power has aided in making the place a manufacturing city. The chief manufactures are pumps, bone goods, cotton webbing, hammocks, rubber goods, silks, toys, shoes, chemicals, harness trimmings, locks, marine hardware and silver-plated ware. The educational institutions are the public and parish schools, the Wesleyan University (q.v.), the Berkeley Divinity School (P. E.), opened in 1854, and the Russell Free Library. It is also the seat of the State Hospital for the Insane, and the State Industrial School for girls. The charter of 1882, under which the government is administered, provides for a mayor, who holds office two years, and a city council. The subordinate officials are chosen by the mayor and council. Pop. about 14,000. Consult Adams, 'Middletown Upper Houses' (New York 1908); Whittemore, 'History of Middlesex County, Conn.' (New York 1884).

**MIDDLETOWN**, Del., town in Newcastle County, on the Appoquinomink River and on the Philadelphia, Baltimore and Washington Railroad, 24 miles south by west of Wilmington. It is in an agricultural region in which the chief productions are fruits. The principal manufactures are canned-fruits, wagons and agricultural implements. The waterworks and electric-power plants are municipally owned. Pop. about 1,500.

**MIDDLETOWN, N. Y.**, city, in Orange County, on the New York, Ontario and Western, the New York, Susquehanna and Wilmington, and the Erie railroads, nearly midway between the Hudson and Delaware rivers, and about 66 miles northwest of the city of New York. Middletown was settled about the middle of the 18th century; its location on the Minisink road, the route to the "West," and half-way between the important rivers of this section, gave the place its name, and its early importance. At first it was included in the Walkill township. In 1848 it was incorporated as a village, and 27 June 1889 was chartered as a city. It is in a fertile agricultural region, and has a large trade in dairy products, live-stock and garden produce. It has the New York, Ontario and Western Railroad shops and the chief manufactures are hats, shirts, saws, automobile tires, cut glass, printers' supplies, files, carpet-bags, leather, condensed milk, paper boxes and cigars. Some of the noted public institutions are the State Homœopathic Hospital for insane, the Federal building, churches, public schools (ward schools), one parish school, an excellent high school, Saint Joseph's Academy (R. C.), and the Thrall Public Library. There are two national and one savings bank and one trust company bank. The government is administered under a charter of 1902 which provides for a mayor, who holds office two years, and a common council of nine members, each one of whom holds office two years. The mayor appoints, subject to the approval of the council, the members of the board of health, and the council elects the engineer, city clerk and corporation counsel. Pop. (not including over 2,000 State Hospital inmates), about 16,000.

**MIDDLETOWN, Ohio**, city, Butler County, on the Miami River, and on the Cincinnati, Hamilton and Dayton, the Cincinnati Northern and the Cleveland, Cincinnati, Chicago and Saint Louis railroads about 34 miles north of Cincinnati. It was settled about 1794. It is in an agricultural section, but is noted for its many paper mills and large steel plants.

**MIDDLETOWN, Pa.**, borough, in Dauphin County, on the Susquehanna River, and on the Philadelphia and Reading and the Pennsylvania railroads, about 10 miles southeast of Harrisburg. It was founded in 1756, and in 1828 was incorporated. It is in a farming region, but it has considerable manufacturing interests. The principal manufactures are shoes, foundry products, stoves, furniture and cars. Stone quarries in the vicinity contribute to the industrial wealth of the borough. Its trade is in the manufactured articles, farm and dairy products. The borough owns and operates the electric-light plant. Pop. 5,374.

**MIDEWIN**, mē'dē-wīn, or **MIDEWIWIN**, mē'dē-wē'wīn, or **MIDE**, mē'dē, or **MEDA SOCIETY**, a secret religious organization of the Algonquian Indian tribe. Both men and women were admitted to it and women as well as men might hold office. A resemblance to the Masonic ritual in its progressive degrees has been remarked. Consult Hoffman, W. J., 'The Midewiwin of the Ojibway' in the 'Seventh Annual Report of the Bureau of American Ethnology.'

**MIDGARD**, mīd'gārd, in Scandinavian mythology, the dwelling-place of the human race, formed out of the eyebrows of Ymir, one of the first giants, and joined to Asgard, the abode of the gods, by the rainbow-bridge.

**MIDGE**. See **BLACK-FLY**; **GNAT**.

**MIDHAT PASHA**, mīd'hāt pāsh'ā, Turkish statesman: b. Constantinople, 1822; d. Arabia, May 1884. He entered the Turkish government service, was made pasha in 1860, was governor successively of Uskup, Bulgaria and Salonica, and distinguished himself by his wise administration. In 1873 he was for a short time grand-vizier. He aided in deposing the Sultans Abd-ul Aziz and Murad V in 1876, was grand-vizier under Abd-ul Hamid (Dec. 1876-Feb. 1877), and was then banished by the suspicious monarch. Later, however, he was governor of Smyrna, then of Syria. He was tried with other pashas for the murder of Abd-ul Aziz, was found guilty and was sentenced to death; but this sentence was commuted to life imprisonment. He wrote 'La Turquie: Son Passé et son Avenir' (1878).

**MIDIANITES**, mīd'i-an-itz, an Arab tribe, descended, according to Scripture, from Midian, the son of Abraham by Keturah. They occupied most of the country between the Arabian Gulf and the Plains of Moab. The Midianites were very troublesome neighbors to the Israelites till Gideon's victory over them. Midian ceased to be Egyptian and became Turkish in 1887. Consult 'Midian Revisited' (1879).

**MIDLAND, Mich.**, city, county-seat of Midland County, on the Chippewa and Tittabawassee rivers, and on the Michigan Central and the Pere Marquette railroads, 18 miles west of Bay City. Its principal manufactures are shingles, lumber, tubs, hoops, pails, chemicals, bromine and salt. It has a fine new Federal building, banks, grade and high schools. The city is governed by a mayor and city council. Pop. 4,500.

**MID-LOTHIAN, or EDINBURGSHIRE**. See **EDINBURGSHIRE**.

**MIDNAPUR**, mīd-nā-poor', India, a town and administrative district of Bengal. The town is the capital of the district and is 68 miles by rail west of Calcutta. It is the centre of an important indigo and silk industry, and has manufactures of brass and copper goods. Pop. about 33,200. The district forms the southern part of the Bardwán division, bounded on the east by the river Hugli. It has an area of 5,186 square miles.

**MIDNIGHT JUDGES, or APPOINTMENTS**, a term applied to executive appointments or nominations made by President John Adams, the last night of his administration. Congress had passed a bill authorizing the appointment of 18 new United States judges, and Adams with the consent of the Senate appointed judges to fill these newly created vacancies. They were known as "Adams Midnight Judges." The new law was repealed early in Jefferson's term and the judges lost their offices.

**MIDRASH** (Hebrew, from *darash*, to make research), among the Jews, is the general name given to the exposition or exegesis of the

Scriptures. When such writings first arose is not known, but the most flourishing period of midrashic exegesis was from about 100 B.C. to 200 A.D. The term midrash expressed "any and every ancient exposition on the law, psalms and prophets, disquisitions that took the form of allegorical illustration, homiletics or practical commentary." Thus in its most general meaning it expressed the whole uncanonical Jewish literature, including the Talmud, down to the compilation of the book *Jalkuth* in the 13th century, since which time the term gradually ceased to be applied to rabbinical writings.

**MIDRIF** (A.-S. *mid*, middle; *hrif*, abdomen), the diaphragm (q.v.).

**MIDSHIPMAN**, in the American and British navy, a young officer who has previously held the position of a naval cadet. The cadets require to be nominated before they can come forward for competition. After two years' training on board a training-ship, the cadet is expected to pass the examinations appointed. If he gain a first-class certificate he becomes a midshipman at once, otherwise he has to serve for 6 to 12 months at sea. A midshipman after four years and a half may become a sub-lieutenant; he then studies at the Naval College, is trained in gunnery and torpedo practice, takes a course in pilotage and then may become a lieutenant.

**MIDSHIPMAN**, a California coast-fish of the genus *Porichthys*. See **CABEZON**.

**MIDSHIPMAN EASY**, Mr., a nautical romance by Capt. Frederick Marryat, published in 1836. It narrates the adventures of a spoiled lad, the son of a so-called philosopher, who cruises about the world, falls in love, has misfortunes and at last good luck and a happy life. The incidents themselves are nothing, but the book is entertaining for its "character" talk, and because the author has the gift of spinning a yarn.

**MIDSUMMER EVE**. See **JOHN'S**, **EVE** OF **SAINT**.

**MIDSUMMER NIGHT'S DREAM**, A. First printed in 1600 and mentioned by Meres in 1598. 'A Midsummer Night's Dream' was probably written in 1594, or even earlier. It was doubtless written for some wedding festival as it has many of the characteristics of a masque. The incidents connected with Theseus and Hippolyta were taken from Plutarch's 'Life of Theseus' and perhaps Chaucer's 'Knights Tale,' while the fairy story which makes up such a large part of the play was Shakespeare's transformation of the somewhat crude elements of mediæval folklore. The first and last acts take place in Athens at the palace of Theseus, and the other three acts in the forest near Athens. Theseus and his queen fit into the story in so far as they celebrate their nuptials, and as they are interested in the love affairs of Demetrius and Helena, Lysander and Hermia; they are brought into the forest only by their love of the chase, which is realistically portrayed. The well-known words of Theseus upon "the lunatic, the lover and the poet, as of imagination all compact," are in striking contrast with the fantastic fairies that really dominate the play. Even further removed from fairy-land are the prosaic mechanics who represent, with all the

characteristics of low comedy, the story of Pyramus and Thésbe. By their rehearsal in the forest they are caught for a moment in the magic web of Oberon, Titania and Puck. Under the same influences fall the Athenian lovers, who after unfortunate experiences are brought to the happy conclusion of their dreams. The title of the play, as indeed the major part of the story and the background, suggest the tone, the atmosphere, of the play. It is the magical midsummer-night with the moon in the sky that forms the appropriate setting of the mystery, the fantasy, and the unreason of fairy-land. Oberon, Titania and Puck, along with the other incarnations of the beauty and magic of nature, have fixed in the popular imagination the principal elements of fairy-land. The fact that they were represented by boys on the Elizabethan stage gave to these creations the spirit of childhood that has been lost in the modern stage representation. No analysis can suggest the delicacy, or the beauty, or the charm of these airy nothings to which Shakespeare has given a local habitation and a name.

EDWIN MIMS.

**MIDWAY ISLANDS**, North Pacific Ocean, so named from being midway between Asia and America, are the northernmost islets of the Hawaiian group, extending about 1,800 miles north by west of Honolulu. The islands have come into prominence as the intermediate station of the American-Pacific cable to the Ladrone and Philippine islands via Honolulu. The group consists of a low coral atoll 18 miles in circumference, enclosing Sand Island, Eastern Island and two islets. Sand Island, the largest, is one and three-fourths miles long, three-fourths of a mile wide and has an average elevation of from 3 to 10 feet above sea-level, the highest point attaining 43 feet. Eastern Island is one and one-fourth miles long, one-half mile wide and from 6 to 12 feet high. Both islands are partly covered with coarse grass and bushes, the breeding ground of the tern or sea-swallow. Good water is obtained by sinking wells, while fish of many varieties, turtles, crabs and crawfish, etc., abound in the lagoon; sea-birds also are easily caught. The islands are inhabited only by the employees at the cable stations. From 1887-89 a shipwrecked crew lived here for 14 months until rescued, losing, however, several of their number from scurvy. A short distance west of the islands a submarine mountain rises 2,200 feet from the ocean bed to within 82 fathoms of the surface, and between the islands and Guam is an abyss of over 4,900 fathoms, one of the deepest in the world.

**MIDWIFE FROG**. See **OBSTETRICAL FROG**.

**MIDWIFERY**. See **OBSTETRICS**.

**MIELATZ**, Charles Frederick William, American etcher: b. Breddin, Germany, 24 May 1860. He came to the United States when a child and was educated in the schools of Chicago, studying drawing at the Chicago School of Design, and painting under F. Rondel, Sr. He was elected a member of the National Academy of Design and as instructor in etching there exerted a considerable influence over the younger artists of his time. He became widely known for his etchings, dry

points, aquatints and lithographs. He has executed a large number of views of New York as well as of rural, woodland and marine scenes. Among his works may be mentioned the etchings 'The Battery'; 'Rainy Night, Madison Square'; 'Kingsbridge on the Harlem'; 'Arch of the Cathedral of Saint John the Divine'; 'Saint Paul's'; 'New York from the Harbor'; 'Chelsea Docks'; 'The Naval Arch'; 'Poe's Cottage at Fordham'; 'Across the Fields, Narragansett'; 'A Glimpse of New Haven'; 'In the Gardens, Georgian Court, Lakewood'; 'Near the Golf Links, Lakewood'; the dry points, 'Falls of Pawtucket'; 'Fisherman's Luck'; 'A Mill at Block Island'; the aquatints, 'Foggy Day on Shore'; 'Winter Night'; and the lithographs, 'Bowling Green'; 'Fifth Avenue.'

**MIELZINER**, mēl'zīn-ēr, Moses, American rabbi and educator: b. Schubin, Germany, 12 Aug. 1828; d. Cincinnati, Ohio, 18 Feb. 1903. After studying at the University of Berlin he became rabbi of a congregation in Waren, Germany, and then head of a theological school in Copenhagen. In 1865 he was called to the rabbinate of a New York synagogue, which he held until 1873, when for six years he was principal of a private school besides co-operating in the Emanu El Preparatory School. In 1879 his real educational work was begun in the United States when he was appointed professor of the Talmud at the Hebrew College, which position he held until his death. As teacher he was clear, exact and thorough. His published works include 'The Jewish Law of Marriage and Divorce' (1884); 'Selections from the Book of Psalms' (1884); 'Slavery among the Ancient Hebrews' (1894); 'Introduction to the Talmud' (1884 and 1903); 'Legal Maxims and Fundamental Laws of the Civil and Criminal Code of the Talmud' (1898); 'Rabbinical Law of Hereditary Success' (1900).

**MIER**, Mexico, commune in state of Tamaulipas, 95 miles northeast of Monterey, on the Rio Grande. Pop. 7,114.

**MIERES**, Spain, city in the province of Oviedo, 12 miles by rail southeast of Oviedo, on the river Caudal. It is situated in a mountainous region with heavy forests and fertile land. It has coal, iron, sulphur and cinnabar mines, and iron and chemical works. The town has also a trade in fruit, timber and livestock. Pop. 27,866.

**MIERIS**, mē'rīs, Frans van (THE ELDER), Dutch painter: b. Leyden, 12 April 1635; d. there, 12 March 1681. He was originally a pupil of the glass painters A. Torenvliet and G. Dous, and eventually became so famous as a canvas artist that the Grand Duke of Tuscany and other noblemen ordered pictures from him; his work was remarkable both for refinement of handling and elegance of design. His portraits and genre pictures, in which both nobility and bourgeoisie are represented, are not conspicuous for striking and original characterization. Only two or three figures appear in most of his genres, and his compositions of this kind are delicate and smooth to a degree that renders them almost inanimate. There are portraits of himself and his wife in the gallery of The Hague, and in the Pinakothek at

Munich, which latter collection is especially rich in examples of this master, among them 'An Oyster Breakfast'; 'Lady Playing a Lute'; 'The Trumpeter'; 'The Sick Woman.' Many of his pictures are to be met with in the galleries of Paris and Dresden such as 'The Artist'; 'A Lady Painting'; 'Love's Message'; 'The Music Lesson'; and in the Berlin Gallery is his 'Young Lady before a Looking-glass.'

**MIERIS**, Frans van (THE YOUNGER), grandson of the preceding, Dutch painter: b. Leyden, 24 Dec. 1689; d. there, 22 Oct. 1763. He painted genre and portraits after the manner of his father, who had produced a number of small club pictures, and of his grandfather. He did more service perhaps by his literary work than by his pictures, which have the ancestral fault of superficiality. He wrote 'Histoire der Nederlandsche Vorsten' (1732-35); 'Groot Charter-book der Graven van Holland, van Zeeland en Heren van Vriesland' (1753-56); and 'Handvesten der Stad Leyden' (1759).

**MIFFLIN**, Thomas, American soldier and politician: b. Philadelphia 1744; d. Lancaster, Pa., 20 Jan. 1800. He was by birth a Quaker; was graduated at Philadelphia College in 1760; entered public life in 1772 as a member of the Pennsylvania assembly; and in 1774 was elected a delegate to the Continental Congress. In 1775 he entered the army with the rank of major, and as colonel and first aide-de-camp to Washington accompanied him to Cambridge. He subsequently held the appointment of adjutant-general, and in the spring of 1776 was commissioned as brigadier-general. He fought in the battle of Long Island, and by his energy succeeded in the latter part of 1776 in raising considerable reinforcements in Pennsylvania to recruit Washington's army. He was present at the battle of Trenton, and did good service in driving back the enemy's line of cantonments from the Delaware. In 1777 he was made a major-general, and in the same year became an active member of the faction organized for the purpose of placing Gates at the head of the Continental army, and known in history as the Conway Cabal (q.v.). The project failing, he resigned his commission, and in 1782 was elected to Congress, of which body he became president during the following year. In this capacity he received from Washington the resignation of his commission as commander-in-chief. In 1785 he became speaker of the Pennsylvania legislature, and in 1787 he was a delegate to the Constitutional Convention. In October 1788, he succeeded Franklin as president of the Supreme Executive Council of Pennsylvania, which position he filled for two years; and from 1790 to 1799 he was governor of the State. In 1794, while holding this office, he rendered important assistance to Washington in quelling the Whisky Insurrection (q.v.).

**MIFFLIN**, Warner, American reformer: b. Accomac County, Va., 21 Oct. 1745; d. near Camden, Del., 16 Oct. 1798. When a boy on his father's plantation he became convinced of the evil of slavery, and when he himself became a slave owner, he freed all his slaves and paid them for their past services. He was a Quaker, and traveled widely, preaching against slavery. It was largely through his efforts that the

Quakers came to oppose slavery, and many followed his example in freeing their slaves. On account of his religious principles he opposed the Revolutionary War, and at the time of the battle of Germantown interviewed both General Washington and General Howe to impress upon them the evils of the war. In 1782 he was instrumental in securing a law in Virginia which allowed for emancipation of slaves; in 1783 he presented a memorial to Congress in regard to slavery, and in 1791 another memorial on the same subject to the President and Congress, which was the cause of a sharp debate on the right of petition. Shortly afterward he published a series of essays defending his position in the matter.

**MIFFLIN, Fort.** See FORT MIFFLIN.

**MIGDOL** (Hebrew, a tower), Egypt, town mentioned in Jeremiah xliv, 1; xlvii, 14, as in lower Egypt; in Ezekiel xxix, 10; xxx, 6, as the northern limit of the country, opposite Syene; as a station on the route of the Israelites to the Red Sea in Exodus xiv, 2, and in Numbers xxxiii, 7. It is also probably the magdolum of the 'Antonine Itinerary,' situated 12 Roman miles from Pelusium.

**MIGNARD, Pierre**, French painter and engraver: b. Troyes, November 1612; d. Paris, 20 May 1695. He studied in Bourges under Jean Boucher and in Paris under Simon Vouet. In 1636 he went to Italy and spent most of his time in Rome, whence he was surnamed "The Roman" (Le Romain). He imitated Annibale Caracci, and among other portraits, including those of many Roman nobles, painted likenesses of Popes Urban VIII and Alexander VII. In 1654 he went to Venice where his success as a portrait painter continued. On being summoned to Paris by Louis XIV he painted portraits of the young king and of Mazarin and afterward was commissioned to decorate the cupola of the church of Val de Grace with over 200 figures of prophets, martyrs, etc. This work, the largest piece of fresco painting in France, soon lost the beauty of its coloring, owing to the painter's want of familiarity with the art of working on a wet plaster ground. He subsequently produced some paintings for the palace of Versailles and was made director of the royal art collection and superintendent of the manufacture of the Gobelin tapestry. His pictures suffer from the faults of his day; they are stiff and conventional; but glow with the warm and harmonious coloring of the Venetian school. His portraits are the best of the early French school. A remarkable collection of his works is to be found in the Louvre, but the Berlin Museum possesses the finest of his portraits, that of Maria Mancini. Consult Lebrun Dalbaume, 'Etude sur Pierre Mignard' (1878).

**MIGNE, Jacques Paul**, French priest and editor: b. Saint-Flour, Cantal, 25 Oct. 1800; d. Paris, 25 Oct. 1875. He was educated at Orleans, was ordained a priest in 1824 and had charge of the parish of Puisseaux in the diocese of Orleans until 1833 when he went to Paris and founded *L'Univers religieux*, which afterward became *L'Univers* under the direction of Veuillot. In 1836 he disposed of his interest in that publication and established a publishing house for the production of religious books in inexpensive editions. While his work as a pub-

lisher was of vast scope much of it was superficial and prepared at too high a rate of speed to be accurate. An exception is the 'Patrology' which was under the direction of the scholar Benedictine J. B. Pitra, and which covers many works not included in other collections nor produced in special editions. It was published as 'Patrologiæ cursus completus' (Latin series, 221 vols., 1844-55; Greek series, in Latin, 85 vols., 1856-61; Greek series, with Greek text and Latin trans., 165 vols. 1857-66). Among other publications are 'Scripturæ sacræ cursus completus' (28 vols., 1840-45); 'Collection des auteurs sacrés' (100 vols., 1846-48); 'Encyclopédie théologique' (171 vols., 1844-66), etc. The Migne publishing plant was a total loss by fire in 1868, but it was rebuilt, and in 1876 it was sold to Garnier Frères, who also purchased Migne's copyrights.

**MIGNET, François Auguste Marie**, fränswä ö-güst mä-rè mën-yä, French historian: b. Aix, Provence, 8 May 1796; d. Paris, 24 March 1884. He was educated at Avignon; studied law in Aix; went to Paris in 1822 after winning a prize from the Academy of Inscriptions by his essay on French institutions, government and legislation in the time of Saint Louis; joined the staff of the *Courrier Français*; lectured on modern history at the Athenée; was elected to the Academy in 1836; and after the Revolution of 1848 lost the place he had held for 18 years as archivist of the Foreign Office. His most important work was a 'History of the French Revolution' (1824). Besides this he wrote biographies of Franklin (1848), of Mary Stuart (1851), and of Charles V (1854). Consult Trefort, 'Mignet und seine Werke' (1885).

**MIGNON**, French term of endearment (darling, favorite, pet), sometimes used as a given name. 1. A mysterious Italian girl, the daughter of an aged harpist, who dies in despair through unrequited love in Goethe's 'Wilhelm Meister's Lehjahre.' 2. Opera by Ambrose Thomas, founded on 'Wilhelm Meister,' with words by Carré and Barbier, produced in Paris in 1866, in London in 1870 and in New York in 1871. 3. A term of opprobrium applied to certain favorites of Henry III, of France, youths of frivolous habits and effeminately fashionable dress, popularly credited with dissolute morals and generally hated because of the king's lavish generosity to them. Among them were Quélus, Saint-Mégrin, Maugiron, Epernon and Joyeuse.

**MIGNONETTE**, mìn-yö-nět', a genus (*Reseda*) of annual and perennial herbs of the family *Resedaceæ*. The species, of which there are about 50, are natives of western Asia and the Mediterranean region. They have simple or compound leaves, and terminal spikes of small, pale, usually greenish flowers. Less than half a dozen species are cultivated, the most important being the common mignonette (*R. odorata*), a universal favorite both in gardens and in greenhouses because of its fragrant flowers. It is a branching annual herb of decumbent habit when in its prime, and will thrive in any cool, moist, fairly rich soil, when partly shaded from the noon-day sun. For outdoor blooming the seeds are sown successively from early spring to midsummer, and for winter blossoming from that time forward at intervals of three or four weeks.

**MIGRAINE, OPHTHALMIC MIGRAINE, or SICK HEADACHE**, a very widespread affection, also known as megrim, hemicrania or bilious headache. It is a vaso-motor disturbance; in other words, one in which the nerves which expand or contract the arteries and blood vessels are affected, thus restricting the flow of blood. The number of happenings which may cause this malady is exceedingly great, including such diverse causes as the merely physical ones of severe blows, falls, fast movements, sudden alteration of temperature or of atmospheric pressure. Migraine may also be caused by chemical stimuli such as nicotine, and by the secretions of various glands of the body such as the thyroid. It is often, too, caused by some other deep physiological alteration, such as that experienced in extreme fatigue, or that coming from some other disease such as meningitis or tumors. It may also have as chief cause some undue emotional strain as in great anger, in fear (which produces important changes in metabolism, q.v.), in disappointment or in chagrin. The vital point about the mental causes is that they may not always be in consciousness, but may be solely in the unconscious, and will therefore be quite unknown and unknowable to the average person, unless he can receive treatment at the hands of an experienced psychoanalyst. (See **PSYCHO-ANALYSIS**). If the causes act through the cerebral sympathetic nervous system, they may produce spasms of the vaso-motor muscles such that the blood pressure is increased in the brain.

The study of the worst forms of the disease alone has enabled investigators to correlate the multiform symptoms into a consistent picture. Fortunately the worst forms are not the commonest, which may be termed abortive forms. In these abortive forms now one and now another of the symptoms appear in individual cases, some having many or most of the symptoms, but in different attacks. One patient, for instance, is on record who in 15 years had at different times all the variations of the disease which have been reported.

The commonest abortive attacks of migraine, begin with chilliness, sometimes accompanied by cold feet and pinched face. Apprehension, depression and general wretchedness then follow, sometimes accompanied by a peculiar defect of sight which is known as scotoma. This is a spot in the visual field, quite distinct from the quite ordinary "blind spot," but one which interferes with the sight to a varying extent, and goes through different phases, sometimes within the short space of 20 minutes, constituting, in the cases where it does occur, the prelude to the actual pain in the head. The scotoma begins only as a slight blurring, noticeable especially when reading. The attention directed to it shows a cloudy spot which shifts with the eye, as it changes its direction. Gradually the spot expands into more or less crescent shape, usually being found in the left eye. The interference in vision is however sometimes found to affect only the upper half of the field of vision, while in rarer instances a temporary total blindness occurs.

Another important disturbance associated with migraine is that of speech. Not only is the ability to pronounce certain words affected,

but the comprehension is also sometimes interfered with. Inability to write is not unknown and also a disturbance of the auditory images used in singing. A case has even been described in which unsteadiness of gait was coupled with a sensation that the body or particular parts of it were doubled.

The headache itself is, however, the most important symptom and has an infinite variability as to its location, its quality, its duration and its intensity. The commonest form appears a quarter or a half an hour after the appearance of the other phenomena including the scotoma, and is generally confined to one side of the head, hence its name: migraine (from *hemicrania*, Greek for "half head"). But cases occur where it involves both sides or may be in the front or back of the head. In many cases the eyes alone are the seat of the pain, while in others the pain may be in the neck. The quality of the pain is described generally as lancinating. Some sufferers become hysterical, rolling on the floor and holding their heads with both hands, and shrieking with pain. Others with less acute suffering describe the pain as beating or thumping, particularly when stooping or requiring to do any violent exercise. All the phenomena of the pain indicate a change in pressure of blood within the brain, a change which may be either an increase or a decrease. The pain is aggravated in diverse ways in different patients, sometimes increasing on the taking of alcohol, on smoking, on eating, which sometimes on the contrary helps, on being subjected to sudden and loud noises, or to strong light. It has been found, too, that certain odors increase the pain, such as that of cooking and of certain drugs like chloroform or ether. The vaso-motor disturbances which accompany all cases of migraine are manifested in the coldness, paleness and gooseflesh, evidences of constriction in the calibre of the blood vessels, or in the redness of skin and even discharge of blood from various parts of the body. The secretions are frequently affected.

The connection between migraine and the mental factors which are above enumerated as among its causes is a matter which is being investigated at the present day through the technique of psychoanalysis (q.v.), which has unearthed much material going to show that the left sided headache represents an unconscious conflict relating to some love affair, while those on the right side are associated with fantasies concerning the nutritive libido. As a preliminary to the onset of the sickness the general conscious situation of the patient may show a slight or almost unnoticeable or even a profound change, varying from violent agitation to mild depression. In the observation of one specialist 25 per cent of the patients showed psychical symptoms, and while others show a smaller proportion, the presence of the purely mental element indicates that an important if not exclusive factor in the causation of the malady is the unconscious conflict. Treatment consists in removing as far as possible all the physical causes known to produce migraine, such as eye-strain, adenoids, diseased turbinates, constipation, dysmenorrhœa, etc., or gastrointestinal disorders, and if the migraine still persists, there is very good reason to believe that the condition is the result solely of the

unconscious conflict. In this case the patient should receive analysis from an experienced psychoanalyst.

SMITH ELY JELLIFFE.

**MIGRATION.** The term migration is often used very loosely in popular writings about animals, so that it seems wise to define it as limited in the present article to: (1) The annual change of residence by a species with the change of seasons from winter to summer or the reverse; (2) irregular mass-movements of a species under pressure of famine, over-population of a locality, or some more obscure influence. While these classes have been enumerated in the order of their prominence to our eyes, especially in the behavior of birds, it will be well to consider the second sort of migrations first, as these sporadic cases may throw light on the more regular phenomena, and how they came to be habitual.

**Insects.**—An eminent entomologist tells us that certain butterflies, as our milkweed fritillary (*Anosia plexippus*) and the cotton moth (*Aletia argillacea*), pass northward in the United States for hundreds of miles in spring, and again in huge swarms southward in autumn; but whether the individuals are the same is not determined. (See MILKWEED BUTTERFLY). Among other butterflies periodical migrations occur, as in movements of vast columns across the Isthmus of Panama out to sea, and flights miles in breadth have been observed to cross Ceylon, the individuals occupying several continuous days in their passage. Wallace observed the swarming of pierid butterflies in the Indian Ocean, and Clark in Venezuela, the vast throng composed of males moving steadily eastward for several days in the face of the trade winds.

The late Dr. A. S. Packard, whose special studies of the habits of the Rocky Mountain locust about 1880 were so valuable, reported that that destructive insect is migratory in certain seasons favorable to the species when over-production occurs; the young on hatching, after having devoured every green thing at hand, are forced, when becoming winged, to rise in enormous swarms and sail on the wings of the wind for hundreds of miles to other regions where they lay their eggs. The next year's brood sometimes returns to the original spawning ground to lay their eggs. The same thing is characteristic of similar locusts in Syria and central Africa.

**Crustacea.**—The members of several families of crabs, mostly tropical, have acquired the power of living out of water, and even of wandering extensively inland, but regularly return to the sea, sometimes in marching hordes, to deposit their eggs in the water, after which they go back to the highlands. See LAND CRABS.

**Fishes.**—Many kinds of fishes are regular migrants; the anadromous families, such as those of the shad, herring and salmon, annually ascend the rivers to spawn, whence in some cases they return to the sea, in others never get back, but their young, after the succeeding winter, go back to salt water. Certain fishes retire to the deeper or warmer parts of the ocean during the winter, but in early summer travel toward the shore-shallows, or to the cool north, in vast swarms; and the same is true of a large variety of other marine creatures, including some of the humblest and most minute

forms, in which cases the direction of the mass-movements are largely determined by the ocean currents. Moreover there occurs in the ocean a regular movement of deep-sea forms toward the surface in the night, the animals sinking again as daylight approaches. Fishermen in the north Atlantic and on the coast of Norway are familiar with the vast influx in the spring of such fishes as herrings, cod, plaice and capelan. The eminent Norwegian naturalist, G. O. Sars, concluded that some of these fish-migrations were undertaken in order to obtain food, and others for the purpose of reproduction. "When the capelan gathers in millions on the coast-banks of Finmark or Labrador, when countless numbers of cod approach the banks of Lofoten, and when the herrings flock to western Norway, they migrate to spawn. The fat-herring collecting off the coast of Nordland, and the cod gathering around the shoals of capelan in the Barents Sea, are examples of feeding-migrations."

Sea-turtles have a similar history, going regularly toward shore in the breeding season to deposit eggs in the beach sand.

**Mammals.**—The reader will have perceived that most of the foregoing cases are not examples of true migration because the element of habitual return is absent, or at best a very few survive to return; or else the movement, when seasonal and regular, is purely local, such as going to the nearest shore for spawning; or is merely the pursuit of traveling prey. In this class must be put most of the so-called migrations of mammals. From time to time certain small animals, as lemmings, field-mice, squirrels and the like, develop enormous numbers in some region (or formerly did so, before civilization was so worldwide) and overflow in great "armies" into neighboring parts of the country, where they gradually expire. In the plains regions of the world a lack of good pasture in one place will often cause movement of antelopes, bison, etc., to some better district in great herds; and in other situations the wild animals are accustomed to go up into the hills in summer and come down to the shelter of the valleys in winter, but these are local movements. The only examples of real migration afforded by the mammals are the case of certain bats that regularly journey every year between the tropics and more northern climes, and the case of the caribou and, to a less extent, the reindeer. These deer do make a real fall migration from the barren Arctic coast to the margin of the forested region southward and go back in the spring. It is to the birds, then, that we must turn for a study of migration in the stricter sense of the term, and even here it is only partial as regards many species and groups.

**Migration of Birds.**—This subject is so large that we can give no more than a superficial sketch, following in general the lines of investigation conducted by the late Wells W. Cooke, of the United States Biological Survey, who devoted almost his whole life to a study of this phase of ornithology as exhibited especially in North America.

The motive or cause of the periodical migration of birds has excited inquiry since ancient times, and at present two different methods of explaining it are in vogue. The opinion is general that in Pleistocene times, just previous

to the advance of the cold climate and finally to the great accumulations of ice and snow over the northern parts of the world, the whole of the northern hemisphere possessed a mild climate, and birds of every sort dwelt comfortably all the year round throughout virtually its whole extent. The coming of the Glacial Period so affected the north, as to limit more and more the residence in winter of birds there, although in summer they might venture somewhat toward it, when vegetation and insect life annually revived. As the ice advanced very gradually, now and then receding, but on the whole enlarging itself, these enforced northward and southward movements of the birds increased both in distance and duration, until migration became a fixed habit with all birds whose life was affected by the change of climatic conditions. Finally most northern birds were restricted all the year to middle America and the Mediterranean region and southern Asia. But the habit of migration had been formed, and when the glacial ice began to retreat toward its present position, the birds annually followed its receding margin, until at last they had established their present long and diversified migration routes.

Thus far all theorists are in substantial agreement. The divergence is as to the prevailing motive. One school argues that a longing to continue their inherited habit of residence in the north, and individually to return to their birthplaces, is the incentive that compels them to leave the tropics and make a journey, often of surprising length, every spring. The other school maintains that "the birds' real home is in the Southland"; that that region becomes overcrowded, and the birds in annually flying northward are seeking a region where there is less crowding and less competition for food. The truth perhaps lies in a combination of these influences, varying in intensity with different kinds of birds. It is an important circumstance, especially with reference to the second theory, that no similar migration occurs southward from the tropics to Bolivia and Argentina, whose plains and mountains offer a poor supply of bird-food, and not much more from the equatorial to South-African districts. "The conclusion is inevitable," Cooke believes, "that the advantages of the United States and Canada as a summer home, and the superb conditions of climate and food for successful rearing of a nestful of voracious young, far overbalanced the hazards and disasters of the journey thither. It must be remembered too that the migratory species have acquired various adaptations relating to their migrating habits that tend to fit them more and more to endure the exertion and danger required; also that the regular routes followed by each species are the products of thousands of generations of experience, and presumably represent the easiest way in each case.

**Phenomena of Bird-Migration.**—In the restricted space of this article it is impossible to go into detail as to the general subject, and attention must be confined mainly to what appears in North America. Australasia and the South Pacific islands share to some extent in the annual movements of continental species, but have an inter-insular migratory system of their own. "In Europe," says a recent re-

viewer, "and central Asia there are numerous routes, at least nine, according to Palmen. Of these one begins on the Siberian shores of the Polar Sea, Nova Zembla, and the north of Russia, and passes down the western coast of Norway to the North Sea and the British Isles; another arising in Spitzbergen follows much the same course, but is prolonged past France and Spain to the west coast of Africa. Many migrants wintering in North Africa (Algeria, etc.) have flown there from northern Russia, by way of the Baltic Sea, Holland, passing up the Rhine Valley, and crossing to the Rhone, the column splitting on reaching the Mediterranean, one line of migration passing along western Italy and Sicily, a second crossing by way of Corsica and Sardinia, the third by southern France and eastern Spain. Egypt receives its winter visitors from the Russian river-valleys of the Obi and Volga, the line crossing the Black, Bosphorus and Ægean seas to the Nile Valley. One important migration-route is to and from India along the Danube Valley and across Persia."

An important fact to consider at first is that the migratory habit is possessed in its completeness by comparatively few birds, and these belong almost wholly to a single order, that of the *Passeres*, or insect-eating song-birds. The exceptions are mainly sea-fowl and certain water-birds. Even in these groups two classes are to be found, one of species that are resident the year round in the regions they severally occupy; and the other whose migrations are of slight extent. Even in the northern half of the United States many birds are present in winter, some of which are those that retreat from the North only so far as driven by deep snow and excessive cold; while the Southern States have a longer list of resident birds, supplemented in winter by many kinds that moved only a little way southward to escape the dearth of food at that season in the snowy parts of the country. This shows that in respect to distance, migration varies from a distance almost as great as the breadth of the globe (the Arctic tern passes annually from Patagonia to Alaska, and back again) to no change of residence at all, even on the Arctic coast and islands.

**Northward Movement in Spring.**—Let us now consider the actions of the real migrants, who have been spending the winter in tropical America, on the arrival of spring. Nothing that we can see compels them to move, yet they abandon the delights of their winter home and proceed northward as soon as the proper time comes. This "proper time" seems to have no relation to the weather or to food-conditions there in the tropics, which are almost changeless, but is determined by the weather and food conditions the bird will find when it arrives at its northern destination, if the season there be an average one. This varies with the requirements of different birds, so that some start much earlier than others. Thus the ducks and geese, which ask only that the rivers and ponds in the north shall be free from ice, come to us much earlier than do the warblers and flycatchers that must wait until flowers are in bloom and insects numerous. As the last are the most numerous they come in crowds soon after the leaving-out of the northern woods and orchards.

Not all, however, pursue the same route, although each species keeps to its traditional path until it arrives in the district suitable to it, when it scatters. The configuration of continents, narrowing into a mere isthmus between North and South America, permits only a very narrow land-path for the migrants between their winter and summer resorts, yet most of those who winter south of Panama crowd along this narrow neck. Certain shore-birds, confident of their strength, strike straight north from Brazil to Nova Scotia, and a few species follow the line of the Antilles from Venezuela to Florida. Birds whose destination is California and northward follow the western coast of Mexico, and those aiming at summer homes in the Rocky Mountain region pass straight north through central Mexico and across the desert, or skirt the eastern coast of Texas and the plains. All these are habitual routes for certain species. The great body of migrants, whose songs are later to be heard in the eastern United States and Canada, fly straight across the Gulf of Mexico from Yucatan to landings on the northern shore all the way from eastern Texas to Florida. Arrived there—and as a rule this is about daylight, the journey from Yucatan having taken but one night—they spread northward along two main channels, one up the coast eastward of the Alleghanian Mountains (diverging into these uplands at each river valley); and two up the Mississippi Valley, separating into bands that ascend every tributary, and rapidly cover the whole country, while those bold species, surprisingly many in number, who are content only in the subarctic zone, hasten on to Alaska and down the Mackenzie Valley. The point to keep in mind in this general sketch is that every species pursues the same route every year, and sometimes it is far from the most direct one. The speed of travel is not great as a rule. The birds must feed by the way, and this food must be found as a rule by daylight; therefore, most species travel during the night, and are often delayed by foggy, rainy nights or by cold storms. The swallows, swifts, night-jars, hawks and some others that capture their prey on the wing feed as they go and probably rest at night. Those bound for the far north must and do move more rapidly than the southern breeders; and Cooke has gathered some very interesting statistics on this matter.

**Autumnal Migration.**—The autumnal return of the birds presents some very different features. It begins in the far north before any change in weather or food suggests the necessity of departure, and is led by male birds, after whom the mothers and young follow as soon as they have strength to travel. The movement is far less direct and hurried than the spring flight. They make a long stage by night, flying sometimes a mile or more above the earth, and drop down at dawn to feed and rest, then loaf along. The members of each species gather gradually into the regular route, which in many cases is quite different from that followed northward in May; and those that are inclined to flocking at this season form large companies that go on together, striking out at last from the Gulf shore to cross in a night that space of dark water, or disappearing in the Mexican forests.

**How do Birds in Migration find Their**

**Way?**—We have seen that they follow definite routes; also that these in places lead across wide spaces of water; also that the routes in some cases differ according to season; and had we been able to give more details it would appear that often these routes are very eccentric. Moreover, they travel mostly at night; and finally certain species cross areas of ocean hundreds of miles wide, and far from land, as when golden plovers fly from Nova Scotia to hundreds of miles wide, and far from land, as in the case of the curlews that migrate between Australia and New Zealand. It is also pleasingly evident that birds return year after year to the same grove, dooryard and nesting-place. How do they do it?

It was formerly taught that they followed landmarks, such as coast lines, ranges of mountains and large river-courses, which are visible even on clear nights from a great height, and doubtless these are aids to the day-fliers and when the sky is clear. But many lines of migration cut across such landmarks, instead of follow them, and others stretch across wide plains and vast water-spaces. Other theories, as of magnetic influences, etc., are without value. It appears plain that birds are guided by an innate sense of direction. This need not be esteemed miraculous, for in a lesser degree it is possessed not only by various other animals, but by wild men, especially those who dwell in a forested region, where in following game they would become lost daily had they not a faculty for orientation. The direct testimony to such a faculty in savage mankind, and comparison of the evident ability of many animals in this direction, makes its presence in the minds of birds easily credible, the more so as the sense is by no means infallible, since birds sometimes become completely bewildered when buffeted about at sea by high winds. Add the elements of observation and memory and a sufficient explanation is at hand of how migratory birds find their way.

**Bibliography.**—An early treatise on this subject of much value is by Alfred Newton in his 'Dictionary of Birds' (London and New York 1893-96). A more recent review is a part of the introduction of Dr. Frank M. Chapman's 'Handbook of Birds' (2d ed., New York 1912), which includes an extensive bibliography. The latest and most important results of study are in the writings of W. W. Cooke, summarized in Bulletin 185 of the United States Department of Agriculture (Washington 1915).

ERNEST INGERSOLL.

**MIGUEL**, mē-gēl', Dom Maria Evaristo, Portuguese pretender, son of John VI of Portugal: b. Lisbon, 26 Oct. 1802; d. Castle Bronnbach, Baden, 14 Nov. 1866. He was brought up in Brazil, and upon the accession of his father repeatedly raised rebellion as head of the Absolutists. In 1826 after his father's death he was made regent, but proclaimed himself king, attempted to keep Maria de Gloria, the real heir to the throne, who had been offered to him in marriage, out of the kingdom, and was successful until Dom Pedro of Brazil came to the aid of his daughter Maria, defeated Miguel and forced him to leave Portugal. Miguel is usually described by the

faction hostile to him as ignorant, vicious and drunken, but his coreligionists make him a model prince.

**MIKADO** (Japanese *Mi*, "exalted," *Kado*, "gate"), the ancient and poetic title of the Japanese emperor, in origin identical with "Sublime Porte" as used of the Ottoman sultan, that is, probably transferred to the ruler and judge from the gateway of his palace, at which he did justice. The word mikado was never used as a separate title for a spiritual ruler; the incorrect idea to the contrary results from the well-known historical fact that much of the temporal power of the Mikado was long usurped by shoguns or generals, who, however, always admitted that they derived their power from the Mikado. The present Mikado, Yoshihito (q.v.), is the 122d (or 124th) of his line, which dates back to 660 B.C.; of him the title "Mikado" is less used than Tenshi Sama, "Son of Heaven," or Shu-jo, "Supreme Master." See JAPAN.

**MIKADO, The, or THE TOWN OF TITIPU**, a comic opera in two acts, libretto by W. S. Gilbert, music by Sir Arthur Sullivan; first production, Savoy Theatre, London, 14 March 1885; first appeared in America at the Museum, Chicago, 6 July 1885. The plot is simple burlesque without the infusion of any Eastern imagery. The Mikado, a highly moral ruler, has issued an edict condemning to death every man found guilty of flirtation "unless connubially linked." To evade this stern sentence the citizens of Titipu hit upon the idea of appointing one thus condemned (Ko-Ko, the tailor) to the office of executioner, with the result that he could not behead the next man until he had first executed himself. It being necessary eventually to execute some one, Ko-Ko, who is engaged to Yum-Yum and is also first on the list of the condemned, finds a substitute in Nanki-Poo (the Mikado's son in disguise), who had gone into temporary obscurity to avoid marrying the elderly Katisha. Nanki-Poo agrees to suffer execution a month hence provided he can be married to Yum-Yum for that period. Legal complications follow, and in the end Nanki-Poo is forgiven and weds Yum-Yum, and Ko-Ko saves himself by marrying Katisha. An amusing character is Pooh-Bah, "Lord High Everything Else."

**MIKANIA**, also known as **WILLUGH-BEIA** (both Neo-Latin from the names of J. C. Mikan and Francis Willughby, respectively), a genus of composite plants of the tribe *Eupatoriæ* and sub-tribe *Agerateæ*. It is widespread throughout tropical and temperate America and grows either in an erect shrub or in twining vines. The genus numbers more than 150 recognized varieties, all natives of the warmer regions of America, except one species which grows in Asia and tropical Africa. The plant is characterized by opposite leaves, heart-shaped or triangular, toothed at the base and with petioles. The flowers are small and white, pinkish or yellowish. The tropical types, *M. amara*, *M. cordifolia* and *M. guaco*, have a high reputation in South America for the cure of snake bite, and administration of a medicine made from them is also supposed to render one immune to snake bite. There is no scientific proof of the efficacy of the herb either as remedy or pre-

ventive. *M. scandens* is the familiar climbing hempweed, with abundant pink flowers, growing in moist soil from Long Island to Texas.

**MIKHAILOV, Mikhail Larionovitch**, Russian author: b. Ural Mountains, 1826; d. Siberia, 1865. He was educated at Petrograd and engaged in literary pursuits as a translator, journalist and writer of fiction. His political sympathies caused his exile to Siberia. He was a contributor to *Sovremennik* (*The Contemporary*) and an able advocate of the reforms of the self-emancipation era. His collected translations and writings were published (3 vols., 1858-59).

**MIKHAILOVSKI, Nikolai Konstantinovitch**, Russian author and sociologist: b. 1842; d. 1904. He belonged to the school of thinkers which became famous in Russia in the seventies and eighties as fearless exponents of political and economic reforms. He was a contributor to the *Otechestvennyia Zapiski* (*The Annals of the Fatherland*) from 1869 until it was suppressed in 1884. He became coeditor of *Sévernui Vestnik* (*The Northern Messenger*) in 1873, and from 1890 until his death in 1904 he was coeditor of *Russkoye Bogatstvo* (*Russian Treasure*) with V. G. Korolenko. His collected writings were published (Petrograd 1913).

**MIKKELSEN, Aksel**, Danish educator: b. Hjørring, 14 Aug. 1849. He introduced the Swedish system of sloyd schools into Denmark, organized schools and seminaries on the system, which teaches manual training as an aid in developing the pupils physically and mentally as well as affording a basis of technical training. From 1907 he was inspector of the sloyd system in Denmark. Author of 'Hvad er Sloyd' (1886); 'Hvordan arbejder Sloydskolen' (1886); 'Opdrageren' (1891-92); 'Slojlære' (1894); 'Arbejdsstilinger' (1896), etc.

**MIKKELSEN, Ejnar**, Danish explorer: b. Vester Brønderslev, Jutland, 20 Dec. 1880. He was a member of the Smdrup expedition to Christian XI Land, East Greenland, in 1900, and in 1901-02 served with the Baldwin-Tiegler expedition to Franz Josef Land. In partnership with Leffingwell he organized an Anglo-American polar expedition in 1906, and succeeded in determining the position of the continental shelf of the Arctic Ocean. His expedition to the north coast of Greenland in 1909-10 resulted in his recovery of the records of the lost explorers Mylius-Erichsen and Höeg-Hagens, and in proving the non-existence of Peary's Channel. Author of 'Conquering the Arctic Ice' (London 1909); 'Lost in the Arctic' (1913); 'Mylius-Erichsen's Report on the Non-Existence of Peary's Channel' (1913), etc.

**MIKLOSICH, Franz von**, Austrian philologist: b. Luttenberg, Styria, 20 Nov. 1813; d. Vienna, 7 March 1891. He took his degree in philosophy at Gratz and in law at Vienna; and for a time practised law at Vienna, soon, however, abandoning that profession for the study of the Slavonic languages. He was appointed to a place in the Imperial Library in 1844 and retained it until 1862, also serving as professor of Slavonic philology at the University of Vienna in 1849-86. He was a man of profound scholarship and not only revolu-

tionized modern Slavonic philology but made important contributions to the knowledge of the Albanian, Gypsy, modern Greek, Hungarian and Rumanian languages. He was a member of the Academy of Vienna and a corresponding member of the French Academy of Inscriptions. His first contribution to Slavonic philology was his review, in 1844, of Bopp's 'Comparative Grammar.' From that time he issued a large number of works, not only on the Slavonic but on other languages, all of high importance, and among which the most notable are 'Vergleichende Grammatik der Slawischen Sprachen' (1852-74); 'Etymologisches Wörterbuch der Slawischen Sprachen' (1886).

**MILAN**, mil'an or mi-län', second city of Italy, the capital of the province of Milan, an archiepiscopal city on the Olona, about 90 miles by rail northeast of Turin. It is situated in a beautiful and fertile plain between the Adda and Ticino, which feed several canals, one of which, encircling a considerable portion of the interior of the city, divides it into two unequal parts. The town is built in the form of an irregular polygon, and is surrounded, except on the castle side, by a wall or rampart called the Bastione, encircled on the outside by a fine road shaded by chestnut-trees. Suburbs have sprung up beyond this circuit, and the general railway station is also outside. The city is entered by 11 gates, several of which are magnificent. The streets leading from these gates are wide, well paved and lighted and traversed by electric street car lines; the lateral streets are less commodious. The houses are built mostly of brick, but have often a handsome and showy exterior. The principal street is the Corso Vittorio Emanuele, a prolongation of the new and handsome Corso Venezia, together leading from the cathedral to the Porta Venezia; other good streets are the Corso Porta Romana, Via Torino, Via Dante, etc. The chief square is the Piazza del Duomo, in which stands the Duomo or cathedral; and another is the Piazza della Scala. Besides fine public gardens (Giardini Pubblici) there is a large public park (Parco Nuovo) occupying an area that was long a drill-ground, and was previously the site of the citadel and connected works. This has been finally laid out and planted, and an artificial lake and mound have been constructed. Adjoining these is an amphitheatre, capable of containing 30,000 spectators. The castle—recently restored and now converted into a museum of art and antiquities—fronts the park on one side; at the opposite side is the Porta Sempione with the fine Arco Sempione or Arco della Pace, a triumphal arch of white marble.

Among the public edifices of Milan the first place belongs to the Duomo or cathedral, a magnificent structure, inferior in magnitude to Saint Peter's at Rome, but in some respects not an unworthy rival. It is built of white marble, and though exhibiting a somewhat incongruous mixture of styles, in which the ancient Gothic occasionally gives way to the modern Italian, is one of the most impressive ecclesiastical edifices in the world. The Duomo in its present form was commenced in 1387, and is not yet entirely completed. Its form is that of a Latin cross, divided into five naves, terminated by an octagonal apsis, and supported by 52 octagonal pilasters of uniform size, except four, which,

having to bear the cupola, are larger. It is 486 feet long, the tower is 356 feet high, it occupies an area of 14,000 square yards and can hold 40,000 people. Around the exterior are 4,500 niches, of which above 3,000 are already occupied by statues; in the interior everything is of the most imposing and gorgeous description. Among the other remarkable edifices are the basilica of Sant' Ambrogio, founded by Saint Ambrose in 387, and though completely repaired in 1631, still retaining much of its original form and containing many relics of the ancient building embedded in its walls; the churches of Sant' Eustorgio, San Lorenzo, Santa Maria della Grazie, with a cupola and sacristy by Bramante, and the celebrated 'Last Supper' by Leonardo da Vinci; Santa Maria della Passione, a majestic edifice, with excellent paintings and a magnificent mausoleum; San Paolo; San Carlo Borromeo, etc. Among the palaces are the Palazzo Reale or La Corte, adorned with numerous frescoes and surmounted by a lofty tower; the archiepiscopal palace, adjoining the cathedral; the Palazzo di Comando Militare; the Palazzo Marino, now the Municipio, a colossal structure; the Palazzo Ciani, completed in 1861, and adorned with heads of Victor Emmanuel, Garibaldi, etc.; and the Palazzo di Brera or Delle Scienze Lettere ed Arte, containing the Pinacoteca or picture-gallery, with a very valuable collection of paintings and statutory, and containing also the library of the Academy, 300,000 volumes. Besides this library Milan possesses the Ambrosian Library, the earliest, and still one of the most valuable, public libraries in Europe. There is also a valuable museum of natural history and one recently founded, of theatrical relics, a world-famous conservatory of music, a military college, a theological seminary, a veterinary school. The principal structure erected in recent times is the Galleria Vittorio Emanuele, a kind of covered street connecting the Piazza del Duomo with the Piazza di La Scala Theatre. It is 320 yards long, contains handsome shops and is adorned with 24 statues of celebrated Italians. Milan has a number of theatres; La Scala is the second largest theatre in Europe, and accommodates 3,600 spectators. The principal benevolent endowments are the Ospedale Maggiore (founded 1456), richly endowed, and occupying a vast range of buildings in the Gothic style, with accommodation for 4,000 patients, and several other hospitals for the cure of diseases. Since it formed part of United Italy no town has more rapidly increased in commercial and industrial activity and in population than Milan. The spinning and throwing of silk employ a large number of hands. Other important articles of manufacture are machinery, locomotives and railway cars, automobiles, boilers, electrical apparatus, tobacco, cotton, lace, carpets, hats, glass, earthenware, chemicals, white-lead, jewelry, etc. Besides these, corn, rice, cheese and wines are the principal articles of trade. The municipality is one of the most progressive in Europe; great street improvements have been carried out; there is an adequate street railway service giving communication with the neighboring communes; and, while there is still much overcrowding and congestion of population, the death rate has been greatly re-

duced. Milan is the see of an archbishop, the seat of courts of primary resort, criminal and mercantile courts, and a Court of Appeal for all Lombardy. The United States is represented by a consul.

The foundation of Milan is attributed to the Insubrian Gauls; but the first distinct notice of it occurs 221 B.C., when it was subdued by the Romans, under whom it acquired so much importance, that in the division of the empire attributed to Constantine the Great it ranks as the second city of Italy. In the middle of the 5th century it was sacked by the Huns under Attila, and again in the following century by the Goths. Greater horrors yet awaited it; and the Goths, who had been driven out by Belisarius, having regained possession by the aid of the Burgundians, gave it up to the flames and put almost all its inhabitants to the sword. Rebuilt, it again became very flourishing under the Lombards and Charlemagne. Arrogance grew with its prosperity, and Milan lorded it so haughtily over the neighboring towns and republics, that in 1162, when the Emperor Frederick I, whose supremacy it refused to acknowledge, had resolved to take summary vengeance, the inhabitants of Pavia, Cremona, Lodi, Como and Novara eagerly hastened to the task and razed it to the ground. The cruelties practised produced a reaction, and in 1167 the famous Lombard League was formed at Pontida, and among other important results succeeded in bringing back the Milanese; and the city, again rebuilt, became even more populous and influential than before. It long continued, however, to be torn by internal factions, headed by the leading nobility, among whom the Visconti at last gained the ascendancy, and ruled it from 1395 till 1447. They were succeeded by the Sforzas, whose rule ended in 1535. Milan passed next into the possession of the Spaniards. At the close of the War of Succession it was allotted to Austria (1714). Under Bonaparte it became the capital of the Cisalpine Republic, of the Italian Republic, and of the Italian kingdom. In 1815 it was restored to Austria, and continued the capital of the Austro-Italian kingdom until 1859, when by the Peace of Villafranca Lombardy was ceded to Piedmont. Pop. about 663,000.

M., 'A History of Milan under the Sforza' (New York 1907); Beltrami, L., 'Reminiscenze di storia e d'arte nella città di Milano' (Milan 1862-67); Noyes, Ella, 'Story of Milan' (in the 'Medieval Town Series,' London 1908); Shaw, Albert, 'Municipal Government on the Continent of Europe' (New York 1906); Valeri, F. M., 'Milano' (Bergamo 1906).

**MILAN, Mo.,** town and county-seat of Sullivan County, on the Quincy, Omaha and Kansas City and the Chicago, Burlington and Quincy railroads, about 100 miles east by north of Saint Joseph. It is in an agricultural and stock-raising region, and in the vicinity of bituminous coal fields. The chief manufactures are flour and lumber. Milan is the headquarters of a division of the Quincy, Omaha and Kansas City Railroad, and the shops of the road are located here. The trade is principally live-stock, grain, lumber and flour. Pop. 2,191.

**MILAN, Tenn.,** city in Gibson County, on the Illinois Central and the Louisville and Nash-

ville railroads, about 95 miles northeast of Memphis. It is in an agricultural and lumbering region; the principal products are cotton and fruit. The chief manufacturing establishments are flour-mills, fruit-canning works, cotton gins and barrel factory. It has a college and good schools. Pop. 1,700.

**MILAN DECREE,** issued by Napoleon I, at Milan, 18 Feb. 1801, cutting off Great Britain from all connection with the Continent.

**MILAN EDICT,** issued by Constantine the Great at Milan, 313 A.D., granting toleration to Christianity and all other religions in the Roman Empire.

**MILAN OBRENOVITCH I,** ô-brên'ô-vich, king of Serbia: b. Jassy, 22 Aug. 1854; d. Vienna, 11 Feb. 1901. He was cousin to Michael Obrenovitch III, Prince of Serbia, by whom he was adopted on the death of his parents. He was educated in Paris at the Lycée Louis le-Grand and upon the assassination of Michael in 1868 he succeeded him as Milan Obrenovitch IV, Prince of Serbia, under a regency headed by Ristitch. In 1872, at the age of 18, he took over the government, retaining, however, the services of Ristitch. He carefully balanced political relations between his country and Austria and Russia, so strengthening his position that after the Russo-Turkish War he was successful in having Serbia's independence declared and himself proclaimed as Milan Obrenovitch I, king of Serbia, in 1882. He then entered into a secret treaty with Austria, by whom his subsequent administration of affairs was largely influenced. He improved transportation facilities and developed the country to a considerable extent, but without due reflection as to expense of the measures, so that heavy taxes and increased military service influenced the country against him. This state of affairs, coupled with his notorious private life and his offensive quarrels with his queen, Natalie, caused great public dissatisfaction and in 1889 he suddenly decided to abdicate in favor of his 13-year-old son, Alexander. He returned to Belgrade in 1894, was officially reconciled to the queen and undertook the reorganization of the army under the sovereignty of his son. He was appointed commander-in-chief in 1897, and is credited with greatly improving the military service in Serbia. Upon the marriage of his son, Alexander, to Draga Mashin, in 1900, Milan resigned his position as commander-in-chief of the army and was banished. He went to live in Vienna and died there in the following year. See SERBIA.

**MILANÉS Y FUENTES, José Jacinto,** hô-sá' yâ-kên'to mē-lân-ás ē fwân'tās, Cuban poet: b. Matanzas, 16 Aug. 1814; d. there, 14 Nov. 1863. He was self-taught, being a poor clerk and later a blacksmith's helper. But when he was 19 some of his verses were published and his excellent drama, 'El Conde Alarcos,' which appeared in 1838, won him a comfortable position. Several other plays followed, notably 'Una Intriga paternal.' But his early hardships had undermined his reason; he traveled for relief in the United States and in Europe in 1848 and 1849, and spent his last years in melancholia broken only occasionally by intelligent literary effort. Consult the biographical sketch in the *North American Review* for 1849.

**MILAN CATHEDRAL**

**MILAZZO**, *mē-lāt'sō*, or **MELAZZO**, Sicily, a fortified seaport city in the province of Messina, on a promontory 21 miles by rail west of Messina. It has a good harbor and carries on a trade in fruit, wine, cattle, fish and sulphur. It has a theatre, a technical school, a library containing over 10,000 volumes, a city hospital; and the building now used as a jail was originally a 13th century castle. Milazzo is the ancient Mylæ off which in 260 B.C. the Romans won a great sea-fight over the Carthaginians. Here also Garibaldi, 20 July 1860, with 2,500 men, defeated 7,000 Neapolitans and compelled the garrison to evacuate the fortress. Pop. of commune 16,569.

**MILBANK**, Joseph, American philanthropist: b. New York, 1848; d. 7 Sept. 1914. He was the son of Jeremiah Milbank, the millionaire organizer and builder of the Chicago, Milwaukee and Saint Paul Railroad, and at an early age became a director of the road. He inherited, with his sister, Mrs. Elizabeth Milbank Anderson, a fortune of great extent, which he further augmented by his own efforts in banking and railroad enterprises. With his sister he gave the Milbank Memorial Chapel to Teachers' College, and Milbank Memorial Hall to Barnard College, Columbia University; the Jersey City People's Palace; founded a Social Welfare Bureau at a cost of \$650,000; and contributed \$500,000 to the Children's Aid Society. Their benefactions totaled \$5,000,000.

**MILBURN**, William Henry, American clergyman: b. Philadelphia, 26 Sept. 1823; d. Santa Barbara, Cal., 10 April 1903. At five he suffered an accident which caused partial and finally complete loss of sight. He was educated at Illinois College (Jacksonville, Ill.); in 1843 became a Methodist itinerant preacher; was largely active in the South; and for a time had charges at Montgomery and Mobile, Ala. In 1845 he was elected chaplain of the House of Representatives, and he served as such in 1853, 1885 and 1887. In 1893 he was made chaplain of the Senate. He lectured with success throughout the United States and in 1859 in Great Britain. He was generally known as the "blind preacher." Among his writings are 'Rifle, Axe and Saddle-Bags' (1857); 'Ten Years of Preacher Life' (1859); and 'Pioneers and People of the Mississippi Valley' (1860), all based on his Western experiences.

**MILCOM**, national god of Ammon (1 Kings xi, 5, 33; 2 Kings xxiii, 13). Other references occur in Jeremiah xlix, 1, 3, and in 1 Kings xi, 7, where the spelling varies slightly but the identity is clear. The name appears to be derived from the West Semitic word *melek*, "king"; although *melek 'am*, "king of the people," is also considered. The name of the deity has not been found in inscriptions and nothing is known of the religion. There is no base for the supposition that human sacrifice was practised by the Ammonites, as it was by the Moabites to their god Molech, which deity is often confused with Milcom. The Ammonites worshipped on the Mount of Olives while the Moabites performed their religious rites in the valley of Hinnom. The Ammonites and their religion disappeared in the migrations and political upheavals which occurred in the districts to the east of the Jordan shortly prior to the Christian era.

**MILDEW**, specifically, any fungus belonging to the group *Erysiphaceæ*, the powdery or true mildews, and *Peronosporaceæ*, the downy or false mildews; loosely, many plant diseases, especially the rusts and smuts of cereals, and some not of fungous origin; vaguely, molds of any kind upon preserved fruit, clothing, walls or other materials, the origin of which is more or less organic. The powdery mildews develop mostly upon the outside of the host plants, which they enter only by means of their sucking organs of attachment (haustoria). In warm weather they develop innumerable spores upon erect branches and later produce thick-walled resting spores which germinate in the spring. Upon the host plants they usually appear as a sort of bloom, but later they often cause distortion of the leaves and not infrequently the death of the host. Being mainly upon the surface they may be combated with any fungicide (q.v.), and often with sulphur, either in the form of powder or vapor (not burned) evaporated without flame. This method is widely practised in greenhouses. Some of the best known are rose mildew (*Sphaerotheca pannosa*), gooseberry mildew (*S. mors-uvæ*), hop mildew (*S. castagnei*), cherry, pear and apple mildew (*Podosphæra oxycanthæ*), wheat mildew (*Erysiphæ graminis*) and grape mildew (*Ucinicula spiralis*).

The downy mildews all live within the tissues of the host plant, appearing outside the surface only when producing summer spores (conidia) which usually give a downy appearance to the infected spots. The resting spores are produced internally and make their escape in the following season when the tissues of the host (leaf or other part infected) have decayed. They cannot be combated like the preceding, because of their habit of feeding internally. Fungicides (q.v.) may be applied to prevent attacks, however, and this, together with the destruction of leaves in autumn and general cleanness of the premises, are believed to be the only safeguards. Among the best known and most destructive are Potato rot, blight, or mildew (*Phytophthora infestans*), lettuce mildew (*Bremia lactuæ*), damping-off fungus (*Pythium debaryanum*), downy mildew of the grape (*Plasmopara viticola*), radish mildew, also found on other members of the *Cruciferae* (*Cystopus candidus*), melon and cucumber mildew (*Plasmopara cubensis*) and onion mildew (*Peronospora schleideniana*).

The rusts and smuts which are sometimes called mildews are discussed elsewhere. The mildews, so-called, which appear upon leather, wall-paper, cloth, etc., belong to various other groups. Since they are generally seen only where dampness prevails, especially in cellars and closed rooms or houses, they may be prevented more or less effectually by the adequate ventilation of such places. And having gained a foothold in these places they may be destroyed by liberal applications of whitewash, in which copper sulphate or sulphur have been mixed, or where this cannot be applied, by burning sulphur in the closed quarters. This last remedy may also be used where cloth is attacked. Awnings, sails, etc., should be thoroughly dry before being stored or folded for any considerable time. They may also be soaked in a solution of copper sulphate and then dried. Until this is washed out by rain it will act both as a pre-

ventive of attack and will often save fabrics if not too far gone.

**MILE** (Latin *mille*, a thousand, a Roman mile being 1,000 paces), a measure of length or distance. The English statute mile, fixed in the reign of Queen Elizabeth, is 1,760 yards. The geographical mile, which is commonly used by the navigators of all nations, is one-sixtieth part of a degree at the equator. In many countries the kilometer now holds the same position, as the English statute mile in Britain. The following are some of the principal standards of miles or leagues which are or have been in use in the principal countries of Europe:

Kilometer.....	1,093.6 yards.
Ancient Roman mile.....	1,614 "
Modern Roman mile.....	1,628 "
English statute mile.....	1,760 "
Tuscan mile.....	1,808 "
Ancient Scottish mile.....	1,984 "
Geographical mile.....	2,028.4 "
Italian mile.....	2,028.4 "
Irish mile.....	2,240 "
French posting league.....	4,263 "
Spanish league (judicial).....	4,635 "
French league.....	4,860 "
Portuguese league.....	6,760 "
German short mile.....	6,859 "
Flanders league.....	6,864 "
Spanish league (common).....	7,416 "
German geographical mile.....	8,113.6 "
German (new imperial).....	8,202 "
Old Prussian mile.....	8,237 "
Danish mile.....	8,244 "
Swiss mile.....	9,153 "
German long mile.....	10,126 "
Swedish mile.....	11,700 "

The English statute mile is generally used in the United States.

**MILEAGE**, a term used in the United States, for fees paid to certain officials, such as members of Congress, of State legislatures, special commissioners and others, for their traveling expenses, at so much per mile. The system has led to gross abuses, each senator and representative estimating for himself the distance he had traveled. There is now a fixed table of mileage. The term mileage was formerly applied in the United States to railroad transportation, sold in tickets good for 1,000 miles of travel. These tickets were issued in book form, convenient for the pocket, and known to travelers as mileage books. In 1903 a system of interchangeable mileage tickets was issued, good for transportation on any one of eight different railroad lines in the Eastern States. Early in 1919 this mileage system was changed, all partly used books recalled and instead there was issued what is known as script, the coupons representing different amounts of money rather than miles. This system is an advantage to the traveler since the script can be used on any road under control of the Federal government.

**MILELLI, Domenico**, dō-mă'nē-kō mē-lē'lē ("CONTE DI LARA"), Italian poet: b. Cantanzaro, Italy, 1841; d. 1905. He was educated for the priesthood, but finding literature more to his liking turned his attention to writing, which is in subject of a paganish character. He was one of the leaders of the class called *Veristi*. Among his works are 'In giovinezza' (1873); 'Odi pagane' (1879); 'Il rapimento di Elena' (1882); 'Verde antico' (1885).

**MILES, George Henry**, American dramatist: b. Baltimore, Md., 31 July 1824; d. Thornbrook, Md., 23 July 1871. He was graduated from Mount Saint Mary's College, Emmitsburg, Md., and practised law in Baltimore for several years, after which he devoted himself to literature. In 1850 his 'Mohammed' was awarded the \$1,000 offered by Edwin Forrest for the best drama by an American author. In 1859 he was appointed professor of English literature at Mount Saint Mary's College, where he remained until his death. His works comprise 'Señor Valiente' (1859); 'Christine, a Troubadour's Song' (1866); 'Abu Hassan the Wag' (1868), etc.

**MILES, Nelson Appleton**, American army officer: b. Westminster, Mass., 8 Aug. 1839. He was a clerk in a Boston mercantile house at the outbreak of the Civil War in 1861, and left his business to raise a company of volunteers, and enter the army as lieutenant in the 22d Massachusetts regiment. In 1862 he was promoted to the rank of colonel, commanding the 61st New York regiment. He was engaged in the battles of the Peninsula, before Richmond and at Antietam, and in every battle of the Army of the Potomac, with one exception, until the surrender of Lee at Appomattox Court House. He was distinguished in the battles of Chancellorsville, Wilderness, Spottsylvania Court House, Reams Station, Richmond campaign of 1864 and many other important battles of the war; and, at one time, at the age of 25, was in command of the Second Army corps, numbering 25,000 men. He was wounded three times, most severely at the battle of Chancellorsville. In May 1864 he was promoted brigadier-general and in 1865 major-general of volunteers.

At the close of the war he entered the regular army and was commissioned colonel of the 40th United States Infantry, and attained the rank of brigadier-general in 1880 and of major-general in 1890. He successfully conducted several important campaigns against the Indians and did much to open up for civilization large portions of the West. In 1874 and 1875 he defeated the Cheyennes, Kiowas and Comanches in the Staked Plains country; he also subjugated the hostile Sioux and other Indians in Montana, driving Sitting Bull across the frontier and breaking up the bands that were led by him and other chiefs. In December 1877, after a forced march over a distance of more than 160 miles, he captured Chief Joseph and his tribe of Nez Perces after a hard-fought battle of four days in northern Montana; in 1878 he intercepted and captured Elk Horn and his band on the edge of the Yellowstone Park. In 1886 he subjugated and forced to surrender Geronimo, Natchez and the band of Apaches that had made a large portion of the Southwest uninhabitable, thus restoring peace and prosperity to Arizona and New Mexico. For his services up to this time he received the thanks of the legislatures of Kansas, Montana, New Mexico and Arizona. Later he settled the Indian troubles in the Dakotas, saving the country from a serious war that had threatened it for years. In 1894 he was in command of the United States troops sent to Chicago at the time of the railroad strike; and in October 1895 succeeded to the command of

the United States army. He represented the army at the scene of the Turco-Grecian War and at Queen Victoria's Diamond Jubilee in 1897. In 1898 he conducted the brief campaign in Porto Rico with ability, taking possession of the island with trifling loss; and in June 1900 was promoted to the rank of lieutenant-general. In December 1901 he was officially reprimanded for publicly expressing his approval of Admiral Dewey's report on the Schley case. In 1902 he made a tour of inspection to the Philippines and on his return filed a report which called forth considerable controversy by its denunciation of some of the abuses he had found in the conduct of military affairs there. In August 1903 he was retired from active service. He wrote 'Personal Recollections' (1896); 'Military Europe' (1898), besides magazine articles and official military reports.

**MILES CITY**, Mont., city and county-seat of Custer County, 150 miles northeast of Billings, on the south bank of the Yellowstone River, and on the Northern Pacific and the Chicago, Milwaukee and Saint Paul railroads. It is situated in an important grazing country and is the centre of the Montana cattle district. It has an extensive trade in cattle, sheep and horses. There are modern waterworks and lighting facilities, high school, State industrial school, an Ursuline convent, public library and a hospital. Pop. 7,621.

**MILES GLORIOSUS** (Lat., "braggart soldier"). (1) Comedy by Plautus. (2) Name slyly applied by Ferdinand of Bulgaria at a banquet when toasting Kaiser Wilhelm II of Germany who mistook it for a compliment.

**MILES O'REILLY**. See HALPINE, CHARLES GRAHAM.

**MILESIAN TALES**, a form of anecdotal satire current in Miletus and Asia Minor about a century B.C. The tales are of an erotic character, but are important in so far as they form a link in the chain of the development of satirical romance, exemplified in Petronius' 'Supper of Trimalchio' and Apuleius' 'Story of Cupid and Psyche.' Six volumes of the tales were collected by Aristides of Miletus and were later translated into Latin by Cornelius Sisenna (119-67 B.C.), but of these only fragments remain. They have been compared to the French *fabliaux* and the tales of Boccaccio. Consult Müller, 'Fragmenta Historicum Græcorum' (IV); Bücheler's small edition of Petronius (Berlin 1882); Peck, H. T., translation of Petronius' 'Dinner [Supper] of Trimalchio' (New York 1898).

**MILESIANS**, *mī-lē'shī-anz*, or *mī-lē'-zhanz*, early colonists of Ireland, a portion of whose inhabitants, according to Irish tradition or legend, are descended from Milesius, a fabulous king of Spain, whose two sons conquered the island several thousand years before Christ, establishing a new nobility. This was the last of the traditional prehistoric colonizations of Ireland.

**MILETUS**, *mī-lē'tūs*, Asia Minor, an ancient city opposite the mouth of the Meander on the Latmic Gulf, which, inhabited by Carians, was in existence prior to the colonization of the coast by the Ionians. The Ionians are said to have taken forcible possession of

the town, massacred the men and taken the women as their wives. The extent of the harbors of Miletus, one of which could contain a large fleet, soon raised the town in the hands of the Ionians to a place of importance, and it became one of the first cities and republics of Asia Minor. Its commerce covered the Mediterranean and extended to the Atlantic. It had upward of 75 colonies, most of which were on the coasts of the Euxine. On the rise of the Lydian kingdom repeated attempts were made to conquer it. It finally recognized the sovereignty of Croesus, and paid tribute. A similar arrangement was made with Cyrus, which saved it the calamities of a contest with the Persians. Civil dissension, however, had long been rife. The Persians were compelled to intervene, and committed the government to the most peaceable landowners. The city revolted against the Persians 500 B.C. It was taken by storm 494 B.C., was plundered and the inhabitants massacred or transported. It recovered its independence in 479 B.C., after the battle of Mycale. It yielded for a time to the supremacy of Athens, but ultimately threw off the yoke. It stood an assault by Alexander the Great 334 B.C., part of the city was destroyed, but the conqueror did not interfere with its government. From the time of its subjugation by the Persians it had never recovered its early importance; but it still continued to enjoy some commercial prosperity under the Romans until the time of Saint Paul, who visited it twice, as recorded in Acts xx, 17 and 2 Tim. iv, 20. It was finally taken and destroyed by the Turks. From the change made on the coast by the deposits of the river the site of the city was with difficulty excavated by the Berlin Museum in 1899, and the foundations of various parts of the city exposed.

**MILFOIL**, or **MILLEFOIL**. See YARROW.

**MILFORD**, *mīl'fōrd*, Conn., town in New Haven County, at the mouth of Wepowaug River, on Long Island Sound and on the New York, New Haven and Hartford Railroad, about 10 miles southwest of New Haven. The place was settled by people from Wethersfield and New Haven in 1639. The Indian village was called Wepowage. Milford became a part of the "Colony of New Haven" in 1644, and in 1664 the town became a part of Connecticut. The chief industries are oyster cultivation, farming, seed-growing, the manufacturing of electrical supplies, telephone apparatus, shoes, straw hats and silverware. It has a beautiful, well-kept park, several fine churches and school buildings, and the Taylor Library, which has about 10,000 volumes. In 1889, on the 250th anniversary of the settlement of Milford, a memorial bridge was erected. Pop. 4,366.

**MILFORD**, Del., town in Kent and Sussex counties, on Mispillion River, and on the Philadelphia, Baltimore and Washington Railroad, about 62 miles south of Wilmington. A settlement was made here in 1678-79 and in 1787 the town was incorporated. It is the trade centre for a fertile agricultural region in which fruit growing receives special attention. The industries of the town are connected with the farm and orchard products. Pop. 2,603.

**MILFORD, Mass.**, town in Worcester County, on the Charles River, and on the New York, New Haven and Hartford and the Boston and Albany railroads, about 17 miles southeast of Worcester. It was settled in 1669 and was then a part of the east precinct of Mendon. On 11 April 1780 it was incorporated as a separate town. It is in an agricultural region, but the town has considerable manufacturing interests. In the vicinity are large granite quarries. The chief manufactures are foundry and machine-shop products, silk, boots and shoes, thread, boot and shoe trees, straw goods and bone cutters. The granite quarries contribute to the industrial wealth of the town. The town has a fine high school, good public and parish schools and a public library. Town meetings, held usually twice a year, administer the government. Pop. 13,055.

**MILFORD, N. H.**, town in Hillsboro County, on Souhegan River, and on the Boston and Maine Railroad, about 27 miles south by west from Concord and 15 miles southwest of Manchester. The chief industries are connected with manufacturing, quarrying granite, lumbering and agriculture. The principal manufactures are canvass, leather, lumber, piano keys, harness, furniture, quarry machinery, post-office equipment, soap, paper boxes, ice-cream freezers, toys and novelties. There are a national and a savings bank, also a building and loan association. The government of the town is in the hands of a board of selectmen. The waterworks are municipally owned. Pop. 4,000.

**MILFORD, Pa.**, town and county-seat of Pike County, on the Delaware River, and seven miles from the Erie Railroad, about 45 miles east of Scranton and seven miles southwest of Port Jervis. It is situated in a portion of the Delaware Valley noted for its beautiful and picturesque scenery. The Sawkill Falls and the Cliffs are in the vicinity, and on the northwest and south of the town are mountains. Three miles south are the falls of the Raymonds Kill and 21 miles south are the cataracts of Big and Little Bushkill creeks. Milford is one of the pre-Revolutionary places, but it was not made a separate township until 1832. The town of Milford was laid out in 1796. It is a favorite resort for hunting and fishing parties. Many of the legends and stories connected with the place may be found in 'Pike County Folks,' by E. H. Mott. Pop. about 900. In summer the population is over 6,000.

**MILFORD, Wales**, a seaport town of Pembrokeshire on the celebrated Milford Haven, one of the safest, deepest and most capacious harbors in Britain, forming a deep indentation in the southwest coast of the county. The haven stretches about 10 miles from east to west, with a breadth of from one to two miles, and branches off into numerous bays, creeks and reaches. The largest vessels can enter and put to sea in any wind or at any tide more expeditiously than from almost any other large harbor in Great Britain, and it has long been proposed to make Milford the eastern seat of the transatlantic trade, as bringing London nearer by several hours. The haven is defended by fortifications. Henry II embarked at Milford Haven in 1172 on his way to the conquest of Ireland, and here Richmond landed

(1485) in his successful effort to dethrone Richard III. The town of Milford on the north shore, eight miles northwest of Pembroke and six miles from the mouth of the haven, has extensive modern docks and a busy agricultural and domestic trade with Irish ports. It is the seat of a United States consular agent. Pop. of urban district, 6,399.

**MILFORD, Engagements at.** Milford, Va., on the east bank of the south branch of the Shenandoah, was the scene of several skirmishes and three cavalry engagements during the Civil War. On 24 June 1862 detachments of the First Maine and First Michigan cavalry attacked about 300 mounted Confederate infantry at the place, without decisive result, and withdrew. When Sheridan, after the battle of the Opequon (q.v.), followed Early up the valley, he ordered General Torbert, commanding the cavalry, up the Luray Valley, to get past Early's right and cut off his retreat. Wilson's division advanced and 21 Sept. 1864 attacked Wickham's cavalry division of two brigades and drove it from Front Royal and up the valley to Milford, where Wickham took up a strong defensive position on the south side of Milford Creek, one flank on the Shenandoah and the other on a knob of the Blue Ridge. When Torbert came up on the 22d he concluded that the position was too strong to be attacked, and not knowing that Sheridan had attacked Fisher's Hill (q.v.) fell back to near McCoy's Ferry, again advancing, and on the 23d occupying Milford, which had been abandoned by Wickham. Sheridan was greatly disappointed by Torbert's failure to carry the place on the 22d. After the battle of Cedar Creek (q.v.), 19 Oct. 1864, Milford was occupied by Lomax's Confederate cavalry division, and its defenses strengthened. On 24 October Powell's cavalry division, two brigades of about 1,100 men, with six guns, moved up the Luray Valley to reconnoitre. Powell skirmished with Lomax's outposts on the 25th, and on the morning of the 26th attacked Lomax in position at Milford, using his artillery freely, and continuing the contest until 2 P.M., when, finding the defense so stubborn and the position too strong to be carried, he withdrew.

**MILFORD HAVEN, Louis Alexander, Marquis of.** See BATTENBERG, LOUIS ALEXANDER.

**MILFORT, Le Clerc, lë klärk mël-för, or mil'fört,** French adventurer: b. Mezières, France, about 1750; d. there, 1817. He came to America, traveled through the colonies and about 1776 visited the Creek Indian nation. Here he attached himself to the Creek chieftain, Alexander McGillivray, whose sister he married. He was made a war chief by the Indians, was called Tastanegy, or "great warrior," and was in active service against the Whigs of Georgia during the Revolution. He remained with the Creeks for 20 years. In 1796 he returned to France and was made a general of brigade by Bonaparte. He wrote, or perhaps merely furnished material for, the interesting 'Mémoires, en Coup-d'œil Rapide, sur mes Voyages dans la Louisiane, et mon Séjour dans la Nation Creeke' (1802).

**MILHAUD, Gaston,** French author and philosopher: b. Nîmes, 1858. He was pro-

fessor of philosophy at the University of Montpellier in 1894-1910, and has since been professor of the history of philosophy at the Sorbonne, Paris. Author of 'Leçons sur les origines de la science grecque' (1893); 'Num Cartesii methodus tantum valet in suo opere illustrando quantum senserit' (1894); 'Les philosophes géomètres de la Grèce, Platon et ses predecesseurs' (1900); 'Le hasard chez Aristote et chez Cournot' (1902); 'Cournot et le pragmatisme scientifique contemporain' (1911), etc.

**MILIARIA (MILIARY FEVER, MILLET-SEED RASH, PRICKLY HEAT)**, a very common fine papular or papulovesicular eruption. It is caused by too profuse sweating attended by undue congestion of the skin. Hot weather, excessive clothing, vigorous exercise, alcoholic dissipation commonly evoke the disease, especially in those who are debilitated or who have a delicate skin. It may appear and disappear rapidly without any apparent cause. Its appearance is attended by pricking, burning or itching sensations. It is generally limited to a portion of the trunk, but may appear upon the face, neck and extremities. Fresh crops may follow one another. In subsiding the vesicles become opaque and yellowish white.

**MILICZ, mé'lich, or MILITZ, Johann**, Moravian reformer: b. Kremsir, Moravia, about 1325; d. Avignon, France, 29 June 1374. He entered the Roman Catholic priesthood in 1350 and in 1360 became canon at the cathedral of Saint Vitus in Prague and was appointed secretary to Charles IV, who took him to Germany. Becoming convinced of the hollowness of court and Church life, in 1363 he resigned and began to preach to the lower classes in Prague in their own tongue, instead of the Latin, and gained over them a wide influence. Convinced that Antichrist had arrived and that the day for reform was at hand, he went to Rome that he might consult the Pope and was arrested by the Inquisition, but was released and was well received by Urban V. Upon his return to Prague he resumed his preaching, but in 1372 he was accused of heresy by his brother priests and summoned to Avignon for trial. He proved his innocence, but died before the verdict was rendered. Consult Palacky, 'Die Vorläufer des Hussitentums' (1869).

**MILITARISM**, term applied to the policy of giving to military training and exploits disproportionate prominence in a nation's affairs and the resulting subordination of civil authority; or the maintenance of a government by military force. The term is used chiefly in connection with the vast armaments maintained by European countries; and has come in particular to mean the preparation, as in the case of Germany prior to the launching of the European War, of a vast force maintained not for purposes of national defense but for those of imposing at pleasure the will of the powerful nation upon those weaker and less well armed. It carries in its train the extremist theories of war as a necessity to the proper development of a nation's material and spiritual welfare.

**MILITARY**. See ARMY; UNITED STATES, ARMY OF THE.

**MILITARY ACADEMY**, Royal, an institution at Woolwich, England, where candidates

for the Royal Engineers and the Royal Artillery of the British army receive their finishing education. See MILITARY EDUCATION.

**MILITARY ACADEMY, United States**. See UNITED STATES MILITARY ACADEMY.

**MILITARY AERONAUTICS**. Ever since the early days of aeronautics, with the development of the old spherical balloon, the use of aircraft in time of war has been a fruitful theme for discussion. Lighter-than-air craft has figured prominently in warfare. The French used a military balloon at the battle of Fleurus on 26 June 1794 and from that date for over a century, until after the South African War, the aerial machines employed for purposes of observation were either captive in the form of balloons attached to winches, or in the guise of man-lifting kites or they perforce drifted at the will of the winds that blew. In the Franco-Prussian War, during the siege of Paris alone, as many as 66 balloons left the stricken city, carrying 60 pilots, 102 passengers, 409 carrier pigeons, 9 tons of letters and telegrams and 6 dogs. Gaston Tissandier went over the German lines and dropped 10,000 copies of a proclamation addressed to the soldiers, asking for peace, yet declaring that France would fight to the bitter end. In the American Civil War an aeronaut named La Fontaine went up in a balloon over an enemy camp, made his observation, rose higher into the air and succeeded in getting into a cross-current, which carried him back to his place of departure. The first cross-channel flight was made by balloon in 1785, by Blanchard, who had with him an American doctor named Jefferies, together with a large supply of provisions, ballast and oars. With the development of dirigible balloons in the closing years of the 19th century and the advent of the aeroplane a few years later the spherical type of balloon fell into disfavor as an auxiliary in war, although it was used with some success by the French in the colonial campaigns and also on the western front during the World War of 1914-18. In the article AERONAUTICS (q.v.) are described the development, construction, advantages and limitations of the several types of aircraft—the spherical balloon, kite balloon, dirigible, non-rigid, semi and rigid types and the aeroplane. In this article it is only intended to point out the development of special military types and their adaptability to the several tasks for which they were designed.

**Uses.**— Briefly, there are five main uses for aircraft in war. The first and widest is for reconnaissance. The second is for co-operation with artillery to locate the enemy's batteries and determine accuracy of fire. The third is as instruments of offense in encounters in mid-air, either by classes of bombs, quick-firing guns or the use of other arms to destroy the pilots or machines of the enemy and therefore to prevent his achieving any of his aerial purposes as well as to cause him loss of personnel and equipment. The fourth is bombardment either of moving military objectives, like transports and so forth, or of stationary objects, such as airdromes, camps and the like; or, contrary to international law as defined by The Hague Convention, to drop missiles on unfortified areas and on buildings such as hospitals, cathedrals, churches and the like. The fifth use is for

convoing vessels such as troopships, merchantmen and even warships, by reason of the much wider range of vision possible from an altitude, whereby the approach of any enemy craft on the surface of the water can be detected at a much greater distance and whereby in normal atmospheric conditions and on certain surfaces it is possible to detect the approach of submarines and the presence of mines. The types of aircraft adapted to these five main uses are:

THE MARTEN HALE  
AEROPLANE BOMB  
(longitudinal section).

The lower part contains 340 steel bullets and an explosive charge of 4.41 pounds of trinitrotoluol. The upper or neck portion carries two small wings (c), a handle and a safety-pin (J). In throwing the bomb the safety-pin J is withdrawn and the handle released. The air-pressure during the fall causes the wings (c) to turn and in so doing they unscrew the stem d until it is stopped by the shoulder f. The two balls g are then free, and the detonator when the bomb lands, compresses the spring and strikes the needle i, which explodes the charge. Adjustment is so fine that the charge is exploded merely by dropping the bomb on a water surface.

**The Captive Balloon.**—Notwithstanding the supremacy of the aeroplane in most fields of aerial warfare, the captive balloon in military operations still has its advocates. The great advantage of the captive balloon is that the observer is constantly in direct telephonic communication with the artillery commanders in his vicinity, constant and thorough inspection of the enemy's positions with the aid of powerful glasses reveals every movement of bodies of troops or anything new that has developed during the previous night and the targets thus presented can be immediately taken under fire. Captive balloons are placed from

two to four miles in the rear of the front line and are separated by intervals depending upon the artillery activity in various sectors. The altitude at which they are held depends upon atmospheric conditions and upon the activity and distance of the enemy's artillery. Captive balloons are usually sent up at daylight and remain in the air until dark, being drawn down whenever necessary to change observers. Occasionally they are left up at night and it is frequently found that enemy guns that are not visible by daylight may be located at night by their flashes. It is customary to have two officers in the car and they are connected with the ground by telephone. The great disadvantage of the captive balloon is the comparative ease with which it may be destroyed by a hostile aeroplane. The late war furnished instance after instance in which the observers in captive balloons were obliged to jump with a parachute on the approach of enemy aeroplanes, so certain had become the destruction of such balloons upon incendiary bullets being hurled into them from an aeroplane. Man-carrying kites have advantages and disadvantages similar to the captive balloon.

**Free Balloons.**—This type is now little used save as a means of communication from a beleaguered city or fortress. There being no means of steering such craft they are as likely to be wafted toward the enemy as toward their friends, as in the case of those liberated during the siege of Paris in 1870, many of which fell into the hands of the Prussians.

**Military Dirigibles.**—The military dirigible is used extensively for night scouting, bombing, and to some extent for transportation of military personnel. Hundreds of dirigible balloons, ranging in size from the small "Blimp," about 180 feet long, to the huge Zeppelins, 700 feet long, were used in the late European War. The "Blimps" were used mostly for coast patrol and for convoing ships; the large dirigibles were used primarily for bombing. Three types of dirigibles are used: (1) the rigid; (2) the semi-rigid, and (3) the non-rigid. The rigid type of dirigible is one in which the shape of the gas compartments is maintained by means of rigid framework. The semi-rigid dirigible has a rigid longitudinal frame usually below the gas bag; this frame serves to distribute evenly the ascensional strains against the supported weights of engines, crew, etc., to prevent buckling of the gas bag which in most dirigibles of this class depends upon internal gas pressure to maintain the shape of the envelope. The non-rigid dirigibles depend entirely on gas pressure within the envelope to maintain shape, the nacelle, or body, being suspended by a net of longitudinal canvas bands sewed to the envelope. The chief advantage of the non-rigid type is that it can be transported deflated; its defect that a rent in the gas bag puts it out of commission. In France dirigibles are classed according to volume, which runs from 2,000 cubic metres for the *Vedette* class to over 10,000 cubic metres for the *cruiser* or *dreadnought* type. The latter is especially favored because of its greater range, speed and lifting power. These ships are equipped with rapid fire guns to repel attacks by hostile aircraft, with wireless equipment in order to communicate with its base. It is however as a bomb-

Clement — Bayard (French).

Aviatik (German).

Deperdussin (French).

Albatross (German).

Fokker (German).

ing machine that these heavy machines find their best field. For reconnaissance purposes the aeroplane is superior. The bombing raids on London throughout the war show the possibilities of attack of the large dirigible type. With the development of anti-aircraft guns, dirigibles were obliged to keep at a greater height when dropping bombs and thus their accuracy of aim was greatly impaired. The verdict of most experts having in view the performances of dirigibles during the late war is that they have been a disappointment. They cannot be safely employed in daylight hours because of their vulnerability to hostile aeroplanes; their great cost as compared with aeroplanes—about 50 to 1—is disproportionate when it is remembered that the aeroplanes can, with a greater margin of safety, perform similar functions. The problem for sheltering dirigibles is also a serious one.

**Aeroplanes.**—The Wright, Farman and Blériot machines (see AERONAUTICS) may be considered as the parent types from which has

been evolved the large variety which at the present time are at the disposal of the military aviator. Among the various types which have sprung from the parent forms we search in vain for any underlying new principles. There is, however, in the various types plenty of variety of constructional detail. Perhaps the two most important features of modern military aeroplane work are (1) the gradual substitution of steel in place of wood, and the general strengthening of aeroplane construction; (2) the armoring of vital parts of aeroplanes for the exigencies of warfare. Regarding the various types of machines now available, it must suffice here to especially mention the features of special interest for the purpose of warlike operations. As the military operations in Europe developed it became apparent that the aeroplane was suitable for very many military purposes. It is from the air that artillery fire is regulated, after the airmen have reconnoitred and photographed the enemy's position, taken the plan of their trenches and discovered the importance

and emplacements of their batteries. It is from the air that the arrival of reinforcements by rail or motor is signaled. By means of aerial bombardments attempts are made to cut, or at least disorganize, the enemy's communications. These attempts are made even on the base rail-

Bristol Biplane (British).

way stations, and, further still, on the factories and powder and ammunition dumps. During the battle the aeroplane flies over the troops and regulates the lengthening of the fire as the assaulting force advances. Four years of war resulted in the subdividing of types and their relegation to various specific duties. Scouting is the first and widest use of the aeroplane in war. For this work fast monoplanes and biplanes have been developed into the strategical reconnaissance type, with a cruising radius of 500 miles, carrying pilot and observer with sketching outfit, aerial camera, wireless set and navigating instruments. The tactical-reconnaissance aeroplane has similar personnel, only the observer is trained in military tactics and transmits technical reports of enemy movements. The fire-control aeroplane is designed to give a particularly wide range of vision to the observer, who transmits the results of his observations by wireless. There are two classes of long-range bombers, the machine of excessive speed with pilot and bomber, and the multiple-engined machine, with heavy bomb load, great wing spread, pilot and two bomber-mechanics. The pursuit machine takes many forms — monoplane, biplane, triplane — one-place and two-place, highly powered and with minimum aerofoil to permit of the maximum of speed and manoeuvrability. The one-place machines are equipped usually with automatic machine guns, firing above or through the propeller zone by means of a synchronizing device. The two-place machines are equipped with from two to five machine guns, several automatically fired by mechanisms thrown into mesh by the operator and others manually by the operator. In the course of the European War aerial strategy developed from the single machine reconnaissance of 1914 to the flying squadron formation, scouting, fighting and bombing groups, under wireless control from the ground, which were operating in 1918. See AERONAUTICS; AEROPLANE; AEROPLANE ENGINES; SIGNAL CORPS; STRATEGY; TACTICS; WAR, EUROPEAN.

G. DOUGLAS WARDROP.

**MILITARY ARCHITECTURE.** Pre-historic.—During the primitive eras of man's development his structural interests were centred in the fulfilment of the demands of simple shelter for worship and protection. Safety from attack was attained by the erection of domiciles in inaccessible places or in rearing lake dwellings on wooden piles, as in Switzerland. Aggregations of houses were in very early times surrounded by walls of earth or stone erected for the purpose of fortification.

**Heroic Age.**—Tiryns and Mycenæ furnish typical examples of the military architecture of the Heroic Age of Greece. At Tiryns the palace of the ruler, reared on an Acropolis, is surrounded by massive walls in which are passages covered by stones successively corbelled until they meet. The masonry is formed of colossal stones put together without cement. At Mycenæ there still exists the remains of a city gate of this period. The huge lintel of this gate is relieved of the superposed weight that the solid and very heavy wall would have brought to bear upon it, by a triangular opening which is filled with a most celebrated sculptured group representing two rampant lions flanking a column. This triangular opening presented the weakest spot in the whole length

of the wall and was embellished with the sacred lion form to protect it from the assault of superstitious assailants.

Civilization gradually traced her way from the flat alluvial areas of Mesopotamia to the valley of the Nile. Reinforced with the elements of progress and power of Egypt, through the medium nations of Asia Minor and the Mediterranean, the laws of order and culture were transmitted to Greece. Greece, in her turn, taught imperial Rome the elements of universal government. As in the other arts, so in the problem of protecting her cities from the carefully planned destructive agency of man, the constructive experience of Egypt and the Orient was transmitted to succeeding civilizations. The first four links of the chain that binds the world together are the civilizations of Minoan, Mesopotamia and Egypt, Greece and Rome. Minoan protective art has been known to us by the remains at Cnossus, Mycenæ and Tiryns, and the primitive walls and embryonic projects at Orchomenos, Delos and Phigaleia.

**Egypt.**—In Egypt the early fortifications consisted of a quadrangular double wall of sun-dried brick approximately 15 inches thick and at times 50 feet in height. Square towers of the same height as the walls occurred at intervals. Both walls and towers were crowned with parapets. At times the entrance was additionally protected with outworks consisting of a second lower wall and towers. Frequently there was a keep or citadel used as a last resort for defenders. Lower Egypt was undoubtedly greatly influenced by the advanced systems of fortifications with which the Egyptians became acquainted during their wars against the Hittites in western Asia.

**Hittite.**—The culminating type of the Hittite military system was the double-moated city of Kadesh, of which we have a lively illustration in the battle scene from the great Kadesh reliefs of Rameses II on the walls of the Ramesseum. These carvings show the capital, Kadesh, situated on an island in the Orontes River. The city, protected by two moats, approached by two parallel draw-bridges, is encircled by a huge, high wall. The main gateways are strengthened by increasing, at the place of their occurrence, the thickness of the wall, heightening the towers and providing rooms for the housing of a special gate guard. The relief shows the city to have been built in the form of a circle or ellipse. (Consult plan of Chateau-Gaillard, France). The plan at once obviates the four danger points inherent in the rectangular city enceinte. The walls were surmounted by battlements and strengthened by auxiliary towers or buttresses, the top of which did not extend far above the main wall. At Senjirli extensive ruins of a fortified Hittite palace have been found. The entrance was planned as a fortress-like portico. Massive towers flanked the approaches. The guard-room, the ceiling of which was supported by columns, intervened between the moat and the gate. The city was divided into sections, each separated from the other by protecting walls. (Consult plan of Haidra, Africa). It is a notable fact that the ancient Hittite protective city plan finds its reproduction in more or less complete form in the great fortified cities and towns of mediæval Europe and Africa.

**Mesopotamia.**—The configuration of the land exposed the cities of Chaldæa, Assyria and Babylonia to easy attack, for the flat character of the territory made siege from four sides possible. Hence it is that military architecture, forced to meet the added hazards of the *locus*, received a mature study and development that had not occurred elsewhere in the pre-classic world. It was in Asia that the early developments of the art of war construction, which subsequently formed the basis of the Roman, Visigothic and Mediæval science, was through necessity established. Numerous ruins serve to show us the character of the Chaldæo-Assyrian protective scheme. Typical of every phase of this art was the city of Dur-Sharrukin, the modern Khorsabad and site of the palace Sargon. The ancient city was surrounded by a wall 150 feet wide and 60 feet high, furnished with battlements, towers and outworks, and entered by means of arched gateways flanked by protecting towers. The palace of the ruler stood upon a stupendous platform constructed straddling the northwest wall. The position of the palace gave to it the maximum amount of protection from within and from without the city.

**Greece.**—Early Greece was settled by wandering tribes. Tribal equality ceased when unusual strength established local domination on the part of a family or a tribe that had waxed powerful. This condition forced, for protection, a union of local interests—through the establishment of these confederations the Greek city came into existence. Religion and daily life were indissolubly connected in Greece, and the acropolis or upper city of the Hellenes was graced with the monuments erected in honor of the beneficent gods who were everywhere the guardians of the city and society. In the Orient the protected heights that the Greeks reserved for their shrines were pre-empted by the luxury-loving despots as the safest place for their court buildings and palaces. Athens, with its Acropolis crowned by the noble Parthenon, was the sacred centre of the Attic life, and upon its safety was lavished the thought and ingenuity of the military experts of the time. Its capture and sack by the Persians forced a reconstruction of all of its defenses. Under Themistocles, the Athenian leader, the entire city was surrounded by a strong wall and the Piræus, the port of Athens, was fortified and its harbors protected by moles. Subsequently the city and port were joined by long walls; thus making it possible to control the Attic lands as well as her maritime interests. These extensive military constructions embody everything that the Greeks thought would be of value to them, with which they had come in contact through the widespread medium of the Delian League. The knowledge thus gained was later absorbed by Magna Græcia and Sicily.

**Rome.**—The Romans exhibited an extraordinary genius for organization and adaptation. The site of a Roman city was usually selected on territory sloping toward a river. If the area chosen were terminated by another embankment sloping in the opposite direction, a perfect site, from the Roman point of view, was available. The city with its walls flanked on one side by the river was approached by a bridge, the end of which on the bank opposite the city

was defended by a *tete-de-pont*. Within the walled area or *enceinte* a castle was constructed which commanded the whole system of defense and provided a final refuge for the garrison. If the walls failed, the side of the town opposite the river, on account of the escarpment, was difficult of access and the protecting wall on this side was comparatively easy to defend. The walls connecting the river walls and the escarpment walls presented the weakest parts of the fortifications. It was therefore necessary additionally to protect the towers and walls in this position with ditches. In order that the defenders might harass the flank of besiegers, the gates were flanked with towers that projected well out from the walls. The Romans took care not to surround a hill with a wall. Their principle was to carry a defense wall across the summit of the elevations of any city site. The typical example of the Roman system, as carried out on a great scale, is the city of Rome herself. The Romans, according to Vegetius, found that the enclosure of a fortified place ought not to be in one continuous line, for the reason that battering rams would thus be able too easily to effect a breaching; whereas, by the use of towers placed sufficiently close to one another in the rampart, greater safety would be provided. In erecting the walls for their fortifications of cities, the Romans built two strong walls of masonry separated by an interval of 20 feet, which interval was filled with the spoil from the extramural trenches. This fill formed the base for a parapet walk. The Roman military camp, curiously enough, has exerted a tremendous influence upon civil architecture. This is because the Emperor Diocletian, upon his abdication, laid out at Spalato, in Dalmatia, a great palace based upon the plan of the military camp. The carefully cut masonry walls enclosed a rectangular space. Four gates gave access to the palace city, one in the centre of each of the walls. Two intersecting avenues connected these entrances. In the usual camp, the quarters for officers and soldiers were built of brick or wood. The general-in-chief was provided with elaborately protected quarters adjacent the Prætorian or principal gate. In the *Castra*, palace of Diocletian, quarters for servants and for the guards were constructed. At Mousmieh, the ruins of the Prætorium or Guard-house, with its curious handling of constructive detail, established an architectural type which exerted notable influence on later work.

**Byzantium.**—The ancient Greek city, Byzantium, was built on a site that was strategically excellent, surrounded, as it was, by water on three sides and protected from the ravages of the barbarians by a wall on the north side. The traditions relating to the construction of the walls cover all the discoveries and technique of the various ages of Greek and early Roman civilization. The Byzantine walls of mediæval Constantinople consist of three distinct sections: that on the west toward landward side; secondly, that on the Golden Horn; and third, that on the Marmora or the seaward side. The Byzantine city was completely enclosed by these wall sections. In the design of all of the Byzantine fortification construction, æsthetic possibilities have been suppressed and completely subordinated to the requirements of defense.

The widespread influence of Constantinople carried the spirit of the Byzantine science of military engineering throughout Mesopotamia, Asia-Minor, northern Africa and southern Spain. At Granada, in Spain, the hill dominating the city was crowned with the strongly-fortified palace of the ruler. The enclosure was surrounded by a strongly-built wall, reinforced by great defensive towers that served to render the palace, in its day, practically impregnable.

**Middle Ages.**—The traditions of Rome, with here and there modifications due to Byzantine influence, determined the arrangement of the defenses of the fortified towns and castles of the Middle Ages. The cities were often protected by several walls; at other times the city proper was located upon the highest available ground and surrounded by heavy walls. Its suburbs were outposts, furnished with protective towers and curtain walls. From the 3d to the 11th centuries the Roman defensive system underwent but little modification. The most notable existing example of this period is the reconstructed Visigothic city of Carcassonne. This was a frontier city of the greatest importance. During the 13th century the Visigothic *enceinte* was thoroughly repaired and the celebrated Tresan tower and Narbonnaise gate on the eastern side were erected. The castle is the most carefully defended work of the period and the precautions taken to ensure its safety arouse the admiration of all who study its intricate arrangement of moats, ramparts and barbicans, or advance fortified towers. Ragusa, on the eastern shores of the Adriatic, and Haidra, Africa, serve to visualize for us the massive picturesque security that made these cities practically unconquerable previous to the use of artillery. In Italy the great feudal lords, commanding lofty sites in the neighborhood of cities, erected secure fortresses. During the first half of the 12th century, due to the intolerable depredations of the half-savage nobles, the various cities of northern Italy overcame and dispossessed the majority of the feudal chieftains and forced them to come into the cities. The great residences that they built were provided with high and strongly-fortified towers. These constructions made it possible for the nobles to defy the municipal restrictions and set at naught the conventions of the city. The famous leaning towers of Bologna, the Asinelli and Garisenda (12th century) are among the very few remaining examples of the Italian defensive towns of the Middle Ages.

**Castles.**—The castles serving as a refuge for a town garrison differed in general plan from the castles of the isolated nobles, which aimed to procure the security that was so well obtained in the Chateau-Gaillard, built by Richard Cœur-de-Lion in the Andelys. Selecting a place where a sharp bend in the Seine formed a strategically strong peninsula, and this peninsula being made secure, on a lofty promontory on the opposite bank the major fortress was built. To the south a tongue of rock, less than 15 feet in width, served to connect the isolated promontory with the adjacent hills. This was the only attackable point of the fortress. To protect this vulnerable point a strong tower flanked by subordinate ones and curtain walls was built and so commanded the plateau. This

outwork was separated from the enceinte of the castle by a deep ditch excavated in the rock. The body of the place consisted of two parts, the lower court, and, separated from this by a moat, the internal castle, with its elliptical enceinte. The strength of the defense culminates in the keep or donjon. The donjon was to the castle what the castle was to the fortified towns — its last retreat, and upon it therefore was lavished the utmost care.

**Artillery — Modern.**— Toward the middle of the 15th century artillery had attained a great development. As a result of this progress the problems of attack and defense were wholly changed. In attack, how strangely modern reads this excerpt from the 'Past and Future of Artillery,' by L. Napoleon Bonaparte, Vol. II: "Instead of erecting bastilles all round the town, the besiegers established before the great fortresses a park surrounded by an intrenchment, beyond the reach of cannon. From this point they conducted one or two branches of the trenches towards the point where they established their batteries. . . . We have arrived at the moment when trenches were employed as a means of approach concurrently with covered ways of timber." It was obligatory, in view of the new agencies of war, to replace the picturesque high, machicolated towers and battlemented walls of feudalism with low breastworks on an extended line. The persistency of tradition, however, caused the retention in numerous places of feudal forms until well in the 17th century.

The following formula, developed by Viollet-le-Duc, epitomizes the necessities of the problems that determined the character of the transition to new and modern military architecture: "To command the outside parts at a distance and the approaches by horizontal fire of artillery, and to provide against escalade by works of a great elevation with crest-works, according to the ancient system for close defense."

The castle of Bonaguil (Charles VII) is one of the very few military structures that have been preserved that was designed to fulfill the spirit of the formula just enunciated. The requirements of present-day defensive civic architecture are based upon the fundamentals that appear in the planning of the castle of Bonaguil and shape the fabric of the numerous modern armory buildings designed for the housing and training of the military safeguard of the nation. Typical examples of the modern adaptation of the newer principles of military architecture, where the necessities of protecting military stores of arms and ammunition from mob and riot assault require the masses and parts of the fabric to be so disposed that the attacking force may be seen while the defenders are hidden from sight, and a possibility of obtaining a cross and defile fire may be provided at all vulnerable portions of the structure, are to be found in the armories of the 8th Coast Artillery and the 15th Infantry, New York City.

**MILITARY BRIDGES.** See BRIDGE; MILITARY ENGINEERING.

**MILITARY COMMISSION.** See LAW, MILITARY.

**MILITARY COURTS-MARTIAL.** For each general or special court-martial the authority appointing the court appoints a judge-advocate, and for each general court-martial one or more assistant judge-advocates when necessary. The judge-advocate prosecutes in the name of the United States and under the direction of the court prepares the record of its proceedings. In conjunction with the president of the court, he authenticates the record by his signature and, at the end of the trial, transmits the same to the reviewing authority. Should the accused, for any reason, not be represented

by counsel, the judge-advocate from time to time throughout the proceedings advises him of his legal rights. During the trial he sees that the accused has full opportunity to interpose such pleas and make such defense as may best bring out the facts, the merits or the extenuating circumstances of his case. In so far as such action may be taken without prejudice to the rights of the accused, any advice given him by the judge-advocate should be given or repeated in open court and noted upon the record. The judge-advocate is not challengeable; but in case of personal interest in the trial or of personal hostility toward the accused he should apply to the convening authority to be relieved. Throughout the trial the judge-advocate should do his utmost to present the whole truth of the matter in question and should oppose every attempt to suppress facts or to distort them, to the end that the evidence may so exhibit the case that the court may render impartial justice. The accused has the right to be represented before a general or special court-martial by counsel of his own selection, for his defense, if such counsel be reasonably available. This counsel performs such duties as usually

devolve upon the counsel for a defendant before civil courts in criminal cases.

General courts-martial have power to try any person subject to military law, for any crime or offense made punishable by the Articles of War. In addition they have power to try any person other than above, who by the law is subject to trial by military tribunals, for any crime or offense in violation of the law of war. Punishment upon conviction is discretionary with a general court-martial, except when mandatory under the law, or when limited by order of the President under the Articles of War; in addition, the death penalty can be imposed only when specifically authorized. The death penalty is mandatory in the case of spies; dismissal is mandatory for conduct unbecoming an officer and gentleman; either death or imprisonment for life is mandatory for murder and rape; punishment is mandatory in part and discretionary in part for false muster, false returns, officer drunk on duty in time of war and personal interest in the sale of provisions. The usual punishments imposed upon soldiers are the following, beginning with the least severe: Detention of pay, forfeiture of pay, reduction, hard labor without confinement, confinement at hard labor and dishonorable discharge. In the absence of evidence of two or more previous convictions, a minor offense, the nature of which appears to demand punishment by hard labor, should ordinarily be punished by hard labor without confinement, rather than by confinement at hard labor. For offenses properly punishable by detention of pay, forfeiture of pay, reduction or hard labor without confinement, those forms of punishment should, as a rule, be resorted to before confinement at hard labor is imposed. Many punishments formerly sanctioned have now, under a more enlightened spirit of penology, become so obsolete as to be effectually prohibited by custom without the necessity of regulations. Punishment by flogging, or by branding, marking or tattooing on the body is prohibited under the Articles of War; and no person can, by general court-martial be convicted of an offense for which the death penalty is made mandatory by law, nor sentenced to suffer death, except by the concurrence of two-thirds of the members of said court-martial and for an offense in the Articles of War expressly made punishable by death. No sentence of a court-martial can be carried into execution until the same shall have been approved by the officer appointing the court or by the officer commanding for the time being. Any sentence of death requires confirmation by the President before the sentence of a court-martial can be carried into execution, except in the cases of persons convicted in time of war of murder, rape, mutiny, desertion or as spies, and in such excepted cases a sentence of death may be carried into execution upon confirmation of the commanding general of the army in the field or by the commanding general of the territorial department or division.

An officer charged with crime or with a serious offense under the Articles of War is placed in arrest by the commanding officer, and in exceptional cases an officer so charged may be placed in confinement by the same authority. A soldier charged with crime or with a serious offense under the Articles of War is placed in

confinement, and when charged with a minor offense he may be placed in arrest. Any other person subject to military law charged with crime or with a serious offense under the Articles of War is placed in confinement or in arrest, as circumstances may require; and when charged with a minor offense such person may be placed in arrest. Any person placed in arrest is restricted to his barracks, quarters or tent, unless such limits are enlarged by proper authority. An officer is placed in arrest by his commanding officer in person or through another officer, by a verbal or written order or communication, advising him that he is placed in arrest, or will consider himself in arrest, or words to that effect. An officer in arrest cannot exercise command of any kind. He cannot wear a sword nor visit officially his commanding or superior officer, unless directed to do so. His applications and requests of every nature are made in writing. Officers are not placed in arrest for light offenses. For these the censure of the commanding officer generally answers the purpose of discipline. In ordinary cases where inconvenience to the service would result from it, a medical officer is not placed in arrest until the court-martial for his trial convenes. Except as provided in the Articles of War, or when restraint is necessary, no soldier is confined without the order of an officer, who previously inquires into his offense; it is proper, however, for a company commander to delegate to commissioned officers of his company the power to place enlisted men in arrest as a means of restraint at the instant when restraint is necessary, but such action must at once be reported to the company commander. Non-commissioned officers are not confined in company with privates if it can be avoided. When placed in arrest, they are not required to perform any duty in which they may be called upon to exercise authority or control over others, and when placed in confinement, they are not sent out to work. When the sentence of a general court-martial prescribes dishonorable discharge and confinement, so much of the sentence as relates to confinement is expressed in substantially the following form: *To be confined at hard labor at such place as the reviewing authority may direct for* \_\_\_\_\_ (leaving to the reviewing authority the designation of the place of confinement). A military post, station or camp is designated as the place of confinement of any general prisoner whose confinement is directed to be in a penitentiary or disciplinary barracks. The arrest of an officer has been compared to an enlargement on bail, the security being the officer's commission. It is for this reason that the punishment for breach of arrest may include dismissal. The distinction between arrest and confinement lies in the difference between the kind of restraint imposed. In arrest the restraint is moral, imposed by the orders fixing the limit of the arrest, or by the terms of the Article of War. The intention or motive that actuates a breach of arrest is immaterial to the question of guilt, though, of course, proof of inadvertence or bona-fide mistake is admissible in guiding the court in fixing punishment.

The present system of courts-martial leads to injustice logically, naturally and inevitably, and needs corrective modification. It is an inheritance from the old British code, which was

adopted in 1774 and never changed. Instead of being a court in the proper sense, it is simply the executive arm of a commanding officer. When the accused is arrested and brought before this tribunal he generally has no counsel skilled in the law and (when convicted) is convicted by a court which has no knowledge of law. The sentence is reviewed by an authority sometimes equally ignorant of law and the man is forced to undergo the sentence imposed. An illustrative case, from the records of trials by courts-martial, is that of a man who was arrested and charged with desertion. He was sentenced to forfeit all pay, be dishonorably discharged and serve ninety-nine (99) years at hard labor. The reviewing authority in sustaining the court naively remarked that it would not enforce the part of the judgment providing for the man's dishonorable discharge until he had served his prison sentence.

*Consulting Military and Civil Engineer.*

**MILITARY EDUCATION.** The foundation of all military education is the school, ranging from the school of the soldier or grenadier to the school of the battalion. Recent wars have demonstrated that it is necessary to organize schools for specialists and schools for command where officers and men of all grades can be instructed in the essential principles of modern war and in the proper employment of different military means and engines. By these schools the complete harmony between the different arms and between the commander and his troops can be secured. The organization of all military instruction must provide for instruction in the essential principles of war and the combination in combat of the different arms employed, and the condition of permanence and of continuity is necessary in all such instruction if the best possible results are to be obtained. As practised in the schools of Europe (patterned largely after the United States Military Academy) the instruction of troops gives them indispensable intellectual training and information on the procedure in battle and assists the officers in obtaining from them their best efforts. The instruction of specialists employs such methods as give the men full confidence in their army and weapon, a confidence based upon results obtained by employing it under the conditions of battle. The schools which correspond most nearly to the United States Military Academy are the Military Schools of Italy, the *École Militaire de Belgique*, or Military Academy at Ixelles, the *Theresa Military Academy* of Wiener-Neustadt, the *Technical Military Academy* of Vienna, the *Royal Military Academy* at Woolwich, the *Royal Military College* at Sandhurst, the *École Polytechnique* at Paris, the *École Speciale Militaire* at Saint Cyr and the *Upper Cadet School* of Gros-Lichterfelde.

The military schools of Italy are divided into three classes, viz.: (1) The *Collegi Militari*, or military preparatory schools of which there are five, established at Naples, Florence, Milan, Rome and Messina. (2) The military schools for the training of officers and non-commissioned officers, known as the *Military School of Modena*, the *Military Academy of Tunis*, the *Military Sanitary School of Application* in Florence and the *Non-Commissioned Officers' School* in Caserta. (3) The military

schools of application proper, for officers, known as the *War School (Scuola di Guerra)*, in Turin; the *School of Application of Artillery and the Engineers*, in Turin; and the *School of Cavalry*, in Pinerola. There are, in addition to the foregoing, schools for artillery and musketry practice, a school of fencing, and batteries and platoons of instruction for training non-commissioned officers.

The *École Militaire*, or *Military Academy*, at Ixelles, supplies officers to the infantry, cavalry, artillery and engineers. The length of the course of instruction is two years for the infantry and cavalry section, and four years for the artillery and engineer section. All students, on commencing the second year's course, contract to serve for eight years, and there are no admissions to the school except by competition. The Minister of War decides upon the persons who are to be admitted to the military academy, in accordance with the results of the competitions.

The *Theresa Military Academy* of Wiener-Neustadt educates officers for the infantry, rifles and cavalry; the *Technical Military Academy* of Vienna educates officers for the artillery, engineers and technical troops (including the railway and telegraph troops). The different kinds of places at these military academies are *Ararial* (imperial or treasury) places, wholly or half free; *Stiftungs* (foundation or endowment) places; and paying places. These different kinds of places are at the disposal of the Imperial War Ministry or the ministries of national defense of Austria and Hungary. The places for which there are endowment of private funds are disposed of in accordance with the stipulations of the letter of donation. The *Ararial* places were formerly given directly by the emperor. In awarding these places preference is given to the sons of officers, and then to the sons of officials. The *Stiftungs* places are disposed of by competitive examination, the persons who are allowed to compete being designated by the state, country or other authorities.

The *Royal Military Academy* is maintained for the purpose of affording a special military education to candidates for commissions in the royal artillery and royal engineers. Candidates must, in the opinion of the commander-in-chief (who is the president of the *Royal Military Academy*), be in all respects suitable to hold commissions in the army. An independent inspection is made annually by a board of visitors, appointed by the Secretary of State for War, and reporting to him. Such visitors are not a permanent body, but are not all changed at the same time. The report of this board is presented to Parliament. The academy is under the control of a military officer, styled governor and commandant, appointed by and responsible to the Secretary of State for War, through the commander-in-chief. The governor is assisted by a staff officer styled the assistant commandant and secretary, who is responsible in his temporary absence for the charge of the establishment. This officer commands the cadet company, and has the custody of the records and correspondence of the academy and gives the governor such assistance as he may require. The governor is assisted in the arrangement of the studies by a board composed of the assistant commandant and the

professors or senior instructors of the different branches. The head of each branch has the supervision and inspection of the studies in his department and reports on them to the governor. Admission to the Royal Military Academy as cadets is granted to the successful candidates at an open competitive examination.

The *Royal Military College* at Sandhurst is maintained for the purpose of affording a special military education to candidates for commissions in the infantry and cavalry. Candidates must, in the opinion of the commander-in-chief, be in all respects suitable to hold commissions in the army. The commander-in-chief is president of the Royal Military College, and, as at the Royal Military Academy, there is an annual independent inspection and a governor and commandant in control, assisted by an assistant commandant and secretary, who commands the cadet battalion and has the custody of the records and correspondence of the college. Admission to the Royal Military College is granted to successful candidates at a competitive examination and to Indian Cadets, pages of honor and others subject to a qualifying examination. The characteristic features of the Woolwich and Sandhurst schools are the brief period of instruction and the somewhat exacting competitive standards for admission. The two occupy to a considerable extent the relation of cause and effect, with some diversity of judgment expressed as to their expediency.

The *Polytechnic School*, or *L'École Polytechnique*, at Paris, was founded in 1794 and has been reorganized by various decrees. The object of the school is to train students for the following branches of the public service: The artillery of the army and the marine artillery; the engineer corps of the army; the engineer corps of the navy or naval constructors; the corps of naval officers; the hydrographic corps; the marine commissariat corps; the corps of highways and bridges; the manufactories of the state; the engineers of the powder and saltpetre service; the mining engineers and the telegraphic lines; also for such other public services as require a profound knowledge of the mathematical, physical and chemical sciences. Admittance to the school is exclusively by competitive examination. After a two years' course the student may go to one of the special schools of application for any of the above mentioned services, provided he can pass successfully the final examinations and is declared to be acceptable for this service by the decision of a committee which draws up the classification list for the public services. Fulfilment of these conditions does not give an absolute right to enter any of the public services; admission to any service depends upon the number of vacancies existing at the time of leaving the school, upon the physical aptitude of the student and his place on the order of merit. The school is directly subject to the Minister of War.

The *Special Military School of Saint Cyr*, or Saint Cyr, as it is popularly designated, dates from the time of Louis XIV, and is intended to supply officers for the infantry, the cavalry and the marine infantry. The course of instruction lasts two years, and no scholar is allowed to remain more than three years at the school. The privilege of taking a third

year to complete the course is only allowed where circumstances of exceptional gravity have compelled a student to suspend work at the school. Admittance to the school is exclusively by competitive examination and competitors are limited to those who have obtained certain degrees, or a certificate of qualification for the baccalaureate degree in secondary or classical modern schools. In France the system adopted in the armies at the front is that of centralizing the instruction in each army. This instruction embraces: (1) Schools of the line—(a) course for captains which prepares for the command of the battalion, (b) special course for commanders of division depots, (c) course for company commanders, (d) course for non-commissioned officers, (e) practical course in engineering; (2) schools of specialists—(a) school for grenadiers, (b) machine-gun schools, (c) automatic rifle school, (d) school for the 37 mm. gun, and (e) school of liaison and signalling. These schools are generally in a zone about two or three days' march from the front. In addition to these schools, practical instruction is given in the division depots to recruits who have just joined combat organizations. Behind the front are instruction battalions formed from recruits of the youngest classes, and in the interior of the country are vast camps where schools of specialists carry on their training.

In Germany, the school which corresponds most nearly to the United States Military Academy is the *Upper Cadet School*, at Gross-Lichterfelde (*Haupt-Katetten-Austalt*). This school is fed or supplied by the "Kadettenhausen," or preparatory cadet schools. Saxony and Bavaria have their own cadet corps corresponding to the preparatory and upper cadet schools of Prussia, from which appointments are made to the Saxon army corps and to the corps of the Bavarian army. Saxony, however, has no artillery and engineer school, and officers of those arms have to pass through the Prussian School at Berlin. Bavaria has its own artillery and engineer school at Munich.

The military educational system of the United States comprises:

1. The Military Academy at West Point for the education of cadets.
2. Post schools for the instruction of enlisted men.
3. At each military post a garrison school for the instruction of officers in subjects pertaining to the performance of their ordinary duties.
4. Service schools. See **ARMY SERVICE SCHOOLS**.
5. The military department of civil institutions at which officers of the army are detailed under the provisions of law. The detail of these officers at these institutions is announced and the regulations governing the courses of instruction therein are issued from the War Department.

War Department orders prescribing regulations to govern post and garrison schools lay down specifically the course to be followed in the more elementary schools for officers and enlisted men. Brigade commanders devote special attention to the post-graduate scheme of instruction, which runs through the entire period of garrison training. The post-graduate course of instruction includes such map

problems, terrain exercises, tactical or staff walks or rides, or other work pertaining to the local terrain as brigade commanders may prescribe; this portion of the course may be made to amplify the work of the elementary schools for officers and enlisted men, as well as the drill and practical instruction preparatory to field training.

See NAVAL EDUCATION and UNITED STATES MILITARY ACADEMY.

EDWARD S. FARROW,  
*Consulting Military and Civil Engineer.*

**MILITARY ENGINEERING.** Military engineering is officially stated to be that branch of engineering science applied by engineer troops in the field to the emergencies of modern warfare in order to protect and assist troops, to ameliorate the conditions under which they are serving, to facilitate locomotion and communication and whenever the occasion requires to act as purely combatant troops. In the performance of these duties engineers are trained and equipped to supplement or amplify by scientific measures the efforts of combatant troops in the services mentioned below and such other special services of an engineering nature as may arise and are beyond the technical training of combatant troops, or such as require the use of engineering implements and material not supplied to combatant troops. The following services are executed under the supervision of engineer officers by engineer troops, by details from other troops, by civilian labor or by any combination of these means as the particular circumstances may require:

1. The service of reconnaissance, including tactical reconnaissance, engineering reconnaissance, surveying, mapping and sketching, panoramic sketching, photography, drafting and map reproduction.

2. The service of castramentation, including the selection, laying out and preparation of camps, the reconnaissance and municipal and sanitary engineering incident thereto, and the installation, operation and maintenance of water-supply systems.

3. The service of fortifications, pertaining both to the attack and the defense and including the selection of defensive positions when not in the presence of the enemy; rectification of and assistance in the selection of such positions in the presence of the enemy; the location, design and construction of the more important field works; assistance in and supervision of the construction of hasty defenses wherever possible; the supply of tools and materials, and the reconnaissance, demolitions, water supply and communications incident thereto.

4. The service of sieges, pertaining both to the attack and defense and including the selection and location of defensive lines, lines of investment and siege works, the construction of saps, mines and counter-mines; the operation of searchlights; preparation for and assistance in attacks, counter-attacks and sorties; organization of captured points, and the supply of tools and materials.

5. The service of demolitions, including the carrying out of all work of this nature authorized by the commander and not within the scope of other troops.

6. The service of battlefield illumination, including the supply and operation of search-

lights and other means of battlefield illumination.

7. The service of general construction, including the location, design and construction of wharves, piers, landings, storehouses, hospitals and other structures of general utility in the theatre of operation.

8. The service of communications, including the construction, maintenance and repair of roads, ferries, bridges and incidental structures; the selection and preparation of forts; the construction, maintenance and operation of railways under military control and the construction and operation of armored trains.

9. Special services, including all municipal, sanitary and other public work of an engineering nature which may be required in territory under military control.

**Fire Action.**—To comprehend the subject of fortifications it is imperatively necessary to know and understand the effect of fire both from small arms and artillery, destructive forces quite different in action from those against which the engineer must ordinarily protect his works. To shoot straight, to direct a projectile true to its target, is a feat of engineering just as much as the accurate adjustment and pointing of a theodolite in a geodetic survey. Rifle fire which dominates a certain space and prevents the enemy from occupying it is just as effective as that which strikes his men, and the greater the space which can thus be occupied by fire action per unit volume of fire the more efficient is that fire. Artillery fire has of late become a most important factor in modern tactics with its great increase and accuracy and bids fair almost to revolutionize battle tactics and the art of fortification. By the application of *indirect fire* and spotting a battery can take up a position of safety and systematically search out the landscape.

**Fortifications.**—Fortifications may be defined as any engineering devices for increasing the fighting power of troops in the field. Entrenchments, screens or blinds, obstacles, communicating trenches, mines and demolitions, all come under the designation of fortifications. Of these the most important are those which afford protection from the enemy's fire and incidentally provide concealment and means of intercommunication. The term fortification, as commonly employed, refers to works of this character only. Field works are usually considered as to (1) location, or siting; (2) trace, or ground plan; (3) construction; (4) concealment. Engineers generally make three distinct classes of field or temporary fortifications: (1) all works devised for the temporary protection of important points, such as cities, arsenals, bridges, fords, positions, etc., technically known as *field works*; (2) the various devices of the engineer for reducing a fortified place by means of parallels and approaches, known as *siege works*; (3) quickly made defenses by which an army in the presence of an enemy protects itself, known as *battle entrenchments* or *hasty entrenchments*.

The general line to be held or defended depends upon strategical considerations and the location of trenches is affected by the general line to be occupied, tactical considerations and features of the terrain. Tactical considerations, such as actual or potential interference by the enemy with the construction, may affect

the location. All works for the defense of a position should provide concealment, a clear field of frontal fire, good communications to the rear, the flanks resting upon some natural obstacle or in contact with adjacent troops. A clear field of fire to the front was formerly considered all important and necessary to be secured at the expense of all other considerations; but, with the greatly increased effectiveness of modern artillery, it has been accepted as a maxim that, *that which is seen is as good as destroyed*, and concealment of the works becomes of first importance.

**Organization of a Position.**—The organization of a position does not imply the estab-

The relation of ground to fire effect.

lishment of a continuous firing trench. The terrain in front of a position is best covered by a combination of frontal and flank fire from distinct elements, such as trenches, block-houses, etc., separated by small intervals; thus economizing the personnel which is one of the advantages of fortification, and minimizing the effect of the enemy's artillery fire. Each of these elements is occupied by a fixed garrison, which should always be a complete unit, the strength of which, variable according to circumstances, may be as much as a platoon. These elements are not uniformly distributed along the front; their distribution is determined by the features of the terrain, the necessity of having a greater volume of fire at one point than at another, in one direction than another, and other tactical considerations. A line can always be forced at some points so that it is necessary to have elements in rear which come into action when the first have fallen. It is, therefore, necessary to disperse the elements laterally and in depth. A group of elements, thus disposed, is known as a *strong point*, and by their mutual support should permit the garrison to hold and stop the enemy by its fire. It should be surrounded by a continuous obstacle and should always be occupied by a fixed unit responsible for its defense. Strong points are grouped together laterally and in depth to form *supporting points* and the combination of several supporting points under one commander forms a *sector*. This organization is a gradual development made during a prolonged occupation of a position in trench warfare such as developed on the western front in Europe. In the initial occupation of a position the first step is the construction of the strong points for the firing line, with their firing trenches and obstacles

first, then their cover, approach and communicating trenches. The next step is the construction of the strong points for the support trenches, with the necessary communicating and approach trenches. Finally the defensive zone is completed by the construction of the reserve and intermediate trenches organized into strong points, and all of these into supporting points and sectors.

**Obstacles.**—The object of an obstacle is to check a hostile rush and delay the enemy under the close fire of the defense, and it should be at such distance from the parapet that it is difficult for hostile bombers to crawl up to it and throw bombs into the trench. On the other hand, the obstacle should be under close observation and fire of the defense. If possible it should be concealed for purposes of surprise and to decrease its liability to injury by artillery fire; it should form no shelter for the enemy. Some form of wire entanglement is ordinarily used. Obstacles are usually placed all around strong and supporting points and often on both sides of approach trenches. Passages through them for counter attacks are usually covered by machine gun fire. At important points the wire entanglement is placed in belts 20 feet wide, two or more belts about 20 yards apart being used. The modern form is a compromise between the high and the low wire entanglement and is generally from two to two and one-half feet high. The wire is strung loosely, and many forms of spirals and hoops have been devised. Barbed wire is ordinarily used; the posts are of wood or iron; the iron ones are provided with eyelets for attaching the wire. There are usually three rows of posts set in quincunx order from six to eight feet apart.

**Concealment and Observations.**—The trenches and other works should be made as nearly invisible as possible, and their concealment should be completed by treating the front slope of the parapet so that its appearance from the front and from aircraft will correspond to that of the surrounding ground.

Portion of a company trench designed for a squad.

Crops should be replaced where disturbed, and carefully arranged; bushes should be planted to hide the parapet, the men on watch, riflemen and observers. Sod should be preserved and placed on the parapet and parados. Dummy trenches and works should be freely employed

so as to deceive the enemy as to the strength of the defender and to scatter his fire. The observation of the enemy is of first importance in position warfare. It should give complete knowledge of all elements of the hostile line and prompt information of any movement of the enemy. It is effected by observation from the ground and from aircraft. Observation from the ground is divided into three echelons: (a) In front of the firing line from small posts and listening posts. (b) On the firing line by sentinels and lookouts. (c) In rear of the firing line, by artillery observers, sentinels and lookouts of the shelters. Observations on the firing line are effected by lookout posts organized preferably at the salients where the view is more extended. They are provided with periscopes, range finders and large scale maps. The location of the lookout posts and observatories must be determined in accordance with a complete plan for each supporting point or sector of defense. In position warfare, careful and studied attention must be given to illumination on the battle field, lines of information, depots for material and ammunition, the employment of machine guns, trench weapons, command posts, first-aid stations, kitchens, latrines, lavatories, shower baths, water supply, maintenance, protection against asphyxiating gas and protection against bombs and grenades. When circumstances render night work necessary, special dispositions must be made.

**Mining.**—Underground communications are classed according to their directions as galleries, which are horizontal or nearly so, and shafts, which are vertical or nearly so. Galleries are classified according to their size as great or grand galleries, which are six feet high by seven feet wide; common galleries six feet by three and one-half; half galleries, four and one-half feet by three feet; branches, three and one-half feet by two and one-half feet; and small branches, two and one-half feet by two. Shafts may be drill holes or wells, or may range in size from the smallest in which a man can work, say three feet by three feet, to any size which may be required, seldom more than 6 feet by 10 feet. If troops or guns are to be passed through galleries, they must be made large enough for that purpose. Grand and common galleries usually meet these requirements. The primary requisites of subterranean excavations are accuracy of direction, prevention of caving, ventilation, drainage and lighting. Picks and shovels for mining are similar in form to standard tools, but are smaller and have shorter handles. A special tool called the push pick is very convenient in soft earth. In large galleries a transit may be used, and in smaller ones a plane table or prismatic compass. The box compass cannot be sighted and read with sufficient accuracy for this work.

The transfer of the azimuth underground depends on whether the gallery starts from a shaft from a reverse slope, or, if not very deep, from a level with a descending branch. In the second and third cases, which will be the rule in military mining, the azimuth may be established in the gallery by a transit or compass used in the ordinary way. In the case of a shaft, which will be the exception, the azimuth must be established across the top or mouth and transferred to the bottom by means of

plumb lines. Prevention of caving is accomplished by linings. In very firm soil it is sometimes practicable to drive small shafts and galleries short distances without lining them. Galleries constructed during a siege are lined with wood. Wooden linings are of two general types, known as cases, and frames and sheeting.

In sinking shafts especial care must be taken to make the excavation no larger than is required for placing the lining. Partly lined shafts should only be used for small depths and when they are expected to stand for a very short time. They are a constant menace to the miners, owing to the danger of their caving in, and in a much greater degree to the probability of stones, etc., falling from the unprotected parts and seriously injuring or killing the men at the bottom. In changing direction horizontally with frames and sheeting, if the soil will stand for a distance of one frame interval, or even less, it is only necessary to place one or more frames at an angle until the necessary change is secured. The sheeting on the outside is placed by running the forward end past the frame and then inserting the rear end behind the last bay of sheeting. When the earth shows a tendency to cave, which it will frequently do in great galleries, the cap sill must be put in position and supported while the miner excavates the grooves for the ground sill and stanchions, for which purpose two crutches are used.

In military mining and especially in gallery work careful attention must be given ventilation and drainage. A pressure-blower, worked by hand or power, is among the essential items of a mining equipment. If water shows itself or is suspected, dead-level galleries must be avoided, and all slopes should fall toward a point or points where the water can be disposed of.

A satisfactory explosive for the purposes of military engineering must be: (1) Stable as to its constitution and characteristics for a long period. (2) Unaffected by ordinary variations of temperature and moisture. (3) Insensible to shock of handling, transportation, projectiles and neighboring explosions. (4) Not too difficult of detonation. (5) Quick enough to give good results when not confined and slow enough to give good results when confined. (6) Convenient in form and consistency for packing and loading and for making up charges of different weight. These conditions point to a high explosive of medium strength of granular or plastic consistency, put up in waterproof cylindrical cartridges of standard size and length. The detonating compound in general use is fulminate of mercury, and all methods of firing involve the explosion of a small quantity of fulminate enclosed in a cap or fuse and placed in the charge. Bickford or safety fuse is used to ignite the fulminate when electricity is not available. This fuse may be used in wet holes, but for underwater use it should have a continuous rubber coating; when a total blast is divided into a number of charges it is important that all should go at the same instant. In simultaneous ignitions by electricity, the fuses are connected in series: that is to say, they are all placed in the same circuit. A lead from the firing apparatus is connected to one wire of a fuse on one flank. The other wire of this fuse is connected to a

wire of the next fuse, and so on, until the last fuse is reached, the second wire of which is connected back by a lead to the firing point. It may be assumed as sufficiently exact that charges of the same explosive develop total energies directly proportional to their weights. This energy is exerted in all directions in compression of the surrounding medium. The distance at which this disturbance remains sufficient to destroy galleries is called the radius of rupture and the surface joining the ends of these radii is called the surface of rupture. The relief of pressure on one side shortens all radii of rupture which have a component in that direction, but does not appreciably affect those which have no such component. Hence, when material is displaced the surface of rupture is ellipsoidal; when no material is displaced it is spherical. Land mines are usually formed by excavating from the surface and are designed to be exploded at the moment the enemy is over them. They are usually employed in front of defensive positions and in connection with visible obstacles. The charges are placed deep enough only to avoid artillery projectiles. If no artillery fire is to be expected they may be placed just under the surface. If a bore hole is sufficient the charge is placed at the bottom and the hole well tamped. If an open pit is dug the mine chamber should be in firm ground at one side and the hole back-filled and well rammed.

In siege operations mining is done at close quarters, and is, or should be, opposed by countermining by the enemy. There is then a double purpose in view; to reach the original objective by placing the charge where intended and firing it, and while so doing to detect and circumvent any attempt of the enemy to interfere, or to prosecute any enterprise of his own.

**Demolitions.**—Military demolitions have for their purpose to destroy or make unserviceable any object in the theatre of war the preservation of which would be unfavorable to the army or favorable to the enemy, excepting always objects neutralized by international convention or the laws of war. Demolition is permissible only under a military necessity. They may be made by fire, by mechanical means or by explosives. Fire is the only agent when absolute destruction is necessary, as in case of food supplies, munitions of war, structural materials, etc. Soluble matter, as gunpowder, sugar, salt, etc., might be destroyed in water, but this method is laborious. Burning is equally effective and much easier. For quick results with slow-burning materials a quantity of highly combustible stuff must be collected. In the destruction of railroads, operations may be directed against rolling stock, bridges, culverts, tunnels, track or accessories, such as water stations, telegraphs, etc. Locomotives are temporarily disabled by removing valves or other small vital parts; permanently, by building a fire in a dry boiler or by detonating a charge of explosive in the boiler. In haste, piston or connecting rods, links, etc., may be destroyed by explosives, or a hole may be blown in the bottom of the tender tank. Cars may be burned or wrecked by collisions or derailment. The best places are in deep cuts or tunnels. Wooden bridges may be burned or small ones may be pried off their seats by levers or dragged off

with tackle. Track may be destroyed by taking it up, burning the ties, heating the rails on the fires and twisting them with bars through the bolt holes, with a chain and lever, or a hook and lever. Telegraph lines are temporarily disabled by breaks, in which the wires are cut, grounds in which the wires are connected to the ground and crossed in which a metallic connection is made between the wires. A ground may be made by connecting a wire to the rail or to a bar or plate of metal in damp earth. Copper is best. To destroy a telegraph line cut down and burn poles, cut and tangle wires and break insulators. To disable guns, smash the sights and firing gear; endeavor to dent or burn the corners of the breech-closing wedge and damage the elevating gear. Unscrew the striker plug and take it out: fire one or two rifle bullets into the opening. The degree of success attained in demolitions with explosives depends upon the experience of the powder men doing the work. The explosive adopted for the United States service is triton (trinitrotoluene, trinitrotoluol, trotyl, TNT). It may often become necessary to use whatever explosive is at hand; for this reason data for their use is given. There are many uncertainties attending the military use of explosives, and local conditions frequently raise a doubt as to the efficiency of the application of formulated methods. Where a lifting effect is desired, gunpowder should be used: but, when a cutting or shattering effect is necessary, a high explosive is better, such as triton, dynamite, gun cotton, etc. Each company of engineers carries on each of its two tool wagons a demolition outfit and supplies, consisting of earth and wood augers, pinch bars, magneto exploders, sledge hammers, picks, shovels, firing wire, caps, fuses, etc., and 200 pounds of explosive. In addition it has two pack demolition outfits, each with demolition tools and supplies, including 45 pounds of explosive. Each squadron of cavalry has a pack demolition outfit with demolition equipment and supplies, including 80 pounds of explosive.

**Bridges and Pontons.**—When an army has to cross a stream, passage may be made on a bridge, by fording, by use of boats, rafts or ferries, or on ice. Tactical requirements will determine the general location of the point of crossing, and within the limits imposed by these requirements the site of crossing must be selected and the method adopted that is best suited to the site. The site is selected as a result of reconnaissance to verify and complete the information shown by existing maps. To meet tactical requirements the near shore in an advance should afford concealment for the preparatory work in connection with the bridge, and should, if possible, facilitate a converging fire upon the enemy, while the farther shore should be open to favor development. The reconnaissance should furnish information as to the liability of freshets and their probable height, the rise and fall in tidal streams, the width and depth of the stream, the presence or absence of navigation, the nature of existing facilities such as roads or fords and the presence of bridge material such as timber, rope or wire. Where possible, the approaches should be straight and in line with the bridge.

Military bridges are divided primarily into

floating and fixed. The types of floating bridges most commonly used are the ponton bridge, built with the equipment carried with the army, and bridges built with boats or

cavalry. Artillery and wagons can cross water three feet deep and keep dry. The bottom should be even, hard and tenacious. A ford may be rendered impassable by a freshet or by

Floating bridge by successive bays.

barges. Types less frequently used are the bridges built with casks, rafts, timber, inflated skins and other means in the nature of bridging expedients. The fixed bridges best adapted to military use are pile, trestle, spar and suspension bridges. Other types that may be used are cribwork, steel girder, trussed and cantilever bridges. Some of the loads (in pounds per linear foot) to which military bridges may be subjected are as follows:

Infantry, single file.....	140
Infantry, column of twos.....	280
Infantry, column of fours.....	560
Cavalry, single file.....	196
Cavalry, column of twos.....	392

In the absence of bridges a ferry may be operated by stretching a cable across the river and pulling the boat by hand along the cable. Another method is to use a long rope fastened to a point up stream, either on the bank or to an island or anchor in midstream, and navigate the boat back and forth by utilizing the force of the current acting obliquely on the boat. This is called a flying ferry. The wooden ponton will carry 40 infantrymen armed and fully equipped, in addition to the crew, under favorable conditions. If a stream has high banks, with trees or other means available as anchorages, it may be practicable to stretch a rope across and transport men and materials in chairs, baskets or slings suspended from the rope.

Fords may be used by small bodies of troops without bridge equipment, but they are unreliable crossings and are generally unsatisfactory for large bodies. If the current is moderate a depth of three and one-half feet may be passed by infantry and four and one-half feet by

the deepening resulting from the loss of material stirred up and carried away during the passage of troops. A ford may be destroyed by filling the deepest part with harrows, teeth up, or with planks filled with spikes, with barbed wire or other obstructions.

Barrel Piers, rafts and bridges.

Benefiting by the experience of the European armies, the United States has greatly increased the proportion of engineer troops. A recent order gives the following units for each field army, in addition to the divisional engineer troops: One regiment, gas and flame; 1 regiment, mining; 1 regiment, water supply; 1 regiment, general construction; 1 regiment,

engineer supplies (1 battalion transport, 1 battalion skilled labor, 1 service battalion to aid in this work); 1 battalion, mapping and printing; 4 battalions transport service (6 service battalions to aid in this work, 6 truck trains of 31 trucks each, 5 wagon trains of 61 wagons each). Assigned to the line of communications and constituting an independent group, each field army has the following engineer troops: One regiment, general construction (6 service battalions to aid in this work); 1 regiment, engineer supplies (3 service battalions to aid in this work); 10 battalions forestry (9 service battalions to aid in this work); 1 regiment, quarrying (3 service battalions to aid in this work). The European War was one of engineers, and upon the efficient leadership of engineer troops depended in large measure the ultimate success of the Allies.

EDWARD S. FARROW,

*Consulting Military and Civil Engineer.*

**MILITARY FRONTIER.** See FRONTIER.

**MILITARY GOVERNMENT.** See GOVERNMENT.

**MILITARY HONORS,** salutes and other marks of deference paid to army and navy officers, government officials and certain other distinguished individuals. See ORDERS AND DECORATIONS OF HONOR; SALUTES, MILITARY.

**MILITARY HOSPITALS.** See HOSPITALS, MILITARY.

**MILITARY INSIGNIA OF RANK.** Insignia of rank are worn to-day in all armies to distinguish the various grades of officers and non-commissioned officers. It is usually in the form of epaulets, straps, braid, buttons or chevrons, and is worn on the shoulder, sleeve or collar of the uniform coat, according to the custom of the country to which the soldier belongs.

Military uniform did not come into existence until after the Thirty Years' War, the household troops of Louis XIV of France being the first to wear it. Badges of rank were not in general use in the different armies until the latter part of the 18th century, although some regiments had adopted distinctive devices for this purpose long before that time.

In all armies the insignia of rank are such as is prescribed by the government, and all officers and soldiers are forbidden to wear any insignia except such as that to which their rank entitles them. The form of the insignia is always the same for officers or non-commissioned officers of the same rank, but its color sometimes differs according to the arm of the service to which the wearer belongs.

The various badges of rank worn to-day in the principal armies of the world are as follows:

#### UNITED STATES.

In the United States army there are three recognized uniforms known as full dress, dress and service. Officers attending social functions of a military nature are permitted to wear a special full-dress uniform of a cut similar to civilian evening dress.

The full-dress coat for officers is dark blue and double-breasted, the dress coat is dark blue and single-breasted having concealed buttons, the service coat is single-breasted and of an olive drab color. The coats of all enlisted men

are single-breasted. dark blue for full dress and dress and olive drab for service. Officers wear their insignia of rank on the sleeves of their full-dress and special full-dress coats, and on the shoulders of their dress and service coats. With the dress coat the distinctive insignia forms a part of the shoulder strap, the field of which differs in color according to the arm of the service to which the wearer belongs; on the service coat the device is attached directly to the shoulder loop which is of the same material as the coat.

#### SLEEVE INSIGNIA.

*Major-General.*—Two silver stars placed above a band of gold embroidered oak leaves which encircle the cuff.

*Brigadier-General.*—One silver star placed as above.

*Colonel.*—Five strands of gold wire lace arranged in the form of a knot extending from the cuff to just below the elbow.

*Lieutenant-Colonel.*—Four strands.

*Major.*—Three strands.

*Captain.*—Two strands.

*First Lieutenant.*—One strand.

*Second Lieutenant.*—Without gold lace.

#### SHOULDER INSIGNIA.

*Major-General.*—Two silver stars.

*Brigadier-General.*—One silver star.

*Colonel.*—One silver eagle.

*Lieutenant-Colonel.*—One silver leaf.

*Major.*—One gold leaf.

*Captain.*—Two silver bars.

*First Lieutenant.*—One silver bar.

*Second Lieutenant.*—One gold bar with a blank field with dress uniform, no insignia with service uniform.

Officers of the United States army wear the letters "U. S." on the collars of their dress and service coats; officers of the United States Volunteers the letters "U. S. V.;" officers of the National Guard the initial letters of their respective States, unless when in national service when "N. G." is superposed on "U. S.;" National army officers wear "N. A." over "U. S.;" Reserve officers "U. S. R."

Each branch of the service and each staff department has a distinctive color with which the uniforms of the members of that portion of the army are faced.

The following are the colors of the different facings:

*Staff Corps.*—Dark blue.

*Engineers.*—Scarlet piped with white.

*Signal Corps.*—Orange piped with white.

*Ordnance Department.*—Black piped with scarlet.

*Medical Corps.*—Maroon.

*Quartermaster Corps.*—Buff.

*Cavalry.*—Yellow.

*Artillery.*—Scarlet.

*Infantry.*—Light blue.

The rank of non-commissioned officers is indicated by means of chevrons, of the color of the arm of the service to which the soldier belongs, worn point upward midway between the elbow and the shoulder on the sleeves of all uniform coats.

Sergeants wear three stripes, corporals two and lance corporals one. In addition to his stripes, a regimental sergeant-major has an arc

of three bars, a battalion sergeant-major an arc of two bars, a battalion quartermaster-sergeant a tie of two bars, a first sergeant a lozenge and a company quartermaster-sergeant a tie of one bar. Non-commissioned officers of the different departments wear the distinctive devices of their departments with their chevrons.

Rank of non-commissioned officers is further indicated by the width of the trouser stripes, sergeants wearing a one and one-quarter-inch stripe, corporals a one-half-inch stripe.

To indicate service in war all enlisted men who have seen such service are entitled to wear on the sleeves of their dress coat a diagonal half chevron of white cloth, piped on each side with the facing of the arm of the service in which they earned the right to wear the chevron.

#### CONFEDERATE STATES.

During the Civil War the rank of officers and non-commissioned officers of the Confederate army was indicated in the following manner, the insignia being displayed upon the uniform coat, which for officers and enlisted men was double breasted and of a cadet gray color.

Rank of officers was designated by an ornament of gold braid worn on both sleeves of the coat extending around the seam of the cuff and up the outside of the arm to the bend of the elbow. The ornament was composed of four braids for general officers, three for field officers, two for captains and one for lieutenants. Besides this sleeve decoration, the rank of officers was further shown by devices worn on the collar of the tunic as follows:

*General Officers.*—A wreath with three stars enclosed, embroidered in gold.

*Colonel.*—Three gold stars arranged horizontally.

*Lieutenant-Colonel.*—Two gold stars.

*Major.*—One gold star.

*Captain.*—Three gold bars arranged horizontally.

*First Lieutenant.*—Two gold bars.

*Second Lieutenant.*—One gold bar.

Rank of non-commissioned officers was indicated by chevrons worn on both sleeves of the coat above the elbow, point downward, of the color of the facing of the arm of the service to which the wearer belonged.

*Sergeant-Major.*—Three bars and an arc in silk.

*Quartermaster-Sergeant.*—Three bars and a tie in silk.

*Ordnance-Sergeant.*—Three bars and a star in silk.

*First Sergeant.*—Three bars and a lozenge in worsted.

*Sergeant.*—Three bars in worsted.

*Corporal.*—Two bars in worsted.

The coats of both the officers and of the enlisted men were piped with a facing of the color of the arm of the service to which they belonged, the facings being as follows:

*General Officers, Adjutant-General's Department, Quartermaster-General's Department, Commissary-General's Department and Engineers.*—Buff.

*Medical Department.*—Black.

*Artillery.*—Red.

*Cavalry.*—Yellow.

*Infantry.*—Light blue.

#### GREAT BRITAIN.

Insignia of rank in the British army is worn on the sleeves and overcoat shoulders by officers, and on the right sleeve of the coat by enlisted men.

The rank badges of the officers, which are of embroidery, and which are attached to the shoulder pieces of the coat, are as follows:

*Field-Marshal.*—Crossed batons on a wreath of laurel, with a crown above.

*General.*—Crossed sword and baton, with star and crown above.

*Lieutenant-General.*—Crossed sword and baton, with crown above.

*Major-General.*—Crossed sword and baton, with star above.

*Brigadier-General.*—Crossed sword and baton.

*Colonel.*—Crown and two stars below.

*Lieutenant-Colonel.*—Crown and one star below.

*Major.*—Crown.

*Captain.*—Three stars.

*Lieutenant.*—Two stars.

*Second Lieutenant.*—One star.

Prior to May 1902, a captain wore two stars, a lieutenant one star and a second lieutenant had no badge of rank.

Regimental officers having brevet rank wear the badges of their army rank, department officers having honorary rank the badges of that rank.

The rank of non-commissioned officers is indicated by means of a chevron, worn point downward, on the sleeve of the coat above the elbow. A sergeant wears three stripes of gold braid, a lance sergeant three stripes of worsted, a corporal two stripes of worsted and a lance corporal one stripe of worsted.

#### GERMANY.

Insignia of rank in the German army is worn on the shoulders by officers and on the collar by non-commissioned officers.

Prior to 1808 there were no recognized badges of rank in the Prussian army, although Bavaria had already adopted them to some extent. During that year a system of rank badges was devised for the officers of the Prussian army which were worn on the shoulder pieces of the coat. During the campaign of 1813-14 these shoulder pieces were converted into epaulets and the insignia of rank was transferred to them, and the epaulet has ever since remained the distinctive mark of the officer. The German army in 1914 was composed of 22 army corps named after the different kingdoms which composed the empire. Each kingdom had some distinctive mark which was worn only by its troops; the insignia of rank however was the same throughout the army without regard to corps or arm of service.

Except in the case of a general field-marshal, the rank of officers is indicated by means of stars worn on the shoulder knots or epaulets.

Officers below the grade of major wear shoulder knots or scale-like epaulets, all other officers fringed epaulets. Shoulder knots are formed of half moon shaped pieces of gold or silver embroidery (according to the regiment) enclosing a cloth field of the color of the army corps to which the regiment belongs. On the field is displayed the regimental number and the

insignia of rank. Epaulets for officers below the grade of major-general are of the same design as that of the shoulder knot with the addition of gold or silver fringe, according to the embroidery of the knot.

The epaulets of general officers are of silver bullion.

Insignia of rank for officers is as follows:

*General Field-Marshal*.—Two gold crossed batons.

*Colonel-General*.—Three gold stars.

*General of Infantry or Cavalry*.—Two gold stars.

*Lieutenant-General*.—One gold star.

*Major-General*.—Blank epaulet.

*Colonel*.—Two gold stars.

*Lieutenant-Colonel*.—One gold star.

*Major*.—Blank field.

*Captain*.—Two gold stars.

*Field Lieutenant*.—One gold star.

*Second Lieutenant*.—Blank field.

Non-commissioned officers wear the insignia of their rank on the standing collar of their coat, the different grades being distinguished in the following manner:

*Lance Corporal*.—Two small buttons of gold or silver (according to regiment) worn, one on each side of the collar directly above the shoulder.

*Corporal*.—A stripe of gold or silver lace extending around the top of the collar.

*Sergeant*.—The same collar stripe as that of a corporal with the addition of two large buttons worn on either side of the collar in the same manner as the buttons of a lance corporal.

#### FRANCE.

In the French army, insignia of rank is worn on the sleeves of the uniform coat by both officers and enlisted men. For officers it consists of stripes of gold or silver braid, according to the arm of the service, worn either straight across the sleeve directly above the cuff, or arranged in the form of a loop extending from the cuff to a point midway between the elbow and the shoulders. For enlisted men it consists of stripes of red or yellow cloth, or gold or silver braid, worn diagonally across the sleeve of the coat above the cuff.

Officers of infantry, engineers, spahis and of the Garde Republican wear straight gold stripes; officers of cuirassiers, dragoons, chasseurs a cheval, hussars, chasseurs d'Afrique, zephirs, and of the gendarmie, straight silver stripes, officers of zouaves, turcos and artillery, looped gold stripes.

Corporals of infantry, zouaves, cuirassiers, dragoons, chasseurs a cheval, hussars, artillery and engineers wear red stripes; corporals of turcos, chasseurs a pied, zephirs, chasseurs d'Afrique and spahis, yellow stripes.

The distinctive insignia of the various grades is as follows:

*General of Division*.—Six stripes of black mohair braid arranged in the form of a pointed loop, and two silver stars on epaulets.

*General of Brigade*.—Six stripes of black mohair braid arranged as for a general of division, and one silver star.

*Colonel*.—Five stripes of gold or silver braid.

*Lieutenant-Colonel*.—Three stripes of gold and two of silver, or three of silver and two of gold.

*Major*.—Four gold or silver stripes.

*Captain*.—Three gold or silver stripes.

*Lieutenant*.—Two gold or silver stripes.

*Sous Lieutenant*.—One gold or silver stripe.

*Sergeant-Major*.—Two gold or silver diagonal stripes.

*Sergeant*.—One gold or silver diagonal stripe.

*Corporal*.—Two red or yellow diagonal stripes.

Adjutants rank between officers and non-commissioned officers, a grade corresponding to that of a warrant officer of the United States navy. They wear practically the same uniform as that of a sous lieutenant, but their stripe is of the opposite color from that of the officers of their regiment.

Insignia of rank is also worn on the cap by officers, the cap being braided to conform with the sleeve decoration. When in full dress, officers wear epaulets of gold or silver according to the arm of the service to which they belong.

#### AUSTRIA-HUNGARY.

In the Austrian army, the insignia of rank is worn on the standing collar of the coat by both officers and enlisted men. Officers below the grade of major and all non-commissioned officers wear the badges of their rank upon a field of cloth, of the color of their regimental facing, extending from the front of the collar to the line of the shoulder piece; all other officers wear their badges of rank upon a field of gold.

The following is the distinctive insignia of the different grades:

*Commander-in-Chief*.—Gold collar embroidered with oak leaves.

*Marshal*.—Three gold stars.

*Field-Marshal*.—Two gold stars.

*Major-General*.—One gold star.

*Colonel*.—Three silver stars.

*Lieutenant-Colonel*.—Two silver stars.

*Major*.—One silver star.

*Captain*.—Three gold stars.

*First Lieutenant*.—Two gold stars.

*Second Lieutenant*.—One gold star.

*Sergeant*.—Three worsted stars, and a yellow stripe extending around the front and lower side of the collar field.

*Lance Sergeant*.—Three worsted stars.

*Corporal*.—Two worsted stars.

*Lance Corporal*.—One worsted star.

#### ITALY.

In the Italian army the insignia of rank, except in the case of general officers, is worn on the sleeve of the coat. The design, which is that of a loop, extends from the cuff to the elbow.

General officers wear one, two or three stars on shoulder straps of bullion according to rank. Sleeve insignia is as follows:

*Colonel*.—One wide and three narrow stripes of gold braid. Three stars on shoulder straps with gold lace edging.

*Lieutenant-Colonel*.—One wide and two narrow stripes of gold braid. Two stars.

*Major*.—One wide and one narrow stripe of gold braid. One star.

*Captain*.—Three narrow stripes of gold braid.

*First Lieutenant.*—Two narrow stripes of gold braid. Three stars on plain shoulder strap.

*Second Lieutenant.*—One narrow stripe of gold braid. One star.

*Sergeant.*—One red stripe with one gold stripe underneath.

*Corporal.*—One red stripe.

#### SPAIN.

The insignia of rank in the Spanish army is worn on the cuff of the coat by both officers and enlisted men. It consists of a form of braiding, technically known as galones, of gold, silver or cloth, which extends across the top and down the back of the cuff. These galones vary in width according to rank and are of gold in some regiments and of silver in others. Stars of either gold or silver, to match the galones, are worn by all officers below the grade of brigadier-general.

The distinctive insignia of the various grades is as follows:

*Captain-General.*—Three stripes of twisted gold braid.

*Lieutenant-General.*—Two stripes of twisted gold braid.

*Major-General.*—One stripe of twisted gold braid.

*Brigadier-General.*—One stripe of twisted silver braid.

*Colonel.*—Three stripes of gold or silver braid (according to regiment) of five threads each, and three eight-pointed stars, of gold or silver, worn below the galones.

*Lieutenant-Colonel.*—Two stripes and two stars like those of a colonel.

*Major.*—One gold and one silver stripe, and one gold and one silver star worn below the galones.

*Captain.*—Three stripes of gold or silver braid, and three stars to match, worn above the galones.

*Lieutenant.*—Two stripes and two stars like those of a captain.

*Ensign.*—One stripe and one star like those of a captain.

*Staff-Sergeants.*—One stripe like that of an ensign.

*First Sergeant.*—Three narrow gold or silver stripes.

*Sergeant.*—Two stripes like those of a first sergeant.

*Corporal.*—Three stripes of scarlet cloth.

*Lance Corporal.*—Two stripes of scarlet cloth.

#### RUSSIA.

Russian army officers wear their insignia of rank on their shoulders, the distinctive badges being displayed upon shoulder straps extending from the sleeve to the collar, when in undress and service uniform, and on shoulder knots and epaulets when in full dress. The following are the designs of the different shoulder straps and the badges of rank worn with them.

For general officers a strap of zig-zag pattern.

*General.*—No badge.

*Lieutenant-General.*—Three stars.

*Major-General.*—Two stars.

For field officers, and staff officers of the same rank, a strap containing two stripes.

*Colonel.*—No badge.

*Lieutenant-Colonel.*—Three stars.

For company officers, and staff officers of the same rank, a strap containing one stripe.

*Captain.*—No badge.

*Second Captain.*—Four stars.

*First Lieutenant.*—Three stars.

*Second Lieutenant.*—Two stars. Sergeant-majors, sergeants and corporals have respectively three stripes, two stripes and one stripe on their shoulder-strap.

The Hussars of the Guard have a special form of shoulder strap but the insignia displayed thereon is the same as that worn by the rest of the army.

In addition to the stars, the shoulder straps bear likewise the numbers or letters designating the unit to which the officer belongs. The different colors of the straps denote the various arms of the service.

#### JAPAN.

The Japanese wear the insignia of their military rank on their sleeves, the design, which is in the form of a pointed loop of braid, extending from the cuff to a point midway between the elbow and the shoulder. The number of stripes which compose the loop indicate the different grades of rank.

For all officers except those of the Pay and the Medical Corps, the stripes are of gold, for the officers of the Pay Corps they are of silver, and for the officers of the Medical Corps of alternate silver and gold. General officers wear their stripes above a band of gold; all other officers wear them above a pointed cuff of the color of the arm of the service to which they belong.

The colors which denote the various arms of the service are, scarlet for infantry, green for cavalry, yellow for artillery and dark red for engineers.

The sleeve insignia of officers is as follows:

*Marshal.*—Seven stripes.

*General.*—Same as marshal.

*Lieutenant-General.*—Six stripes.

*Major-General.*—Five stripes.

*Colonel.*—Six stripes.

*Lieutenant-Colonel.*—Five stripes.

*Major.*—Four stripes.

*Captain.*—Three stripes.

*First Lieutenant.*—Two stripes.

*Second Lieutenant.*—One stripe.

The rank of non-commissioned officers is indicated by means of stripes of the color of the arm of the service to which the wearer belongs, worn in the form of a band around the cuff.

*First Sergeant.*—Three stripes.

*Sergeant.*—Two stripes.

*Corporal.*—One stripe.

#### MILITARY LAW. See LAW, MILITARY.

**MILITARY MASTS**, in naval architecture, masts on a modern fighting ship, provided purely for military purposes. They are of steel, and hollow, and through them access is had to the conning tower on the superstructure of the deck where are the wheel, the wires communicating to all parts of the ship, and where the captain generally takes his stand; to the fighting-top with its rapid-fire guns; and to the look-out far above all of these.

#### MILITARY MINING. See MILITARY ENGINEERING.

**MILITARY MUSIC.** See **BAND**; **MUSIC**.  
**MILITARY OCCUPATION,** Law of. See **LAW, MILITARY**.

**MILITARY ORDERS.** See **ORDERS, ROYAL**.

**MILITARY POLICE,** in the United States army police duty is required of the provost guard; in the British army it consists of mounted and unmounted branches of the regular army service; in France police duty is performed by the gendarmes (q.v.); in Canada, the Northwest mounted police do patrol duty, and there are similar bodies in Australia. In South Africa, the Cape mounted police are available for military duty, and there are similar forces in most of the African colonies.

**MILITARY PRISONS,** in the United States, penitentiaries or prisons set apart for military convicts. Long term prisoners are sent usually to the military prison at Fort Leavenworth, Kan., or on Alcatraz Island in San Francisco Bay. For small offenses prisoners are confined in the smaller prisons connected with forts and barracks. Most of the prisoners in the Department of the East are confined at Governor's Island, N. Y.

**MILITARY PUNISHMENTS.** See **LAW, MILITARY**.

**MILITARY RAILROADS.** The general subject of military railroads includes the location, construction, operation and maintenance of railroads in the theatre of war under military auspices and for military purposes; that is, with a personnel consisting of officers, enlisted men and civilian employees, and for the main purpose of facilitating the movements and supply of an army. The difference between war and peace conditions causes a wide departure of military from civil railroad practice. The more prominent conditions of military railroad service are:

1. Quick results for a short period.

2. A trained personnel for the full development of the mechanical possibilities of the property.

3. Moderate and practically uniform speed requirements for all traffic.

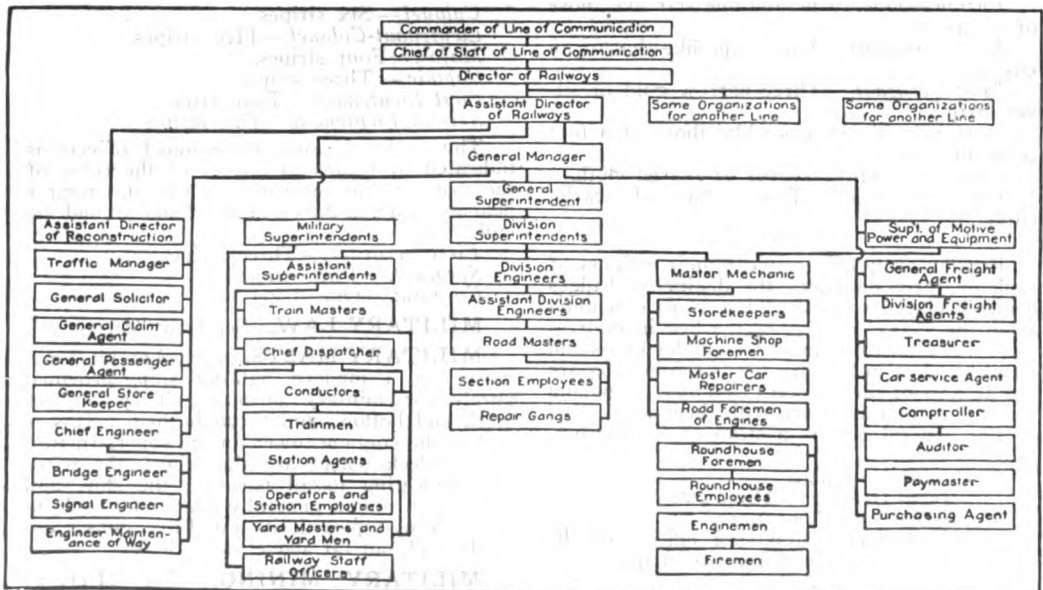

4. A civil road is operated on the presumption that the track is safe; a military road must be operated on the presumption that the track is unsafe.

5. The property is usually in fair but unequal condition, often hastily restored after partial demolition. The operation of the whole depends on the condition of the most inferior parts.

6. A military road is best operated with an ample supply of motive power and rolling stock, and a moderate speed: whereas on a civil road the tendency is to increase speed to economize motive power. The known ratios of equipment and mileage on civil roads cannot be taken as sufficient for military roads.

Railways constructed and operated for military purposes vary from a rough, narrow-gauge road on which the motive power is man or mule, to a fully equipped modern, standard-gauge road. The first would probably be used in the approaches of siegeworks or to supply an army in a winter camp or a fortified position of great extent, and the latter when an existing commercial line is taken over for military uses. Between these two extremes are numerous grades of railways, but each grade shades gradually into the next above and below, and any considerable classification must be artificial and of very little use in discussing the general subject. The only classification that seems logical is to divide them into those that are built and operated *within* and *beyond* the field of the enemy's field of observation and fire. The former are called *combat railways* and the latter *supply railways*.

Within the field of observation and fire of a besieged place practically all movements must be made under artificial cover. The location of

these lines of approach are dictated by military principles, and the line of the combat railway will therefore be determined, not by questions of economy, or ease of construction, but by the location of the siege approaches and parallels. For the same reason, the grade of the line is practically thrown out of the consideration, although a slight change in the direction of the approach might be made to keep the grade of the line below the limiting grade, if by such a change no military advantage were lost. This limiting grade should be kept as low as practicable, for the difficulty of moving cars under such adverse conditions is very great, and for any slope greater than six or eight feet in a hundred, the difficulties of ascent with loaded cars will be great, even for animal traction; and above that, the cars would have to be moved by cable.

The possibilities of combat railways for both offense and defense are very great and have never been fully realized. Guns up to six inches calibre and howitzers of larger calibre can easily be fired from cars. Some blocking up may be necessary. Such use of a railway increases greatly the amount of artillery available in any sector of the defense whence it can be as rapidly moved elsewhere. Owing to the light weight or narrow-gauge cars, an empty car can be easily lifted back on the track if it is derailed. With loaded cars, however, this is not always the case, and car replacers will be necessary to facilitate this replacing without unloading the cars. Whether a road is constructed or merely taken over for military purposes makes no difference in the operation and maintenance of the line. The unit of organization is the *division*, or a section of line from 150 to 300 miles in length which is self-contained. The persons in charge of a military railway are divided into two classes — *Military Controlling Staff* and *Civilian Officials*. The former is chosen from engineer officers and others who have had railway experience, and their function is to make known the military desires and to see that the roads are operated so as to attain these ends. Having given their instructions, they allow the civilian officials and employees to work out the technical details in the manner dictated by their railway experience; the military staff only interferes in cases where they believe that the civil officials are not endeavoring to carry out the military plans, or are not succeeding in doing so. The organization and line of responsibility and the relation of the military controlling officials are shown in the diagram.

The presence of civilian employees on a military railroad, particularly in the lower grades, is likely to prove a source of friction with the personnel of the service of defense, with the railroad troops and with troops of all kinds traveling on the line. Furthermore, the lack of military discipline is prone to cause difficulty in strikes, disagreements as to pay and promotion and individual insubordination and desertion. It is seldom practicable to secure a purely military organization, but in the case of railroads operated in occupied foreign territory effort should be made to secure a military organization with fixed military rank, pay and allowances for all employees, if possible, and in any case for all train crews, yard operatives and the higher officials. The transpor-

tation and equipment of railway troops should be that provided for an engineer regiment in so far as relates to supply, shelter and administration: technical equipment with its necessary transportation is furnished as deemed necessary from the base by the director of railways. Sanitary personnel and equipment should be the same as provided for an engineer regiment.

The duties of the director of railways of an army and his staff are, to operate the railroads so as to promote the plans of the commanding general, to supply the military knowledge not possessed by the railway staff and to shield the railway operatives and officials from unauthorized military interference. In any large theatre of operations there are one or more independent lines of railway. For military purposes all such lines should be operated as a single system under the director of railways. If only one line exists, the director of railways acts as the military executive of the line. If more than one line exists, he acts as military executor of the system and assigns an assistant director of railways to each separate line to act as military executive of that line. If two or more lines of communications exist in one theatre of operations, they might be operated as separate systems under separate heads *if they were entirely separate lines physically*; but if at any point they come together, they should be operated under a single director of railways.

As soon as a railroad is taken under military control, a bulletin for railway use is published, giving the capacity of cars, and the maximum number of cars, loaded and empty, to be run in trains, where the whole tonnage rating of the engines cannot be utilized. The carrying capacity of coaches and other cars is given for both *normal transportation* and *hurried transportation*; the normal transportation is used unless the other be specifically stated, in which case trains are made to carry every available man that safety will permit. Rations to the men on the train are carried in the baggage cars, or kitchen cars if provided.

When an entire unit cannot be carried on one train, battalions can be broken up and certain companies assigned to one train, while the remainder follow in another. The assignment of troops to trains rests with the railway officials. Where regiments carry tentage and camp equipage these are normally sent ahead of the troops in one train and is not divided up amongst the trains carrying the troops. In infantry regiments, the officers' horses are shipped ahead in the train with the camp equipage. In mounted regiments, the first trains carry the horses, with men to look after them. The picket lines and a proper amount of forage are carried on the horse trains. Guns, caissons and wagons follow on trains in the rear of the regiments to which they belong. In loading artillery wagons on trains, they are loaded on the cars from a platform or from portable ramps. They are loaded on one car and run by hand or horse power to the car on which they are to be carried. The openings between cars are covered by plates of iron, or wooden runways, over which the vehicles may run. Unloading of troops and animals at or near the railhead must be expedited in every possible way, platforms and portable ramps

being supplied at all unloading points. The method of unloading is the converse of the method of loading.

The defense of a railway against a brigade or division that may be sent against it or its systematic destruction can only be made by a force of sufficient strength to meet and defeat the raiding forces. Besides these attacks by large bodies there are the continual depredations against the line made by small bodies ranging from a regiment down to the lone individual who tries to burn a bridge or misplace a switch. The greatest difficulties in operating a road come from small bands which can operate against the line, especially in a hostile country, without great danger of apprehension. The defense of the railway is usually maintained by the combined use of block houses and armored trains. See RAILWAY ENGINEERING AND CONSTRUCTION and SUPPLY RAILWAYS.

EDWARD S. FARROW,

*Consulting Military and Civil Engineer.*

**MILITARY RESERVATIONS, United States**, a general term applied to all military posts set aside for military occupation. In most instances large tracts of land surrounding military forts, schools, barracks, etc., are purchased by the government and improved and adorned; buildings, constructed thereon for officers' residences, parade grounds established and works of defense erected. The Presidio reservation in San Francisco is one of the largest in this country.

**MILITARY RULE.** See LAW, MILITARY.

**MILITARY SANITATION.** Military sanitation is largely a matter of engineering combined with discipline. The health and fighting strength of a command is maintained by (1) excluding from the service the physically unfit and those predisposed to disease, by (2) the exercise of surgical and medical skill in promptly restoring the sick and wounded to duty, and (3) by securing preventive measures such as the various vaccinations, inoculations and prophylactic treatments tending to increase individual powers of resistance to disease or to prevent its development after infection. All of these are the special province of the Medical Corps.

The engineering problems connected with camp sanitation comprise water supply, drainage, disposal of refuse (animal wastes, garbage and rubbish) and the selection and laying out of camp sites, or castramentation. Nearly all diseases to which the soldier is subject are caused by germs, which are either little animals or plants so very small that they can only be seen by aid of the microscope. All diseases caused by germs are "catching." All other diseases are not "catching." There are only five ways of catching diseases: (a) Getting certain germs on the body by touching some one or something which has them on it. Thus, one may catch venereal diseases, smallpox, measles, scarlet fever, chicken pox, mumps, boils, body lice, ringworm, barber's itch and other diseases. Wounds are infected in this manner. (b) Breathing in certain germs which float in the air. In this way one may catch pneumonia, consumption, influenza, diphtheria, whooping cough, tonsillitis, spinal meningitis, measles and certain other diseases. (c) Taking certain

germs in through the mouth in eating or drinking. Dysentery, cholera, typhoid fever, etc., may be caught in this manner. (d) Having certain germs injected into the body by the bites of insects, such as mosquitoes, fleas and bedbugs. Malaria, yellow fever, dengue fever and bubonic plague may be caught in this way. (e) Inheriting the germ from one's parents.

In both permanent and temporary camps the water supply is a matter of the greatest importance both as to quality and quantity. Where the character of drinking water is the least in doubt it should be made safe by sterilization. The usual method of boiling cannot always be resorted to, owing to lack of time and fuel, and troops in the field generally resort to the chlorination method of sterilization which simplifies the problem. The liquid chlorine treatment, though probably the most efficient, is not adapted to military field use on account of the apparatus required. Of the hypochlorites, that of sodium, in liquid form, is more efficient for its bulk, but that of calcium (bleaching powder) is ordinarily the more readily obtainable. The latter, however, when loose or packed in cardboard, loses its strength very rapidly. It is best kept by making up and bottling a strong stock solution.

The strength used in sterilizing municipal supplies is 0.2 parts per million, that in the field about 10 times as great, or 2.0 per million. In the former case fresh powder, from air-tight drums, is usually available, the mixing is more thorough and the distribution more carefully regulated. Usually also the water has been partially purified by sedimentation in a reservoir. In such cases, 20 minutes is supposed to render the water safe for drinking. For field use, a level teaspoonful of calcium hypochlorite (chloride of lime) is dissolved in two quarts of water for a stock solution. One teaspoonful of this solution is added to a gallon of water, or 10 tablespoonfuls to a barrel. The water is considered safe to use after standing for 30 minutes.

A sterilizing bag, of linen fabric, holding about 40 gallons of water, is issued to troops in the field. As the chemical acts better in clear water, a filter cloth is provided to strain it in filling the bag. The sterilizing medium is calcium hypochlorite, sealed in glass tubes, which are marked with a file to facilitate breaking them without fragments. They each contain about 15 grains of the chemical, which gives a proportion of 2.0 parts per million, sufficient to destroy germ life in even highly infected, though not in sewage polluted, waters. The bag is covered to keep out dust, and the water is cooled by the evaporation of the moisture which exudes through the fabric. Water is drawn off through small self-closing faucets set in a circle around the bag, slightly above the bottom.

A camp site requiring extensive drainage operations to make it habitable should not be adopted, as even when drained it will remain damp for a long time. Occasionally, however, sites are found which are otherwise favorable, but upon which water may be inclined to stand after a heavy rain. A simple system of ditches constructed by the troops themselves will usually remedy this defect. The camp should never be sited upon the lowest ground in a neighborhood, even if perfectly dry, as drainage

during and after rains will then be very difficult.

The interior drainage of the camp is taken care of by gutters along the company's streets and by crowning the latter to avoid puddles and mudholes. Ditches are dug around the tents, directly under the canvas walls, with the earth banked up *inside* the tent. These ditches connect with the street gutters. The ground under picket lines is crowned and gutters dug, leading to lower ground; otherwise, the ground would become very muddy in wet weather.

Animal wastes are the most dangerous to the health of the camp, and naturally the greatest precautions must be taken to see that these are finally disposed of in a manner which will effectually prevent their ever becoming a source of infection or nuisance.

Where a system of water carriage can be installed, this method is of course the most desirable. Its layout and operation will differ little from ordinary municipal practice. Such a system will be quite a tax upon the water supply of the camp, as well as a considerable additional expense, and may require treatment works if the discharge is into an inland river. In tidal estuaries or waters not used for public supplies these works would not be necessary. Where the cost would be prohibitive, or where the water supply is insufficient for water carriage, other systems must be adopted. Various systems of dry sewerage, as the pail system, have been advocated and used to a considerable extent, but are open to many objections, the principal one of which is the hauling or carrying of this matter through the camp. The ground about the pails becomes much polluted, accidents happen in removing them, causing pollution of the ground within the camp, and the final disposal is always a matter of much difficulty. Burial, dumping into water and incineration have all been tried and none found entirely satisfactory. The pollution of water supplies and the creation of a breeding place for flies are the main objections. Incineration usually creates an odor, which, while probably not a menace to health, is distinctly disagreeable when carried to camp. The most satisfactory method has been dumping into large pits, the deposits being covered with crude oil. This prevents odor and keeps the flies out. The problem of cartage through the camp, however, and of cleaning the pails, has not been satisfactorily solved, and leads naturally to an inquiry as to the possibility of making the place of deposit the place of final disposal.

Kitchen wastes and kitchen water must be carefully regarded and removed. Kitchen crematories and incinerators of the most approved types should be freely used. The company incinerator largely used in the United States army which is economical of fuel and efficient in the consumption of liquids and solids is constructed as follows: Dig a pit five feet long, three and one-half feet wide and one foot deep. Fill the ground level with rock. Build a rim wall one foot thick and one foot high on two sides and one end. Bank earth on the outside against the rim walls to the top of same leaving open the end with no rim wall. If clay is available make a mortar of same and plaster it over the earth, banked against the two sides and one end. When hard this clay covering may be whitewashed. A

man should be specially detailed to care for the incinerator and keep it clean and neat at all times. The style of incinerator shown in the drawing employs an extra flue to secure an induced draft.

Incinerator with induced draft.

Vermin may be killed with gasoline, or by hot ironing or scorching underclothing. It is comparatively simple, by attention to personal cleanliness, to destroy full-grown lice, but the eggs are killed with difficulty, for they are deposited in the seams of underclothing, trousers, etc. Brush thoroughly, apply heat or rub in the special grease (vermijelli), which smothers the young on emerging from the eggs. Dust also with vermin powder.

In general, the functions of the sanitary service are as follows: (a) The institution of all practicable sanitary measures, to the end that the fighting forces suffer no depletion in strength due to avoidable causes. (b) The temporary care and professional treatment of the sick and wounded and their transportation to accessible points where they are transferred with as little delay as possible to the line of communications. (c) The supply of the necessary sanitary equipment. In addition, the sanitary service is charged with the preparation and preservation of individual records of sickness and injury in order that claims may be adjudicated with justice to the government and the individual.

The personnel of the sanitary service in the zone of the advance may be classified into two general groups, as follows: First, that attached to organizations smaller than a brigade, which functions under the immediate orders of the organization commander and accompanies its unit into combat; second, that attached to the sanitary train which functions under the orders of the division surgeon in accordance with such general or specific instructions as he may receive from the division commander. When necessary the sanitary personnel attached to organizations may be temporarily detached, in whole or part, and directed to operate with the sanitary train.

**MILITARY SCHOOLS.** See MILITARY EDUCATION; UNITED STATES MILITARY ACADEMY.

**MILITARY SCIENCE, Development of.** In tracing here the development of military science, we shall begin with the 19th century because everything relating to the military art

before its opening may be regarded as taking on, if the expression be not too strong, an archaeological character. In a military point of view, this century divides itself naturally into certain well-marked periods. We have first the great era of the Napoleonic wars, closed by the battle of Waterloo. This is followed by long years of peace, broken at last by the Crimean War. The next period to come under notice is that of our own Civil War, in which, in reality, modern conditions of warfare may be said to have taken their rise. The use of independent cavalry, the proper organization of field artillery, the entrenched battlefield, the influence of railways, to say nothing of other particulars now regarded as essential by all military nations, find their first formal expression, if not always their full development, in this great struggle. Recrossing the Atlantic, the next term in the military progress of the century is found in the rise of Prussia, through the defeat of Austria in 1866, as a power of the first rank, a position confirmed four years later by its complete overthrow of France. Since that epoch, military development, where fostered, has consisted almost wholly in an imitation, more or less close, of the German system of organization. These last years are marked, moreover, by a hitherto unparalleled application of the arts and sciences to the improvement of the material of war.

It is clear, then, that the growth of the military art during the 19th century was in no wise a direct function of the time. In some of its most notable aspects the art developed more rapidly during the past 40 years than it had in the preceding 100. So conspicuously is this true that we may not assert that its state at the opening of the century was even a transition state. In all countries, with the exception of France, the conditions of the 18th had overflowed almost unchanged into the 19th century. The era was that of the great Frederick. His example still bore undisputed sway, to such a degree, indeed, that the husk was mistaken for the kernel, the appearance substituted for the reality. The armies of the day were in all essentials hired armies, the soldiers mercenaries, in the sense that war was largely a trade. Organization, recruiting, mobilization, administration, supply, transportation—all these, the life-blood of a modern army, were, if not unknown, at least not understood as they are to-day. They had not as yet been generalized into a continuing system applicable to a state either of peace or of war.

Similarly of arms and of equipment: the flint-lock musket, found in the hands of the troops of all armies, had been for many years substantially a constant quantity, while gunpowder, the only explosive and propelling agent employed, had an unbroken ancestry of centuries of continuous use. The great objective in the training of men, France again possibly excepted, lay in the development of a machine-like precision of drill, and this rigidity was carried so far as to convert manœuvring, even under fire, into a sort of geometrical exercise. On the field, deep columns and serried ranks were the rule. Infantry opened fire at 200 yards with uncertain, if not innocuous, results at superior ranges. Naturally, under these conditions, cavalry could and did intervene directly in the decision of affairs on the battlefield. The range

of field artillery was limited, and, until Napoleon's appearance, its powers and possibilities were not, on the whole, well understood.

The picture changes when we turn to the 20th century. The army is now the "nation in arms"—that is, war is no longer a trade, but a duty, and preparation for war a personal obligation to the state. Upon a declaration of hostilities, at the present day, the effort is made to bring the full strength of the nation to bear, or in other words, mobilization takes place. But this implies a full degree of preparedness, and preparedness, in its turn, a thorough study and application of the principles of organization and training, of supply and administration. Here we touch upon a well-defined characteristic of final as contrasted with initial conditions; preparation for war goes on unceasingly, in times of the profoundest peace, although no possible cause for war can be discerned in any direction. On the material side, the transformation is equally complete. All the possible resources of modern science have been levied on to contribute their share not only toward the improvement of weapons and of war material in general, but toward supplying the means of placing and maintaining an army in the field. Where 100 years ago but one explosive was known, modern chemical science has supplied hundreds, and the end is not yet. Whereas, in the days of our grandfathers, any respectable foundry could turn out serviceable guns, to-day, the gun is the finest product of metallurgical science, and its construction necessarily limited to specialists. Instead of the flintlock, harmless beyond 200 yards, we have the magazine rifle, sighted up to 1,800 yards, and deadly two miles and more away. The muzzle-loading field-piece of limited range and accuracy has given way to the rapid-fire, breech-loading field gun, delivering from 10 to 15 aimed rounds of shrapnel a minute upon a target so distant as to be practically invisible to the naked eye, with an accuracy so great in trained hands that exposure is suicide. Under these conditions in open combat, the masses of elder days have dissolved into thin lines of invisible skirmishers, and cavalry has all but disappeared from the field of actual conflict. In general, armies have increased vastly in size, and important battles last for days and even months.

In war, as in everything else, the secret of success lies in organization and preparation. It is interesting, then, to note how two separate and apparently independent conditions have been combined in the evolution of the modern army. The first of these in time, and, with reference to actual combat, in importance, is the creation of the army corps by Napoleon in 1805. What a long step forward this was may be inferred from the fact that Frederick the Great's army was not formed into even brigades and divisions. Besides assuring unity of command, the creation of this strategic unit has led in modern times to the full recognition and definition of the "tactics of the three arms." All modern armies, therefore, whether they belong to military or to unmilitary nations, on taking the field are formed into corps, and these corps are maintained as organic units in times of peace by the great military nations of the world for administrative as well as for purely military reasons.

Hardly less important as leading to a prin-

ple of organization was the limitation imposed by Napoleon after Jena upon the size of the Prussian army. This was never to exceed 42,000 men, and, in fact, it never did; that is, at no time while the limitation was in force did Prussia keep more than that number of men under arms. But, thanks to Von Scharnhorst's foresight and intelligence, the members of this army were continually changing. As fast as trained, they were liberated to make room for new and untrained men. With the immediate results of this idea we are not here concerned: what we wish to bring out clearly is that this plan of organization, originally local in both time and circumstance, is to-day fundamental in the formation of the armies of all military states. Indeed, these, if the paradox be permissible, may be said not to have a regular army at all. Great Britain has one, as have the United States, but in all other important nations the condition of universal military service has made the distinction superfluous, if not meaningless, by wiping out one of its terms. Hence, with the exceptions noted, a mold exists, so to say, a form, through which all citizens capable of bearing arms have to pass. From this comes the dictum, "The army is to-day the nation in arms," as distinguished from the purely professional army of the earlier part of the century. The application of the principle of universal service has resulted naturally in a classification of the male population with respect to service. Thus we find in Germany the active army made up of the men with the colors, the reserve of the active army, the Landwehr and the Landsturm (q.v.). Classes more or less similar exist in other countries under different names, the underlying principle being, however, substantially the same in all. This principle further leads directly to the distinction between peace footing and war footing, passage from the one to the other being effected by mobilization, an operation unknown at the opening of the century. Since, moreover, the whole nation is the army, it results that the modern army has greatly increased in size, a result that would prove embarrassing but for the existence of the staff. It is clear that the formation, instruction, training, supply and administration of this army form a task of the greatest magnitude. Furthermore, when once formed, if it be not intelligently led and accurately directed upon its objective, it runs the risk, from its mere size, of degenerating into an armed mob. Hence the conditions leading to the formation of the modern army have led, *pari passu*, to the formation of the modern staff. This simply means that by a natural evolution the functions of the staff have expanded until they now include duties not formerly contemplated. Thus the conception of a general staff, whose special business it is during times of peace to study and prepare for any campaign whatever on any theatre of war whatever, is distinctively modern. The existence of such an organization is evidently a necessity due partly at least to the great size of modern armies. This very condition, by increasing the difficulties involved, has suggested the only cure of these difficulties—a body of specialists trained to weigh them in peace and to remove them in war. And so of the administrative staff under the same conditions: the supply of an army, taking that term in its most comprehensive sense, is reduced to

a continuously operating system. Obviously this particular question could not be left to look to chance for its answer.

The limits of this article forbid more than a mere mention of the influence of the railway, of the telegraph and of the telephone. The telephone is in current use upon the battlefield and wireless itself has been applied to military purposes both in action and in manœuvres leading to action. Without the railway, rapid concentration and regular supply would be impossible, a matter of capital importance in view of the great numbers enrolled. It would be hazardous to assert that it has been a prime factor in determining these numbers, but there can be no doubt that it has wielded a great influence in this direction. Other things being equal, it is logical and proper to have a large army, because the means of transporting and of supplying a large army are at hand.

The art of war is usually defined to consist of two elements, strategy and tactics. Of these, the former is essentially immutable, its principles, few and simple, having remained unchanged throughout the whole course of history. The only recent development in strategy is one, therefore, affecting not its principles, but the means of applying those principles. The employment of the railway, of the telegraph and of other means of communication has greatly increased the rapidity with which strategic combinations may now be carried out, and has added to the number possible within a given time and area. In general, then, strategy is not a measure of the changes occurring between any two given epochs, while tactics, on the contrary, responding sooner or later, if not instantaneously, to any new influence, does furnish such a measure. We shall here briefly consider the tactics of infantry from this point of view, because this arm is still the "queen of battles," and the others have to conform to its possibilities.

To clear the way, let us recollect that the tactics of infantry had remained substantially unchanged from the days of Gustavus Adolphus to those of Frederick the Great; that the latter, by the use of lines in place of columns as a habitual formation, had increased the mobility, and, by the substitution of an iron for a wooden ramrod, the rate of fire, of his troops. As, however, the range of the musket was extremely limited, fire was opened at very short distance, and, independently of any system of tactics, the bayonet was, therefore, a weapon of great importance. Indeed, it might happen on a rainy day that the bayonet was the only weapon available. As was but natural, Frederick's system, known as the "linear" system of tactics, was copied by all other armies.

With the French Revolution came a change. Unquestionably inspired by our own Revolution, in which, for the first time, skirmishers appeared on the field of battle, the French abandoning the precise linear system, substituted therefor small columns for manœuvre and assault, and deployed lines for firing. In manœuvring, skirmishers covered the front, unmasking it as each company arrived on the firing-line. We note at once that this employment of skirmishers is not the modern use, but, nevertheless, it marks the breaking of tradition. The French system, known as the perpendicular, was followed in all Napoleon's earlier cam-

paigns. In 1805 he prescribed that the normal formation of the division should be by "linked brigades," a disposition carrying with it the advantage of giving each brigade a separate objective. This principle is to-day fundamental in combat-tactics, even the company having its designated objective.

Frederick's system, decisively beaten at Austerlitz, was finally overthrown at Jena-Auerstädt, and, in 1813, the tactics of the French, including the use of skirmishers, became universal. But before this the English had adopted a two-rank formation, and had successfully opposed thin lines to the heavy columns which the French, for reasons into which we need not here enter, had apparently found themselves compelled to readopt in the Peninsula. In fact, the type-formation was not as yet firmly fixed, the English using heavy columns at New Orleans, and the French, in spite of their experience in Champagne, resuming them with disastrous results at Waterloo.

All the changes here touched upon, it will be noticed, are independent of any change or improvement in weapons, and are simply efforts in the direction of increased mobility and flexibility. Passing by the Crimean War in which, apparently, the experience of the past had been totally forgotten by both sides, we reach our own Civil War, "remarkable as a turning-point of tactics, there being scarcely a feature of the tactics of the present day that did not have its germ, its prototype, or its development in that great contest." Both armies were now armed with the rifle, the extreme range being 1,000 yards; in the Union army the breech-loader made its appearance before the end of the war. Marksmanship was of a high order on both sides, and infantry fire consequently so deadly as to effect marked changes in tactical formations. These are, briefly, attacks by rushes, attacks in successive deployed lines, the use of heavy lines of skirmishers in place of the line of battle, and the use of hasty entrenchments. They were brought about by the common sense of the American soldier, who, unhampered by tradition, knew how boldly to adopt his tactics to the confronting situation.

Europe, however, was slow in learning the lessons of our war. In 1866 the Prussians, using the breech-loader against the Austrian muzzle-loader, generally attacked in company columns, preceded by skirmishers, who were ordered to feel and develop the enemy. But the Prussian privates instinctively left their columns to join the skirmishers, with the result familiar to all. Strange as it may seem, the Prussian authorities failed to appreciate the new conditions of warfare, for, deprecating "the disorder and tumult of the impromptu attack-formation, which had sprung into being under the Austrian fire, . . . they waited for the appalling losses of a greater war to emphasize the necessity of a change in their prescribed tactical methods." This experience came in 1870. Both combatants were now armed with the breech-loading rifle, the Chassepot being effective at 1,300 yards. Before the end of the war, under the superior rifle fire of the French, the Germans found themselves compelled to deploy their columns, the direct attack being made, and the hostile position invariably carried, by the rushes of swarms of skirmishers.

All the nations of Europe now hastened to bring their tactical systems into agreement with the experiences of the Franco-Prussian War. But it took still another war to drive home the conclusions reached by us in 1861-65. The Turks, in 1877-78, armed with the Peabody-Martini rifle, a weapon vastly superior to any heretofore used, by their use of the American system of hasty entrenchments compelled the Russians finally to deliver their assaults in successive lines of deployed battalions.

This very brief outline shows us that the revolution wrought in infantry tactics has been due almost wholly to the improvements in the rifle. The most recent of these, namely, the introduction of rapid fire through the use of a magazine, will simply carry on the development along the lines already laid down, while the advent of smokeless powder has increased the powers of the defense. All the conditions of the modern combat, therefore, combine to make the frontal attack the exception, flank attack the rule, a principle which is characteristic of modern tactical methods. And it should be recollected that where flank attack is impossible (e.g., on the western front, War of 1914), frontal attacks are preceded by artillery preparation of so intense a character, that, under these circumstances at least, the artillery is the principal, the infantry, the auxiliary, arm.

But progress has been marked in other directions as well. We may remark the importance of "combined tactics," or "tactics of the three arms." This, of course, is not a new idea; it has simply received fuller expression through a more stringent application of the principle of division of labor, growing out of the universal recognition of the corps as a strategic unit. As this is really a complete army in itself, though on a small scale, so its full effect can be felt only in case all the arms composing it act in concert to secure the common end. Hence, the powers of the three arms are, perhaps, more accurately measured, their relations to one another better adjusted. The new rôle of cavalry, too, deserves notice. If it has lost its former weight on the actual battlefield through the power of both infantry and artillery fire, it has gained in consequence of its employment in independent masses. Operating far in advance of the army, it is the purpose of these masses to cover its concentration and to screen its movements, while seeking at the same time to prevent the formation of the hostile forces, and in any case to discover their emplacements, numbers and objective.

In other ways, too, it has gained. The dismounted fire-action of this arm—that is, its action on foot as in infantry—is now recognized, the alternative being helplessness on the tactical defensive. So highly have we developed this mode of using cavalry in our own country that many foreign writers have asserted that our cavalry is only mounted infantry. Our answer is that all European mounted troops are either reluctantly or unconsciously conforming to the type of the American cavalryman of 1864-65, without abating one jot or tittle of their right to be, and to be called, cavalry. In England, chiefly, a solution was sought in the creation of mounted infantry. The idea here was that the horse shall serve purely as a means of rapid transportation, his rider dismounting

on reaching the scene of action. No better example can be found than that furnished by the British themselves in South Africa, in their attempts to cope with the mobility of the Boers. The reader will recognize at once in the mounted infantry a reversion to the original type of dragoon. But mounted infantry has now ceased to exist.

We may fitly conclude this part of the discussion by drawing attention to the increased responsibilities devolved by modern conditions of warfare on the private in the ranks. He has ceased to be considered a machine, mere food for powder, a molecule of the mass whose shock is to crush the adversary. On the contrary, as many occasions will surely arise calling for the exercise of sound judgment, so is he expected to be an intelligent element of the national defense, his value to his country bearing a direct ratio to the degree to which his intelligence can be awakened and trained.

No survey of the subject would be adequate without some reference to the immense development given by the mechanical spirit of the age to the engineering of war. Of course, the impulse in question is not purely military; it is simply the application to war of a principle pervading every other phase of life. In general, every invention that might possibly increase the economy, certainty or rapidity of a displacement, whether of men, of material or of projectiles, has been summoned to give its share of improvement. All inventions bearing on the transmission or acquisition of intelligence have been pressed into service. One of the latter is the balloon; it antedates the century, but the idea of photographing the enemy's position from its car is new. So is the application of wireless telegraphy to purposes of communication in the field; this invention was turned to a military end almost before it had definitely left the inventor's hands.

The greatest advance, however, has been in the perfection of man-killing machinery. Upon this one subject have been expended all the resources of modern metallurgical and chemical skill until the projectile weapon of the day, whether gun or small-arm, is a marvel of strength, accuracy and convenience. From the rude tube of our forefathers we have passed to engines of complicated structure, deadly beyond the limits of unaided vision, and of a rapidity of fire undreamed of even 30 years ago. So great is the volume of fire, so destructive the shrapnel, that in field artillery duels the question of success is reduced to that of being the first to get the range. Each class of guns must now have its special propelling agent, and a serious effort is making to discover some means of launching in safety the frightfully destructive explosives due to modern chemical research.

Side by side with this sort of development has marched that of the art of protection. But here, in contrast with the increasing complexity of the means of offense, we remark the increasing simplicity of the means of defense. At the dawn of the century, the genius of Vauban still prescribed the bastion system for any and all sites to be fortified. Just as in the field, rigid and pedantic notions governed all troop-evolutions, so in fortification the prevailing idea in each case was to furnish a rigid geometrical solution. But later the idea was first of all to

adapt the work to the site, independently of the type. Steel turrets, cupolas, armored casemates, were provided for specially exposed points—a solution made possible by the great general advance in metallurgy. Concrete displaced masonry, and the face presented to the enemy was always either of earth or, where that was impossible, of steel.

Upon the general question of fortifications, authorities were divided into two camps. Those of the first asserted that fortresses covered a mobilization, retarded the enemy, allowed a defeated army to refit under shelter. Their opponents, on the other hand, maintained that they tied down an army, reduced the numbers of the field armies; that forts would be covered and not reduced; that they would not keep out a superior, and would be useless against an inferior, enemy; and that a government could not afford to man them, if the antagonists were otherwise evenly matched. In the meantime, the frontiers of Europe bristled with forts, and most important capitals were the centre of a vast entrenched camp. The great contribution of the 19th century to the question of fortification was not so much one relating to the type, though this was marked, as one relating to the occasion. From hasty or improvised entrenchments these latter days have seen the evolution to such defenses as those first of Petersburg, then of Plevna, and lastly of the battlefields of the War of 1914, erected not with the deliberation of peace, but under the stress of war, to meet its exigencies as they arise. See FORTIFICATIONS.

The principles hereinbefore set forth came to their full growth during the World War. The nation in arms, the importance of communication, the application of mechanical resources, the power of artillery, all these and other matters as well, received in that war an extension undreamed of before. To these must be added aeronautics and the use of the motor vehicle. So marked has been the effect of all these elements, that on one front, the western, war may be said to have changed its face, in that it passed from field fighting to trench-fighting; it is within the compass of the truth to say that on this front we have had the phenomenon of two armies besieging each other. And this example is typical of future conflicts between two numerous, brave, highly-trained and completely equipped adversaries.

The principle of the "nation in arms" coupled with growth of population (Germany) or with the existence of a great population (Russia) has led to the formation of armies so vast that operations pure and simple are continental in range, e.g., western front, from the Channel to Switzerland; eastern, from the Baltic to Rumania. Hence violations of neutrality with consequent degradation of international law. The needs of the vast modern hosts call for an equally vast development of the systems of transportation. Hence not only are railway systems increased in time of peace, sometimes merely for future military necessities, but motor transport has been, and will in future be, called upon to the limit of its possibilities. An excellent illustration is furnished by the French at Verdun, regularly supplied by a train of over 6,000 motor vehicles. But the application of motor resources is only one item of the "mobilization of industries" by a

nation at war, a mobilization as vital to success as the science of the generals and the valor of the men on the line, and that will assuredly be a factor of dominating importance in any war to come. In other words, whenever a great nation goes to war, not only must it put into the field and there maintain enormous armies, whose effectives are numbered by millions, but the energies of the people at home must be wholly concentrated upon the supply of those armies in the field. The expression "the nation in arms" has taken on a new and significant meaning.

The most important of the supplies just mentioned, in a purely military point of view, is that of munitions. For side by side with other improvements has gone the evolution of artillery. Foreshadowed in the Balkan wars, it is accepted as a principle that an army must be accompanied not only and merely by the classic field piece of small calibre, but also by large-calibred pieces, effective not only against troops, but against positions as well, and not only against positions taken as the fortune of war may dictate, but against positions, i.e., fortresses, or their future substitutes, carefully prepared in time of peace. For the evolution of artillery has caused fortresses as such to lose their value: Liège, Namur, Maubeuge, Antwerp proved of no account, and if Verdun held out, it was not because of its strength as a fortress, but simply because it had become a sector in a long line, like that of Ypres or Arras. It has been made abundantly clear by the war that cities, capitals, fortresses and provinces will be taken in vain, so long as the enemy army remains unbeaten.

When two armies are besieging each the other, and resting on impassable flanks, only frontal attacks are possible: this has produced a strength of trench that can be overcome only by the intensest long-continued artillery fire using high-explosive shell, an expense of ammunition made possible only by mobilization of industries. Under these conditions, "lines" have become literally areas of trenches, one line behind the other, joined by communications. The capture of a first line may be a success of no value. In the defense of these entrenched lines, the machine-gun has played during the European War, and will play in the future, in field-, as well as in position-fighting, a part of the first importance. Mining and counter-mining, heretofore used only in sieges of regular fortresses, will have peculiar weight when two entrenched armies face each other over a long front impossible to flank. And these armies will normally live, move and have their being under the ground.

A feature of trench warfare in the World War was the occasional but deliberate use of asphyxiating gases and burning liquids. Whether in the future this violation not only of The Hague Convention but of fundamental humanity will be endured only experience can tell but there is every reason to believe that asphyxiating gases have come to stay. The end of the war saw them used in cloud form, and in projectiles (projection and artillery projectile proper). That is, the gas projectile had won its right in open warfare, and had become as much a necessity as the shrapnel itself.

The greatest advance in the military art proper has resulted from the application of

aeronautics, the great contribution of the 20th century. First shown to be practicable by the Wright brothers, aviation, neglected in America, was at once seriously taken up by the French and converted to military use. The rest of the world (the United States and Great Britain excepted) soon followed suit. The aeroplane has been without influence on strategy, but has profoundly affected tactics. It has made surprise well-nigh impossible and dissipated the fog of war. Thanks to its assistance a commanding general now *sees* the enemy, and what is more sees him almost at once. Hence combinations of troops, movements, concentrations are reported almost as soon as made, intentions laid bare and adequate measures of prevention made possible in good time. The aeroplane moreover has proved itself indispensable to the artillery by correcting fire and by detecting hostile batteries whose emplacements would otherwise be unknown. As an agent of destruction, it was not nearly so useful at first as it was in the acquisition of information. But as the war progressed bombing became generalized on both sides; with direct military results when employed against railway stations, depots, ammunition dumps, troops in concentration and even in combat. The airship (Zeppelin) has on the whole disappointed expectation: it should be recollected, however, in respect of both airships and aeroplanes that the whole subject, in spite of the experience of the Great War, is still visibly in its infancy. See MILITARY AERONAUTICS.

Whether other wars will follow the great conflict that broke out in 1914 no one can undertake to say. In the meantime it may be safely asserted that human nature, integrated into national ambitions, will continue to be what it always has been. Hence future struggles are not unlikely. When they do occur, they will call into play the whole of a nation's energy. High courage, nobility of principles, unselfishness of ambitions, these alone will not avert defeat and disaster.

C. DEW. WILLCOX,  
Colonel, United States Army; Professor,  
United States Military Academy.

**MILITARY SERVICE INSTITUTION OF THE UNITED STATES**, a society of officers of the United States regular army, organized in 1878 by Generals Fry, Stanley, Rodenbaugh, Colonel Lieber and others. It was designed as a similar organization of the Royal United Service Institution of Great Britain. The presidents of the American Society have been Generals Hancock, Schofield, Miles and Ruger. The headquarters are at Governor's Island, N. Y., where the institution has acquired a library of 20,000 volumes, including many rare documents. The society issues *The Journal of the Military Service Institution*.

**MILITARY SURGERY.** Military surgery was first recognized as a separate branch of medical science about the middle of the 16th century, but was not taught as a special study in medical colleges until the year 1829. Since then instruction has been given by the ablest surgeons both in Europe and America.

At no time in the history of the world has there been so great a number of powerful and destructive instruments of war as during

the terrible conflict of the great World War. Statistics prove that at no time has there been so great a saving of life among the sick and wounded. We must not be surprised to note that a great part of mankind has occupied, and still continue to occupy, themselves in the improvement and perfection of the art of war, and that this art of destroying life is constantly advancing.

For the earnest, faithful army surgeon many opportunities for careful study and close investigation are offered. Perhaps on his skill in caring for the sick and wounded depends the success of a campaign. The well-defined and carefully prepared plans of our ablest generals have been defeated and come to naught through the incompetency of medical officers. It is, therefore, the duty of the military surgeon to prevent, as far as possible, all useless expenditure of life. If battles must be fought, the results should be obtained with as little mutilation, suffering and sacrifice as is consistent with life and the welfare of the cause. For this the world is indebted to our profession.

Subjects absolutely necessary and important for the surgeon to understand in performing the duties that pertain to an army surgeon are: In addition to climatic condition, he must have knowledge of the location of the country from which the soldier comes and his surroundings there; knowledge of the care of the individual—clothing and personal hygiene. It is to be remembered that the majority of soldiers are made up of youths from the age of 18 to 25, and, generally speaking, they know very little about the care of themselves individually. In the examination of the selective draft man the medical department must learn all about his habits, some of them to be corrected, as he enters upon his military life, and others of such a nature as to exclude him. The study of hygiene is of great importance, such as the care of the camp. Soon after our men were being assembled at the cantonments there was a development of chest trouble, such as bronchitis and pneumonia. Surgeon-General Gorgas made a very thorough, personal inspection, discovered it was the result of an overcrowded condition, very difficult to correct, but attended to as rapidly as possible and resulting in immediate lessening in number of the sick. Also the kitchen, cooking utensils, drainage and sanitary surroundings of every kind should be carefully studied. The subject of food supply and its manner of preparation exacts great interest on the part of the medical officer, regarding a correct diet. You might present a meal to the British soldier that would please him very much, but it would not be well received by the American soldier, or those of other nations. The medical officer must inform himself also upon the nature of all insects, vermin of every description, the evil effects of even the house-fly, for at the present time all of these factors enter into the development of diseases that disable and impair the best work of the soldier. He must understand fully all that pertains to the quartermaster and commissary departments, in order that his sick may receive such luxuries and comforts as are their due. His knowledge of camp diseases is absolutely necessary—typhus, typhoid fever, for all infectious diseases come to him and must

have immediate attention. These are conditions that will admit of but a few hours' delay, and then attention to minor cases, such as the care of the feet, is so very important. Within a few years the specialty of chiropody has advanced in a marvelous manner, and the soldiers are fortunate in having with them a number of attachés of the hospital who are competent to give proper treatment. Proper care must be taken of the feet, and perfectly fitting socks and shoes is another of the admirable methods adopted by the surgeon-general's office, all this working to the advantage of the soldier.

The military surgeon must have an acquaintance with many medical problems: The conditions developing diarrhœa and dysentery, the exposure to heat and cold, causing sunstroke and frost-bite, all of which he must be familiar with; the condition and treatment of the various classification of burns that occur from fire and from the materials used in some of the high explosives, also the care of the soldier who suffers so seriously from multiple wounds made by the explosion of the so-called "mud shell," the particles penetrating the clothing, and where there are often 50 to 100 abrasions that are very painful. A responsibility of grave importance is the selection of the camp site, and which is usually entrusted to the medical officer, as it should be.

When the United States entered into the European War the surgeon-general's office, endorsed by the War Department, organized schools of instruction. The splendid response made by the members of the medical profession to comply with the government's request that they have a few months' preparation for army service has enabled thousands of doctors to better fit themselves for looking after the sick and wounded soldiers than in any of our previous wars. It was said by United States army surgeons, when this war began, in August 1914, that, in many respects, it would be the most humane ever waged; that it would be settled in a much shorter period of time than most persons believed possible; however, this prophecy came far short of the real result. Today dressing stations, evacuation and base hospitals are terms with which we have become very familiar. It was stated, and this has proved true, that the mortality list from disease would be very small. The control of typhoid, typhus and malarial fevers has been very perfect. Alas! that the epidemic of influenza and septic pneumonia has presented so many serious conditions hitherto unknown, causing a death rate that, while not large, yet was unexpected.

While it was believed that the rapid-firing rifle, with its smaller metal cap bullets, would disable men quickly, the results would not be so fatal in the loss of life, and would not cause so great a number of seriously injured as when the slow-firing, larger bullets, such as was the Minié ball, used during the Civil War. This, to a great extent, has proved true. The breaking of bones, the tearing of blood vessels, the injuries to nerve trunks, in proportion to the number of wounded, has not been as great in this war as some of our recent conflicts.

Much important experience had accumulated during the Russo-Japanese and some of value during the Spanish-American War. To-day, as a whole, wounds have not been so fatal, but

the prediction that there would be a less number of infective wounds and injurious complications has not proved to be true. The knowledge of preventive methods, and important sanitary precautions, has helped decidedly in the saving of life, as they have been so vigorously investigated and carried out. The sad lesson of the Spanish-American War had served to warn our medical officers and they have made a noble success of all that has been placed at their disposal for the care of the soldier. One can enumerate but a few of the many aids that have come to the medical and surgical departments of the American army, in this war, such as the Red Cross, the Y. M. C. A., the Y. W. C. A., the Knights of Columbus, the Salvation Army, the establishment of canteen huts, stations at the front for dressing of wounds, the evacuation hospitals, base hospitals, methods of transportation, which have never been equalled, and when the statistics are finally compiled, it will be greatly to the credit of our surgeons that they did all that was possible for the sick and wounded soldiers.

When war begins suffering and pain enter, and the surgeon, having everything in readiness, endeavors to relieve his patient as promptly as possible. The use of anæsthetics has passed through a very thorough analysis, resulting in the positive doing away with all mixtures of ether, chloroform and alcohol, for they have met with little endorsement in military operations. The same experience has come to many surgeons in civil life as the unequal evaporation makes their use somewhat uncertain. The administration of ether, or chloroform, separately, with plenty of air, has resulted very favorably. It is to be observed that many of the writers on the subject have endorsed placing the patient under a minimum narcosis, then watching them very carefully, and the after effects have been excellent. Local anæsthesia seems to have inspired a good deal of confidence, particularly among those who are working in the evacuation and base hospitals, as well as rest homes.

As the battle opens the sight of blood is the first object lesson to the alert surgeon. For lack of prompt and efficient treatment of hemorrhage many a soldier has yielded up a noble life. The control of hemorrhage has been carried out along the lines of the civil surgeon. Mombert's method of controlling hemorrhage, for amputation at the hip-joint, does not seem to have met with any great advance, and the number of operations done are comparatively few. The use of the tourniquet in some form has been applied by fearless assistants and the stretcher-bearers in so intelligent a manner that many lives have been saved. Wyeth's method has been of service.

Surgery of the heart has presented some very striking illustrations of progress, in keeping with the advances of the past few years in civil life, regarding the operations done in this direction. Especially is this true in bayonet and stab wounds, and here an excellent opportunity is offered for securing an estimate of the final results. There are so many more cases to be studied than in civil practice. Much research work has resulted and more operations were performed than could possibly have occurred in civil life for decades.

It is interesting to note the treatment of

such large vessels as the inferior vena cava and others that have been reached when operating upon wounds of the abdomen. Injuries to the arteries and veins have developed a large number of traumatic and arterio-venous changes. Apparently nothing has escaped the military surgeon of to-day. Surgery of the blood vessels, in the form of traumatic aneurisms, as well as like surgical procedures, will, when the concensus of opinion has been reached, show that great skill has been exercised from time to time in doing this work.

Possibly there is no part of the body that will show such marked advance in immediate operative interventions as that of gunshot and stab wounds of the lungs, together with more or less fracture of the thorax and in the lodgment of foreign bodies within the cavity of the pleura. This is well illustrated by the entrance of a portion of shrapnel within the cavity of the lung. An immediate operation is done, at the nearest place to the receipt of the injury, with safety to the operator and assistants, the wound enlarged, portions of fractured ribs removed, if required, hemorrhage controlled as promptly as possible, the lung exposed, the foreign substance searched for and removed, then thoroughly aseptic work accomplished, the wound closed, with or without drainage, and a very large proportion of these patients make a prompt recovery, without suppuration. The employment of air bags, sacks or balloons to fill space, and for the lungs to press against—removing them gradually—apparently has proven of value. No such splendid work as this has been accomplished in the history of any of our previous wars.

This same prompt operative intervention also applies to wounds within the abdominal cavity. There was a marked contrast in the history of surgery during the first year of the World War, and that of the last, regarding the advances made in the treatment of these wounds. In the first period many surgeons were of the impression that non-operative interference in a penetrating wound of the abdomen led to more successful results, but, gradually, in the study of these cases, they became more practical, and, as a result of their observations, surgery was pushed to a point of careful inspection and operative work, where "the sooner the better" it was discovered. So soon as the patient could reach a place of safety, and proper appliances, an operation was done at once, consisting of opening up the abdominal cavity, if necessary resecting the intestines, or properly closing all wounds or lacerations within the cavity of its contents, controlling hemorrhage, and then carefully closing the wound. It has been shown that many of these cases die of hemorrhage if not operated upon at once. Only in such cases as seemed absolutely necessary was drainage made use of, and the percentage of recoveries has been most marked. In these wounds, and which also applies to the cavity of the cranium, the same bold successful surgery was done in enlarging the opening in the skull, trephining as called for, placing the patient in as comfortable a position as possible for transportation—which applies to all wounds in any portion of the body—not handling any more than can be avoided, the dressing watched carefully, not to be disturbed, if all goes well, and when

reaching the base hospital keeping them absolutely quiet.

There is no doubt that when the final chapter on the history of surgery in this Great War is written, there will be largely to the credit of the skilled and able surgeon a record of such great progress as will astonish the medical man, who can yet look back and call to mind his experiences during the Civil War, the Franco-Prussian War, the Spanish-American War and the Russo-Japanese War.

Never has an army had such eminent specialists to care for their sick and wounded. Great advances have resulted in the splendid manner in which the question of transportation has been solved. No army has ever had such a perfect system of ambulances—electric and otherwise—steamboat and railroad facilities, and the avoidance of handling the wounded has added greatly to their recoveries.

Especially to the credit of the American surgeon is the adoption of the method of continuous treatment from the dressing stations to evacuation and base hospitals, and the standardization of splints. This has been kindly received on the part of the surgeons in the various armies, and has proved of inestimable value. In all the various wounds that have been studied and treated, during the nearly five years' of this war, it is plainly noticeable that, step by step, surgery has advanced, with that degree of success, that the final summing up will demonstrate the greatest progress in history, in the ability to return men to the fighting ranks, with so little loss of service, and in the actual saving of life.

Another chapter has been added to making surgery a more exact science. The art, the skill, could scarcely be improved, for in other wars we have had evidence of some of the most scientific operations possible for human ability to perform; however, the great advantage this modern military surgeon possesses, in instruments, operating paraphernalia, dressings, splendid nursing, can not be excelled in the best of civil hospitals and all this aided materially in the wonderful success.

Great gratitude is due the women of America for much of these splendid results. Their weary days of preparing surgical dressings have been well rewarded. Out of it all is to come a knowledge of the treatment of wounds that is apace with the fierceness exhibited by the cruel weapons employed in this recent war, and with more destructive surroundings than ever known in the history of the world.

What can directly be called military surgery has never presented such an amount of material, including research, laboratory investigations and the study of all forms of wounds inflicted by every possible kind of missile—gas, mustard and poisoned bombs, liquid fire, disease-producing germs, everything conceivable for the destruction of human life. All of these conditions our surgeons, aided by the chemist and investigations in the laboratories, have been able to treat promptly and successfully, as our medical journals so clearly indicate.

In collating the advances made in the department of military surgery medical journalism deserves great credit.

In the War Supplement of the 'Index

Medicus, 1914-17,' the classification of all papers and addresses on the subject is a marvel.

The energy exhibited by the bacteriologist and the ability to bring the laboratory up to the firing line has aided immensely in obtaining methods of relief; however, it is yet too early to give any positive, concise summary of the methods adopted for the treatment of these differently classified wounds, under the care of the evacuation and base hospitals, but out of the vast amount of material there will result unmistakable evidences of success.

X-ray work has been of a superior quality, particularly when applied to the extremities, such as the long and small bones of the arms, hands, legs, feet and all irregular bones, as well as soft parts, muscles, vessels and nerves. The apparatus is now so perfect there is little risk in the development of X-ray burns.

Great progress in the treatment of wounds followed the Russo-Japanese War, yet no war has ever presented when the ability to treat injuries of the kidneys, ureters and bladder was equal to that which has been accomplished in this present conflict, regarding the immediate care of these cases. It may be stated here that the rich supply of X-ray apparatus has enabled the surgeon to study with great exactness or to obtain such important information, after receipt of the patient in the evacuation hospital, as was hitherto unknown.

There is now a record of the application of modern dentistry, by employment of the X-ray and producing radiograms to be studied carefully, that not only is of great value in immediate treatment, but will continue to be in all reconstructive work.

There can be no question but that the wearing of steel helmets has lessened scalp and skull wounds and injuries of the upper portion of the face and neck by a large percentage.

It is interesting to note that in shaping the latest patterns they had had in mind even greater protection. The one objection has been their weight.

It is a matter of great interest to note the similarity of wounds in connection with the American Civil War and the European War.

The free use of shrapnel presents a bullet producing a wound very much like that of the Minié ball of the Civil War, but the bullet of the machine gun of to-day is not so destructive as that of the rifles during the earlier conflict.

Aside from this progress, to which we have referred, the study and treatment of tetanus became a very important subject. The first year of the war very rapidly developed the danger of immediate infection of the wounds, and a large percentage of the cases when they reached the base hospitals were in an infected, suppurative condition. In association with these wounds was also the development of cases of acute tetanus, largely thought due to the nature of the infective soil where the fighting occurred, and here, near the battle line, laboratory work has been of great assistance. The consequence is that prophylactic treatment by use of the tetanus antitoxin serum, in all lacerated and dirty wounds, lessened the number of these cases very decidedly.

The British were slow in making use of this antitoxin. The American military surgeon had

learned from civil life its great value and was at once prepared to employ it. Here credit should be given to the great State of New York in early establishing a State laboratory for the study and free distribution of this serum to its boards of health.

The one great department that can be classed as a division of military surgery will be known as orthopedic or reconstructive work, and the hospitals that have been established by the United States government will undoubtedly result in the restoration of the functions of various portions of the body in a manner hitherto deemed impossible.

Reconstructive occupational therapy in the study and treatment of lesions of the organic nervous system is apparently receiving a good deal of attention.

Shell shock is a new term, possibly to be followed by a better interpretation of this new lesion in war surgery, but its proper understanding and treatment is being worked out in a most admirable manner. There can be no doubt that men are seriously affected by the bursting and passing of shells and the firing of these high explosives. The system receives a shock that afterward manifests itself in various ways. The patient may become temporarily insane, his mentality receiving a severe shock in many forms. It may be only functional and disappears when surroundings are such as to restore his confidence, returning him to his former normal courage and ability to get control of himself. There have been a good many of these cases, and great care must be exercised that no injustice be done in their diagnosis and treatment.

The treatment of gunshot wounds of the face and jaws have attracted much attention. In the building up of the face, the nose, and especially that portion that relates to fractures of the upper and lower jaws, our military surgeons have recognized the aid of the up-to-date dentist.

During the entire time of this World's War civil practice has been quite entirely overshadowed, the study and treatment of wounds received in battle claiming the greater attention.

In the care of wounds it was early observed that prompt treatment was of great importance. The removal of all possible sources of infection, giving a clean incision in the soft parts, then bringing them together, resulted in excellent recoveries.

It was assumed that wounds passing beyond the eighth hour were in danger of infection and more serious complications, giving a prolonged and anxious line of treatment.

Free incision, when once the wound showed evidence of infection, care in removal of any material that might have been left behind, brought out different views as to irrigation, drainage and the use of antiseptics. There has been great discussion regarding the use of the latter, some surgeon writers coming to the conclusion that any sterile preparation — and keeping the part clean — was sufficient.

The Congress of American Surgeons and Clinical Surgeons was arranged with great care by its officers for 1918, and many surgeons connected with the armies abroad accepted invitations to prepare papers and discussions on the classification and treatment of wounds.

In consequence of the epidemic of influenza this meeting had to be abandoned, which was a great disappointment to all; however, the foreign delegates who did come visited a number of our larger cities, attended hastily called meetings and gave clinics, that, later, as they appear in our medical journals, will add greatly to our present literature on military surgery.

As has been stated, it is impossible at the present time to make any positive report on what is ultimately to be shown as the better treatment of all wounds; however, this can safely be said: At dressing stations, so far as time and the wound will permit, such dressings should be applied as will enable the patient to reach the base hospital. More serious wounds are to be treated at the evacuation hospital, such as the control of hemorrhage, amputation that may be necessary, all wounds that can be, and time will allow, to have more permanent dressings, in order to transport distances to the base hospital with as little handling and disturbance of the dressings as possible. Here should be used prophylactic doses of the tetanus antitoxin in such wounds as seem to require it. On arrival of the wounded at the base hospital all cases to be carefully inspected, those found infected to have free incision, all necrosed tissues, or foreign substances, such as pieces of clothing, dirt, fragments of missiles, anything that may conduce to the spread of infection, removed, and bringing the wound into a better condition for immediate union. Also in these cases there enters the application of the drainage tube, and the beginning of the Carrell method of treatment, the Dakin antiseptic solution, the use of the newer antiseptics, such as dichloramin-T., chlorinated eucalyptol, chlorinated paraffin oil, aceflavin and proflavin, brilliant green and other methods of antiseptic dressings. Wright's theory of thorough irrigation and the 20 per cent solution of picric acid in alcohol have been used with good success in the treatment of sepsis. In the cases of gas infection, or gas gangrene, emphasis is placed upon long and free incisions, amputations without any attempt at bringing the flaps together and also the use of the serum treatment. Keen's book on "Treatment of War Wounds" has afforded much valuable information.

In the treatment of convalescents it is very much to the credit of our government that the wounded are being brought as near to their homes as possible, and one has but to notice the almost daily arrival of steamers to observe how faithfully this is being carried out.

ALBERT VANDER VEER, M.D.

**MILITARY TELEGRAPH**, commonly applied to the use of telegraph wires in warfare as in the Civil War when a corps of engineers constructed temporary telegraph lines from the front to points in the rear of an army. In later years this system has been superseded by the heliograph (q.v.) and still later by wireless telegraphy and the use of flag signals commonly known as wig-wagging (q.v.).

**MILITARY TENURE.** See **TENURE**.

**MILITARY TERMS.** The numerous changes (strategically and tactically) and advancements in the science and art of war brought forward many technical military terms, most of which are known and understood only

by the military student. The following are the more important of such terms:

- ADVANCE SECTION.**—The area of the service of the line of communication within which are situated the advance depots of ammunition, supplies, animals and material from which issues are made to divisional trains.
- AERIAL MINE.**—A type of grenade, weighing as much as 200 pounds, used to beat down the enemy's defenses, destroying his sand bags and revetments, and cutting away wire entanglements and other obstacles. A smaller variety is known as the *winged torpedo*.
- ALIGNMENT.**—A straight line upon which several elements are formed, or are to be formed; or the dressing of several elements on the same line.
- ARDOIS SIGNALS.**—A system of signaling in which a set of electric lanterns arranged vertically on a staff is used to send alphabetical signals. The globes of the lanterns are half red and half white and the letters are formed by the different combinations of the two colors.
- ARMED TRACTOR.**—An armored motor car, resembling an enormous armadillo, capable of advancing over rough terrain. Its chief work is to locate the machine gunners and blow them out of their positions and thus save the advancing infantry.
- ARTIFICIAL DARKNESS.**—A temporary expedient in dissimulation. It may be produced by the discharge of black powder, or by burning damp straw or setting fire to vegetation to form a heavy cloud of smoke. The darkness of night may be intensified by throwing the beam of a searchlight across and some way in front of the object to be screened.
- ASSEMBLY POSITIONS.**—When compelled to withdraw, troops that have been actively engaged are usually obliged to fall back for several miles in deployed formation before efficient reorganization and assembly is possible. The assembly position must be far enough to the rear to enable the deployed lines to thoroughly free themselves from all contact with the enemy.
- AZIMUTH DEVIATION.**—In gunnery, the difference between the azimuths from the directing point of the battery to the centre of the target and to the point of splash at the instant the projectile strikes.
- BARRAGE.**—A wall of shell fire thrown against an advancing enemy with such regularity that troops cannot pierce it. It is employed to prevent an enemy's advance or retreat, or the bringing up of reinforcements. It is also used for the protection of troops advancing to the attack.
- BASE.**—A place where the line of communication originates, where magazines of stores for the forces in the field are situated and maintained under direct military management and control and where the business of supplying these forces is located and organized under the military authorities; in fortification, the exterior side of the polygon; in ordnance, the protuberant rear portion of a gun between the knob of the cascabel and the base-ring; also the element on which the movement is regulated.
- BATTALION RESERVES.**—Reserves, usually consisting of at least one company, used to reinforce the firing when the whole of the supports have been thrown into it, to reinforce the firing line at the moment of the assault, to cover the advance of the firing line, to protect the flanks from counter-attack and, if possible, to bring an oblique or enfilading fire to bear on that portion of the enemy's position which is being attacked by the firing line.
- BATTLE SIGHT.**—The position of the rear sight on the service rifle when the leaf is laid down. This corresponds to a range of 547 yards.
- BAYONET COMBAT.**—The last resort, either in attack or defense, is the bayonet. The percentage of bayonet wounds, as compared with bullet or shrapnel wounds, is small, but a man wounded in bayonet combat seldom recovers. Hand grenades are much used in breaking up bayonet charges.
- BEARING.**—In map reading, the angle a line makes with the true north line is a true bearing. The angle a line makes with the magnetic north line is a magnetic bearing. The angle in both cases is measured from north by east and south.
- BELGIAN PITS.**—In trench warfare, small shallow pits, constructed in a number of rows, generally seven. The spaces between the pits are made impassable by pointed stakes and tripwire. Wire nooses are also anchored here and there.
- BEST POINT OF ENTRY.**—In an approach against a fortification, the *blindest eye* of the work, or the particular spot in its firing-line where its own fire is least effective over its immediate foreground, or is least well supported by cross fire from adjacent works, or from artillery in the distance.
- BLEAZID.**—A high explosive used for detonations. Its force of detonation is twice as great as that of fulminate of mercury and it resists high temperatures.
- BOMB SCREEN.**—For protection against bombs and grenades a grille of wire netting is erected in front of the trenches and arranged at such a slope that the majority of grenades passing over the screen will also clear the trench.
- BRACKET.**—In gunnery, a space in the direction of range, the limits of which are determined by firing. A target is said to be enclosed in a 100-yard bracket when, of two ranges differing from each other by 100 yards, one is over and the other is short of the target; also, the cheek or side of an ordnance carriage.
- BURST INTERVAL.**—In gunnery, the distance in the plane of site from the point of burst to the target. It is given with a minus sign when it is between the gun and target, and with a plus sign when it is beyond the target.
- CAMOUFLAGE.**—A blind or cover screening military movements and operations from the enemy air scouts, and other reconnoitering parties. The most practicable and convenient cover is made of small foliage-bearing trees and brush. Camouflage, in its fullest sense, is the art of varying the visibility of objects, and of deceiving as to their nature.
- CLOCK-FACE METHOD.**—In gunnery, a method employed to indicate the position of the target described in relation to a description point. In employing it, the clock-face must be imagined as hanging vertically, with its centre directly over the description point.
- CLOSE BILLETS.**—Billets adopted when a greater state of readiness is required than is possible in ordinary billets. For this reason, tactical considerations invariably have precedence over considerations of comfort, and arms and units should never be mixed.
- COAST ARTILLERY SUPPORTS.**—Small bodies of coast artillery or mobile troops assigned to the defense of the fortifications against attack by raiding parties; they are under the orders of the coast defense commanders.
- COEFFICIENT OF WIND-PRESSURE.**—In gunnery and aerodynamics, the numerical constant in the formula expressing the pressure of the wind against a stationary object or of the air resistance to a moving object.
- COMBAT PRACTICE.**—In small arms firing, the prescribed firing at targets which simulate the appearance of an enemy under conditions approaching those found in war, and the application of this class of fire to tactical exercises.
- COMMUNICATION TRENCHES.**—Those connecting fire trenches with the cover trenches and the cover trenches with any trenches (reserve) in rear where natural covered communication is impracticable. They are zigzagged to escape being enfiladed.
- CONE OF DISPERSION.**—In small arms firing, a term applied to the figure formed in space by the trajectories considered together of a series of shots fired by a body of soldiers at a common objective and with the same rear sight setting; also the elliptical shaped cone made by the dispersion of shrapnel balls when the shrapnel bursts in the air.
- CONVERGENCE DIFFERENCE.**—If the guns of a battery be accurately laid for converging fire upon a target and the panoramic sights be then turned upon a common aiming point, the sight readings will be found to vary by differences which are for all practical purposes equal from gun to gun throughout the battery. This common difference is called the *convergence difference*.
- COUNTER-TRENCHES.**—Trenches made against the besiegers, which consequently have their parapets turned against the enemy's approaches, and are enfiladed from several parts of the place on purpose to render them useless to the enemy if he should chance to come into possession of them.
- COVERING POSITION.**—In the transport service, a position to be occupied by an advanced detachment of troops at such distance from the selected landing that neither anchorage, beach nor forming-up place is exposed to shell fire from the enemy's land forces.
- CURTAIN FIRE.**—Another name for *barrage* or a zone of artillery, machine gun or trench weapon fire established for the purpose of preventing the passage of troops.
- CURVED FIRE.**—When a projectile is fired so as to just clear an interposing cover, and then descend upon the object, the line of fire being perpendicular or nearly so to the front of troops or works to be destroyed; fire with low muzzle velocity, the elevation not exceeding 540 mils, usually from howitzers.
- DANGER ANGLE.**—The angle which the tangent to the trajectory at the point of splash makes with the plane containing the point of splash and parallel to the horizontal plane through the muzzle of the piece in the firing position. Also called *Angle of Splash*.
- DANGER SPACE.**—The distance, in the plane of the slope considered, over which an object of a given height would be pierced by a given trajectory.
- DEFLECTION.**—Generally the angle set off on the panoramic sight of the directing gun. It may or may not be the same for the other guns. In direct laying, it is such as is necessary to correct for wind, drift and the movement of the target; the deviation of a shot or ball from its true course; sometimes written *deflexure*.
- DEFLECTION DIFFERENCE.**—The common converging or diverging difference applied to guns other than the directing gun, necessary to bring them to bear on their proper portion of the target. The deflection difference for parallel fire is always equal to the parallax of the aiming point. It is positive if the aiming point is in front and negative if in rear.

- DELAYING ACTIONS.**—Actions in which the advance of the enemy is delayed as long as possible without imperiling the safe withdrawal of the delaying force; and, in which this force must hold its position for a time that is dependent upon conditions in other parts of the field or in the theatre of war.
- DEPLOYMENT.**—An evolution by which a command extends its front; it may be partial, as when heads of columns form on the same line; or complete, as when a firing line is formed, with supports and reserves.
- DEPTH BOMB.**—A bomb designed for use against submarines and other submerged objects. Submarines, once seen below the surface, are pursued and destroyed by dropping *depth bombs* from the observing aircraft. Depth bombs are also known as *diving torpedoes*.
- DIAMOND-HITCH.**—In animal transportation, the side packs are slung across the aparejo by the sling ropes and lashed on with the lash rope and cincha in the form of the *diamond-hitch*, the formation of which is accomplished by two packers, termed the "near" and "off" packers.
- DISSIMULATION.**—The production of targets less attractive to the enemy than those which would be offered by the undisguised works of the defender, and which are less likely to arouse the enemy's suspicion, while at the same time they conceal the true nature of the defenders' powers of offense.
- DRESSING STATIONS.**—Stations established during combat by ambulance companies of the sanitary train in the immediate rear of the line of regimental aid stations, which are the places where all wounded unable to walk are collected from regimental aid stations by bearers of ambulance companies.
- ECHOLON.**—A body of troops is "in echelon" with reference to another body when it is more or less advanced and unmasked or uncovers the same, wholly or in part. Units so placed are called *echelons*. Sometimes used to designate the different elements of a tactical command.
- EFFECTIVENESS OF FIRE.**—The effectiveness of fire under battle conditions and in combat firing exercises is dependent upon the three factors, the percentage of hits made, the number of targets hit and the time of execution. The ultimate effect may be expressed synthetically by the number of enemies disabled or targets hit in a unit of time.
- ELEMENTS.**—The simplest of the distinct *isles of resistance*. They are generally made up of a small collection of trenches and barricades, and receive as a garrison a *complete unit*, from a squad to a platoon, having special orders to fit their location.
- ENERGY OF RECOIL.**—An expression for the work done in the recoil of a gun when fired. It may be reduced by decreasing the weight of the projectile, by decreasing the muzzle velocity or by increasing the weight of the gun and carriage.
- ENFILADING BATTERY.**—A battery used for destroying the artillery and traverses, and silencing the fire of the defenses. Positions are chosen for the enfilading batteries from which the terrepleins of the faces can be swept throughout.
- EVACUATION POINTS.**—In the sanitary service, the places at which the sick and wounded are transferred from the division to the lines of communications.
- EXAMINING POST.**—A small detachment, under the command of an officer or a non-commissioned officer, stationed at some convenient point to examine strangers and to receive bearers of flags of truce brought in by the outguards or patrols.
- FIELD TELEPHONE.**—A line of telephone set up and quickly transferred from place to place in the field of military operations, employed for transmitting information from various points to the station of the general officer commanding and for the distribution of orders emanating from said station.
- FIELD WIRELESS.**—Temporary wireless stations set up in the field of military operations to facilitate the transmission of orders, to gain knowledge of enemy movements and to communicate with aircraft acting under orders of the ground officer.
- FILES.**—Two men, the front rank man and the corresponding man in the rear rank. The front rank man is the *file leader*. A file without a rear rank man is a *blank file*. The term *file* applies also to individual men in single rank formation and to a single mounted man in ranks.
- FIRE CONTROL.**—The exercise by a commander, over his unit or units, of that power which enables him to regulate the fire in obedience to his will. It pertains especially to the technicalities immediately involved in delivery of fire.
- FIRE DIRECTION.**—A general term embracing the various steps, including tactical disposition, which enables the commander of one or more fire units to bring an effective fire to bear upon the desired target at the proper time. It pertains especially to preparation of fire.
- FIRE DISCIPLINE.**—The training of men so that they will instinctively carry out all orders of fire-unit commanders and in the absence of orders adjust their sights and fire with due regard to the tactical situation.
- FIRE SUPERIORITY.**—Superior moral or physical fire effect as compared to that of the adversary. Fire superiority is implied if the assailant can advance or force back the defender.
- FIRING FOR EFFECT.**—The fire delivered for the purpose of producing effect on the target. It usually follows immediately after adjustment and is delivered with the greatest rapidity consistent with proper laying of the guns.
- FIXED BATTERIES.**—The batteries containing the siege guns and mortars of the heaviest calibre and longest range, placed when possible in enfilading positions and delivering their fire within the interior slope of the face enfiladed.
- FLIGHT COMMANDER.**—In aeronautics, an officer who commands and leads a squadron of aircraft, executing orders of the ground officer as far as possible, being followed by the squadron.
- GAS ATTACKS.**—Attacks in which chlorine and other gases are brought up to the trench compressed in steel cylinders. These are dug into the bottom of the trench and connected with pipes leading over the parapet. When the valves of the cylinders are opened the gas escapes with a loud, hissing noise, mixes with the air and is carried by the wind to the opposing trenches, spreading out in a continuous cloud as it goes.
- GAS HELMET.**—A defensive mask, usually referred to as the P. H. helmet or tube helmet, consisting of a flannelette bag which pulls over the entire head and which is chemically treated. It is fitted with a mouthpiece with a valve which is rubber covered, and when in use is gripped by the teeth. Inserted in the front are glass windows for the eyes. During the passage through the material of the helmet, the poisonous gas is absorbed by the chemicals.
- GAS WARFARE.**—The use of poisonous and asphyxiating gases in attacking the enemy, either by emanation or by means of shells and grenades. The first requires a favorable breeze of about five miles per hour and there must be no rain. In the shells and grenades method of dissemination, shells and bombs are used containing liquid gas, or a substance which gives off irritant fumes.
- GROUND SECTION.**—In gunnery, the zone of dispersion. In connection with the effective ranges of shrapnel balls it will be found that many balls impacting near the outer limit of a ground section are ineffective due to lack of man-killing energy.
- GROUP OF POSTS.**—Sub-sections organized by the commander within each section of an entrenched zone. The general duties of the commander are the same as those for an outpost commander.
- GUN SQUADS.**—Soldiers grouped for the purpose of making units for the operation and service of guns in battle and to facilitate their control and movement. Their habitual formation is in column.
- HAIRBRUSH GRENADE.**—A racket bomb used to demoralize the enemy, the noise created by its explosion being very great. It consists of a board about 12 inches long and 6 inches wide, cut down to the shape of a brush. On the large end of this is wired or tied a slab of wet gun cotton. In the centre of the slab is placed the dry primer or cone of guncotton with detonator and time fuse.
- HEAD COVER.**—A vertical shield of any material which protects the heads of the troops from fire. In fortification, any horizontal cover which may be provided above the plane of fire. It is advantageous only when the conditions of the foreground are such that the enemy cannot get close up.
- HEIGHT OF BURST.**—The angle in mils which a line joining gun and the point of burst makes with the plane of site. The height of burst adopted for adjustment is one mil and for effect three mils.
- HIGH EXPLOSIVE SHRAPNEL.**—A shrapnel differing from the common shrapnel only in the substitution of an active for an inert matrix. The matrix surrounding the balls in a common shrapnel is resin and mono-nitro-naphthalene; in the high explosive shrapnel the matrix is tri-nitro-toluol, a high explosive. The fuse of the high explosive shrapnel, in so far as the time action is regulated, is the same as the field artillery 21-second combination fuse.
- HOLDING ATTACK.**—An attack for the purpose of holding the enemy to his position by offensive action in one part of the field while a decisive blow in the nature of an assault or of an enveloping or a turning movement is struck in another quarter.
- ILLUMINATING GRENADE.**—A contrivance, weighing about 14 ounces, attached to the muzzle of the ordinary service rifle. In projecting it into the air, the butt of the rifle is placed on the ground. A firing rod releases a parachute and ignites the illuminating substance—calcium carbide.
- INCENDIARY GRENADE.**—A form of grenade designed to scatter molten metal upon bursting. The most effective of the kind contains the ingredients necessary for making the compound known as *thermit*.
- INDEPENDENT CAVALRY.**—Cavalry independent of the infantry divisions advancing behind it and under the sole orders of their own commander, who receives his instructions direct from the commander-in-chief. It is the chief means of providing the commander-in-chief with the information which he requires in order to dispose the whole of his force to the best advantage and with the greatest hope of success.
- INTERIOR GUARDS.**—Police guards, guards of property, etc., who are liable to come in contact with the enemy.
- JOURNAL OF ATTACK.**—In actual siege operations, a daily record made by each engineer officer on duty in the trenches,

- of the amount of work done, the time required, the means of execution, etc., with any observations that may seem of value.
- JOURNAL OF DEFENSE.**—A journal in which is kept by the commander of a place and the chiefs of engineers and of artillery, during war, in order of date, without blank or interlineation, all orders given or received, the manner in which they are executed, their results, and every event and circumstance of importance in the progress of the defense.
- JUMP OF A GUN.**—The increased angle of departure at which a projectile leaves a gun, after the gun has been truly leveled at the target or object to be struck.
- KNUCKLE KNIFE.**—In raids and trench work, a knife about nine inches long, ending in a handle that has openings for the four fingers to go through, thus serving as a "knuckle duster."
- LATERAL COMMUNICATIONS.**—Communications between the different portions of an army when moving from one common base by different roads toward an enemy, so that in case of a concentration being required on any particular point, instructions and orders can be readily carried out.
- LIAISON.**—A French term signifying the connection or communication to be established between various officers or between various units and officers.
- LINE.**—A formation in which the different elements are abreast of each other; the numbered organizations of an army in contradistinction to the guard or guards; the infantry, cavalry, artillery, etc., in contradistinction to the staff corps and departments; a picket line or side line; an imaginary limiting line in fencing; a trench or rampart; a general term applied to all combatant troops; a position occupied by troops, as a defensive line.
- LINE OF CIRCUMVALLATION.**—An exterior line of works forming an unbroken line of entrenchments composed of the most simple elementary parts, as tenailles, redans, etc., with a slight profile; its chief object being to prevent succors of small detachments from slipping into the place.
- LINE OF COMMUNICATION.**—The communication by rail, road and navigable waters between the army and its base or bases inclusive, together with the district through which it passes, within such limits as the commander-in-chief may determine.
- LINE OF COUNTERVALLATION.**—The line of field works constructed in front of the camps, and on the side next to the besieged position, to defend the camps, parks and trains against any attacks which might be made by the besieged.
- LISTENING POSTS.**—Sheltered positions in advance of a defensive line for the purpose of early detection of the enemy's movements. They are connected with the main line by a communicating trench or subterranean gallery.
- LONGITUDINAL DEVIATION.**—In gunnery, the perpendicular distance (over or short) of the point of splash from the vertical plane passing through the centre of the target and perpendicular to the plane of direction.
- LONGITUDINAL RESISTANCE.**—In gunnery a strain or resistance produced by the longitudinal pull or elongation caused by the direct thrust of the pressure in the bore on the head of the block, and by the displacement in longitudinal direction caused by the pressures which act normally upon the interior and exterior of the jacket.
- LOOKOUT POSTS.**—Protected positions, usually located in the first line trenches, at points where good views may be obtained of the enemy's line. They are usually constructed on the right side of a traverse and in an excavation in the front wall of the trench.
- MAP READING.**—The art of forming a clear mental picture of the actual features of the ground by reading the characters representing the same on the map. To be able to do so, the scale and map distances of the map must be known.
- MEAN RADIAL DISTANCE.**—The mean radial distance of the shots from the centre of the group on the target. To determine it, find the point of mean impact, and measure the absolute distance of each shot from it. Divide the sum of these distances by the number of shots on the target.
- MEETING ENGAGEMENTS.**—Meeting engagements are characterized by the necessity for hasty reconnaissance, or the almost total absence of reconnaissance; by the necessity for rapid deployment frequently under fire; and usually by the absence of trenches or other artificial cover. These conditions give further advantages to the offensive. The whole situation will usually indicate beforehand the proper general action to be taken on meeting the enemy.
- MEETING SYSTEM OF CONVOYS.**—A system under which two sections of transport, one of which is loaded and the other unloaded, meet at some point half way between two stages, exchange their vehicles or transfer their loads, and then return to their respective stages.
- MIL.**—The unit of angular measure, 1-6400 part of a circle. The arc which subtends a mil at the centre of a circle is, for practical purposes, equal to 1-1000 of the radius. The arc and its tangent are nearly equal for angles not greater than 330 mils.
- MILITARY ORDER.**—An authoritative direction, respecting the military service, issued by a military commander with a view to regulate the conduct of military persons, or control the movements or operations of individuals or organizations under his command.
- MILITARY POLICE.**—Police whose duty is to enforce all police regulations in the theatre of operations and in mobilization and concentration camps. They protect the inhabitants of the country from pillage and violence and prevent excesses of all kinds; keep all roads clear; arrest all soldier and civilian employees absent without proper authority from their organizations; arrest all marauders; and are charged with relieving organizations from the care of prisoners of war and with their safe conduct.
- MILITARY RECONNAISSANCE.**—A survey or examination of a country made under the protection of an armed force. It is one of the most essential operations connected with the tactics of the field, and serves as the basis of every movement or combination which it may be proposed to make.
- MILITARY VOCABULARY.**—The technical terms applied to the organization, weapons, equipment, formations and duties of various arms. It is important that the military vocabulary in each unit of an army should be uniform as to its various terms, especially in regard to the indication and description of targets.
- MOTOR TRANSPORT.**—A constant and serviceable means of transport, for troops and materials. In conjunction with trailers it may be employed for any and all special purposes, embracing motor ambulances, ammunition-wagons, artillery and machine-guns, kitchens, searchlights and telegraphs, and causes a close union of the three arms of service. It greatly increases the efficiency of engineer troops, making possible the more rapid transportation of tools and materials, gasoline power plants, etc.
- N-SQUARE LAW.**—In aeronautics, an expression meaning that if, for example, only five machines were flying in sufficiently close formation to act in attack or defense simultaneously—that is to say, so that the enemy could not approach one without coming under fire of all—they (in formation) would be more than a match for any force of machines (of equal individual fighting value) that might attack singly up to the number of 25.
- NATIONAL SALUTE.**—A salute of 21 guns. It is also the salute to a national flag. The salute to the Union, commemorative of the Declaration of Independence, and consisting of one gun for each State, is fired at noon on 4 July, at every post provided with suitable artillery.
- NATURAL POINT-BLANK.**—The point at which the line of sight intersects the trajectory the second time; or, more practically speaking, it is that point which, being aimed at, is struck by the projectile.
- NIGHT ASSAULT.**—An assault undertaken in order to gain a point of support for further operations in daylight, to drive in an enemy's advanced troops, to secure an outpost position as a preliminary to an attack at dawn or to surprise an ill-trained, ill-disciplined or semi-civilized enemy.
- NIGHT OPERATIONS.**—Movements undertaken to outmanoeuvre an enemy; to avoid observation, particularly when the enemy is provided with aircraft; to pass over an area of ground which it has been found difficult or impossible to traverse in daylight; to continue or complete an attack begun before dark; and to effect a tactical surprise.
- NOBEL LIGHTER.**—A lighter for hand grenades having a five-second fuse attached. It consists of two cardboard tubes, one fitting over the other. Inside the top end of the outer tube there is a layer of friction composition; fixed on the top end of the inner tube is a forked brass friction head, which is held in position by a safety pin fastened through both tubes. Inside the other end of the inner tube is a small copper band, into which the fuse is fitted.
- NOISEZ SYSTEM OF FORTIFICATION.**—A system embracing the teaching of the school of Metz and having no sensible departure from the views and method of Cormontaigne, excepting to introduce such modifications as would remedy some of the acknowledged defects of his method. The front planned by Noisez has been taken as an elementary exercise for instruction in the art of fortification for the cadets at the United States Military Academy at West Point.
- OBSERVATION.**—Watching the effect of fire on the target with a view to correction or verification of sighting, either by watching for the dust thrown up by bullets, or the behavior of the enemy.
- OFFENSIVE PATROLS.**—That class of patrols made exterior to the line of outposts, with a view of gaining intelligence of the enemy's whereabouts. They are composed of larger bodies of men than defensive patrols. In aviation, these patrols go far beyond the lines and make invaluable reconnaissances.
- ORDINARY BILLETTS.**—Billets in which troops are lodged in houses or buildings at the rate of about one man to each three to four square yards of floor space. In agricultural districts, ordinary billets without subsistence can be provided at the rate of about 10 men per inhabitant.
- ORDNANCE DEPOTS.**—The ordnance services on the lines of communications consist of ordnance depots, the personnel for which is found from one or more ordnance companies,

- These depots are distributed at the base, advance base and at other localities on the lines of communications. Intermediate depots are also established as may be necessary. Ordnance depots contain all the necessary reserves of arms, ammunition, equipment, etc., exclusive of medical and veterinary stores.
- ORIENTATION.**—In artillery, the determination of the east point of the compass, in taking bearings. The orientation of mortars is frequently tested and the setting of the azimuth indices corrected. A drawing is said to be oriented when so placed that its true meridian is parallel to the true meridian of the ground.
- OUTWARD FLANK.**—The extreme file on the right or left of a division, subdivision or section, according to the given front, when the battalion is at close or open column, and which is the farthest wheeling point from line into column, or from column into line.
- OVERHEAD FIRE.**—Fire directed over the heads of troops. Its object is to cover the advance of troops, to increase the fire effect on any particular portion of the enemy's lines and to cover the enemy communication trenches and prevent supports coming up.
- OVERSEA OPERATIONS.**—Operations undertaken with a view to (a) the establishment of a base for military operations either against the enemy's field armies or against a coast fortress, (b) the establishment of a flying naval base, or (c) raids against shipping, communications, etc.
- PACK TRANSPORTATION.**—A division of animal transportation, in which the animal is the unit, and each can carry, on a conservative estimate, 300 pounds gross or 225 pounds net load. The great advantage of pack transportation is its mobility, and ability to go over rough country where wagons are impassable.
- PANORAMA SKETCH.**—A sketch too extended to be viewed in its entirety at once, but is exhibited part at a time by being unrolled and passing continuously before the spectator. Panoramic sketches are made by means of panoramic cameras transported by aircraft or otherwise.
- PARACHUTE GRENADE.**—A percussion grenade whose body consists of a tin cylinder of explosive with a hemispherical head of larger diameter containing shrapnel bullets. A buffer cylinder passes through the body and projects, so as to produce the explosion slightly above ground. A parachute safety arrangement is attached to the head of the handle in order to prevent fragments flying to the rear on explosion, and also to cause the grenade to fall on its head.
- PATROLS.**—Small detachments employed for a variety of purposes, the name of the detachment indicating its duty, as visiting, connecting, combat, exploring, reconnoitring, flanking, harassing, pursuing patrols, etc.
- PERMISSIBLE EXPLOSIVES.**—Explosives based variously upon ammonium nitrate, nitroglycerine and nitrostarch. They are poorly adapted for demolitions, but are peculiarly suitable for mining operations.
- PHOTOGRAPH OFFICER.**—In aviation, an officer in charge of the photographic lorry who is responsible for the photographic apparatus and the development of plates delivered by the observing aviators who have been aloft.
- PICRIC POWDERS.**—Powders consisting of pure picric acid, or that acid combined with a non-metallic base. They are non-sensitive to shock, unacted by heat or cold, and in some forms by water, can be produced in a granular form or fused into solid shapes. Melinite, lyddite, ecrasite and shimose are of this class.
- PILL-BOX.**—A slang term for a concrete and steel shelter and outpost defense, armed with machine guns as used by the Germans on the western front. It generally contained two main chambers and mounted from three to five machine guns in a bastion beyond these chambers. A stairway led to the top which might be used for observation purposes.
- PLANE OF SITE.**—A plane containing the right line from the muzzle of the gun to the target, and a horizontal line perpendicular to the axis of the bore at the muzzle. It is sometimes called the *zero plane*.
- PLUNGING RICOCHET.**—The description of *ricochet fire*, when the angle of fall is comprised between 6 degrees and 10 degrees. In this fire, the ball is given a small velocity, and the curve described is short and high.
- POINT BLANK RANGE.**—The distance from the muzzle of the piece to that point in the projectile's trajectory where it cuts the prolongation of the natural line of sight, a second time, the natural line of sight being horizontal.
- POSITION OF DEPLOYMENT.**—A place (preferably a large open space) near some landmark easily recognizable, where the whole of the infantry detailed for the attack can halt for a few minutes in order to make sure that all the units are present and can easily deploy for the attack.
- POSITION IN READINESS.**—A position for action in which troops are placed where it is intended to resist the advance of the enemy in the immediate vicinity and the knowledge of his movements is not sufficiently definite to decide upon a plan of action.
- POTENCE.**—Troops are ranged *en potence* by breaking a straight line, and throwing a certain proportion of it either forward or backward, from the right or left, according to the circumstances, for the purpose of securing that line. An army may be posted *en potence* by means of a village, a river or a wood.
- PRACTICE MARCHES.**—A part of the field training of troops having in view the hardening of the men and animals and the instruction of officers and men in duties incident to a campaign, marching, camping, cooking, etc., and the principles of tactics, including the services of information and security.
- PROFILING.**—An operation by the construction of field works which consists in erecting at proper points along the sub-crests wooden *profils* which give the form of the parapets at those points, and which guide the workmen in the construction of the works.
- PROGRESSIVE POWDER.**—A gunpowder made so that it burns slowly until the projectile moves, and then with increasing, or progressive rapidity, to avoid the extreme pressure caused by the explosion of powders in which the combustion is instantaneous.
- PROTECTIVE CAVALRY.**—The first line of security until the opposing infantry columns get within striking distance of each other. It covers the advance of the army or group of divisions to which it is attached, to prevent the enemy obtaining information as to the disposition of the force which it is covering, and to allow the force tactical freedom of action.
- PROTECTIVE PATROLS.**—Patrols detailed for the immediate protection of the force and to prevent the enemy's scouts and patrols from attempting to penetrate the screen and gain the fullest information as to the advancing infantry.
- PROVOST GUARDS.**—Guards used in the absence of military police, generally in conjunction with the civil authorities at or near large posts or encampments, to preserve order among the soldiers beyond the interior guard.
- QUADRANT.**—In gunnery, an instrument, generally made of brass, for ascertaining or adjusting the elevation of ordnance, particularly mortars, which have no tangent scale. It is graduated into degrees and parts of a degree, having a movable index, with a spirit level and vernier attached to it.
- QUARTER GUARD.**—A guard mounted in camp, immediately on the arrival of each corps on its ground. It is placed in front of the centre of the camp, at about 80 paces from it, and is charged with special duties.
- QUARTER-SIGHTS.**—In gunnery, division marked on the upper quarters of the base-ring, commencing where it would be intersected by a plane parallel to the axis of the piece, and tangent to the upper surface of the trunnions. These sights are used for giving elevations up to 3 degrees.
- RADIAN.**—A unit of angular measurement. The true mil is a thousandth part of a radian, or practically 1-1570 part of a right angle.
- RAFALE.**—A variety of artillery and infantry fire which has for its object the production of a paralyzing, instantaneous effect produced by suddenly delivered, very violent gusts of fire of short duration, separated by more or less prolonged intervals of calm. *Rafale* in French literally means "squall".
- RALLY.**—The rapid grouping behind a leader of the various elements of a command without reference to their previous situation or formation.
- RANGE-AZIMUTH TABLE.**—A table of ranges and the corresponding azimuths from a gun to points in the centre of the main ship channel or channels. It is kept at the gun and used for firing without the use of range-finding apparatus.
- RANGE OFFICER.**—In coast artillery, the officer in charge of the position finding equipment and the range section of the battery command. His station is at the battery plotting room and he is responsible to the battery commander for the condition of the material and for the efficiency of the personnel under his charge; an officer charged with the police and care of a target range and its accessories.
- RECORD PRACTICE.**—In small-arms firing, a practice to afford the soldier an object lesson of his progress, and to obtain a record by means of which the soldier may be graded in awarding insignia and increased pay.
- RE-ENTERING PLACE OF ARMS.**—In fortification, an enlargement of the covered way, at the re-entering angles of the counterscarp; this space is formed by setting off demi-gorges of 30 yards (more or less) and making the spaces form angles of 100 degrees with the adjoining branches of the covered way.
- RELIEF.**—The height of the interior crest of a parapet above the bottom of the trench; or, the length of time that men have to work before being relieved; or, a number of men who work or are on duty for a given length of time.
- RENDEZVOUS.**—Place to which the columns of the line of communication are sent where they are met by agents of the trains and conducted to refilling points.
- REPRESENTATIVE FRACTION.**—In military map reading, a fraction whose numerator bears to the denominator the same proportion that a distance on the map bears to the distance on the ground it represents. The numerator must always be 1, and the denominator is expressed in similar units.
- RING-GAUGE.**—A circular steel gauge used in inspecting shot and shells. They are made of two sizes for each calibre, the larger being a trifle more and the smaller a trifle less in diameter than the true calibre of the projectile. All shot received must pass through the larger gauge, but are rejected if they pass through the smaller.

- ROLLING FIRE.**—A discharge of musketry by soldiers in line, in quick succession, and in the order in which they stand; also a fire where the axis of the piece is parallel or nearly so, with the ground or water, and the projectile rebounds over the surface in a succession of ricochets.
- ROUTE MARCHES.**—Marches used in peace to conduct a body of troops from one station or post to another. In time of war they are used for the purpose of assembling the fractions of an army on its base of operations of conducting troops through a country where there is no enemy.
- RUSSIAN SAP.**—A gallery without sheathing, the top of which is cut in the form of an arch. The earth is carried to the rear as in the case of the deep sap. Ventilation holes are arranged here and there, permitting the location of the arched roof in relation to the surface of the earth as the work progresses.
- SALIENT.**—In fortification, that which points outward from the interior of any work. For example, the central angle of a bastion, pointing toward the enemy, is a salient angle. Also, in map reading, a projection from the side of a hill or mountain, running out and down from the main feature.
- SALVO.**—Concentrated fire from a greater or less number of pieces of artillery. Salvos, corresponding to volleys of musketry, are frequently fired by way of salutes over the graves of officers at the time of burial.
- SANITARY SERVICE.**—The service embracing the institution of all practicable sanitary measures to the end that the fighting forces suffer no depletion in strength, the temporary care and professional treatment of the sick and wounded and their transportation and the supply of the necessary sanitary equipment.
- SANITARY TRAIN.**—A train including all vehicles, animals, personnel and reserve sanitary material, not attached to organizations, employed in collecting and caring for the sick and wounded of the division pending their evacuation by the line of communication.
- SEARCHING FIRE.**—Searching is the term applied to collective fire when the depth of its dispersion over a beaten zone is increased by the use of combined sights.
- SEARCHLIGHTS.**—Important elements of the defense in a coast defense command. The standard service searchlights are 60-inch. Depending upon their tactical use, they are classified as searching or as illuminating lights, and, depending upon their assignment, as fort, fire or mine searchlights.
- SECOND LINE.**—The line of fire trenches, with the covering fire trenches, support trenches, support dug-outs (an exact duplication of the front line system) far enough behind the front line that in the event of the first system being taken, the second line is ready to be taken up by the troops driven out of the front line, and receive the support of troops lying in brigade or divisional reserve.
- SECONDARY BASES.**—Bases required, as an army advances, to enable it to have its supplies at hand. These bases, which should present the same qualities as does the original base, are usually established by detached bodies of troops, or by the reinforcements sent forward, so that the army will not be delayed in its onward movement.
- SECTOR.**—The joining together of several supporting points under the same commander is called a sector. It is generally held by a division, and is divided into sub-sectors of brigades and regiments. The force assigned to defend a sector has its own separate reserve district from the reserves of the supporting points.
- SECTOR OF EXPLOSION.**—At the moment a gun is fired, a spherical sector of fire is formed in front of the piece, whose extremity presses against the bottom of the bore, while the external portion of it terminates in the air, which this sector compresses and drives in every direction.
- SECTOR WITHOUT FIRE.**—That space exterior to a work which is not defended by the direct fire of the adjacent faces. The space is included between lines drawn through a salient, perpendicular to the faces.
- SENTRY OVER ARMS.**—A sentry mounted at the picket post to watch for any signals from the videttes or cossack posts, or in the case of infantry sentries or sentry groups, and to guard the picket against surprise.
- SENTRY SQUAD.**—A squad posted in observation at an indicated point. It posts a double sentinel in observation, the remaining men resting near by and furnishing the reliefs of sentinels. In some cases it may be required to furnish a patrol.
- SERVICE COLORS AND STANDARDS.**—National colors or standards made of bunting or other suitable material, but in all other respects similar to the silken national colors or standards. These colors and standards are for use at drills and on marches, and on all service other than battles, campaigns and occasions of ceremony.
- SERVICE OF THE INTERIOR.**—The function of the service of the interior, in time of war, is to supply the commander of the field forces with the means necessary for the accomplishment of his mission. This service is carried on by the bureau chiefs, department commanders, and in certain instances by commanders of concentration camps and of ports of embarkation. Their respective operations are directed and co-ordinated by the Secretary of War through the medium of the chief of staff.
- SHEAF RANGING.**—In coast artillery, the firing of two or more guns at the same instant with their range settings differing by equal increments and increased or decreased from the right by the specified increment in yards, observing the relative positions of targets and splashes, and making corrections from these observations.
- SHELTER RECESS.**—In fire-trenches made in favorable ground, a forward burrow, made by the individual rifleman, into the interior slope at the level of the firing step, in which he can lie in safety and at full length when not on duty at the firing point.
- SHOT GROUP.**—Owing to different well-known causes the variations in the trajectory are such that in a series of shots fired at a target, no two shots will strike in the same spot, the hits being arranged in a certain diagram called the *shot group*, the size of which varies with the skill of those firing. Good shots will make a small group and poor shots a large one.
- SNIPERSCOPE.**—A device by the use of which a soldier can both aim and fire his piece at an object in front without exposing himself above the parapet.
- SPADE WARFARE.**—War or hostilities carried on from trenches and underground constructions. The spade has become a main feature in land warfare, since it has become necessary to get down into the earth to seek cover against the destructive effects of machine-guns, rapid-fire guns and other modern firearms.
- SPRENGLE EXPLOSIVES.**—A class of explosives consisting of separate constituents, each non-explosive, which are combined at the moment of use. The most common is *rack-a-rock*, which consists of chlorate of potash a dry crystalline substance, and nitrobenzol, a liquid.
- STOKES TRENCH MORTAR.**—A light mortar, weighing 105 pounds, made in three sections (the barrel, the mount and base plate) to ensure easy transportation to the front line trenches. It projects a bomb 3 inches in diameter which weighs 11 pounds and is loaded from the muzzle of the gun or mortar. The bomb slides down the barrel and when it strikes the bottom it is fired automatically.
- SUPERVISION TRENCHES.**—Trenches to facilitate the movement of the troops, general supervision of same and to afford more shelter, freer movement and for accommodation of any additional men who are necessarily required when an assault is intended.
- SUPPLY COLUMNS.**—A part of the supply service for troops in campaign. Line of communications supply columns (usually auto-trucks or tractors with wagons) are dispatched to a rendezvous point, where they are met by an agent of the commander of the field forces and conducted to distributing points. When it is possible to do so, the supply columns go to the actual distributing points.
- SUPPLY TRAIN.**—A train including all vehicles, animals and personnel employed in transporting the divisional ration and grain reserve, or in bringing up the same from the refilling points to the distributing point. To it may also be attached herds of beef cattle, remounts, etc.
- TABLES OF OCCASIONS.**—Tables showing by whom and on what occasions each article of uniform of the United States is worn; they also show the various articles of uniform and equipment — by whom, when and how worn.
- TABLES OF ORGANIZATION.**—The details of organization, the amounts and kinds of transportation and the factors on which the allowance of transportation is based are fixed in the tables of organization United States army.
- TACTICAL DECISIVE POINTS.**—Points on a field of battle which, when occupied by an army, will enable it to make an attack on the enemy whose success would be decisive on the issue of the engagement.
- TACTICAL PURSUIT.**—Pursuit directed at a flying enemy with a view to directly harassing him, causing him as much loss as possible and maintaining the loss of morale which may have such important consequences.
- TACTICS OF POSITION.**—That element of tactics or strategy of the battle-field which depends largely on the moral energy of the commander-in-chief for accomplishment.
- TARGET DESIGNATION.**—It is sometimes necessary, where a target is indistinct, to use what are called "auxiliary points" for target designation; and in this case the method is resorted to of giving the direction of the point to be fired upon from this auxiliary point. In giving this direction the notations on the clock face are used as in determining the direction of the wind on a target range.
- TEAMWORK.**—The work and accomplishment of a number of persons or soldiers associated together. The comparatively wide fronts of deployed units increase the difficulties of control. The success of the whole depends largely upon how well each subordinate co-ordinates his work with the general plan.
- THEATRE OF OPERATIONS.**—The whole area of land or sea in which fighting may be expected, or in which the movements of troops, etc., are liable to interruption or interference on the part of the enemy.
- THERMIT.**—A compound of powdered aluminum and oxide of iron successfully used in incendiary projectiles. When ignited the heat given off is sufficient to melt the free iron.
- TIN CUPS.**—Cups used with heavy breech-loading guns, which serve, in conjunction with the vent piece, to seal

- more effectually the powder-chamber, and to prevent the escape of gas, which is very destructive to the angular face of the vent piece.
- TOWER FORTS.**— Towers employed either as isolated forts or combined in a system of detached works for covering a space to their rear for an entrenched camp. They have several tiers of covered fire for artillery and musketry, and an open battery on top.
- TRAVELING TRUNNION-BEDS.**— Contrivances for the purpose of distributing the load more equally over the gun-carriage. On the upper surface of the cheeks, near the rear ends, are placed two projecting bolts which, with the curve of the cheeks, form resting places for the trunnions, when the piece is in position for transportation.
- TRAVERSING.**— Sketching by means of a continuous series of measured straight lines, the direction or bearing of which is taken with a compass at each change of direction. These lines are called *traverse* lines, and the sketcher must pace actually along these lines. The detail is sketched by means of offsets or cross-bearings.
- TRAVERSING-GEAR.**— An automatic traversing apparatus, in machine-guns, by which a limited angular movement in a horizontal plane may be given. Elevating or depressing the gun does not interfere with the lateral traverse.
- TRENCH-DUMP.**— A convenient spot or place selected by whosoever may be commanding that particular sector of trench to which carrying parties bring up the *trench stores* during the night in order to have them ready for distribution in the morning.
- TRIP.**— A useful trick in bayonet fighting. It is performed when in close grips with an opponent, by leaning forward and pushing him backwards, so as to cause him to throw his weight on one foot, at the same time deftly and quickly jerking his other foot upwards. This will throw him on his back at once.
- TRIPPING PIECE.**— A part of the firing mechanism in quick firing ordnance, being a flat piece of steel, fitted over a stud at the rear of the striker, and kept pressed downwards by a flat spring. It has a shoulder for the smaller cam-lug on the inner end of the firing lever to engage with in order to cock the striker.
- TRITON.**— An explosive made by the successive nitration of toluene, a coal-tar derivative. It is a neutral compound, very stable, of great strength, yet highly insensitive. It is pressed into blocks under high pressure, the insensitiveness of the explosive increasing with its density. Also written *trinitrotoluene*, *trinitrotolual* and *trotol*; frequently abbreviated as TNT.
- VERY LIGHTS.**— Lights used to signal between aeroplanes or stations or between the ground and aeroplanes, when a code is prearranged; a flare for illuminating the enemy's position.
- VIEW OF A PLACE.**— A reconnaissance of a fortified town, its situation, the nature of the country about it, as hills, valleys, rivers, marshes, woods, hedges, etc., taken in order to judge of the most convenient place for opening the trenches, and carrying out the approaches.
- VISITING PATROLS.**— Patrols detailed to keep up communication with the pickets, the supports on either flank and the reserve (if any). They also patrol any ground lying between the pickets and supports, which cannot be observed by either.
- WARNING CALLS.**— The class of calls comprising first call, guard mounting, full dress, overcoats, drill, stable, water and boots and saddles, all preceding the *assembly* by such interval as may be prescribed by the commanding officer.
- WHEEL TRANSPORTATION.**— A division of animal transportation, in which the wagon is the unit, and each animal can haul, on a conservative estimate, 1,200 pounds gross or 700 pounds net load. Wagon transportation should always be used unless the country is impracticable or the rate of march too rapid for wheels.
- WIND COMPONENT INDICATOR.**— In artillery and gunnery, a device for determining the wind reference numbers to be used on the range and deflection boards and to indicate the numbers to the operators of these boards.
- WING TRAVERSES.**— In fortification, where the approach is exposed to an enfilading and a slant reverse fire, and does not admit of a change of direction to avoid these wing traverses are erected across the line of trench to cover an enfilading view.
- WIRE COMPANY.**— The field signal organization used by the commander of a division for establishing and maintaining those tactical lines of information which radiate from division headquarters, and which serve, in general, to connect these headquarters with the major subordinate units.
- ZERO OF A RIFLE.**— That reading of the wind gauge necessary to overcome the drift of a rifle at a particular range. All allowances for wind should be calculated from this reading.
- ZONE ENERGY.**— A mode of expression in artillery, whereby the relative power of different guns as armor-piercers is estimated, viz., by the number of foot-tons per inch of the shot's circumference. At the muzzle of each gun, this power is a maximum.
- ZONE OF OPERATIONS.**— The strip of territory which contains the lines of operations, or lines on which an army advances, between the base and the ulterior object.

The foregoing terms or definitions have been officially approved by the United States War Department. Consult Farrow's Dictionary of Military Terms (New York 1918).

EDWARD S. FARROW,

*Consulting Military and Civil Engineer.*

**MILITARY TERRITORIES OF FRENCH SUDAN**, former designation applied to the French Sudan, now known as the colonies of the Upper Senegal and Niger and the Military Territory of the Niger. Extensive changes in the administration of the governmental affairs of the region were inaugurated in the period from 1895-1905. See FRENCH SUDAN; FRENCH WEST AFRICA; NIGER, MILITARY TERRITORY OF; UPPER SENEGAL AND NIGER.

**MILITARY TRANSPORTATION.** In wheel transportation the wagon is the unit, and each animal can haul, on a conservative estimate, 1,200 pounds gross or 700 pounds net load. In pack transportation the animal is the unit, and each can carry, also a conservative estimate, 300 pounds gross or 225 pounds net load. A given quantity of freight carried on packs requires three times as many animals as would be necessary to carry it on wheels. The larger number of animals means a proportionate increase of the forage to be provided and in the labor of feeding, shoeing, etc. If, however, the country and season are favorable for grazing, the pack mule will get on without any forage, while the draft mule cannot. Other disadvantages of pack service are that packages must be limited in size and weight much more closely than for wagons; long articles, as tent poles, cannot conveniently be carried except by special construction, and loading of pack cargoes is an expert service which must be performed by a few trained men, while loading of wagons is work in which all can participate.

The great advantage of pack transportation is its mobility, and this consideration is often paramount. A good pack train, well handled, can make two miles to one of the best wagon trains on good roads and more on bad ones, and can besides go where there are no roads and where the country is so rough that roads could hardly be made and wagons could not pass them if they were made.

Wagon transportation should be used unless the country is impracticable or the rate of march too rapid for wheels. The permanent pack train should be limited to the probable requirements of rapidly moving columns, and in those baggage, etc., should be kept down to an absolute minimum. When great difficulties of wagon transportation are foreseen the draft mules should be broken to pack service and enough aparejos carried in the train so that in case the wagons must be abandoned one-fourth to one-third of the loads may be placed on the mules and the march continued. The combination of harness and pack saddle which naturally suggests itself in this connection is not practicable. Such a combination would make a very poor harness and a worse pack saddle.

The mule is the standard draft and pack animal of the United States service. He can best be described and understood by noting his points of difference from the horse, which he resembles very closely. The points of difference in conformation are mainly larger, thicker

head, longer ears and smaller feet, larger girth, shorter legs and longer body. The relative disposition of bones and their angles are the same as for the horse.

**Pack Saddles.**—The adopted pack saddle is of the Spanish type, and is commonly called by its Spanish name, aparejo. Its principal parts are the body, the cover, the cincha and the crupper. These parts are subdivisions, which are less important. The accessories added to the above to make the aparejo complete are the corona, the blanket, the lash rope with its cincha, the sling ropes, the lair ropes and the mantas or pack covers.

The body of the aparejo consists of two pieces of heavy leather 24 inches wide by 58, 60 or 62 inches long, sewed together at the edges and across the middle of the length, forming two pouches, into which moss or hay is stuffed to form pads fitting the contour of the animal on either side of the backbone. In the American form the pads are given a peculiar elastic stiffness by means of ribs of wood or metal extending from a saddle piece at the top of each pouch to a boot piece at the bottom. These ribs are stiffer at the front and more flexible at the back, varying uniformly between. They convert each pad into an elastic lever, by which the pull of the cincha on the bottom acts to raise the aparejo and its load from the backbone, while the stuffing distributes the load uniformly over a large space on the ribs. The stuffing is introduced through a hand-hole in the middle of the underside of each pad, through which it is always accessible, and the finest art of the packer consists in fitting the pads to the shape of the particular animal which is to carry the aparejo, and keeping them so regardless of changes in the animal's condition by shifting, removing or renewing the stuffing. If a bunch rises on the animal it can be worked down by taking out stuffing immediately over it so as to take off the pressure at that point. Determine the proper point by wetting the top of the bunch and laying the aparejo on the mule. Aparejos and mules are numbered and the same pack is always on the same mule.

**Animal Power.**—The capacity of an animal to exert a tractive effort decreases as speed and time increase. As a basis, it may be assumed that an average draft mule can pull on a level 80 pounds at  $2\frac{1}{2}$  miles an hour for 10 hours every day, or, in other words, can pull 80 pounds over 25 miles of average level roads every day. If a pull of 160 pounds is required it can be made over  $12\frac{1}{2}$  miles a day only, the lesser distance being covered by a slower gait or longer rests, or, as is usually the case, partly by each. An animal can exert  $2\frac{1}{2}$  times the normal pull for a few minutes at a time and five times for a few seconds, provided in each case the demand is not repeated too frequently.

The load which can be hauled on any pull depends mainly on the kind and condition of the road and a little on the wagon, especially as to width of tire and size of wheels. For the standard army wagon and on a level average dirt road in good condition the load corresponding to 80 pounds standard pull may be taken at 1,000 pounds per animal. Of this, 300 pounds will be wagon, leaving 700 pounds net freight. Any reduction of this load to lessen the pull must come out of the 700 pounds.

To reduce the pull to 40 pounds, 500 pounds must be taken from the freight, leaving 200 pounds only to be hauled. This 200 pounds pulled over 25 miles would equal 5,000 pounds pulled over 1 mile, while if the full load of 700 pounds is hauled over  $12\frac{1}{2}$  miles, which can be done with the same effort, the result equals  $700 \times 12\frac{1}{2} = 8,750$  pounds hauled 1 mile. If the length of the march is fixed, the animal can be relieved only by reducing the pull; otherwise it is better to relieve them by shortening the march.

On hilly roads there is no traction on the down grades and an increased gait is usually taken without appreciable extra exertion. This saves time, which may be spent in rests, allowing greater effort on the up grades. Up to 8 per cent grade, the load can be retained by reducing the distance. Up to 3 per cent grade, the distance can be maintained by reducing the pull. Above 8 per cent, both pull and distance must be reduced. The reduction of pull may be accomplished by removing part of the freight, by doubling up teams or by putting men on drag ropes.

**Motor Transportation.**—The company commander of an organization equipped with motor transportation is responsible for everything connected with its operation and maintenance. He formulates rules for the proper handling of the vehicles on the road and in camp or garrison and sees that the same are rigidly enforced. He establishes the division of responsibility with reference to operation, repairs and upkeep of the mechanical equipment of his company and sees that each member is thoroughly familiar therewith. He personally sees that all motor governors are properly sealed and keeps the sealing tool in his personal possession. He keeps accurate check on all gasoline, lubricating supplies, tools and spare parts. It is a favorite practice to use gasoline for many purposes except fuel. Motor parts, being high priced and readily salable, can only with difficulty be protected against theft.

In organization supplied wholly or in part with motor transportation a mechanic or mechanics are designated to assist in the repair of vehicles. In the telegraph company five mechanics are provided; a chief mechanic and one for assignment to each station, if desired. The chief mechanic, assisted by the other mechanics, has general supervision over the mechanism of the motor vehicle equipment, as well as the detailed repair work. He is in charge of the company repair outfit and utilizes it for the above purpose as necessity requires. He sees that the assistant mechanics are qualified and if necessary instructs them.

Chiefs of section are responsible for the proper operation and maintenance of the motor vehicles under their direct supervision. This especially applies when, as will frequently happen, the section is operating detached. In this case a mechanic, if available, should always be assigned to duty with the section.

The duties of the driver include the keeping of his assigned vehicle and its equipment in proper repair and working order. He is required to be familiar with the mechanism of his vehicle and its proper operation. Repair work performed by drivers is limited to that class designated as minor repair. Work on the motor, ignition and lighting system, or on the

interior mechanism of running parts should be performed normally under direct supervision and orders of the chief mechanic or one of his assistants. Drivers are responsible for proper lubrication at all times and promptly report any defect noted or repair needed. Each is responsible that the vehicle under his charge is not subjected to abuse of any kind and that all regulations in force regarding operation and maintenance are properly observed.

Field trucks furnished organizations by the quartermaster corps are of standard make and are normally equipped with the war body. The inside dimensions of this body are as follows:

	Length, feet	Width		Depth, feet
		Feet	Inches	
One and one-half ton...	10	5	1	2
Three-ton.....	12	6	6	2

See ARMY TRANSPORT SERVICE.

**MILITARY TRIBUNALS.** See LAW, MILITARY.

**MILITARY UNIFORMS.** See UNIFORMS.

**MILITCHEVITCH, Djakov Milam,** Serbian author and ethnologist: b. Ripany, 4 June 1831; d. Belgrade, 1908. H concluded his theological education in 1850, entered the service of the state in 1852 and in 1861 he became secretary to the Minister of Education. He edited the periodical *Skola* in 1868-76, in addition to his official duties; and in 1886 was appointed librarian at the National Library of Belgrade. He ranked as one of the foremost Serbian scholars of his time. He wrote 'History of Pedagogy' (1871); 'The Principality of Serbia' (1876); 'Life of the Serbian Peasant' (1867-77); 'Lives and Works of Illustrious Men' (1867-79); 'The Kingdom of Serbia' (1884); 'Biography of Famous Serbians of Modern Times' (1888), etc.

**MILITIA.** The World War has greatly enlarged the conception of national military power. Militia from the earliest period has signified the manhood power of a nation, available for military purposes (and also, in a restricted sense, the enrolled volunteers from that body, who might, under sanction of law, be locally organized), as distinguished from such regular governmental military force, as a nation might maintain. Strong governments have maintained large, regular armies, the larger, the surer to strike aggressively; while republics have been prone to neglect the creation of armies until some necessity drove them to act for defense.

The advance of civilization found the entire man power of the nations of the world, in 1918, organized on military lines, some from preconceived ideas, some from necessity, and the nations becoming exponents of universal military training and service. What the war sequel will be is a fruitful theme for thought.

When the Constitution of the United States was adopted, the term militia had a definite meaning. By that instrument Congress obtained power to "provide for organizing, arming and disciplining the militia, and for governing such part of them as may be employed in the service

of the United States. . . ." The Constitution also created the President "Commander-in-Chief of the Army and Navy of the United States, and of the militia of the several States when called into the actual service of the United States." The Articles of Confederation had provided, "that every State shall always keep a well regulated and disciplined militia, sufficiently armed and accoutered, etc." When the colonies united against the mother country they joined their quotas of volunteers from the militia, and with them fought the battles of the Revolution; and 80 years later the great Civil War was fought by militia, using that term in the sense which the government had adopted. By the Act of Congress passed in 1792, the first exercise of its power, the militia was defined to be all male citizens of the United States between the ages of 18 and 45 years, excepting certain specified exempt classes. The term thus used by our original lawmakers, with apparent positiveness as to its meaning and as to its function, was a natural result of the following facts.

**English Militia.**—As early as the time of Alfred the Great, the division and organization of society in England comprised the enrolment of the people in bands or companies, commanded by a leader, who was elected in the folkmotes, and called ealdorman or earl, and whose authority extended over the county. "By the Anglo-Saxon laws, or rather by one of the primary and indispensable conditions of political society, every freeholder, if not every free man, was bound to defend his country against hostile invasion." Every 10 families, as far as convenient those related to each other, formed a tithing, commanded by the "bors-holder" in his military capacity; 10 tithings formed a hundred, several of these forming a trything, or riding, as the word has been perpetuated in Yorkshire. Three public burdens, the *trinoda necessitas*, were imposed upon the citizen; to serve under arms, to repair and construct fortresses and to make and repair roads and bridges. The Norman Conquest was the means of creating an army made up of bands which attended the king under the command of their immediate lords by "knight service," but that in no way changed the fundamental character of the militia. It was enacted by Henry II (1181, The Assize of Arms) with the consent of Parliament, that every freeman, according to the value of his estate or movables, should hold himself constantly furnished with suitable arms and equipments, the poorest having to provide himself with a "wambais" or linen coat stuffed with cotton, and a lance. In the time of Edward I (1275) the Statute of Winchester defined these requirements more clearly. "Every man between the ages of 15 and 60 was assessed and sworn to keep armour according to the value of his lands and goods, a hauberk and iron breastplate, a sword, a knife and a horse. For smaller property less expensive arms were required and these provisions were enforced by semiannual inspections by constables chosen in every 100." From the earliest times the high constable of the county, or sheriff, was the officer by whose authority the citizens were called out, either to drive off predatory bands of robbers, or to assist him when he was in the performance of

any duty required by the courts of law. When thus called out for the latter purpose, the body was known as the *posse comitatus*, or power of the county, and to this day the same power is lodged in our office of sheriff and is the ultimate resort of the county officer charged with legal process. The constitutional military force of the kingdom consisted, therefore, of the feudal troops and the *posse comitatus*. But the latter could not be marched out of the kingdom, nor yet out of their shire, except in case of invasion. The sheriff was also charged with the same duty of calling out the militia when the citizens were organized in pursuance of parliamentary enactments, but later, when the kings considered themselves to be in need of troops more under their immediate control, he was superseded by commissioners of array, although his authority remained unaltered as to summoning assistance for local duties. Prior to the reign of Elizabeth, lords lieutenant in the several counties were appointed by the Crown to marshal the military forces. The people were always exceedingly jealous of their rights, and as a nation insisted more upon pursuing their home labors than upon conquests and achieving glory, and one of the earliest records of this spirit is the enactment in the time of Edward III, made as a restraint upon the infractions of the rights of the people, that no man shall be obliged to equip himself except as has been the custom, and shall not be obliged to leave his shire except when necessity require it for the defense of the realm. Conscriptions and levies were resorted to at times, but were tolerated by the people only when their love for the government exceeded the bounds of resistance or revolution. The Civil War of 1642, the result of which was the execution of Charles I, was precipitated and protracted in part by the militia question. The right of the king, as chief executive of the nation, to call the militia into service in time of need was undoubted, but through the natural jealousy and distrust of Parliament, the power of the king was sought to be curtailed by making the office of lord lieutenant irrevocable for two years and giving those offices to the persons approved by Parliament. For six years this was one of the main topics of contention in the wars and negotiations which resulted in the establishment of the Commonwealth. The result of the war was to put England under the subjection of Cromwell and his army, and ultimately to fill the people with a great detestation of a permanent military establishment, and the whole course of subsequent legislation upon soldiery was directed with care to avoid the dangers of a standing army. The Restoration of 1660 was finally accomplished through the militia of England. To epitomize Macaulay's statement: "It was an exciting time," the flame of civil war was actually rekindled, the nobility put forth their best energies to assemble and train the militia, and train bands were held ready to march in every county. The popular feeling and strength were too great to be disregarded; the old army of 50,000 men was humored as well as intimidated into accepting the unmistakable desire of the nation, and it saw itself destroyed, without striking a blow, looking sullenly on the triumphal entry of Charles II into London, while the militia invested the country with a strength they dared

not measure. A force of upward of 120,000 men had been organized to act in this great emergency.

Shortly after the Restoration, the Parliament, filled with the idea of how important as well as how trustworthy the militia was, passed a bill organizing it. A horseman was required to be provided, equipped and paid for by every one having an income of £500 a year derived from lands or £6,000 of personal property. And every one whose income or possession was one-tenth of those amounts was charged with the equipment and pay of a pikeman or musketeer, and those of less estate were obliged to combine in furnishing horse or foot soldiers. The size of the body of soldiery thus created was estimated at 130,000 men. For a time, this force became a useful and serviceable body, but the influence of the Crown was not lent to perfecting it. The king's desires were rather to obtain possession of any army that could be used to do his bidding. James II was met by the jealousy of Parliament just as Charles I had been. Of a religion that was hated by the mass of the people, and repeatedly thrusting men who were tools of the Crown into office, James II awakened a sense of distrust and opposition; his attempts to raise a regular army, by demands for the necessary appropriations from Parliament, were the occasions of debate upon what the military establishment of the country was and should be. These arguments were renewed pro and contra on different occasions, but the king's wishes were disregarded when, at the very height of his power, the dangers of a standing army were emphasized by Parliament; and a bill to make a militia more efficient was passed at the same time that supplies for the army were granted. The popular feeling was embodied in what was said in Parliament at this time in answer to what the courtiers had to urge in favor of regular troops. Sir Edward Seymour, Sir William Twisden, Sir Richard Temple and Sir John Maynard, the most learned lawyer of this time, gave vent to these utterances. Said the first of these: "The militia might not be in a satisfactory state, but it might be remodeled, and he would rather give up a million to keep up a force from which he had nothing to fear than half a million to keep up a force of which he must ever be afraid." The troops enrolled in the regular service, however, continued to increase in number, made necessary through the foreign relations of the English government, but the people accepted the increase always holding fast to the idea of a militia as their real protector. The force of circumstances, when the House of Orange was called to the throne, changed to an extent the feeling of the country in this regard, and danger from foreign foes made soldiers a necessity which the people reluctantly recognized, without such fear for their domestic content as they had before entertained. The sentiment of the country was again shown when the House of Hanover came to the throne of England, although at this time the regular army had become a permanency, having been continuously provided for on the theory that a standing army was a necessity "for better preserving the balance of power in Europe." In 1757 the militia of England was again reorganized, the impelling motive being that which had always been uppermost in the

minds of Englishmen, namely, to take away the pretext for a standing army, and a quota was fixed for each county. The provisions were for five years' service, the position of an officer was made important by proper qualifications and it was provided that without the exigency of service the companies should not be marched out of their counties. It was believed that the possession of the offices by gentlemen of estates would, although under the authority of the Crown, always ensure the services of the militia to the good of the people. This force gradually became, by reason of the limited size, the right given to furnish substitutes and a progressive necessity to supply pay, clothing and all other expenses, a feeder for the regular establishment, a distinct species of reserve, and in consequence the free, patriotic and military spirit of the country began to manifest itself by the creation of volunteer organizations. Prior to that time the "militia had enjoyed for many years as compared with the regular forces, a social, as well as a constitutional superiority." The volunteers so called into existence now replaced, to an extent, that ancient power and continued until the events of the Boer War when they ceased to exist and the Territorial Army was created. The control of the militia of Great Britain was taken from the country and lodged in the Crown in 1871, and since then the militia has been a part of the regular force and has constituted the army that shared in the defeat of Germany.

The foregoing brief reference to the militia of Great Britain is of greater interest than an account of the militia of Greece, of Switzerland, of South Africa, of Argentina or of any other country, because it is the foundation of our military policy. In all free or republican countries the embodiment of the military spirit is shown by the willingness and ability to bear arms and to organize for war. The transition of nations from a condition of popular military education, discipline and strength, to military powers, possessing large armies, devoted to war for defense or conquest, involves an understanding of the great World War begun in 1914.

**American Militia.**—The peculiar life of the colonies in America rendered it necessary that the colonists should keep themselves armed and experienced in the use of weapons of defense; inheriting the institutions of the mother country, the existence of a militia was an assumed matter in their organization. The adoption of the Constitution of the United States, above quoted, in 1789 was the subject of innumerable debates and political views and prophecies, and the proceedings of the constitutional conventions concerning the adoption of the clauses relating to the militia are most interesting as a matter of political history; space, however, will not permit an account of them. Singularly enough, South Carolina and Virginia were on the side of giving the government greater power, while Massachusetts and Connecticut were opposed to curtailing the State control. Propositions were successively voted down in attempts to frame the Constitution in this regard, among others as follows:

(a) To make laws regulating and disciplining the militia, not exceeding one-tenth part in any one year.

(b) To establish a uniform and general system of discipline for the militia of the States and to make laws for arming and disciplining and governing such part of them as may be employed in the service of the United States.

(c) To establish a uniformity of arms, exercise and organization for the militia and to provide for the government of them when called into the service of the United States.

(d) To add to the clause reserving to the States respectively the appointment of the officers, the words "under the rank of General Officers."

We have to bear in mind that the majority tried in many instances to yield to the general government the minimum of the powers deemed essential to that government, and this fact explains the fragmentary character of the provisions as to the militia. But the conviction was general that the militia must be trained with uniformity and be so organized as to become a defense to the nation, and that the only authority to provide therefor was the general government. Hamilton in the *Federalist* fully defended the Constitutional plan. Patrick Henry in Virginia was convinced that ruin would follow the adoption of the law. So much concern was felt regarding the militia that among the 10 amendments which were promptly made and declared to be in force 15 Dec. 1791 was that (No. 2), providing "a well regulated militia being necessary to the security of a free State, the right of the people to keep and bear arms shall not be infringed." The State constitutions and the State laws have from time to time, and invariably, dealt with the militia of the respective States and are held by the courts to be controlling, so far as not inconsistent with the Federal laws, but they have not been uniform as to service, duty or organization. It has been demonstrated that Congress by the Act of 1792 made an ineffective law, by merely prescribing uniform duties for the entire male population composing the militia, and though thereafter for over 100 years the law was retained with slight amendment upon the statute book, it was not enforced and was the subject of repeated efforts at modification. The Presidents of the United States, notably Washington, Jefferson, Madison, Adams, Jackson and Van Buren in their messages to Congress, urged further legislation to create an efficient militia. Elaborate reports were made from committees in Congress, but nothing was accomplished except that in 1808 an annual appropriation of \$200,000 was begun, which was increased in 1887 to \$400,000 and in 1900 to \$1,000,000. Between 1819 and 1825 various bills and propositions were advanced for a classification of the militia, so that only a small part of it would have duty to perform in time of peace; then a board was convened by the Secretary of War, which made a report that was transmitted to Congress recommending the instruction of officers in camps of instruction 10 days each year. Jackson urged encouraging volunteer organizations. The Secretary of War of President Van Buren's Cabinet, in 1840, proposed that 100,000 men apportioned to the States be maintained, by draft or otherwise, to serve four years, one-fourth to go out each year and to form the reserve, continuing

as such four years more, the President, to order the active portion on duty 30 days each year and defray all charges for pay, subsistence, etc. It is said that no subject, except finance, was more discussed prior to the Civil War than the militia. The debates in Congress are full of it, reports and bills are numerous, both from the War Office and the committees of the Senate and House, but as stated, they were unacceptable, until after the war with Spain. The language of the Constitution "reserving to the States respectively, the appointment of the officers, and the authority of training the militia, according to the discipline prescribed by Congress," was always considered to be an insurmountable obstacle to Federal control of the militia in time of peace. As indicated, the army and Congress long endeavored to secure the adoption of a plan to limit the organized militia to a practicable number.

**Military Law of 1903.**—In 1903 the United States Congress adopted a new militia law, by which the militia was defined to be practically all able-bodied males between 18 and 45 years, divided into two classes, namely (a) "the Organized Militia," being such forces as may be created, under State laws, regardless of the name they bear, and (b) the remainder of the militia. A period of five years was given to all the States to adopt laws making the organization, drill and discipline of their organized militia the same as that of the regular army and the participation of the States in an annual appropriation of \$1,000,000 was made dependent on such State action and the creation of forces accordingly; the limit in number was as it stood theretofore, to wit, 100 men for each Congressional representative; those States which became entitled to participate in the annual fund became a part of the "Organized Militia." Authority was given to the President to call forth such number of the militia "organized" or "reserve," as he might deem necessary, in case of invasion, danger of invasion, rebellion or inability to execute the laws of the Union, and officers or enlisted men who neglected to present themselves to a mustering officer to be mustered into the service of the United States, if found fit, were subject to trial by court-martial.

Subsequent to 1903, the continued threat of Mexican trouble kept the military topic uppermost and a continuous series of legislative measures followed.

In 1916 the country had advanced to the position that the above supposed insurmountable obstacle about appointing officers and training the militia should be surmounted—or ignored. By the Act of 3 June 1916, Congress enacted that the army of the United States consisted of the Regular Army, the Volunteer Army, the Officers' Reserve Corps, the enlisted Reserve Corps, the National Guard while in the service of the United States and such other land forces as are now or may hereafter be authorized by law.

The National Guard is thereby made the regular enlisted militia between 18 and 45 years of age organized, armed and equipped as therein provided. The number to be organized is in the proportion of 200 for each senator and representative in Congress, and increased each year in the proportion of 50 per cent until a

strength of 800 for each senator and representative in Congress be reached, which creates theoretically a force of 420,000 men.

Power was given to the President to assign units to divisions, brigades, etc., and to detail officers to command them; likewise officers as chiefs of staff and assistants to the chiefs of staff. Adjutants-general of States report to the Secretary of War. Funds apportioned under "just and equitable procedure" in ratio of the number of enlisted men are to be paid for all general purposes. The States may fix the location of units within their borders and enlistments are to be for six years; three in the active and three in the reserve, and the law prescribes the contract, which creates a Federal soldier. Provisions for reserve units exist and authority is given to supply all material, as may be necessary to arm, uniform and equip the "National Guard," also for training, inspections, service schools, details, courts-martial and pay for service. The "National Guard" may be used for Federal service or may be drafted into the military service of the United States, in which case they cease to be National Guard and are discharged therefrom.

On 6 April 1917, the United States declared a state of war, and then followed the enactment for universal military service. This great and wise step has done more to educate the United States than any act passed by Congress; and its relation to the militia of the United States will be far reaching.

The war having been brought to a close the continued pressure for universal military instruction and training has not yet resulted in concrete plans. The creation of reserve officers' training corps in colleges and universities under the National Defense Act of 1915 is being accomplished by the War Department and the officers' reserve corps is a present factor of great importance through the demobilization of the American Expeditionary Forces.

The fact that the great body of the militia (except the 420,000 above mentioned comprising the "National Guard") are not yet subject under the law to military consideration is not likely to be ignored permanently.

**State Militia or State Guard.**—For over 100 years the militia had been called the State force, being in time of peace under the State, as in England it was under the county; the new law seeks to secure uniformity and perfection through active national participation in control, under the general power in Congress to raise armies. The term "National Guard" had been adopted by some States to designate its organized or volunteer militia. This appellation was adopted by one of the most famous militia organizations of the world, the Seventh Regiment of New York, at the time Lafayette visited America in 1824 and in his honor, after the "Garde Nationale." The State of New York appropriated the term in 1862 to describe the organized militia, and other States followed, but the term that Massachusetts has used, "Volunteer Militia," was more correct. The organized militia of the States bore names as follows: Georgia, South Carolina and Florida "State troops"; Arkansas and Kentucky, "State Guard"; Louisiana, "State National Guard"; Rhode Island, "Militia"; Texas, "Volunteer Guard"; Virginia, "Volunteers"; Massachu-

setts, "Volunteer Militia." The remaining States used the term "National Guard."

The State guard, regardless of its name, has always been a volunteer body, and although in many States some military organizations have existed excellent in drill, discipline, rifle shooting and general military proficiency, actually comparable with corresponding bodies in the regular service, their character has been partly social. Sustained by men who were fond of military work and who enjoyed performing patriotic service and attaining a prominence which gratified pride, such units were developments of a latent military spirit and were the means of giving popular military education to the youth of the country.

The assumption of general and universal military training of the youth of the land by the Federal government, and the inhibition of the maintenance of troops by the State, except a police force or constabulary, brings the State guard into a new form of organization.

During the World War the States generally created defense bodies, or State guards without support of the Federal government, and in the reorganization of the National Guard they are likely to be absorbed.

The military policy of the nation involves the proper conception of the militia. It is a political, economic and patriotic question of statecraft. The military sciences, which have been so marvelously developed by war, will naturally enter into the question, as well as the trained personnel of the army and navy, because the subject relates to the embodiment of national forces, but only for the perfection of a result and not for its creation.

The military power is subordinate to civil authority except when the military power must be exercised for the life or welfare of the nation. Asserting that this should be always kept in mind, Hallam says: "Nothing would more break down this notion of the law's supremacy than the perpetual interference of those who are really governed by another law."

**Bibliography.**—Concerning the English institution consult Edward, Earl of Clarendon, 'History of the Rebellion and Civil Wars in England'; Napier, 'Defence of England by Volunteers Corps and Militia'; Chamberlayne, 'State of England'; Grose, 'Military Antiquities respecting a History of the English Army'; Hallam, 'Constitutional History of England'; Macaulay, 'History of England'; Townshend and Windham, 'Plan of Discipline for Norfolk Militia' (1760); and for the United States reference may be made to Elliot's 'Debates,' Curtis' 'Constitutional History of the United States,' American State Papers (Military Affairs), Congressional Debates, reports of Secretaries of War and of congressional committees, messages of Presidents to Congress, opinions of attorney-generals, and numerous court decisions, both in the Federal and State courts. Among the former, reference should be made to the opinions of Justices Washington, Johnson and Story (in *Houston v. Moore*, 5 Wheaton, 1), of Justice Story (in *Martin v. Mott*, 12 Wheaton, 19), of Chief Justice Taney (in *Luther v. Borden*, 7 How. 1).

CHARLES E. LYDECKER,  
Brevet Lieutenant-Colonel, N. G., N. Y.,  
retired.

### MILITIA, Naval. See NAVAL MILITIA.

**MILIUM, or GRUTUM**, an old name, a skin disease caused by the retention of the secretion of the sebaceous glands, resulting in small white or yellowish-white globules the size of a pinhead or less, constituting a minute tumor. It usually forms around the eyes, on the cheeks or forehead, although it also occurs on other parts of the body. The tiny tumor lies just beneath the skin, slightly raised above its surface, and is supposed to form through the destruction of duct through which the secretion of the sebaceous formerly passed. It may undergo calcification, but at no time in the process of its formation nor in its continued presence is there inflammation. In some cases it disappears in the course of the continuous change in the cuticle. The treatment consists of opening the globule with a fine-pointed knife, evacuating the contents and treating the sac with tincture of iodine or nitric acid. Electrolysis is likewise employed in the same manner as for the permanent removal of hair.

**MILK** may be defined as the normal secretion of the mammary glands. The milk of all mammals is similar in qualitative composition, consisting essentially of water, fat, proteins, milk-sugar and salts or ash. Colostrum, the fluid secreted for a short time immediately after giving birth to the young, is composed of similar substances, but differs considerably from normal milk in its quantitative composition and physiological properties. The average percentage composition of some of the more important milks is approximately as follows:

	Water	Fat	Protein	Sugar	Ash
Human milk.....	88.00	3.80	1.50	6.40	0.30
Cows' milk.....	87.00	4.00	3.35	4.90	0.75
Goats' milk.....	85.70	4.75	4.30	4.45	0.80
Ewes' milk.....	80.80	6.85	6.55	4.90	0.90
Asses' milk.....	89.50	1.75	2.00	6.25	0.50
Mares' milk.....	90.75	1.20	2.00	5.70	0.35

Human milk varies to such an extent that any attempt to state its average composition is liable to be misleading. The percentage of any constituent, and especially that of proteins, may differ widely from that given above while the milk is still entirely normal. Such differences are found not only in the milk of different women, but in that of the same woman at different periods of lactation.

Cows' milk differs from human milk in containing less sugar and considerably more proteins and ash. The proteins are also of a somewhat different character, the casein being more easily coagulated and forming a denser curd. Goats' and ewes' milks being rich in fats and proteins are well adapted to the manufacture of cheese and are largely used for this purpose in some parts of Europe. Asses' and mares' milks have been recommended as preferable to cows' milk for infant feeding, since they show some resemblance to human milk in the amount and nature of the proteins which they contain. In this country, however, the milk of the cow is the only one of commercial importance. Unless otherwise explained all of the statements which follow will be understood

to refer to cows' milk, but many of them are true of the milk of other mammals as well.

**Cows' Milk.**—The constitution of cow's milk has been concisely stated by Richmond: "It is essentially an aqueous solution of milk-sugar, albumin and certain salts, holding in suspension globules of fat and in a state of semi-solution, casein together with mineral matter. Small quantities of other substances are also found." As regards its physical properties, milk is an opaque, white or yellowish fluid, somewhat heavier and more viscous than water, having a faint characteristic odor and a slightly sweetish taste. The yellowish color is due to the fat and the opacity and viscosity in part to the fat and in part to the casein and lime salts present. The specific gravity is usually between 1.029 and 1.034 at 15.5° C. (60° F.). Normal fresh milk shows toward litmus an amphoteric reaction, and reacts acid with phenol-phthaline. This property is attributed to the presence of phosphates and of carbonic acid. The gases contained in cows' milk, carbonic acid with small amounts of oxygen and nitrogen, are for the most part evaporated in the usual processes of handling the milk and therefore need not be further considered here.

**Proportions of Water and Solids.**—The proportion of water in cows' milk varies considerably, depending upon breed, individuality, period of lactation, etc. While the average amount is about 87 per cent, the mixed milk of a herd may easily show as much as 88 or as little as 85 per cent of water corresponding respectively to 12 or 15 per cent of solids. The milk of a single healthy cow in normal condition may sometimes contain as little as 10 or as much as 18 per cent of solids, while in extreme cases even these latter limits may be passed. The writer has found 19.88 per cent of solids in the milk of a perfectly healthy cow and 27.40 per cent in that of a cow having fever. Over 16 per cent of solids in the mixed milk of a herd or over 18 per cent in that of an individual is, however, comparatively rare.

**Breed.**—While much depends upon the individual cow, it is well known that some breeds tend to yield richer milk than others. The following figures, obtained by averaging the records of tests made at the New York and New Jersey agricultural experiment stations, serve to illustrate the variation in richness of milk yielded by different breeds:

BREED	Total solids, per cent	Fat, per cent	Solids-not-fat, per cent
Jersey	14.87	5.19	9.68
Guernsey	14.69	5.16	9.53
Shorthorn	13.38	4.05	9.33
Ayrshire	12.73	3.64	9.09
Holstein	11.96	3.43	8.53

**Advance of Lactation.**—After the third or fourth month the milk tends to increase in richness as lactation advances. A study of nearly 50 lactation periods of individual cows at the New York State Experiment Station yielded the following average results, the ob-

servation being continued in each case for 10 months:

MONTHS	Total solids, per cent	Fat, per cent	Solids-not-fat, per cent
First month	14.00	4.54	9.46
Second month	13.50	4.33	9.17
Third month	13.47	4.28	9.19
Fourth month	13.64	4.39	9.25
Fifth month	13.75	4.38	9.37
Sixth month	14.00	4.53	9.47
Seventh month	14.18	4.56	9.62
Eighth month	14.33	4.66	9.67
Ninth month	14.46	4.79	9.67
Tenth month	14.83	5.00	9.83

In the last few days of lactation, when the yield becomes very small, the proportion of solids often rises to a marked degree, sometimes reaching 20 per cent or over.

**Food, Weather, etc.**—Other conditions being the same milk is richer in winter than in summer, in cooler than in warmer weather, and on rich dry food than on pasture, except that on first turning the cows to pasture a richer milk may be obtained for a time. Probably anything which induces a greater consumption of food has a tendency to increase at first the richness of the milk secreted. In most cases, however, such increase in richness is found to be only temporary, the more permanent influence of better feeding being to improve the quantity rather than the quality of milk produced.

**Partial Milking.**—All of the statements regarding the composition of milk refer to the product of a complete milking. In partial or fractional milking the first portions drawn are comparatively poor, especially in fat, and the last portions or "strippings" are much richer.

**Milk Fats.**—Milk fat, like other fats, is a mixture of glycerides (compounds of glycerin and fatty acids). It differs from other animal fats in containing a smaller proportion of stearic acid and large proportions of the acids of lower molecular weight. A detailed study of the constitution of milk fat by Browne gave the following results:

ACID	Per cent of acid obtained	Corresponding per cent of glyceride
Oleic	32.50	33.95
Dioxytstearic	1.00	1.04
Stearic	1.83	1.91
Palmitic	38.61	40.51
Myristic	9.89	10.44
Lauric	2.57	2.73
Capric	0.32	0.34
Caprylic	0.49	0.53
Caproic	2.09	2.32
Butyric	5.45	6.23
Total	94.75	100.00

The last four acids are the "volatile fatty acids," the large amount of which serves to distinguish milk fat (butter) from other fats which as a rule have only a fraction of a per cent of these acids. In the milk the fat exists in the form of minute suspended globules which

vary considerably in size, but average about  $\frac{1}{10000}$  of an inch in diameter. A drop of average milk contains over 100,000,000 fat globules.

**Amount of Fat in Milk.**—The percentage of fat in milk varies more than that of any other solid constituent or, indeed, of all the other solids combined. In the mixed milk of herds where the influence of individual cases of advanced lactation is minimized, we may consider the usual range to be from 3 to 6 per cent of fat and from 8.5 to 9.5 per cent of solids not fat. Hence the varying richness of cow's milk is due principally to differences in fat content, and as fat is also the constituent of greatest pecuniary value, a "rich" mil- is essentially one containing a high percentage of fat.

**Nitrogenous Compounds or Proteins of Milk.**—The greater part of the nitrogen in milk (usually over three-fourths) is in the form of casein, a compound protein which contains phosphorus in organic combination and is probably also combined with lime salts. Casein is readily coagulated by acids or rennet and the curd thus formed encloses the greater part of the fat which the milk contained. Of the nitrogen compounds other than casein, albumin is by far the most abundant. Milk albumin is not coagulated by rennet, nor by acids at ordinary temperatures, but is coagulated by heat. In addition to casein and albumin milk contains small amounts of other protein bodies including the enzymes or unorganized ferments which play an important part in cheese-making and probably aid the digestion when milk is consumed in the fresh state without previous heating. Among the nitrogenous compounds other than proteins which have been found in milk may be mentioned small amounts of lecithin, amino acids, "vitamines" and traces of ammonia and urea.

**Amount of Proteins in Milk.**—Formerly, through faulty methods of separation, the reported percentages of proteins were often very inaccurate and were usually too high. The amount of protein matter as determined by modern methods is usually between 3 and 4 per cent, being higher in those samples which are rich in fat. Average milk with 13 per cent of solid matter usually contains about 4 per cent of fat and 3  $\frac{1}{3}$  per cent of proteins. In richer milk the increased amount of solids is usually made up of about three-fourths fat and one-fourth proteins. In other words, the percentages of fat and proteins tend to rise and fall together approximately in the proportions represented by the formula—Proteins =  $2.00 + \frac{1}{3}$  Fat. Variations in fat, especially if due to temporary causes, are not always accompanied by so much variation in proteins as the formula would indicate. On the other hand, the percentage of proteins is apt to exceed that indicated by the formula, in very advanced lactation. As a rule when the amount of solids-not-fat exceeds 9 per cent, the excess is due chiefly to excess of proteins.

**Milk-Sugar.**—Milk-sugar, or lactose, has the same composition as cane-sugar, but differs from the latter in some of its chemical properties and is less sweet and less readily soluble in water. The amount of sugar is rather more constant than that of proteins, being usually between 4.5 and 5.25 per cent in normal milks. While the latter figure is rarely exceeded, occasional samples may show considerably less than

4.5 per cent. In any genuine milk containing an unusually low percentage of solids-not-fat, the deficiency is apt to be principally in the milk-sugar. Such milk is apt to be yielded in case of fever or unusual excitement or fatigue, and may sometimes be obtained from apparently healthy cows under normal conditions, especially during hot, dry weather.

**Salts or Ash of Milk.**—When milk is dried and burned there remains a white ash, the average composition of which is stated by Fleishmann and Schrodt to be:

	Per cent
Potassium oxide.....	25.42
Sodium oxide.....	10.94
Calcium oxide.....	21.45
Magnesium oxide.....	2.54
Ferric oxide.....	0.11
Sulphuric anhydride.....	4.11
Phosphoric anhydride.....	24.11
Chlorine.....	14.60
	103.28
Less oxygen equivalent to chlorine.....	3.28
	100.00

A part of the phosphoric anhydride of the ash is derived from the phosphorus of the casein. The sulphuric anhydride also comes from the oxidation of the milk proteins. If these acid constituents are deducted the bases in the ash are found to be in considerable excess. In the milk these bases are combined partly with the casein and partly with citric acid, a very small quantity of the latter being a normal constituent of cows' milk. The amount of ash does not, therefore, exactly represent the mineral matter originally present. The ash of normal milk is usually between 0.65 and 0.80 per cent, averaging about 0.73 per cent. The ash tends to vary with the proteins approximately in the proportion—Ash =  $0.38 + \frac{1}{10}$  Protein.

**Nutritive Value and Place in the Diet.**—From the above statements regarding the composition of milk one may conclude that it contains proteins, fats, carbohydrate and salts in good quantitative relation to each other. The nature of the nutrients in milk also emphasizes its value as a food. Recent feeding experiments comparing different proteins have shown milk albumin to have the highest nutritive value of any protein known, both for maintenance of grown animals and for supporting the growth of the young. Casein also has a very high nutritive efficiency and it is probably safe to say that the proteins of milk are of superior value in nutrition to those of any other known article of food. The fat of milk being in the form of an emulsion is more easily digested than ordinary food fats, and while the various fats after being digested and absorbed are of about equal value as sources of energy, yet milk fat and the butter made from it have been found to have a special value as food because of the presence therein of the recently discovered fat soluble vitamin mentioned below. The sugar of milk is less likely than cane sugar, either to directly irritate the stomach or to undergo fermentation, and it is among the most readily available of foodstuffs, requiring only a single cleavage to bring it into form for absorption and utilization by the body. The proportions of the different elements in the ash of milk make it an exceptionally valuable source of these inorganic foodstuffs, particu-

larly because of its high calcium content. In addition to the foodstuffs of known chemical nature it has recently been found that there are required for normal nutrition two other substances or groups of substances both of which are furnished by milk. The one has already been mentioned as occurring in the milk fat. It is referred to in recent literature as "fat soluble vitamine" or "fat soluble A". The other essential foodstuff furnished by milk is soluble in water and therefore remains in the skim milk in butter-making or in the whey in cheese-making. It is referred to as the "water soluble vitamine" and as "water soluble B." Milk is therefore the nearest approach to "the perfect food" that we have in any one commercially available article of diet.

On account of the richness of milk in all groups of foodstuffs, including those whose existence has only recently been recognized, the purchase of milk at ordinary prices is a much more economical investment than is commonly supposed. For families spending as much as 20 cents per person per day for food, milk at 10 cents a quart may be considered a more profitable investment than the average of the food purchased; and for those able to spend 30 to 40 cents per person per day for food the purchase of the highest grade of milk, even at a price of 15 to 20 cents a quart, is by no means extravagant. The commonest defect of the dietaries of city families is the inadequate use of milk. Investigations under the auspices of the New York Association for Improving the Condition of the Poor have shown that city dietaries are more often deficient in calcium than in any other chemical element and that the use of more milk is the most effective way of remedying this defect and at the same time making the diet better balanced in other respects and much better suited to the needs of growing children. In families where there are as many children as adults, at least as much money ought to be spent for milk as for meat.

**Food Laws—Standards of Purity.**—On account of the great importance of milk as food most of the States had laws regulating the sale of milk and established standards of composition for it even before the enactment of the general food laws. More attention has doubtless been given to the standard of purity for milk than for any other article of food. The official definition and standard of composition followed in the enforcement of the United States Food and Drugs Act and is most of the States is as follows:

Milk is the fresh, clean, lacteal secretion obtained by the complete milking of one or more healthy cows, properly fed and kept, excluding that obtained within 15 days before and 10 days after calving, and contains not less than 8.5 per cent of solids-not-fat and not less than 3.25 per cent of milk fat.

In recent years much attention has also been given to the establishment of sanitary standards and the grading of milk on the basis of sanitary qualities. The grades and standards recommended by the National Commission on Milk Standards are as follows:

#### GRADE A.

**RAW MILK.**—Milk of this class shall come from cows free from disease as determined by tuberculin tests and physical examinations by a qualified veterinarian, and shall be produced and handled by employees free from disease as determined by medical inspection of a qualified physician, under sanitary conditions, such that the bacteria count shall

not exceed 10,000 per cubic centimeter at the time of delivery to the consumer. It is recommended that dairies from which this supply is obtained shall score at least 80 on the United States Bureau of Animal Industry score card.

**PASTEURIZED MILK.**—Milk of this class shall come from cows free from disease as determined by physical examinations by a qualified veterinarian, and shall be produced and handled under sanitary conditions, such that the bacteria count at no time exceeds 200,000 per cubic centimeter. All milk of this class shall be pasteurized under official supervision, and the bacteria count shall not exceed 10,000 per cubic centimeter at the time of delivery to the consumer. It is recommended that dairies from which this supply is obtained should score 65 on the United States Bureau of Animal Industry score card.

#### GRADE B.

Milk of this class shall come from cows free from disease as determined by physical examination, of which one each year shall be by a qualified veterinarian, and shall be produced and handled under sanitary conditions, such that the bacteria count at no time exceeds 1,000,000 per cubic centimeter. All milk of this class shall be pasteurized under official supervision, and the bacteria count shall not exceed 50,000 per cubic centimeter when delivered to the consumer.

It is recommended that dairies producing grade B milk should be scored and that the health departments or the controlling departments, whatever they may be, strive to bring these sources up as rapidly as possible.

#### GRADE C.

Milk of this class shall come from cows free from disease as determined by physical examinations, and shall include all milk that is produced under conditions, such that the bacteria count is in excess of 1,000,000 per cubic centimeter. All milk of this class shall be pasteurized, or heated to a higher temperature, and shall contain less than 50,000 bacteria per cubic centimeter when delivered to the consumer.

Whenever any large city or community finds it necessary, on account of the length of haul or other peculiar condition, to allow the sale of grade C milk, its sale shall be surrounded by safeguards such as to insure the restriction of its use to cooking and manufacturing purposes.

These grades and standards have been adopted, either directly or with such modifications as local conditions might suggest, in several of the States and cities of the United States and it seems certain that such grading of the milk supply will soon become the general rule.

**Significance of Bacteria in Milk.**—There has been considerable controversy as to what sanitary significance can properly be attached to the presence of large numbers of bacteria in milk. It is certain that many of the species which multiply most rapidly in milk are entirely harmless and in fact certain fermented milks which contain enormous numbers of lactic acid bacteria are believed by many to be particularly wholesome. On the other hand it is, in general, only as a result of unsanitary methods or insufficient safeguards in the handling of milk that the large numbers, sometimes found in market milk, can be accounted for, so that in general the presence of large numbers of bacteria reflects serious doubt upon the sanitary quality and even upon the wholesomeness of milk. Present opinion on this matter is perhaps best presented in the words of the following resolution recently adopted by the Commission on Milk Standards:

"Whereas, milk is one of the most perishable foods, being extremely susceptible to contamination and decomposition, and

"Whereas, the milk consumer is justified in demanding that milk should be clean, fresh and cold, in addition to having the element of safety, and

"Whereas, milk which is from healthy cows and is clean, fresh, and which has been kept cold, will always have a low bacterial count, and

"Whereas, milk that is dirty, stale, or has been left warm, will have a high bacterial count; therefore, it is resolved:

"First: That the health officer is justified in using the bacterial count as an indicator of the degree of care exercised by the producer and dealer in securing milk from

healthy cows and in keeping the same clean, fresh and cold; and

"Second: That the health officer is justified in condemning milk with a high bacterial count as being either unhealthy or decomposed, or containing dirt, filth, or decomposed material as a result of the multiplication of bacteria due to age and temperature.

"Third: That the health officer is justified in ruling that large numbers of bacteria are a source of possible danger, and that milk containing large numbers of bacteria is to be classed as unwholesome, unless it can be shown that the bacteria present are of a harmless type, as for example, the lactic acid bacteria in buttermilk, or other especially soured milks."

**Pasteurization.**— Since under ordinary conditions it is not always possible to guard perfectly against the possible introduction of the germs of communicable disease into milk and since times and temperatures of heating milk, so as to ensure destruction of such pathogenic bacteria with exceedingly little, if any, injury to the milk itself, have now been thoroughly worked out, there is now practically unanimous agreement among those most interested in the subject that all milk, except that produced under extraordinarily good sanitary conditions, should be subjected to modern low temperature pasteurization before being used. In order to guard against injury to the antiscorbutic properties of the milk it should preferably be pasteurized at a temperature of only 140° to 145° F. (60° to 63° C.). Heating at this temperature for 20 to 30 minutes is the best safeguard against distribution of disease through milk; and milk thus pasteurized and protected from subsequent contamination or deterioration may be used with confidence that it has been rendered safe as regards pathogenic bacteria without serious injury to any of the normal constituents of the milk itself. Since there is a possibility that the antiscorbutic properties of milk may be injured to a slight extent by even low temperature pasteurization, it is advisable that infants and young children fed on pasteurized milk should be given orange juice or other food of known antiscorbutic property and suited to the age of the child.

**Preservation of Milk.**— Milk produced under usual conditions contains large numbers of bacteria. At ordinary temperatures these multiply rapidly and soon cause such changes as to render the milk unpalatable, if not unfit for use. Various preventive measures may be adopted, either to prevent bacteria from getting into the milk, to check or control their growth or to destroy them entirely. Strict cleanliness and the use of sterilized utensils exclude a large proportion of the bacteria usually present in milk and greatly improve its keeping qualities. If such milk is protected from access of air and kept cold, it will remain sweet and fresh for at least two or three weeks without any other preservative measures. (The sanitary production and handling of milk are more fully described in the article: DAIRY INTERESTS, AMERICAN). In this respect the American dairy practice is much in advance of that of other countries, as was strikingly shown at the exhibit of dairy products at the Paris Exposition of 1900. Three dairies engaged in city milk supply, one in New York, one in New Jersey and one in Illinois, sent regular shipments of fresh milk and cream to Paris throughout the summer. These products were found to be sweet and sound when opened from 15 to 20 days after bottling, and it was only with great difficulty that European dairy

experts could be convinced that nothing but "cleanliness and cold" had been used to preserve them. No other country except France attempted to show natural milk and cream and the French exhibits were all sour on the second or third day.

It is evident that milk may be preserved much longer than is usually necessary by the observance of cleanliness to exclude bacteria as far as possible and the maintenance of a low temperature to retard the growth of those present.

**Chemical Preservatives.**— Various substances have the power of preventing or retarding the growth of bacteria. Those most often used to prevent milk from souring are boracic acid or borax, and formaldehyde. Much more rarely salicylates, chromates, fluorides and other substances have been reported. Since milk often forms the sole food of infants and invalids, the use of chemical preservatives is more objectionable in milk than in other foods and should be strictly prohibited, as is usually the case.

Milk is sometimes treated with carbonate or bicarbonate of soda which neutralizes the lactic acid which would otherwise make the milk sour. These substances do not check the growth of bacteria but simply mask the results of their activity. By neutralizing the lactic acid they favor the growth of the bacteria which attack the proteins as well as those which affect principally the milk-sugar. Such milk, therefore, tends to become unwholesome more rapidly than milk to which nothing is added.

**Methods of Analysis and Detection of Adulterations.**— The complete analysis of a sample of milk requires much time and elaborate apparatus and is not practicable for others than trained chemists. The tests described below are more easily performed and if carefully carried out will in many cases yield all the information required. Before taking a portion for any determination the milk to be tested should be thoroughly mixed by repeatedly pouring it from one vessel to another.

**Determination of Fat.**— Since fat is both the most valuable and the most variable of the solids in milk, its determination is often required. This may be accomplished by the method devised by Dr. S. M. Babcock, of the Wisconsin Agricultural Experiment Station, and popularly known as the Babcock test. In making this test, a measured amount of milk is treated with about an equal volume of commercial concentrated sulphuric acid which dissolves the other constituents, leaving the fat free in a heavy solution from which it is separated by centrifugal force and collected in the graduated neck of the test bottle, where its volume is read off at once on the completion of the test. Complete directions are furnished with the testing outfit, which can be purchased for a few dollars from dealers in chemical apparatus or dairy supplies.

**Determination of Specific Gravity and Estimation of Solids-Not-Fat.**— Since the specific gravity of milk is raised by all of the other solids and lowered by the fat, it follows that after the influence of each has been determined, it should be possible to estimate from the percentage of fat and the specific gravity

the percentage of solids-not-fat which the sample contains. To determine the specific gravity it is convenient to use a "Quevenne" or a "Soxhlet" lactometer, either of which is practically a hydrometer of sufficient range to cover the gravity of all ordinary milks and so graduated that the thousandths in excess of unity are represented by whole numbers on the scale. Thus a milk with a specific gravity of 1.0315 will give a lactometer reading of 31.5. The temperature should be observed at the same time with the lactometer reading and the latter corrected to 60° F. by adding to the reading 0.1° for each degree F. above the standard temperature of 60° F. One-fourth of the corrected lactometer reading plus one-fifth of the percentage of fat gives a fairly close approximation to the percentage of solids-not-fat. The lactometer reading may also be useful aside from the estimation of solids-not-fat. Although the addition of cream to milk would lower the gravity, yet in general the lactometer reading is a rough indication of the richness of the milk, because a high percentage of fat is usually accompanied by a high percentage of protein which raises the lactometer reading. Cases in which genuine milk shows a low gravity as the result of a high percentage of fat are not common and can usually be detected by noticing the viscosity and opacity of the milk as it runs from the bulb of the lactometer. The lactometer reading taken in connection with the appearance is therefore a useful preliminary test and is used as such by the milk inspectors of many cities.

#### Detection of Skimmed or Watered Milk.

— The most common adulterations of milk are the removal of cream (or the addition of skimmed milk, which amounts to the same thing), and the addition of water. Milk which contains less than 3 per cent of fat has usually been partially skimmed, and milk containing less than 8.5 per cent of solids-not-fat has usually been watered. In most States there are minimum limits established by law and milk falling below the limit is considered to be adulterated. Thus in New York State milk must contain at least 3 per cent of fat and at least 11.5 per cent of total solids. As stated above, the percentage of fat varies much more than that of solids-not-fat. Skimming is therefore more difficult to detect than watering. In fact, it is usually impossible to distinguish by analysis between a genuine sample containing, say, 3.6 per cent of fat, and a sample originally containing 4.5 per cent of fat, one-fifth of which has been removed. On the other hand, the addition of 20 per cent of water would almost certainly reduce the percentage of solids-not-fat to a figure considerably below the normal minimum. Recently, too, a more delicate method for the detection of watering has been devised.

**Other Adulterants.**— The addition of chalk, calves' brains, etc., though frequently mentioned in the older works on food adulteration, is now almost unknown. Cane-sugar or starch may sometimes be added to mask the effect of watering. The former may be detected by the rose-red color produced when about 10 cubic centimeters of milk are boiled for five minutes with one cubic centimeter of hydrochloric acid and 0.1 gram of resorcin. To detect the presence of starch, boil about 10 cubic centimeters of milk, cool it thoroughly and then add a few

drops of a solution of iodine in potassium iodide. If starch is present a characteristic blue color will be produced.

**Artificial Coloring Matter.**— Caramel or yellow coloring matter such as is commonly used in butter may occasionally be added to milk. The detection of these is of little practical importance, since they would ordinarily be used only to mask the effects of gross skimming or watering such as would be readily detected by the methods already given.

**Detection of Preservatives.**— **FORMALDEHYDE** ("FORMALIN").— Dilute the milk with an equal bulk of water in a test tube and carefully pour in commercial concentrated sulphuric acid, inclining the tube so that the acid and milk will not mix. If formaldehyde is present a violet ring forms at the junction of the two liquids. If pure acid is substituted for the commercial, a trace of some ferric salt should be added. **BORACIC ACID** OR **BORAX**.— Evaporate a portion of the milk to dryness and burn to ash. Moisten with a few drops of dilute hydrochloric acid and introduce a slip of yellow turmeric paper. This is turned reddish brown by boracic acid and the color may be changed to bluish black by treating with a solution of sodium carbonate. **CARBONATES** OR **BICARBONATES** if present in the milk would remain as carbonate after ignition and be shown by an effervescence when the ash was moistened with acid in the test for boracic acid just described.

**MILK, Human.** This liquid has a specific gravity of 1028.34, and contains water, 87.4; total solids, 12.6; fat, 3.4; albuminoids, 1.2; sugar, 7.0; ash, 0.2. It is slightly alkaline, is sterile and differs mainly from cow's milk in being sweeter and having less fat and casein. Its fat is more fluid and the casein is more readily dissolved. Cow's milk is frequently acid and its casein is often digested with difficulty. Experience shows that an infant should, if possible, be nursed during the earlier months of its life, for human milk is usually adapted to the digestive powers of infants. Its alkalinity, its temperature (98°-100° F.), its chemical constituents aid the development of the child. But poor health of the nurse, mental emotions, improper food or deranged digestion of the infant may prevent natural feeding or require its cessation. It is an interesting fact that the demands of the nursing infant have a great influence upon the quantity of mother's milk. Thus a wet nurse feeding two infants produced 720 grams, but this quantity increased to 1,750 grams when it becomes necessary for her to nurse five. In human milk there is a great variability in the fat contained, while the globules are more numerous in human than in cow's milk. The effect of variation of food upon the composition of human milk is doubtful, with the exception that when the mother is undernurtured, her consumption of fat will increase the fat in her milk but when fat is fed to well-nurtured mothers the fat in their milk increases only temporarily. It is therefore concluded that only a diminution of food can permanently affect the fat in human milk. The effect of some drugs is seen in the mother's milk. Traces of alcohol have been found in the milk of mothers after they have drunk to excess. In cases where the mother is syphilitic, the injection of salvarsan has produced an excretion of it in her milk and in these cases the child which has also the disease is sometimes improved but has in other cases died. Immunity to certain diseases is thought to be secured through the mother's milk, from the fact that typhoid fever, mumps, scarlet fever and measles are not usually contracted by nursing infants.

If it is impossible for any reason for the mother to nurse her own child, and a suitable wet nurse cannot be obtained it is quite easy for the physician to direct the making of a modified milk from cow's milk which shall have almost the same properties as human milk, this is secured by the removal of the cream or a part of it and mixing it with the proper proportion of the skimmed milk and with milk-sugar. Often a small amount of lime water is added to offset the greater acidity of cow's milk. For this modified milk it is imperative that the cleanest possible raw milk be had, as pasteurization of the milk removes some of the requisite qualities and that the cream be "gravity cream," i.e., be not removed by a separator which produces so-called "Centrifugal cream." With modified milk prepared in this way under the direction of a physician experienced in infant's diet the child may be brought up to be quite as healthy as those fed at the breast. The formula of milk, cream, sugar of milk and lime water will be changed from week to week as the child increases in weight and the sugar of milk and

lime water gradually diminished until the infant's digestion is trained to take unmodified cow's milk.

**MILK-CURE.** The living on milk alone, or mainly, for weeks is a recognized form of treatment in obstinate hysteria, hepatic congestion, dropsy and various disorders of nutrition. The amount of milk taken is gradually increased, beginning at about four ounces every three hours. When used exclusively, two or more quarts are ordinarily consumed daily. When the taste of milk becomes disagreeable, salt, coffee, bread, arrowroot, cocoa, rice, etc., may be added as the attending physician decides. The sole use of milk for a length of time may increase the frequency of the pulse, stimulate the kidneys to undue action, coat the tongue and produce obstinate constipation. It is not a cure to be undertaken without the supervision of a physician.

**MILK-FEVER** (called ephemeral fever when the symptoms disappear very quickly) is a febrile state, the temperature reaching 102° F. or over, occurring in the mother usually two or three days after delivery, considered to be connected with the beginning of the milk supply. It chiefly affects those in a feeble condition or under- or over-fed, or in whom the milk-ducts have not been freed by early lactation. A chill may induce it. It occurs in the lower animals as well as in the human being. It begins with rigors, which are followed by headache, pains in the limbs, fever, swelling and tenderness of the breasts (going on, it may be, to abscesses), and sweating, when the symptoms abate. Pain is to be relieved by hot-water bottles, breasts to be emptied, bowels moved by salines and fever reduced by diaphoretics; other medicines may be necessary. Owing to antiseptic obstetrics and great care as to hygienic measures, milk-fever is nowadays comparatively rare. If not relieved promptly by medical skill, it may prove a dangerous disease.

**MILK FISH**, a clupeoid fish (*Chanos chanos*) common in the Pacific Ocean and valuable as a food fish. It attains a length of about four feet.

**MILK-LEG.** See PHLEGMASIA.

**MILK-SICKNESS** (sometimes called "trembles"), a malignant fever attacking man and some of the lower animals, such as unweaned calves and their mothers, horses and colts, sheep and goats. Formerly it prevailed in the Western and Southwestern States, recently in North Carolina and Indiana. The cause was formerly supposed to exist in poisonous herbs eaten by cattle, but later researches have established the fact that it is caused by the presence of the *Bacillus lactimorbi* discovered by Jordan and Harris in 1907-09. Man is infected by the products of cattle—meat, milk, cheese or butter. The disease belongs to the end of summer and the beginning of autumn. The symptoms are headache, loss of appetite, fatigue, nausea, vomiting, thirst, constipation, a foul breath, then a typhoidal condition with coma or convulsions. The prognosis is generally favorable, but death may occur in a few days. The duration of the disease is from two or three days to as many weeks. The treatment consists in clearing out the intestinal tract, and in administration of sodium bicarbonate. Serum therapy has not yet been successfully tried.

infected animals should be isolated and no milk or milk products used either for animals or humans.

**MILK SNAKE.** See HOUSE-SNAKE.

**MILK-TREE**, any of various tropical trees yielding a milky, wholesome sap. See COW-TREE.

**MILK-VETCH**, a pea-plant of the genus *Astragalus* (see VETCH), regarded as increasing the flow of milk when eaten by goats. Many species grow in the United States, especially on the Western plains, where they are useful fodder-plants, although including one baneful species, the locoweed (q.v.).

**MILKWEED.** See ASCLEPIAS.

**MILKING MACHINE**, a mechanical apparatus for milking cows without hand labor. The milking is accomplished by producing a vacuum at the end of the cow's teat. The apparatus consists of a rigid teat cup with a collapsible upper edge for the purpose of preventing the entrance of air, and which receives the milk, the four cups being attached to four rubber tubes which are connected to a larger rubber tube emptying into a covered pail. One or two cows are attached to a pail and the vacuum is furnished by a large pump, run by electricity or gasoline, and is made intermittent by means of a pulsator piston. Some machines are provided with an air filter which further lessens the danger of contamination to the milk. While the machines are still in process of improvement there are several which perform their work efficiently and without injury to the cow, while at the same time producing milk in which the bacteria count is reduced to a minimum provided the apparatus is kept thoroughly clean and the rubber tubes and teat cups immersed in a 10 per cent solution of salt when not in use. The bearing of the machine on the labor problem is considerable, since two men can raise food and otherwise provide requisite care for a herd of cows for which three milkers are required. The practicability of the machine depends largely upon the size of the herd, the attitude of the men toward the machine and their adaptability in using it. Young cows are said to take more readily to machine milking than those long milked by hand, and young cows hard to milk because of short teats and older cows known as "hard-milkers" are often more satisfactorily milked by the machine than by hand. A quiet, well-treated herd is said to yield more readily to the use of the machine than a herd roughly handled. In some cases no difficulty is encountered in milking "clean" by the machine, and in others it is found more practical for one man to operate two double milking units while a second man follows and "strips."

**MILKOWSKI**, Zygmunt, or Sigismond (pseud. THEODORE THOMAS JEZ), Polish novelist: b. Saracea, 1824; d. Lausanne, Switzerland, 13 Jan. 1915. He was educated at the Odessa Lyceum and at the University of Kiev, and was connected with the Hungarian uprising in 1848 and with that of Poland in 1863. He was thereafter compelled to live abroad and in 1877 he settled definitely in Switzerland, becoming curator of the Polish Museum at Rapperswil. His romances founded on Galician history form an important contribution to the literature of

the Slavonic peoples, but his novels with Polish historical backgrounds were less successful. He wrote 'Handzia Zahornica' (1860); 'Szandor Kowacz' (1861); 'Historia o praprawnuku i prapradziatku' (1864); 'Uushoki' (1870); 'Derslaw z Rytian' (1872); 'Ofiary' (1874); 'Pod Obuchem' (1878); 'Z ciezkich dni' (1881); 'Narceczona Harambaszy' (1882); 'Rycerz chrzescianski' (1890), etc.

**MILKWEED**, or **MONARCH BUTTERFLY**, a large, reddish-brown, black-veined nymphalid butterfly (*Anosia plexippus*) of North America. Its black and green caterpillars, which have a pair of black filaments at each end of the body, are found upon milkweed almost throughout the world. The bright green, gold-dotted chrysalids hang from the under sides of the leaves in midsummer. The adults, which are among the strongest flyers of their order, migrate southward in the autumn and hibernate. In spring they fly northward even into Canada. They often form immense flocks in glades, even concealing the bark of trees upon which they alight in the lee of the wind. They are protected from their enemies by scent scales and are imitated by species not so protected, especially in the United States by the viceroy butterfly (*Easilarchia disippus*).

**MILKWORT**, the common name for plants of the genus *Polygala*, widely distributed throughout the temperate and tropical zones. See POLYGALA.

**MILKY WAY**, The, or **THE GALAXY**, in astronomy a luminous band of irregular form, consisting of a great circle entirely surrounding the heavens. It contains myriads of stars, so crowded together that their united light only reaches the unaided eye; this band of stars can be seen on any dark, clear night. If we could stand where the earth is and have it removed, we could see this splendid circle completely surrounding us; it is thus reasoned that we are a part of the Milky Way, and that our sun is near the centre of it. The circumpolar constellations Cassiopeia and the Swan are always to be found in the Milky Way, while Sirius, Capella and Aquila may be seen on its edge when they are in sight. The formation of the Milky Way assumes the general appearance of a silvery ribbon, but in places it is divided into two great branches, which afterward reunite. Between these divisions are dark places comparatively devoid of stars; one of these, the Coal Sack, has become celebrated, and was so named by sailors because they could see no stars in this dark spot.

**MILL**, Hugh Robert, Scottish geographer: b. Thurso, Caithness, 28 May 1861. He was educated at the University of Edinburgh, was physicist and chemist to the Scottish Marine Station in 1884-87 and University Extension lecturer in 1887-1900. He was librarian for the Royal Geographical Society in 1892-1900; and in 1910 presented to the trustees the accumulated records for the rainfall of the British Isles from 1677. Since 1901 he has edited *British Rainfall* and *Symons's Meteorological Magazine*. He wrote 'The Realm of Nature' (1892; new ed., 1913); 'The Clyde Sea Area' (1895); 'The English Lakes' (1895); 'Hints on the Choice of Geographical Books' (1897); 'New Lands' (1900); 'The Siege of the South

Pole' (1905); 'Historical Introduction' to Sir Ernest Shackleton's 'Heart of the Antarctic' (1909). He also edited the 'Report of the Sixth International Geographical Congress' (1896), and 'The International Geography' (new ed., 1911).

**MILL, James**, British economist, historian and utilitarian philosopher: b. Northwater Bridge, Forfarshire, Scotland, 6 April 1773; d. Kensington, 23 June 1836. His father was a cobbler, his mother a farmer's daughter and his early abilities were so marked that great care was taken with his education, so that in 1790 he entered Edinburgh University. There he was carried away with Dugald Stewart's philosophy until he came to know Bentham's system, which he then adopted. But in the university he was better known as a remarkable Greek scholar than as a philosopher. In 1802 he went to London, where he was from 1803 to 1806 editor of the *Literary Journal* and then began the 'History of India,' which occupied him 10 years. During this time he wrote much for periodicals and came to know Bentham personally; at the same time he was busied with the painstaking education of his children, notably John Stuart Mill (q.v.). The 'History of India,' a wonderfully scholarly and unpartisan work, marred only by his lack of personal knowledge of country and people and a consequent theorizing at times, was published in 1818 and immediately won for him a place in the India Office and relief from his long battle with penury. This position was the more flattering a tribute since he was now well known as a radical and a skeptic. He rose rapidly, becoming head of the office in 1830. The *Westminster Review* founded in 1824 as the organ of Bentham's followers contained many contributions by Mill; and several appeared in the *London Review*. Both in ethics, where his position was strongly utilitarian, and in political economy, where he may still be reckoned as typical of the orthodox school so bitterly attacked by Ruskin, Mill is little more than a follower of Bentham, with greater force, perhaps, because of his comparatively larger knowledge of the world. In psychology, however, although largely a follower of Hartley, his work is more important, for he developed and gave to Hartley's principle of association a wider application, and thus was the founder of the school to which Spencer and Bain belong. Mill took part in politics and contributed largely to the success of the Reform Bill by introducing to England philosophical radicalism. His personal character was strangely unhuman and unlovable, though perfectly correct. His important works besides the 'History of India' are 'Elements of Political Economy,' the first great philosophic treatise on the subject (1821), and 'Analysis of the Phenomena of the Human Mind' (1829). Consult Bain's biography (1882) and J. S. Mill's 'Autobiography' (1867).

**MILL, John Stuart**, English social and political reformer, philosopher, economist: b. London, 20 May 1806; d. Avignon, 8 May 1873. Few have combined so intimately a vital enthusiasm for human progress, with a keenly critical and most scholarly temper. He presents in all his most important lines of work the interesting conflict which results when a candid,

open mind, instinct with human interest, attempts to work with narrow conceptions and an inadequate method. The conceptions and method have in many respects been superseded, but the candor and sincerity, the scholarly, investigative temper, the deep interest in all things human, the democratic sympathy which manifest themselves in his works, give them permanent value.

Mill was the oldest son of James and Harriet (Burrow) Mill. His early education, conducted by his father, was extraordinary. He began Greek when about three years old, and Latin at seven, and read a great amount in both languages, especially in Greek, before he was 12. He studied algebra, geometry and the differential calculus also in this period. History he read of his own accord and found amusement in books on natural science. At 12 Aristotle's 'Logic' began a more advanced course of instruction which included the more difficult classical authors, and ended, so far as his father's personal instruction was concerned, in his 14th year with a thorough study of Ricardo's 'Political Economy.' Mill himself says that it "was not an education of cram." "Anything which could be found out by thinking I never was told, until I had exhausted my efforts to find it out for myself." At the same time he declares that it "was in itself much more fitted for training me to *know* than to *do*." After a year in France, which had an important influence, the reading of Bentham made an epoch in his life. "I now had opinions; a creed, a doctrine, a philosophy; in one among the best senses of the word, a religion; the inculcation and diffusion of which could be made the principal outward purpose of a life." In the winter of 1822-23 he planned a society to which he gave the name of "Utilitarian," and thus brought the term into common use. In May 1823 he received an appointment from the East India Company as clerk in the office of the examiner of India correspondence. Here he remained 35 years, rising to be examiner two years before the transfer of India to the British government in 1858, when he retired upon a pension of £1,500. He became a frequent contributor to the *Westminster Review* founded in 1823 as a Radical organ, and in 1834 became editor of a new Radical review, the *London Review* (afterward the *London and Westminster*). He was one of an ardent party of "philosophic radicals"; his object in life "to be a reformer of the world." Bentham, Malthus and Ricardo were influential upon the group. But several new influences now began to unsettle his political and social views. Coleridge, especially through Maurice and Mill's intimate friend Sterling, Carlyle, Goethe, Wordsworth, and the Saint Simonians, gave broader views of human interests, and greater importance to feeling and sentiment than James Mill and Bentham. In Mill's own judgment, however, the most important influence, especially in leading "him to apply his abstract principles to the actual state of society and estimate their bearing upon human interests and sympathies more clearly and widely than he would otherwise have done," was that of Mrs. Taylor, to whom he was first introduced in 1830. He maintained with her for 20 years a friendship of increasing intimacy, and after the death of her husband

married her in 1851. Mill loved his wife tenderly and spoke of her, notably in the 'Autobiography,' and in the dedication of the volume 'On Liberty' which was a joint production, in terms which seemed extravagant to his friends. A third period of Mill's mental progress fell at about the time between the first and third editions of his 'Political Economy' (1848-52). In the earlier period, he writes in his 'Autobiography,' "I was a Democrat, but not the least of a Socialist. We were now much less democrats than I had been, because so long as education continues to be so wretchedly imperfect, we dreaded the ignorance and especially the selfishness and brutality of the mass; but our ideal of ultimate improvement went far beyond Democracy, and would class us decidedly under the general designation of Socialists." In 1858 his wife died of congestion of the lungs in Avignon. When the Civil War in America broke out he contributed a strong article on the side of the North. In 1865 he was elected a member of Parliament from Westminster, and took an active part in support of various reform measures, but was defeated for re-election in 1868. His later years were spent in literary labors until his death, which occurred at Avignon. He had then come to be generally regarded as the foremost living philosopher and economist of England.

Mill's published works are the following: 'System of Logic' (1843); 'Essays on some unsettled questions of Political Economy' (1844); 'Principles of Political Economy' (1848); 'Memorandum of the Improvements in the Administration of India' (1858); 'On Liberty' (1859); 'Thoughts on Parliamentary Reform' (1859); 'Dissertations and Discussions' (1859-75); 'Considerations on Representative Government' (1861); 'Utilitarianism' (1863); 'Examination of Sir William Hamilton's Philosophy' (1865); 'Auguste Comte and Positivism' (1865); 'England and Ireland' (1868); 'Subjection of Women' (1869); 'Autobiography' (1873); 'Nature, the Utility of Religion and Theism' (1874). In addition may be mentioned his edition, with notes, of James Mill's 'Analysis of the Phenomena of the Human Mind' (1869); his 'Inaugural Address delivered to the University of Saint Andrew's' (1 Feb. 1867); 'Speech in Favor of Women's Suffrage,' 12 Jan. 1871 (1873); 'Speech on the Admission of Women to the Electoral Franchise,' 20 May 1867 (1867); H. D. Pym's 'Memories of Old Friends,' which contains 14 letters from J. S. Mill (1882); several articles in the *Westminster Review* and the *London and Westminster Review*, not reprinted in the 'Dissertations and Discussions.'

The keynote to Mill's method is found in the individualism which he inherited from the 18th century. This meant associationalism in logic and psychology, a metaphysical conception of reality as made up of separate phenomena, an ethical theory that made pleasure and pain the motives of action, *laissez-faire* in political economy, and the political doctrine that the end of government is to protect each individual in the possession of the produce of his labor. But in all these various fields he passed the bounds set by his inheritance. He was more concerned to find truth than to maintain a creed.

As *Logician*, Mill's greatest contribution was

his treatment of induction. The four "methods" of agreement, difference, residues and concomitant variation had been mentioned by J. Herschel, but were by Mill first brought out clearly. In the part of his 'Logic' which deals with the nature and conditions of knowledge he attempts, with only partial success, to give logic a more vital relation to truth and fact than it had borne since Hobbes and Locke. He insists that propositions concern "things" not "ideas"; that there are "real kinds," not merely class names; that cause is not to be defined with Hume as "invariable antecedent" but as "unconditional antecedent" or "sum of conditions." But he does not see that this really implies a reconstructed view of nature, in which a conception of an interrelated system or whole should replace the conception of a mere sum of individuals or particulars. He remains true to his older presuppositions in holding that reasoning is from particular to particular, and that axioms owe their force to association. Matter, he holds, following Berkeley, is only permanent possibilities of sensation. In his view of the self, on the one hand, he considers that we can know only states of consciousness, that the law of association is the "governing principle," and that the conceptions by which knowledge is organized are impressed upon the mind from without"; on the other hand he recognizes "the paradox, that something which, *ex hypothesi*, is but a series of feelings, can be aware of itself as a series." He therefore admits that "the mind, or ego, is something different from any series of feelings or possibilities of them." While, then, he holds to the doctrine of "circumstances" as determining character, he is careful to insist that this is not "necessity" in the ordinary sense; "our own desires can do much to shape those circumstances."

As *Economist*, Mill attempted to follow the general plan of Adam Smith and give the science a more concrete form than it had received at the hands of Ricardo; to treat it not merely as an abstract science of the "economic man," but as "branch of social philosophy, so interlinked with all the other branches that its conclusions are only true conditionally." The current economist had aroused the antagonism of the working classes. Malthusianism held out a grim prospect of increasing stress with increase of population. Ricardo's presentation of the laws of wages seemed to condemn as absolutely futile all effort to raise wages, whether by voluntary association or by political action. The repeal of the corn laws would, it was feared, ultimately benefit the employers instead of the employed. Mill retained the Malthusian doctrine as one of his cornerstones. He sees hope for the laboring classes only if they will restrict their offspring and thus diminish the supply of labor. He retains also the doctrine that labor is supported by capital, and in his 'Political Economy' speaks of a "wage fund." But as an ardent sympathizer with the working class Mill makes various concessions and suggestions which made his work far less a "dismal science." 'Political Economy' "has no pretension to the character of a practical guide, apart from other classes of consideration." While the laws of the production of wealth are real "laws of nature," the modes of its distribution, "subject to certain conditions, depend on human will."

The "existing arrangements of society" have much to do with determining what shares fall to laborers, capitalists and landlords, and these arrangements may be altered "by the progress of social improvement." At first he thought only of getting rid of primogeniture and entails, and of promoting restraint of population by general education. He later came to look for a great advance in co-operation, and in the character which this implies. In 1869 he definitely retracted the "wage-fund doctrine, recognizing that there is a considerable range in the wage which economic conditions allow and hence that trades-unions may raise wages to a certain extent." In his last years he was especially impressed with the injustice of the places which the landowners occupy at "Malthus's feast." "Land alone has the privilege of steadily rising in value from natural causes." The "unearned increment" should be not for the private owner but for the nation. He differed from more complete Socialists in retaining competition in his scheme, and insisting that the associations for co-operation must be voluntary. He regarded the problem of the future to be "how to unite the greatest individual liberty of action, with a common ownership in the raw material of the globe, and an equal participation of all in the benefits of combined labor."

His moral and political theories are set forth in his 'Utilitarianism,' 'Liberty' and 'Subjection of Women.' He always remained a Utilitarian in the sense that he believed "those actions right which promote the greatest happiness of the greatest number"; further, he attempted to prove this by the individualistic doctrine that since each one desires his own happiness, the general happiness must be a good, not noticing the possible conflict between such happiness-seeking in individuals, which would make a "sum" impossible. But elsewhere he breaks away decisively from Bentham's doctrine that happiness means only pleasure of varying intensity, length, certainty, etc., regardless of what objects produce it. "Higher pleasure," a "sense of dignity," will not be exchanged for any amount of the "lower" by the expert judge. It is "better to be Socrates dissatisfied than a pig satisfied." This is evidently abandoning pleasure pure and simple as standard, and setting up instead a "standard for pleasure," namely, the character of the man who judges. In the 'Liberty' he states that the utility which is the ultimate appeal "must be utility in the largest sense, grounded on the permanent interests of man as a progressive being." The motives on which he relies are not the external "sanctions" of Bentham; nor yet the association of private with public happiness which James Mill had regarded as the structure of conscience. These suddenly appeared to him artificial. Partly under the influence of Comte he came to hold, rather, that conscientious regard for others is supported by natural social instincts. His 'Liberty,' the most carefully written of his works, contains a fresh and vigorous argument for the principle that only self-protection—to prevent harm to others—justifies society in interfering with the individual's liberty of action. "His own good is not a sufficient warrant." The positive reason for this is the great value of individuality in human welfare. The prin-

ciple requires not only liberty from legal restraint, but from the coercion of public opinion. It comprises, first, liberty of thought and discussion, in order that truth may be reached; secondly, liberty of tastes and pursuits; thirdly, freedom to unite for any purpose, not involving harm to others. In the 'Subjection of Women' he argues for the complete legal equality of men and women, not only to remove injustice but because "the only school of genuine moral sentiment is society between equals." "We have had the morality of submission, and the morality of chivalry and generosity; the time is now come for the morality of justice." Moreover, a position of equality with its accompanying effects of enlarged interests, wider responsibility, greater dignity and the possibility of individual development and satisfactions would add immeasurably to the well being of all other members of the family.

Mill's religious views are found chiefly in the 'Examination of Sir William Hamilton' and in the three essays published after his death. He found no warrant for making nature a standard of morals or for inferring from it perfect benevolence or justice. Indeed only by sacrificing the attribute of omnipotence can we reconcile nature with the existence of a moral deity. In all this he is considering the older deistic conceptions, nature, man and God, as three separate beings. But there is much in his thought which is incompatible with such mechanical separation of nature and spirit, and of human and divine, notably in the famous passage from the 'Examination.' In reply to Dean Mansel's mode of reconciling supposed divine action with human conceptions of justice by the doctrine that God is Inconceivable, and therefore what is wrong by human standards may be right by divine standards, Mill replies, "I will call no being good, who is not what I mean when I apply that epithet to my fellow creatures; and if such a being can sentence me to hell for not so calling him, to hell I will go." See MILL, JOHN STUART, AUTOBIOGRAPHY; ON LIBERTY.

JAMES H. TUFTS,

*Professor of Philosophy, University of Chicago.*

**MILL, JOHN STUART, AUTOBIOGRAPHY.** This has been called the history of an education, showing what may be accomplished in forming a boy's mind both for good and ill. Mill's teacher was his father, whose ardor in the task was stimulated by the facility of his pupil. He began Greek at three; Latin at eight; by 12 he knew most of the best in both languages, besides reading in English "chiefly histories," and composing one book in continuation of Pope's 'Iliad.' From 12 he began logic, at 13, political economy, at 17 he was writing articles for the *Westminster Review*. But such forcing of the faculties must be paid for. It was impossible that Mill's education should not produce a distinguished mind, it was equally impossible that it should produce a joyous one. His boyhood lacked games and youthful companionship. At 20, a not unnatural reaction caused a sudden collapse in his whole intellectual outlook, resulting in profound depression, when this brilliant boy "seemed to have nothing left to live for." From this state of "dry, heavy dejection," he was roused by the discovery of beauty, art, music and poetry, all of which had been omitted from the system of the elder Mill. Thus he came to perceive the value of feeling and emotion, and was brought back to hope and enjoyment by pleasure in Wordsworth's poetry and the *Memoirs of Marmontel*. Admirable as all this is, not less so is his account of "that friendship which has been the honor and chief blessing of my existence," his marriage with Mrs. Taylor in 1851. Mill's intellectual isolation made the experience a vital one; and the words in which he draws his wife's character and their companionship in work and thought are among the most impressive of their kind. Much of the 'Autobiography' is taken up with an account of the genesis and growth of Mill's chief works and with a discussion of his father's character and opinions and of the philosophy of Sir William Hamilton and of Comte. But the book, while primarily intellectual, is not without humanity and warmth, even apart from the glowing passages devoted to the author's wife. Mill's friends, Austin, Maurice, Sterling, the Carlyles and others, come into the human picture as well. The style is admirable for the purpose, clear, dispassionate and not unduly restrained; and the attitude of sane analysis, of modesty and of thoughtful discrimination has never been surpassed in any autobiography. The world has taken the earlier portion of the book—the story of the growth of the boy's mind and character—as its unique contribution to the literature of autobiography; but scarcely less valuable are Mill's pictures of his contemporaries and his analysis of the thought and the social movements of his time.

ANNA ROBESON BURR.

**MILL**, the general name of a machine for grinding, crushing or pulverizing. Also a lapidary's grinding wheel, known as roughing mill. Also a machine, or complication of engines or machinery, for working up raw material; as, a cotton mill, a spinning mill, a saw mill, an oil mill, etc. In die-sinking, the harded steel roller having the design in cameo, and used for impressing in intaglio a plate, as in the bank-note system of engraving; or a copper cylinder,

as in the process of engraving cylinders for calico printing.

**MILL ON THE FLOSS**, *The*. This novel, by George Eliot (Mrs. Marianne Evans Cross), published in 1860, was the second of the long novels of the author, being preceded by the various 'Scenes from Clerical Life' and the novel 'Adam Bede.' It was favorably received on publication and the opening parts, particularly those dealing with the childhood of Tom and Maggie Tulliver, are commonly regarded as among the best work that George Eliot ever did, but the last of the three volumes as originally published was regarded less favorably, largely because of some artificiality of episode and treatment.

In many respects 'The Mill on the Floss' is the most personal of the author's stories. In depicting the heroine she drew to some extent from her own experience, and many of the characters in the book are drawn from people in her own family. The central idea is characteristic of the writing of the author. It is the hopelessness of the attempt of a person of given temperament to accommodate herself to unsympathetic conditions. Maggie Tulliver, a young woman of unusual sensibility and always seeking for happiness, grows up among plain, hard, matter-of-fact people and narrow surroundings. Her volatile temperament causes numerous misunderstandings with her robust and sturdy young brother, Tom, as notably in her forgetting to feed his rabbits during his absence. His partisanship in the feud that had wrecked the fortunes of the Tulliver family and brought about the ruin and death of his father thwarts Maggie's growing love affair with Philip Wakem and later on condemns her for her lack of fairness and firmness in the somewhat artificial episode of Stephen Guest. Meanwhile she has sought consolation in reading 'The Imitation of Christ,' but this, like her family and friends and her affectionate nature, proves a fragile reed. The author, apparently despairing of any possible outcome under such conditions for the happiness of Maggie Tulliver or for her finding even a satisfactory place in the world, drowns her along with her newly-reconciled brother in a somewhat supererogatory flood. The desire of the author was apparently to push the temperament to an inevitable conclusion but the real problem was to account for Maggie had she remained normally alive. The factitious elements which have been spoken of are out of keeping with the general tendency of George Eliot's work, which is to analyze and account for the development of character under less accidental conditions of life. The life of George Eliot by her husband, J. W. Cross, should be referred to.

WILLIAM T. BREWSTER.

**MILL SPRINGS**, Ky., village in Wayne County, on the Cumberland River, about 90 miles south of Frankfort. It has steamer connections with places on the Cumberland and Ohio rivers. A battle was fought here on 19 Jan. 1862, between the Federal and Confederate forces. (See **MILL SPRINGS, BATTLE OF**). A National cemetery located here contains 718 graves of soldiers.

**MILL SPRINGS, Battle of.** The opening of the Kentucky-Tennessee campaign of 1862. At the close of 1861 the Confederate line extended from Columbus, Ky., on the Mississippi, through Fort Henry on the Tennessee, Fort Donelson on the Cumberland, Clarksville, Tenn., and Bowling Green, Ky., to Mill Springs on the Cumberland. Gen. A. S. Johnston was in chief command. Gen. D. C. Buell was the opposing Union commander. Gen. F. K. Zollicoffer established the Confederate right at Mill Springs early in December. Gen. Geo. B. Crittenden took general command there at the middle of the month, with the brigades of Zollicoffer and W. H. Carroll under him. Gen. Leonidas Polk held the Confederate left at Columbus, Gen. J. B. Floyd reached Fort Donelson 13 February, and had under him Generals Pillow, Buckner and Bushrod Johnson. Gen. A. S. Johnston was at Bowling Green, the centre. Gen. Geo. H. Thomas was on the Union left, with General Schoepf immediately opposed to Zollicoffer, while General Buell, with headquarters at Louisville, was in close communication with the Union centre, which threatened Bowling Green and Nashville.

General Zollicoffer, having crossed from Mill Springs to the north bank of the Cumberland and entrenched his position, from which he threatened central Kentucky, General Thomas was sent against his forces, now commanded by General Crittenden, from the direction of Lebanon. On 18 January General Thomas reached Logan's Cross Roads about 10 miles from Crittenden's entrenchments. The latter officer, with the purpose of attacking before Thomas could concentrate his forces, marched at midnight of the 18th with Zollicoffer's and Carroll's brigades, consisting of eight regiments of infantry, six guns and four battalions of cavalry, and attacked General Thomas soon after daylight of 19 January.

The Union troops, consisting of six infantry regiments, one battery and a portion of a cavalry regiment, were brought rapidly into action, both sides fighting with spirit. Finally, when three fresh Union regiments fell on the Confederate right, and the 2d Minnesota was pouring a galling fire upon the centre, the 9th Ohio (German Turners) made a brilliant bayonet charge completely turning the Confederate left, resulting in the Confederate lines breaking and retiring in confusion. At this point General Schoepf's brigade from Somerset reached the field, and the whole force continued in pursuit, reaching the Confederate entrenchments during the night, and forming to assault them at daylight. During the night the Confederates succeeded in crossing their men, leaving artillery, cavalry, horses, mules, wagons, camp equipage and private baggage. The Confederate right wing was effectually broken and largely dispersed.

The overthrow of the Confederate right was followed 6 February by the capture by Admiral Foote, acting in co-operation with General Grant, of Fort Henry on the Tennessee, and 16 February by the capture of Fort Donelson, with its artillery and garrison of about 15,000, by General Grant.

On 8 February General Johnston notified the Secretary of War that the loss of Fort Henry and the movement against Fort Donelson made

the Bowling Green line untenable, and that he had directed General Hardee at Bowling Green to prepare to fall back on Nashville. The evacuation was completed 14 February, and by the 17th General Hardee had crossed the Cumberland at Nashville and proceeded toward Murfreesboro. Ten days later, all army supplies having been sent to Chattanooga, which place was held by troops sent by General Bragg from Mobile, Johnston's army marched for the line of the Memphis and Charleston Railroad at Decatur, this line having been decided upon as the next for defense.

By the last of March Johnston's column had taken position at Corinth, Bragg's forces had reached him from Mobile and a portion of Polk's from Columbus.

Meantime (15 February) Bowling Green was occupied by Union forces under O. M. Mitchell. Pressing on, he reached Edgefield opposite Nashville on the 14th. Nelson's division arrived by transports the next day, and soon after the first of March Buell's entire column, coming partly by land and in part by river, was concentrated at Nashville.

The Union movement to Pittsburg Landing began 10 March by the dispatch of Gen. W. T. Sherman's division from Paducah up the Tennessee. It proceeded, under orders of Gen. C. F. Smith, to the vicinity of Eastport; but finding all streams inland at flood, the expedition dropped back to Pittsburg Landing, where it found Hurlbut's division. The latter took post one and one-half miles back 18 February, and Sherman's the next day about three miles back, at Shiloh Church. These were followed within a few days by the divisions of Prentiss, McClelland and W. H. W. Wallace, each selecting its own camp without special reference to a general line, the movement being regarded as a concentration preparatory to an advance on Corinth. Gen. Lew Wallace's division was halted at Crump's Landing, five miles below Pittsburg. General Grant arrived and assumed command 17 March, establishing his headquarters at Savannah nine miles below, on the opposite side of the Tennessee.

General Buell's advance left Nashville 15 March to join General Grant at Savannah. After marching 130 miles in nine days he was stopped by high water in Duck River, necessitating bridging, and then marched the remaining 90 miles in six days. General Grant had advised him that it was not necessary to hurry, as he would not be ready to cross his command over the river till 8 April. However, Buell pushed on and fortunately reached Savannah with the head of his column the night of the 5th. General Johnston, with the design of attacking Grant before Buell could join him, had marched from Corinth 3 April, with the expectation of attacking on the 5th, but heavy rains delayed his columns, and his unexpected attack was delivered soon after daylight of 6 April, thus opening the battle of Shiloh or Pittsburg Landing. See SHILOH, BATTLE OF.

H. V. BOYNTON.

**MILL VALLEY**, Cal., town, 12 miles north of San Francisco on the Northwestern Pacific Railroad. Marin County, in which this town is situated, is noted for its beautiful scenery. Mill Valley is in a fine fruit-growing district and owns its waterworks. Pop. 2,550.

**MILLAIS**, mil'lä', Sir John Everett, English painter: b. Southampton, England, 8 June 1829; d. London, 13 Aug. 1896. His earliest years were spent in Jersey and at Dinan in France, and at the age of eight he was sent to study art under Mr. Sass in London. In 1840 he became a student in the Royal Academy, and in 1846 he exhibited his 'Pizarro seizing the Inca of Peru.' Next year the gold medal of the Academy was awarded to his 'Young Men of Benjamin seizing their Brides.' In 1848, along with Holman Hunt, Dante G. Rossetti and others, he founded the Pre-Raphaelite Brotherhood. Among the chief works of this period are 'A Huguenot,' 'The Order of Release' and the 'Proscribed Royalist.' In 1853 he was elected an associate of the Royal Academy, and 10 years later Academician. For a few years thereafter his pictures were still influenced by the Pre-Raphaelite principles, which he gradually abandoned. He developed into a splendid colorist, a master of technique and altogether a great modern master. Numerous honors fell to him; he was decorated with the Legion of Honor in 1878, elected a member of the Académie des Beaux-Arts in 1882, created a baronet in 1885 and elected to succeed Lord Leighton as president of the Royal Academy in 1896; but he only held this last position about six months, dying on 13 August of the same year. He was most successful in figure-pieces and portraits, but he also produced a certain number of landscapes, one of the finest being 'Chill October' (1871). He painted portraits of some of the foremost men of the day, including Mr. Gladstone, Lord Beaconsfield, Lord Salisbury, Mr. Ruskin, Lord Tennyson and others. Consult Baldry, A. L., 'Millais: His Art and Influence' (London 1899); Bayliss, 'Five Great Painters of the Victorian Era' (New York 1902); Hare, T. L., 'Leaders of English Pre-Raphaelites' (New York 1909); Millais, J. G., 'Millais' Life and Letters' (London 1899); Reid, J. E., 'Sir J. E. Millais' (New York 1909); Spielmann, 'Millais and His Works' (London 1898).

**MILLAIS, John Gaille**, English artist and author, son of Sir John Everett Millais (q.v.): b. London, 24 March 1865. He was educated at Trinity College, Cambridge, and in 1886 entered the 72d Highlanders, retiring with rank as first lieutenant in 1892. He has traveled in Iceland, Africa, western America, Canada, Newfoundland, Norway, Alaska and the Carpathians. He has a museum and a collection of about 3,000 birds, mostly of the British Isles. He has illustrated several books on sport and natural history, among them Seebohm's and Sir R. Payne Galloway's works, and the 'Encyclopædia of Sport.' Author of 'Game Birds and Shooting Sketches' (1892); 'A Breath from the Veldt' (1895); 'British Deer and Their Horns' (1897); 'Natural History of British Surface' (1902); 'British Diving Ducks' (2 vols., 1913); 'European Big Game' (1914); 'American Big Game' (1915); 'Rhododendrous and Their Hybrids' (1917), etc.

**MILLAU**, or **MILHAU**, France, city in the department of Aveyron, at the confluence of the Tarn and Dourbie rivers, 74 miles north of Béziers and on the Southern Railway. There is the Romanesque church of Notre Dame, re-

stored in the 16th century; a notable Gothic belfry; and a fine modern church of Saint François. It was the ancient Æmilianum, and in the Middle Ages was the seat of the counts of Barcelona and afterward of the counts of Armagnac. It was a Huguenot stronghold in the 16th century and after its revolt and submission in 1620 its fortifications were leveled by the orders of Richelieu and Louis XIII. The modern town is noted for its manufactures of gloves, and has other leather and woolen industries. It has a trade in wool, wines, skins and Roquefort cheese. Its present prosperity dates from after the Revolution. Pop. about 17,673.

**MILLBURY**, mil'bū-rī, Mass., town in Worcester County, on the Blackstone River, and on the Boston and Albany and the New York, New Haven and Hartford railroads, about six miles southeast of Worcester. It was settled in 1743 and was called North Parish of Sutton until 1813 when it was incorporated. It is claimed as the place where the "Lyceum Lecture System" originated in 1820. It is a manufacturing town; the chief industrial establishments are foundries, machine-shops, linen cloth factory, woolen mills, thread factories, hosiery mills, lumber mills, weaving machinery and cotton mills. Pop. 4,740.

**MILLEDGE**, mil'ēj, John, American soldier and politician: b. Savannah, Ga., 1757; d. 9 Feb. 1818. At the outbreak of the Revolution he was one of the party which, led by Joseph Habersham, made a prisoner of Wright, the royal governor, 17 June 1775, the first bold revolutionary act performed in Georgia. When Savannah was taken by the British, Milledge escaped to South Carolina, where he was captured by a party of Americans, and came near being hanged as a spy. In 1779 he was present at the unsuccessful siege of Savannah. He was also at the siege of Augusta, and in South Carolina and Georgia, at various places, did valuable service in the patriot army. In 1780 he was appointed attorney-general of Georgia, and afterward served frequently in the State legislature. In 1802 he was elected governor of Georgia and served two terms. He was a representative in Congress from 1792 to 1802, except one term, and United States senator from 1806 to 1809. Milledge was the principal founder of the University of Georgia, and purchased and presented a tract of land which is the site of the university and of a part of Athens, its seat. See MILLEDGEVILLE.

**MILLEDGEVILLE**, mil'ēj-vīl, Ga., city and county-seat of Baldwin County, on the Oconee River, and on the Georgia and the Central of Georgia railroads, about 30 miles northeast of Macon. It is near the geographical centre of the State; and streams nearby furnish natural drainage and water power. The dam on the Oconee increases the water power. The place was settled in 1803, received its city charter in 1836 and was named in honor of John Milledge (q.v.). From 1807 to 1867 it was the capital of the State. It is in a fertile agricultural region in which cotton, corn, wheat, hay and fruits are the chief products. In the vicinity are fine deposits of talc, kaolin and fire-clay. Ornamental and building brick are manufactured extensively and quantities of clay are shipped to other places. The preparation of

cotton for the markets is a most important industry. The building which was once the State capital is now the Georgia Military College, a school with an attendance of over 500 students. Other institutions are the Georgia Normal and Industrial College, a State School for Girls and the State Sanitarium for the Insane. The State prison farm is just outside the city limits. The government is administered under a charter of 1900 and is vested in a mayor, who holds office two years, and a council. The mayor is a member of the council. Pop. 4,385.

**MILLENARIANS.** See MILLENNIUM.

**MILLENARY**, the space of a thousand years; same as MILLENNIUM (q.v.). The word is also used to designate a thousandth anniversary, such as that of the Domesday Book, 12 May 1886; and the commemoration of the death of King Alfred, at Winchester, England, 18-20 Sept. 1901.

**MILLENARY PETITION**, in English history, a petition named from the number of signatures appended to it presented by the Puritans to James I, in 1603. The petitioners desired to be relieved from the use of the sign of the cross in baptism, the ring in the marriage service, confirmation and bowing at the name of Jesus. The petition in reality contained only 750 names, instead of 1,000.

**MILLENNIUM** (Lat. *mille*, 1,000, and *annus*, a year), a period of 1,000 years. Hence it is a term applied to the period during which, according to some, Jesus Christ will return to reign on earth before the end of the world. This premillennial appearance of Christ will be signalized by a first or particular resurrection of the just, who are to reign with Him on earth, and by the destruction of Antichrist. Those who hold such views are called millenarians or chiliasts, and their tenet chiliasm (Gr. *χίλιος*, 1,000). It is admitted on all sides that these views were, if not general, at least very common in the ancient church. The belief was generally founded on Psalms xc, 4, according to which 1,000 years are before the Lord as one day, compared with the account of the creation as given by Moses. The six days of creation are taken as designating 6,000 years of toil, and the subsequent sabbath as designating 1,000 years of rest and happiness. The millennium was to be the sabbath rest of the new creation of mankind in Christ. Besides these passages, Rev. xxi, 1-6, is especially quoted by chiliasts in support of their views. Chiliasm prevailed chiefly among the Jewish Christians, who retained after their conversion the hope that they would rule over all other nations under a royal Messiah (q.v.). The Ebionites, the Nazarenes and Cerinthians all advocated it and Montanus, and the sect which was called after him, regarded it as a fundamental doctrine of the Christian religion. Some early fathers of the Church also declared themselves generally in favor of the doctrine; Papias, Irenæus and Tertullian were chiliasts; and Papias appealed in support of his view to apostolic traditions. On the other hand, however, the epistles of Clement of Rome and Ignatius of Antioch are silent about it. Justin Martyr who wrote in the 2d century was a believer in the millennium. "I and all Christians whose belief is in every respect correct," he says, "know that there will be both a resurrection of the flesh and a thou-

sand years in Jerusalem, which will then be rebuilt, adorned and enlarged, as the prophets Ezekiel, Isaiah and others declare." This view was opposed by the whole Alexandrian school, especially by Origen, who believed in a spiritual supramundane interpretation of Revelations. Still it continued to find advocates during the 3d century, among whom Tertullian, Nepos, bishop of Arsinoe, and Methodius, bishop of Tyre, were prominent. In the 4th century, Jerome, who did not believe in it himself, did not dare to condemn it, in consideration of the many pious and learned advocates it had found in former centuries. Soon after it began to die out; it was temporarily revived toward the close of the 10th century, by the popular belief in the approaching end of the world, but it never regained great strength. The reformation of the 16th century gave a new impulse to chiliasm. Fanatical opinion identified the Pope with Antichrist, and regarded the anticipated downfall of the Roman Catholic Church as foreshadowing the approach of the millennium. But when the Anabaptists undertook in 1534 to erect the new Zion, both the Lutheran and Reformed churches declared themselves against this reversion of the old doctrine. Yet it was preached by many sectarians and theologians of the 16th and 17th centuries, among whom were Weigel and the Moravian bishop Comenius in Germany, Jurieu in France, the Labadists in the Netherlands and Joseph Mede and Jane Lead (d. 1704) in England. A third period in the history of chiliasm may be commenced with the writings of the esteemed exegete and New Testament commentator, Johann Albrecht Bengel. He practically reintroduced it into Protestant theology, where it has ever since been advocated by a number of prominent theologians. The ingenious prelate Oetinger (d. 1782) brought it into connection with his favorite theosophic views. Hahn (the founder of a pietistic sect in Württemberg), Stilling, Lavater and Hass gave it a wide circulation among the lower classes of the people in Germany and Switzerland. In opposition to the "spiritualism" of modern exegesis, it was advocated, with exegetical arguments, by Hoffmann, Delitzsch, Kurtz, Hebart and others; while Thiersch, Nitzsch, P. Lange and Ebrard supported it from a dogmatical as well as an exegetical standpoint. Swedenborg taught that the last judgment took place in 1757, and that the New Church or church of the New Jerusalem had actually been formed both in heaven and on earth. After Germany, England and America have been the chief fields of modern chiliasm. The "Catholic Apostolic Church," organized by Edward Irving, laid great stress on the belief that the kingdom of glory was very near. Chiliasm lies at the foundation of Mormonism, whose adherents call themselves "Latter Day Saints" in reference to the near approach of the last day. In the United States great excitement was caused by the preaching of William Miller (q.v.) who sought to prove from the Scriptures that the second advent of Christ would take place about 1843. He not only met with numerous chiliasts in most denominations, but he also founded the sect of Adventists (q.v.). Chiliasm has been seriously taken in declarations of doctrine formulated by several churches. The Augsburg Confession implicitly repudiates it, speaking of "the last

days foreshown in Holy Scripture, in which the world is to become ever more and more degenerate and mankind more sinful and weak." The Council of Trent declares that "the Scriptures also inform us that the General Judgment shall be preceded by the preaching of the Gospel throughout the world, a defection from the faith and the coming of Antichrist." There is a sort of millennium also looked forward to by those who disbelieve in religion as the renovator of the world. According to these teachers there is a material millennium quite within the range of future possibilities. They teach that the race must look to its renewal and improvement by the non-propagation of disease and impotency of every nature, and to the persistent and joyous multiplication of the best elements of our race, in a continual progress toward the Hierarchy of Life. The millennium, according to this newly invented philosophy, will come by natural and not supernatural means. See **ESCHATOLOGY**; **RESURRECTION**; **JEW** AND **JUDAISM**—**ZIONISM**.

**MILLEPEDE**, a myriapod of the *Chilognatha*, the second order of the class *Myriapoda* in which each segment of the body, except a few of the front joints, bears two pairs of legs—the joints in the nearly-related centipedes (q.v.) bearing each one pair only. The common species (genus *Julus*) are found in damp places, concealed under stones, or under the bark of trees. The body consists of from 40 to 50 joints, protected by a horny skin, and when irritated or at rest these animals coil up for protection. The mouth is provided with a pair of strong jaws or "mandibles"; and the antennæ or feelers consist of six or seven joints. See **MYRIAPODEA**.

**MILLEPORE**, family (*Milleporidæ*) of *Hydrozoa*, remarkable for secreting massive calcareous skeletons like corals, with which they were for a long time classed. The hydranths are of two kinds: gastrozooids, or feeding polyps, which provide nourishment for the colony, and dactylozooids, which are elongated, mouthless, protective polyps provided with large numbers of nematocysts. The generative cells are remarkable for their wanderings through the tissues of the polyps and colonies. The colonies are hermaphrodite, but the related family *Stylasteridæ* has unisexual colonies. They live in warm seas and form reefs in shallow waters. *Millepora alicornis* is abundant near low water in the West Indies, where

representatives of the *Stylasteridæ* also occur in deep water.

**MILLER, Adolph Caspar**, American economist: b. San Francisco, Cal., 7 Jan. 1866. He was graduated at the University of California in 1887 and later studied at Harvard, Paris and Munich. He was connected successively with the faculties of Harvard, the University of California and Cornell; was professor of finance at the University of Chicago in 1892-1902, and Flood professor of economics and commerce at the University of California in 1902-13. He served as assistant to the Secretary of the Interior in 1913-14, and has since been a member of the Federal Reserve Board. He is advisory editor of the *Journal of Political Economy*.

**MILLER, Charles**, American financier: b. Oberhoffen, Alsace, France, 15 July 1843. He came to the United States in 1854, received a common school education and in 1869 entered the oil business. He was for many years president of the Galena-Signal Oil Company—and afterward was chairman of the boards of the American Steel Foundry Company and the American Locomotive Company, serving also as director in some 40 other corporations; and as president of the Lake Erie, Franklin and Clarion Railroad Company. He was mayor of Franklin, Pa., for two terms, served for six years on the Pennsylvania State Board of Charities, and was for five years a major-general in the Pennsylvania national guard. He is active in church work and since 1890 has conducted at his own expense the Miller Night School at Franklin. He is a Chevalier of the French Legion of Honor.

**MILLER, Charles Henry**, American landscape painter: b. New York City, 20 March 1842. He was graduated from Mount Washington Collegiate Institute, New York, and exhibited his first oil-painting at the National Academy of Design, 1860. He received the degree of M.D. from the New York Homeopathic College in 1863, but after his first trip to Europe as surgeon of a ship in 1864 he resolved to devote his life to the fine arts. He studied at the Bavarian Royal Academy with Adolf Lier from 1867 to 1870, when he returned to America. He was president of the New York Arts Club for five years, having become a member of the National Academy of Design in 1875. His paintings are principally landscapes of Long Island. He received the gold medal from Boston and New Orleans international expositions. His best-known work, 'The Bouquet of Oaks,' is in the Metropolitan Museum. His 'Sunset, East Hampton' (1878) is in the Brooklyn Museum; 'High Bridge' hangs in the Democratic Club, New York. He is a lecturer, and author, under the pen name of Carl de Muldor, of 'The Philosophy of Art in America' (1885).

**MILLER, Cincinnatus Heine** (better known as **JOAQUIN MILLER**), American poet, whose pseudonym was due to his defense of Joaquin Murieta, a Mexican bandit: b. Wabash district, Ind., 10 Nov. 1841; d. San Francisco, Cal., 17 Feb. 1913. His father took him to Oregon in 1854. He got a little schooling but soon ran away from home; went to the California gold mines; accompanied Walker on the

Nicaragua filibustering expeditions; lived familiarly among the Indians and the Spaniards of the Pacific slope; studied law for a few years, having graduated at Columbia College, Oregon, in 1858; practised law unsuccessfully in Idaho, where he soon turned express messenger, and in 1863 settled in Oregon for a short time, becoming editor of the Eugene City *Democratic Register*, which was suppressed in the same year because of its treasonable character. In 1864 he began to practise law in Cañon City, Ore., made himself popular by his services against the war-like Snake Indians and from 1866 to 1870 was judge of Grant County. His writings collected under the title 'Songs of the Sierras' he could not sell in the East, and so took them to London, where they were published and brought him fame. He visited London again in 1873; lived in Washington, D. C.; and in 1887 returned to California, settling near Oakland. His life sums up the adventure of the Pacific slope, and his verse and fiction are to be prized especially on this account as being real "documents" of certain phases of American life. They are, moreover, fresh, vigorous and original in style; his metre is free and powerful and his narrative forcible. He excels, perhaps, in his pictures of Nature. In a few short lyrics there is a quiet melancholy, bred of communion with solitary wood and mountain. But on the whole he is not a great artist, although his work has a distinct value as descriptive of various American types. Hence his fame has been much greater in England, where he was even styled "the American Byron," than in America. Miller's verse includes 'Songs of the Sunlands' (1873); 'Songs of the Desert' (1875); 'Songs of Italy' (1878); 'Collected Poems' (1882); and 'Songs of Mexican Seas' (1887); 'Building of the City Beautiful' (1893). His prose works are 'The Baroness of New York' (1877); 'The Danites in the Sierras' (1881; later in the form of a play); and '49, or the Gold-Seekers of the Sierras' (1884). An introduction and an autobiography appear in the definitive edition of his 'Poems' (6 vols., San Francisco, 1909-10).

**MILLER, Edward**, American physician: b. Dover, Del., 9 May 1760; d. New York, 17 March 1812. He studied in the hospital at Baskingridge, N. J., was surgeon's mate in the Revolutionary War and in 1784 was graduated from the medical department of the University of Pennsylvania. He practised at Dover in 1783-96, and then established himself in New York. With Dr. Elihu H. Smith and Dr. Samuel L. Mitchell he founded in August 1799 the first American medical periodical, *The Medical Repository*. He was appointed professor of the practice of medicine at the University of New York in 1807, and clinical lecturer at New York Hospital in 1809. He wrote a highly valuable report, 'Yellow Fever in New York in 1805,' a paper which is still regarded as authoritative. His other papers were included in the biography written by his brother, Samuel Miller, 'Memoir and Writings of Edward Miller' (1814).

**MILLER, Ferdinand von**, German bronze founder: b. Fürstenfeldbruck, 18 Oct. 1813; d. Munich, 11 Feb. 1887. He studied at the Munich Academy, and under his uncle Stigl-mayer, as well as under Soyer in Paris. He

executed the castings from the designs of Schwanthaler, and likewise the great statue of Bavaria at Munich and that of Germania in the Niederwald monument. Among a large number of commissions in America perhaps the most notable was that of the capitol doors at Washington, D. C.

**MILLER, Ferdinand, Baron von**, German sculptor and bronze founder: b. Munich, 8 June 1842. He studied under his father, Ferdinand von Miller (q.v.), and afterward in London, Paris, Berlin, Dresden and Munich. He later traveled in Italy; served in the Franco-Prussian War in 1870-71, with rank of lieutenant; and afterward traveled in the United States. He became a director of the Bavarian Academy of Fine Arts in 1900, and received the title of baron in 1912. His work is well represented in the United States and includes the figure of a soldier for the Soldier's Monument at Charleston; statues of Shakespeare, Columbus and Humbolt at Saint Louis, and the statutory for a magnificent fountain at Cincinnati. He also executed the equestrian statue of Emperor William I, at Metz, and others of King Ludwig I, Prince-Regent Leopold, Prince Friederich-Karl, etc.

**MILLER, Florence Fenwick**, English doctor, lecturer and author: b. 5 Nov. 1854. She entered the Ladies' Medical College, London, in 1871; gained a wide practice and did much charity work; was thrice a member of the London school board; and is a prominent advocate of women's suffrage. She married Frederick A. Ford in 1877, but kept her maiden name. She wrote 'The House of Life' (1879); 'Physiology for Schools' (1880); 'Atlas of Anatomy' (1880); 'Readings in Social Economy' (1883); 'Life of Harriet Martineau' (1884); and 'In Ladies' Company' (1892).

**MILLER, Francis Trevelyan**, American journalist and historian: b. Southington, Conn., 8 Oct. 1877. He was graduated from Trinity College, Hartford, 1899; and received the degree of LL.B. from Washington and Lee University in 1901; Hon. Litt.D. from Washington College in 1913; and Hon. LL.D. from the University of Kentucky in 1913. He entered on his journalistic career in 1894 and was connected with various newspapers of the country. From 1907-11, he was editor-in-chief of the *Journal of American History*. He conducted and published numerous sociological investigations of Greater Antilles and contributed short stories, essays and articles to newspapers and magazines throughout the United States. He is the founder and editor-in-chief of the 'Photographic History of the American Civil War' (10 vols., New York 1910-11); 'Travel History of the World' (18 vols. in process); 'Photographic History of the Great War' (1914-15); and has published text-books on geography and history, now in use in New York City schools.

**MILLER, Frank Augustus**, American inn-keeper and antiquarian: b. Tomah, Wis., 3 June 1859. He removed with his parents to California in 1872, and later founded the Glenwood Mission Inn at Riverside, Cal. He has made the inn a careful reproduction of the architecture of the old Spanish missions in America, and has gathered a notable collection of objects connected with the missions of the

18th and early 19th centuries. In 1898 he built the Riverside and Arlington Electric Railway, of which he was manager for 15 years; and he has been active in promoting the growth and public interests of Riverside.

**MILLER, George Abram**, American mathematician: b. Lynnville, Pa., 31 July 1863. He studied at Muhlenberg College, Pennsylvania, Cumberland University, and at Paris and Leipzig. He was instructor in mathematics at the University of Michigan in 1893-95, and at Cornell in 1897-1901. He was associated with the faculty of Leland Stanford, Jr., University in 1902-06, was associated professor of mathematics at the University of Illinois in 1906-07, and has since been professor of mathematics there. He is editor of the *American Mathematical Monthly* and of *School Science and Mathematics*; and coeditor of the *Encyclopédie des Sciences Mathématiques*. He wrote 'Determinants' (1892); 'Historical Introduction to Mathematical Literature' (1915); is co-author of 'Mathematical Monographs' (1911), and 'Theory and Application of Groups of Finite Order' (1915).

**MILLER, Harriet Mann** ("OLIVE THORNE MILLER"), American author: b. Auburn, N. Y., 25 June 1831; d. 1918. Her earliest writings were signed "Olive Thorne," and after her marriage to W. T. Miller in 1849 she added her husband's name to her signature. She began her study of birds in 1880 and has published for young people's reading 'Little Folks in Feathers and Fur' (1879); 'In Nesting Time' (1888); 'Little Brothers of the Art' (1892); 'A Bird-Lover in the West' (1894); 'Under the Tree Tops' (1897); 'The First Book of Birds' (1899); 'The Second Book of Birds' (1901); 'True Bird Stories' (1903); 'What Happened to Barbara' (1907); 'Harry's Runaway and What Came of It' (1907); 'The Bird our Brother' (1908); 'The Child's Book of Birds' (1915).

**MILLER, Henry**, American physician: b. Lexington, Ky., 1 Nov. 1800; d. Louisville, Ky., 9 Feb. 1874. He was graduated at the Transylvania University, Lexington, Ky., in 1821, and practised for a time in Glasgow and in Harrodsburg. Upon the founding of the Medical Institute, Louisville, Ky., he became its professor of obstetrics and the diseases of women and children, a position he held until he became professor emeritus in 1869. He then occupied a similar chair at the Louisville Medical College until his death. He was author of 'A Theoretical and Practical Treatise on Human Parturition' (1849), later revised and published as 'Principles and Practice of Obstetrics' (1858). A partial list of his writings appears in the Surgeon-General's Catalogue, Washington, D. C.

**MILLER, Henry (John)**, American actor: b. London, England, 1 Feb. 1860. He came to America in 1871, received a public school education and made his first appearance on the stage in Toronto. He became a member of Modjeska's company in 1878; played with Adelaide Neilson for two seasons; and appeared at Daly's Theatre, New York, in 'Odette' in 1882. He appeared as "Herbert" in 'Young Mrs. Winter' at the Madison Square Theatre; was leading man for Minnie Madern; and was the leading juvenile of the

original Lyceum Theatre Company. He was leading man in the Empire Theatre Stock Company under Charles Frohman; and starred in the original production of 'Heartsease' in 1896. He was star in 'The Master' in 1898, and created the leading rôle in 'The Only Way' in 1899. He opened the Princess Theatre with 'The Great Divide' in 1906; he was leading man in 'The Havoc' in 1911, and in 'Daddy Long-Legs' in 1915, and appeared in 'The Fountain of Youth' (1918).

**MILLER, Hugh**, Scottish geologist and author: b. Cromarty, 10 Oct. 1802; d. Portabello, near Edinburgh, 23 Dec. 1856. When five years old he lost his father, a seaman, and thus came under the care of his mother and her two brothers, who were unable to keep him in school, so fond was he of outdoor life, of unrestrained reading and of composition. That he might have the winter months free to write in he chose the trade of a stonemason, at which he worked from 1819 to 1834. He gained some literary repute in the meantime, especially by letters to the *Inverness Courier* on the herring fishery; in 1834 became accountant in the bank at Cromarty; wrote 'Scenes and Legends of the North of Scotland' (1836); and gradually became known for his knowledge of geology, to the study of which he had first been drawn by noting the ripple marks on a block he was handling in the stonemasons' yard. 'Old Red Sandstone, or New Walks in Old Fields' (1842) made Miller famous, and the Old Red Sandstone became freshly important to the geologist. Miller was a devout Christian, one of the founders of the "Free Church" of Scotland, and intensely orthodox in his opinions. Hence he opposed the doctrine of development advanced in the anonymous 'Vestiges of Creation,' and in 1847 published 'Footprints of the Creator,' to which 'The Testimony of the Rocks' (1857) formed a sort of sequel. In these books Miller held that, while the Bible is not a scientific textbook and should not be so regarded, yet it is not contradicted by science. In particular, he urged that the narrative of a six-day creation was entirely consonant with modern geological discovery; indeed he divided into six eras, to correspond with these six "days," all geological history. His interest in the Free Church movement prompted him in 1839 to write 'A Letter to Lord Brougham' and 'The Whiggism of the Old School,' in which he protested against the law of patronage and vindicated the right of popular election to pastorates in the Scottish Church. Both pamphlets were so forceful that their author in 1840 was made editor of the *Witness*, an Edinburgh bi-weekly devoted to the cause of ecclesiastical independence. This post he held (with a brief interval) for nearly 17 years, while his health gradually broke under the stonemason's disease contracted years before; at the same time his mind suddenly failed, and in a moment of aberration he shot himself.

Miller's enduring fame may be set down to his admirable, simple and fascinating style. As a scientist he did, it is true, urge the doctrine of specific creation, and emphasize the complete definiteness of demarcation between strata of various geological series and the catastrophic nature of the change from one era to another; but these views were not reactionary at the time, being held by other scientists with far

wider and deeper training than Miller. His common sense and native sagacity led him to the correct solution of many minor concrete problems in geology; and his books popularized the study of that science. As a controversialist he was the literary brain of the Free Church. Consult Miller's famous autobiography, 'My Schools and Schoolmasters' (1852); Bayne, 'Life and Letters of Hugh Miller' (1871); a memoir by Agassiz in the later American editions of 'Footprints of the Creator,' and Brown, 'Labour and Triumph' (1858).

**MILLER, James**, American soldier and politician: b. Peterboro, N. H., 25 April 1776; d. Temple, N. H., 7 July 1851. He studied for the bar, but entered the army as major in 1808, and distinguished himself on the northern frontier. In 1812 he was brevetted colonel for bravery as commander at Brownstown, and in the following year participated with credit in the capture of Fort George. In 1814, as colonel of the 21st Infantry, he accompanied the invading army into Canada, and fought with gallantry at the battles of Chippewa and Lundy's Lane (q.v.), the success of the Americans in the latter conflict being mainly due to his capture of a British battery. For these services he was made brigadier-general, and received from Congress a gold medal. In 1819 he resigned his commission in the army, and from that year until 1825 served as governor of the Territory of Arkansas. He was collector of the port of Salem, Mass., from 1825 to 1849, when he retired to private life.

**MILLER, Joaquin**. See **MILLER, CININNATUS HEINE**.

**MILLER, Johann Martin**, German novelist and poet: b. Ulm, 3 Dec. 1750; d. 21 June 1814. He was educated at Göttingen and was on terms of intimate friendship with Klopstock, Voss and Höltz. He attained a wide popularity as a writer of lyric verse and of romantic tales. His 'Siegwart' (1776), a novel written in the manner of Goethe's 'Sorrows of Werther,' was widely popular and was translated into French, Dutch and Polish. His verse was published in the periodicals of his time, 'Was frag' ich viel nach Geld und Gut' making an especially wide appeal. His collected verse was published (1783). His further efforts in fiction include 'Beitrag zur Geschichte der Zärtlichkeit' (1776); 'Geschichte Karls von Burgheim und Emiliens von Rosenau' (1778-79), etc.

**MILLER, John Franklin**, American soldier: b. South Bend, Ind., 21 Nov. 1831; d. Washington, D. C., 8 March 1886. He graduated at the New York State Law School in 1852 and established a practice at South Bend, and took a leading part in State politics. In 1860 he was elected State senator, but resigned to enter the army the next year. He was in active service from almost the beginning of the Civil War, and in the battle at Stone River he performed services which led to his promotion to the rank of brigadier-general. He resigned at the close of the war though offered a commission as colonel in the regular army, and removed to California, where he for a time practised law and then entered business life. He continued an active interest in politics, and from 1881 until his death was United States senator.

**MILLER, Joseph**, also known as **Joe MILLER**, English comedian: b. 1684; d. 1738. For several years he was connected with Drury Lane and was a great favorite in many rôles. In 1739, the year following his death, there appeared a collection of jests under the title 'Joe Miller's Jest's.' The real compiler was a certain John Mottley, an obscure author (1692-1750).

**MILLER, Joseph Nelson**, American naval officer: b. Ohio, 22 Nov. 1836; d. Brick Church, N. J., 26 April 1909. He entered the navy in 1851, in 1861 had risen to the rank of lieutenant, and was promoted lieutenant-commander in 1862. As executive officer of the *Passaic* he took part in the attack upon Fort McAllister and Fort Sumter, and in the two attacks upon Fort Fisher as executive officer of the *Monadnock*; and was commended by his commanding officers for bravery and skill in these engagements. In 1870 he was promoted to the rank of commander, and in 1875 was assigned to the *Tuscarora*, and had charge of the deep sea soundings between the Hawaiian and the Fiji Islands. He obtained the rank of captain in 1881, commodore in 1894 and rear-admiral in 1897. In the latter year as commander-in-chief of the Pacific stations he hoisted the American flag at Honolulu, and in 1898 again raised the flag there, when American sovereignty of Hawaii was established. In 1897 he was the representative of the United States navy at Queen Victoria's Jubilee, with the *Brooklyn* as flagship; and during the Spanish War (1898) he organized the naval reserves on the Pacific Coast. He was retired from active service in November 1898.

**MILLER, Lewis**, American inventor and philanthropist: b. Greentown, Ohio, 1829; d. New York, 17 Feb. 1899. He was a machinist, settled at Canton, Ohio, where he made agricultural tools, many of them after his own designs, notably the first successful reapers and binders; and later had factories at Akron and Mansfield. In Akron he built a model Sunday school, and he gave much money for Sunday school work throughout the country. On his ideas the Chautauqua Assembly was planned and he was its president from 1874 until his death.

**MILLER, Merrill**, American naval officer: b. Ohio, 13 Sept. 1842; d. 5 Aug. 1914. He was appointed to the United States Naval Academy in 1859 and upon the outbreak of the Civil War was assigned to active duty. He was in the Mississippi squadron in 1862-63, was at the battles of Arkansas Post, Haines Bluff, the siege of Vicksburg, and in 1864-65 was with the North Atlantic squadron. He continued in the navy after the war in different stations, was promoted captain in 1893 and was in command of United States receiving-ship *Vermont* (1897-1900), commandant of the navy yard at Mare Island (1900-03) and of the Pacific Naval District (1903-04) until 13 Sept. 1904, when he was retired.

**MILLER, Olive Thorne**. See **MILLER, HARRIET (MANN)**.

**MILLER, Patrick**, Scottish pioneer in steam navigation: b. Glasgow, 1731; d. Dalswinton, Dumfriesshire, 9 Dec. 1815. He was engaged in business as a banker in Edinburgh,

and was a leading stockholder in the Carron Iron Company, in whose shops carronades were first manufactured and from which they derived their name. In 1785 he purchased the estate of Dalswinton in Dumfriesshire, and here spent the latter part of his life, devoting his attention to agriculture (he introduced fiorin grass, or white bent, into Scotland, and wrote a treatise on it), and to experiments in shipbuilding. On 14 Oct. 1788 he first demonstrated the possibility of steam navigation by sailing a steam-propelled boat, 25 feet long and 7 broad, on the lake near his house. Miller had Robert Burns at one time as his tenant and correspondent. Consult Woodcroft, 'Steam Navigation' (1848).

**MILLER, Richard E.**, American artist: b. Saint Louis, Mo., 22 March 1875. He studied at the Saint Louis School of Fine Arts, and at Julien Academy, Paris, and made his first exhibition at the Paris Salon in 1901, receiving the gold medal. He has since received medals at Saint Louis, 1904; Liège, Belgium, 1905; Portland Exposition, 1905; the Temple gold medal of the Pennsylvania Academy of Fine Arts; the Clark prize at the National Academy of Design; Potter Palmer gold medal, Chicago; and the gold medal of honor at the Panama Exposition, 1915. His work is represented in the Luxembourg and other European galleries, and in the Corcoran Gallery, Washington; the Metropolitan Museum, New York; the Pennsylvania Academy of Fine Arts; the Art Institute, Chicago; the Carnegie Institute, Pittsburgh; and other galleries. He is a professor of the École Colorossi, Paris; and in 1906 became a Chevalier of the Legion of Honor. Among his paintings are 'The Old Maiden Ladies'; 'Portrait of an Old Woman'; 'The Boudoir'; 'The Open Window.'

**MILLER, Samuel Freeman**, American jurist: b. Richmond, Ky., 5 April 1816; d. Washington, D. C., 13 Oct. 1890. He was graduated from the medical department of Transylvania University in 1838 and engaged in practice, but in 1847 he was admitted to the bar and abandoned medicine. He was an earnest advocate of emancipation of the slaves, and in 1850 freed his own slaves and removed to Keokuk, Iowa, where he established a law practice and changed his political affiliations from the Whig party to the Republican, becoming a party leader in his State. In 1862 he was nominated by President Lincoln to succeed Justice Peter V. Daniels as a justice of the United States Supreme Court, where for many years before his death he was senior justice. He gained a high reputation for ability and force of character and his decisions carried great weight. Among his official opinions was that on the Louisiana slaughter-house cases, defining the respective rights of the State and Federal governments; the Kilbourn-Thompson Case, defining and limiting the authority of Congress as a co-ordinate branch of the government; and his motion as a member of the Electoral Commission in 1877, which resulted in the decision that Congress possessed no authority to go behind the returns of legally accredited State officials. He was selected by the Electoral Commission to prepare its report and to go before Congress to explain its decisions. He was president of the National

Conference of the Unitarian Church for three years, and was the principal orator at the centennial celebration of the adoption of the United States Constitution held at Philadelphia in 1887. Author of 'Lectures on the Constitution of the United States' (1891).

**MILLER, Warner**, American manufacturer and politician: b. Hannibal, Oswego County, N. Y., 12 Aug. 1838; d. 21 March 1918. He was graduated from Union College in 1860; and for a year was professor of Greek and Latin at the Fort Edward Collegiate Institute. In the Civil War he served in the Fifth New York Cavalry, enlisting as a private, and attaining the rank of lieutenant; he fought under Sheridan, and was taken prisoner at the battle of Winchester, was paroled on the field and afterward honorably discharged. After the war he established a paper manufacturing business, in which he continued to hold large interests. He was also an active member of the Republican party, was delegate to the National Convention in 1872 and was elected to the New York legislature in 1874; and was a member of Congress from 1879 to 1881. In 1881, when T. C. Platt (q.v.) resigned from the United States Senate, Miller was elected to fill the vacancy, serving as senator till 1887; in 1888 he was nominated for governor of New York by the Republicans, but failed of election. Later he was interested in the Nicaragua Canal project, and was president of the Nicaragua Canal Company.

**MILLER, Willet Green**, Canadian geologist: b. North Walsingham, Ontario, about 1870. He was educated at the universities of Toronto, Chicago, Howard and Heidelberg. He was assistant in field geology in the Canadian Geological Survey in 1891-93; lecturer and subsequently professor of geology at Queen's University, Kingston, in 1893-1902; and has since been provincial geologist and inspector of mines for Ontario. He had charge of the field work for the Eastern Ontario Bureau of Mines in 1897-1901, and was president of the Canadian Mining Institute in 1908-10. He was a member of the Ontario Nickel Commission in 1915-16; and since 1918 has been Canadian Representative on the Imperial Mineral Resources Bureau. He is author of numerous papers on the pre-Cambrian and economic geology of Ontario; corundum-bearing rocks, iron ores, gold deposits, cobalt-silver ores and kindred subjects, and of 'Minerals and How They Occur' (1906).

**MILLER, William**, American religious leader: b. Pittsfield, Mass., 5 Feb. 1782; d. Low Hampton, Washington County, N. Y., 20 Dec. 1849. Most of his education he obtained through books procured by wood-chopping. He became a farmer at Poultney, Vt., in 1803, and in 1816 removed to Low Hampton, N. Y. In the War of 1812 he was captain of a company organized to protect the northern frontier. He was at first a student of Hume, Voltaire, Thomas Paine and Ethan Allen, and an avowed deist; but afterward became a member of the Baptist church at Low Hampton. After a prolonged study of the Bible, enlightened by no help excepting that of a concordance, he began in 1831 to preach the second advent of Christ. He was licensed as a preacher by

the church at Low Hampton, but was never ordained. For a time all pulpits except the Roman Catholic and Episcopalian welcomed him. He first set the time of the second coming as somewhere between 21 March 1843 and 21 March 1844, and on 14 March 1844 proclaimed it as near at hand. Months intervened and then in October the faithful gathered in their assemblies. At the end of November they dispersed. Many of the Second Adventists, or Millerites, as they were sometimes called, affiliated with other sects, but about 50,000 remained under the direction of Miller, who, on 25 April 1845, called a convention by which a declaration of faith was adopted, and the name of "Adventist" selected for the sect, which increased in numbers, and is to-day divided among six branches. Miller assisted in establishing in 1840 *The Signs of the Times and Exposition of Prophecy*, later called the *Advent Herald*. He published 'Evidence from Scripture and History of the Second Coming of Christ about the year 1843 . . . in a Course of Lectures' (1842); a widely-circulated 'Dream of the Last Day' and other writings. Consult the biographies by Bliss (1853) and White (1875). See ADVENTISTS; MILLENNIUM.

**MILLER, William**, English soldier: b. Wingham, Kent, 2 Dec. 1795; d. on H. M. S. *Naiad*, Callao Harbor, Peru, 31 Oct. 1861. He entered the field train department of the British artillery and was appointed assistant commissary in 1811. He served with Wellington's army in the Peninsula campaigns in 1811-14, and later saw service in the war against the United States in the operations about the Chesapeake and New Orleans. After the peace he traveled in Europe for two years and then went to South America. He joined the army of Chile in its struggle for independence, and later commanded the marines on the *O'Higgins*. He became a general of brigade in the Peruvian army in 1823 and attained rank of general of division and commander-in-chief of cavalry under Bolivar, rendering important service at the decisive battle of Ayacucho in 1824. He was appointed governor of Potosi in 1825. In 1826 he returned to Europe, but returning to Peru in 1830 he filled various important positions until 1839, when changes in political control caused his banishment. He was appointed British consul-general in the Pacific in 1843 and died while on a mission to the Peruvian government. Consult Miller, J., 'Memoirs of General Miller' (2 vols., London 1829).

**MILLER, William**, English line engraver: b. Edinburgh, 28 May 1796; d. Sheffield, 20 Jan. 1882. He was educated in England and at the University of Edinburgh, and studied engraving at Edinburgh and also under George Cooke during a residence in London, after which he returned and settled in his native city. His work was much commended by J. M. W. Turner, and he engraved many plates after and in accordance with the suggestions of that master. Of these the most important are 'The Bass Rock in a Storm' (1826); 'Great Yarmouth' (1829); 'The Grand Canal, Venice' (1837); 'Modern Italy' (1849); 'The Bell Rock Light-house in a Storm' (1864); 'Saint Michael's Mount' (1866). The chief features in his

engravings are the remarkable skill with which he gives the tone and value of color effects in black and white; the boldness and freedom with the line is employed in expressing the movement and gloom of storm clouds, the transparent fluidity of tossing waves and the glassy surface of still rivers. He was remarkably successful in book illustrations, of which fine examples may be seen in the Abbotsford edition of the Waverley Novels.

**MILLER, William**, Scottish poet: b. Bridgegate, Glasgow, August 1810; d. Glasgow, 20 Aug. 1872. Uncertain health preventing his becoming a physician, he adopted the trade of wood-turning. He published 'Whistle Binkie' (1852-53) and 'Scottish Nursery Songs and Other Poems' (1863), which earned for him the title of the "Laureate of the Nursery." One of his most popular poems is 'Wee Willie Winkie.'

**MILLER, William**, Canadian statesman: b. Antigonish, Nova Scotia, 12 Feb. 1834; d. 25 Feb. 1912. He was educated at the Antigonish Academy, was called to the bar of Nova Scotia in 1860 and became queen's counsel in 1872. He served in the Nova Scotia assembly in 1863-67 and was a staunch supporter of the projected Confederation, although certain features, particularly the financial plan, were opposed by him. Largely through his efforts a compromise was effected which secured the adherence of Nova Scotia and the appointment of the delegates to London in 1866. He served in the Senate from 1867 until his death, and in 1883-87 he was speaker. He served on many important committees and was chairman of the Parliamentary committee for the codification of the Dominion's criminal law. He declined judicial appointments from both Alexander Mackenzie and Sir John Macdonald. He became a privy councillor for Canada in 1891.

**MILLER, William Hallowes**, English mineralogist: b. Velindre, near Llandoverly, Carmarthenshire, 6 April 1801; d. Cambridge, 20 May 1880. He was graduated at Saint John's College, Cambridge, in 1826, was elected a Fellow there in 1829, and in 1832 he was appointed professor of mineralogy, which position he occupied until 1870. His system of crystallography was published in 1838 and received prompt recognition for its great worth, a reputation it still retains. He was one of the committee appointed in 1843 for the purpose of restoring the standards of weight and length, which were destroyed when the Houses of Parliament burned in 1834. His report of the work appears in the 'Philosophical Transactions' (1856). In 1870 he was appointed to the Commission International du Mètre, where he rendered valuable service. He was elected to the Royal Society in 1838, was its foreign secretary in 1856-73 and received a royal medal in 1870. He was also a knight of the orders of Saint Maurice and Saint Lazare in Italy, and of Leopold in Belgium, and was a corresponding member of the French Academy. He was author of treatises on hydrostatics and hydrodynamics, contributed 45 papers to the 'Royal Society's Catalogue,' as well as writing for other scientific publications, and edited William Phillips' 'Elementary Introduction to Mineralogy' (1852).

**MILLER, William Henry Harrison**, American jurist: b. Augusta, N. Y., 6 Sept. 1840. He was graduated from Hamilton College, Clinton, N. Y., in 1861 and in 1862 entered the army, serving through the war. He engaged in law practice in Fort Wayne, Ind., 1866-74; in 1874 removed to Indianapolis and formed a partnership with Benjamin Harrison, and under the latter's administration (1889-93) was Attorney-General of the United States.

**MILLER, William Lash**, Canadian chemist: b. Toronto, about 1865. He was educated at the universities of Toronto and Munich, and became demonstrator in chemistry at Toronto. Since 1907 he has been professor of physical chemistry there. He is a member of the American Association for the Advancement of Science, a Fellow of the Royal Society of Canada and author of numerous technical papers.

**MILLER, Fort**, a former fortification on the site of the present village of Fort Miller, Washington County, N. Y., on the Hudson River, 40 miles north of Albany.

**MILLERAND, Alexandre**, French lawyer and statesman: b. Paris, 10 Feb. 1859. He was educated at the Lycée Vanves, the Lycée Henri IV and at the University of Paris, where he studied for the bar. He established his reputation when he acted as a member of counsel for the defense of the strikers at Montceau-des-Mines in 1882. In politics he was a radical Socialist and as such he was elected to the Chamber of Deputies in 1885, advocating collective ownership of production, and international unions of labor. He was, with Clemenceau, one of the arbitrators of the Carmaux strike in 1892. He had owned and edited *La Voix* from 1889, and he later edited *La Petite République*, the organ of the Socialists. In 1899 he was appointed Minister of Commerce in the Waldeck-Rousseau Cabinet, after which time he abandoned his extreme views and bent his energies toward encompassing certain practical reforms. Among them were improvements in the merchant marine; stimulation of trade; reforms in postal service; the establishment of a 10-hour working-day for women and children; an eight-hour day for miners; and the inauguration of one rest day a week for workers. He also endeavored to secure an enforcement of arbitration in labor disputes. He was an advocate of old age pensions, the law for which was passed in 1905; and he was responsible for the institution of separate departments for the direction of labor, insurance and pensions. His influence with the Socialists waned and his connection with the party was severed because of his entering the cabinet of an opposing party. In 1898 he became editor of *La Lanterne* and in 1902 the Waldeck-Rousseau Cabinet was dissolved. He served in Briand's Cabinet as Minister of Public Works in 1909-10, and was Minister of War under Poincaré in 1912-13. On the organization of the war cabinet under Viviani, 26 Aug. 1914, he was again appointed Minister of War. He was criticized for lack of vigor in prosecuting the war and in the cabinet organized by Briand 31 Oct. 1915 he was succeeded by General Gallieni, whereupon he resumed his law practice, but continued in active service in the Chamber of Deputies. He was designated to attend the War Conference at London 20 Jan. 1916. He

wrote 'Socialisme Reformiste en France' (1903); 'Travail et Travailleurs' (1906); 'Politique de réalisations' (1911); 'Pour la défense Nationale' (1913); 'The Charitable Efforts of the United States' (1917); 'La guerre littéraire' (1918), etc.

**MILLERITE** (named in honor of W. H. Miller (q.v.), and formerly known as *hair pyrites* and as *capillary pyrites*), a mineral consisting of nickel sulphide; of bronze color and having a metallic lustre. It occurs in tufts of capillary crystals and in incrustations of delicate fibres loosely interwoven. It is found at Merthyr Tydvil, South Wales; in Cornwall, England; Saxony and Bohemia; in Sherbrooke County, Quebec; Jefferson County, N. Y.; Lancaster County, Pa.; and in Missouri and Wisconsin.

**MILLER'S TALE OF THE CARPENTER, The**, one of Chaucer's 'Canterbury Tales' (1475). It records the deception practised on an old husband, a carpenter of Oxford, by his young wife and a clerk who lodges with them. The source of the tale is unknown.

**MILLER'S-THUMB**, the English name for a spiny fresh-water goby (*Cottus gobio*), of which many species occur in Europe and elsewhere. It seldom exceeds three or four inches in length, the fins are large, the flesh delicate and when boiled of a salmon color. They are frequently called 'bullheads' (q.v.), but are different from the small American catfish so called. Consult Gill, T. M., 'Miller's-thumb and Its Habits' (Smithsonian Institution Miscellaneous Collections, Washington 1910).

**MILLERSBURG**, mil'érz-bèrg, Ohio, village, county-seat of Holmes County, on Killbuck Creek and on the Cleveland, Akron and Columbus, and the Baltimore and Ohio railroads, about 70 miles northeast of Columbus. It is a manufacturing village; its principal industrial establishments are flour and lumber mills, foundry, brick yards and machine shops, and its waterworks are municipally owned. In the vicinity are deposits of iron ore and bituminous coal. Pop. 2,020.

**MILLES, Ruth Anna Maria**, Swedish sculptor, sister of Vilhelm Karl Emil Andersson Milles (q.v.): b. Vallentuna, Uppland, 10 Feb. 1873. She studied at Stockholm and at Paris and is known for the delicacy and elegance of her statuettes, groups, bas-reliefs. Among her works are 'Red Riding-hood and the Wolf' (1902); 'Fisherman's Wife'; 'Yvonne,' 'Wildflower,' 'After Waiting,' National Museum (1907), etc.

**MILLES, Vilhelm Karl Emil Andersson**, Swedish sculptor: b. Lagga, near Upsala, 23 June 1875. He studied at Stockholm and at Paris and early gained a reputation as a sculptor of great promise. His work is chiefly in bronze and has placed him in the foremost ranks of Swedish sculptors. Among them are the Sten Sture monument, near Upsala, executed in 1901; portrait busts of Julius Kronberg, in the Göteborgs Museum (1902); Professor Mittag-Leffler (1904); F. Boberg, National Museum (1906); O. Leventin (1910); and G. Stridsberg, National Museum (1910); numerous groups of animals in granite and in

bronze, the Scheele statue at Köpings (1912), etc.

**MILLET, Aimé, ä-mä më-lä**, French sculptor: b. Paris, 1816; d. there, 14 Jan. 1891. He studied art under David d'Angers (see DAVID, PIERRE JEAN), and the architect Viollet-le-Duc (q.v.), applied himself first to painting and exhibited a picture in the exhibition of 1842, toiling at the easel for 10 years with no success. He meanwhile had turned his attention to the plastic arts and exhibited his first statue, a 'Bacchante,' in 1845. This was followed by his 'Ariadne' (now in the Luxembourg), a 'Mercury' and a statue of 'Civic Justice' for the mairie of the First Arrondissement, Paris; the statue of a 'Young Girl' for a monument in the cemetery of Montmartre, an 'Apollo' for the façade of the New Opera House and a bronze statue of 'Vercingetorix' (1865). Among his portrait and personal works are the statues of Chateaubriand at Saint Malo; of Denis Papin, at Blois, and numerous busts. His style has all the realism of modern French sculpture, combined with a certain theatrical demonstrativeness, a vividness of expression, pathetic, tragic or passionate. Consult Dumesnil, 'Aimé Millet, Souvenirs Intimes' (Paris 1891).

**MILLET, Francis Davis**, American artist, author, war correspondent and illustrator: b. Mattapoiset, Mass., 3 Nov. 1846; d. 15 April 1912, one of the victims of the *Titanic* steamship disaster. During the Civil War he acted as drummer and assistant surgeon. In 1869 he was graduated A.B. and A.M. in 1872 at Harvard University. While contributing and illustrating special articles for American publications he studied, in 1871-72 at the Royal Academy of Fine Arts, Antwerp, and in France and in Italy. In 1877-78 he was official correspondent for the New York *Herald*, the London *Graphic* and the London *Daily News* during the Russo-Turkish War, receiving Russian and Rumanian medals and decorations for bravery. In 1885 he was elected to the National Academy of Design, later to the American Academy of Arts and Letters, and was made an honorary member of the American Institute of Architects. He was awarded medals for pictures exhibited in 1889 at Paris, in 1893 at Chicago where he was in charge of the decorations and functions in connection with the World's Fair, and in 1901 at Buffalo. In 1898 he was correspondent for the London *Times* and *Harper's Weekly* in the Philippines. In 1905-06 he was actively engaged in organizing and securing endowment for the American Academy at Rome, of which he was elected the first secretary. Among his best-known paintings are 'An Old-Time Melody' and 'A Cozy Corner' in the Metropolitan Museum, also 'At the Inn' in the Union League Club, New York city; 'Between Two Fires' in the National Gallery of British Art, London. Portraiture includes paintings of Nicholas Murray Butler, president of Columbia University, and of Mrs. Millet. His best-known works are his five mural paintings, notably the 'Evolution of Navigation' in the Baltimore (Md.) Custom-house, and those in the Essex County Courthouse, Newark, N. J.; the Hudson County Courthouse, Jersey City, N. J.; the Cleveland, Ohio, post office; the Supreme Court at Madison, Wis., and in the Minnesota

State Capitol. Besides his numerous contributions to periodical literature his published books include 'Capillary Crime and Other Stories' (1892); 'The Danube' (1892); 'The Expedition to the Philippines' (1899). With Maj. Archibald W. Butt, another victim of the *Titanic* disaster, he is commemorated by a memorial fountain erected in 1913 in Washington, D. C.

**MILLET, Jean François, zhôn frän-swä më-lä**, French painter, the founder of the Barbizon school of painting: b. Gruchy, near Cherbouurg, 4 Oct. 1814; d. Barbizon, 20 Jan. 1875. The son of a Norman peasant, he owed much in his childhood to a woman of simple piety and strong individuality, and to her brother, and learned enough Latin to delight in the Vulgate and Virgil. He was educated in the Academy of Design at Cherbouurg, and received a bursary from that city which enabled him, in 1837, to proceed to Paris, where he entered the studio of Delaroche. This does not seem to have been a congenial home for his early art life, yet at first he struggled to comply with his surroundings and painted genres in the style of Watteau (q.v.) and Boucher (see BOUCHER, FRANÇOIS), as well as Biblical and mythological incidents, with landscape backgrounds, and signboards. It was in 1848 that he really found himself, and hit upon the line of art in which he could give utterance to the sincere feelings of his heart. This turning point in his career was marked by the appearance of his genre painting, taken from country life, 'The Winnow.' Henceforth his days were to be spent far from the glitter of Paris, the competition and jealousies of the studios; settling in Barbizon, on the edge of the forest of Fontainebleau, he devoted himself to the study and portrayal of peasant life. The hardship, toil and privation of the farm laborers he sympathized with acutely, and some have even accused him of being a social revolutionist, but he professed no views of this tendency, though his interpretation of the peasant's lot may be too gloomy and pessimistic, and his ironical bitterness of spirit such that it infected his canvas and clouded the beauty of external nature as depicted there. He himself was almost all his life battling with that poverty whose privations had early robbed him of his young wife. There is a profound pathos in his conception of the rural isolation and hardship of soil slavery, with all its stolid but unrequited patience, and this he has portrayed with a certain broad and impressionistic treatment which is both sincere and original. At first, his works were passed by or misunderstood, but gradually they were recognized at their true value, and he was hailed as the greatest painter of modern France. Since his death his pictures have been sold at enormous prices and are looked upon as the most precious pieces in private or public collections.

Millet's greatest picture, the 'Angelus' (1859), was sold by him for 1,800 francs and later brought at auction 800,000 francs. Millet himself sold his picture 'The Woman with the Lamp' for \$2,800 in 1872. Shortly after it was sold for \$4,600 and again for \$7,000. In 1882 it fetched \$18,000. The most important of his other works are 'The Sower' (1850); 'Man Spreading Manure' (1852); 'The Reapers'

(1853); 'The Gleaners' (1857, in the Louvre); 'Death and the Woodcutter'; 'La Becquée' (Feeding Her Birds)—a mother feeding her three children from the same bowl. These all belong to his early period when he was tortured with sickness and harassed by debt. After the appearance of the 'Angelus' his reputation was established, but chronic poverty still pursued him. In 1860 he produced his wonderful picture, the 'Sheep-Shearing' in which he seems to express as much pity for the dumb beast as for the patience of the human toiler who is bent over it. In 1862 appeared the 'Potato Planters'; in 1863 'The Wool Carder,' and 'The Man with the Hoe.' In 1867 he was awarded at the Paris Exposition a medal of the first class and the ribbon of the Legion of Honor in 1868. He took refuge in Cherbourg during the Franco-Prussian War, but returned to Barbizon in 1871, where he continued in broken health, though still working with untiring brush, until the end came.

Among the paintings of this artist now in the United States are 'The Sower'; 'The Water Carrier' (Vanderbilt collection); 'A Peasant Grafting a Tree' (Rockefeller collection); 'The Turkey Tender' (C. A. Dana collection, New York); 'The Buckwheat Threshers' and the 'Potato Planters' (Quincy Shaw collection, Boston); 'Harvesters Resting' and 'Homestead at Gréville' (Boston Art Museum); 'The Churners' (F. L. Ames collection); 'Potato Diggers' and 'Breaking Flax' (Walters collection); 'The Man with the Hoe' (San Francisco Museum).

The drawings, etchings and pastels of Millet are eagerly sought after and always bring a high price at auction or private sale. The most familiar is his own portrait, a sketch often reproduced. His 'Woman Feeding Chickens', 'Flock of Sheep with Shepherd'; the 'New-born Lamb'; 'Laundresses on the Shore' are best known. Among his pastels are 'The Vine Dresser' and 'Butter Making.' All his works show masterly drawing, and the landscapes which appear in many of them are put in with an ease and atmosphere worthy of the best periods of French art. His coloring may be sombre, and he disregards the power of the human countenance as giving expression to the sentiment of his conception. But the life of each picture is to be found in the inimitable pose of the figures, and the suggestiveness of the background. The hands, shoulders and feet of these figures, as they move in harmony with forms cumbrous, almost grotesque, are made to suggest the dull torture in which stolid and half-bestial creatures are held under the yoke of toil and poverty. The light reflected upon these figures from religious sentiment or natural affection only serves to intensify the profound melancholy by which the story of their lives is clouded.

**MILLET, or MILET, Pierre,** French-Canadian pioneer missionary: b. Bourges, France, 1635; d. Quebec, Canada, 31 Dec. 1708. He entered the Jesuit order and in 1667 went to Canada. In 1668 he was sent as missionary to the Iroquois in New York and in 1671 he was placed at the head of the Oneida mission. He succeeded in converting the principal chief and slowly gathered a congregation of considerable proportions. In 1684 he left his work among the Oneidas to accompany De La Barre in his campaign against the Senecas, and he served as interpreter between the Iroquois and the French at Frontenac in 1686. He was stationed at Fort Niagara in 1687 and afterward at Frontenac, in the hope that his experience among the Iroquois might enable him to promote friendly relations between them and the French. During the siege of Frontenac in 1689 he was captured by the Onondagas, who after maltreating him gave him over to the Oneidas. There he was sentenced to the stake but was finally rescued by an Indian convert who succeeded in having him adopted into the tribe. In 1694 he was permitted to return to Quebec, and afterward was petitioned by the Oneidas to return to them. From 1697-1703 he was missionary at Sault-Saint Louis.

**MILLET**, a popular name for many grasses grown in the Old World as cereals, but in the New almost wholly as forage. The principal ones are true or broomcorn millet (*Panicum milaceum*); foxtail millet (*Setaria italica*); barnyard or Japanese (*Panicum crus-galli*); pearl or cat-tail millet (*Pennisetum typhoides*) and the African, Chinese, Indian, black and erroneously called "pearl millet" (*Sorghum vulgare*). Sometimes *Elusine coracana* is called African millet. In general they constitute one of the most important groups of food-plants, since they are the staple diet of about one-third of the world's population, the annual plantation in India alone being estimated at approximately 35,000,000 acres. The first three mentioned are the most important groups grown in the United States. The plants all thrive well upon rather light, well-drained soils, which should be prepared as for other cereal crops. In order to make a millet harvest succeed the harvest of other cereals, the seed is sown late in the spring. Broadcasting and drilling are both practised, the latter more extensively. Just after blossoming, the crop may be cut and cured for hay; for seed, just before the seed becomes fully mature to prevent loss from shattering. The hay makes valuable fodder, but some stockmen attribute various animal ailments to its excessive or exclusive use; others experience no such difficulties. The seed may be ground for stock food, but it is little used. For poultry, especially for young chicks, it is widely employed.

**MILLIGAN, George,** Scottish educator and clergyman: b. about 1860. He was educated at the universities of Aberdeen, Edinburgh, Göttingen and Bonn, and was afterward minister of Saint Matthews, Morningside, and of Caputh. Since 1910 he has been regius professor of divinity and religious criticism at Glasgow University, and he has served as clerk of the senate since 1911. Author of 'History of the English Bible' (1895); 'The Theology of the Epistle to the Hebrews' (1899); 'The

New Testament Documents: Their Origin and Early History' (1912); coauthor, 'The Vocabulary of the Greek Testament' (Parts I and II, 1914-15), etc.

**MILLIGAN, Robert Wiley**, American rear-admiral: b. Philadelphia, 8 April 1843; d. 14 Oct. 1909. He entered the navy with rank as third assistant engineer and was attached to the United States steamship *Mackinaw* in the North Atlantic Blockading Squadron during the Civil War. He saw service at both battles of Fort Fisher, and was present at the fall of Wilmington, N. C., and of Petersburg and Richmond, Va. He afterward served in the North and South Atlantic and Pacific squadrons, and was on duty as instructor at the United States Naval Academy. He was promoted chief engineer in 1892, in which capacity he served on the United States battleship *Oregon* on her famous run from the Pacific to the Atlantic coast in the Spanish-American War, and also served at the battle of Santiago. He was fleet engineer of the North Atlantic Fleet, on the flagship *New York*, for one year; was promoted commander in 1899 and was chief engineer of the Norfolk navy yard in 1899-1905. He received rank as captain in 1902 and was retired with rank as rear-admiral in 1905.

**MILLIGAN, William**, Scottish Presbyterian clergyman and commentator: b. Edinburgh, 15 March 1821; d. Edinburgh, 11 Dec. 1893. He was educated at the University of Saint Andrew's; entered the ministry of the Established Church of Scotland, held pastorates at Cameron and Kilconquhar and was professor of Biblical criticism in the University of Aberdeen from 1860. He was moderator of the General Assembly in 1882, and was appointed principal clerk to the assembly in 1886. He was one of the revisers of the New Testament and the author of 'The Higher Education of Women' (1878); 'The Resurrection of Our Lord' (1881); 'Commentary on the Revelation' (1883); 'The Resurrection of the Dead' (1890), etc. He visited the United States in 1872 as a delegate to the Presbyterian General Assembly from the General Assembly of the Scottish Church.

**MILLIGAN, Ex Parte**, a decision handed down by the Supreme Court of the United States in 1866 holding a military commission to be without power in a State not invaded nor in rebellion, and where the usual civil courts, both Federal and State, were open; rendered by a barely sufficient majority, with Chief Justice Chase and Justices Wayne, Swayne and Miller dissenting, and Chief Justice Chase pronouncing a forcible protest. The case was that of one Lambdin P. Milligan, a United States citizen residing in Indiana, arrested by military authorities in 1864 on a charge of conspiracy, disloyal practices, inciting insurrection and aiding and comforting the enemy. He was found guilty by a military commission and sentenced to death. His counsel filed a writ of habeas corpus in the United States Circuit Court and the case eventually was carried to the Supreme Court, where the military commission was held to be without jurisdiction in his case. Chief Justice Chase asserted that the power of Congress "to authorize trials for crimes against the security and safety of the national forces,

may be derived from its constitutional power to raise and support armies and to declare war"; and that while the civil courts "might be open and undisturbed in their functions . . . yet wholly incompetent to avert threatened danger, or to punish, with adequate promptitude and certainty, the guilty conspirators." Consult 'Wallace's Reports of the Supreme Court of the United States' (Vol. IV, 1866).

**MILLIGAN COLLEGE**, in Milligan, Tenn., a coeducational institution founded in 1882 by Josephus Hepwood, under the auspices of the Disciples of Christ. It has a preparatory department and a college department; the courses lead to the degrees of A.B., B.S. and Ph.B. In 1915 there were connected with the school 14 professors and over 170 students. The library contained about 3,000 volumes. The grounds and buildings were valued at \$75,000, and the income was about \$14,000.

**MILLIGRAM**, the thousandth part of a gram. See WEIGHTS AND MEASURES.

**MILLIKEN UNIVERSITY**. See JAMES MILLIKEN UNIVERSITY.

**MILLIKEN'S BEND, Engagement at**. Milliken's Bend, La., on the west bank of the Mississippi, about 15 miles above Vicksburg, was the base of some of the military operations against that place and the lower Mississippi. Early in June 1863, when Grant was besieging Vicksburg from the east, Gen. E. Kirby Smith, commanding the Confederate Department of the Trans-Mississippi, sent Gen. J. G. Walker's division of 4,000 men to seize the place and other points on the river, and open communication with General Pemberton, in Vicksburg, with the object of furnishing him supplies, or failing in that, to cover his escape across the river. Walker moved to Alexandria, La., and reported to Gen. R. Taylor, commanding in West Louisiana, and was sent in transports up the Washita and Tensas rivers, until abreast of Vicksburg, when he landed and marched across to Richmond. At this time Milliken's Bend was held by Gen. E. S. Dennis, with about 1,400 men, mostly colored troops. A reconnoitring party sent out by Dennis was driven back by the Confederates. Walker arrived at Richmond at 10 A.M. on the 6th, and was ordered by Taylor to send one brigade to Young's Point and one to Milliken's Bend, distant respectively 20 and 10 miles, and to hold a third brigade in reserve six miles in advance of Richmond. Harris' brigade moved at night on Young's Point, was delayed and accomplished nothing. Gen. H. E. McCulloch, with a Texas brigade of 1,600 men and 200 cavalry, marched from Richmond at 6 P.M. on the 6th and at 3 A.M. on the 7th, when within one and a half miles of Milliken's Bend, the Union skirmishers were encountered and the Confederate advance driven back in some disorder; but McCulloch rallied his men and pushed on, driving the Union troops back slowly to their main line, carrying the Union breastworks, then driving the Union troops to the bank of the river, where two gunboats came to their assistance and, pouring shells into the ranks of the Confederates, obliged them to withdraw and return to Richmond. The Union loss was 127 killed, 287 wounded and 266 missing; the Confederates lost 44 killed, 131 wounded and 10

missing. Consult 'Official Records' (Vol. XXIV).

**MILLIKIN, James**, American banker and philanthropist: b. Pennsylvania, 2 Aug. 1830; d. Orlando, Fla., 2 March 1909. In 1860 he engaged in banking and later founded the firm of *Milliken and Company* at Decatur, Ill., now the *Milliken National Bank*. He is president of the *Union Works*. He founded the *Anna B. Millikin Home*, an institution for the care of aged women and children, built and supported mostly by him, and named by the board of directors after his wife, *Anna B. Millikin*. He also founded the *James Millikin University*, dedicated in 1904 by President Roosevelt.

**MILLIN, Aubin Louis**, French antiquary and naturalist: b. Paris, 19 July 1759; d. there, 14 Aug. 1818. He was destined for the priesthood but preferring to devote himself to literature he entered the *Royal Library*. His sympathies in the Revolution caused his imprisonment at *Saint Lazare*. He was appointed keeper of medals and antiquities at the *Royal Library* in 1794; and he also assumed the editorship of the *Magasin Encyclopédique* in 1795, which publication became the *Annales Encyclopédiques* in 1817. In the issues of these periodicals appeared many highly-learned articles by Millin himself. He was a member of the *French Institute* and a chevalier of the *Legion of Honor*. He translated 'Mélanges de littérature étrangère' (6 vols., 1785-86); and was author of 'Antiquités nationales' (5 vols., 1790-98); 'Discours sur l'origine et les progrès de l'histoire naturelle en France' (1790); 'Description statues du jardin des Tuileries' (1798); 'Monuments antiques inédits ou nouvellement expliqués' (2 vols., 1802-04); 'Nouveau dictionnaire des beaux arts' (3 vols., 1806); 'Histoire métallique de la Révolution française' (1806); 'Voyages dans les départements du midi de la France' (5 vols., 1807-11); 'Peintures des vases antiques' (2 vols., 1808-10); 'Galerie mythologique' (2 vols., 1811); 'Voyage en Savoie, en Piémont, à Nice et à Genève' (2 vols., 1816); 'Voyage dans le Milanais' (1817), etc.

**MILLINOCKET, Me.**, village in Penobscot County, 83 miles by rail north of Bangor, on the Bangor and Aroostock Railroad and in the Maine lake region. There are paper mills and a limited lumber trade. Pop. 3,368.

**MILLIPEDE**, or **MILLEPED** ("thousand-legs"), common name for a myriapod of the sub-order *Chilognatha* or *Diploda*, so called from its many feet. The body is hard and cylindrically shaped, with many segments, most of which have two pairs of feet. They are found in water or damp places and are harmless, differing in this respect from some of the centipedes. See *CENTIPEDE*; *MYRIAPODA*.

**MILLIS, John**, American army engineer: b. Wheatland, Mich., 31 Dec. 1858. He was graduated at the *United States Military Academy* in 1881. He was in charge of the improvements in the *New Orleans Harbor* and the *Mississippi levees* in 1890-94; and was chief engineer of the *United States Lighthouse Board*, Washington, D. C., in 1894-98. He was on duty with the *Engineers' Battalion* at *Willetts Point*, N. Y., and in *Cuba* in 1898-1900, reaching rank as major in 1900. He had charge of the con-

struction of harbor fortifications on *Puget Sound*; of river and harbor improvements in *Washington*, *Idaho* and *Montana*; of improvements in *Mount Ranier National Park* and of surveys and harbor improvements in *Alaska* in 1900-05; and was in charge of all fortifications construction in the *Philippine Islands* in 1905-07. While on leave of absence he traveled through *China*, *Burmah*, *India*, *Egypt* and *Europe* on his return from the *Philippines*. He was in charge of river and harbor improvement work on *Lake Erie* and in *Ohio*, *Indiana*, *Massachusetts* and *Rhode Island* in 1908-12; and in 1912-16 was on special duty in connection with the lighthouses of the northeast shore. He was promoted colonel in 1910. He was division engineer for the *Southeastern Coast Defenses* in 1916, and in 1917 was appointed chief engineer of the *Southeastern Military Department*, *Savannah, Ga.* Author of 'Safety of Navigation on Great American Lakes' (1912).

**MILLOM**, England, market-town in Cumberland, on the *Duddon Estuary*, nine miles northwest of *Barrow* and 60 miles north of *Liverpool*, on the *Furness Railway*. There is an early Norman church and the dismantled castle of *Millom*, built in the 11th century and fortified in the 14th century. The park of the castle was turned into farm lands early in the 19th century. The largest known deposits of red hematite in the country are located here, and a seawall and embankment have been built for the mine's protection as part of it lies under the *Duddon Estuary*. There are smelters in the neighborhood and the town owns its water and gasworks and has a technical school. Pop. 8,612.

**MILLS, Albert Leopold**, American military officer: b. New York City, 7 May 1854. He was graduated from *West Point* in 1879 and was commissioned in the cavalry. He served in several campaigns against the *Indians* and in 1894-98 was instructor in the *United States Military School* at *Fort Leavenworth, Kan.* Upon the opening of the war with *Spain* he was ordered to the front, where he rendered distinguished service at the battles of *Las Guasimas* and *Santiago* and was brevetted major and lieutenant-colonel. From 1898-1906 he was superintendent at *West Point*, with the rank of colonel and regimental captain. On 28 July 1902 he was awarded the *Congressional Medal of Honor* for distinguished gallantry in action near *Santiago de Cuba*, 1 July 1898, for encouraging those about him, though shot through the head and practically sightless. He was commandant of the *Department of Visayas* (1907-08); of the *Department of Luzon* (1908-09); of the *Department of the Gulf, Atlanta, Ga.* (1909-12); president of the *Army War College* since 1912.

**MILLS, Benjamin Fay**, American Presbyterian clergyman: b. Rahway, N. J., 4 June 1857. He was graduated from *Lake Forest University, Illinois*, in 1879; was ordained to the *Congregational ministry* in 1878; held pastorates at *Rutland, Vt.*, *Albany, N. Y.*, and other places; and was a prominent evangelist from 1886 to 1897. In 1897 he withdrew from the *Congregational denomination*, owing to his liberal views, and in 1897-99 conducted independ-

ent religious meetings in Boston. In October 1899 to October 1903 he was pastor of the First Unitarian Church of Oakland, Cal. From November 1903 to June 1915 he delivered courses of lectures on philosophy, psychology and sociology in leading cities throughout the United States. In June 1915 he returned to the evangelical ministry, was received as a member of the Presbytery of Chicago and resumed his former evangelistic work. Among his books are 'Power from on High' (1899); 'Victory Thru Surrender' (1892); 'God's World' (1893); 'The Divine Adventure' (1904).

**MILLS, Clark**, American sculptor: b. Onondaga County, N. Y., 1 Dec. 1815; d. Washington, D. C., 12 Jan. 1883. He went South, learned the millwright's trade, worked at New Orleans and later at Charleston, where he was employed by a plasterer, and discovered a method for taking a cast from the living face which enabled him to make plaster busts cheaply. In 1845 he completed a bust in marble of Calhoun, which was placed in the Charleston city hall in 1846. In 1848 he was appointed by the government to execute an equestrian statue of Andrew Jackson. This was the first large statue cast in metal in the United States. Mills was obliged to learn casting, since there was then no foundry in the country adequate to the work, and when the statue was at last completed it was at a loss to himself of \$7,000. This was later repaid to him by Congress in an appropriation of \$20,000 for a replica at New Orleans. His colossal equestrian statue of Washington, depicting the general at the battle of Princeton, was unveiled at Washington on 22 Feb. 1860. He also cast from designs by Thomas Crawford (q.v.) the statue of "Freedom" which was placed surmounting the dome of the capitol in 1863, and took a life-mask of President Lincoln shortly before the latter's death.

**MILLS, Darius Ogden**, American banker and capitalist: b. North Salem, Westchester County, N. Y., 5 Sept. 1825; d. 3 Jan. 1910. He was educated in the North Salem Academy and the Mount Pleasant Academy, Sing Sing, N. Y. He became cashier of the Merchants' Bank of Erie County, Buffalo, N. Y. In 1849 he went to California where he founded the banking-house of D. O. Mills and Company; from 1864-67 was president of the Bank of California, San Francisco, and after the failure of that institution he again took charge of it until 1878. After 1880 he was largely interested in New York real estate; also prominent in philanthropic enterprises, the Mills hotels being the most noted examples of his generosity.

**MILLS, David**, Canadian jurist: b. Oxford, Ontario, 18 March 1831; d. 8 May 1903. He was educated at the University of Michigan and entered early upon a public life. He served in the Dominion House of Commons in the Liberal interest 1867-96 and was editor of the *Canada Daily Advertiser*, London, Ontario, 1882-87. In 1876-78 he was Minister of the Interior, was elevated to the Senate in 1896, was Minister of Justice 1897-1902, and in 1902 was appointed a puisne judge of the Supreme Court of Canada. He was an authority on constitutional and international law and was the author of a 'Report on the Boundaries of the Province of Ontario'

(1873); 'Canadian View of the Alaskan Boundary Dispute' (1899); and 'The English in Africa' (1900).

**MILLS, Hiram Francis**, American engineer: b. Bangor, Me., 1 Nov. 1836. After graduation from the Rensselaer Polytechnic Institute in 1856 he was engaged in engineering work for the Bergen, N. J., tunnel of the Erie Railroad (1858); for the Brooklyn waterworks (1859); and for those at Cohoes, N. Y., and Lowell, Mass. He was also engaged in engineering work on the Hoosac Tunnel, Fitchburg Railroad, Mass. Mr. Mills' chief distinction is in connection with the control and distribution of water. He was instrumental in planning the control of water power on the Merrimac River at Lawrence and Lowell; was chief engineer of the Essex Company at Lawrence in 1894; consulting engineer of the Boston Metropolitan Water and Sewerage Board; and from 1896 to 1914 engineer member of the Massachusetts Board of Health and chairman of its committee on water supply and sewerage. He also directed the Lawrence Experiment Station investigation of water and sewerage purification. In 1878-93 he designed and built the slow-sand filters of the waterworks of Lawrence, Mass., which began a new era in the purification of water. He was consulting engineer for important works in many cities of the United States and Mexico, and published numerous papers and essays on engineering subjects. Harvard gave him the degree of M.A. in 1889.

**MILLS, James**, Canadian agriculturist and educator: b. near Bond Head, Ontario, 1840. He was graduated at Victoria University in 1868. After teaching for many years he became president of the Ontario Agricultural College at Guelph in 1879. As president and organizer of farmers' institutes for 25 years, he greatly promoted agriculture in Ontario. In 1899 he was a member of the San José Scale Commission. In 1904 he was appointed a member of the Board of Railway Commissioners for Canada. From 1890 to 1910 he served on the board of regents for the Victoria University and he also became senator of the Toronto University. With Thomas Shaw he published 'First Principles of Agriculture' (1890).

**MILLS, Lawrence Heyworth**, American philologist: b. New York, 1837. He was graduated at New York University in 1857, and at Fairfax Episcopal Theological Seminary, Virginia; and entered the Episcopal ministry in 1861. He was stationed in Brooklyn for six years; retired from the ministry in 1867; studied Gnosticism and the Avesta in Europe 1872-87; and in the last-named year, having established his reputation as an authority on the Zend-Avesta, went on Max Müller's invitation to Oxford, where he became professor of Zend philology in 1898. He contributed largely to Oriental journals various papers on the Gâthâs and early Zoroasterianism; translated 'Zend-Avesta' (Part III in 'Sacred Books of the East,' 1887); and wrote 'Study of the Five Zarathushtrian Gâthâs' (1894); 'Gâthâs of Zarathushtra in Metre and Rhythm' (1900); 'Dictionary of the Gâthic Language of the Zend-Avesta' (1902-14); and 'Zoroaster, Philo, the Achæmenids and Israel' (1903-06); 'Avesta Eschatology Compared with the Books

of Daniel and Revelations' (1908); 'Yasna I,' with Avesta, Sanskrit, Pahlavi and Persian texts (1910); 'Our Own Religion in Ancient Persia' (1913); 'Lore of Avesta in Catechetical Dialogues' (1914); 'The Creed of Zarathushtra' (1916); 'The Vital Necessity of the Persian Theology to all Biblical Study' (1916).

**MILLS, Robert**, American architect and engineer: b. Charleston, S. C., 1781; d. Washington, D. C., March 1855. He was a pupil of the architect Benjamin Latrobe (q.v.), and beside designing important structures in Philadelphia, including the single-arch bridge across the Schuylkill, erected custom-houses and marine hospitals in various parts of the United States and the Washington Monument in Baltimore. In 1837 he was appointed architect of the general government at Washington, where he built the Treasury, General Post Office and Patent Office and designed the Washington Monument. He published 'Statistics of South Carolina' (1826); 'American Pharos, or Lighthouse Guide' (1832), etc.

**MILLS, Roger Quarles**, American lawyer and politician: b. Todd County, Ky., 30 March 1832; d. 1911. He moved to Texas in 1849 and studied law; was admitted to the bar at 20, the Texan legislature removing the disability of minority; and began practice at Corsicana. In 1859 he was elected to the Texas legislature. On the outbreak of the Civil War he joined the Confederate service and fought throughout the war. In 1872 he was elected to Congress as a Democrat, serving till 1892; he was chairman of the House Committee on Ways and Means, and drafted the Mills Tariff Bill, which, however, failed to become a law. In 1892 he was elected to the Senate to fill an unexpired term and in 1893 was re-elected for the full term of six years.

**MILLS, Samuel John**, American Congregationalist clergyman: b. Torrington, Conn., 21 April 1783; d. at sea, 16 June 1818. He was graduated from Williams College in 1809, where he had as an undergraduate organized the first society of foreign missionaries in America, and he afterward studied at Yale and at Andover Seminary. In 1810 he founded the American Board of Commissioners for Foreign Missions. He was licensed to preach in 1812 and at once went on a missionary tour through the Southern States and made a second tour in 1814, succeeding in organizing various religious societies. He was ordained to the ministry in 1815 and in 1817 was sent to Africa to select a site for a colony. He died on the way home.

**MILLS, Thomas Wesley**, Canadian physiologist and educator: b. Brockville, Ontario, 1847; d. 1915. He was educated at Toronto University and studied medicine at McGill University, Montreal, afterward completing his course in Germany and England. In 1910 he became professor emeritus of physiology at McGill after having taught there from 1882. He was one of the founders of the Society for the Study of Comparative Physiology in 1885. His publications include 'Text Book of Animal Physiology' (1889); 'Text Book of Comparative Physiology' (1890); 'How to Keep a Dog in the City' (1891); 'The Dog in Health and Disease' (1892); 'Nature and Development of Animal Intelligence' (1898); and 'Voice Pro-

duction in Singing and Speaking on Scientific Principles' (1906).

**MILLS BILL.** See **TARIFF.**

**MILLS COLLEGE**, at Mills College (P.O.) in Alameda County, Cal., was founded in 1871 as Mills Seminary for Young Women. It was chartered as a college in 1885 and the preparatory department was discontinued in 1911. The A.B. and B.S. degrees are granted. Beside the so-called standard departments, four-year courses in home economics and physical training are offered leading to the B.S. degree and a teacher's certificate. In 1915 there were 30 instructors and 153 students. The property was valued at over \$400,000.

**MILLSAPS COLLEGE**, in Jackson, Miss., founded in 1892 by the Methodist Episcopal Church, South. The courses of study lead to the degrees of A.B., B.S. and Ph.D. In 1916 there were connected with the school 22 professors and instructors and 250 students.

**MILLSPAUGH, mill'pâ, Charles Frederick**, American botanist: b. Ithaca, N. Y., 20 June 1854. He studied two years at Cornell; was graduated from the New York Homœopathic Medical College in 1881; practised medicine for 10 years and became botanist of West Virginia University in 1891; professor of medical botany in the Chicago Homœopathic Medical College in 1897; and has been curator of the department of botany in the Field Museum of Natural History since 1894. He traveled in Mexico, in Brazil, in the West Indies, Japan, China, Straits Settlements, Java, Burma, Philippines, India, Ceylon and Europe. He is a member of the Explorers' Club and various scientific societies, as well as of the Mexican and Brazilian Faculties of Medicine. His published works are 'American Medical Plants' (1887); 'Flora of Saint Croix, D. W. I.' (1902); 'Plantæ Yucatanæ' (1903); 'Contributions to North American Euphorbiaceæ' (1898); 'Plantæ Insulæ Ananasensis' (1900); 'Plantæ Utowanæ' (1900); 'Contributions to the Flora of Yucatan I, II, III' (1895-98); 'Prænucciæ Bahamenses' (1906); 'Flora of the Sand Keys of Florida' (1907); 'One Thousand American Fungi' by MacIlvaine, revised and supplemented edition (1912).

**MILLSPAUGH, Frank Rosebrook**, American Protestant Episcopal bishop: b. Nichols, N. Y.; d. November 1916. He was graduated from the Shattuck School, Fairbault, Minn., in 1870, and from the Seabury Divinity School there in 1873. He entered the Episcopal ministry in the year last named, served as missionary in Minnesota 1873-76, was subsequently dean of the Omaha (Neb.) Cathedral, rector of Saint Paul's, Minneapolis, and dean of Topeka (Kan.) Cathedral. In 1895 he was consecrated bishop of Kansas.

**MILLSTONE**, one of the two cylindrical stones used to grind grain into flour (q.v.). The best foreign stones are the German basaltic lava quarried near Cologne, and the French burstone; both are imported into the United States in small pieces from which the cylindrical stone is built up. The native stone is commonly used in the single piece; a sandstone found in Ulster County, N. Y., and in Lancaster County, Pa., and a burstone much like the French, are the best materials, being hard

and tough and having a cellular structure, which in the burstone is due to the presence of fossil casts. The lower stone is usually fixed; the upper stone is the "runner." Each stone is deeply scored with furrows, which lead the milled grist away from the centre; the intervals are styled "land"; and the hole in the center is called the "eye." A depression about the eye is the "bosom." The scheme for scoring the stone varies greatly. The roller process (described under FLOUR) has relegated the millstone to the minor grist mills. See MINERAL PRODUCTION OF THE UNITED STATES.

**MILLSTONE GRIT**, a hard siliceous conglomerate with quartz pebbles found at the base of the Pennsylvania coal measures series of the carboniferous system. The formation occurs as far north as New York and as far south as Alabama, practically throughout the Appalachian Range. In Pennsylvania the beds are coarse and over 1,200 feet thick. The rock in Pennsylvania is light in color and is called the Pottsville Conglomerate. It is interstratified with some sandstone, thin beds of carbonaceous shells and thin beds of coal. In the southern portion of the Appalachian Mountains the coal beds are richer and more plentiful. See CARBONIFEROUS.

**MILLVALE**, Pa., borough, in Allegheny County, on the Allegheny River, opposite Pittsburgh. It is an industrial suburb of Pittsburgh; its chief manufactures are lumber, iron and steel products, saws and dressed stone. Pop. 8,600.

**MILLVILLE**, mil'vil, N. J., city in Cumberland County, on the Maurice River, a navigable stream 20 miles in length, which empties into the Delaware Bay, and on the West Jersey and Sea Shore Railroad, a branch of the Pennsylvania Railroad, situated just 40 miles south of Philadelphia and 40 miles north of Cape May, N. J. In 1801 Millville was incorporated as a town and in 1866 received its city charter. It is entirely a manufacturing city, and the largest industrial centre in South Jersey. Its chief industrial establishments are foundries, glass factories, dye works, bleacheries, cotton mills and machine shops. Sand mining is also a very important industry in this community. It has a large up-to-date high school, eight grammar schools and one parochial school, 10 large and beautiful church buildings, consisting of all denominations, a large park, situated on the shores of Union Lake, a body of fresh water three miles long and almost a mile wide, and numberless fine private residences, paved streets and sidewalks. The city proper covers a radius of five square miles, and is one of the best electric lighted cities in the East, having installed the very latest and most up-to-date type of street lights. The best State roads in the State lead through the city, which can be approached from any direction and there is also a new and high-grade Municipal Hospital, erected in 1913, at a cost of \$35,000. The government is administered under the new city charter of 1913, which provides commission form of government by the election of five commissioners who hold office for a period of four years, and who have charge of various departments of the city's business. The president of this commission is one of the five commis-

sioners, who is elected as such, and termed mayor by his colleagues. Pop. 13,500.

**MILMAN, Henry Hart**, English historian and poet: b. London, 10 Feb. 1791; d. near Ascot, 24 Sept. 1868. He was graduated from Brasenose College, Oxford, in 1814, became a Fellow of the college in that year, took orders in 1816, was appointed incumbent of Saint Mary's, Reading, in 1818, and was professor of poetry at Oxford 1821-31. In 1835 he became rector of Saint Margaret's, Westminster, and in 1849 dean of Saint Paul's. His best-known works are his 'Fazio,' a poetical drama (1815), first presented at London in 1818 with great success; 'History of the Jews' (1830), in which he showed himself a pioneer in the application of criticism to the records of the chosen people; and his 'Latin Christianity' (1855), an excellent general survey written with admirable candor and breadth. Among his other publications are 'The Fall of Jerusalem' (1820), a dramatic poem; 'History of Christianity under the Empire' (1840). He is the author of such well-known hymns as 'When Our Heads are Bowed with Woe' and 'Brother, Thou art gone before us.' Consult Milman, A., 'Henry Hart Milman' (1900).

**MILMORE, Martin**, American sculptor: b. Sligo, Ireland, 14 Sept. 1844; d. Roxbury Highlands, Boston, Mass., 21 July 1883. He studied at Boston with Thomas Ball and established there his own studio. In 1863 he executed for the Sanitary Fair the statuette 'Devotion,' later studied for a time in Rome, where he made busts of Pius IX, Charles Sumner, Wendell Phillips, Emerson and others of eminence and designed the soldiers and sailors' monument on Boston Common, for which he had been commissioned by the city. This monument, generally regarded as his greatest work, was dedicated in 1877. He executed also the soldiers' monument at Charlestown, Mass., a mediocre composition 'America' at Fitchburg, Mass., and the 'Weeping Lion' at Colby University, Waterville, Me. His bust of Sumner is in the Metropolitan Museum, New York; that of Ticknor in the Boston Public Library; and a bronze copy of that of Phillips is also in the Boston Library, to which it was presented by the Phillips Memorial Association in 1900. One of his best-known works is the huge granite Sphinx in Mount Auburn Cemetery, Cambridge, Mass.

**MILNE, John**, English geologist and seismologist: b. Liverpool, 1850; d. Isle of Wight, 30 July 1913. He was educated at King's College and the Royal School of Mines, London, and practised as mining engineer in Cornwall, Lancashire, central Europe and Newfoundland, besides accompanying an expedition to Arabia as geologist. In 1875 he was appointed by the Japanese government to the chair of geology and mining in the Imperial College of Engineering at Tokio, where he married a Japanese lady and remained nearly 20 years. In 1880 he founded the Seismological Society of Japan, from which hundreds of observing stations sprang up all over the country—a land subject to perhaps a thousand earthquake shocks a year. With the assistance of English colleagues Milne was the first to devise instruments for recording these shocks, and his investigations led to the precision now obtaining

in the science of seismology. Shortly before leaving Japan his residence was destroyed by fire; all his books, instruments and 2000 volumes of the 'Transactions of the Seismological Society of Japan' were lost. Returning to England in 1895 Milne and his wife settled in the Isle of Wight, where he erected the world-renowned seismological observatory and equipped it with instruments that record shocks in any part of the globe. This annual analyses of the records thus obtained approximately determined the positions of 57 earthquakes per year. The Milne seismograph is the standard instrument in use to-day. He compiled a 'Catalogue of Destructive Earthquakes, A.D. 7 to A.D. 1899' (1912) for the British Association, showing 4,151 entries. His two volumes on 'Seismology' and 'Earthquakes' are standard textbooks. Milne was the recipient of numerous decorations and honors from different countries.

**MILNE-EDWARDS, Henri**, French naturalist: b. Bruges, Belgium, 23 Oct. 1800; d. Paris, 28 July 1885. His parents were English. He studied medicine in Paris, taking his degree in 1823. Soon he turned his attention to zoology. After teaching for several years in the Collège de Henri IV, he was elected in 1838 a member of the Académie de Sciences in Cuvier's place. His 'Recherches anatomiques sur les crustacés,' published in 1828, attracted attention, and from that time until his death he published books and essays on his specialty; taught natural history, and became a noted educator, as well as an original investigator. In 1837 he became editor of the zoological department of the 'Annales des sciences naturelles,' which he held for 50 years and to which he was a contributor. In 1841 he became professor of entomology in the Jardin des Plantes (Museum of Natural History), Paris, where 21 years later he succeeded Geoffrey St. Hilaire in the chair of zoology. In 1864 he became director of that famous institution. The Royal Society of England honored him in 1850 with the Copley medal for his zoological work. Milne-Edwards was the first to describe the important biological principle of the physiological division of labor. Although a contemporary of Darwin and Huxley, Milne-Edwards was little influenced by those men of science and held to the doctrine of special creations instead of the evolution theory. In the work of his latest years he was assisted by his son, Alphonse (1835-1900), who was a specialist in the study of fossil birds and deep-sea exploration. Milne-Edwards published 'Éléments de zoologie ou leçons sur l'anatomie, la physiologie, la classification, etc., des animaux' (1834-35), which had an enormous circulation, and was much used as a basis for manuals of zoology; a revision of Lamarck's 'L'histoire naturelle des animaux sans vertèbres' (1836-45), and with Dehayes 'Leçons sur la physiologie et l'anatomie comparées de l'homme et des animaux' (1855-84); 'Histoire naturelle des crustacés' (1834-40) and 'Histoire naturelle des corallinaires' (1857-60) were noteworthy. His 'Lectures on the Physiology and Comparative Anatomy of Man and the Animals' (14 vols., 1857-81) are valued for their great fund of information and ample references. He also published 'Natural History of the French Coasts' (1832-45) and 'Natural History of the

Mammalia' (1871). His elder brother, WILLIAM FREDERICK (Jamaica 1776-Versailles 1842) was almost as celebrated. He founded the Ethnological Society in Paris and is considered as the father of ethnology in France.

**MILNER, Sir Alfred**, VISCOUNT MILNER, English administrator: b. Bonn, Germany, 23 March 1854. He studied in Germany, where his father had been instructor in English at the University of Tübingen, then at King's College, London, and at Balliol, Oxford; was Fellow of New College, Oxford; was called to the bar in 1881, and after several years in journalism, part of the time on the *Pall Mall Gazette*, became private secretary to Mr. Goschen, Chancellor of the Exchequer, in 1887. From 1889 to 1892 he was Under-Secretary of State for Finance in Egypt; in 1892 became chairman of the Board of Inland Revenue, and in 1897 was appointed to the double post of high commissioner for South Africa and governor of Cape Colony. In 1900 he became administrator of the Transvaal and Orange River colonies, of which he was made governor in 1901. He took a prominent part in all negotiations with the Boers before, during and after the war, and his conduct throughout was the subject of much controversy in Great Britain. After the passing of a resolution in the House of Commons directed against his policy on Chinese labor he resigned in December 1905. He has taken a prominent part in advocating the causes of imperial federation, tariff reform and compulsory national service. In December 1916 he became a member of the Inner War Cabinet in Lloyd George's National Ministry. He is a man of high culture and is the author of 'England in Egypt' (1892), and 'The Nation and the Empire: Speeches and Addresses' (1913). He was created G. C. B. baron in 1901 and viscount in 1902. Consult Worsfold, 'Lord Milner's Work in South Africa' (1906) and 'Reconstruction under Lord Milner' (1913).

**MILNER, John**, Roman Catholic bishop and archaeologist: b. London, England, 1752; d. Wolverhampton, England, 1826. He was ordained priest in 1777. In 1779 he settled in Winchester, the architecture and historical associations of which appealed to him strongly. In 1803 he became titular bishop of Castabala, Cappadocia. In 1804 he settled in Wolverhampton, having been made apostolic vicar of the Midland district in England. He took conspicuous part in the controversy regarding the removal of the right of vote on appointment of Roman Catholic bishops as part of Peel's Catholic Relief Act (passed in 1829). His courageous action in this fight gained him the sobriquet of "the English Athanasius." He was the author of 'Antiquities of Winchester' (2 vols., 1798-1801; 3d ed., 1839); 'Treatise on the Ecclesiastical Architecture of England during the Middle Ages' (1811; 3d ed., 1835), and 'The End of Religious Controversy' (1818). Consult Husenbeth, F. C., 'Life of John Milner' (Dublin 1862), and Ward, 'Dawn of the Catholic Revival in England, 1781-1803' (2 vols., Dublin 1909).

**MILNER, Joseph**, English ecclesiastical historian: b. Leeds, England, 1744; d. 15 Nov. 1797. He was educated at Leeds Grammar School and at Cambridge and became well known as headmaster of Hull Grammar School.

In 1768 he was lecturer at Holy Trinity Church, Hull, and greatly advanced the success of the Evangelical movement, both there and as vicar of North Ferriby, near Hull. He published essays and sermons, but his chief work is the 'History of the Church of Christ,' of which he lived to complete three volumes, ending with the 13th century. The fourth volume (to the 16th century) was edited from manuscripts by his younger brother, Dr. Isaac Milner, dean of Carlisle Cathedral, who also published a complete edition of the works of Joseph Milner (8 vols., 1810). The principles on which Milner based his 'History' are of the narrowest kind and he shows little critical insight.

**MILNES, Richard Monckton.** See HOUGHTON, RICHARD MONCKTON MILNES.

**MILLO,** mil'ō, ancient Greek athlete. He was a native of Crotona, in Magna Græcia, Italy, and celebrated for his great strength. He bore off the prize six times in the Olympic games, and on an equal number of occasions at the Pythian. He was appointed to command an army against the Sybarites, and at the battle at the Crathis, 511 B.C., his great strength is said by Diodorus to have given the victory to the Crotonians. Many anecdotes are related of him. He once carried a heifer of four years to the sacrifice on his shoulders, killed it with a blow of his fist, and afterward, it is added, ate the whole of it on one day. His death is characteristically related. When enfeebled by age he attempted to rend open the trunk of a tree partially split by wood-cutters, but the wood, closing on his hands, held him fast and he was attacked and devoured by wolves.

**MILLO, Titus Annius,** Roman tribune and political leader: b. Lanuvium in early part 1st century B.C.; d. district of Thurii, 48 B.C. In 57 B.C., when tribune of the plebs, his quarrel with Publius Clodius began. Seeking preferment in the state, he became the ally of Cneius Pompey, urging the recall of Cicero from exile, whither he had been sent at the instance of Clodius, as a pretext for their acts. Bands of gladiators in the employ of Milo and of Clodius kept Rome in constant terror by their skirmishes. Finally, in a clash at Bovillæ, on the Appian Way, Clodius was murdered 20 Jan. 52 B.C. Milo was impeached for acts of violence in occupying public places and going about under arms, and for bribery in his canvass for the consulship. His trial began 4 April 52 B.C. Cicero undertook his defense, but the hostility of the Clodius faction was so marked that his speech was not delivered. In a revised and enlarged form it was sent by Cicero to Milo at Massilia (Marseilles), whither he had gone into exile upon his condemnation under the first count. In 48 Milo returned to Italy and joined Marcus Caelius in rebellion against Cæsar.

**MILLO, or MILOS.** See MELOS.

**MILOSH,** prince of Serbia. See SERBIA; OBRENOVITCH.

**MILOUNA** (mil-loo'nā) **PASS,** Greece, a frontier-pass of the Olympian Mountains in Thessaly, a few miles north of Tyrnavos. On 18 April 1897 it was the scene of a fierce battle between the Turks and Greeks during the Græco-Turkish War of that year. About 50,000

men were engaged on both sides, and the Greeks were defeated with heavy loss.

**MILREIS,** mil'rēs, or **MILREI,** a Portuguese coin and the unit of account in Portugal. A thousand reis is one milrei, equal to \$1.08. In enumeration the figure \$ is used to denote the thousandth place, thus one milrei is written \$000. The colon marks the place of contes (1,000,000 reis), the period the place of thousands of millions. The milreis is also the monetary unit of Brazil and is valued at 54.61 cents (United States).

**MILROY, Robert Huston,** American soldier: b. Washington County, Ind., 11 June 1816; d. 1890. He was graduated from Norwich University, Vermont, in 1843 and served in the Mexican War, after which he studied law and was admitted to the bar in 1849. In 1851 he was appointed justice of the Eighth Judicial Circuit Court of Indiana. When the Civil War broke out he organized a company of volunteers and was mustered into service as colonel, later receiving the rank of brigadier-general, and in 1862 was made major-general. In 1863 he was engaged in battle with a superior force under General Lee, and after a gallant fight of three days' duration was compelled to retreat. An investigation of his conduct followed, which resulted favorably for Milroy, who, however, resigned in 1865. He was trustee of the Wabash and Erie Railroad in 1868, in 1868-74 was superintendent of Indian matters in Washington Territory and in 1874-85 Indian agent.

**MILTIADES,** mil-ti'a-dēs, Athenian general: d. 489 B.C. He was a descendant of the Philaides and, after being archon at Athens in 524, inherited a minor principality in the Chersonesus in 518. He governed well there; accompanied Darius against the Scythians in 515, and being left at the bridge across the Danube urged its destruction in order that Greece might thus be rid of a possible Persian enemy. This plan was vetoed by Histæus, another Greek tyrant. In 493 he left his kingdom for fear of the Persians, and upon their invasion of Greece in 490 became one of the 10 generals of the Athenian army. Each of the other generals retired in Miltiades' favor, but he refused to lead the army until his own day of command came. Then he won the great battle of Marathon, routing the Persian land forces. The victorious general in the next year asked the state of Athens for a fleet of 70 ships, got his request, but did not explain that he wished to punish the people of Paros from motives of private revenge, and, when his expedition failed and its purpose became known, he was impeached, fined 50 talents and imprisoned for lack of ability to pay. He died in prison of a wound received at Paros.

**MILTIADES, Saint,** also called **MELCHIADES,** Pope or bishop of Rome from 2 July 310 to 10 or 11 Jan. 314. He is best known as having sat as presiding officer at a synod held at Rome in 313, by desire of the Emperor Constantine, to hear a petition from the Traditones or Catholics in North Africa who had, on demand of the Emperor Diocletian, given up their sacred books and thus, in the opinion of those who resisted the demand, forfeited the rights and privileges of Church membership. The action of the Traditones split the Church

into two bitter factions, a condition that was not suppressed until several synods and other courts, of which the Roman synod was one, had effectually quelled the movement by denying the pleas of the Traditores on every occasion. Nothing is known of the early history of Miltiades, except that he was born in Africa, and the date of his death is uncertain.

**MILTITZ, Karl Von**, German ecclesiastic: b. about 1490; d. about 1529. He was the son of a nobleman of Saxony, entered upon a clerical career as priest, and was subsequently canon of Mainz, Treves and Meissen. By favor of Pope Leo X, after appointment as a papal notary in 1515, he was chosen by that pontiff to confer with Luther, then very troublesome to the Church authorities, also with Frederick the Wise, of Saxony, Luther's protector. The sale of indulgences had been condemned by Luther, and Miltitz was dispatched to the scene of Luther's activity with a view to pacification. The whole subject was earnestly discussed, and as an outcome of the conference Luther promised to submit and possibly recant his heretical opinions. Later meetings between the Saxon priest and Miltitz took place at Altenberg, Liebenwerda and Nichtenberg, but the triumph of the Pope's envoy was annulled by the receipt of a papal bull of denunciation before the conference came to an ending. Miltitz was subsequently sent to discipline Tetzl, the priest who had aroused Luther's ire, and denounced him as being both indiscreet and unclerical. Miltitz died, it is supposed by drowning, when on his way back to the Vatican. Consult the biography by Creutzberg (Freiberg 1907).

**MILTON, John**, English poet: b. London, 9 Dec. 1608; d. London, 8 Nov. 1674. He was the son of John Milton (d. 1647), a prosperous and cultivated scrivener with marked leanings to Puritanism, and Sarah Jeffrey (d. 1637), of whom little is known. The pair had six children, three of whom came to maturity. The eldest of these was Anne, mother of the infant girl upon whom Milton wrote his elegy, 'O fairest flower, no sooner blown than blasted'; of Edward Phillips, author of 'Theatrum Poetarum,' and of the hack-writer, John Phillips, both of whom Milton taught. She married for her second husband, Thomas Agar. John, the poet, was the second of the Milton's surviving children. The youngest was Christopher (1615-93), who became a loyalist and a Roman Catholic, and was knighted and made a judge by James II.

Milton was born in Bread street, Cheapside, at the sign of the Spread Eagle, where his father conducted his business. The elder Milton was a talented organist and composer, who is said to have taught his son to play the organ and to have made his house the resort of the best musicians of the day. John was beautiful in childhood and soon showed literary and scholarly proclivities. He was at first taught at home by Thomas Young, afterward a noted Puritan clergyman, to whom he addressed his fourth Latin elegy. Then he attended Saint Paul's School under the two Alexander Gills, profiting from the classical acquirements of the elder. Here he formed the most memorable of his friendships, that with Charles Diodati, the son of an Italian Protestant who had settled in

London as a physician. He spent between four and five years at this school, straining his eyes with study, learning five languages and reading much poetry, especially that of Spenser, whom he later acknowledged as a master, and Joshua Sylvester's (q.v.) uncouth translation of Du-Bartas, which had a slightly deleterious influence upon his own early poetical compositions. Metrical paraphrases of Psalms cxiv and cxxxvi, preserved by Milton, furnish specimens of his juvenile accomplishments.

On 9 April 1625 he matriculated as a pensioner of Christ's College, Cambridge, his tutor being William Chappell, a religious controversialist, afterward bishop of Cork. With this tutor Milton had some unexplained trouble, which apparently led to a short rustication and to his transfer to another tutor. The interlineation in the manuscript of Aubrey's sketch of the poet to the effect that Chappell "whipt" his most famous pupil may refer to some sort of personal encounter, or else may represent anti-Puritan gossip.

It is abundantly clear from later references to Cambridge in his writings, that Milton, although he was honored for his character and his scholarship, and was several times selected to represent his college as a public speaker, had no great respect for the university's methods and ideals. His beauty of person and his chaste life gained him the nickname of "the lady" and he seems to have formed no special friendships with such promising undergraduates of other colleges as Thomas Randolph, and Edmund Waller (q.v.), his seniors, or with John Cleveland (q.v.), the satirist, and Henry More, the Platonist, junior members of his own college. This aloofness from his fellows and his apparent inability to find inspiring personalities among his instructors probably increased his absorption in his studies and encouraged him to correspond in Latin with Diodati, then at Oxford, as well as to compose poetry, in both Latin and English, not inconsiderable in quantity and extraordinarily good in quality. 'On the Morning of Christ's Nativity' (1629) is the crowning performance of this period and, despite some youthful defects of fantastic extravagance, is one of the few really great odes in our literature. Less excellent but still memorable are the lines on Shakespeare (1630), the sonnet 'On his Having Arrived at the Age of Twenty-Three' and 'An Epitaph on the Marchioness of Winchester.'

Milton, whose brother Christopher had followed him to Christ's, took his bachelor's degree 26 March 1629 and his master's 3 July 1632. He tells us that the college authorities would have been glad if he could have continued to reside with them—probably as a Fellow. His design had been to take orders in the Church, but the High-Church reaction, which Archbishop Laud was fostering, was obnoxious to him, and he was unwilling to come under the control of that masterful prelate. Theological difficulties and objections to an elaborate ritual do not seem to have weighed greatly with him at this time—certainly not to such a degree as the natural aversion of a proud and liberty-loving spirit to submit to the restraints imposed by an ecclesiastical organization dominated by a zealot. No other profession spe-

cially attracting him — though there are hints that he thought of the law — he gave himself up to reading and study, with the hope that he might later compose something the world "would not willingly let die." As this meant that for several years he must be a charge upon his father, the latter surely deserved the thanks conveyed to him in the Latin poem entitled 'Ad Patrem,' and he should be considered one of the most farseeing of parents.

From July 1632 to April 1638 Milton lived at his father's semi-suburban residence at Horton, in Buckinghamshire. He visited London to purchase books and to take lessons in mathematics and music; but he doubtless found his chief interest at home in studying the classics and French and Italian literature, and in enjoying the beauties of the country around him. His occupations and ideals seem to be described in the companion poems 'L'Allegro' and 'Il Penseroso,' which are generally assigned to the second half of 1632; unless, indeed, these idyllic pieces, contrasting as they do two varieties of temperament and modes of life, represent the perplexed state of his mind when he was choosing between a secular and an ecclesiastical career, and belong to a slightly earlier period. To the Horton epoch we certainly owe three of the most notable of his so-called 'Minor Poems' — the songs and rhymed speech entitled 'Arcades,' the masque 'Comus' and the pastoral elegy 'Lycidas.' The first named was part of an entertainment given before the Countess-dowager of Derby at Harefield in 1633 or 1634. The music for this was furnished by the composer Henry Lawes (q.v.), a friend of Milton's family, and their copartnership in the slighter performance probably led to their association in providing a masque for the celebration of the entrance of the Earl of Bridgewater upon his duties as president of the council of Wales. 'Comus,' as the masque has been called without Milton's authorization, was probably performed in the great hall of Ludlow Castle on Michaelmas-night (29 September) 1634. So many of Lawes' friends asked afterward to be allowed to read it that the composer had an edition published anonymously in 1637. From that day to this it has been one of the most admired of English poems, and whatever its defects of construction, it is unsurpassed as an idealistic presentation of the power and charm of personal purity. The year that 'Comus' was printed saw also the writing of 'Lycidas,' which has been pronounced by Tennyson to be a "touchstone of poetic taste" and by Dr. Johnson to be a poem which no man could have fancied he read "with pleasure had he not known its author." This elegy was first published in 1638 in a volume of academic tributes to Edward King, a successful rival of Milton's for a fellowship, who was drowned in the Irish Channel in August 1637. The apparent absence of great personal interest on the part of the poet in his subject, and the decreased toleration of the conventions of pastoral poetry, probably account for much of the adverse criticism 'Lycidas' has received; but it should be remembered that Milton could have attained the requisite sincerity of utterance by centring his thoughts and emotions upon the loss sustained by the Church in the death of so promising a clergyman, and that such consummate art of versification and dic-

tion as 'Lycidas' displays and such a felicitous adaptation of a time-honored form of poetry to comparatively modern uses should render a poem, which a series of competent judges has pronounced a masterpiece, unamenable to the censure of the catholic reader. On the other hand, it may be remarked that it seems somewhat uncritical to rank, as is often done, these poems of the young poet of Horton, admirable but still not magnificent in scope, above the sublime masterpieces which gave Milton his place among the supreme poets of the world. It is scarcely conceivable that if Milton had died immediately after writing 'Lycidas' his name would now be widely known outside the English-speaking nations.

In 1638, after his mother's death, Milton, through his father's generosity, was enabled to take a foreign tour in a style befitting a gentleman. At Paris he met Grotius (q.v.), but he did not like the city and passed soon into Italy, going by sea from Nice to Leghorn. He spent about a year on the peninsula, two visits of some two months each being given to Florence, where he made friends among men of culture, and impressed them by his accomplishments both in the classics and in Italian. In Rome his outspoken Protestantism almost got him into trouble. At Naples he formed an acquaintance with the aged Marquis Manso, the protector of Tasso and Marini, to whom he addressed some Latin verses important as showing that he was planning an epic upon King Arthur. Here he abandoned his intention of visiting Sicily and Greece, since the political news from England was too disturbing to allow a patriot to wander far from home. He made a leisurely return, was in Geneva early in July 1639, where he probably heard of the death of Diodati, and landed in England toward the end of the month.

The literary memorials of the tour consist of a few fluent Italian sonnets and a canzone (which afford shadowy evidence of a love affair with a young lady of Bologna), and some Latin verses, including three epigrams inspired by the singer, Leonora Baroni. Milton does not seem to have profited greatly from what he saw of the treasures of plastic art, but his contact with historic places and with the natural beauties of Italy and his association with great men, of whom Galileo, whom he met at Florence, is the most illustrious, must have broadened and deepened his capacities of thought and feeling. With the close of his journey and the composition of what is practically his last, and plainly his best, Latin poem, the touching pastoral elegy on Charles Diodati, entitled 'Epitaphium Damonis,' Milton's first period ends. The comely, accomplished young man, who blends the grace of the Cavalier with the serious purpose of the Puritan, gives place to the strenuous controversialist, the zealous reformer in church and state, the idealistic partisan. The poet is not entirely swallowed up in the prose man, but he is nearly submerged.

On his return to England Milton took lodgings in Saint Bride's Churchyard and began to tutor the two children of his sister by her first marriage, Edward and John Phillips. Then he moved to a house in Aldergate street, where his nephews boarded with him. Here he lived the life of an abstemious student and developed and practised the stimulating, though rather visionary, educational theories later outlined in

JOHN MILTON

his letter to Hartlib (June 1644). In 1643 he received a few more pupils, and he continued to play the part of schoolmaster until the autumn of 1647, when his father's death apparently left him in fairly comfortable circumstances.

Meanwhile he had been giving earnest of his literary and scholarly ambitions and of his interest in public affairs, which were rapidly approaching chaos. He planned to write some poem on a noble scale, whether a tragedy or an epic, and he made a list of nearly a hundred possible subjects, chosen from sacred and early English history. At the head of this were four entries which show that the theme of 'Paradise Lost,' to be treated in the form of a Greek tragedy, was then uppermost in his mind. There were also two entries dealing with the story of Samson, one of which later bore fruit in 'Samson Agonistes.' But the times were not propitious to poetical composition, and for nearly 20 years Milton wrote only occasional sonnets and scraps of verse, besides some rather astonishingly doggerel versions of Psalms. In 1645, however, he collected his somewhat scanty tale of English and Latin poems into a volume, which was published by Humphrey Moseley, the Tonson or the Moxon of the day. It seems to have made much less impression on readers than the collection of Waller's poems issued the same year. He also worked upon tasks in keeping with his duties as schoolmaster, such as his 'History of Britain' to the Norman Conquest, not published until 1670, and probably, his 'Accidence commenc't Grammar' (1669) and 'Artis Logicæ Plenior Institutio ad P. Remi Methodum concinnata' (1670).

His prose writings practically began in the summer of 1641 with his 'Of Reformation Touching Church Discipline in England.' Attacks had been made in the Long Parliament upon the episcopal system, and the Bishop of Exeter (later of Norwich) Joseph Hall (q.v.), long since famous as a satirist, had published a defense of his order and a remonstrance to Parliament, which had drawn forth a reply from five Puritan divines under the pen-name "Smectymnuus" formed from their initials. The "t" and the "y" of this uncouth compound were furnished by Milton's former tutor, Thomas Young, who is probably responsible for his pupil throwing himself into the fray. Hall replied to "Smectymnuus" and secured the support of the learned Archbishop Usher (q.v.) and the five Puritans vindicated themselves. Milton's was the sixth pamphlet of the series; and between May 1641 and April 1642 he contributed four others — 'Prelatical Episcopacy' (June 1641, a reply to Usher); 'Animadversions upon the Remonstrant's Defense against Smectymnuus' (July 1641, a bitter, point by point answer to Hall's reply to "Smectymnuus"); 'The Reason of Church-government urged against Prelaty' (about February 1641-42, his most weighty and dignified argument against the episcopal system); and 'Apology against a Pamphlet called A Modest Confutation of Animadversions upon the Remonstrant against Smectymnuus' (March 1641-42, a reply to the pamphlet, whose title is included in his own title, which was apparently the work of Hall and his son, and was certainly a personal attack, the grossness of which largely extenuated the fierceness of Milton's retort).

Of these five anti-prelatical tracts, none of

which is of great length, the first and third have most value in themselves, because they have a broad basis in history, philosophy and theology, and thus afford proofs of Milton's learning and of his powers as an idealistic controversialist. The three others too frequently give unpleasant evidence that Milton was an almost unrivaled master of personal invective. The chief value of the entire series lies in the fact that they contain much nobly conceived and expressed autobiographical information, as well as some of the most sonorously harmonious prose to be found in any literature — for example, the closing paragraphs of the first tract. In general, their cumbrous style, their involved arguments and their antiquated subject matter make them difficult reading to all save professed Miltonians; but when their many merits are duly weighed and the standards of 17th century controversy are borne in mind, it seems scarcely an exaggeration to say that they combine with Milton's other works in prose and verse to give his fame a broader foundation than is possessed by any other English writer.

The pamphleteer and poet appears to have determined deliberately that he could do his country more good by writing on subjects of public concern than by entering the army. It was doubtless a wise decision. This can hardly be said of his resolve to marry. In the spring of 1643 he took a mysterious journey into Oxfordshire — possibly to collect a debt owed him by a cavalier named Richard Powell. A few weeks later he returned to London with this gentleman's 17-year-old daughter, Mary, as his bride. Of the wooing and the reasons for the marriage nothing is known. The bride is said to have remained with Milton a month and then, finding her life dull, to have gone back to her father with the promise that she would return to her husband by the end of September. She failed to keep her promise, and Milton sent a messenger for her, who was unpleasantly treated by her family. Then the irate husband declared he would never receive her and wrote his first tract on divorce. Such is the story given by Edward Phillips. There is an extant copy of the divorce tract, however, which is marked 1 Aug. 1643 — and, unless this is a mistake, we are forced to believe that Milton was pleading for liberty to break the chains of matrimony at a time when, according to precedent, he should have regarded them as strings of roses. Such an idealist might have expressed such views without reference to his own experiences and desires, but it is hard to divest one's self of the belief that in this instance the wish was the father of the theory. It is almost certain that, whether or not there was between the pair a suddenly discovered incompatibility of temperament, each had reason to regret the alliance, Milton because he had too young and flighty a partner, his wife because her Puritan husband, twice as old as herself, was too serious and self-absorbed. In the absence of evidence it is idle to discuss the suggestion that the bride resolved to be one in name only.

In 'The Doctrine and Discipline of Divorce Restored, to the Good of Both Sexes,' Milton took the advanced stand that "obstinate incompatibility of mind or temper between husband and wife is as lawful a ground for divorce as

infidelity." (Masson). He argued with his usual idealistic fervor and showed plainly that no man could have a higher conception of true marriage than he; but he was singularly blind to the weight of the sociological objections to his theory. His views naturally met with adverse criticism and he expanded them in a second edition under his own name (February 1643-44). In July 1644 he published a less interesting, but far from feeble tract entitled, 'The Judgment of Martin Bucer on Divorce.' Then he was denounced before Parliament, which decreed that a licensing ordinance be prepared and that Milton and his printers be sought for. Nothing further happened, so far as the bold pamphleteer was concerned, save that later he came near being examined by the House of Lords, and that he was given the occasion to write the best-known and most uniformly excellent of his prose works, his eloquent 'Areopagitica, or Speech for the Liberty of Unlicensed Printing' (November 1644). It is needless to say that the Parliament he addressed so boldly with arguments, not absolutely liberal but far in advance of his times, had no opportunity to listen to Milton's own voice, which, however, in a metaphorical sense has since echoed in every legislative hall of every free people. It is probable that he had friends in Parliament who blocked the measures taken to call him to account and that in a less turbulent period he might have paid dearly for his rashness. As it was, he had the dubious honor of having a group of adherents named after him and he published without molestation two more tracts on divorce—'Tetrachordon, or Expositions upon the four chief places in Scripture which treat of marriage' (March 1644-45), and 'Colasterion: a Reply to a Nameless Answer Against the Doctrine and Discipline of Divorce' (March 1644-45). The temper displayed in the latter pamphlet was not calculated to allay the hostile criticism that assailed him, nor was the rumor that he was courting the attractive daughter of a Dr. Davis particularly to his credit. This rumor and the financial distress of her royalist family seem to have brought Mrs. Milton to terms. She suddenly appeared before her husband while he was visiting at a neighbor's, begged his pardon, and was taken back.

The united couple took a larger house in the Barbican, and the school was somewhat enlarged. Between July 1646 and May 1652 three daughters and a son were born to them, the boy dying in infancy. The mother died not long after the birth of her last child. Meanwhile her father and mother, with some of their children, had been obliged to live with Milton, and money troubles had arisen, scarcely to be wondered at. Another house had also been taken—in High Holborn—and the school had been given up.

During these years Milton seems to have grown as radical in his ecclesiastical and political views as he apparently was in his educational theories and in his domestic economy. He sympathized with the army against the Parliament, with the Independents against the Presbyterians and was one of the first to approve the execution of Charles I. His loosely reasoned 'Tenure of Kings and Magistrates' appeared within two weeks of that event, and was probably the cause of his speedy appoint-

ment as Latin Secretary to the Council of State at a salary of about £290 (March 1649-50). His main task was the translation of dispatches intended for foreign governments, but he had also to answer attacks made on the home government, and, ironically enough, to act as a sort of censor of the press. He was given official apartments in Scotland Yard, was expected to be present at audiences of foreign envoys, in short, held a post of considerable dignity and importance.

The first of his official publications was his 'Observations on the Articles of Peace between Ormonde and the Irish rebels' (May 1649). The second was 'Eikonoklastes,' a point for point answer to the popular 'Eikon Basilike,' supposed to be the last meditations of Charles I, but really, it would seem, the work of John Gauden (q.v.). Milton's answer, which appeared in October 1649, is perhaps the strongest of his controversial pamphlets, but it is now mainly known for its exposure of a plagiarism by Gauden from Sidney's 'Arcadia' and for the over-emphasized evidence it affords of Milton's increasing Puritanism in matters of taste. Another answer to a more important book was the 'Defensio Pro Populo Anglicano,' published in or about March 1650 to counteract the effect produced by the 'Defensio Regia pro Carolo I,' which the learned Salmasius (Claude de Saumaise, professor at Leyden) had written at the instigation of Charles II. Milton's book gave him a Continental reputation, for it was generally felt that he had shown himself to be a match for Salmasius (q.v.) as a writer of Latin, and more than a match as a scurrilous controversialist. Such a reputation was, however, but a slight recompense for the loss of his sight, which was partly due to his persisting to labor on this book as a patriotic task despite the warnings of his physicians. The glaucoma, from which he seems to have suffered, would probably have ended in blindness in any event, but the sublimity of the poet's patriotic self-sacrifice is scarcely lessened by this fact.

Milton's next book was his 'Defensio Secunda' (May 1654), a reply to an invective by Peter Du Moulin which had been edited by a professor in Holland, one Alexander Morus or More, "a Frenchman of Scottish descent." Milton mistook the editor for the writer and overwhelmed him with abuse, not disdaining to rake up charges of sexual misconduct. Morus naturally but unluckily attempted a reply and was again violently assailed by Milton in his 'Pro Se Defensio' (August 1655). Even the most devoted Miltonian must regret the writing of these gross tracts, although the former does contain interesting passages illustrative of its author's life and political ideals.

Meanwhile Milton at the close of 1651 had removed to a home in Petty France, Westminster. By the middle of 1652 he was wholly blind, but he continued with the help of assistants to do the work of his office at a reduced salary. The most important dispatches, such as those of Cromwell protesting against the persecution of the Vaudois, were still entrusted to him. On 12 Nov. 1656 he married his second wife, Katherine Woodcock, who died 15 months later in childbirth. Milton wrote in her memory a fine sonnet, imitated from an Italian one, but beyond this testimony to her worth little is known of her. We are equally

ignorant of the way his house—with a blind father and three small daughters—was conducted during his two periods of widowhood. He had a small circle of friends, including two of his old pupils, Cyriac Skinner and Henry Lawrence, Lady Ranelagh and Andrew Marvell (q.v.), the last named of whom from 1657 to 1660 assisted him in his duties as secretary. Toward the close of the Protectorate his literary work declined to the writing of a few sonnets and the publication of two or three ecclesiastical and political pamphlets, which are important chiefly as showing that he resisted steadfastly the drift toward monarchy and an established church. It is pathetic to find him at the end of Richard Cromwell's short régime willing to preserve republicanism in name only provided liberty of conscience could be secured. His projects were chimerical and were much ridiculed, the nobility of his idealism making but a slight appeal in such tumultuous times. The dashing of his hopes as a reformer probably led his thoughts back, however, to the channel from which they had been diverted throughout the period of strife. From about 1658 he seems to have meditated an epic poem on the theme of 'Paradise Lost.' The Stuarts were restored to their kingdom and Milton to his; but, while we may be grateful for this, we need scarcely, with Mark Pattison, view Milton's controversial period as so many lost years. It seems better to agree with Dr. Garnett that 'Paradise Lost' would not be the poem it is if Milton had not been allowed to develop his powers through his contact with men and affairs.

At the Restoration Milton went into hiding in a friend's house. Two of his books were burned by the hangman, but in some unexplained way, partly no doubt through the influence of Marvell, he was not exempted from the benefits of the Act of Indemnity (29 Aug. 1660). Later he was arrested, but he was soon released and he had influence enough to protest vigorously against being required to pay excessive fees to the sergeant-at-arms of the House of Commons. His immunity from punishment caused much comment, and stories like that of a mock funeral and that of the intervention of Sir William D'Avenant (q.v.) in return for a previous similar intervention by Milton, were probably invented to account for what seemed to be an extraordinary case of leniency or of forgetfulness. When he was out of danger, Milton took a house in Holborn and then in Jewin street. The loss of his salary and of some investments doubtless forced him to lower his scale of living and also prompted him to look out for a third wife who would manage his home better than his eldest daughter did. In February 1662-63 he married Elizabeth Minshull, who seems to have made his last years comfortable in a house in Artillery Walk, Bunhill Fields.

Not long after this last marriage he appears to have finished 'Paradise Lost' and, with some trouble, to have secured a license for it from Thomas Tomkyns, chaplain to the Archbishop of Canterbury. During the plague of 1665 he retired to Chalfont Saint Giles in Buckinghamshire, and there he loaned his Quaker friend, Thomas Ellwood (q.v.), the complete manuscript of the great epic. Ellwood on returning it made the famous remark which led to the writing of *Paradise Regained*: "Thou hast

said much here of *Paradise Lost*, but what hast thou to say of *Paradise Found*?" It was not until April 1667, partly, perhaps, in consequence of the fire of 1666, that Milton secured a publisher for 'Paradise Lost.' Then he signed a contract with Samuel Symmons by which the latter was to pay £5 down and £5 more on the sale of each of the first three editions, which were not to exceed 1,500 copies apiece. This is usually referred to as a hard bargain, but in view of Milton's unpopularity, the length and theme of his poem, and his innovation in the use of blank verse, it seems unfair to blame Symmons. It is equally unfair to Milton's contemporaries to maintain that Addison's criticisms in *The Spectator* first showed Englishmen that they possessed an epic poet worthy to rank with Homer and Virgil. Six editions had been published before the close of the 17th century, elaborate annotations had been made upon it and Dryden and Marvell had extolled it. The religious nature of its theme has always, of course, given it a standing somewhat independent of its consummate poetic merits; but these, especially its sublimity and its unrivaled harmonies, have rarely been denied by competent critics of any nationality, and efforts to show Milton's excessive indebtedness to other poets, such as Andreini and Vondel, have not met with great success. That 'Paradise Lost' is a popular poem or Milton a poet whose genius is ungrudgingly acknowledged by all is not to be maintained; but the supreme and isolated greatness of both seems likely to escape serious challenge. When 'Paradise Regained' was finished and when 'Samson Agonistes' was written cannot be accurately determined. They appeared in one volume in 1671, and probably represent Milton's last creative literary labors. It is said that he could not bear to have 'Paradise Regained' pronounced inferior to 'Paradise Lost'—a fact, if fact it be, which has been twisted into the statement that he preferred the poem which the public most systematically neglects. This is scarcely credible since the theme, scope and style of the two poems are so different as to render comparison rather meaningless save with regard to interest and to the level kept by the poet's imagination, points in which the superiority of 'Paradise Lost' is manifest. On the other hand, 'Paradise Regained' in its poised nobility and its artistic use of the materials furnished by the Gospel narratives of the Temptation is so perfect of its kind that Milton's indignation at hearing it undervalued is easily comprehended. 'Samson Agonistes' has fared better at the hands of critics and readers. It is probably the most successful tragedy of the Greek type ever written by an English, if not a modern, poet, and it is certainly full of the unquenchable spirit of its author. Samson blind, in the midst of his enemies, the victim of his own infatuation for a woman, was a hero with whom Milton, of all men, could thoroughly sympathize.

The poet's health was now undermined by the gout, and he devoted his closing years to setting his miscellaneous writings before the world in a proper shape. Besides the academic publications already mentioned, he revised his early poems in 1673, adding to them a few youthful pieces and some of his later sonnets, and the next year he collected his *Familiar*

Epistles, with his College Exercises. On 8 Nov. 1674 he died peacefully, and four days later he was buried in Saint Giles, Cripplegate, beside his father. It may be inferred that some of the obloquy once heaped upon him had been dissipated, since his funeral was well attended. His daughters, who had not made his life pleasant, and whom he had employed as readers in languages they could not understand, and had not educated or perhaps appreciated as a schoolmaster and man of such refinement might have been expected to do, disputed with his widow the terms of his nuncupative will, but the matter was finally compromised. The widow survived till 1727, a date at which all trace of the poet's descendants through certain Clarkes in India seems to have been lost. The granddaughter for whose benefit 'Comus' was performed in 1750 had buried her seven children in infancy. Nor was the poet's progeny short-lived only; it appears to have sunk decidedly in the social scale.

From the portraits and descriptions of Milton it may be gathered that he was somewhat short and well made, with light hair and clear-cut features. He was stately in his manners, dressed neatly, was temperate and methodical in his habits, which were those of the student rather than of the artist, although he kept up his music to the end of his life. He was on pleasant terms with a small group of friends, and was accessible to foreigners of distinction. He took regular exercise and indulged in an occasional pipe. Perhaps his only striking eccentricity—for in such an age of confusion his religious and political radicalism should not excite surprise—was his adoption of the notion that his creative genius worked freely only from the "Autumnal Equinoctial to the Vernal." It is at least fairly certain that his poetical powers were not so distinguished for affluence as for felicity and strength. When he was in the mood for composing (in his latter years) he seems to have stored up passages in his memory and to have dictated them by batches of 20 and 30 lines to any chance amanuensis he could secure.

Milton's position in English literature, as settled by popular consent, would seem to be not far below Shakespeare and well above all other authors. He has had and has adverse critics, however, while a few persons would place him at least on an equality with Shakespeare in greatness. As a conscious poet artist he has not been clearly surpassed in the literature of the world; he is doubtless the consummate master of the sublime; and he has few equals as a writer of erudite and sonorous prose. As an exponent of idealism in conduct he is almost as memorable as he is in his function of poet; as an inspired and inspiring patriot of liberal mold he is practically unparalleled. In total range of appeal as poet, scholar, patriot and man his closest students are seldom willing to admit his inferiority to any other mortal.

The titles and dates of the main works published by Milton during his life have already been given. To these should be added, as posthumous publications, a surreptitious collection of 'Letters of State' (1676, translated by Phillips, 1694); 'A Brief History of Moscovia' (1682), and 'J. Miltoni Angli de Doctrina Christiana Libri duo posthumi' (edited by

Sumner, 1825). This treatise on 'Christian Doctrine,' the manuscript of which went through curious adventures, gives formal justification to the idea that Milton developed a sort of semi-Arianism, traces of which have been discerned in 'Paradise Lost.' Milton's 'Commonplace Book,' edited in 1876 and 1877 (for the Camden Society), seems to include nothing original. The manuscript now in the library of Trinity College, Cambridge, which contains the lists of subjects for a long poem and copies of several early poems, including 'Comus' and 'Lycidas,' was published in facsimile in 1899. Several productions have been attributed to Milton on 'but slight grounds, the latest being a romance in Latin, 'Novæ Solymæ Libri Sex' (1648), resuscitated by the Rev. Walter Begley and translated and published by him in 1902. The real author appears to have been Samuel Gott. See AREOPAGITICA; COMUS; IL PENSEROSO; L'ALLEGRO; LYCIDAS; PARADISE LOST; PARADISE REGAINED; SAMSON AGONISTES.

**Bibliography.**—Among the most important editions of Milton's poetical works are those of Newton (1749-52), Todd (1801, 1809), Sir Egerton Brydges (1835), R. C. Browne (1870, 1901, the English Poems), Masson (1874, 1877, 1882), Bradshaw (1892—the New Aldine), W. V. Moody (1899), H. C. Beeching (1900), and W. Aldis Wright (1903). The Aldine edition of 1832, with a life by John Mitford, should also be mentioned, as well as Bentley's curious edition of 'Paradise Lost' (1732), and Thomas Warton's excellent edition of the so-called *Minor Poems* (1785, 1791). Editions of separate poems, especially for school purposes, are very numerous. Of the prose works the following editions may be noted:—Of John Toland (1698), T. Birch (1738), T. Birch and R. Barron (1753), C. Symmons (1806), R. Fletcher (1833), R. W. Griswold (1847), J. A. St. John (Bohn's Standard Library, 5 vols., 1848-53, including the 'Christian Doctrine'), J. Mitford (1851, 8 vols., including the Poems, but not the 'Christian Doctrine'). There is no thoroughly good modern edition of the complete works; but there has been of late more attention given to the prose. Consult elaborate editions of tracts in 'Yale Studies in English' and E. Lockwood's 'Of Education,' etc., containing reprints from the earliest biographies of Milton (Boston 1911). There are concordances to the Poems by G. L. Prendergrast, C. D. Cleveland (1867) and John Bradshaw. 'A Lexicon to the Poetical Works of John Milton,' by L. E. Lockwood, was published in 1902.

The standard biography of Milton is the monumental work of Professor Masson (6 vols., 1859-80). Most of the editions mentioned above contain memoirs, which in some cases are very elaborate, e.g., that by Mitford in the edition of 1851. Of the early memoirs, that by Milton's nephew, Edward Phillips, was prefixed to his translation of the *Letters of State* (1694), and that by Toland to his edition of the prose works (1698). Later lives are by Thomas Keightley (1855), Alfred Stern ('Milton und Seine Zeit,' 1877-79), Mark Pattison (1879, in the *English Men of Letters*), Stopford Brooke (1879, in *Classical Writers*), and Richard Garnett (1890, in *Great Writers*, with a bibliography). Dr. Johnson's famous life in the 'Lives of the Poets' influenced public opinion against Milton until the tables were somewhat turned by Ma-

caway's enthusiastic essay in the *Edinburgh Review* (1825). The number of essays and monographs and books dealing with special topics connected with Milton's life and works is, of course, very large, e.g., 'Milton's Prosody' (1893, 1901), by the poet Robert Bridges, Edmundson's 'Milton and Vondel' (1885); Spaeth's 'Milton's Knowledge of Music' (1913); Myers' 'Relations of Latin and English during the Age of Milton' (1913), and Bailey's 'Milton and Jakob Boehme' (1914). Important critical discussions of moderate length may be found in the collected works of Matthew Arnold, Walter Bagehot, the elder William E. Channing, S. T. Coleridge, De Quincey, Emerson, Lowell and Macaulay. To these critics may be added Augustine Birrell, Edward Dowden, Edmund Scherer and Sir Leslie Stephen. Special volumes dealing with the poet are Hiram Corson's 'Introduction to the Works of Milton' (1899), W. P. Trent's 'John Milton: a Short Study of his Life and Works' (1899); Walter Raleigh's 'Milton' (1900); Alden Sampson's 'Studies in Milton' (1913), and Thompson's 'Essays on Milton' (1914). The chief histories of English literature, such as Taine's and that by Garnett and Gosse, as well as Saintsbury's 'Elizabethan Literature,' and the 'Cambridge History of English Literature,' should also be consulted. An excellent edition of Johnson's life, the merits of which should not be underrated, is now provided in Dr. Birkbeck Hill's edition of the 'Lives of the Poets,' in three volumes (1905). The Milton tercentenary, celebrated in 1908, was the occasion for the publication of a 'Catalogue' of the exhibition held in London in that year, and of the 'Milton Memorial Lectures,' edited by Percy W. Ames. The course of Milton's fame may be traced in J. W. Good's 'Studies in the Milton Tradition' (Urbana, Ill., 1915). For further bibliographical information consult E. N. S. Thompson's 'John Milton Topical Bibliography' (New Haven 1916).

WILLIAM P. TRENT,

*Professor of Literature, Columbia University.*

**MILTON, John**, soldier and politician: b. Jefferson County, Ga., 21 April 1807; d. Tallahassee, Fla., 1 April 1865. Milton received a good school education, studied law and practised with success in Columbus, Mobile and New Orleans. As a captain of volunteers he took part in the Seminole War. In 1846 he engaged in cotton planting in Florida, but maintained a lively interest in public affairs, serving (1849) as a Democrat in the State senate and in numerous party positions. He favored secession and in 1861 was elected governor for a four-year term. During the Civil War Milton raised, outfitted and dispatched troops, collected supplies and provided for the defense of the State. Much distressed at the misfortunes of the Confederacy, Governor Milton's mind gave way and he died soon after.

**MILTON**, Canada, town, in Ontario, and capital of Holton County, on the Canadian Pacific and Grand Trunk railways, about 30 miles southwest of Toronto. Its industries and manufactures are lumber, flour, wire, nails, cream, boots and shoes, pressed brick, crushed stone and lime, wood, screws, rivets, carpets, nickel and silver plating, electric motors. Mil-

ton has two parks, waterworks and electric lighting. Pop. 1,654.

**MILTON**, Mass., town in Norfolk County, seven miles south of Boston, on the Neponset River and the New York, New Haven and Hartford Railroad. Milton is an attractive and wealthy residential suburb of Boston, valued in 1914 at \$31,602,839 and occupying about 13 square miles. A portion of the Blue Hills belongs to Milton. On Great Blue Hill (625 feet) fires were kindled on the news of the repeal of the Stamp Act; of the adoption of the Declaration of Independence; and on the surrender of Burgoyne and Cornwallis. Beacon fires burned here during the Revolutionary War. At an early date an observatory for tourists was erected on Great Blue Hill and in 1885 the Blue Hill Observatory for meteorological investigations was established by Abbott Lawrence Rotch (1861), who made important investigations regarding clouds. Milton Academy was founded in 1798 and a public library was opened in 1871. Milton owns two granite quarries and two public parks: Cunningham Park and Hutchinson Field, the latter on a portion of the estate of Thomas Hutchinson, a colonial governor of Massachusetts. Milton was settled in 1640. It was originally a part of Dorchester and was called Uncataquissett. The town was separated in 1662 and incorporated. It owes its name either to Milton Abbey, Dorset, from which members of the Tucker family emigrated, or to the number of mills established here—Mill Town. It was the residence of two colonial governors—Jonathan Belcher and Thomas Hutchinson. In 1712 the Blue Hill lands were divided between Milton and Braintree. In 1868 part of Milton was given to the new township of Hyde Park. Milton now includes the village of East Milton, Lower Mills and Mattapan. Milton was brought into political importance during the early days of the Revolution by the passage of the famous "Suffolk Resolves." These bold resolutions were passed on 9 Sept. 1774, at a meeting of the citizens held in the house of Daniel Vose, these men having adjourned from Dedham. The "Suffolk Resolves" declared that a sovereign who breaks his contract with his subjects forfeits their allegiance; that the repressive measures of Parliament were unconstitutional; that tax-collectors should not pay over money to the royal treasury; that the towns should choose public officers from the patriot party; that they would obey the Continental Congress; that they favored a provincial congress; that they would seize Crown officers as hostages for any political prisoners arrested by the governor; and they recommended that all persons in the colony should abstain from lawlessness. Consult Teete, A. K., 'History of Milton, Mass.' (Milton 1887).

**MILTON**, Pa., borough, in Northumberland County, 50 miles north of Harrisburg, on the Susquehanna River. It is situated on the Pennsylvania and the Philadelphia and Reading railroads and on the Pennsylvania Canal. The scenery is picturesque and a fine bridge spans the river. Milton was settled in 1792 and incorporated in 1817. It is governed by a revised charter of 1890 and has a chief burgher, elected every four years, and a council. Its industries and manufactures are rolled iron, lum-

ber, cars, wood-working, machinery shops, nails, nuts, bolts, furniture, shot, fly nets, bamboo novelties and paper-boxes. It suffered from a severe fire in 1880. Pop. 7,460.

**MILTON**, Wis., village, in Rock County, on the Chicago, Milwaukee and Saint Paul Railroad, eight miles northeast of Janesville, in a grain-growing district. It is the seat of Milton College (Seventh Day Baptist). Fountain pens are manufactured here. Pop. 873.

**MILTON COLLEGE**, in Milton, Wis., a coeducational institution, was founded in 1844 by pioneers from Eastern States, the most of whom were Seventh-Day Baptists. It was first known as Du Lac Academy; in 1848 it became incorporated; in 1854 the name was changed to Milton Academy; and in 1867 it received its charter as a college. The influence of Milton College is Christian rather than sectarian, although it has always maintained a closely sympathetic relation to the Seventh-Day Baptist people. It is strictly a college of liberal arts, of general culture. In 1916 it reported 16 professors and instructors; 135 students; over 10,000 volumes in the library; grounds, buildings and apparatus, valued at \$85,000; productive funds, nearly \$150,000; total income for the year, \$15,500. The number of graduates up to 1916 was over 400.

**MILUTIN**, Dmitri Alexievitch, COUNT, Russian field-marshal: b. 1819; d. Yalta, Crimea, 5 Feb. 1912. The son of poor parents, he entered the army in 1833 and studied at the Military Academy in Saint Petersburg (Petrograd), where he became professor of geography. His first active service was in the Caucasus against Schamyl. From 1861 to 1881 he was Minister for War, during which long period he introduced important reforms, especially the establishment of conscription in 1874. He took part in the Russo-Turkish War in 1877-78 and for a time added the duties of Foreign Minister to his own. He retired in 1881 and devoted himself to writing military history.

**MILVAIN BRIDGE**, or **MULVAIN BRIDGE**, ancient bridge over the Tiber at Rome built in 109 B.C. by Marcus Æmilius Scaurus on the famous Flaminian Way. Here Cicero had the ambassadors of the Allobroges arrested (60 B.C.) who were conspiring with Cataline; and here Maxentius was drowned after his defeat by Constantine (312 A.D.). The modern Ponte Molle now spans the Tiber in place of the Milvain Bridge. Consult Platner, S. B., 'The Topography and Monuments of Ancient Rome' (2d ed., New York 1911).

**MILWAUKEE**, mil-wă'kē, Wis., capital of Milwaukee County and the metropolis of the State; on the west shore of Lake Michigan, at the confluence of three rivers — Milwaukee, Menomonee and Kinnickinnic. The converging streams flow into a bay of great natural beauty, which extends nearly three miles inland and affords excellent harborage for vessels within the shelter of two miles of breakwater constructed by the Federal government.

**Topography**.—A distance of six miles separates the high north and south headlands that mark the extremes of the bay. The intervening shore, except around the deltas formed by

the disemboing streams, is a series of bold bluffs that overlook the harbor from an altitude varying from 85 to nearly 150 feet above Lake Michigan, thence sloping gradually to the lower levels of the rivers that enter the city from the north, south and west respectively. The river bottoms were, half a century ago, stretches of wild-rice marshes and tamarack swamps, but the leveling processes prompted by business necessities have transformed them into solid ground whereon the chief business section has been built. The residence districts are located on the higher altitudes above the three valleys formed by the streams that trisect the city.

**Trade and Industries**.—Milwaukee's excellent harbor has been the leading factor in promoting the commercial and industrial growth of the city. Three navigable rivers, the Milwaukee, Menomonee and Kinnickinnic, which merge at a common mouth, afford, with connecting canals and slips, about 20 miles of water frontage. A large proportion of the frontage on the Milwaukee River, however, is occupied by mercantile structures which face thoroughfares paralleling the river. The Menomonee River, which flows from the west and has a navigable length of about two miles, carries the major portion of the tonnage of the port. The Kinnickinnic River, extending southerly about two and three-quarters miles, is next in this respect, while the Milwaukee River, reaching to the northward about two miles, ranks third. The rivers average from 140 to 225 feet in width and have a maximum depth of 20 feet.

Coal represents the greater portion of the receipts of the port, and grain and miscellaneous freight of the shipments. In normal times the total inbound and outbound tonnage aggregates between eight and nine million tons with a combined valuation of close to \$150,000,000. Governmental statistics rank Milwaukee as the second largest coal receiving port on the Great Lakes. The port holds first place in point of number of arrivals and departures, second place as to valuation of freight tonnage and third place in the matter of shipments of flour and grain and grain products.

In addition to the coal and grain trades, a large volume of general merchandise is transported by steamers which run to Georgian Bay and ports on Lake Erie. Two car ferry lines maintain service throughout the entire year to and from ports on the east shore of Lake Michigan, where direct connection is made with railways to the East. These ferries carry 30 railway cars each and make daily trips. In addition to the car ferry service, two steamboat companies operate passenger and freight steamers to across-the-lake points practically the year round. Passenger and freight steamers also ply daily between Milwaukee and Chicago and also make trips to points north, including Green Bay ports.

A feature of Milwaukee harbor is an outer anchorage basin, or harbor of refuge, formed by a sea wall extending southeasterly from the north point of the bay. The protected area available for the use of vessels is about 270 acres with a depth ranging from 16 to 32 feet. Plans are now being prepared under the direction of the harbor commission for the development for harbor purposes of the lake front

from Wisconsin street on the north to Russell avenue on the south, a distance of about two miles, and also the inner side of a peninsula known as Jones Island, at an estimated cost of from five to six million dollars. The project contemplates municipally-owned terminals of every nature, and has for its purpose the accommodation of the increased traffic of the future and the diversion of as much business as is possible from the present congested and closely bridged channels to the more accessible deep-water district above named.

The chief industries of the city, in the order of their importance as regards annual product, are metal, \$107,802,063; packed meats, \$42,220,000; leather, \$39,200,000; beer, \$28,110,000; coal and wood products, \$25,000,000; automobile parts and commercial trucks, \$24,000,000; electric and telephone supplies, \$24,000,000; boots and shoes, \$21,650,000; malt, \$21,000,000. From 1880 to 1890 the total product of the city's industries increased 147 per cent; from 1890 to 1900, 88.6 per cent; 1900 to 1910, 88.8 per cent; 1910 to 1915, 21.8 per cent; 1915 to 1917, 48.3 per cent.

The manufacturing statistics in 1917 were as follows: Persons employed, 147,087; paid in wages, \$113,820,814; capital employed, \$350,222,365; value of products, \$595,520,102; the value of products increased 80.7 per cent from 1910 to 1917; wages paid, 72.8 per cent.

**Population.**—Within the city's corporate limits are comprised 24 square miles, a smaller area than that of any other city of considerable population in the United States. The first enumeration, in 1838, revealed a population of 700, which had increased to 9,666 by the date of the incorporation of the city in February 1845. The number of inhabitants according to the Federal census of 1900 was 285,370. During the next decade (1910) it increased to 373,587. The estimated population in 1917 was 471,203. The great bulk of the residents are workmen, and it is estimated that fully 80 per cent of them own their own homes. Local banking statistics show savings deposits aggregating \$45,409,476, of which 75 to 80 per cent are estimated to be those of wage-earners. There has been no considerable strike in Milwaukee since the general labor disturbance of 1885, except a walk-out of street car employees in 1896. The population of the city is polyglot. A map of the city with division lines determined by the predominating nationalities inhabiting certain districts would bear much resemblance to that of Europe as to nomenclature. For many years the population was largely of German birth, and Milwaukee acquired the title of the "German Athens of America." The first German settlers came in 1838, but it was not until 1845 that large numbers of Germans began to make the young city their home. For nearly half a century their customs found expression in the chief social life of the city. At one time the number of daily newspapers printed in German was nearly twice the number printed in the English language. A theatre was built expressly for performances in German, with stock companies drawn from Germany. A German market hall was constructed. Six turner halls were erected, and a seminary for students of physical training was established. During the Civil War, one company of volunteers was composed wholly of German turners.

The tide of German immigration was followed, beginning 40 years ago, by a stream of Poles, Dutch, Scandinavians and Bohemians, and more recently Italians and Syrians have established colonies in certain sections of the city. The preponderance of German population has now disappeared, although certain wards remain largely German. The foreign-born inhabitants are grouped in various sections of the city. German, Polish, Bohemian and Scandinavian papers and periodicals are published in Milwaukee, including two dailies in the Polish and one in the German language. The first Polish daily paper established in the United States was printed here.

**Churches.**—The seat of a Catholic archbishopric and of a Protestant Episcopal bishopric are located in Milwaukee. The 206 churches are distributed among the following faiths and creeds: Adventist, 1; Baptist, 9; Catholic, 45; Christian, 2; Christian Science, 4; Congregational, 4; Episcopal, 10; Evangelical, 10; Evangelical Association, 7; Greek, 1; Italian Evangelical, 1; Jewish, 8; Lutheran, 60; Free Lutheran, 1; Methodist Episcopal, 20; Free Methodist, 1; Mormon, 1; Presbyterian, 12; Reformed, 3; Serbian, 1; Spiritualistic, 3; Syrian, 1; Unitarian, 1. The property of the religious organizations is valued by the tax commissioner at \$10,878,380. Some of the church edifices are architecturally beautiful, notably Saint Paul's Church, in the Norman style; Saint Josaphat's, Byzantine; Gesu, Immanuel and Saint James, Gothic. The convent of Notre Dame, which occupies a square in the heart of the city, is the mother house of the order in the United States. In the suburb of Saint Francis the Catholic seminary of Pio Nono is surrounded by a magnificent tract of 200 acres. Marquette University (Jesuit) and Concordia College (Lutheran) are located on the west side.

**Government.**—The elective city officers are the common council, mayor, city attorney, city treasurer and city comptroller. In addition to these are the various appointive officials, including the commissioner of public works, commissioner of public health, tax commissioner, inspector of buildings and the chiefs of the fire and police departments. The common council, as constituted in 1918, consists of 37 members, 25 of whom are elected by wards for a term of two years. Twelve are elected for terms of four years by the city at large. In 1920, according to an amendment to the city charter adopted in April 1918, the council will be reorganized to consist of 25 aldermen, elected by wards for a term of four years each. The distinctive feature of the government of Milwaukee is the board or commission plan. An increasing number of these boards have been created with broad administrative powers, in most cases entirely independent of the common council, except in the matter of financial supervision. Chief of these is the school board, which consists of 15 members elected by the people at large, and entirely independent of the common council even in its financial transactions. Other boards are the park board, library board, sewerage commission, museum board, central purchasing board and the board of city service commissioners, all of which control the city activities indicated by their names. The members of these boards are in most cases

appointed by the mayor subject to the approval of the council.

**Public Works.**—The water works property valued at \$8,906,170 is owned by the city, the entire cost of construction and maintenance having been paid out of its proceeds, and its surplus revenues aid in defraying other municipal expenses. Following a comprehensive survey of street lighting systems and problems, a system of electric light distribution, unique both in practical efficiency and artistic beauty, has been designed and is now being installed. An incinerator for consuming garbage, which is collected by the city without charge, is in operation. A free emergency hospital, originally a private benefaction, is maintained at public expense, likewise six large natatoriums throughout the year, and in the summer two free public bath-houses on the lake beach. In addition to triangles, squares and boulevards, there are 13 parks of which the total acreage is 939. These parks vary in size from 6 to 180 acres. During the winter months free public evening lectures for adults are given in public school halls, the expense being borne by the school extension fund. A city hall was completed in 1896 at a cost of \$1,016,935, and the library and museum building is valued at over \$2,000,000, with contents. The library contains 351,848 volumes. There are 397,607 specimens in the museum, as well as 24,565 books, pamphlets and maps, and 17,310 lantern slides. The city is constructing a system of intercepting sewers and the sewage commission is conducting extensive experiments in the activated sludge system of sewage disposal.

**Education.**—Milwaukee is splendidly equipped with educational facilities. Its public school system is composed of six high schools, 64 district schools, a trade school for girls, a boy's technical high school and a day school for the deaf. There is an open-window school for children who are below normal. Special classes are provided for blind and crippled children. The girls' trade school, with classes in sewing, dressmaking and cooking, has an average membership of 421. In addition to the public school system, there are, including Lutheran and Catholic institutions, 58 private parochial schools. Marquette University for men includes in its curriculum not only general academic courses but fine schools of medicine, law and engineering. Milwaukee Downer College, for women, has a well-deserved reputation throughout the Middle West. The State of Wisconsin has located a normal school in the city, which offers regulation courses for teachers as well as training for kindergarteners, music teachers and teachers of art. The Extension Division of the University of Wisconsin maintains an office in Milwaukee which offers unusual opportunities to the student.

**History.**—The first permanent settlement of Milwaukee is usually dated from 1818, when Solomon Juneau erected his little log cabin on the east side of the Milwaukee River. French and English traders had been here before that date, and a procession of Jesuit priests and French voyageurs had preceded them. The first recorded visit of a white man on the site of the future city is in the journal of Father

Zenobe Membéré, a Recolle missionary priest who accompanied Robert Cavalier de la Salle on his memorable exploratory trip from Lake Erie to the Illinois country in 1679. He notes that both Mascoutens and Foxes were dwellers "on the banks of the river called Melleoki." John François Buisson de Saint Cosme journeyed in 1699 along the west shore of Lake Michigan from Michilimackinac to the Mississippi. "On the seventh," he wrote, "we arrived at Melwarik (Milwaukee). This is a river where there is a village which has been considerable and inhabited by the Mascoutens and Foxes, and even some Pottawattamies." The word Melleoki and its numerous variants, which by a process of evolution has become Milwaukee, is of Pottawattamie origin and signifies "good land." Another definition accepted by some historians is "council place," this having been regarded as neutral territory by different tribes of Indians. The dwellers in the old Indian village were evidently a turbulent set, for Col. Arent de Peyster, commandant at Michilimackinac, wrote of them in the early years of the Revolutionary War as "runagates—a horrid set of refractory Indians." Lieutenant James Gorrell, whose British regulars occupied the stockade at Green Bay in 1762 and gave it the high-sounding title of Fort Edward Augustus, wrote the name of the place as "Milwacky." An English trader lived among the Indians at this place in that year. Fur traders made brief stays in the village from time to time. Alexander Lafromboise and his brother were located as traders here in 1785, with a large stock of goods. In 1795 Jean Baptiste Mirandeu, a Canadian blacksmith who had married an Indian woman, built a cabin and made himself useful to the Indians by mending their firearms. He received as compensation game and furs. He died in 1819, being survived by a family of 10 children, who joined the Indians when the Milwaukee band was removed. Thomas Gummersall Anderson, the son of a Loyalist, was a resident upon the site of the future city of Milwaukee from 1803 till 1806. He took an active part in the capture of Prairie du Chien by the British during the War of 1812. When Solomon Juneau arrived in 1818 he found a Pottawattamie village. He settled on the east side of the Milwaukee River, which later was called Juneautown; the west side of the river became Kilbourntown, after Byton Kilbourn (1834), and George H. Walker gave the name of Walker's Point (1834) to the region south of the Menomonee River. Each of the three natural geographical divisions became the nucleus of a little community, and acrimonious rivalry was a natural resultant. The different names of streets on opposite sides of the rivers, now connected by 28 bridges, are a survival of the bitter feelings then engendered. The village of Milwaukee, now the East Side, was organized 27 Feb. 1837; Kilbourntown, now the West Side, was annexed 11 March 1839; and Walker's Point, now the South Side, 5 Feb. 1845. The city was incorporated 5 Feb. 1845, and Solomon Juneau chosen first mayor.

**MILYUKOV, Pavel Nikolaevitch**, Russian historian, educator and political leader; b. near Saint Petersburg, 1857. Educated in Moscow he became a tutor in history at the university in 1886-95. Because of his liberal views regarding political reforms he was banished from Russia. He then went to Bulgaria and became professor of history at the University of Sofia. In 1897-98 he traveled in Europe and then came to the United States. Settling in Chicago he lectured on Russian subjects at the University of Chicago. A course of lectures delivered there was published in 1905 under the title of 'Russia and Its Crisis.' In 1905 Milyukov returned to Russia on the outbreak of the revolutionary movement to further the cause of liberty. He was imprisoned for a while, but on his release resumed his activities and was instrumental in forming the Union of Unions (composed of the educated and professional classes). He was elected to the first Duma as a Constitutional Democrat, which party (universal suffrage and constitutional government) he had created. While the Duma was in session he was arrested. After a month's imprisonment he was liberated. He was a member of the Balkan Committee of Inquiry which investigated the conduct of the war of 1913. Milyukov edited the Constitutional Democrat papers, the *Free Nation* and *Popular Rights*, until they were suppressed by the Russian authorities. Then he became editor of the Petrograd newspaper called *Rech*. Besides a vast number of essays and magazine articles Milyukov has published many books. These include 'Main Currents of Russian Historical Thought' (1893-95); 'Sketches of the History of Russian Culture' (1895-96); 'Russia and its Crisis' (1895); 'Democracy and the Second Duma' (1905); 'A Year of Struggle' (1907); and 'The Balkan Crisis and Politics' (1910).

**MĪMĀNSĀ** (from the Sanskrit *man*, to investigate), investigation, is the collective name of two of the six divisions of orthodox Hindu philosophy. The two Mīmāṃsā divisions are: (1), the Pūrva-mīmāṃsā (Prior Inquiry, or Karma-mīmāṃsā), investigation concerning works that deal chiefly with the Vedic ritual and its significance; and (2), Uttara-mīmāṃsā (Later Inquiry, or Brahma mīmāṃsā), investigation concerning the Supreme Spirit, or, more

commonly, Vedānta (see VEDĀNTA PHILOSOPHY), dealing with speculations on the nature of the Supreme Spirit. The principles are embodied in a series of *Sūtras*, or aphorisms, in 12 books, discussing the sacred ceremonies of the Veda and the merit accruing from their proper performance. Although the Mīmāṃsā is ranked by all Indian writers with the other philosophical systems, the term philosophy can hardly be applied to it in the same sense as to the other systems of philosophy. The object of the Mīmāṃsā is merely to lay down a correct interpretation of such Vedic passages as refer to the Brahmanic ritual; to solve doubts wherever they may exist on matters concerning sacrificial acts and to reconcile discrepancies (or seeming discrepancies) of Vedic texts. Jaimini, a sage, was the founder of this school of interpretation. The standard introduction to the study of the Mīmāṃsā is by Mādhava Achārya. Consult Cowell and Gough, 'The Sarva-Darsana-Samgraha of Mādhava-Acharya' (London 1894). The oldest extant commentary on the Mīmāṃsā is the Bhashya of Cabara-Svanim, written before the birth of Christ. This commentary was annotated about 700 A.D., by Kumarila, a great authority on Indian philosophy. Colebrooke published a treatise on this subject in 1826, which was published in his 'Miscellaneous Essays' (London 1873). The subject is finely treated in 'The Six Systems of Ancient Indian Philosophy,' by Max Müller (New York 1903). Consult also Macdonell, 'Sanskrit Literature' (London 1913).

**MIMBRES RIVER.** A stream rising on west slope of Mimbres Mountains in the northern part of Grant County, N. Mex., flowing south across Luna County near Deming and disappearing in the wide desert flat east of Florida Mountains. This flat is separated from Rio Grande Valley but to the south opens into the wide basin which contains Lake Guzman in Sonora, Mexico. The river has running water in Grant County, but excepting in time of freshet is dry in Luna County. The name is Spanish for osier or water willow which grows in the upper part of the valley.

**MIME**, a dramatic entertainment, native to Sicily and Magna Græcia, and appealing to popular taste by its scurrilous caricatures of low life. Originally performed in public squares on festival days, it was later developed into artistic form by Sophron Syracuse in the 5th century B.C. The 'Mimiambi' of Herondas (q.v.), a Greek poet of perhaps the latter half of the 3d century B.C., representing the everyday life of the common people, furnish trustworthy examples of these literary mimes. The Romans adopted the mime in its unliterary form as early as the 3d century B.C., but it was not until Cicero's time that it received a place in literature at the hands of Decimus Laberius and Publius Syrus, of whose works we have fragments. As an after-piece, and under the empire as an independent performance, it was as popular as it was indecent in words and action.

**MIMETITE**, a mineral consisting of a lead arsenate and chloride closely resembling pyromorphite, occurring in hexagonal crystals. In color mimetite is usually yellow, or brown, rarely white, or colorless. Like pyromorphite, mimetite is found in the upper parts of veins

of lead ore where it has been formed by the oxidation of galena and mispickel.

**MIMICRY IN ANIMALS.** One of the ways by which species and groups of animals are perpetuated. Its effect is to assure the safety of individuals by reason of their having such a likeness to something else that the eye of another animal seeking to do them harm overlooks them, by mistaking their real nature for the object mimicked, so that the enemy passes on. This is one of the phases of "protective resemblance," of which the two principal are: (1) *Mimicry*, similarity in form to some inanimate object; (2) *Imitation*, similarity to another animal that for some reason is immune from attack by the enemies of the imitating species. In both cases color is likely to serve as an important element in the practical deception. See COLORATION, PROTECTIVE; IMITATION.

These two phases, and other manifestation of deception for safety's sake, are regarded by the exponents of the Darwinian theory of organic evolution as results of the gradual and unconscious acquirement, through the process of natural selection, of changes advantageous to the animal in its struggle for existence. The present article considers such beneficial results as have been obtained by acquiring by certain animals a resemblance to some vegetable or inanimate article of no interest or value to the enemy.

It is plain that if a moth or a caterpillar sitting on a tree-trunk can be mistaken by a bird or lizard for a bit of lichen or a dried twig it may frequently be passed by, and thus allowed to live long enough, perchance, to perpetuate its species. This happens actually in nature. Mimicry is developed, however, almost exclusively in small creatures that are otherwise defenseless; and sometimes is restricted to the young of a species whose individuals when adult can either take care of themselves well or develop some special method of concealment or passive resistance. It also occurs in a few plants.

It is mainly exhibited by insects, but is manifest in some marine animals, for example sea-anemones, which when closed are to all appearance lumps of mud; and many hydroids have a most deceiving resemblance (in our eyes, at least) to the seaweeds on or amid which they grow; while a pipe-fish, standing on its head, among the eel-grass alongshore, as is its custom, is as effectually concealed as anything can be. A few large examples might be cited, as the mata-mata turtle of South American rivers, which is so tagged and fringed with outlying processes that it has the exact appearance of a weedy rock; but in this case, as in some others of mimicry, the advantage is more that the turtle's prey (fishes, etc.), will come near enough to be seized before they suspect its fatal presence, than that the turtle itself will be safer.

Mimicry is most prevalent, however, among insects and spiders. These are to be found in all countries with deceptive resemblance to withered, gnawed or moldy leaves; to bits of twig, particles of dung, cocoons whose contents are breaking out; or to any of various objects under which insects seek refuge or concealment, as flakes of bark or bits of stone. The

records of observation in the books of Darwin, Wallace, Bates, Fritz Müller, Semper, Belt, Forbes and other naturalists abound in instances, many of which were discovered by the merest accident. The classic example is the amazing likeness of a kind of butterfly of the East Indies, when at rest, to a leaf which extends not only to the general color of the under surface of the closed wings and their markings, but to the attitude of the insect as it alights, for it places itself in a relation to the branch to which it clings precisely similar to the natural arrangement of the real leaves about it; and, of course, frequents only the one kind of tree whose leaf is mimicked. A tropical "walking-stick" insect has flat extensions of the skin along its legs and body which are so shaped, and so mottled in color, that Wallace found even the sharp-eyed Dyak boys of the Bornean forest deceived into thinking this insect "a stick grown over by a creeping moss." But our own northern, greenish-brown walking-sticks are sufficiently deceptive in their twig-like aspect when, as is their custom, they sit on a bush-branch, holding their bodies stiffly out at an angle with their fore legs stretched straight in front of their heads; many must be overlooked for one that is detected. More familiar, perhaps, are the measuring-worms (hairless caterpillars of geometrid moths) which, clasping a branch firmly by their hind legs, will stand out rigidly from it, and maintain this attitude for hours. Their dull gray color gives them exactly the appearance of a broken twig, and as long as they remain motionless they are virtually safe. The whole race of mantids exhibit this character in a greater or lesser degree.

Another very striking example of mimicry is that first made known by H. O. Forbes who met with it in Java and in Sumatra. In the first instance, he noticed a certain butterfly perched, as often happens, on a white patch of bird's excrement dropped on a leaf. Approaching cautiously, he closed finger and thumb over the wings of the insect, which seemed glued to the sticky substance; "To my surprise, however," Forbes relates, "part of the body remained behind, adhering, as I thought, to the excreta. . . . I looked closely at, and finally touched with the tip of my finger, the excreta to find if it were glutinous. To my delighted astonishment I found that my eyes had been most perfectly deceived, and that the excreta was a most artfully colored spider lying on its back, with its feet crossed over and closely adpressed to its body." Forbes made the same mistake a second time, some months later in Sumatra; and speaks of this extraordinary spider as "a living bait so artfully contrived as to deceive a pair of human eyes even intently examining it." Consult for the examples mentioned above Wallace, A. R., 'Malay Archipelago' (New York 1869); Forbes, 'A Naturalist's Wanderings' (New York 1885).

ERNEST INGERSOLL.

**MIMIR**, mē'mīr, in Scandinavian mythology, the god of wisdom, and most celebrated of the giants. "Mimir's Well" was the fountain of all wit and wisdom, in whose depths the future was clearly mirrored.

**MIMNERMUS**, the earliest writer of Greek erotic elegy, was born in Colophon or Smyrna,

and lived in the last half of the 7th century a.c. His collection of love-poems, called 'Nanno' from the name of a flute-player whom in his old age he courted in vain, survives only in fragments which may be read in a separate edition by N. Bach (Leipzig 1826) or in Bergk's 'Poetae Lyrici Graeci.'

**MIMOSA**, a genus of herbs, shrubs, trees and a few climbing species of the natural order *Leguminosae*. The species, of which more than 200 have been described, are natives principally of the American tropics. They have pinnate leaves, usually spicate clusters of small flowers, followed by flat, oblong or linear pods which when ripe break into one-seeded joints. Many of the species are noted for their sensitive leaves which at nightfall close and droop. Others respond to a touch. Of these the humble or sensitive plant (*M. pudica*) is perhaps the best known.

**MIN**. Egyptian god of agriculture, typifying the generative forces of nature. Annual harvest festivals were held in his honor. He is represented as a human being with a headdress of two enormous feathers and in his right hand he holds a flail. Behind him is a shrine with trees. The ram is sacred to him. Min was the local god of Panopolis or Akhmin and of Koptos. In later times Min was identified with Ammon Ra. The Greeks identified him with Pan. Consult Budge, A. Wallis, 'The Gods of the Egyptians' (London 1904); Wiedemann, 'Religion of the Ancient Egyptians' (New York 1897); Erman, A., 'Life in Ancient Egypt' (London 1894).

**MINA**, Francisco Espoz y, Spanish guerrillero leader and general: b. Ydozin, Navarra, Spain, 17 June 1781; d. Barcelona, 24 Dec. 1836. As he sprang from the yeoman class, he naturally espoused radical and democratic ideas at an early age. When Napoleon tried to seize Spain, in 1808, Mina enlisted in Doyle's regiment and then passed into a band of guerrilleros commanded by his nephew, Xavier Mina. When Xavier was captured by the French in 1810, seven men of the band decided to follow Mina; and soon afterward the Junta of Aragon gave him command of all the guerrilleros of Navarra. The national government of Cadiz gave him rank and in 1812 he was promoted commander-in-chief in Upper Aragon and on the left bank of the Ebro. Mina was an excellent organizer and strategist. His position made it possible for him to confiscate war supplies imported by the French and to levy duty upon all imported war materials. This provided him with money to pay his troops regularly; and he was, therefore, able to maintain an excellent morale among his men and to please the countryside by avoiding a levy of taxes and contributions. Mina served with distinction under the Duke of Wellington in the campaign of 1813-14 and was frequently wounded. When Ferdinand VII was restored, he fell from favor, made an unsuccessful attempt to instigate an uprising among the Liberals at Pampluna and went into exile. The Revolution of 1820 brought him back and he served the Liberal party throughout northern Spain, resisting the French attempts to bring back the king. He was forced by the French to capitulate in November 1823, and the French allowed him to escape into England. In 1830

he made another attempt against Ferdinand; but notwithstanding this, on the death of Ferdinand he was recalled to Spain and the government of the regent, Cristina, gave him the command against the Carlists, in 1835, although fearing his Radicalism. By this time his health was broken and he resigned his command in April 1835. A year later he took command in Catalonia and aided in forcing the regent to grant a constitution to Spain (August 1836). Mina was a brave man. Mention is made of him in all the histories dealing with Spanish matters in the early days of the 19th century. He was a master in the practice of irregular mountain warfare and was not averse to high-handed methods. His first act was to arrest and shoot a brigand who was pretending to be a patriotic guerrillero. He made large claims; for instance that in two years (1810-12) he had fought 143 actions, taken 13 fortified posts and captured 14,000 prisoners. He also said that he immobilized 26,000 French troops which would otherwise have served with Marmont in the Salamanca campaign. In 1825 he published 'A Short Extract from the Life of General Mina.' Consult his 'Memorias,' published by his widow (Madrid 1851-52).

**MINA**, Francisco Xavier, Spanish soldier: b. Ydozin, Navarra, 1789; d. Mexico, 11 Nov. 1817, nephew of Francisco Espoz y Mina (q.v.), with whom he served in the guerrilla warfare against the French in 1808-10. Taken prisoner, he was detained four years in Vincennes. In 1814 he served against Ferdinand VII, and fled to France and thence to England. While in England he became interested in the cause of Mexican patriots, and, aided by some wealthy Englishmen, he organized an expedition. Arriving in the United States he received support. Two hundred volunteers followed him to Galveston in November 1816. More assistance came from New Orleans. His force landed at Soto Marina, province of Tamaulipas, in April 1817. With his 300 men he took the towns of León and Guanajuato with the fortress of Sombrero and defeated the generals Armiñán and Ordóñez; but he was deserted by his followers, surprised by an overwhelming force and taken to Mexico, where he was shot.

**MINA**, an ancient Greek denomination of money. The Attic mina contained 100 drachmæ, and was valued at about \$16.

**MINA-BIRD**, or **MYNA**, a starling or grackle (*Eulabes religiosa*), very familiar throughout India and eastward, nesting confidently in gardens. Its color is a deep velvety black with purple and green reflexions, and with a white mark on the base of the quills of the wing. The bill and feet are yellow, and there are two yellow wattles on the back of the head. The Hindus regard it as sacred to Ram Deo. Certain other similar species are also called mynas in some localities.

**MINÆANS**. See **SABÆANS**.

**MINAHASSAS**, a medley of Malayan tribes of more or less savage type living in the province of Minahassa in northern Celebes. By some authorities this group of natives is called Alfuros, meaning wild, or half-savage. In language the Minahassas seem to belong to the Malay stock, but physically they resemble the Tagals and other Philippine tribes. Some

of them have a suggestion of Japanese characteristics. They are supposed to have immigrated from the north into the island. The word *Minahassa* means "a country that has been formed by binding a number of territories into one." The original form was *Nimahasa*. The chief town is Manado, or Menado, pleasantly situated on the shores of a wide open bay of the same name. The population of Manado consists of a very small percentage of white Europeans, a number of half-castes comprising Chinese, Eurasians, Arabs, Christians, a few Mohammedan natives and the Bantiks, a race of Alfuros that still retains its old religion. The population of Manado is between 5,000 and 6,000. The exports are copra, coffee, cocoa, vanilla, rattan, spices (chiefly nutmeg) and ebony and other wood. After the arrival of the Dutch colonists, wars, assassinations and revolting savage customs disappeared and the people are now peaceful, industrious and law-abiding. The change from a strict matriarchy to a strict patriarchy has, in many instances, taken place by the introduction of capture marriages. The change may be seen in operation in some of the Malay tribes at the present day. For a complete account of the history, manners and customs, mythology and industries of the Minahassas, consult Hickson, Sydney J., 'A Naturalist in North Celebes' (1889).

**MINAMOTO YORITOMO**, Japanese warrior and statesman and one of the most famous figures in Japanese history: b. 1146; d. 1199. The chief clans in Japan in the middle of the 12th century were the Taira and their rivals, the Minamoto. The Mikados, like the Valois kings of France in the wars of the Huguenots and Catholics, vainly tried to balance one party against the other. In 1159 the Taira clan crushed the Minamoto clan and one of the Minamoto chieftains, Yoshitomo, was killed. Four of his sons escaped; two of them, Yoritomo and his younger brother, Yoshitsune, were destined to overthrow the Taira and to subjugate the three islands, Honshiu, Shikoku and Kiushiu. When Yoshitomo was treacherously murdered by Kiyomori, chief of the Taira clan, Yoritomo fled. Captured and brought before Kiyomori he was ordered to be beheaded; but, at the request of Kiyomori's stepmother, he was spared. He was banished instead to Idzu. While there, he married the daughter of Hojo Tokimasa, one of his guardians in exile. In 1180 he gathered an army made up of his father's scattered retainers, followers of his father-in-law and some monks of Hiyeizan,—a force of 27,000 men. He occupied the north bank of the Fuji River; and across the river was the Taira army nearly double the size. A decisive battle was about to be fought when suddenly the Taira army was seized with panic and retreated westward toward Kioto. At this moment Yoritomo was joined by his younger brother, Yoshitsune (1158-89), a graceful, well-knit youth, and, notwithstanding his early age, the best swordsman in Japan. Yoshitsune became lieutenant of his brother, Yoritomo, and marched out of Kioto 19 March 1184 with 75,000 men, most of them bodies of mounted archers. On 21 March Yoshitsune, while the Taira troops were engaged on both flanks, with a detachment of cavalry of the Minamoto army threaded his way across the mountains and riding down the steep

declivity charged the enemy's centre. Both the Taira wings were crushed and the battle of Ichi-No-Tani was won. The victory of Ichi-No-Tani did not end the war, however, for the Taira fleet was intact. Yoritomo preferred to attack it; and the great sea-fight of Dan-No Ura took place on 25 April near the Straits of Shimonoseki. Yoshitsune was in command and had 800 junks as against 500 junks. Yoshitsune was victorious. The island of Kiushiu, like that of Shikoku and most of Honshiu, fell under control of the Minamoto leaders. Yoshitsune returned to Kioto with the reputation of being the foremost soldier and sailor in Japan. His success excited the jealousy of Yoritomo, who tried to have him assassinated. Yoshitsune, however, escaped with 11 comrades and raised a rebellion against his brother, which was unsuccessful. Finally Yoshitsune was murdered by a great noble named Mutsu.

Yoritomo now made Kamakura his capital and instituted many reforms, both civil and military. He became Shogun in 1192 and his methods for ensuring that the executive power should remain in his own hands and in those of his successors were remarkable. With the establishment of the Shogunate a new epoch in Japanese history began; and, with only a few breaks, it remained the prevailing form of government until the 19th century when Japan came into relation with the modern world. The foundation of the Shogunate must not be regarded, however, as the work of one man; it was the result of a long evolution of the feudal system which had its beginnings in the time of the Fujiwara.

Like Napoleon Yoritomo was a short set man with a large head. His voice was powerful and ringing; when he pleased his manners were extraordinarily gentle. Brave, astute and iron-willed, he is one of the most noteworthy of all Japanese characters. Of a cold, calculating nature, he knew how to use men and women as his tools and he stopped at nothing, not even at fratricide, to achieve his ends. In religious matters he proved a tolerant ruler. Among the monuments still extant at Kamakura are the temple of Hachiman, the god of war and tutelary deity of the Minamoto clan, and the temple of Kwannon, both of which he erected. The institutions founded by Yoritomo and modified by Tokugawa Iyeyasu at the beginning of the 17th century lasted until 1868. The Minamoto were in time superseded by the Hojo clan into which Yoritomo had married. On the death of Yoritomo, his son became Shogun, but his grandfather, Hojo Tokimasa, had him murdered after he had reigned four years. His brother, the third Shogun, succumbed to a plot by Hojo Yoshitoki and the Hojo clan ultimately obtained possession of the Shogunate. A portrait of Minamoto Yoritomo and also a battle of the Minamoto and Taira appear in Saito, Hisho, 'A History of Japan,' translated by Elizabeth Lee (1912).

**MINARET** (Arabic, *minarat*, a lantern), a tower generally surrounded with balconies, and erected in connection with the mosques in Mohammedan countries, and peculiar to Mohammedan architecture from which the muezzin summons the people to prayer and announces the hours, bells not being used by the Moslems. The form is derived from the Pharos lighthouse at Alexandria. The earliest mosques had

no minarets, the first known being that of Damascus, erected about 705. They are a square construction up to the height of the wall of the mosque, with a winding stairway, and above they are octangular. The tower of the Madison Gardens in New York is copied from the Giralda of Seville, which is 308 feet high. See **MOSQUE**.

**MINAS**, mē'nās, or **BELLO HORIZONTE**, Brazil, the capital of the state of Minas Geraes, stands at an elevation of over 3,000 feet, 60 miles northwest by rail of Ouro Preto, which it replaced as the administrative seat in 1894. It is a modern town with wide streets, electrically lighted, and adorned with handsome public buildings, elegant residences and fine parks. Pop. 14,000.

**MINAS**, Uruguay, the capital of the department of Minas, 56 miles by rail northeast of Montevideo. It carries on a trade in the produce of the surrounding agricultural region, and in the marble and granite of the neighboring quarries. Pop. 8,955.

**MINAS GERAES**, mē'nās zhā'rīs, Brazil, a southeastern state bounded north by Bahia, east by Bahia and Espirito Santo, south by Rio de Janeiro and São Paulo, southwest by São Paulo, and west by Goyaz; area, estimated at 221,951 square miles. The surface is mostly mountainous, and though lying within the tropics its general elevation, averaging about 2,000 feet, renders the climate temperate and healthful; but the low tracts are periodically flooded, and contain extensive swamps and pools. It is rich in minerals, gold and diamonds being at one time a great source of wealth; silver, platinum, copper, lead, rubies and other precious stones being found. Extensive iron-works have been erected in the neighborhood of Ouro Preto. Sugarcane, cotton, millet, tobacco and coffee are cultivated. The cultivation of cereals is extensive, and the finest European fruits have been introduced. Vast herds of cattle and swine feed in the pastures and forests. Timber and dye-woods of the most valuable kind, together with numerous varieties of gums, balsams and medicinal plants, grow freely in the latter. Some trade in home manufactures, and an extensive foreign commerce, have been established. For administrative purposes Minas Geraes is divided into 14 comarcas. It sends 20 members to the general assembly and 10 to the senate. The provincial assembly is composed of 36 members. It sits at Minas (q.v.) since 1894, when the administrative seat was removed from Ouro Preto. Pop. 4,649,825.

**MINAS DE RIO TINTO**, Spain, town in the province of Huelva, 32 miles northeast of the city of Huelva. The mountainous country in which this town is situated contains rich deposits of copper ore which were worked by the ancient Phœnicians. In 1873 a London company took control of these mines and produced the ore by new methods. More than 10,000 workers are now employed. In 1911 the ore produced amounted to 1,603,854 tons. In 1845 the town had only 800 inhabitants: in 1910, 12,626.

**MINBU**. A district and division of Upper Burma. This district consists of 3,299 square miles with a population of 233,377. The physical

features exhibit low plain land toward the Irrawaddy, and an undulating country inland, rising ever higher westward toward the Arakan hills. Between the plain and the Arakans run the Nwa-Madung hills, north and south. The chief rivers and streams are the Irrawaddy, the Mōn, the Maw and the Salin. They are much used for irrigation. Along the Irrawaddy and in the lagoon fed by it, called Paughlin Lake, there are fisheries, the rights to which are sold yearly by public auction, and realize an average of \$5,000. The valleys are cultivated, but are deadly except to natives. Oil has been discovered near the mud volcanoes of Minbu, but lie too deep to be profitably worked. Along the Mōn River the betel-vine is cultivated. The district of Minbu contains much forest land. The chief crops are rice, millet, grain, beans, peas, sesamun and tobacco. The annual rainfall varies everywhere. In the hot months the thermometer rises to 100° F., and in December it falls to 49° F. The chief town is also called Minbu. It is situated on the Irrawaddy, which is here three miles wide with many islands and sandbanks. Pop. about 5,780. In the dry season the steamers cannot come nearer to the town than two miles. The division of Minbu consists of the districts of Minbu, Magwe, Thayetmyo and Pakōkku. Its area is 17,172 square miles. Pop. about 1,076,280.

**MINCH**, The, Scotland, the channel off the northwest coast between the mainland and the northern part of the Outer Hebrides; it is from 25 to 45 miles wide and has a very rapid current, and on either side are numerous lochs or sea-arms penetrating inland. It is connected with the Sea of the Hebrides on the south by the Little Minch, the channel between the island of Skye and Long Island; it is from 14 to 20 miles wide. *7/Unnicat*

**MINCIO**, mīn'chō, Italy, a river, the ancient Mincius, which flows from the south extremity of Lake Garda, near Pescheria, and after forming the lake and marshes that surround Mantua falls into the Po eight miles below the city. Its banks are remarkably fertile, and celebrated for their beauty by Virgil, who was a native of this country. It formed an important base of operations in the wars between France and Austria. The length of its course is about 115 miles.

**MINCOPIES**, min-kō-piz, natives of the Andaman Islands. They are typical Negritos, averaging less than five feet in height with cephalic characteristics similar to those of the negro. Their condition is low. They live in open huts (called chongs), consisting of a roof on four stakes, and subsist on roots, wild fruit and game. In hunting they use a peculiar S-shaped bow. There are 12 tribes of Mincopies, all descended from a common stock but each with its own dialect and tribal habits. Consult Deniker, 'Races of Man' (1901); Brown, A. R., 'Notes on the Language of the Andaman Islands' (1914) and 'Aborigines of the Andaman Islands' in the *Journal of the Anthropological Society* (Vol. XI, London 1882).

**MIND**. See **PSYCHOLOGY**.

**MIND-CURE**. See **MENTAL SCIENCE**; **SUGGESTION**.

**MIND READING.** See HYPNOTISM; TELEPATHY.

**MIND-STUFF.** See PANPSYCHISM.

**MINDANAO**, mên-dā-now', Philippines, the most southeastern and second largest island of the archipelago, lying between lat. 5° 35' and 9° 50' N. and between long. 121° 53' and 126° 28' E., about 220 miles northeast of Borneo. It is bounded on the east by the Pacific Ocean and on the west by the Sulu Sea; area, 35,457 square miles; with its dependent island, 36,293 square miles.

**Topography and Climate.**—The outline of the island is very irregular and the coast is uneven and much indented with deep bays and inlets; the shore line is 1,592 miles and the width of the island from east to west 386 miles. The island is very mountainous, particularly in the interior, the mountain system consisting of a number of irregular ranges extending generally north and south, and as a rule approaching near the coast. The mountain formation shows the effect of earthquake and volcanic action, and there are many volcanoes, some of which are active. The principal peaks are Apo (10,312 feet), near the southeastern coast, and Malindang (8,560 feet) in the northwest. The island is drained chiefly by two large rivers, both over 200 miles long, the Grande de Mindanao (q.v.), flowing southwest and west, on the western side of the central mountain range, and the Butuán or Agusán, flowing northwest, on the eastern side of the same range. There are numerous other small streams and nine large mountain lakes. There are iron springs at Placer, in the province of Surigao; sulphur springs at Mainit, Surigao and Balingasag, Misamis, and medicinal thermal springs at Malibato. As the island is within 10° of the equator, the climate is hot and humid, but more equable than that of Luzon; rains are frequent and heavy, the annual fall being 100 inches.

**Forests and Fauna.**—The island is covered with forests of valuable woods for ship and house-building and furniture making; among these are the molave narra (similar to the yellow pine), teak, ebony and cypress; the gum and resin-producing trees and medicinal and dye plants also grow abundantly. Animal life is abundant in these forests; over 200 species of birds have been classified, of which 17 species are peculiar to Mindanao and Basilan; deer, wild hogs, monkeys and the haguang or colugo (q.v.) are numerous. Reptiles, including the giant lizard, iguana and large snakes, particularly the boa, also infest the forests and crocodiles the river.

**Industrial Resources.**—The staple, agricultural products are rice, sugar, cotton, corn, tobacco, indigo, coffee and hemp; other products of special value are cloves, nutmegs, cinnamon and other spices, betel nuts and betel peppers. The most important industry is the cultivation and shipment of hemp and forest products; large herds of cattle and horses are raised; and there is a little weaving of hemp and cotton fabrics for home use. Less than 2 per cent of the land is under cultivation. Edible birds' nests are also gathered and exported. Communication is largely by water, as there are few roads except in the immediate vicinity of the chief towns, and the towns and

villages are situated on the coast or on the large lakes and rivers. Gold is obtained in small quantities by the natives, and is doubtless abundant; coal, sulphur, copper and platinum are also reported.

**People and Government.**—About a third of the population of Mindanao is composed of Christianized Malays; there are also tribes of the Moro race who are Mohammedan in religion; the interior is peopled by pagan tribes and the northern and eastern coasts by Visayan Filipinos. The island was first occupied by United States troops in 1899. Civil government was provided for Mindanao and adjacent islands under the Philippine Commission in 1903, under the name of the Moro Province. In 1914 the department of Mindanao and Sulu was created, the military governor of the old Moro province giving place to a civil governor invested with wide powers and whose constructive task it will be to bring a turbulent and suspicious Mohammedan population into harmonious relations with the Christian Filipinos. There was a serious outbreak of cholera in 1915. Pop. 499,634. See PHILIPPINE ISLANDS; MOROS.

**MINDANAO, Grande de**, grân'dā mên-dā-now', a large river of the island of Mindanao, Philippines. It rises in the Rangayán Mountains, flows south to the Lake of Liguasan, and passing through this lake flows northwest to Ilana Bay. About 25 miles from its mouth it divides into two branches, which enter the bay about five miles apart, with a large delta between them; the north arm is the larger and more navigable; the south arm is narrow and only five feet in depth. The river is navigable for 70 miles for small vessels not drawing over four feet. Its course is mostly through a very fertile region and it drains an extensive plain with several large lakes; in length and volume it is the largest river of the Philippines. In the upper part of its course it is known also as the Pulangui.

**MINDEN**, Neb., city and county-seat of Kearney County, on the Chicago, Burlington and Quincy Railroad, about 120 miles west by south of Lincoln. It is in a fertile agricultural region in which stock-raising is also a prominent industry. It has considerable trade in wheat, corn, hay and livestock. There are one State and two national banks, courthouse and an excellent high-school building. Pop. 1,600.

**MINDEN**, Prussia, a town of Westphalia, on the left bank of the Weser, 35 miles southwest of Hanover. It is one of the oldest towns in Germany and the streets in the ancient parts are narrow and crooked. It has a fine cathedral of the 13th century, in the early pointed Gothic style, a gymnasium and an orphan hospital; manufactures of linen and cotton, tobacco, chicory, chemicals, soap, lamps, machinery, etc., and an important transit and general trade. It was made the seat of a bishopric by Charlemagne, was afterward a member of the Hanseatic League, became a possession of the Elector of Hanover and finally passed into the possession of Prussia in 1814. On 1 Aug. 1759 the French were defeated here by an Anglo-Hanoverian army during the Seven Years' War. Pop. 26,454, predominantly Protestant.

**MINDORO**, mēn-dō'rō, Philippines, an island lying south of Luzon, a little north of the centre of the archipelago; length, northwest to southeast, 110 miles; width, northeast to southwest, 56 miles; area, 3,851 square miles, with dependent islands, 4,024. The island, which is oval in outline, is mountainous, the general topographical features consisting of several high broken ranges, forming an elevated plain in the interior; and from this plain sierras extend in different directions toward the coast, which is mostly low and marshy, especially on the north and east; on the west coast along Mindoro Strait is prairie land. The culminating point of the mountain system is Halcón Mountain in the north (8,800 feet). There are numerous small rivers, but no general river system of main stream and tributaries. The climate is variable; the rainfall heavy and monsoons frequent; the western coast is temperate and healthful, but the northern and eastern coasts are hot.

At one time, before the decay of the Spanish monarchy, the rice yield was so abundant that Mindoro was called "the granary of the Philippines"; but the frequent attacks of Moro pirates destroyed the prosperity of the island, and the agricultural products are now unimportant, being almost entirely for home consumption. Sugarcane is being profitably exploited; rice, cocoa, tobacco, hemp, cotton, etc., are raised; the cultivation of hemp is increasing and a small amount of cotton is exported to the island of Ipil. In the time of the early Spanish explorers reports of great mineral wealth, especially gold, were circulated; the real mineral resources are but little known, though as far as modern exploration has gone copper, gold and coal have been found. The island is heavily wooded and its chief commercial wealth is in forest products; the trees include cedar, ebony, mahogany, gum trees, gutta-percha, palms and dye woods. Near the principal towns wood-cutting and rattan splitting for the Manila market is the chief industry; rattan, buri, honey, forest gums, balao oil, pitch and other forest products are the chief articles of export; tortoise-shell, obtained from the small neighboring islands, and canoes cut from a single piece of wood are also exported; and there is a considerable production of sago. There are only a few roads, access to inland villages being by mountain trails or by river-canoes; the local trade between coast towns is carried on mostly by native sailing craft; all exports for Manila and other islands are concentrated at ports of call for steamers.

In June 1902 civil government was extended to Mindoro and adjacent islands, and it was detached from the province of Cavité and made a subprovince of Marinduque (q.v.). The inhabitants of the interior are wild tribes, among whom the Manguianes (about 15,000 in number) predominate; the people of the north coast are mostly Tagálogs, those of the south coast Visayans. Pop., estimated to include wild tribes of the interior, 28,361.

**MINE ACCIDENTS.** The conservation of human life in mining and other industrial plants is of such importance that it has resulted in the enactment of inspection laws, the purpose of which is to safeguard the workmen. The first coal mine-inspection law was

enacted in Pennsylvania in 1870,\* and since then the other States have done likewise until all the important coal-producing States are under State inspection.

The United States has produced 11,093,500,000 tons of coal under inspection since the first State-mine inspection law was enacted. The complete records for this production to the close of 1917 show that 59,269 men have been killed in coal-mine accidents while in the performance of their regular duties of mining coal. The number of men engaged in the production of this amount of coal represents the equivalent of an army of 18,078,000 men engaged for one year. The number of men killed per 1,000 employed during this 48-year period was 3.28. For every 10,000,000 tons of coal produced 55 lives were lost, or a production of 186,700 tons for each life.

At the beginning of the inspection service, the fatality rate was 5.92 per 1,000 men employed, or a production of 74,238 tons of coal per fatality. In both 1915 and 1916, the fatality rate was 3.09 per 1,000 men employed, while in 1917, owing to war conditions, the fatality rate was 3.56 per 1,000 men employed. The largest production per fatality was in 1916 when 265,094 tons of coal were mined for each man killed during the year.

Records of non-fatal accidents at coal mines are incomplete, but with the enactment of compensation laws since 1911, data relating to these are being collected, but it has not been assembled sufficiently to give a total for the United States for any particular year. However, it is believed they will be comparable with the figures for the metal mines.

Inspection in metal-mining States has not been as complete as in the coal-mining States. However, in 1911 the United States Bureau of Mines began a systematic census of metal mines and quarries, resulting in representative data. Complete returns are not possible, by reason of the law not making it compulsory to report to the bureau. Sufficient data have been obtained, however, to indicate that the non-fatal accident rate in metal mines is more than 300 per year per 1,000 men employed. It is believed that this rate will also apply to coal mines. The quarry rate is less, about 125 per 1,000, as all work is performed in the open daylight conditions.

Table 1 shows that for the mines, quarries and metallurgical works of the United States more than 1,000,000 men are employed, of whom three out of every 1,000 are killed each year. At least 300 per 1,000 in the combined industries are injured to the extent that valuable time is lost, and in most cases medical attendance required. A reduction of 50 per cent in the number of accidents would mean an annual saving of 1,500 lives, to say nothing of lessening the injuries and sufferings sustained by about 300,000 workmen. From an humanitarian point of view, a great good would be accomplished if this reduction could be brought about. Accidents will occur, yet experience shows that they may be reduced in number, although it is impossible to eliminate them entirely.

\*For details of coal-mine fatalities, 1870-1914, the reader is referred to U. S. Bu. Mines Bull. 115, coal-mine fatalities in the United States, 1870-1914, by A. H. Fay.

The accompanying tables point out some of the principal causes of accidents and furnish enough basic information to call attention to the importance of accident prevention.

As a summary of what may be done to assist in accident reduction, the following is submitted:

1. Keep exact records of all accidents as to time, place, cause and result of accident along the line of the report required by the insurance companies before a claim is paid.
2. Keep detailed records of men employed, days worked, as well as shifts and wages lost by reason of accidents. This will bring out the economic loss due to accidents.
3. Standardization of mining laws, rules and regulations so that all companies will be required to render to the State mine inspector, or compensation commission, the same type of report.
4. Co-operation with State and Federal agencies, whose objects are a reduction of acci-

dents, the welfare of the workman and the installation of safety devices.

5. The spread of safety-first propaganda as much as possible in any manner whatever whereby an interest may be created among the employees, and thus educate them to be able to take care of themselves.

6. The installation of safety devices; systematic inspection, and above all the education of employer and employee as to the needs of results to be obtained from accident-prevention work.

**Fatalities in the Mining Industry Due to Explosives.**—Table 4 shows the number of fatalities from the use of explosives in the bituminous coal mining industry and Table 5 shows the number and percentage of fatalities at metal mines and quarries due to explosives. In 1903 (Table 4) 9.8 per cent of the fatalities at bituminous mines were due to the use of explosives, whereas in 1917 only 2.65 per cent

TABLE 1.—FATALITY RATES IN DIFFERENT BRANCHES OF MINERAL INDUSTRIES IN 1917 COMPARED ON A 300-DAY BASIS.  
(Length of shift not considered.)

BRANCH OF MINERAL INDUSTRY	Average days active	Men employed		Days of labor performed	Killed	Number killed per 1,000 employed	
		Actual number	Equivalent in 300-day workers (calculated)			On actual time basis	On 300-day basis
Metal mines.....	287	200,579	192,085	57,625,811	852	4.25	4.44
Metallurgical workers:							
Ore-dressing plants.....	303	24,111	24,372	7,311,499	47	1.95	1.93
Smelters *.....	342	44,376	50,659	15,197,643	53	1.19	1.05
Auxiliary works.....	328	15,555	17,014	5,104,146	16	1.03	.94
Coal mines.....	251	757,317	634,666	190,399,680	2,696	3.56	4.25
Coke ovens:							
Beehive.....	308	18,820	19,295	5,788,576	25	1.32	1.30
By-product.....	360	13,597	16,300	4,889,853	51	3.75	3.13
Quarries (inside).....	249	54,804	45,449	13,634,773	91	1.66	2.00
Quarries (outside).....	285	27,486	26,076	7,822,584	40	1.46	1.53
Total, 1917.....	266	1,156,645	1,025,916	307,774,565	3,871	3.35	3.77
Total, 1916.....	255	1,128,257	957,393	287,218,232	3,224	2.86	3.37

\* Does not include iron and steel industry.

TABLE 2.—NON-FATAL INJURIES IN THE METAL MINING INDUSTRY OF THE UNITED STATES, BY MINING METHODS.\*

METHOD OF MINING	1915		1916		1917	
	Number of injuries	Number injured per 1,000 300-day workers	Number of injuries	Number injured per 1,000 300-day workers	Number of injuries	Number injured per 1,000 300-day workers
Room and pillar.....	2,819	413.95	4,013	477.17	2,953	290.68
Overhand stoping.....	15,668	382.72	13,198	436.44	13,066	358.23
Underhand stoping.....	976	507.81	1,707	460.11	1,380	297.99
Caving methods.....	5,801	328.13	7,134	349.71	6,545	329.94
Open pit, with steam shovel.....	1,908	250.97	2,416	281.58	2,287	221.39
Open pit, without steam shovel.....	142	120.03	108	348.39	109	86.71
Total and average.....	27,314	358.73	28,576	398.83	26,340	318.52

\* The data shown here represents 75,000 300-day workers, or three-eighths of the entire metal mining industry for each of the three years.

TABLE 3.—METAL MINES, COAL MINES, AND QUARRIES: PRINCIPAL CAUSES OF FATALITIES, SHOWING PERCENTAGE DUE TO EACH CAUSE, 1911 TO 1917, BY YEARS.\*

INDUSTRY	Cause of death							Total	
	Falls of overburden, roof, quarry material, ore, or coal	Explosives	Haulage and handling rock, ore, or coal	Falls of person	Electricity	Machinery	Gas and dust explosions		Other causes
1911:									
Metal mines.....	35.52	11.22	7.63	15.39	2.45	3.16	.....	27.63	100.00

\* Fay, Albert H., "Metal-mine accidents in the United States," 1917; Tech. Paper 224, Bureau of Mines, 1919.

were due to this cause, owing to the introduction of permissible explosives.

Table 5 shows that from 11 to 14 per cent of the metal-mine fatalities and 16 to 26 per cent of the quarry fatalities are due to explosives, whereas in Table 4 for the same years the percentage in bituminous coal mines was 3.68 to 2.65 in 1917.

ALBERT H. FAY,  
*Mining Engineer, United States Bureau of Mines.*

**MINE GAS**, the same as fire-damp (q.v.).

**MINE PLANTERS.** The mine planter service in time of peace is organized for instruction purposes. In time of war the vessels of this service, together with such additional vessels as may be obtained for this duty by the War Department, are assigned to the various coast defenses for service in planting mines. The vessels for this service are known as United States army mine planters, and when not assigned to coast artillery districts, coast defenses or to the Coast Artillery School, are under the control of the quartermaster-general of the army.

Upon arrival in a coast-defense command for the purpose of carrying out the instructions of the War Department, the commanding officer of a mine planter reports by telegraph to the coast artillery district commander and in person to the coast-defense commander. He retains command of his vessel, but the planter becomes a part of the local submarine defense equipment of the coast-defense command. The planter is assigned, for instruction purposes, to the mine commands by the coast-defense commander. The latter exercises general supervision over the mining instruction, and is held responsible that full advantage is taken of the presence of the planter for instruction purposes. Except in case of emergency he does not use the mine planter, nor permit the use thereof, for any other purpose than for carrying out the instructions prescribed by the War Department.

Whenever a mine planter leaves one coast-defense command for another, or leaves for any locality outside the limits of a coast-defense command for repairs or for other purpose, the commanding officer of the planter telegraphs to the coast artillery district commander his time of departure, and on arriving at his destination his time of arrival thereat. During the time mine planters are beyond the limits of a coast-defense command they are under the direct control and supervision of coast artillery district commanders. At such times coast artillery district commanders have the same control over mine planters, as they have over other elements of the coast defenses, within the limits of their districts, respectively, subject to the requirements prescribed by the War Department.

Upon completion of the work in a coast-defense command, the commanding officer of the vessel submits a report covering (1) in general terms the work done during the presence of the mine planter; (2) a statement of any unusual difficulties encountered; (3) the condition of the entire mine equipment in the coast-defense command (including both structures and material) and (4) any important recommendations. This report is submitted in triplicate to the coast-defense commander. Communications relating to the crew's equipment and repairs are sent to the quartermaster-general of the army.

On the last day of each month the commanding officer of the vessel forwards to the adjutant-general of the army, through military channels, an extract from the logbook, showing the movements of the vessel during the month; any unusual incidents, collisions, groundings or other accidents; assistance rendered other vessels; dates of inspections and by whom; also the quantity of coal consumed, in pounds, and the number of miles run each day; with the total coal and water consumption, number of mines planted, number of mines taken up, miles of multiple cable laid, miles of multiple cable taken up and miles traveled during the month. The shipping laws recited in the official logbook of the Mercantile Marine of the Depart-

ment of Commerce govern so far as they may be applicable to mine-planting boats and are not in conflict with army regulations and orders of the War Department.

When engaged in planting or taking up mines a lifeboat is kept in readiness for immediate launching.

EDWARD S. FARROW,  
*Consulting Military and Civil Engineer.*

**MINE RUN, Campaign of.** During the Civil War, on 7 and 8 Nov. 1863 General Meade crossed the Rappahannock at Kelley's Ford and Rappahannock Station, and concentrated his army of 70,000 men in the vicinity of Brandy Station, General Lee, with 50,000 men, withdrawing beyond the Rapidan to an entrenched line, the left of which covered some of the fords of the river, the right being perpendicular to it and extending to Bartlett's Mill on Mine Run. On 26 November Meade began the Mine Run campaign by sending the First, Fifth and Second corps to cross the Rapidan at Culpeper Mine and Germanna fords, and the Third and Sixth corps to cross at Jacob's Mill, all five corps to converge upon the old turnpike and the plank-road near Robertson's Tavern, both leading to Orange Court House, and turn the right of Lee's position. An early start was made on the 26th, but owing to delay in some of the columns, all were halted for the night but a short distance beyond the river. The march was resumed at daylight of the 27th. The Second corps reached Robertson's Tavern at 10 A.M., to find itself in the presence of a considerable body of Ewell's corps which Lee had hastened there, and it was ordered to remain on the defensive, until the Third corps, followed by the Sixth, came up on the right. But the Third corps was delayed. Lee, on discovering Meade's movement, had promptly ordered Early, commanding Ewell's corps, to move to the right. Part of his command had reached Robertson's Tavern and confronted the Second corps, and Johnson's division was moving in the same direction when it came into collision with the Third corps, on Payne's Farm, and a battle ensued, lasting until dark. Both sides claimed the advantage, but the engagement resulted in a delay to Meade's operations, and, as he claims, the failure of his campaign. The Union loss was 125 killed, 747 wounded and 71 missing. Lee reported a Confederate loss of 545. The Second corps was severely engaged during the day, and advanced some distance beyond Robertson's Tavern. At night the First corps moved up to the support of the Second. The Fifth corps, which had supported Gregg's cavalry division in an engagement at Parker's store, on the Orange plank-road, was brought over to support the Second, and next morning the Third and Sixth corps came up on the right of the Second. On the 28th Meade advanced to the attack, but on driving in the Confederate pickets it was found that Ewell's corps had fallen back. Pursuit was made, the Second corps in advance, and after a march of two miles Ewell was found in position on the west side of Mine Run. A. P. Hill had come up and formed on Ewell's right, covering the Orange plank-road. The line was very strong, and on it were 150 guns. It was after dark when the Second, Sixth and First corps, with part of the Third, fronted this position. An examination of Lee's position convinced Meade that

there was no probability of success in an attack in his immediate front, and he determined to send General Warren, with his Second corps and a division of the Sixth, to feel for Lee's right flank and turn it if practicable. The 29th was spent in reconnoitring and demonstrations, while waiting for Warren's movement. Early in the morning of the 29th Warren started from Robertson's Tavern, crossed over to the plank-road, drove in the skirmishers of A. P. Hill's corps and late in the day came upon Hill's position across the road. Warren reported to Meade that the conditions were favorable for an attack, and personally assured him that he could carry everything before him. Meanwhile some of Sedgwick's division commanders had discovered weak points on Lee's left, no works being thrown up, and Meade ordered an attack for the morning of the 30th, the right and centre to open with artillery at 8 o'clock, at which time Warren was to make the main attack, and at 9 o'clock Sedgwick was to assault Lee's left with five divisions of the Fifth and Sixth corps. Two divisions of the Third corps were sent to Warren, thus increasing his command to six divisions of 26,000 men. The batteries on the right and centre opened a furious fire at 8 A.M. The skirmishers of the First and Third corps advanced across Mine Run and drove in those of the enemy, and Sedgwick was about to assault when Meade ordered him to desist. He had received a dispatch from Warren advising against an attack on Lee's right, as it could not succeed. During the night of the 29th Warren had made dispositions for an overwhelming assault, but on the morning of the 30th he saw on the heights before him a line of strong works thrown up over night, well filled with infantry, and heavy batteries covering the slope up which it was necessary to charge, and therefore he deemed successful attack impossible. Meade rode over to Warren, who proved unchangeable in opinion, and Meade tried to arrange for an attack later in the day, but found it impracticable. The armies remained confronting each other that day and the next, and on the night of 1 December Meade withdrew to his former position beyond the Rapidan. Lee followed part way on the 2d. The Union loss in the Mine Run campaign, 26 November to 2 December, was 173 killed, 1,099 wounded and 381 missing. The Confederate loss was 110 killed, 570 wounded and 65 missing. Consult 'Official Records' (Vol. XXIX); Humphreys, 'From Gettysburg to the Rapidan'; Pennypacker, 'Life of General Meade'; Wather, 'History of the Second Army Corps'; Powell, 'History of the Fifth Army Corps'; The Century Company's 'Battles and Leaders of the Civil War' (Vol. IV).

E. A. CARMAN.

**MINE SURVEYING.** See SURVEYING.

**MINE-SWEEPING.** Almost immediately upon the development of the mine itself came the development of measures for combating of mines. From the very first the mine was used as a weapon of offense and it became necessary to find some means of protection against it. As early as 1777, Bushnell, an American inventor, devised moving machines which were discharged in the Delaware River against British ships. These were later ridiculed in a ballad called 'The Battle of The Kegs.' Later in the

blockade of American harbors by the British in 1813, and in the Crimean War, nothing more useful seems to have been employed in the detection and destruction of mines than dragging for them with nets, etc.

During the American Civil War, however, mines began to be used on so large a scale and so effectively that it became necessary for the Northern States to adopt adequate measures for protection against them. The first idea was to creep for the cable connecting the torpedoes, in the hope that the creep would break the cable or explode the mines. Later, chains towed between two vessels were used in an attempt to seize the moorings of the mines, the latter being then raised and rendered harmless. These methods do not appear to have met with any great measure of success.

In 1863, Ericsson constructed his mine-destroyer, which consisted mainly of a strong float attached to the forward part of the ship and extending well to the front of the bow. At the extreme front end of the float and several meters under the surface of the water was fixed an explosive charge of 700 pounds of powder. In front of the charge were rigged two timbers which, upon engaging an obstacle, closed upon each other as do the parts of a parallel ruler, thereby igniting the charge. The important feature of the invention was the air chamber placed directly in front of the charge. This gave way at the push of the explosion and allowed the full force to be sent forward against the obstacle, thereby protecting the float itself from any damage. A large number of these mine-catchers were produced at that time, but for some reason or other no further use was made of the invention.

Up to quite recent times nothing had been done toward the improvement of methods for the detection of mines. They had been used mostly as a weapon of defense for the protection of coastal localities and the blocking of channels, until the outbreak of the Russo-Japanese War. During this war, however, it became the custom to strew broadcast great numbers of unanchored mines, and it became necessary to find a means of searching out the location of these mines and destroying them.

The oldest method of protecting warships against mines was in the use of less valuable ships as exploders. One or more of these would go ahead of the battleships, in the hope of striking and exploding enough mines to make a breach in the minefield. The exploder had to be of draught at least equal to that of the ship to be protected, and also had to be so constructed that after the explosion of the first mine the engines would still drive it ahead to the destruction of others. To meet the latter requirement, the ship had to have its engines located aft, as in the case in tank steamers. Of course, the exploder was inevitably sacrificed, so that the method was a very expensive one. Other objections were that even a number of these ships might go through a field and miss mines that would sink the ships to be protected, and that success in the exploder's mission meant sure death to her crew.

Another contrivance for the discovery of and protection against mines is the mine-catcher. This is a very heavy and clumsy apparatus, consisting of steel frames or wooden balks fixed to the sides of the vessel, supported and stiff-

ened below by wire hawsers. The mine-catcher is expected to break the moorings, causing the mine to rise to the surface, where it can be rendered harmless, or to overturn the mine, causing the explosive to be displaced. In any case, it is quite likely that the resulting explosion will damage the catcher, necessitating frequent repair. In order to be able to break a wire hawser, the mine-catcher has to be very strongly constructed. This results in a bulk and weight which greatly hinder the proper navigation of the ship and hold it down to a very slow pace. Counter-mines are often used although they are in reality not employed to seek out the location of mines, but rather to destroy a field which has already been located. They are joined up in a series and towed along on a wide front. When it is found that the counter-mines have engaged the enemy mines, the boats sheer off the necessary distance and the charges are exploded by electricity, the nearby enemy mines being thereby destroyed.

A many-fluked grapnel is often used to drag for the cables of such mines as are exploded from the shore. In some cases the fished-up cable fails to break, so that it is well to have an explosive charge in the grapnel, with an arrangement for detonating it from the vessel by which the grapnel is operated. During the American Civil War, search was made for mines with chains and hawsers. This is the method which is now usually employed when no other means are at hand. It was the one used by the Russians when they first started searching for the mines which the Japanese placed in waters about the harbor-mouth at the siege of Port Arthur.

The Russians used two boats in dragging for mines, with a hawser stretched between them. It was soon found that little could be accomplished with this arrangement on account of the fact that the hawser in motion tended to rise toward the surface, and that it formed an acute angle in the middle, thus reducing greatly the area swept. The first of these difficulties was partially overcome by attaching weights to the cables where they were fastened to the sweeping-hawser. A further improvement, partially overcoming the second difficulty, was in placing floats at the ends of the cables, suspending weights from each float to the proper depth, and attaching the hawser to these weights. The floats were so constructed and attached as to cause them to sheer out, thus giving the sweep the necessary spread.

From this time dates the organization of the first mine-sweeping flotilla ever employed. It searched and cleared the channel on a regular plan, affording ships a safe ingress and egress. No Russian ships went out of the harbor until the mine-sweeping flotilla had first searched the channel. The use of floats and weights necessitated a contrivance of great bulk, difficult to cast and haul in, and too heavy to permit of any but the slowest speed. To overcome these difficulties, use was made of the well-known theory that a pent-shaped log, towed behind a boat, can be kept at any given depth with any given speed by adjusting the tow-line to the proper length.

Sjostrand, a Swedish inventor, used this theory in producing his mine-sweeper, which consisted of a drag-hawser attached at the ends to logs or kites kept at the proper depth by

regulating the length of cable and the speed of the vessel. The kites were constructed and attached in such manner as to cause them to sheer out and maintain a wide spread of sweep. This device was in reality only a mine-searcher. An improvement converted it into a mine-remover as well. The hawser was so attached to the cable at one end that, upon encountering a mine-mooring, it would break from the cable. At the loose end was fixed a grappling-hook containing an explosive charge. The mooring having been encountered and the hook end freed thereby, the hawser was dragged along the mine cable until the hook or catcher grappled and held it. The charge was then exploded from the ship and the mine destroyed or brought to the surface.

The removal of mines brought to the surface is most easily accomplished by firing into them; for this work, small-calibre guns firing shell are provided. Small-bore rifle bullets make holes so small that the water enters very slowly into the mines. Guns firing shell produce much larger holes, and there is always the possibility of exploding the mine with a fragment. The great importance which the experience of war attaches to all means of combating mines has led to the production of a great many appliances, but none of them are practicable, so that the mine-sweeping appliance of Swedish origin remains the most advanced and the best. This sweep is useful only against mines which are anchored, since it attacks the moorings. Against free mines, there is no protection except a sharp lookout. The only real protection against drifting mines lies in the development of naval aircraft, from which the location of mines can be established, especially drift mines, which float on or near the surface.

EDWARD S. FARROW.

*Consulting Military and Civil Engineer.*

**MINE WORKERS OF AMERICA, United**, an American labor organization, formed 25 Jan. 1890, to "unite mine employees that produce or handle coal or coke . . . and ameliorate their condition by means of conciliation, arbitration, or strikes." Its executive officers are president, vice-president and secretary-treasurer; a national executive board is made up of these officers and of 25 delegates, one each from the various district divisions. The United Mine Workers made great gains in membership by its bituminous strike in 1897, and by the famous anthracite strikes of 1900 and 1902; the two last mentioned strikes were under the leadership of Pres. John Mitchell (q.v.). The policy is typically aggressive and almost the entire funds of the union are used to support strikes and spread the organization. The organ is *The United Mine Worker*.

**MINER, Alonzo Ames**, American Universalist clergyman: b. Lempster, N. H., 17 Aug. 1814; d. Boston, Mass., 14 June 1895. He was educated in secondary schools, taught for a time, was ordained to the Universalist ministry in June 1839, was pastor at Methuen, Mass. (1839-42), and at Lowell (1842-48), was colleague of Hosea Ballou at Boston (1848-52), and full pastor (1852-62; 1874-95). In 1862-74 he was president of Tufts College (Medford, Mass.). He originated the Universalist Publishing House, Boston; was chairman of the Amer-

ican Peace Society, which he represented at the international congress, Paris, 1889; was Prohibition candidate for governor of Massachusetts in 1878 and for mayor of Boston in 1893; and was also once known as a lecturer on anti-slavery. He edited the *Star of Bethlehem* at Lowell, and published 'Bible Exercises' (1854-84); 'Old Forts Taken' (1878-85); 'Doctrines of Universalism.' Consult Emerson, G. H., 'Life of Alonzo Ames Miner' (Boston 1896).

**MINER, Charles**, American journalist: b. Norwich, Conn., 1 Feb. 1780; d. Wilkesbarre, Pa., 26 Oct. 1865. At the age of 19 he removed to the Wyoming Valley, Pennsylvania, where, with his brother, he established the *Luzerne Federalist* and afterward *The Gleaner*, for which he wrote humorous sketches. Subsequently he became assistant editor of the *Political and Commercial Register* of Philadelphia and also established, with his brother, the *West Chester Village Record*, to which he contributed under the name of "John Harwood." He was a member of Congress from Pennsylvania in 1825-29 and was the first to bring to the notice of that body the possibilities of the culture and manufacture of silk in the United States. His 'History of Wyoming' (1845) contains a vivid description of the Wyoming massacre, obtained from an eye-witness.

**MINER, William Harvey**, American journalist and author: b. New Haven, Conn., 5 March 1877. He took a special literary course at Yale University in 1896 and was graduated at Columbian (now George Washington) University in 1899. For a time he was a staff member of the *Lowell (Mass.) Mail*. He traveled extensively in the Middle and Far West, in Canada and in Europe and published 'George Catlin, a Memoir' (1900); 'The Lewis and Clark Expedition' (1901); 'Daniel Boone' (1901); 'The Rowfant Club' (1903); 'The Beginnings of American Science' (1906); 'Savage and Chatterton' (1907); 'Life of Charles Churchill' (1907); 'The Iowa Indians' (1911); 'History of the American Indians, North of Mexico' (1913).

**MINERAL ACIDS, Toxicology of.** Poisoning by ingestion of sulphuric acid causes pain in mouth, nose, throat and epigastrium; bloody saliva; vomiting, bloody diarrhoea; feeble pulse; cold, damp surface; and collapse. Ulceration of stomach and larynx may occur and if the patient survives, a form of Bright's disease follows quickly. The antidote is any available alkali as soap, chalk, magnesia or whitewash, scraped, perhaps, from a wall. Hydrochloric acid (q.v.) causes similar though possibly less severe symptoms and recovery is more often possible. The antidotes are the same. Nitric acid (q.v.) exceeds sulphuric in the violence of the symptoms caused, with sudden death. Instead of black sloughs in the mouth, œsophagus and stomach, such as occur in sulphuric-acid poisoning, in nitric-acid intoxication yellow sloughs and stains are found after death. Nitromuriatic-acid poisoning resembles poisoning by nitric acid in symptoms and pathological results. Similar yellow staining is found. The antidotes are alkalis. Phosphoric acid (q.v.) is not corrosive to animal tissues, though the glacial acid coagulates albumen. Its antidote

is any alkali at hand, but its effects are not highly dangerous. See ACIDS; TOXICOLOGY.

**MINERAL COLORS**, inorganic materials in the making of paint. They date as far back (or farther) in the history of coloring materials as organic materials, the paints used by primitive peoples for personal decoration being more commonly of this class. In Greek painting the main sources of coloring matters were carbonate of chalk for whites; red and yellow ochres; and carbon. Apparently these same colors were used in Egyptian wall-painting. The range was much widened at the beginning of the Christian era at Rome and the chemical activity of the last century has added largely to the mineral sources of colors. These may be roughly classified as follows: Whites from calcium, for example, carbonate and sulphate; from barium, for example, sulphate (natural and artificial) and tungstate; from lead, for example, carbonate, hydrocarbonate, sulphate, antimonite, tungstate; from zinc, the oxide, oxychlorine, etc.; from silicium and talc; from antimony; and from the hyponitrate of bismuth. Reds are based on iron, as sesquioxide and red ochre; on mercury; on lead, as minium; on arsenic, as arseniate of cobalt; on antimony and on gold. The greatest source of yellows is chromic acid derivatives; next the lead colors; and then the ochres and other minor sources. Blues are derived from copper (hydrate, arseniate, carbonate), from cobalt (aluminates and silicates) and from iron (phosphates, etc.); greens from chrome (notably sesquioxide), copper, manganese, etc.; and blacks mostly from carbons. An excellent handbook of the subject is Perret, 'Couleurs Minérales' (1902).

**MINERAL LAND LAWS OF THE UNITED STATES.** Mineral lands of the United States are disposed of under the general laws dating back to 1866. Lands containing valuable mineral deposits may be acquired by one of two methods, the first as provided for lode claims and the second as provided for placer claims. The applicant must be a citizen of the United States or have declared his intention to become a citizen. Each person in the case of an unincorporated association must be similarly qualified and a corporation making mineral entry must be organized under the laws of the United States or of any State or Territory.

Lode claims are those based upon a lode, ledge or vein of mineral-bearing rock and they may include an area of not more than 1,500 linear feet along the course of the vein and not more than 300 on each side of the vein; that is an area of about 10½ acres. The law, however, recognizes the local laws and customs which may provide for smaller limits in the area to be taken. This method of acquisition is intended to include gold, silver, copper, lead, tin and other similar minerals occurring in veins. One who discovers a mineral deposit may record his claim in the local county records as provided by the State laws or regulations and he may retain the right of possession indefinitely by performing \$100 worth of labor thereon annually or making improvements of equivalent value. Patent from the United States may be obtained by filing mineral entry

in the local land office and making proof in accordance with the law and the regulations.

Placer claims are those allowed in the case of discovery of mineral deposits not occurring in a lode or a vein. These claims may not exceed 20 acres in the case of an individual nor 160 acres by an association of persons. Annual proof of \$100 worth of labor or improvement is required as in the case of lode claims and there must also be proof of improvements of a value not less than \$500. Besides the precious minerals, placer claims have been extended to include deposits of phosphates, oil, gas, etc. Patent is obtained in the same manner as in the case of lode claims. By the Act of 17 July 1914 Congress provided for agricultural entries in the case of lands classified as containing phosphate, nitrate, potash, oil, gas or asphaltic minerals. This permits the use of the surface of the land for agricultural purposes in such a way as not to interfere with the extraction of these minerals. Mineral lands are supposed to be classified at the time of survey by the surveyor who indicates the several areas which appear to be agricultural or mineral; but lands not so classified as mineral may be acquired under the mineral laws.

The coal land laws provide for the acquisition of lands valuable for coal by entry by an individual above the age of 21 who is a citizen of the United States or has declared his intention to become such and shall not exceed 160 acres. An association of persons may take 320 acres but each person composing an association must be qualified as in the case of an individual entryman. When an association of not less than four persons each qualified as above shall have expended not less than \$5,000 in working and improving a mine or mines of coal upon the public lands, such association may enter not exceeding 640 acres, including such mining improvements. Only one entry of coal lands may be made by any person or association of persons.

The land must be paid for at its appraised value according to the estimated amount and character of the coal therein, the price being not less than \$10 per acre when situated not more than 15 miles from a completed railroad and \$20 when situated within 15 miles of a completed railroad.

In the Territory of Alaska coal land can be acquired only by lease in tracts not exceeding 2,560 acres to any person above the age of 21 who is a citizen of the United States or to any association of such persons or to any corporation or municipality organized under the laws of the United States or of any State or Territory. These leases are offered through advertisement, competitive bidding or such other method as the Secretary of the Interior may adopt. The lessees shall pay such royalties as may be specified in the lease which shall not be less than two cents per ton and an annual rental at the rate of 25 cents per acre for the first year, 50 cents for the second, third, fourth and fifth years and \$1 per acre for every year thereafter during the continuance of the lease, which may not exceed 50 years, but shall be subject to renewal on such terms and conditions as may be authorized by law at the time of such renewal. The earliest action in regard to the mineral lands of the United States is found in

the ordinance of 20 May 1785 for the disposal of lands in the Western Territory passed by Congress under the Articles of Confederation, and provided for the reservation of one-third of all gold, silver, lead and copper mines to be sold or otherwise disposed of. By the Act of 3 March 1807 Congress inaugurated the plan of leasing mineral lands. This method of dealing with the mineral lands was continued in force until the conditions developed by the discovery of gold in California and other Pacific States forced Congress to take more definite action. As a result of long years of investigation Congress by the Act of 26 July 1866 provided the means for acquiring title to mineral lands, the areas and other conditions of acquisition to be subject to the local customs or rules of miners in the district where the land is located. This method was adopted because in the absence of any definite law miners in each district were forced to organize and adopt some plan for defending and protecting the rights of those who were discovering and working mineral claims. While there was a similarity in the local rules so adopted there was sufficient variation to make it rather difficult for Congress to fix specific conditions at that time. By gradual developments the law in regard to mining and placer claims was fixed as above described.

Under the Acts of Congress of 17 July 1917 and the Soldiers' and Sailors' Civil Relief Act of 8 March 1918 no right to any entry or claim to the public lands will be subject to cancellation or forfeiture while the applicant is in military service.

There is a general feeling among those interested in mines and mining that present laws and decisions of the courts are not well adapted to future development and there is a strong movement on foot for a codification of the mining laws so that they may better apply to the present conditions of the mining industry.

MORRIS BIEN,  
*United States Reclamation Service, Washington, D. C.*

**MINERAL PAINTS.** See MINERAL PRODUCTION IN THE UNITED STATES.

**MINERAL PHOSPHATES.** See FERTILIZERS.

**MINERAL POINT, Wis.,** city in Iowa County, 50 miles west of Madison, on the Chicago, Milwaukee and Saint Paul and the Mineral Point and Northern railroads. Iron, lead, zinc and sulphur are found in the vicinity. The chief industry is the manufacture of oxide of zinc, lead and sulphuric acid. The city owns waterworks, a public library, a high school building and a municipal auditorium. Mineral Point was settled in 1827. Pop. 2,925.

**MINERAL PRODUCTION OF THE UNITED STATES.** The output of mineral products in the United States has had a steady increase for many years and in 1916 reached a grand total of more than \$3,500,000,000. The European War had great influence in increasing

TOTAL VALUE OF MINERAL PRODUCTS OF THE UNITED STATES FROM 1880 TO 1916.

## MINERAL PRODUCTION OF THE UNITED STATES

the production in 1914-16 for a vast amount of mineral matter was consumed in many lines of manufacturing, munitions, ship-building, etc., connected with the conflict. The values of mineral products from 1880 to 1916 and the

production of the principal minerals in 1916 are given in the following tables together with the figures for 1908 for comparison. They are taken from the data obtained by the United States Geological Survey.

## MINERAL PRODUCTION OF THE UNITED STATES.

(First Products).

PRODUCTS	1908		1916	
	Quantity	Value	Quantity	Value
Arsenious oxide.....			5,986 short tons	\$555,186
Asbestos.....	936 tons	\$19,624	1,479 short tons	448,214
Asphalt <sup>1</sup> and bituminous rock	78,565 short tons	517,485	98,477 short tons	923,281
Barytes.....	38,527 short tons	120,442	221,952 short tons	1,011,232
Bauxite.....	52,167 long tons	263,968	425,100 long tons	2,296,400
Borax (crude).....	25,000 short tons	975,000	103,525 short tons	2,409,459
Bromine.....	1,055,636 pounds	102,344	688,260 pounds	922,225
Cement, natural.....	1,686,862 barrels	834,509	842,137 barrels	430,874
Cement, Portland.....	51,072,612 barrels	43,547,679	94,552,296 barrels	104,258,216
Chrome ore.....	359 long tons	7,230	47,035 long tons	726,243
Clay products.....		133,197,762		297,260,091
Coal, anthracite.....	74,347,102 long tons	158,178,849	78,195,083 long tons	202,009,561
Coal, bituminous.....	332,573,944 short tons	374,135,268	502,519,682 short tons	665,116,077
Emery.....	669 short tons	8,745	15,282 short tons	123,901
Feldspar.....	70,474 short tons	428,553	132,681 short tons	702,278
Fluorspar.....	38,785 short tons	225,998	155,735 short tons	922,654
Fuller's earth.....	29,714 short tons	278,367	67,822 short tons	706,951
Garnet.....	1,996 short tons	64,620	6,171 short tons	208,850
Glass sand.....	1,093,553 short tons	1,134,599	2,018,317 short tons	1,957,797
Graphite, crystalline.....	144 short tons	132,840	5,416 short tons	914,748
Graphite, amorphous.....	1,443 short tons	75,250	2,622 short tons	20,723
Grindstone.....				766,140
Gypsum.....	1,721,829 short tons	4,075,824	2,757,730 short tons	7,959,032
Iron ore.....	35,983,336 long tons	81,845,904	77,870,553 long tons	181,902,277
Iron ore, manganiferous.....	55,620 long tons	132,556	548,803 long tons	2,005,491
Lithium minerals.....	203 short tons	1,550	619 short tons	12,035
Magnesite.....	6,587 short tons	19,761	154,974 short tons	1,393,693
Manganese.....	6,144 long tons	62,779	26,997 long tons	627,417
Mica, scrap.....	2,417 short tons	33,904	4,433 short tons	69,906
Mica, sheet.....	972,964 pounds	234,021	433 short tons	524,485
Marls.....	8,469 short tons	4,330		
Millstones.....		31,420		44,559
Monazite.....	422,646 pounds	50,718	37,872 pounds	3,400
Mineral paints.....	68,694 short tons	2,410,367	135,606 short tons	23,515,803
Mineral waters.....	55,868,820 gallons sold	6,712,680	55,928,461 gallons	5,735,035
Molybdenum.....			1,228 short tons	114,866
Natural gas.....		54,640,374		120,227,468
O lstones.....		217,284		154,573
Petroleum.....	178,527,355 barrels	129,079,184	300,767,158 barrels	330,899,868
Phosphate rock.....	2,386,138 long tons	11,399,124	1,982,385 long tons	5,896,993
Peat.....		133,000		369,104
Pumice.....	10,569 short tons	39,287	33,320 short tons	82,263
Precious stones.....		415,063		217,793

<sup>1</sup> Not including asphalt manufactured for American petroleum.

PRODUCTION OF METALS IN THE UNITED STATES.

(First Products).

PRODUCTS	1908		1916	
	Quantity	Value	Quantity	Value
Aluminum	11,152,000 pounds	\$2,434,600		\$33,900,000
Antimonial lead	13,629 short tons	1,264,771	24,038 short tons	4,463,582
Antimony			4,500 short tons	40,580
Cadmium			135,212 pounds	205,433
Copper	942,570,721 pounds	124,419,335	1,927,850,548 pounds	474,288,000
Ferro alloys	152,018 long tons	6,080,720	589,738 long tons	50,281,692
Gold	4,574,340 Troy ounces	94,560,000	4,479,056 ounces	92,590,300
Iron, pig	15,936,018 long tons	254,321,000	39,126,324 long tons	663,478,118
Lead	310,762 short tons	26,104,008	552,228 short tons	78,207,000
Magnesium			75,401 pounds	311,462
Molybdenum			206,740 pounds	205,000
Nickel			918 short tons	671,192
Platinum	750 Troy ounces	14,250	28,088 ounces	2,301,762
Quicksilver	19,752 flasks	824,146	29,932 flasks	2,576,547
Silver	52,440,800 Troy ounces	28,050,600	74,414,802 Troy ounces	48,953,000
Tin	few tons		278,000 pounds	120,874
Zinc	190,749 short tons	17,930,406	563,451 short tons	151,005,000

SOME IMPORTANT SECONDARY MINERAL PRODUCTIONS OF THE UNITED STATES.

PRODUCTS	1908		1916	
	Quantity	Value	Quantity	Value
Asphalt from petroleum	102,281 short tons	\$1,322,616	688,334 short tons	\$6,178,851
Alum	7,700 short tons	236,710	27,257 short tons	1,177,881
Alumina sulphate			153,860 short tons	4,410,741
Alumina abrasive (alundum, etc.)	1,580 short tons	189,600	30,708 short tons	2,139,230
Ammonium sulphate	87,600 short tons	5,247,240		
Arsenic	2,603,505 pounds	99,193	11,972,000 pounds	555,186
Bromine	1,149,000 pounds	103,410	688,260 pounds	922,225
Calcium chloride			26,062 short tons	216,129
Cement, slag	4,535,300 barrels	3,628,240		
Coke	23,496,666 short tons	55,595,792	54,533,585 short tons	170,841,197
Copper sulphate	37,654,961 pounds	1,833,796	49,728,577 pounds	
Copperas	35,334 short tons	388,674		
Graphite, artificial	7,385,511 pounds	502,667	8,398,000 pounds	
Lead, white	125,728 short tons	11,488,315	128,977 short tons	21,274,480
Lead, red and orange mineral	11,751 short tons	1,199,339	23,035 short tons	3,933,566
Lime	2,766,873 short tons	11,091,186	4,083,803 short tons	18,618,816
Litharge	12,254 short tons	1,231,206	37,739 short tons	5,853,543
Manganese residuum	110,225 long tons	220,450	Not public	
Mineral wool	9,197 short tons	77,228	Not public	
Potash			9,720 short tons	4,242,730
Silicon carbides (carborundum, etc.)	2,453 short tons	294,430	7,025 short tons	707,120

The various mineral products of economic importance are described in detail under separate headings throughout the Encyclopedia. The following is a brief review of the source in the United States of the principal ones in the above lists:

**ANTIMONY.**— Chiefly used for hardening lead; was in considerable demand during the World War. Part is produced as antimonial lead. Since 1915 Alaska has furnished a large proportion of the antimony ore; same comes also from California, Nevada and a few other Western States.

**ALUMINUM.**— The extensive demand for aluminum lightweight machinery and utensils and the lowering of its price by improved methods of reduction account for the vast increase in its production in the last decade. Much of it is made from bauxite largely mined in Pulaski and Sabine counties, Ark., with smaller supplies from Georgia, Alabama and Tennessee.

**ARSENIC.**— The arsenic of commerce extensively used in making dyes, glass, poisons and drugs is mostly produced from mines in Washington and small amounts are obtained from some of the smelters.

**ASBESTOS.**— Most of our supply of this useful mineral fibre is imported from Canada (133,339 tons in 1916), but small amounts are mined 40 miles northeast of Globe, Ariz., and near Salt Mountains, Georgia. The fine asbestos in the bottom of the Grand Canyon appears to be too inaccessible to be utilized.

**ASPHALT.**— Besides the 688,334 tons of asphalt produced from petroleum, natural asphalts and bituminous rocks are mined at various places in Utah, California, Kentucky and Texas. While much of the material is used for roads, the minerals gilsonite, grahamite, wurtzilite and ozocerite have many uses in the arts.

**BARYTES.**— Used principally as white pigment notably in "lithopone," is mostly mined in Georgia, Missouri, Tennessee, Kentucky, South Carolina, North Carolina, Alabama and southwestern Virginia. Production has been increasing steadily and in 1910 it passed the \$1,000,000 mark.

**BISMUTH.**— This metal is used mostly in alloys for safety fuses, and in medicine. It is separated from various ores at several smelters and is also mined in small amounts in Colorado and Utah.

**BORAX.**— This salt is produced from colemanite mined in a few localities in southern and southeastern California.

- The famous Death Valley mines are no longer large producers.
- BROMINE.**—Separated from salt brines at several places in Michigan and West Virginia and at Pomeroy, Ohio. It is used extensively in photography, for dissolving gold and in various chemicals and medicines.
- CADMIUM.**—Produced in small amount as a by-product in lead and zinc smelting, is used as an alloy for safety plugs of automatic fire extinguishers, for increasing the malleability of silver for silverware, in pigments and in dental amalgam. Its value is about \$1.50 a pound.
- CEMENT.**—There is almost an unlimited supply of limestone and other materials available for making Portland and other cements but their utilization depends on the demand and proximity to market. Pennsylvania leads in its manufacture but Indiana, Iowa, California and New York are important producers.
- CHROMIUM.**—Chromite or chromate of iron is the principal source of this metal which is in great demand for hardening steel. It is also used for pigments, notably in one which gives khaki its distinctive tint. Shasta County, Cal., is the largest producer but additional supplies come from other parts of that State and from Oregon, Wyoming and Maryland.
- CLAY.**—See CLAY.
- COAL.**—See COAL.
- COPPER.**—Arizona is the leading producer of copper with Montana second, Michigan third and Utah fourth. Several other States have large yields, notably Nevada, New Mexico, Alaska, and California. The only Eastern State is Tennessee, where the Ducktown mines contributed nearly 8,000 tons.
- EMERY.**—Ordinarily a large amount of emery is imported from Asia Minor and Greece. It is mined near Peekskill, N. Y., the purer mineral corundum is produced in North Carolina and imported from Canada.
- FELDSPAR.**—Used mainly in making pottery, china and enamels and there are projects for using it as a source of potash. The principal production is from Maine, with small amounts from Maryland, New York, North Carolina, Pennsylvania, Georgia and Virginia.
- FLUORSPAR.**—An important agent in the manufacture of open-hearth steel. Illinois and Kentucky afford the largest supplies with small amounts from Colorado, New Hampshire, New Mexico and Arizona.
- FULLER'S EARTH.**—But little Fuller's earth is now employed for fulling cloth, its principal use being for decoloring oils and fats. Florida, Arkansas, California, Georgia, Massachusetts and Texas are the principal producers with 80 per cent from Florida at an average price of \$10.62 a ton. The vast deposits between the Black Hills and Big Badlands in South Dakota are not yet utilized.
- GARNET.**—This mineral is considerably harder and tougher than quartz and is used as an abrasive for leather and wood, and general grinding and polishing. The principal supply comes from Adirondack Mountains, and from New Hampshire and North Carolina.
- GLASS SAND.**—A sand of much more than ordinary purity is required for high grade glass. Uniformity of size of grain and low percentage of iron, magnesia and clay are important requisites. Illinois, southern New Jersey, West Virginia, western Maryland, Missouri and Ohio are the principal producers with small amounts from a dozen other States. The friable Saint Peter sandstone of Illinois is the source of about 500,000 tons a year.
- GRAPHITE.**—Graphite or "black lead" occurs mostly in metamorphic rocks either in grains or in veins of various sizes. Some deposits are coal beds baked by igneous rocks. Most of the domestic production is from Alabama and the southeastern slope of the Adirondacks in New York, Texas, Pennsylvania and California. An amorphous variety comes from near Providence, R. I. Much artificial graphite is produced in electric furnaces at Niagara Falls. The chief uses are "lead" pencils, lubricants, crucible, stove polish and paint. A large amount is imported.
- GRINDSTONE.**—Ohio with 22 quarries leads in the production of grindstones but there are also quarries in Michigan and West Virginia.
- GYPNUM.**—This mineral when roasted and ground is plaster of Paris. It occurs in large amounts in many parts of the western United States, notably New Mexico, Wyoming, Utah and Texas, but New York, Michigan and Iowa yield the largest part of the product. The usefulness of the deposit depends largely on its proximity to markets.
- IRON ORE.**—About 82 per cent of the ore is mined in the Lake Superior region. The Birmingham district in Alabama contributes about 10 per cent and smaller amounts come from New Jersey, New York, Pennsylvania, Georgia, Tennessee, North Carolina and some other States. The amount mined in the Far West is about 1 per cent. Iron ore being pre-eminently a war mineral the production was greatly increased in 1915 and succeeding years. Iron ores containing manganese have lately become very important because of diminution of foreign shipments of manganese during the war and the great need of that metal in steel making. Manganiferous iron ores occur most extensively in the Cuyuna district, central Minnesota, but smaller deposits at Leadville, Colo., Philipsburg, Mont., Tombstone, Ariz., and Franklin, N. J., and near Batesville, Ark., are also producing.
- LEAD.**—A large amount of lead is produced in the reduction of silver ores, especially when the price of silver is high. Missouri leads in lead production with Idaho not far behind, Utah third and Colorado far behind as fourth. Smaller amounts come from Nevada, Arizona, Montana, Oklahoma, Wisconsin and a few other Western States.
- LIME AND LIMESTONE.**—Limestone is quarried in part for burning and in part for building stone in 43 of the 48 States and large bodies of the rock are in proximity to the larger industrial centres. Production in the Western States is relatively small because of limited market. A large amount of limestone is used for Portland cement and road metal. Some is used in agriculture.
- LITHIUM MINERALS.**—Lithia salts are used in small amounts in manufactured mineral waters and in storage batteries. Spodumene and amblygonite from the Black Hills, and lepidolite (lithia mica) and amblygonite from near Pala in California, are the principal sources.
- MAGNESITE.**—Carbonate of magnesia extensively used in the basic open-hearth process of steel making is mostly produced from mines near Porterville, Tulare County, Cal. Smaller amounts come from adjoining counties and from newly discovered deposits of crystalline mineral 60 miles north of Spokane, Wash.
- MANGANES.**—As this metal is required in large amounts in modern steel-making, the ore is in great demand. Much is imported. Most of the mines in the United States are in Georgia, California, Virginia and Arkansas. Manganiferous iron ores, often in some of the silver mines and residue from zinc ore of Franklin, N. J., are also native sources of the metal.
- MARLS.**—Marls containing the potash-bearing greensand, glauconite, are dug in southern New Jersey and eastern Virginia for fertilizer both for direct use on the fields and for admixture with fish scraps.
- MICA.**—With the vast increase in manufacture of electrical supplies mica production is continually increasing, especially as the small plates are now utilized for insulating. Ground mica is also in demand and mica board is made by compressing small fragments. The principal supply comes from North Carolina and some is mined in the Black Hills of South Dakota, New Hampshire and Virginia. Much is imported from Canada and India.
- MILLSTONES AND GRINDSTONES.**—Sandstones quarried in eastern New York, Pennsylvania, North Carolina and Virginia, Ohio, Michigan, West Virginia. Both have to be of particular hardness and structure.
- MINERAL PAINTS** (ochre, umber, sienna, Indian red, etc.).—These pigments are oxides of iron varying from deep-red hematite to light-yellow ochre and mostly containing considerable clay. Principal production is from Georgia, Pennsylvania, New York and Tennessee with small amounts from California and Vermont.
- MINERAL WATERS.**—Waters from mineral springs are bottled at many localities and some of them are shipped to distant markets. Saratoga, N. Y., is a large producer. See special article on this subject.
- MOLYBDENUM.**—Used mainly in steel-making is obtained from ores from a few mines in Arizona with smaller amounts from California, New Mexico and Utah.
- MONAZITE.**—The principal source of thorium used extensively in incandescent gas mantles. Some varieties carry as much as 20 per cent. Most of the native supply is from North Carolina and South Carolina.
- NATURAL GAS.**—Wells producing the largest amounts of natural gas are in West Virginia, Pennsylvania, Ohio, Oklahoma, Kansas, California, Texas, New York and Louisiana. West Virginia yields more than one-third, having been in the lead since 1910.
- NICKEL.**—Is used in most high grade steels, especially in armor plate. The only production from native ore is a by-product in the electrolytic reduction of certain copper ores.
- PEAT.**—The extensive deposits of peat in the North Central States and New England are not drawn on very heavily for fuel in this country but considerable is used for fertilizers and for mixing with stock food.
- PETROLEUM.**—See PETROLEUM.
- PHOSPHATE ROCK.**—Calcium phosphate occurs in various forms in nature from the mineral apatite to fossil bones. Large bodies of phosphate rock occur in Montana, Idaho, Utah and Wyoming, Arkansas, Tennessee, South Carolina and Florida. The South Carolina deposits have been worked since 1867, the Florida deposits from 1888. The vast beds in the Far West are not yet utilized extensively and the deposits in north central Arkansas are only worked on a small scale. See FERTILIZERS.
- PLATINUM.**—This metal, used most extensively for part of the apparatus for producing sulphuric acid by the contact process, is mostly imported from Russia and Colombia. In 1916 about 710 ounces were obtained in gold dredging in California and Oregon.
- POTASH.**—This material which is used mostly for fertilizer has been produced in the United States in quantity only, since imports from Germany were cut off. Natural brines furnished about two thirds, alunite and furnace dust far-

hished about one-seventh, kelp one-fifth and the remainder came from distillery waste and ashes. The alkali lakes of western Nebraska yield a steady output and the great deposits of mixed salts at Searles Lake, California, are being utilized.

**PUMICE.**—The volcanic ash mined in Nebraska, Kentucky, California, Idaho and Utah is termed pumice but as the material is pulverulent the name is a misnomer. It is used extensively in polishing powders called "cleansers."

**PRECIOUS STONES.**—See **GEMS**.

**PYRITE** or iron sulphide is employed mainly for the manufacture of sulphuric acid. The native production is only about one-third to one-quarter of the amount used. Virginia and California are the principal producers with smaller amounts from Illinois, New York, Missouri, Indiana, etc.

**QUICKSILVER.**—About two-thirds of the ores of mercury are mined in California while nearly 30 per cent comes from Texas. Nevada, Arizona and Oregon yield smaller amounts. The use of mercury in detonators naturally caused greatly increased demand for the metal during the war.

**SALT.**—See **SALT**.

**SAND-LIME BRICK.**—Bricks made by heating a mixture of lime and sand are fast growing in popularity and more than a quarter of a billion were produced in 1917. Michigan leads in the production, with Minnesota second and Massachusetts third.

**SILICA.**—Sand dug so extensively in many places for concrete and other uses consists of silica. Quartz and quartzite are also mined and crushed in various States for pottery, paints, polishes, polishing powders and soaps, sandpaper, filters and many minor uses.

**SILVER.**—Many ores of gold have silver as a by-product and much silver occurs in lead ores. Ores of the latter class are worked extensively in the Coeur d'Alene district, Idaho; Park City, Tintic and San Francisco districts, Utah, and Aspen, Creede and Rico districts, Colorado, and some other localities in the West.

**SLATE.**—States of various kinds come mostly from Vermont, eastern New York, Pennsylvania and Virginia, with smaller amounts from New Jersey, Maryland, Georgia, Arkansas, California and Minnesota. Most of it is used for roofing, but considerable of it is made into mantels, table tops, tiles, floorings, etc.

**SOAPSTONE AND TALC.**—Virginia is the principal producer of soapstone which is used largely for laundry tubs, switch boards and table tops. Talc or the purer mineral is mostly ground for toilet powders, paints, heat insulators, paper filler, lubricant and many minor uses. It is obtained mostly from near Gouverneur, N. Y. Some comes from North Carolina, Pennsylvania and California.

**STONE, BUILDING.**—The great deposits of building stones in the United States are worked at many localities, some producing "sandstone," "marble," "granite" and a variety of others. Part of this is in building blocks and part crushed for concrete and road making. Nearly all the States produce some form of stone excepting along the coastal plain from New Jersey to Texas, where rock is scarce and in the interior Western States where the local demand is slight.

**STRONTIUM MINERALS.**—Celestite, the principal source of strontium, is mined in small amount in Arizona, California and Washington. It is used largely for making red fire in fireworks, signals, etc.

**SULPHUR.**—Nearly all the sulphur produced in the United States come from Louisiana and Texas. It has been estimated that the consumption in 1916 was about 900,000 tons for paper, chemicals and explosives and other uses.

**TIN ORE.**—Tin is mostly imported, but 139 tons were produced from ore obtained in Alaska. A small amount comes from North Carolina. The deposits in Black Hills of South Dakota and San Bernardino County, Cal., are not producing.

**TITANIUM ORES.**—Rutile (TiO<sub>2</sub>) is the principal source of titanium now used in electric lights, steel making and coloring artificial teeth and pottery glass. Nelson County, Va., is the principal producer.

**TRIPOLI AND INFUSORIAL EARTH.**—Tripoli, a light-colored silica resulting from weathering of silicious limestone, is produced mostly in Missouri and rottenstone of similar origin is mined in central Pennsylvania. They are used for polishing powders. Infusorial or diatomaceous earth consists of silicious remains of minute aquatic plants. It is used as an absorbent, for fireproofing and in records for talking machines. The principal production is from California, Nevada and Maryland.

**TUNGSTEN ORE.**—Tungsten is in great demand for hardening steel for use in high speed work and also for electric lamp filaments. Atolia, Cal., Boulder County, Colo., and Dragoon, Arizona, are the principal producers.

**URANIUM AND VANADIUM MINERALS.**—Carnotite, the most important ore of uranium and vanadium in the United States, also contains minute amounts of radium. This ore is obtained mostly from western Colorado and adjoining portions of Utah, disseminated in sandstone or in joints. It also is obtained near Green River, Utah. Uvanite is produced near Temple, Utah. Pitchblende is mined

near Central City, Colo. Vanadium is used for hardening steel; it is mined in San Miguel County, Colo.

**ZINC ORE.**—Zinc is produced directly from various zinc ores and also as a by-product in working lead and silver ores. Leadville, Colo., and Coeur d'Alene, Idaho, are important producers of the latter. The Joplin district of Missouri furnishes about one-fourth of the zinc ore and Franklin Furnace, N. J., and Butte district, Mont., each yield about one-fifth.

NELSON H. DARTON,

*Geologist, United States Geological Survey.*

**MINERAL TALLOW**, also called hachittite, a yellowish-white, soft and inodorous mineral wax, or tallow, that melts at 115° to 170° F. It is composed of about 86 per cent carbon and 14 per cent hydrogen. The substance is closely related to ozocerite. It is found in Wales, Scotland, Moravia, Austria, Germany and Siberia.

**MINERAL WATERS**, a term used to designate such waters as have as constituents an unusual proportion of medicinal minerals. Mineral waters have been used as remedial agents from the earliest days of Greece and Rome. There were sulphurous thermal springs at Tiberius, which are still used by invalids from all parts of Syria, in cases of tumor, rheumatism, gout and other diseases. There are also warm springs at Calirrhoe, near the Red Sea, which are mentioned by Josephus as having been tried by Herod in his sickness. The Romans discovered the thermal springs in Italy, and the springs in other parts of Europe—Baden-Baden, Aix-la-Chapelle, the Spa in Belgium and others. Pliny mentions mineral springs in various parts of Europe.

**Classification.**—No classification of mineral waters based upon their chemical composition can be strictly exact, because many springs are intermediate between well-characterized groups. The following classification is regarded as the most comprehensive:

The first general division is as to thermal or non-thermal. Waters which issue from the ground at a temperature above 70° F. belong in the first class; those whose temperature is below 70° to the second class.

Four divisions are made as to the chemical constitutions of the several waters: (1) the alkaline; (2) the alkaline-saline; (3) the saline, and (4) the acid. The *alkaline* waters are those which have an alkaline reaction and contain carbonic acid or bicarbonic acid ions in predominating quantities; or boric or silicic acid ions in predominating quantities, so that their alkalinity is evidently due to the presence of borates or silicates. The *saline* waters are those having an alkaline or neutral reaction and contain sulphuric, muriatic or nitric acid ions in predominant quantities. The *alkaline-saline* waters come between the two groups just described: they have an alkaline reaction and contain sulphuric, muriatic or nitric acid ions along with carbonic or bicarbonic acid ions; or they contain sulphuric, muriatic or nitric acid ions along with boric acid or silicic acid ions—both classes being present by predominating constituents. The *acid* waters have an acid reaction and contain either sulphuric or muriatic acid ions in predominating quantities.

Mineral waters are also grouped as to their gaseous constituents: (1) non-gaseous; (2) carbon-dioxidated,—containing carbon dioxide gas; (3) sulphuretted—containing hydrogen sulphide gas; (4) azotized—containing nitro-

gen gas; (5) carbureted—containing methane gas, and (6) oxygenated—containing oxygen gas.

The scheme proposed by the United States Bureau of Chemistry for the exact classified descriptions of mineral waters is as follows:

Thermal or non-thermal	{ Sodic Lithic Potassic Calcic Magnesic Ferruginous Aluminous	Carbonated or Bicarbonated Borated Silicated	} Alkaline	} Arsenic Bromic Iodic Siliceous Boric Lithic Ferruginous Etc.	} Non-gaseous Carbonic acid Sulphureted Azotized Carbureted Oxygenated	
		Sulphated Muriated Nitrated				} Alkaline- Saline
		Sulphated Muriated Nitrated				} Saline
		Sulphated Muriated				} Acid

The description of a sample mineral water might read according to this schedule, "a non-thermic, calcic, bicarbonated, alkaline water"; or "a thermal, sodic, borated and carbonated, alkaline water"—and be exactly classified.

The substances which are usually sought for and measured quantitatively in mineral waters are basic radicles (*cations*): iron, aluminum, manganese, calcium, strontium, barium, magnesium, sodium, potassium, lithium, ammonium and hydrogen.

Acidic radicles (*anions*): chlorides, bromides, iodides, fluorides, carbonates, bicarbonates, sulphides, thiosulphates, sulphites, bisulphites, sulphates, bisulphates, nitrites, nitrates, arsenites, arsenates, metaborates, pyroborates, orthophosphates, metasilicates and hydroxides.

Gases: carbon dioxide; hydrogen sulphide; oxygen, and methane.

The therapeutic action of mineral waters depends chiefly upon their chemical composition and to some degree upon their temperature. Other circumstances, as situation, elevation, climate, geological formation and mean temperature have an important bearing upon the success of the treatment.

All drinking of these medicinal waters for remedial effects should be solely under the direction of a physician. The effects upon each individual are largely constitutional and a course of water beneficial to one may be highly injurious to another. As a general rule mineral water at the springs is taken before breakfast, at intervals of about a quarter of an hour between each tumbler, moderate exercise being taken in the intervals. In many cases bathing is of even greater importance as a remedial agent than drinking. Baths are generally between breakfast and dinner, and should never be taken soon after a full meal. The time during which the patient should remain in the bath varies very much at different springs, and the directions of the local physician should be strictly attended to on this point. As a general rule the treatment should not be protracted beyond the space of six weeks or two months, but on this point the patient must be solely guided by the physician resident at the springs. As regards temperature, if the waters are between 70° and 98° they are called tepid, while all exceeding the latter are classified as hot springs. The following examples give the degrees of temperature found in different ther-

mal springs: Sweet Springs, W. Va., 74°; Warm Springs, French River, Tenn., 95°; Washita, Ark., 140° to 156°; San Bernardino Hot Springs, Cal., 108° to 172°; Las Vegas, N. Mex., 110° to 140°; Sulphur Springs, Aix-les-Bains, France, 108°; Kaiserquelle, Aix-la-

Chapelle, Prussia, 131°; Carlsbad, Bohemia, 162°.

**American Springs.**—In the United States the Rock Spring was known at Saratoga, N. Y., among the Indians as early as 1767, and over 40 springs have since been discovered there. In 1830 springs were well and popularly known in West Virginia, and of these the Bath mineral spring, now known as the Berkeley Spring, was visited as early as 1777, while the White Sulphur Springs were used by the Indians in 1778. In these American springs, like those in Europe, the geologists agree that dissolved mineral substances are obtained from the rocks through which the water has flowed. The majority of waters contain carbonic acid which greatly increases their solvent powers in the presence of lime, magnesia and iron. If the waters are alkaline they may take up substances which are ordinarily rather insoluble, such as silica. There is, undoubtedly, more or less relation between hot springs and the geological structure of a region.

**Alkaline Waters.**—Simple alkaline acidulous waters are composed of carbonic acid and bicarbonate of soda. The most important springs of this class are the thermal springs of Las Vegas, N. Mex., and the cold springs at Sharon, N. Y. These waters are useful in certain forms of indigestion, jaundice, gallstones, gravel, gout and chronic catarrh of the respiratory organs. Muriated alkaline acidulous waters, which differ from the preceding, contain a considerable quantity of chloride of sodium. The most important springs of this kind are the thermal springs of Ems and the cold springs of Selters and Salzbrunn. They are useful in chronic catarrhal affections of the bronchial tubes, the stomach and intestines. Alkaline saline waters contain sulphate and bicarbonate of soda, such as the warm springs of Carlsbad, serviceable to patients suffering from abdominal plethora, if unconnected with diseases of the heart or lungs. These waters afford an excellent remedy for habitual constipation.

**Bitter Waters.**—The chief contents of these waters are the sulphates of magnesia and soda. The best-known springs of this class are those of Sedlitz and Kissingen; English examples are in the bitter waters of Cherry Rock, in Gloucestershire, and the Purton Spa, in Wiltshire, and in America the springs at Mount Clemens,

Mich. These waters act as purgatives and diuretics.

**Muriated Waters.**—Simple muriated waters contain a moderate quantity of chloride of sodium or common salt. The chief springs of this class are Wiesbaden and Baden-Baden, which are hot; and those of Kissingen, Homberg and Cheltenham, which are cold. The muriated saline springs of Saratoga, in the United States, are some of them chalybeate, others sulphurous or iodinous; all of them being rich in carbonic acid gas. The Ballston saline springs near Saratoga have a very high proportion of carbonic acid. They are chiefly employed in cases of gout, rheumatism and scrofula. Muriated lithia waters contain chlorides of sodium and lithium. In gout they first aggravate the pain, but then give relief; and in periodic headache they have been found serviceable.

**Earthy Waters.**—These contain sulphate and carbonate of lime. The Wildungen water is a diuretic, and not only promotes the elimination of gravel, but by its tonic action on the mucous membrane of the urinary passages serves to prevent the formation of fresh concretions. It is also much used for chronic catarrh of the bladder. The baths of Leuk, in which many patients remain nine hours daily, until an eruption appears, are chiefly used in chronic skin diseases.

**Mild Thermal Waters** contain a small amount of saline constituents. Of the springs of this class the most important are Hot Springs, Ark., and Roanoke, Va. Their most striking effects are to stimulate the skin and excite the nervous system. They are especially used in chronic rheumatism and chronic gout and in diseases of the skin.

**Chalybeate Waters.**—Simple acidulous chalybeates contain carbonic acid and bicarbonate of protoxide of iron. Saline acidulous chalybeates contain sulphate of soda and bicarbonate of protoxide of iron. The quantity of iron present is very small—from .08 to .15 in 1,000 parts. Many of the chalybeate springs, especially in Germany, contain also much carbonic acid; carbonate, sulphate and chloride of sodium are frequently present and may help in the cure. The Putnam Spring at Saratoga and the springs of Maine and Massachusetts are examples of chalybeate wells which are very seldom thermal. Maine has both chalybeate and sulphurous springs. Chalybeate waters are valuable in anæmia.

**Sulphurous Waters.**—These waters contain sulphuretted hydrogen or metallic sulphides (sulphurets), or both. The most important sulphurous thermals are those of Aix-la-Chapelle, Baden, Barèges and Bagnères de Luchon, in Europe. There are hundreds of these sulphurous springs in the United States, including those at Mount Clemens, Mich., Bath, Va., and Warm Springs, Va. They are extensively used in chronic disease of the skin, and are of service in many cases in which exudations require to be absorbed, as in swellings of the joints, in old gun-shot wounds and in chronic gout and rheumatism. The sulphurous waters are employed externally and internally, and mineral mud-baths are believed by many physicians to form a valuable auxiliary.

**Production.**—The commercial output of

mineral waters in the United States in 1916 amounted to 55,928,461 gallons, valued at \$5,735,035. The imports in the same year amounted to 1,723,440 gallons. These figures are based on 802 producing springs as against 695 springs in 1908. New York, Wisconsin, Minnesota, Ohio, Massachusetts, Connecticut, California and Virginia are the largest producing States in the order given. The above figures do not include the quantities of water drunk at the springs, but do include the natural waters which were carbonated artificially, or otherwise combined and placed on the market for sale. The effect of the war in shutting out the usual supplies from Austria-Hungary and Germany was to increase the demand for American medicinal waters, so that the receipts for such waters have been larger for the last three years than before. It has been found that there are springs in America which almost exactly duplicate the analyses of famous foreign springs, and give equal satisfaction to consumers.

The majority of the commercial springs of the United States are found east of the Mississippi. In the South, Kentucky, Tennessee and Arkansas are the chief producers of mineral waters. The Hot Springs of Arkansas are among the most important thermal springs in the entire country. The Texas springs are peculiar from the fact that many of them show free sulphuric acid. In Wisconsin the springs of Waukesha are widely known. In New Mexico, the Las Vegas Hot Springs are often visited. There are no hot springs in the New England States.

W., 'Mineral and Aerated Waters' (London 1913); New York State Saratoga Springs Reservation Commission Report 1914, 'Report on European Spas' (Albany 1914); Oefele, F., 'American Balneology' (New York 1915); United States Chemistry Bureau Bulletin No. 91, 'Mineral Waters of the United States' (Washington 1905); United States Foreign Commerce Bureau, Special Consular Reports, Vol. 14, Part 2, 'The Mineral Water Industry' (Washington 1901); Walton, G. E., 'The Mineral Waters of the United States and Canada' (New York 1890).

**MINERAL WELLS**, Tex., city in Palo Pinto County, 55 miles northwest of Fort Worth, on the Weatherford, Mineral Wells and North-western and the Gulf, Texas and Western railroads. The well-known mineral springs in the vicinity attract thousands of visitors and more than 1,000,000 gallons of waters are shipped annually. There are numerous drinking pavilions in and near the town, which is essentially a health and pleasure resort. Near by are places of scenic beauty, including Lake Pinto, Elmhurst Park and Lovers' Retreat. Commission government was adopted in 1913. Pop. 3,950.

**MINERAL WOOL**, a product of molten slag, or rock under air or steam-jet, also called slag wool, rock wool, silicate cotton, cotton fibre. The result of this process is a thin vitreous fibre, useful as a non-conductor. It was first manufactured in Germany in the early 70's. In 1875 a little was made at the Greenwood iron furnace, Orange County, N. Y.; the industry

was firmly established by 1885; then because of the entry into the field of rock wool, that is, a fibre made directly from the rocks and not from slag, the slag wool industry fell off. In 1909 11,626 tons of mineral wool, valued at \$101,621, was the product of the United States, a gain of more than 35 per cent over the preceding year when the product weighed 9,197 tons and was valued at \$77,228. These figures included rock and slag wools; the former command a price 50 per cent higher than the latter. The slag wools have a small percentage of sulphur, unless especially desulphurized after the slag has been remelted, and thus sulphuric acid may be formed if water gets access to the wool and acts on the calcium sulphide in it. The sulphuric acid thus formed is injurious to the pipes. Hence rock wool is substituted for slag wool, or the slag wool is carefully desulphurized. Mineral wool of either sort, if of good grade, is one of the best practical non-inflammable coatings; as a lining for floors it has the double advantage of being sound-proof and non-conducting.

**MINERALOGY** is the science which treats of minerals and especially of the properties of these minerals, their chemical behavior and composition, their crystalline form and structure, their physical characters, their classification and their determination. Mineralogy also considers the part each mineral plays in Nature, its history, its formation and alterations, its variations under different conditions and its relation to other minerals. From a practical standpoint it records the uses of each mineral and the localities in which it has been found.

Mineralogy has many connections with other sciences, especially with crystallography and geology, for minerals are crystals for the most part and must be studied as such, and rocks are only aggregates of minerals and are identified by study of the component minerals. Physics, chemistry and mathematics are fundamental in the study of minerals and minerals are the raw material of the chemist and used by the physicist for the establishment of physical laws. Finally the arts of mining and metallurgy are concerned, the one with the extraction of minerals from the earth, the other with the extraction of metals from minerals.

Minerals are those substances of definite chemical composition which are found ready made in the crust of the earth and are not directly products of the life or decay of an organism. Usually also they will exhibit definite and characteristic molecular (crystalline) structures.

Although minerals constitute the larger portion by far of the known so-called mineral kingdom, the definition excludes certain portions. Lack of homogeneity excludes asphalt and petroleum; lack of definite chemical composition excludes the natural glasses; ice made in the factory and ruby made in the furnace are not minerals. Coral and pearl are direct products of organic life, therefore not minerals.

The fundamental requirement of definite chemical composition is sometimes apparently waived because other facts, especially proof of definite crystalline structure, have been obtained, although a satisfactory formula has not. For

instance, it is not yet possible to state an unobjectionable formula for tourmaline, and the formulas of the great triclinic feldspars were long a source of confusion. The reasons are manifold, faulty analysis, impurities, replacements of one element or group by another, and sometimes, as in the so-called colloid minerals, the originally formed material has taken out other things from solutions which in the dried-out mineral remain inextricably admixed.

The characteristic crystalline structure is so frequent that minerals are sometimes defined as natural crystals. But it is now recognized that crystallinity is dependent on conditions during or preceding solidification, and that, theoretically, like any other chemical substance a mineral may, under different conditions, form in the crystalline state or the amorphous state. Not only is this theoretically true, but there are many so-called "gel" minerals which are known only in the amorphous state and other minerals which are known both in the amorphous and the crystalline state.

Historically, mineralogy as a science dates from the 18th century only. While the ancients utilized a very considerable number of minerals, some for the metals they contained, others as pigments, others as ornaments, charms and talismans and still others in medicine and the arts, they knew little as to their composition and nothing as to their molecular structure. They classified them, it is true, for there is still extant part of a work, "On Stones," written by Theophrastus, who died 286 B.C., while Pliny in his great work on natural history, published 77 A.D., devotes five books to "earths, metals, stones and gems."

The greatest contribution to mineralogical knowledge prior to the 18th century was made by Georg Agricola (1494-1555), professor of chemistry at Chemnitz, Saxony, who minutely discussed the known important ores, their mining, concentration and metallurgy; and may be said to have summed up and systematized the knowledge of minerals at that period.

As chemical knowledge increased the compositions of minerals were gradually determined and chemical tests began to replace arbitrary distinctions of structure, color and the like. This is clearly shown in the works of Wallerius, 1747, and Werner, 1798; and from this time the composition became the dominating character.

The existence of a characteristic crystalline structure for most minerals was very gradually recognized and, until the publication of the works of Romé de l'Isle in 1783 and René Just Haüy (who "raised mineralogy to the rank of a science"), played no part in the study of minerals. From this period the fundamental importance of the crystalline structure and the part it plays in the interpretation of both physical and chemical phenomena have been everywhere recognized.

Mineralogy may conveniently be considered under the following headings: (1) Crystallography; (2) Physical Mineralogy; (3) Chemical Mineralogy; (4) Formation and Occurrence; (5) Uses; (6) Descriptive Mineralogy; (7) Determinative Mineralogy.

1. **Crystallography.**—Crystallography, although a distinct science, has developed with mineralogy and is so interwoven with it that the two sciences are usually taught and studied

by the same specialists. Crystallography is discussed separately in the articles CRYSTALS; CRYSTALLOGRAPHY; CHEMICAL CRYSTALLOGRAPHY; and PHYSICAL CRYSTALLOGRAPHY. The subject need here be only briefly referred to in its relation to mineralogical study.

As previously stated most minerals exhibit in all or some of their occurrences a definite crystalline structure. If the mineral develops "well faced" crystals the geometric symmetry and constants are obtained by a measurement of the interfacial angles of these crystals. If however these plane-faced crystals are lacking the crystalline structure is studied by the directional characters: cleavage, behavior with polarized light, etch figures, thermal and electrical properties, etc., which yield not only characteristic constants but often the complete symmetry.

Aside from these mentioned constants and symmetry relations resulting from a study of the crystals, interesting problems arise such as the relations between composition and crystalline structure, the causes of variation in crystal habit, and the reasons for vicinal planes and parallel growths.

**2. Physical Mineralogy.**—Physical mineralogy considers the physical characters of minerals. Many of these are crystal characters since they vary with the direction and have therefore been discussed in the articles on CRYSTALS; CRYSTALLOGRAPHY; CLEAVAGE; and PHYSICAL CRYSTALLOGRAPHY. Other physical characters, however, which are not dependent or notably dependent on the direction the test is made, are, nevertheless, important and some of these may be described as follows:

**Lustre**, in the mineralogical sense, is not the degree of brilliancy, but the kind of brilliancy. Light reflected from different substances and quite independently of the color, produces different effects; one substance resembles a metal, another glass, another silk, and they are said to possess respectively metallic lustre, vitreous lustre and silky lustre. The determining causes appear to be transparency, structure and refractive power. The most used terms are: Metallic lustre exhibited by those opaque minerals which with the exception of the native metals have a black or nearly black powder. Non-metallic lustre exhibited by all transparent or translucent minerals, which is subdivided into vitreous, adamantine, resinous, pearly, silky and waxy according to the similarity in sheen to glass, diamond, resin, mother of pearl, silk and wax respectively.

**Color**, by either transmitted or reflected light, depends upon the power of the substance to absorb different proportions of the lights of different wave lengths which together make up the light used. The same substance may, therefore, appear of different colors when viewed with different sources of light; and some minerals are strikingly different as, for instance, alexandrite, which by daylight is bluish to olive green and by lamp or gas light raspberry red. Color is one of the least constant mineral characters and varies with different specimens of the same species. The variation may be due to a few hundredths of 1 per cent of some organic or inorganic substance dissolved in the mineral, or to larger amounts of mechanically included foreign mate-

rial. Color effects may also be due to interference of light, usually as a result of some imperfection in the substance, or, in cut stones, from some purposely chosen shape producing notable dispersion of the white light into its component colors. Such effects are known as play of color, iridescence, opalescence, asterism, etc.

**Streak**, is the color of the fine powder of the mineral and is nearly constant, no matter how the color of the mass varies.

**Hardness**, to the mineralogist, means the resistance to abrasion of a smooth surface by a pointed fragment. It is usually, though very crudely, determined by comparison with the following scale introduced by Mohs: (1) Talc; (2) Selenite; (3) Calcite; (4) Fluorite; (5) Apatite; (6) Orthoclase; (7) Quartz; (8) Topaz; (9) Sapphire; (10) Diamond. Intermediate values are window glass 5.5; jeweler's file 6.5; zircon 7.5; chrysoberyl 8.5; carborundum 9.5. The more common procedure is to use pointed fragments of the scale minerals to scratch smooth surfaces of the mineral being tested. Sometimes this is more conveniently reversed and roughly polished plates of the scale minerals are tried by sharp edges or points of the mineral. The members of the scale are not in arithmetical ratio. The average of five attempted comparisons from 9 down give, roughly, sapphire 100, topaz 30, quartz 18, orthoclase 12, apatite 7, fluorite 3½, calcite 2½, gypsum ½. The scale, nevertheless, serves a useful purpose and no convenient substitute has yet been suggested. Elaborate tests with a diamond point, loss of weight by grinding with a standard powder, production of a crack by impact or pressure have been tried but fail to agree even approximately.

**The Specific Gravity** of a mineral, as of any other chemical substance, is of first rank as a test and is a function of the density of the molecule. As explained in the article CHEMICAL CRYSTALLOGRAPHY comparative molecular volumes are obtained by dividing the molecular weights by the specific gravities.

The specific gravity of a substance is defined as its weight divided by the weight of an equal volume of distilled water at 4° C. The range, in varieties of the same species, is not great and even this is principally due to actual differences in composition. The value is usually obtained by means of a delicate balance provided with attachments for weighing the substance in water, such as a small wooden bench to hold a beaker of distilled water above the scale pan, and a platinum spiral to hold the specimen. Three weighings are needed:

$W$  = weight of the stone.  $S$  = weight of the spiral when suspended from the end of the balance frame and immersed in the distilled water.  $W'$  = weight of the stone and the spiral suspended in distilled water.

$$\text{Then, Sp. Gr.} = \frac{W}{S + W - W'}$$

Instead of absolute weighings, relative weights may be determined on a scale by the stretching of a spring as in the Jolly balance or by the distance the apparatus sinks in water, as in the hydrometer; the results are approximate.

Liquids of high specific gravity such as concentrated solutions of mercuric and potassic

iodide or of silver thallium nitrate, or organic liquids-like bromoform or methylene iodide, are often used for quick distinctions between similar appearing substances, one higher in specific gravity than the liquid, the other lower. They may also be conveniently used for certain exact determinations, being equally accurate for minute fragments and coarser material. A liquid is chosen which will float the material; the proper diluent is then stirred in drop by drop until a stage is reached at which the substance, if pushed down, will neither sink nor rise but stay where pushed. The specific gravity of the liquid may then be determined either roughly by dropping in fragments of material of known specific gravity until one is found which just sinks and another which floats, the liquid being of a specific gravity between these; or for more accurate determination a special balance, such as the Westphal, may be used.

Numerous other non-directional characters, some of which, such as fusibility and elasticity, are susceptible of exact determination, are approximately expressed by convenient terms. Fusibility, for instance, is determined in terms of a scale of seven minerals by comparing the effect of the blowpipe flame on small fragments of similar size. Elastic substances are distinguished as elastic and flexible. Tenacity is expressed as brittle, sectile, malleable, ductile or tough. The fracture surface is said to be conchoidal, even, uneven, splintery; and terms are used describing taste, odor and the sense of touch.

Certain characters are limited to a few minerals rather than exhibited by all. Such a character is luminescence or the property of emitting light at ordinary temperatures after being subjected to some exciting influence, such as light, friction, X-rays, ultraviolet light or radium.

**3. Chemical Mineralogy.**—Minerals are either elements or are formed by the uniting of atoms of different elements in definite proportions in accordance with the laws of chemistry and for either identification or classification their chemical composition is their most important characteristic.

The methods of analyses and the calculation of formulæ are in general the same as in the analyses of other definite chemical substances. Much attention has to be paid to securing homogeneous material and in general the problem is complicated by the fact that most minerals are isomorphous mixtures (or mixed crystals) rather than simple salts.

True molecular formulæ are not generally determinable. The empirical formula is calculated from the analysis. Thus, for instance, beryl:

	Percentage Composition		Atomic Weights		Proportionate Number of Groups
BeO.....	14.01	+	25	=	.56
Al <sub>2</sub> O <sub>3</sub> .....	19.26	+	102	=	.189
SiO <sub>2</sub> .....	66.37	+	60	=	1.106

or closely in the ratio 3BeO.Al<sub>2</sub>O<sub>3</sub>.6SiO<sub>2</sub>, or, summing up, Be<sub>3</sub>Al<sub>2</sub>(SiO<sub>3</sub>)<sub>6</sub>. If the material is an isomorphous mixture, the sum of the ratios of the replaceable elements or groups is considered, for instance, in the sphalerite analysis which follows, the sum of the propor-

tions in which Zn Fe Cd and Pb are found is 1.040 and the S 1.039.

	Per-centage		Atomic Weight		Pro-portion		Number of Groups
S.....	33.25	+	32	=	1.039		I
Zn.....	50.02	+	65.4	=	.756	} 1.040	I
Fe.....	15.44	+	56	=	.276		
Cd.....	.30	+	112	=	.003		
Pb.....	1.01	+	207	=	.005		

Such a composition could be expressed either by RS or (Zn.Fe.Cd.Pb)S, the letter R being used to represent a varying group of isomorphous or equivalent elements, and the parentheses with periods between the elements to show that the zinc, iron, etc., taken together accompany one atom of sulphur.

The question whether the water given off during heating is due to the destruction of an acid or basic salt or a hydroxide or is more loosely held as so-called water of crystallization, or is present in solid solution or is adsorbed or adhering atmospheric water, is often difficult to answer. Carefully worked-out water curves showing the loss at frequent intervals of temperature and the rate of loss at each temperature will often assist the judgment.

The chemical testing of minerals in practice is very commonly by the so-called "blowpipe tests" which possess certain advantages in speed, minute amounts of material needed and in directness of application. Usually no attempt is made to secure a complete qualitative analysis, but merely to determine the dominating constituents. Easy tests exist for most of the common and many of the rare elements, and while group separations, except for instance into volatile and non-volatile, are not practicable the order of testing is such that certain elements are detected and largely removed before the tests for the others are made.

**4. The Formation and Occurrence of Minerals.**—The history of a mineral, the rôle it has played, is largely told by its occurrence, associates and alterations, and these facts are often illuminated by the successful reproduction of a mineral by a method which does not conflict with the known natural conditions. The processes of mineral formation may be broadly grouped under the headings:

(1) Crystallization from a fluid magma consisting chiefly of silicates but partly of oxides, sulphides, fluorides and ferrates mutually dissolved in each other with certain volatile constituents, chiefly water. By far the greater portion of the earth's crust has formed from such magmas and a comparatively few mineral groups are found to dominate them. Clarke's estimate\* is

1. The feldspars.....	59.5 per cent.
2. The pyroxenes and amphiboles.....	16.8 " "
3. Quartz.....	12.0 " "
4. The micas.....	3.8 " "
5. Accessory minerals.....	7.9 " "
	100.0 " "

The estimated 7 per cent of accessory includes rarer silicates, elements, sulphides and oxides, sometimes in quantities which are of economic value, especially when they have undergone a natural concentration known as magmatic segre-

gation, as in the important nickel ores of Sudbury, Canada.

(2) Formation by pneumatolysis, that is processes in which gases and vapors especially steam, hydrofluoric, boric, sulphuric and hydrochloric acid play a principal part. These gases and vapors are released by the cooling magmas and when charged with dissolved matter deposit it later as new minerals in pegmatite veins, contacts, tin lodes and other places to which they may penetrate. These vapors dissolve, transport and concentrate minerals rare in the rocks which they penetrate; they form new species into the composition of which they enter and they serve as "mineralizers," apparently with catalytic action.

(3) Crystallization or precipitation from aqueous solutions. Rain water carrying oxygen and the underground waters with dissolved carbon dioxide and other constituents are the chief agents in the disintegration and alteration of the minerals which are at or near the surface. They take away selectively much of the soda, potash and lime and much less of the magnesia and alumina and silica. The solutions due to this "weathering" are in part re-deposited as cements, in part precipitated in the residual minerals, but much is carried away to rivers, lakes or oceans, and there may form deposits of new minerals, such as carbonate of lime in rivers or underground channels, salt or other minerals of soda in lakes (or if boric acid has been present borates may form) and in land-locked basins, great beds of anhydrite, gypsum and common salt, or, more rarely, as at Stassfurt, salts of potassium and magnesium.

The minerals of veins by their composition and arrangement are shown to be deposits from watery solution, but in most cases not simply solutions of the neighboring rocks in the underground water, but also solutions in the vapors of deep-seated magmas. As the vapors rise into regions of lower pressure and temperature condensation takes place, fluid solutions form, various species separate and are deposited on the walls and may ultimately fill the fissure, forming a vein.

Animal and vegetable organisms often assist in the formation of minerals from watery solutions. The original deposits may not always be strictly mineral species as with coral, shells, diatomaceous earth, but directly or indirectly true species often result, such as limonite, apatite, sulphur and soda nitre. The formation of a mineral may involve very complex agencies such as the combined action of intense pressure from rock folding and of circulating waters often hot and charged with many constituents, including the so-called mineralizing agents. The new minerals are often denser than the originals and many contain constitutional water.

5. **The Uses of Minerals.**—The mineral industry of this country ranks next to the agricultural, and the value of the minerals considerably exceeds \$2,000,000,000 a year. While the principal value of these minerals is for the extraction of particular constituents such as the metals or the substances of use in the chemical industries, there is a large use of the minerals in their natural state not only as constituents of building stones, but as abrasives, fertilizers, fluxes, pigments, refractory materials and in the making of pottery, porcelain, glass, etc. Minerals susceptible of polish and with any

claim to beauty are utilized as precious or ornamental stones.

Minerals are the raw material from which all the metals and all the chemical salts except the organic compounds are made. Not all minerals containing a desired element are utilized, and generally only one or two materials are obtained *directly* from a mineral. These products are themselves used for the manufacture of others, as for instance the mineral halite or common salt is the indirect source of nearly all of the sodium salts, but is the direct source principally of a crude sodium sulphate from which a multitude of other salts are manufactured.

6. **Descriptive Mineralogy.**—It may be said that it is the province of descriptive mineralogy to sum up all the results of the study of minerals, as already outlined, into orderly form for each mineral species and to so classify the different species that related minerals shall be grouped together.

The basis of classification may be scientific, or economic or genetic; each for certain purposes being the most satisfactory. Classifications until the 18th century were based on distinctions of structure, color, use, or some fancied similarity, and as has been said were "chiefly designed to enable amateurs to arrange their collections in a fixed order." Pliny the naturalist (23-79 A.D.) classified as metals earths, stones and gems. Avicenna nearly 1,000 years later used a very similar classification with many subdivisions based on either external characteristics or easily ascertained properties.

Scientific classifications based on essential characters began as the increased chemical knowledge brought composition and chemical tests to the front. This was instanced in the systems of Wallerius in 1747 and Werner in 1798. The still later realization that most minerals possessed a characteristic molecular structure revealed by its crystals and physical characters followed naturally the discoveries of de l'Isle, Haüy and others of the laws governing crystals; and the methods of examining crystals placed crystalline structure alongside chemical composition as the bases of natural scientific classification. The system of James D. Dana is probably most used throughout the world and "follows first the chemical composition and second the crystallographic and other physical characters which indicate more or less clearly the relations of individual species." Eight principal divisions are made from a chemical standpoint as follows:

- I. Native Elements.
- II. Sulphides, Selenides, Tellurides, Arsenides, Antimonides.
- III. Sulpho-salts.—Sulpharsenites, Sulphantimonites, Sulphobismuthites.
- IV. Haloids.—Chlorides, Bromides, Iodides, Fluorides.
- V. Oxides.
- VI. Oxygen Salts.
  1. Carbonates. 2. Silicates, Titanates. 3. Niobates, Tantalates. 4. Phosphates, Arsenates, Vanadates, Antimonates, Nitrates. 5. Borates, Uranates. 6. Sulphates, Chromates, Tellurates. 7. Tungstates, Molybdates.
- VII. Salts of Organic Acids.—Oxalates, Mellates, etc.
- VIII. Hydrocarbon Compounds.

In subdividing, the chemical composition and crystalline form are considered with the purpose of assembling in groups those minerals which have analogous compositions and closely similar forms. For instance the barite group

under anhydrous sulphates consists of sulphates in which Ba, Ca, Sr and Zn are in the same Mendeléeff group, and which show close similarity in crystal constants.

	a	b	c
Barite BaSO <sub>4</sub> .....	0.8152	1	1.3136
Celestite SrSO <sub>4</sub> .....	0.7790	1	1.2801
Anglesite PbSO <sub>4</sub> .....	0.7852	1	1.2894
Anhydrite CaSO <sub>4</sub> .....	0.8933	1	1.0008
Zinkonite ZnSO <sub>4</sub> .....	0.8925	1	1.4137
Hydrocyanite CuSO <sub>4</sub> .....	0.7971	1	1.1300

Descriptive mineralogy also serves to keep in order the nomenclature. Uniformity can only be obtained if after careful consideration the term entitled to priority and otherwise satisfactory is made the name of the species and the host of synonyms and often unessential variety names assembled under it.

**7. Determinative Mineralogy.**—This subject has already been discussed in a separate article. See DETERMINATIVE MINERALOGY.

**Bibliography.**—The following is a partial list of comparatively recent works and may be supplemented by the lists following the articles on Crystals and Crystallography.

**TREATISES, MINERALOGY.**—Dana, J. D., 'System of Mineralogy' (6th ed., with three appendices, 1899, 1909 and 1915, New York 1892); Hintze, Carl, 'Handbuch der Mineralogie' (Bd. I, 1904; Bd. II, 1897, Leipzig; still incomplete).

**MINERS MILLS, Pa.,** borough in Luzerne County, three miles northeast of Wilkesbarre, on the New Jersey Central, the Delaware and Hudson and the Lehigh Valley railroads. The chief industry is coal mining. The town contains a flour mill, a brick plant and iron-works. Pop. 3,159.

**MINERSVILLE**, Pa., borough, in Schuylkill County, on the west branch of the Schuylkill River, and on the Philadelphia and Reading and the Lehigh Valley railroad, about 45 miles north by east of Harrisburg. Situated in the hard coal region, its chief industries are connected with mining and shipping coal. Industrial establishments include machine shops, foundries, underwear factories, lumber and brick yards. Pop. 7,500.

**MINERVA**, *mī-nēr'va*, from the Greek *μήνορ*, *menos*, spirit, strength, typifying The Thinker,—Goddess of Wisdom—and applied to Pallas Athena, signifying Maid of Athens, a Greek divinity, in earlier times worshiped as Ergane, the goddess of crafts, and Nike, the goddess of battles. Her statues called Palladina (often said to be gifts or windfalls from Heaven) were sternly guarded in the city temples as ensuring the citadel's impregnability. Her greatest shrine, the Parthenon—from *parthenos*, virgin,—the "Temple of the Virgin" at Athens, graced with the gold ivory statue by Phidias, was the highest achievement of Greek architecture. Minerva was perpetuated in Roman mythology, as a daughter of Jupiter, and one of the great divinities. She was looked upon as the patroness of all Roman arts and trades, and her annual festival, called Quinquatrus, celebrated throughout Etruria, lasted from the 19th to the 23d of March, inclusive. Consult Fairbanks, A., 'The Mythology of Greece and Rome' (New York 1907) and 'Handbook of Greek Religion' (New York 1910); Fowler, W. W., 'Roman Festivals' (London 1899).

**MINERVINO MURGE**, Italy (Lucus Minervæ), a walled town in Apulia, 43 miles west of Bari. Fruits, vegetables and oil are produced here. There are also large quarries and limekilns. Pop. 19,325.

**MINES**, Drainage of. See MINING.

**MINES**, Submarine. See SUBMARINE MINES.

**MINES AND MINING**, Law of. See MINING LAWS OF THE UNITED STATES.

**MINES AND MINING**, Military. In all periods of the history of warfare, particularly in siege operations and the somewhat similar operations in trench warfare, recourse has been had to the use and construction of subterranean passages, either as a means of penetrating the lines of the enemy, or to avoid a dangerous advance under fire at the surface, or for the destruction of a hostile position by the use of explosives, or to prevent on the part of the enemy undertakings such as those already described. These operations constitute military mining, and the charge of explosives set off under a position of the enemy is known as a mine. While any of the devices and methods employed in commercial mining may be used in appropriate military situations, military mining is dominated by the consideration of simplicity—for complicated tools cannot be brought up to the battle-line—speed and inconspicuousness. In addition, by far the greater part of the work is done in soil which is sufficiently soft to present relatively little difficulty to excavation, but which manifests a constant tendency to cave in. This tendency is accentuated by the continual disturbance of the soil by artillery fire and the countermines of the

enemy. Accordingly the reinforcement of the walls of his excavation is generally among the chief problems of the military miner. The methods used are much the same, whether the excavation is a vertical shaft or an approximately horizontal gallery. They fall into two general classes. In one casings are inserted as the work progresses. These consist of four lengths of stout planking surrounding the excavation. Two opposite lengths are provided with mortises and the other two with tenons. In the other type of mining, longitudinal planks known as sheathing are held in place by frames of strong timber.

Galleries are divided into great or grand galleries (6 feet high by 3½ feet); half galleries (4½ feet by 3 feet); branches (3½ feet by 2½ feet); and small branches (2½ feet by 2 feet). The smaller galleries are often excavated by earth augers; the larger ones by ordinary excavating tools reduced in size so as to be adapted to use in a confined space. An especial digging tool known as the push-pick is also employed. The direction of galleries is determined by the ordinary surveying instruments used on the surface, due allowance being made for the unreliability of the compass under ground. The targets are of course slits through which an artificial light shines. The azimuth is transferred from the top to the bottom of a shaft by means of a pair of plumb-lines, which are oriented by compass and map above ground. Ventilation is essential, and is secured by various mechanical means, or in a system of galleries with two or more outlets, by a fire near the upper end of a shaft. In difficult places, air may be pumped in by a hose. Respirators may be worn in case of emergency. Drainage is secured by sloping the floors of the galleries and supplying them with gutters. If it is not possible to make all the galleries slope toward the entrance, a sump is dug from which the water is pumped or carried in buckets. The lighting of galleries is often a difficult problem, on account of the nearness of explosives and the difficulties of ventilation. Electric lights are often used. Where it is possible, daylight is reflected into the gallery by mirrors or white surfaces, and the walls are whitewashed. The disposal of the excavated earth is often a difficult problem. It is usually taken away in sacks or relays of wheelbarrows. Sometimes small narrow gauge railways have been used.

The mine chamber is nearly cubical or of the shape of a cylinder with an altitude twice its radius. It is often simply the end of a gallery or shaft. The charge is usually some high explosive such as dynamite or trinitrotoluol. It is set off by a detonator and primer, usually fired by electricity, though a powder fuse may be used. The charge is tamped by obliterating from 6 to 10 feet of the passage leading up to the chamber.

The explosion of a mine produces a compression of the surrounding soil which will blow in any gallery within a certain radius. It also causes a pit or crater to be excavated in the surrounding soil, provided the chamber is sufficiently near the surface. A mine which does not break the surface is known as a comoulet. In a normal mine, the depth of the charge beneath the surface is equal to the radius of the crater at the surface of the ground.

Mines dug from the surface are known as land mines, or if the crater is filled with stones, etc., so as to form a crude mortar, as fougasses. Land mines are only permissible in ground obviously prepared for defense. They may be set off by devices under the control of some operator, or automatically by triggers or other such means.

The tactics of mining depend on the opposition of mines by counter-mines. It is always necessary to supplement one's own effort to attain his objective by an effort to frustrate the plans of the enemy. The only way by which reliable information of the progress of the enemy can be attained is by listening either directly, or with the aid of microphones. Men are trained for this purpose, and stationed in galleries called listeners, placed sufficiently near to one another to prevent a hostile gallery from being pushed between them without being heard.

It is generally better in mining operations to come into actual contact with the counter-mines than to fire too soon. The best place to attack a hostile gallery is from the side, as then a greater length of gallery is destroyed.

Mines are sometimes used to form craters to take the place of trenches in an advance. A row of such craters serves not only as a parallel on the surface but as a starting-point for new mines.

Galleries are usually started as near the hostile lines as possible, i.e., from advanced saps. In fortresses concrete lined permanent galleries often serve as a beginning for counter-mine galleries in case of siege. Consult 'Engineer Field Manual' (Washington 1912).

**MINETTE**, an igneous rock belonging to the syenite group, of granular texture and composed essentially of feldspar and biotite. It occurs in dykes.

**MINGHETTI**, min-gét-tè, Marco, Italian statesman and writer; b. Bologna, Italy, 8 Nov. 1818; d. Rome, 10 Dec. 1886. He came of a wealthy family and was given a university education. After studying the political institutions of France, Great Britain and Germany, he returned to Italy and published an essay on the commercial advantages of free trade as existing in England, espousing the economic views of Richard Cobden, which were similar to the teachings of the Tuscan economist, Bandini, already adopted by him. Minghetti began his public career in 1846 by establishing a liberal journal, *Il Felsineo*, in Bologna. In 1847 he was called to Rome by Pius IX to become a member of the Consulta delle Finanze and in 1848 he became Minister of Public Works. When the Pope yielded to Austria, Minghetti transferred his services to Sardinia, joining the army under Charles Albert in Lombardy. He was appointed on the royal staff with the rank of captain. After the battle of Goito, he was made major and distinguished himself in the engagement of Custoza (25 July 1848). Invited to Rome by Count Rossi as a member of the new constitutional ministry, he arrived the day of Rossi's assassination. He refused the Pope's request to take Rossi's place and returned to the Piedmontese army. After the defeat at Novara (1849), Minghetti lived quietly in Milan for several years, devoting himself to political economy. In 1859 he became Cavour's Secretary of State for Foreign Affairs. On Cavour's

death in 1861 he was regarded as the ablest representative in the Italian Chamber. In 1863 he became Prime Minister and in 1864 he concluded with Napoleon III the "September Convention," which seemed to place an obstacle in the way of completing Italian unity. He left office in 1864. In 1868 he was Ambassador to London. For a short time, subsequently, he was at the head of the Agricultural and Commercial Department of the Menabrea Ministry (1869). He was Ambassador to Vienna in 1870-73; and from 1873 to 1876 again head of the Cabinet, first as Minister of Finance and then as Minister of Foreign Affairs. His last years were spent in partial retirement and study. Minghetti's writings include 'Della economia pubblica e delle sue attinenze con la morale e col diritto' (1859); 'Lo Chiesa e lo Stato' (Milan 1878); 'Opuscola letterari ed economici' (1872); and 'Discorsi parlamentari' (Rome 1888-90). Minghetti was also a student of the fine arts, lectured on Dante and Raphael and wrote a book, 'Le donne italiane nelle belle arte al secolo XV e XVI' (1877) and a biography of Raphael (1885). His autobiography, 'I miei ricordi,' appeared after his death (1888).

**MINGO JUNCTION**, Ohio, city in Jefferson County, 12 miles northeast of Urbana and 50 miles south of Youngstown, on the Pennsylvania, the Pittsburgh, Cincinnati, Chicago and Saint Louis and the Wheeling and Lake Erie railroads. The Carnegie steel works are situated here. Farming, dairy-produce and fruit-growing are the chief industries. Coal is found in the vicinity. The place was settled about 1800. Pop. 4,049.

**MINGRELIA**, a region bordering on the Black Sea and situated in the Caucasus, a former province of Transcaucasia. It is now included in the Russian state of Kutais. Long a vassal state of Georgia, it became in 1414 independent under its own princes, although tributary to Turkey and Persia. Mingrelia passed under Russian control in 1803 but the administration was left in control of native chiefs until 1867. Then, as a result of peasant uprisings, begun in 1857, Russia annexed it. The population is now about 250,000. In ancient times the district was known as Colchis, famous in Greek mythology as the home of Medea and the Golden Fleece, the goal of the Argonauts. To the Greeks the province was famous as the seat of Dioscurias, a colony of Miletus, noted for its wines and fruits. Colchis was subject to Persia; to Mithridates, king of Pontus; and ultimately came under the rule of the Roman Empire.

**MINGRELIANS**, inhabitants of Mingrelia, now in the Kutais region of the Caucasus. Of the Georgian group they are above the average in height and many of them, like the Georgians proper, possess much physical beauty. Their language varies considerably from the Georgian stock. They have a folk-literature, consisting of legends and songs and folk-music and dances. Many of this tribe are Christian. Their national character is not admirable. "All trace of the names of Colchians, Iberians and Albanians has long since passed away," writes James Bryce in 'Transcaucasia and Ararat' (London 1896), "and though Mingrelians now live where Jason found the Colchians, there is

nothing to show that any of the blood of *Æetes* and *Medea* flows in their degenerate veins, though the names of the Greek hero and his formidable bride are used to-day as Christian names in the country. We find the Mingrelians along the Black Sea coast from the Turkish border to Sukhum Kaleh. They are the ne'er-do-wells of the Caucasian family. All their neighbors, however backward a Westerner may think them, have a bad word and a kick for the more backward Mingrelian. To believe them, he is lazy, sensual, treacherous and stupid, a liar and a thief. Lazy, the Mingrelian certainly is; and he lives in so damp and warm a climate that violent exercise must be disagreeable. He is a well-made, good-looking fellow, but with a dull and, perhaps, rather sensual expression. And he is certainly backward in agriculture and trade, making very little of a singularly rich country."

**MINIATURE PAINTING** (from the Latin *minium*, "red lead"), a painting on a very small scale. The art has its origin in the practice of embellishing books, in which the principal pigment used was red lead. Hence the Low Latin verb "miniare," to color with red lead, was applied to the art, and those who practised it came to be known as "miniatori." (See MANUSCRIPTS, ILLUMINATED). The exact date of the introduction of portraits into these embellishments is difficult to ascertain. However, such tiny likenesses gained great favor, often engaging the effort of great artists; and eventually the word "miniature" took on a new meaning, and was applied to very small portrait paintings exclusively.

The early artists painted on vellum, and used body-colors, i.e., colors mixed with white or other opaque pigments and this was continued until the 17th century when thin leaves of ivory fixed on cardboard with gum were substituted. The ivory was adapted naturally to richer and more varied coloring, and transparent colors were employed on faces and hands, while opaque colors were used for other textures. From the use of miniatures on various articles such as snuff boxes, card-cases, etc., enamel came into popular favor also.

Of the earliest painters of portrait miniatures, Holbein (the younger) stands foremost in excellence. The miniatures ascribed to him are characterized by the same perfection which mark his larger portraits. He was followed in England by Nicholas Hilliard, who was the first to develop painting in miniature as an art *per se*. He flourished about 1547-1619, and painted chiefly on vellum. His productions show a marked adherence to manuscript form—the colors used are opaque, while gold is used for background and ornamentation. His son Lawrence improved in coloring. Isaac Oliver (about 1567-1617), his contemporary, produced some excellent work, but the best English work of the 17th century was done by Samuel Cooper (1609-72). His work is not limited by the size of his canvas, and in breadth and dignity shows the master hand. Other well-known English miniaturists were Richard Cosway (1741-1821) who produced exquisite effects on ivory and vellum; George Engleheart (1750-1829); Andrew Plimer (1763-1837); John Smart (1741-1811), who displays a fine treatment of texture; and Andrew Robertson (1777-1845) and Sir William Ross, who de-

veloped the so-called larger miniatures. The revival in the 19th century brought others to the foreground.

In Germany, some of the great artists painted an occasional miniature, notably Lucas Cranach the Elder. German and Austrian miniaturists are best represented by Ismael Mengs (1688-1764), Sophie Friederike Dinglinger (1736-91), Martin van Meytens, a Swede who executed his principal work at Vienna (1695-1770), and Heinrich Friedrich Füger (1751-1818). The 19th century revival found an able exponent in E. Bastanier at Berlin.

Italy, the home of the miniature in its original meaning, produced comparatively few portrait miniaturists of note. Guilio Clovio, in the Renaissance period, executed charming little portraits, rich in color and vigorous and clear in their drawing. Rosalba Carrera, the 17th century painter of pastels and a native of Venice, painted imaginative delicate miniatures which have few equals.

France produced numerous prominent artists in this field, especially in the 18th century. The art is said to have been introduced by Jean Clouet in the early 16th century. One of the earliest exponents of the art was Klingstet, a native of Riga, who practised in France, but he pandered too much to the decadent taste of the 18th century society to produce works of lasting value. His portraits, however, are estimable creations. Massé also flourished at this period, his notable contemporaries being Tibaldi, Sartori, Camerata, Lainé and Jean Gros. Under the sovereignty of Marie Antoinette, the art of the miniature reached its height and was promulgated by prominent artists: Vincent, La Chaussee, Mausson, Mosnier, Villers; and, greatest of all, the Swede, Hall (1783-93). The extreme finesse and vigor with which he subordinated details to the general effect won for him the title of "the Van Dyck of Miniature." Siccardi and Fragonard continued in his style, increasing the breadth of treatment. Dumont, Isabey, Augustin and Duchesne carried the art to a high point of perfection, during the days of the Directory and the Empire. Their portraits of Napoleon and his court are fine and spirited examples. In enamel work, excellent miniatures were produced by Petitot (1607-91) for Louis XIV. His son carried on his work.

In Spain the painter Goya executed some fine miniatures. Hans Bol (1543-93) in Holland gained considerable reputation.

The United States is best represented in this field by the portrait painters, Copley, Gilbert Stuart and Peale. Malbone (1777-1807), however, was the first great American miniaturist. His portraits show warmth and depth, and by their excellence placed American miniature on an equal footing with those of foreign contemporary artists. Fraser, his contemporary, Miles and George Freeman also deserve mention.

The introduction of photography greatly lessened the demand for small portraits and the life of the art of miniature was threatened. However, it was not long before the superior artistic merit of the little paintings began to awaken a new interest in discriminating persons, and an important revival of the art took place in the latter part of the 19th century. Miniature still flourishes, although the popular

demand has relegated it to a comparatively minor place.

Of miniature collections one of the very finest is that of J. P. Morgan (Metropolitan Museum of Art, New York). Excellent collections are in the possession of the king of England, the queen of Holland and also at the Louvre, Amsterdam, Berlin, Petrograd, Vienna, Florence, Stockholm and Helsingfors. Private collections of fine quality belong to notable families in England.

Consult also the catalogues of the various collections.

**MINIÉ**, mee-nee-ay, **Claude Etienne**, French soldier and inventor: b. Paris, 1814; d. 1879. He enlisted in the army as a private when very young and left as a colonel in 1858. He devoted himself to the perfecting of fire-arms and in 1849 invented the Minié rifle and bullet. In 1858 the Khedive of Egypt appointed him director of a small arms factory and musketry school in Cairo.

**MINIMITES** (*Fratres minimi*, "least brethren"), a Catholic religious order founded by Saint Francis of Paula (1416-1507). Having become a Franciscan monk Saint Francis went into retreat near Paula, where he was joined by devout companions and, their number increasing, a community life was begun in 1454, when a large monastery and church were built. The rule of life was of extraordinary severity. To express the character of extreme poverty and humility Saint Francis eventually obtained from the Holy See permission to call his order, Minims, "the least of all religious bodies." In 1474 Sixtus IV confirmed the order which was first known by the title Hermits of Saint Francis. Alexander VI changed it to Minims. Their first definite rule was drawn up by Saint Francis in 1493. It was so austere that all animal products, including butter, cheese, milk and eggs were forbidden, as well as meat. At one time the order numbered 450 monasteries and convents, but to-day only a few remain in Italy. Saint Francis also founded an order for nuns, which never had more than 14 convents, and a third order for persons living in the world. Louis XI summoned Saint Francis to France; and in Paris the order was known as "Bons Hommes," from the fact that it succeeded an older monastery of that name in Vincennes. In Spain the order was called Fathers of Victory, because the recovery of Malaga from the Moors was attributed to their

prayers. The Emperor Maximilian called the Minims to Germany in 1497. Consult d'Attichy, 'Histoire générale de l'ordre sacré de Minimes' (2 vols., 1824); Butler, 'Lives of the Saints' (1798-1800).

**MINIMUM DUTIES.** See **DUTY**.

**MINIMUM THERMOMETER.** See **THERMOMETER**.

**MINIMUM WAGE**, the lowest reward that legislature considers just payment to laborers for their regular work. It is a wage, not only commensurate with the bare cost of living, but, so far as reasonably possible, to supply to every worker the means of procuring health, comfort and happiness in the broadest sense of those words. The minimum is difficult to determine because the cost of food, housing, fuel and clothing differs in different countries and States. Investigations of the conditions of living have to be taken into consideration before the sum can be determined. The minimum wage movement may be defined as a concerted effort on the part of social reformers and workers to wrest from capitalists a fair sum for the workers employed by them. The statutory minimum wage movement is a modern idea. It first appeared in Belgium in 1887 in the form of a minimum wage statute for laborers employed in public work. The first legislative minimum wage applying to private employment was adopted in Victoria, Australia, in 1896, and was soon followed by similar statutes in other Australian provinces and in New Zealand. It has also been in force in England since January 1910. These acts were applied to both male and female laborers. The adoption of a minimum wage in this country, beginning with the Massachusetts act of 1912, was borrowed, as was other labor legislation, from England. See **LABOR**; **WAGES**.

**MINING.** Mining is a basic industry, the magnitude of which is indicated by the 6,000,000 men employed in the various mines in the world. Of this number about 3,800,000 men are engaged in coal mining and 2,200,000 in other mining. In addition millions are employed in the allied industries, such as the manufacture of iron and steel, copper wares, coke and chemicals, all of which are directly based upon the mining industry. The mines and quarries of the United States in 1917 employed over 1,127,000 men segregated as follows: Coal mines, 757,000; metal mines and metallurgical works, 280,000; quarries, 90,000.

**Geographic Distribution.**—The mining industry of the United States is roughly geographically distributed as follows: The anthracite coal mines are in northeastern Pennsylvania the bituminous coal mines occupy the western slope of the Appalachian Mountain system from northern Pennsylvania to northern Tennessee, with a large coal field in the vicinity of Birmingham, Ala. The central coal field occupies central and southern Illinois, southwestern Indiana and western Kentucky. The coal fields west of the Mississippi River include southern Iowa, northern and western Missouri, southeastern Kansas and northeastern Oklahoma, with large bituminous and lignite fields in Texas. The coal fields of the Rocky Mountain States are scattered with the principal fields in southern Wyoming, northern Wyoming, western Montana and northeastern

New Mexico and southeastern Colorado. The Pacific Coast States coal fields occupy the north-western part of Washington with a small area in western Oregon and a small field in California. Alaska has coal fields in the southern portion which are of considerable importance, although not well developed. The United States is the greatest producer of coal, and in normal times the yield is 38 per cent, Great Britain 22 per cent and Germany 20 per cent of the world's output of coal. The metal-mining industry of the United States is distributed approximately as follows: The principal iron mines are in Minnesota, Michigan, northern Wisconsin, northeastern New York and central Alabama. The principal copper mines occur in northern Michigan, western Montana, Utah, Nevada, Arizona and southern Alaska. The lead mines are in southeastern Missouri, the Cœur d'Alene district, Idaho, and in Colorado. The principal zinc mines occur in southwestern Missouri and eastern Oklahoma; Leadville, Colo., and Butte, Mont., are becoming large producers. The gold and silver mines occur in Alaska, California, Colorado and Nevada, while every Rocky Mountain and Coast Range State produces more or less of the precious metals. Phosphate rock occurs in large quantities in Tennessee, Florida and South Carolina; bauxite in Arkansas and Georgia; salt in New York, Michigan and Kansas; petroleum and natural gas in Oklahoma, Texas, California, Pennsylvania, Ohio, West Virginia and Indiana.

The United States is the world's largest producer of copper, iron, lead, zinc and petroleum. About 20 per cent of the world's gold supply comes from the United States; 40 per cent from South Africa and 15 per cent from Australasia. (See article on GOLD MINING). The Central Powers of Europe produce only 0.6 per cent, while the United States and her allies produce 91.3 per cent, and neutrals (1918) produce 8.1 per cent.

**Prospecting.**—Preliminary work in mining operations is known as prospecting, and is often conducted by individuals who work on their own account, spending weeks or months in outlying districts in search of mineral outcrops or rock indicating that valuable minerals may be present. The prospector of the early days is fast disappearing and prospecting is now carried on in a scientific way by large development or exploration companies, whereby a promising mineral field is thoroughly tested by churn drills or core drills as economy may suggest. The core or diamond drill is most important in this particular work in that it obtains a core so that it is possible to know accurately the formation through which the drill has passed together with its thickness, depth and mineral content. The ground is marked out in squares of 100 to 500 feet on a side and at the corners or in the centre of each square a drill hole is sunk, and the core or cutting thoroughly tested. This work is carried on in conjunction with geological studies, in which the character of the various country rock is studied, as, for example, its position and composition, lithological character and other data which may be of interest to the prospector and geologist, and help to point out the places where ore deposits are most likely to occur. Trenches are often cut across mineral zones, and small

shafts sunk to test the character and quality of the mineral.

**Development.**—After a property has been prospected and it is definitely known that it contains mineral deposits of economic importance the development proper begins by the construction of shafts, entries or slopes, and the blocking out of the ore or coal which is to be taken out at a later date. This work is usually done preliminary to the building of a mill or other reduction works.

**Drainage.**—In the development of mines one of the important factors to be taken into consideration is the matter of drainage and ventilation. Of course drill holes and preliminary shafts indicate to a certain extent the amount of water that will be encountered, but as the mine workings are extended larger areas are opened for the entrance of ground waters, thus increasing the amount of water which in the small mines would be considered negligible. When a mine is opened on a hillside, the drainage is usually taken care of by an adit and all of the mine workings drained from the lowest level, the upper workings in this case being absolutely without water. Where a mine cannot be thus drained, it is necessary to install large and expensive pumping plants, as frequently the amount of water handled is far in excess of the coal or ore produced.

**Ventilation.**—The ventilation of mines is also an important item to be considered, especially when mines are opened to a considerable depth. The ventilation of coal mines has been well worked out in the anthracite and bituminous fields by reason of the fact that many of the mines generate noxious or poisonous gases, making it impossible to work without adequate ventilation. The metal mines as a rule do not generate gas, therefore their ventilation has not, in many cases, received proper attention. Natural ventilation in metal mines is usually provided for by surface openings at different elevations which, in most cases, give a very satisfactory distribution of fresh air. Where there is but slight difference in elevation of two or more openings it is necessary to install mechanical ventilation whereby fresh air is supplied by fans. Coal mines, and frequently metal mines, are often opened by a drift-slope tunnel or adit with no outlet at the inner end, so that it is necessary to use a force fan to send in new air to the working face. The fresh air then circulates through the places in the mines where the men are at work; the air thus circulated becomes more or less vitiated as to its oxygen content, and is also burdened with gas and dust, before escaping from the mine. Its escape is often assisted by a suction fan. The circulation of large volumes of air is necessary to make working conditions tolerable in gaseous mines.

#### SYSTEMS OF MINING.

There are two classes of mines, namely: (a) Open-pit mines, which are operated with or without steam shovels, and (b) underground mines, which are entered by a shaft, drift, entry or slope, and in which the mining is done under cover of rock.

**Open-pit Mines.**—This class of mines is becoming more and more important since the development of the steam shovel. In the iron mining districts of Minnesota, it is not un-

common for mines to be operated where an overburden of 100 or 150 feet is stripped and carried a distance of three or four miles in order that large ore bodies may be exposed. After the overburden has been removed the operation of the steam shovel is continued and the iron ore loaded into railway cars which are provided for it in the bottom of the pit which in many cases is 80 acres, or more, in area. Steam-shovel mining is the principal method of mining ore in Minnesota, and is rapidly coming into favor for mining copper ores in Arizona, Utah and Nevada. The steam shovel is becoming an important factor in coal mining where an overburden of 15 to 50 feet may be removed from a four- or five-foot coal bed, and the coal loaded by steam shovel into railroad cars. The open-pit mines operating without steam shovel are usually small and in this connection the overburden is removed by drag line scrapers, wheel scrapers, as in the case of railway excavations, or by the use of wheel-barrows and hand labor. This work is confined largely to the less important minerals, as barite, small iron-ore deposits, phosphate deposits and to shallow coal beds.

**Placer Mining.**—Another class of open-pit mines is known as placers or placer mines, where gold-bearing sands and gravels are mined for the gold which they contain. In the earliest stages of placer mining the gravel was washed in pans, the gold collecting at the bottom, and saved as metallic gold. This was followed by mechanical devices such as the rocker, long tom and sluice. The sluice consists of a long wooden trough or box, or channels cut in the bed rock, provided with riffles in which the gold collects as the gold-bearing sands are washed through the sluices. Mercury is spread in the bottom of the sluice so as to catch the fine particles of gold, forming a gold-mercury-amalgam. The "clean-up" takes place at stated intervals when the amalgam is collected and the mercury is driven off by heat and the gold collected. The large placer operations are known as hydraulic and dredging. Mining by hydraulic methods consists in using water under various pressures from 250 to 400 pounds per square inch, which escapes through a nozzle and is directed at the gold-bearing gravel banks; as the water carries the finer gravels and sands to the sluices the gold is collected in the manner described above under sluicing. The latest commercial development in placer mining is dredging, whereby it is possible to recover sands and gravels containing as low as five or six cents in gold per cubic yard. The powerful dredges scoop up the sand and pass it through screens, the finer material being washed through sluice boxes provided with riffles and mercury traps and the gold is recovered by cleaning out the sluice and retorting the amalgam.

**Underground Mining.—Stoping.**—A method of mining in which the ore is excavated from a vein by driving horizontally upon it a series

of workings, called stopes, one immediately over the other or vice-versa. (See Fig. 1). A stope is an excavation from which the ore has been extracted, either above or below a level, in a series of steps and is usually applied to highly-inclined or vertical veins, or an open place in a thick ore body. The term is frequently used incorrectly as a synonym of room, which is a wide working-place in a flat mine.

FIG. 1.—Stoping Method. The upper portion is known as "overhand," and the lower as "underhand" stoping.

Each horizontal working or stope (probably a corruption of step), when a number of them are in progress, assumes the shape of a flight of stairs. When the first stope is begun at a lower corner of the body of ore to be removed, and, after it has advanced a convenient distance, the next is commenced above it, and so on the process is called *overhead stoping*. When the first stope begins at an upper corner and the succeeding ones are below it, it is *underhand stoping*. The term stoping is loosely applied to any subterranean extraction of ore except that which is incidentally performed in sinking shafts, driving levels, etc., for the purpose of opening the mine. This method probably originated in the Cornish tin mines and is applicable to vertical or highly-inclined ore bodies; also to massive deposits which may have great thickness.

**Room-and-Pillar.**—A system of mining in which the distinguishing feature is the winning of 50 per cent or more of the coal in the first working. The coal is mined in rooms separated by narrow ribs or pillars. The coal in the pillars is won by subsequent working which may be likened to top slicing in which the roof is caved in successive blocks. The first working in rooms is an advancing and the winning of the pillar coal a retreating method. (See Fig. 2). The rooms are driven parallel with one another, and the room faces may be extended parallel with, at right angles, or at an acute angle to the dip. When applied to metal mines, with a good cover, as much as 75 to 85 per cent of the ore is removed, leaving pillars 10 to 20 feet in diameter; wherever possible, pillars

are left in the poorest ore, hence their position is more or less irregular as compared with the pillars left in coal mining. This method is applicable to flat deposits, such as coal, iron ore, lead and zinc, etc., which occur in bedded deposits. Modifications of this method are County of Durham system; Double-entry room-and-pillar mining; Double-room system; Double-stall working; Heading and stall; Pillar and stall; Post and stall; Room and stoop; Single-entry room-and-pillar mining; Single-

FIG. 2.—Room and Pillar Mining.

stall working; Square work (South Staffordshire thick seam method); Stall and breasts; and Triple-entry room-and-pillar mining.

**Longwall Method.**—A system of working a seam of coal or ore in which the whole bed or seam is taken out and no pillars left, excepting the shaft pillars, and sometimes the main-road pillars. *Longwall advancing* consists in mining the coal outward from the shaft pillar and maintaining roadways through the worked-out portion of the mine. (See Fig. 3, in which the arrows indicate the direction of advance and points to the working face). *Longwall retreating*, first driving haulage roads and airways to the boundary of a tract of coal and then mining it in a single face without pillars toward the shaft. The longwall method is usually applied to coal mining and occasionally to flat ore deposits, as iron, etc. This system of mining is also known as Longwork, Shropshire method, Combination longwall and Nottingham or Barry system.

**Milling.**—A system of mining originating in the combination of open cut and underground mining, where the ore is mined in open cut (surface workings) and handled underground. It is underhand stoping applied to large deposits, wherein the ore is mined near the mouth of winzes or raises and dropped by gravity to working levels below for transportation to the

surface. Sometimes called "glory-hole" method. (See Fig. 4).

**Caving System.**—A method of mining in which the support of a great block of ore being removed, it is allowed to cave or fall, and in falling is broken sufficiently to be handled; the overlying strata subsides as the ore is withdrawn. Two important variations are Top slicing and cover caving; Top slicing combined with ore caving.

**Top Slicing and Cover Caving.**—The important feature in this method is the working of the ore body from the top down in successive horizontal slices that may follow one another sequentially or simultaneously. The whole thickness of the slice is worked and the ore broken by overhead or under hand stoping in each unit. It is a retreating method, as the overburden or cover is caved after mining a unit. The longwall, the pillar robbing in both room-and-pillar and bord-and-pillar methods of mining coal are essentially the same in principle as top slicing. The principal difference is that a single slice only is worked in these methods when applied to coal mining. There are two modifications: top slicing by drifts and top slicing by rooms. A timber mat is used as a cover in almost all cases. The method is applicable to thick or massive ore deposits. Other terms used for this system are Caving system; Crosscut method (combined with removal of pillars); Horizontal slicing descending; Mining ore from top down; Panel slicing; Prop slicing; Removing pillars and allowing roof to cave; Slicing under mats of timber in panels; Square-set slicing; Top slicing and caving; Transverse slicing with caving.

**Top Slicing Combined with Ore Caving.**—In this method the ore body is worked from the top down in successive slices. Instead of taking the full height of the slice, only the lower part is taken and the upper part is caved. After removing this portion of the ore, the cover is caved. A timber mat is used in most cases to separate the broken cover from the ore to give safety. Also known as Caving system, Sub-drifting and caving, Sub-slicing, Slicing under ore with back caving in rooms, Sub-level caving and Sub-level slicing.

**Explosives.**—In all methods of mining, explosives are essential. The maximum amount of explosives is used in stoping and room-and-pillar methods, while a minimum amount is used in the caving system and its various modifications, due to the fact that much of the ore is loosened by caving of the overburden. The importance of the mining industry is further shown by the fact that 75 per cent of all explosives used in the United States are used in the mining industry (not including quarries). The enormous production from the mines in the United States would not be possible without the use of large amounts of explosives. The total production of explosives in the United States in 1917 was as follows: Black powder, 277,118,525 pounds; dynamite and high explosives other than permissibles, 262,316,080; per-

missibles, 43,040,722. Of the black powder, 85 per cent was used in coal mining; of high explosives, 10.8 per cent; and of permissibles, 76.5 per cent. Other mining consumed 3.4 per cent of the black powder, 50.4 per cent of high explosives and 14.2 per cent of permissibles. In the production of coal an explosive is required which will not shatter the coal and at the same time not produce too long a flame nor too much heat and thus ignite gas and dust with which it might come in contact. This led to the introduction of so-called safety or short-flame explosives in the coal mines of Pennsylvania at Johnstown in 1902, and since that date their use has increased rapidly. The term "permissible explosives" was coined by Dr. J. A. Holmes in 1908, and in 1909 the Federal Bureau of Mines established a testing station at Pittsburgh to determine the permissibility of explosives that are to be used in coal mines. This work is still being carried on in connection with the investigation of mine explosions to determine the nature and character of an explosive that will meet the needs of the various branches of mining, and especially to increase safety in coal mines. Both the improper use of explosives and the use of improper explosives have resulted in coal-mine disasters. The Federal Bureau of Mines has brought about what is little short of a revolution through the introduction of new types of low-temperature, quick-flame powders, designated as "permissible explosives," for use in the more dangerous coal mines of the country. In the bituminous coal mines of the United States the fatality rate per 10,000 men employed has been reduced from 3.39 in 1903 to 0.80 in 1917, largely as a result of the use of permissible explosives. In metal mining a different type of explosive is needed, namely, one which will shatter the hard mineral formation, and for this purpose dynamite of different grades is employed. Black powder, by reason of its slow heaving action, is used to a certain extent in the iron mining districts, where steam-shovel work is carried on, and where it is necessary to loosen large masses of soft or friable ore.

**Mine Haulage.**—The transportation problem is one of the most important features in the development of the mining industry with which the mining engineer and mine manager have to deal. (It is seldom given a passing thought by the layman). The quantity of merchantable material handled by the various mines and quarries in the United States during a single year is in excess of 1,000,000,000 tons. The work of the Panama Canal is cited as perhaps the greatest engineering feat in modern times, yet the amount of material handled at the canal each year was but slightly in excess of the amount of iron ore and overburden removed annually in two States, namely, Michigan and Minnesota. The task of moving 1,000,000,000 tons of ore, coal and rock would require 20,000,000 50-ton cars. Reducing this to trains of 40 cars, each would represent 500,000 trains. Assuming the average length of a 50-ton car as 40 feet, the length of train

required to carry the above amount of ore would be 151,500 miles, or six times the circumference of the earth. The mine-haulage problem is usually separated into three divisions: (1) *Underground haulage*, that is, from the working face of the mine to the bottom of the shaft or to the surface in the event that the mine is opened by a tunnel or adit. (2) *Hoisting*, that is, handling the ore or coal from the mine through either vertical or inclined

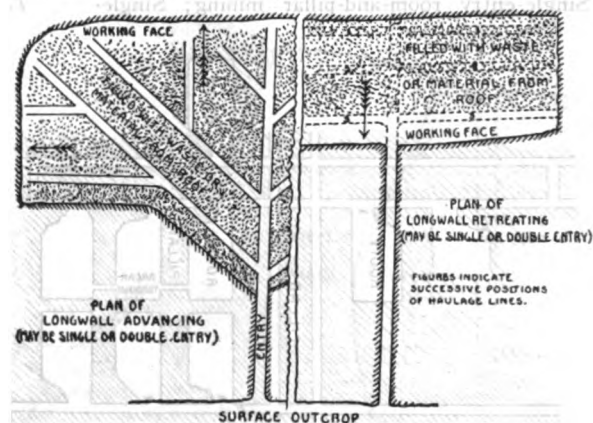

FIG. 3.—Long Wall Method of Mining.

shafts to the surface. (3) *Surface haulage*, which delivers the ore or coal from the mouth of the shaft to ore bins at smelters or coal tipples at railway yards.

**Evolution of Mine Haulage.**—In the early years of the mining industry the transportation of ore or coal was crude, and even to-day primitive methods prevail in the more remote districts. In China the ore is transported by coolies, and in some of the mining regions of Mexico Indians carry the ore on their backs for perhaps a number of miles. This class of transportation will apply both to surface and underground workings. In Central America Indians carry ore in a box mounted on two small poles, similar to a hospital stretcher, two men working together. In Peru and Bolivia the llama is the beast of burden and occupies the same position as the burro in Mexico. In early years a large percentage of the coal transportation underground in Great Britain was handled by women and children. The coal was loaded into buckets which were mounted on sleds and when these were used in thin coal beds it was necessary for the women or children to creep along the floor on their hands and knees and draw the sled behind them. A laborious task indeed. The next step in underground transportation was the introduction of two-wheel carts and wheelbarrows, followed by small wooden cars operated on wooden tracks. In 1803 the wooden tracks were first covered with strap iron. The motive power in these cases was largely women and children, and this condition existed in Great Britain until prevented by law in 1842. In 1846 ponies were first used in the English mines. The next improvement was the introduction of *iron tracks* followed by the use of substantial wooden cars and sheet-iron cars with a capacity of about one ton. The cars were enlarged and horses

and mules were introduced into many of the mines, and to-day occupy an important place in underground and surface haulage in both the United States and foreign countries. In many cases the animals are lowered into the mines and remain there until they are either crippled or too old to work. Dogs have been used to some extent for haulage purposes, and as late as 1909 one coal-mining company in Illinois was reported as using 31 dogs for this

underground and surface haulage. In some of the old abandoned mines in Mexico, the prospector frequently finds notched poles, nicknamed "chicken ladders," which were used by the early Spaniards and the Indians in mining the precious metals. The ore was placed in skin bags containing 50 to 100 pounds each and carried on the backs of the natives as they climbed these poles to the surface. Oftentimes a series of these ladders would cover an elevation of 500 to 1,000 feet. Similar methods of ore transportation are still in use in remote districts of China.

Vertical ladders were used for many years for carrying ore to the surface, which now find a place only as a secondary escapeway to be used in case of accident. Following this was the introduction of a crude hand windlass with ropes made from the skins of animals. The hand windlasses are usually known as "Armstrong" hoists, as the power is applied through the arm of the operator. The next improvement was probably in the matter of cables whereby the skins were successively replaced by hemp, cotton and steel cables. As work progressed, the hand windlass was replaced by the horsewhim wherein by means of a long sweep geared to a drum the horse performs the winding as he travels in a circle. Following this was the small steam plant which is now in common use in all prospects and small mines in all the mining districts. These small steam winding plants will handles 500 to 1,000 pounds of ore at a single hoist, and have been gradually enlarged and improved until we have to-day the huge plants with winding drums 20 to 30 feet in diameter and capable of containing 5,000 to 6,000 feet of cable. The

largest hoist of this kind is the one used at the Tamarack shaft, Michigan, where ore is hoisted at a single lift from a depth of 5,260 feet vertically. The Transvaal mines in South Africa are from 2,000 to 5,000 feet deep, and next to our Michigan mines have the best hoisting equipment of any mines in the world. These shafts are equipped with hoisting plants that will handle from 5 to 10 tons of ore at a single trip, at a rate of 3,500 feet per minute. The majority of these larger hoists are operated by steam. The increasing use of electricity has led mining engineers to consider the question of substituting electric motors for the steam hoisting engine. The first electric hoist in America was installed in July 1888 at Aspen, Colo. The motor was seven and one-half horse power with a capacity of handling 1,500 pounds at the rate of 100 feet per minute. In 1894, then the largest electric hoist in the United States was installed in Colorado. The plant consisted of a 150 horse-power motor with an auxiliary 60 horse-power motor. There were two reels, each capable of containing 1,500 feet of  $4\frac{1}{2}$ -inch  $\times$   $\frac{3}{8}$ -inch flat cable. The cage weighed 1,375 pounds, and operated at a speed of 600 feet per minute. It had a capacity of carrying an overbalanced load of 10,000 pounds. The Seamans-Ilgner electric hoisting system utilizes high tension currents that are reduced to about 500 volts. Between the motor and generator is mounted an enormous balance

FIG. 4.—Milling System of Mining.

purpose. Dogs are used in the far North for transporting mine supplies during the winter season, when the snow and ice are suitable for sleighing purposes. Steam locomotives have been used underground since the early 50's, but on account of the smoke given off their use is restricted to small, well-ventilated areas. The compressed-air locomotive was introduced into the mines about 1885 and still occupies a prominent place in the mining industry. Electric haulage was begun in 1887 and is now common in the large coal and metal mines. The first electric tramway for mine use was installed in Colorado in 1890. In 1890 electrical storage battery locomotives were first considered for use in mines, and to-day they are in successful operation. They are used largely inside the mines for gathering the coal from the working face and delivering it to the main haulage system. In the operation of these locomotives a track is laid from the main haulage system to the working face, and the storage-battery locomotive operates over these lines without the danger attending installations where trolley wires are in place. The latest motive power applied to mine haulage is the gasoline locomotive, and tests on this engine indicate that it may be an important factor in underground transportation, providing ventilation is such as to get rid of the waste gases.

**Hoisting.**—Hoisting through inclined or vertical shafts is the connecting link between

wheel which is kept in continuous motion and absorbs the shock due to the sudden starting of the heavy loads. A hoist of this type is now in use at the Hecla mine, Burke, Idaho. The balance wheel weighs 30,000 pounds. There are two reels, each capable of holding 2,500 feet of  $\frac{3}{8}$ -inch  $\times$  4-inch flat steel cable, and hoisting at a speed of 2,400 feet per minute. The capacity of this hoist is 16,000 pounds unbalanced load from a depth of 2,500 feet. The total weight of the equipment is 300,000 pounds.

Another electric hoist recently installed is that of the Ray Consolidated Mining Company, Ray, Ariz. While it is not intended to hoist from a great depth, it handles a load of 12½ tons from a depth of 500 feet at a rate of 300 feet per minute.

**Surface Haulage.**—The evolution of surface haulage follows closely to that of underground work as given above, beginning with coolies in China, Indians in Mexico as men of burden, followed by the llama, burro and pack trains, and later by wagons, as represented by the 20-mule-team of a borax company in California. A few years ago 125 horsepower traction engines were tried in the West many of which were abandoned on the plains by reason of the fact that they could not carry sufficient fuel and water to run them across the desert country. Steam, compressed-air, gasoline and electric locomotives are in almost universal use in the various mining districts of the United States. The introduction of the motor truck is now quite common in many of the remote districts where railroads have not yet been built.

**Wire Rope Trams.**—Wire rope trams were first introduced 200 years ago. Cable ways, such as are now used in quarries, were invented and used in 1851. One of the earliest large installations of cable ways was in the Tilly Foster mine, New York, where 600,000 tons of ore was recovered after the removal of an overburden of 300,000 tons. A typical example of the aerial tram is that of the American Nettie mine in Colorado. This tram is 3,400 feet long, the first 500 feet of it sloping 45 degrees. The longest span is 1,800 feet. The ore is carried in buckets each carrying 1,000 pounds of ore. Another example of an aerial tram used in coal mining is one installed at Electric, Mont. The cable is 7,800 feet long, the elevation of the upper end of which is 1,200 feet above the lower. This type of transportation finds a place in rough inaccessible mountain regions.

**Gravity planes** are used at some of the mines, as for example, the one now in use at the Boston Consolidated mine in Utah. This plane is 1,900 feet long sloping 22 degrees, and representing a height of 737 feet. Twelve-ton skips are used on this incline and 1,350 tons of ore is handled per eight-hour shift. This is one of the largest incline planes in the United States.

**Belt Conveyor.**—An example of belt conveyors is that recently installed at Miami, Ariz., where a 30-inch belt conveyor travels 300 feet per minute up an incline of 15 degrees. The capacity of this belt is 2,000 tons of crushed ore daily. Belt conveyors are used largely in ore-dressing plants, cement mills and other surface plants. Many of these are operated by electric motors.

**Endless Rope Haulage.**—Endless rope haulage is in use at many mines.

**Railway Haulage.**—At nearly all large mines, the major part of the surface haulage is on the scale of railroad operations. For example, in the Minnesota iron mines, and copper mines in the West where the mining is done by steam shovels, the ore is loaded direct into 40 or 50-ton steel cars. In the case of the Minnesota iron mines these loaded cars are sent 75 to 100 miles to Duluth to the ore docks, where the cars are dumped automatically into bins from which the ore is drawn into the lake steamers. It requires less than two hours to load one of these steamers with 10,000 tons of ore. In the case of the Western copper mines, the standard gauge cars that are loaded by steam shovel are sent direct to the smelter varying from only a few miles to 100 or more.

**Treatment of Ores.**—After the ore or mineral has been mined, it is subjected to various metallurgical treatments as the case may require; thus iron ore is sent direct to the blast furnace where it is melted into pig-iron. Copper ores are concentrated and the concentrate sent to the blast furnace where it is smelted in a manner similar to the iron ores, thus producing copper bullion. Gold and silver ores require various treatments depending upon the character of the ore, the principal methods being stamp milling, amalgamation, cyaniding, chlorination and lixiviation. (See article on GOLD MINING). Lead ore, after concentration, is smelted in an ordinary blast furnace, while zinc ore is distilled in retorts and collected in its metallic state known as spelter. Mercury is likewise distilled and condensed in retorts and when cold remains liquid. The treatment of minerals from which such metal as chromium, cobalt, titanium, tungsten and vanadium are obtained is described under the various headings. See COPPER; GOLD; LEAD; ZINC, etc.

**Bibliography.**—The following books (frequently used as textbooks) are sources of much information on various phases of the mining industry:

**MINING AND MINING METHODS.**—Hoover, H. C., 'Principles of Mining'; Ihseng, M. C., and Wilson, E. B., 'A Manual of Mining'; Crane, W. R., 'Ore Mining Methods'; Mayer, L. W., 'Mining Methods in Europe'; Sanders, W. E., MacDonald, B., and Parlee, N. W., 'Mine Timbering'; Brinsmade, R. B., 'Mining without Timber'; Storms, W. H., 'Timbering and Mining'; Redmayne, R. A. S., 'Colliery Working and Management'; Weatherbe, D. A., 'Dredging for Gold in California'; Wilson, E. B., 'Hydraulic and Placer Mining'; Peele, R., 'Mining Engineer's Handbook'; Fay, A. H., 'Glossary of the Mining and Mineral Industry.'

ALBERT H. FAY,

*Mining Engineer, United States Bureau of Mines.*

**MINING ENGINEERING**, is that branch of engineering which pertains to the operations of extracting useful minerals from the deposits in which they occur. While no distinct line can be drawn between the fields occupied by mining and mining engineering, the former may be termed an art and the latter a science. The present article will be confined to a consideration of the qualifications, professional duties and training of the mining engineer; the subjects relating to mining as an art, namely, the modes of searching or prospecting for mineral deposits, the various systems or methods of working mines, and the details of the operations connected therewith, are dealt with under the head of **MINING**.

The province of the mining engineer comprises the testing and valuing of mineral deposits, the planning and execution of the various mining works required to reach the deposit—such as tunneling, shaft-sinking, etc.—the choice and application of a suitable method of opening the mine and bringing the ore to the surface; and, lastly, the installation of the necessary surface and underground plant. In addition, therefore, to a knowledge of the theory and practice of the various kinds and methods of mining, the successful pursuit of the profession demands not only a training in mathematics, mechanics, physics and other fundamental subjects which underlie all technical education, but also an intimate acquaintance with certain of the natural sciences, particularly geology, mineralogy and chemistry, and many of the principles of civil, mechanical and electrical engineering. In a well-planned course of professional instruction the scientific studies would preferably come first, but the engineer is incomplete until to these he adds a knowledge of the actual practice of mining. The arts of metallurgy, ore-dressing and milling, moreover, are so related to the art of mining that these subjects also, at least in part, must be included in the equipment of the mining engineer. The functions of the mining engineer cannot be defined in precise terms, largely because of the infinite variety of local conditions which may be encountered, and the differing physical, mineralogical and chemical characteristics of the ore deposits themselves. (See **ORE DEPOSITS**). There has been perhaps a greater tendency toward specialization in mining than in other departments of engineering. As the professional field has broadened, no one man can hope successfully to cover it all. Quite a sharp distinction exists, for example, between metal mining and coal mining. The modes of deposition of coal and of the metalliferous ores, the geological and physical conditions, and the accepted systems of mining, are so different that the engineering of collieries has become largely

a specialty. So again among the metals themselves. Engineers may be led to specialize in the direction of iron, or lead and zinc, or copper, or gold and silver mining. This latter differentiation is not the result of any fundamental diversity in the methods of developing and working the mines, but is due rather to differences in the scale of operation, the physical characteristics of the deposits themselves, the treatment of the ores of the various metals and their final disposition. It frequently happens that the dressing, or concentration, and even the smelting, or other process for the reduction of the ore, are carried on at or near the mine itself, and under the same general management. The mining engineer, therefore, must be something of a metallurgist also, and, though not necessarily highly skilled in this direction, he should at least be able to decide upon and select the plant and process appropriate to the character of the ore, and to supervise its erection and operation. But this applies to the mining and treatment of the non-ferrous metals. The metallurgy of iron and steel forms far too large a field to be included in the range of work of the mining engineer. It requires a special training, and has developed into a distinct profession.

Several more or less conventional distinctions are made as to the particular branch of work in which a mining engineer may specialize. He may devote himself to examining, valuing and reporting on mines, being engaged for such work by intending sellers or buyers; he may serve in the capacity of consulting engineer for one or more mining companies; or in doing a general business he may be retained by his clients in an advisory capacity similar to that occupied by a counsellor-at-law, leaving to others the actual execution of the work or the carrying out of the policy determined upon. On the other hand, a mining engineer who becomes identified with the management of the affairs of a particular company must be a successful organizer and business man; he must possess the ability to make favorable contracts for work, the purchase of material and disposal of product, to control men, and not only to plan work but to know how it should be executed to attain the best economic results. He often combines with his purely professional functions the duties of superintendent or manager, and the smaller the property the greater usually is the variety of responsibility devolving upon the engineer. When in charge of a small or temporarily non-paying mine, especially one situated in a remote region, the engineer may be compelled to serve simultaneously in the capacities of superintendent, foreman, assayer and bookkeeper. He must know enough of chemistry and of civil, mechanical and electrical engineering to exercise intelligent control in matters relating to these branches, and he should have at least a general knowledge of mining law.

Formerly, the profession of mining engineering was less complex and exacting in its requirements than at the present time. The great advances made during the past 50 years in scientific and technical lines have brought with them constantly increasing responsibilities. An inspection of the course of study prescribed in mining schools of good standing will show how largely the education of a student in mining engineering lies in the direction of subjects

not relating specifically to the art of mining itself. Manual labor has been more and more replaced by mechanical appliances, and the engineer must be alert in availing himself of the innovations which have been introduced in endless variety; the ever-widening applications of electricity and compressed air for the transmission of power, the use of internal combustion engines, the numerous improvements in machines and processes for the concentration and reduction of ores, the increase in knowledge of the relations of geology to the deposition of ores; all these constitute new tools in the hands of the mining engineer, but they unite also in demanding a broader and more severe training. Up to 1870 applications of electricity and compressed air to mining were practically unknown; now they are employed in nearly all departments of mine work. Compressed air rock drills are used everywhere for both surface and underground excavation of rock; electric and compressed air locomotives or rope haulage have superseded hand tramping and haulage by mules and horses, wherever the conditions are suitable and the quantity of material dealt with is sufficient to warrant the additional first cost of plant; the greatly increased depths at which mining is carried on in many districts have made necessary the design and erection of enormously powerful and complicated hoisting engines; and finally, the successful and economical operation of such plants requires the maintenance of well-equipped machine and other repair shops.

The question of hoisting large quantities of ore from great depths, that is, vertical depths of say more than 5,000 feet, is one of the most serious mechanical problems at present confronting the mining engineer. Depths of approximately 5,000 feet have been already attained in several mining districts, notably in the Lake Superior copper region and the Witwatersrand in South Africa, while in the important Butte, Mont., copper district, the silver mines of the Comstock Lode, Nevada, and the Bendigo gold fields of Victoria, Australia, depths of 3,000 to 3,500 feet have been or are being reached. In a number of places where the present maximum depth of shaft does not exceed 3,000 feet, elaborate engines capable of hoisting from 5,000 feet or more have been installed. The prosecution of work at such depths involves the solution of rather intricate problems, among which are the proper construction of hoisting drums for winding the great lengths and weights of rope required, the design of reliable controlling apparatus for hoisting at speeds of 3,000, 4,000 or even 5,000 feet per minute, the means of raising and lowering with safety, speed and economy the hundreds of men required in large and deep mines, and the difficulties involved in the varying weight of the rope itself, as it winds upon its drum, a weight which often greatly exceeds that of the ore raised at each hoisting operation. A high degree of mechanical skill and knowledge is demanded for the effective solution of these and other problems. Consult discussions on "Hoisting from Great Depths," which appeared during 1902 and 1903 in the *Transactions of the Institution of Mining and Metallurgy*, London, the South African Association of Engineers; and the *Engineering and Mining Journal*, New York.

In all branches of his work the mining engineer of the present day finds himself compelled to introduce every new method and appliance that promises some saving in the cost of production. This is the result, not only of competition and of increase in wages but also of the reduction in market price of nearly all of the metals within the past four decades. In 1873 the price of silver was \$1.30 per ounce; now (May 1919) it is \$1.01; copper was then worth 30 cents per pound, now 15.3 cents; lead was then 6.5 cents per pound, now 4.7 cents, and other similar examples of the decline in value of the staple metals can be cited. Furthermore, as the more easily accessible mineral deposits are exhausted, the mining engineer is called on to practise his profession farther afield, often in regions remote from centres of population. Here he may be confronted with new problems arising from the lack of transport facilities, distance from source of supplies and materials, labor insufficient in quantity and poor in quality and adverse and unhealthy climatic conditions.

That function of the mining engineer which relates to examining and reporting on mining properties is both delicate and difficult, and calls for the highest degree of professional efficiency. In brief, the examination of a mine includes a study of the local conditions, topographical, geological and economic, and of the mineral deposit itself; the mineralogical character, quality, quantity and grade of the ore and its value per ton; an estimate of the cost per ton of mining the ore and the net profit which reasonably may be expected; and, lastly, the probable life of the mine. Upon these factors depends the market value of the property. In determining the quantity and grade of the ore, the deposit, as revealed by the development work already done, must be carefully and systematically tested. This is done by taking a series of samples in a manner which will enable the engineer to obtain a true average of such ore as can be examined and measured with sufficient accuracy and definiteness to warrant confidence in the results obtained. Evidently much depends upon how and to what extent the mine has been developed. The variety of conditions which may be met is almost infinite. Nature does not work with rule and plumb-line. Besides the ore which can be actually measured and sampled, the engineer may often be warranted in taking into consideration the quantity of ore which in the future will probably be rendered available by further development of the mine. In balancing such probabilities or possibilities, he must be guided mainly by geological and mineralogical analogies deduced from his previously acquired knowledge and experience. Lengthy discussions bearing upon this subject, by well-known engineers, have been published in the transactions of the mining engineering societies and in the technical periodicals. It may be added that the circumstances under which mine examinations are made are often rendered difficult and embarrassing where the perpetration of fraudulent practices by interested persons may be attempted, for the purpose of misrepresenting or concealing the true condition of the mine; records of cost and of the value and amount of previous production may be falsified, or the

samples taken by the engineer tampered with. Constant vigilance is required to guard against such contingencies.

With the development of the mining industry and the wider adoption of mechanical appliances and engineering methods in connection with mining operations, the demand for trained engineers has steadily increased until, at the present time, probably no field of engineering affords better opportunities for a young man. It is true that the course of preparatory study is exacting and the life somewhat arduous, but as yet it is one of the few professions which cannot be said to be overcrowded. Formerly, the so-called "practical" man monopolized most of the positions of responsibility and emolument, but the educated engineer has made his way to a degree that has produced an active demand for his services. Mining companies have found that the greater breadth of view resulting from a sound technical education has a direct money value. The trained engineer is acquainted with what is being done in his profession in other regions or countries. He keeps himself informed as to the experiments and discoveries made by others; is quick to utilize improved and more economical methods, and knows not only what to do but also what to avoid. His competitor who lacks this knowledge, and who has at his command only what has come within his own personal experience, is in danger of failure, if circumstances bring him face to face with new conditions, and with problems the prompt and efficient solution of which must be based on a familiarity with the principles of engineering practice. It must be remembered that the young graduate of a mining school is not yet an engineer; he has been grounded in the fundamentals of his profession, has absorbed a multitude of facts relating to its practice and his powers of observation have been cultivated; but before he is fitted to deal successfully with the diverse problems which sooner or later will confront him, he must in most cases patiently continue his education in the field for some years after graduation. His first employment is likely to be that of chemist, assayer, draughtsman, surveyor or assistant to one of the heads of department in the mine or works. How fast he advances will depend on his native energy and ability and the efficiency of his preparatory training. Not all young men are fitted by nature to become successful mining engineers. If the student has no aptitude for such a pursuit, the sooner he finds it out the better, both for himself and his instructors. Unquestionably, an immense amount of time, money and energy are wasted in the attempt to give a scientific and technical education to young men whose bent—if they possess any decided bent—is in some other direction. The curriculum of the school, therefore, should be so planned as to eliminate inefficient students as early in the course as possible.

In the making of an engineer, circumstances and opportunity are important. A well-known engineer and instructor has said: "A man without school education may make a remarkable engineer; but it may have taken him years to get his training and at the end of the time there may be whole regions of knowledge utterly unknown to him; in other words, he is liable to be a one-sided man without a broad outlook upon other fields than his own. The

school cannot teach him everything, but it can give him the keys to the storehouses which he may need to draw from in after life." A graduate of a good mining school has this advantage over his uneducated competitor; that he is better able to avail himself of the opportunities presented to him.

**Mining Schools.**—The need of technical schools specially equipped for preparing young men for the profession of mining engineering was long ago recognized in Europe, and some of the institutions there established have exerted through their graduates a marked and beneficial influence upon the mining industry of the world. Previous to 1865, mining practice in the United States was based chiefly upon European methods, and the earliest work prosecuted on a large scale in this country—for example, at the Comstock mines, Nevada—was in great measure planned and managed by American engineers who had received their education in Europe. The influence of the Continental institutions also made itself felt in the organization of the older American mining schools. The first School of Mines in the United States was founded in 1863 under the auspices of Columbia College, New York. Since then, mining schools have been established in many parts of the country, the total number being now about 40. The majority of them, however, are small, with limited equipments and teaching forces. Many exist simply as departments of technical schools connected with State universities. A few are separate and distinct institutions. The leading mining schools of the United States are the School of Mines of Columbia University, the Mining Department of the Massachusetts Institute of Technology, the College of Mining of the University of California, the State School of Mines of Colorado, the Michigan College of Mines, the School of Mines of the University of Minnesota and the schools at Rolla, Missouri, Lehigh University and Lafayette College. The courses of study leading to the degree of mining engineer generally occupy four years but exhibit quite wide variations in plan and scope. Some of the best of the schools have rigidly prescribed courses; others offer a range of elective subjects, comprised in more or less interdependent groups. Without attempting a comparison of the curricula of these schools, a condensed statement of the ground that should be covered by a well organized School of Mines may here be given:

*First Year.*—Algebra—general theory of equations (elementary algebra required for admission), analytical geometry, spherical trigonometry (plane trigonometry required for admission), general inorganic chemistry, qualitative analysis, physics, descriptive and determinative mineralogy, including crystallography and blow-piping, theory of surveying and mechanical draughting. In the vacation following the first year, five weeks' field practice in surveying.

*Second Year.*—Calculus, elementary and analytical mechanics, physics, industrial chemistry, theory of railroad surveying, general geology, elements of electrical engineering, quantitative analysis, descriptive geometry and drawing. In the vacation following, five weeks' field work in general surveying and four weeks' railroad surveying.

*Third Year.*—Analytical mechanics, economic geology, properties and resistance of structural materials, masonry and timber construction, engineering of power plants, earth and rock excavation, railroad and mine tunnels, boring and shaft-sinking, exploration, development and methods of working mines, general metallurgy, and metallurgy of the non-ferrous metals, graphic statics, assaying, principles of electrical engineering, experimental mechanical engineering, optical mineralogy and petrography. Vacation work: six weeks' systematic study in mines selected for the purpose, one week of mine surveying, one week's study in metallurgical works and one week of field geology.

*Fourth Year.*—Thermodynamics, steam engines and boilers, heat and its applications, internal combustion engine, hydraulics, ore-dressing, mine engineering, mine plant and equipment, mine surveying, mine administration, metallurgy of silver, gold, copper, lead, zinc, iron and steel, draughting and design of mine plant, geological examinations and surveys, mining laws, thesis or project in mining. Laboratory work is required in connection with geology, mineralogy, physics, qualitative and quantitative analysis, assaying, testing of materials, electrical engineering, metallurgy and ore-dressing.

*Admission.*—The requirements for admission to the best American mining schools comprise elementary and certain portions of advanced mathematics, elementary chemistry and physics, free-hand drawing, English, history and elementary French, or Spanish. Under certain circumstances, students may be admitted on certificate of other institutions.

ROBERT PEELE,  
*Professor of Mining, Columbia University,  
New York.*

**MINING ENGINEERS, American Institute of,** an organization founded in 1871 to promote the arts and sciences connected with the economical production of the useful minerals and metals, and the welfare of those employed in these industries, by means of meetings for social intercourse and the reading and discussion of professional papers, and to circulate, by means of publications among its members and associates, the information thus obtained. The publications of the organization are issued in three volumes of 'Transactions' annually and in the monthly *Bulletin*. The headquarters are in New York City in the Engineering Building. Membership over 5,000.

**MINING GEOLOGY,** the application of geology to the exploitation of mineral resources. See **MINING**; **GEOLOGY**; also **ORE DEPOSITS**; **ECONOMIC GEOLOGY**.

**MINING INDUSTRY, American.** See **MINING**.

**MINING LAWS OF THE UNITED STATES.\* Government Ownership of Minerals—Discovery of Gold.**—The United States mining statutes apply mainly to the ownership and acquisition of minerals in the public lands. They do not regulate or control underground mining operations. The government on its formation made no claim to minerals in lands within the original States. The Ordinance of 20 May 1785, providing for the disposal of public lands, reserved one-third of all gold, silver, lead and copper mines. An early enactment of Congress required surveyors to note in their fieldbooks the situation of all mines. By resolution, 16 April 1800, Congress authorized the collection of information relative to copper mines near Lake Superior.

A system of leasing the lead mines and of reserving all salines was in force for many years. But President Polk in his first message, 2 Dec. 1845, suggested that the leasing system was defective and unprofitable, and recommended that mineral lands be sold "reserving to the government an equitable percentage of the gross amount of mineral product." The policy of the government always has been to reserve all minerals and to dispose of them by methods distinct from that of the disposal of other public lands. No discovery of the precious metals had been made in the public lands before the cession of the territory by Mexico, in 1848. For 300 years the Spaniards had found no gold in the sands of that vast domain. Americans, seeking the development of the country, discovered the precious metal before the treaty of peace was signed. At this time there was no statute authorizing the private appropriation of minerals discovered upon the public domain. The laws of the United States were never extended to the territory acquired from Mexico, but automatically this domain came under mill-

\* This article treats only of the United States mining statutes. The mining codes of the various states regulate mining operations under ground and include features separate and distinct from those of the Federal mining statutes.

tary rule, and on 12 Feb. 1848, 10 days after the peace treaty had been signed and 25 days after the discovery of gold, the military governor, Col. R. B. Mason, issued a proclamation abolishing the Mexican laws and customs prevailing in the California region relative to the denouncement of mines. But Mexican rule and law over the ceded territory ended without this manifesto. No law authorized and none prevented miners from prospecting for gold. Pioneers were occupying the land without Congressional license, and the miners began prospecting under the passive leave of the government. The silence of the ruling body was construed to be consent. From the time of the discovery of gold until 1853 there was neither authority nor law permitting, prohibiting or condemning the wholesale trespassing upon the public lands, and the mining and appropriating the minerals that belonged to the government. In 1853 the Supreme Court of California decided that the deposits of gold and silver within its boundaries belonged to the State. The Congress, and the executive branch of the government, acquiesced in this holding, and mining operations on the public domain grew to vast proportions. Not until 1861 was this doctrine of State ownership repudiated, and the title to the minerals conceded to be in the United States.

In the meantime, miners from the southern Appalachian regions, from the tin and lead mines of Great Britain, from the mines of Mexico, South America, Continental Europe and from the islands of the sea, and adventurers from the Eastern States and from all quarters of the civilized world poured into California as a new El Dorado.

**Miners' Rules and Regulations.**—At the beginning of this wild rush there was locally no law to restrain and no court to punish an offender for trespass, misdemeanor, larceny or murder. The miner whose rights were invaded, or whose property was taken, had neither court nor authority to which he could resort for the protection of his rights, or redress of his wrongs. This tide of immigration carried on its crest men of learning, integrity and honor; but it also swept before it the derelicts of society, the depraved, the vicious, the thug and the thief—criminals fleeing from punishment past or prospective. For self-protection, the thoughtful and law-abiding prospectors organized themselves into local communities acting with the direction and authority of constituted bodies exercising power to preserve order and punish offenders. These communities were known as "mining districts." These districts usually included one or more "diggings" or mining camps, and were bounded by natural objects—mountains, gulches and rivers. The districts varied in size from a small mining area to vast stretches of valleys and gorges. In each district meetings were held at stated times, or as necessity might demand, on call. The meetings were in a sense deliberative assemblies, conducted in an orderly manner "with the business tact of American instinct for public assemblies." The meetings were the people's forum, an instance of pure democracy, legislative in their nature and executive in purpose; they were more than mere occasions for mental effervescence or than safety valves for community complaints. Their sessions were governed by properly

selected officers, and records were kept of their proceedings.

These meetings enacted laws for the punishment of offenders, including all grades of offenses. From lack of jails and places of confinement for persons convicted of violating the laws, capital punishment was inflicted on the more serious offenders, and those convicted of lower grades of crimes were flogged or banished. Here also were formulated and adopted rules and regulations for the government of mining claims. These rules stated the miners' rights, prescribed the size of mining claims, the method of locating, holding and working them, and declared the rules as to abandonment and forfeiture, and even the method of using water. They usually stated the conditions that would excuse the working of a claim and permit the claimant to retain title. In some instances, the rules and regulations prescribed the qualifications of locators of claims. Recorders were selected, and their duties were usually defined, including the recording of claims in a suitable book to be kept for that purpose, the book to be open for the inspection of interested persons. A miners' rule or regulation did not acquire validity by the mere enactment, but its legal force arose from the customary obedience thereto after its adoption, and unlike a statute it lost its force and validity from general disuse. On this theory a rule or regulation duly enacted by a regular meeting might on abandonment be supplanted by an unwritten custom that prevailed generally, however different or even contrary to the original written rule.

The origin of these miners' rules and regulations is not well authenticated. It cannot be attributed solely to the American genius for formulating laws, but rather to the American genius for adopting practical ideas and embodying them in workable codes. The gold hunters incorporated into these local codes the valuable features of the mining laws of foreign countries. Their information came from miners working with them from Cornwall, Derby and Devonshire; from Mexico, Chile and Continental Europe. These brought with them the mining laws of their several countries and into the local codes were incorporated the best features of the Chilean, the Mexican and the Spanish mining laws and the rules and terms that were born in the stannary parliament of Cornwall, Derby and Devonshire. These facts, even in the absence of other authority, are sufficiently attested by the mining terms that were incorporated into the earliest of these regulations and that still in form and substance are found in the present mining codes, and in the prevailing mining vernacular.

These rules and regulations were the governing codes of the early prospector and miner. They were of such importance as to be recognized in all Congressional enactments, and are by statutes in the mining States made admissible in evidence in actions relating to mining claims. Federal and State laws governing the location of mining claims have supplanted these local laws, but their influence is stamped upon these statutes, and is reflected in the jurisprudence of Federal and State courts.\*

\*A collection of these miners' rules and regulations is found in Volume 14 of the Census Reports of 1880.

**Federal Mining Legislation.**—Five days after the admission of California as a State, 14 Sept. 1850, Senator Frémont introduced a bill "to make temporary provisions for the working and discovering of gold mines and placers in California and providing order in the gold mining districts." The discussion of the Frémont bill showed on the part of some senators a desire for the government to retain the ownership of all minerals in the public lands and to create a revenue from the mining operations. A majority of the senators, as evidenced by the vote, were against the revenue idea and in favor of making the mineral lands open to free acquisition and the minerals subject to private ownership without fee, license or royalty. Senator Frémont's bill passed the Senate, but reached the House too late in the session for action.

The miners of California and the people of the country generally accepted the provisions of this bill and the sentiments expressed by the majority vote of the Senate as at least reflecting the attitude of the United States government toward its mineral lands. They assumed that the miners who had been taking the minerals were not to be regarded as trespassers but that these minerals were, and would continue to be, open for free exploration, and the fruit of the miners' work was to be without rent or royalty. From 1848, to 1866, the miner dug over the valleys, tunneled into the mountains and took from the earth a billion dollars worth of the precious metals without a single expression of assent or dissent from the owner of both land and minerals. In this period of time these gold hunters accumulated, erected, owned and were operating on the public lands millions of dollars' worth of mining property and were increasing and continuing their industry on the assumption that no barrier would be interposed to their operations.

Congress, on 27 Feb. 1865, passed an act providing that possessory actions between persons for the recovery of mining claims or for damages thereto should not in any wise be affected by the fact that the paramount title to the land and the mineral was in the United States. Proceeding the 39th Congress, December 1865, agitation was general on the question of free mining and on the disposal of mineral lands as distinct from that of other public lands. Some public men and private citizens advocated a royalty on minerals as a source of substantial revenue to aid in the payment of the national debt which had reached an alarming sum. Another party insisted that no distinction should be made between the disposal of mineral lands and other public lands. A third party, which proved to be the majority, opposed any change of policy after such long delay and acquiescence on the part of the government. On 13 Dec. 1865, George W. Julian, chairman of the House Committee on Public Lands, introduced a bill providing for the subdivision and sale of gold and silver lands and for the coinage of these minerals as mined. The bill proposed a change in the policy respecting the disposal of mineral lands and was intended to increase the revenues. On 9 April 1866, Senator Sherman of Ohio introduced a bill embodying the recommendations of the Secretary of the Treasury providing for the payment of royalties on the products of mines. This bill was amended by the Commit-

tee on Mines and Mining, representing the majority, and favored the free mining policy. The bill as passed by the Senate was entitled, "A bill to legalize the occupation of mineral lands and to extend the right of pre-emption thereto." It was taken up in the House on 3 July 1866, and on motion was referred to the Committee on Public Lands, but no opportunity was ever given either the Committee or the House to consider the bill. Mr. Higby of California, on 8 March 1866, introduced in the House a bill entitled, "Granting the right of way to ditch and canal-owners in the State of California over the public lands." This bill was passed 13 June 1866. This bill was taken up in the Senate and amended by substituting the bill formerly passed by the Senate and, as amended, was passed by that body 20 July 1866. The amended bill was taken up in the House 21 July 1866, when the Senate substitute was explained by Mr. Ashley of Nevada, and on his motion the previous question was ordered and the bill was ready to be put upon its passage. Mr. Julian and his followers bitterly assailed the proceedings and viciously attacked the bill. After much filibustering, Mr. Julian was given the privilege of explaining its provisions and he charged that it was an attempt to put the bill through under a gag rule with no opportunity for debate or amendment and that interested persons were attempting to force through the House a measure "revolutionizing the whole land policy of the government, abdicating in the name of the nation its authority and jurisdiction over the richest mineral possession on the face of God's earth, found imbedded here and there over a million square miles of our national territory."

Thereupon the motion to pass the bill under the previous question was reconsidered and withdrawn and the entire matter was open for discussion and those opposing the bill were given a full hearing. A substitute embodying his views was offered by Mr. Julian and received only 17 votes, and on 26 July 1866 the substituted Senate bill passed the House by a vote of 77 to 37.

The misleading title was retained because the substituted bill had passed the Senate under that title, and possibly to prevent the bill from being referred to Mr. Julian's committee. But no member of either Senate or House was misled or deceived by the title, and instead of the bill being surreptitiously passed, as sometimes charged, it was accorded the fullest and freest discussion in both branches of the Congress and its friends and opponents alike were well informed as to its contents. This act as passed by Congress and found in Vol. XIV, United States Statutes at Large, page 251, consists of 11 sections. The purpose of the bill as declared in the first section was that "the mineral lands of the public domain, both surveyed and unsurveyed are hereby declared to be free and open to exploration and occupation by all citizens of the United States." It did not purport to be a mining code and its object was not to regulate mining as such, but to authorize entry upon the mineral lands and to permit prospectors and miners to discover and possess themselves of the hidden treasure. It was the first mining law enacted by Congress, and it was the first instance in history where a sovereign, as owner of the minerals, broke

away from the old regalian rights and made to the citizens an absolute gift of all the mineral wealth without condition and without limitation. The act of 1866 made no provision for the location of placer claims and on 9 July 1870 the act was amended by the addition of six new sections (16 United States Statutes at Large, 217), providing for the location of placer claims and with some detailed provisions as to procedure in the location of mining claims. The original act of 26 July 1866, after a test of six years, was found to be inadequate in that it failed to give the locator of a claim a sufficient quantity of surface ground for the proper working of a claim, and limited the claim along the lode to 200 feet and did not contain adequate provisions for patent. Experience proved that 200 feet on a vein was insufficient to justify an investment in mining machinery and property sufficient to properly operate a mine. Accordingly a new act embracing all the features of the acts of 1866 and 1870 was passed by Congress, 10 May 1872. This act was entitled, "An act to promote the development of the mining resources of the United States" (17 United States Statutes at Large, 91). It was subsequently codified and with the addition of an introductory section constitutes sections 2318 to 2346, United States Revised Statutes 1878. On 3 March 1873 Congress passed an act providing for the entry of coal lands, and this act is a part of the revision of 1878 following the sections relating to minerals, as sections 2347 to 2352.

**Location of Claims—Lode Claims.**—The law as codified reserves all lands valuable for minerals from sale except as specially directed, and makes all valuable mineral deposits free and open to exploration and provides that the deposits of mineral and the land in which they are found shall be open to purchase by citizens of the United States and by those who have declared their intention to become such.

The statute provides that upon the discovery of valuable mineral deposits a location may be made upon the surface. Location is made upon or along what is termed the "apex" or the outcrop of the vein or lode. The side lines of the location must be so laid along the strike of the vein as to include the vein within the boundaries of the location, but cannot extend more than 1,500 feet in length and shall not be more than 300 feet on each side from the centre of the vein at the surface. These lines are required to be neither straight nor parallel but may bend or turn with the direction of the vein. No claim shall be limited to less than 25 feet on each side of the middle of the vein at the surface. The end lines must be parallel and straight, or the locator is deprived of a valuable right. The location on the surface may be in the form of a parallelogram, a square, a trapezium or substantially a triangle.

No notice is required to be placed upon the claim but "the location must be distinctly marked on the ground so that its boundaries can be readily traced." If a State statute or a miners' rule requires a record of a claim, then such record shall contain the name of the locator, the date of the location and such a description of the claim located by reference to some natural object or permanent monument as will identify the claim. Not less than \$100 worth of labor shall be performed or improve-

ments made during each year so long as a claim is held without patent. Where claims are held in common or where claims are in a group with a common ownership, the work or improvements required for each may be done upon one claim, or outside of all claims, if it tends to facilitate the development and the extraction of ore from all the claims. The owner of a mining claim may hold his claim indefinitely by the performance of the annual assessment work. If he opens and works a mine, and the work and improvements are equivalent to the required amount, the statute is satisfied. The possessory right under these conditions secures for him the same protection that complete title would. The time for the performance of assessment work or for making the improvements for the first year commences the first day of January of the year following the date of location, and closes with the last day of December of that year. After the end of the year in which the location was made the labor must be performed or improvements made before the end of each year. Upon the failure of a locator to perform the required assessment work, within the statutory period, the claim is subject to relocation; and a valid relocation made of forfeiture gives the relocater not only the right to the possession of the ground, but also to all buildings and improvements placed thereon by the original locator. But if a locator has failed to complete his assessment work before the end of the year and is in the course of its performance, the ground is not subject to relocation. Upon the failure of any co-owner to perform or contribute to the performance of the assessment work, his interest may be forfeited, on notice. A claim that has been abandoned by the locator or owner is open to relocation at any time after the abandonment is complete.

Where two or more veins intersect or cross each other below the surface, the owner of the senior surface location is entitled to all the minerals within the space of intersection, but the owner of the junior location is entitled to a right of way through such point of intersection for the working of his vein below such point. If the two veins unite, the senior surface locator is entitled to the entire vein both at and below the point of union. Authority is given for discovering veins or developing mines by means of tunnels. The owner of a tunnel is given all veins or lodes within 3,000 feet from the face of his tunnel on the line thereof, not previously known to exist, and is protected against discoveries from the surface, if he prosecutes his tunnel construction with reasonable diligence. A State legislature may enact statutes, or the miners of a mining district may make rules and regulations, governing the location of mining claims, the manner of recording and the amount of assessment work, but these must not be in conflict with the United States statutes.

**Location and Discovery a Unit.**—No time is given by the statute in which to make a location as distinct from the fact of discovery. The statute in effect makes discovery and location a unit, and a location without a discovery is of no force. A vein does not always outcrop on the surface and time may be necessary to discover the required valuable deposit. The statutes of most of the metal mining States

have cured this defect in the United States statutes by giving a locator a stated and reasonable time in which to make a discovery after otherwise perfecting his location, and in consideration of this they require the locator to do certain specific work, such as the excavation of a discovery shaft of a given circumference and depth. The purpose of such State statutes is to give the locator time to explore the vein and to find its true strike and thus enable him to lay his claim properly upon the surface. Such requirements are not in conflict with the United States statutes and are valid and recognized as beneficial.

**Sufficiency of Discovery.**—The statutory test of a valid mining claim is the discovery of valuable mineral deposits; but a prospector is not required to discover a profitable mine in order to validate his location. The statute is satisfied when minerals have been discovered and the evidence is sufficient to justify a person of ordinary prudence in making an expenditure of labor and money with reasonable prospect of success in developing a valuable mine.

**Protection of Miner's Possessio Pedis.**—A miner not infrequently marks out his surface location without an actual discovery of minerals and to validate his claim by discovery he proceeds to make excavations in the hope of finding the required valuable mineral deposits. In such a case, where a controversy has arisen, the courts have kindly supplemented the mining statute and protected the miner in what is termed his *possessio pedis*, so long as he continued diligently in prosecuting his discovery work. The courts have not limited this *possessio pedis* to the miner's actual working place while seeking a discovery, but hold it to be co-extensive with his surface location.

**Swinging a Claim.**—A locator may on making the explorations required by a State statute discover not only the required mineral deposit but may also discover the true strike of the vein and find that his surface location does not comply with the statutory requirements. In such case he may, within the period given by the State statute, swing his claim in any direction so as to extend along the strike of the vein within a circular area, the diameter of which is equal to the longest distance claimed from the point of discovery, and all conflicting locations made subsequent to the time of his surface location are invalid to the extent of any conflict.\*

**Extralateral Rights.**—Locators of valid mining claims, on continued compliance with existing laws and regulations, are entitled to the exclusive possession of all ground within their surface lines and of all "veins, lodes and ledges throughout their entire depth, the top or apex of which lies inside of the surface lines extended downward vertically, although such veins, lodes, or ledges may so far depart from a perpendicular in their course downward as to extend outside the vertical side lines of such surface locations. But their right of possession to such outside parts of such veins or ledges shall be confined to such portions thereof as lie between vertical planes drawn downward,\* as above described, through the end lines of their locations so continued in their

own direction that such planes will intersect such exterior parts of such veins or ledges."

This right to follow a vein beyond the vertical planes of the side lines of a surface location is known as the "extralateral right." It is sometimes referred to as the "apex" law. The veins of mineral bearing ore in the Western mining regions are usually in the form of thin and broadly extended sheets, standing or resting at a greater or less angle from the perpendicular. The upper edge of this sheet or vein frequently extends to and is exposed at the surface and is variously denominated the "outcrop," "apex" or "top" of the vein. The line of this outcrop or apex as it extends along, or more or less below, the surface is called the "strike" and the downward course of the vein is known as its "dip." Mining operations usually begin at the outcrop, the ore being taken from the vein as it extends downward on its dip. The miner in taking out the ore is given the right to follow the vein on its dip without reference to the side lines of his surface location; but he can only follow this dip within the section of the vein as cut and bounded by the vertical planes of his end lines. The parallelism of the end lines operates to give him the same portion of the vein in following it on its dip. Generally, the veins have an identity and continuity resembling in a degree that of the several roots of a tree and ordinarily can be followed on their dip with the same degree of certainty that a single or separate root of a tree could be followed and taken out.

In no event can a claimant mining out his vein enter upon the surface of another claim in following his vein, but the vein must be followed on its downward course beyond the vertical planes of the side lines as it is mined out under ground and the operations on the surface must be within the boundaries of the surface location. A vein may thus be followed so long as its identity and continuity can be traced and these are questions of fact that a claimant must establish by proof if his right is controverted. If the end lines of a location are not parallel, or if the vein is flat, or what is known as a broad vein, the locator loses this extralateral right.\*

**Placer Claims.**—Placer claims may include all forms of deposit except veins of quartz or other rock in place. In locating placer claims the legal subdivisions of 40 acres may be subdivided into 10-acre tracts. A single claimant may not make a location in excess of 20 acres; but an association of two or more persons may make a location in extent equal to 20 acres for each member of the association; but an association location is limited in any event to 160 acres, this being the largest area that can be embraced in any placer claim. Two or more persons having contiguous claims of any size though less than 10 acres may make joint entry thereof. Placer claims when on surveyed lands shall conform to the legal subdivisions, and no further survey or plat is required. "No such

\* It is variously charged that the exercise of this extralateral right has been the source of practically all mining litigation in the Western States. But in answer to this charge it has been shown that 2,331 cases have reached the highest courts of the nine leading metal mining States involving all phases of the mining industry, and of these only 71 involved controversies have grown out of the grant of extralateral rights — a percentage of 3.045.

\* This rule was established by the Supreme Court of Montana in *Sanders v. Noble*, 22 Mont. 110.

location shall include more than 20 acres for each individual claimant." The land embraced in a placer claim must be paid for, if patented, at the rate of \$2.50 per acre. Where a vein or lode is known to be within the limits of a placer claim, the claimant must, on application for a patent for his placer, include such known vein or lode, or the patent will not embrace such known vein or lode and it is subject to location by any other discoverer, except the width of the lode claim throughout the placer cannot exceed 25 feet on each side of the vein. But a placer patent includes all veins and lodges within its limits that are not known to exist at the time the patent issues.

**Mill Sites.**—The owner of a mining claim worked as a mine may appropriate and patent a tract of non-mineral and non-contiguous land, not exceeding five acres, for a mill site on the same conditions as he may obtain patent for his claim. So the owner of a quartz mill or reduction works not owning a mine in connection therewith may have a patent for his mill site as for a mining claim.

**Patent.**—If a qualified locator desires a patent for his claim he may file in the General Land Office his application under oath, giving an accurate description with a plat and field notes, showing the boundaries and monuments. He must file proof of the posting and publication of notice of the application and a certificate of the surveyor-general to the effect that \$500 worth of labor has been expended or improvements made on the claim. He is required to pay \$5 per acre for the land covered by his lode claim. Any person having an adverse claim or superior right to that of the applicant must advise the application by filing a statement of his claim in the Land Office. Upon the filing of an adverse claim, the adverse claimant must within 30 days begin proceedings in a court of competent jurisdiction to determine his right to the claim. The judgment of the court determines the relative rights of the parties and the successful claimant must present a certified copy of the judgment to the Land Office. A court of competent jurisdiction is within the statute an ordinary State court or a Federal court, if the other necessary jurisdictional requirements are present—such as the proper amount in controversy or diverse citizenship.

By special provision a patent may issue for a mining claim in the absence of an adverse claim, if the locator or if the locator and his successors have held and worked the ground as a mining claim for a period equal to the Statute of Limitations of the State in which the claim is situated. This provision was to obviate the difficulty or impossibility of making the required proof in patent proceedings in cases of claims of long standing.

**Mining Statutes Supplemented.**—The United States statutes governing the location of mining claims have stood for practically a half century with few amendments and no substantial changes. The defects in the original enactments have not been so pronounced as to induce Congress to attempt their general revision. The several States by permission of these Congressional enactments have adopted local mining codes supplementing and improving the United States laws. Both Federal and State courts in the heart of the mining country

and in sympathy with the prospector and the miner have so interpreted these laws as to make them practicable and workable. Under the stimulus of these benign statutes the golden treasure has been mined from the valleys and mountains and the country has been enriched beyond the most fantastic dreams of those who placed these laws upon the statute books. P., 'Handbook on American Mining Law' (Saint Paul 1908); Lindley, Curtis H., 'American Law Relating to Mines and Mineral Lands' (3rd ed., San Francisco 1914); Morrison, R. S., 'Mining Rights' (14th ed., Denver 1910); Snyder, W. H., 'Mines and Mining' (Chicago 1902); Thompson, J. W., 'United States Mining Statutes Annotated' (Washington 1915); White, E. J., 'Law of Mines and Mining Injuries' (Saint Louis 1903).

J. W. THOMPSON,

*Law Examiner of the Bureau of Mines, Department of the Interior, Washington, D. C.*

**MINING AND MILLING MACHINERY.** Problems in mining may be classified into groups according to their relation to geology, engineering, machinery and metallurgy; but as the problems of each group overlap to some extent those of the others, the special consideration of the subject of mining machinery necessarily involves a general consideration of mining methods and results in their geological, engineering and metallurgical aspects.

Mining methods differ according to the form and geological relations of the mass of ore or other minerals to obtain which the mining operations are instituted. These relations outline two general methods—those applicable to "surface deposits," and the more complicated methods required in the working of "underground deposits."

**Surface deposits** are those in which the mass of ore is of considerable superficial extent and lies on or near the surface of the ground. The first step in this case is to uncover the ore by "stripping" off the overlying worthless material called the "burden." If this consists of soft earth or gravel it may be removed with pick, shovel and wheelbarrow, or by the use of steam shovels and small tram-cars drawn by horses, mules or locomotives. If the burden is too hard to be stripped by any of these methods, blasting operations are usually employed. The burden is first blasted off and removed, and the subsequent work of extracting the mineral thus exposed is carried on by benches or terraces along the hillside, so that the cuts will naturally drain into the pit, and the ore will have a favorable grade for its transportation, in removal. If the pit is located in level or depressed ground the use of pumping machinery will become immediately necessary, entailing a heavy expense at the very beginning of the operations. Open cuts are the simplest and most convenient form of excavation, but they expose the men and machinery to the weather, and usually necessitate the abandonment of all operations during the winter. Another method of surface mining consists in the employment of water jets for working auriferous gravels. This is technically known

as "hydraulic mining." Water conducted from great distances and elevations is directed against the ore-bearing gravel banks and beds, in the form of powerful jets through large nozzles called "giants." The impact of the water under the great pressure due to its heavy fall washes away the gravelly material of the banks with almost incredible rapidity through sluices where the gold is separated from the sand and gravel by amalgamation with the mercury in the riffles of the sluice boxes. The sluices usually consist of a series of 12-foot troughs which empty into one another and often form a line of troughs several hundred feet long. The bottoms of the troughs have corrugations called riffles, and are cut out at intervals and replaced by a grating called a "grizzly." Under the grizzly another broad trough is placed at right angles to the top trough and empties into another trough which runs parallel to the direction of the top trough and forms the continuation of the main sluice. As the material of the bank is washed through the sluice boxes by a strong stream of water the sand and gravel is caught by the grizzly while the gold passes through into the lower trough where it amalgamates with the mercury which is frequently sprinkled into the riffles.

**Underground deposits** are worked by the use of shafts and tunnels driven through the overlying earth and rock into the "lodes" or veins of ore. In these operations the overlying rock is always supported in place over those portions of the mines where the borings are used as passageways, and the arrangements for ventilation are more and more carefully made as the workings grow deeper and deeper.

The machinery employed in underground mining is not extensive as to variety. The principal tool is the drill with which is formed the hole for the explosive used to break out the metalliferous rock. To drive the drill the pneumatic hammer is the machine commonly used. In some cases steam is the source of power, but the compressed air mechanism is valued above steam because its exhaust supplies the mine chambers with a continuous supply of fresh air. The air-compressor is commonly located above ground at the mouth of the shaft, the air being brought to the drills by a pipe conduit. In mining native metal, as in the case of virgin copper, a chisel is used, driven by the pneumatic hammer. One of the accessory machines of the mine is the drill sharpener, operated usually by steam. This is an adaptation of the power hammer, carrying a die with which is reformed the cutting edges of the drill heated to cherry-redness. The tempering is done by hand. In most underground mines the water-pump is as much a necessity as in the surface diggings. Hoisting engines are an indispensable part of the outfit and are of various design, adapted to the varying conditions.

The metalliferous rock or ore as broken out by the explosive is prepared for the extraction of its valuable constituent by processes to which the designation "ore dressing" has been given.

*Ore dressing* consists of two processes—crushing and separation, which employ two distinct types of machinery.

By crushing, the material is broken up into coarse fragments, or ground into a fine powder,

and the valuable ore detached from the worthless rock. In some mines the coarse crushing is done underground.

By separation, the valuable ore is concentrated into smaller bulk and weight by being separated from the waste, or in the case of two valuable ores, they are separated from one another. The term "concentration" is specifically used for a separation by mechanical means as distinguished from that accomplished by hand.

The selection of the particular types of crushing and grinding machinery is always determined by the character of the ore and the process of extraction for which the ore is prepared.

The processes of extraction may be briefly defined as follows: (1) Smelting processes in which the pure metal is extracted from its ore by fire; (2) amalgamation process in which the metal forms an amalgam with mercury from which it is subsequently separated by the distillation of the latter; (3) chemical processes in which the metal is dissolved by various solutions and then precipitated in solid form by suitable precipitations; (4) electrolytic processes in which the extraction is accomplished by electrolysis.

The crushing and grinding machinery used in mining consists of the following classes of machines:

*Rolls*.—These are the standard machines for crushing brittle ores which are being prepared for concentration except where fine crushing is required.

*Steam stamps* are the standard machines for crushing ores containing native copper.

*Gravity stamps* are the machines most extensively used for fine crushing.

*Tube mills* are also quite extensively used for fine crushing and are the most efficient competitors of the gravity stamps, and in many gold mines are used to follow the latter for the finest grinding.

*Pulverisers* are used for crushing and grinding ore as it comes from the crusher or rolls, for fine concentration or for the recrushing of middlings and tailings from jigs for subsequent treatment on concentrating tables or other concentrating machines.

The preliminary crushing is usually accomplished by jaw or gyratory crushers and then the material is passed over to the rolls, stamps or ball mills. The selection of screens having the proper mesh to crush through is one of the most important details. For purposes of concentration it is usually advantageous to begin by crushing to a coarse size, separating as much of the waste as possible, then recrushing to a finer size and again separating the waste. In crushing gold ores for subsequent treatment by the cyanide process, fine crushing gives a higher extraction than coarse crushing.

The following examples have been selected to illustrate the various classes of these machines:

Fig. 1 shows a general view of a Blake Crusher, a machine of the "jaw-crusher" type. They are made in dimensions which provide a capacity of receiving rocks ranging from 1½ inches by 3 inches to 15 inches by 24 inches in size, which they reduce to fragments ranging from 1 inch to 3 inches in size, at the rate of

15 to 250 tons per 10 hours of work, according to the size of the machines.

They range in power from one-half horse power in those weighing 1,000 pounds to 25 horse power in those weighing 26,000 pounds,

FIG. 1.—Blake Crusher.

and require a speed of 225 to 250 revolutions per minute for their operation.

Fig. 2 shows a general view of an Austin Gyrotory Rock Breaker. It represents one of the strongest and most durable of this class of crushers. It is made in sizes which have receiving openings ranging from 4 inches by 5 inches to 18 inches by 63 inches, and have reduction capacities ranging from 2 to 200 tons per hour, according to the fineness to which

FIG. 2.—Austin Gyrotory Crusher.

the material is reduced and the size of the machine. In weight they range from 3,000 to 100,000 pounds, and require from 4 to 150 horse power to drive them at speeds ranging from 350 to 500 revolutions per minute.

Fig. 3 shows a general view of a set of crushing rolls. It consists of a set of stationary and a set of movable rolls; an automatic feed hopper built in sections, so that the wearing parts may be easily replaced; a dust cover;

FIG. 3.—Crushing Rolls.

and two extra heavy, band wheels for the driving belts. The main frame and the journals for the stationary rolls are cast in one piece. The movable journal is held in the centre of the main frame by means of a heavy steel shaft, and the swinging journals are held in place by tension rods which are attached to nests of powerful coiled springs between washers on the rods. These springs are stiff enough to resist the pressure imposed upon them by ordinary crushing without being compressed, and yield

FIG. 4.—Allis-Chalmers Steam Stamp.

only to abnormal strains caused by the accidental passage through the rolls of uncrushable substances, such as broken drill points, etc. The rolls may be adjusted to a nicety by screwing or unscrewing the nuts on the adjust-

ing bolts, which are attached by a "key colter" to the movable journal and are held in place by lock nuts which rest against the heavy brackets cast on the main frame.

The size of rolls ranges from 24" x 15" to 60" x 24", and ranges in weight from 14,000 to 60,000 pounds. Their operative speed ranges from 100 revolutions per minute for the larger and from 100 to 175 revolutions per minute for the smaller machines.

Fig. 4 shows an Allis-Chalmers steam stamp designed for the reduction of copper ores. This stamp is driven by a vertical steam cylinder with valve gearing arranged to keep the steam-port freely open during the downward stroke, thus adding the power of the steam to the weight of the stamp. The mortar has four discharge screens and rests on a heavy anvil or bed plate, and is held in place by angle guide pieces cast upon the massive framing of iron columns. The upper and lower guides for the

FIG. 5.—Ten-Stamp Battery.

stamp-stem are detachable bronze bushings in which the stem is slowly revolved by a horizontal pulley on a sleeve between the upper and lower guide brackets. The sleeve contains two feathers which fit into corresponding slots in the stamp-stem, by which the latter is rotated. The steel piston-rod is connected to the steam-stem by a circular disc which is encased in a cast-iron bonnet bolted to the flange of the stem, the space between being filled with pure gum-rubber packing, so as to relieve the shock on the piston and to permit its removal for repairs without disturbing the stamp. These stamps have a capacity of several hundred tons per day. Other forms used chiefly on copper ores are the Kraus Atmospheric Stamp and the Tremain Steam Stamp.

Fig. 5 shows the general aspect of a 10-stamp battery operating gravity stamps. The screen and a portion of one of the sectional mortars is removed so as to reveal the stamps and the

dies. Fig. 6 shows a sectional view of the same battery, with automatic feeders in place. From the ore bin the various devices and their movable

FIG. 6.

parts, which comprise the battery, are illustrated by the following figures: Fig. 7, ore-bin gate and spout. These are built in sizes ranging from 18 to 24 inches, or in special sizes as may be required. Fig. 8, a "Challenge" ore-feeder. This is an automatic arrangement which may be used with wet or dry ores. Its operation is simple and regular: The cast-iron plate placed

FIG. 7.—Ore-Bin Gate.

at an angle below the hopper is rotated by bevel gears actuated by a friction device in the shape of a tappet-rod or forked lever, which engages a feed collar placed on the central stem of the

battery. The entire apparatus is about 4½ feet in height, 3 feet 9 inches in width and weighs about 845 pounds. Other types of feeders are the "movable suspended," and the "fixed sus-

FIG. 8.—"Challenge" Ore-Feeder.

ended," automatic feeders. The principal advantage of using the suspended type of feeder is that it gives an unobstructed floor space behind the battery, and thereby facilitates the work of "clean up," repairs, etc. When they are used for feeding "Huntington" mills or other pulverizing mills, they are usually arranged to be driven by belting.

Mortars are made in a great variety of forms, and are designed for both wet and dry crushing. Fig. 9 is an example of the deep single dis-

charged up against the screens by the falling stamp. Amalgamation takes place within the mortar by the pulp being splashed up on the copper lining plates. Fig. 10 is an example of a deep straight-back mortar not provided with copper lining plates, amalgamation being effected outside. It is provided with steel lining, and a steel wearing plate, and is so proportioned that it affords unusual facilities for the quick discharge of the pulp through the screen. Fig. 11 illustrates a double-discharge mortar

FIG. 11. FIG. 12.

designed for use in wet crushing silver, in concentrating or in combination mills where large crushing capacity is desired. The pulp discharged through the back screen flows toward the centre at the back of the mortar, and passing through an opening in the base of the mortar proper joins the pulp from the front screen. Fig. 12 is an example of the mortars designed for dry crushing. All of them are made double-discharge, with the dies so placed that the dry pulp will easily reach the screens when it is dashed up against them by the action of the stamps. A peculiar feature is the fastening of the die by a dove-tail flange at the bottom. Fig. 13 illustrates a general view and cross-section of a sectional mortar. Its construction in sections adapts it for mule-back transportation in mountainous countries.

It is important to note in this connection that the capacity of a battery of stamps depends very largely upon the construction of the mortars used.

Battery or mortar screens are usually made of genuine Russia iron, or of the best quality of cold rolled homogeneous steel. They are of various patterns—"roundhole screens" with

FIG. 9. FIG. 10.

charge type, designed for copper lining plates in the back and front, the former bolted through the mortar, and the latter attached to a block under the screen frame. The copper plates are coated with mercury. The ore is fed through the opening in the back near the top and is distributed under the stamps by their own action, peculiar to the order of their drop. The water enters at the top against each stamp and carries the crushed ore or "pulp" through the screen as fast as it becomes fine enough, by being

FIG. 13.

perforations ranging from ¾ to 1 millimeter in diameter; "needle slot screens" perforated with diagonal or horizontal slots usually 15/32 of an inch in length, and ranging from 12 to 70

mesh; and "indented-slot screens." Fig. 14 illustrates an example of each type. In addition to these regular patterns, most of the large manufacturers are always prepared to furnish screens punched according to any specifica-

FIG. 14.—Perforated-iron Screens.

tions that may be submitted as may be required for use with particular ores.

*Stamp dies* are made of very hard and tough material, usually the same as that used for the body of the shoe. Fig. 15 shows six of the principal forms.

FIG. 15.

*Stamp shoes* are made in a variety of regular and special patterns. Fig. 16 shows one of the usual patterns. In wet crushing mills it is attached to the stamp-head by means of strips of wood placed in the space between the neck of the shoe and the socket of the head. The wooden strips are swelled by the water and thus hold the shoe and head firmly together. In

FIG. 16.

FIG. 17.

dry crushing mills strips of iron are used for this purpose.

*Stamp-heads* are made the same diameter as the stamp shoes. As shown by Fig. 17, the stamp-head has a tapering socket at each end—

the lower for the neck of the shoe, and the upper for the tapering end of the stamp-stem, which requires no other fastening than the wedging action of its taper to bind it firmly to the head. Slots are cut from the outside of the head into the sockets, through which by means of wedges the stem and the shoe can be forced out when necessary.

FIG. 18.

The *tappets* are collars fastened to the stamp-stems. They bear against the revolving cams and thus alternately lift and drop the stamps. Each tappet is fitted with a gib which, being pressed against the stem by cross keys behind, binds the tappet on the stem as firmly as possible, and at the same time admits of a quick adjustment to another portion of the stem whenever necessary. As shown by Fig. 18, they are

made with either two or three keys, and are counterbored to prevent slipping on the stem.

*Cams* are being made in a variety of patterns depending upon the height the stem is lifted and dropped, and the necessary distance between the centre of the cam-shaft and the centre of the stamp-stem. They are made both right-handed and left-handed, and are either keyed onto the cam-shaft, or attached by means of taper-bushings which give a self-tightening effect. Fig. 19 shows side and edge views of both types, and the method of applying the taper-bushings.

Fig. 20 shows their positions on the cam-shaft so as to give the most general order of a drop for a 10-stamp battery, when driven from either end of the shaft.

The other essential parts of the battery are the "cam-shaft boxes," "cam-shaft pulley" and the "stamp guides." These are illustrated by Figs. 21, 22, 23, respectively. The cam-shaft boxes are made of metal and in the improved forms are provided with an oil drip launder which extends around the two ends and the front of the box and thus prevents the lubricating grease from dripping into the mortar and onto the amalgamating plates. Standard cam-

shaft pulleys are built up of well-seasoned pine, properly laid in oil and spiked. The face and sides are turned and thoroughly covered with oil paint. The hub is of cast-iron, the through sleeve and one flange being cast in one piece. The sleeve is bored to fit the cam-shaft and

FIG. 19.—Cams.

turned and key-seated to receive the following flange, the two flanges being bolted together with through bolts.

The stamp guides are made of wood; wood bushings in iron frames; or entirely of iron. They are made either solid or sectional, the latter form being preferable as a considerable saving in time can be effected by their use, especially when the guides require dressing down.

The stamps range from 840 to 1,200 pounds

FIG. 20.

in weight each, and are usually operated through a mean space of six inches at rates ranging from 105 to 110 drops per minute. Their crushing capacity ranges from 6 to 40 tons for 24 hours according to the milling quality of the ore.

*Tube Mills.*—These are used for the purpose of reducing ores to a fineness up to 200 mesh. Fig. 24 is an example of the cylinder type. Another favorite form is conical or double conical. With the demand for extreme fineness in the cyaniding and flotation processes, as well

FIG. 21.

FIG. 22.

as for concentration and speedy amalgamation, the tube mill has become increasingly popular, and has been greatly improved by being enlarged as to diameter and shortened. This gives a greater force to the falling balls, and the cost of grinding has been reduced to seven cents per ton of ore, for the larger sizes. The progressive

FIG. 23.

treatment of ore has thus become the Blake or gyratory crusher for the primary work, the stamps, disc crushers or rolls for secondary and the tube mills for finishing—a conical mill for a 90-mesh product for amalgamating or concentrating and a cylindrical mill for a 200-mesh product for the cyanide and flotation

FIG. 24.—Tube Mill.

processes. One of the advantages of the tube mill is the capability of grinding in any desired size. This type of mill, however, is not an economical crusher for hard quartz ores, but is best adapted to those of moderate hardness. In the case of the hard ores, the stamp mill has

no rival. In the gold mining plants it is now the practice to use one tube mill for regrinding to each 10 stamps in the battery. The type of mill to be used depends upon the character of the ore; the harder the ore the larger diameter required. In the Marathon tube mill a series of rods from one-half inch to two inches in diameter replace the balls or pebbles of the usual type.

FIG. 25.—Huntington Mill.

**Pulverizers.**—Perhaps the best representatives of this class of machines are the "Huntington" and the "Chilian" mills. Fig. 25 shows a general view of a Huntington mill of the latest pattern. In operation, the ore and water fed into the mill through the hopper is thrown by the rotating rollers and scrapers against the ring-die where it is crushed to any degree of fineness desired by the centrifugal force of the rollers as they roll over it. The water and pulverized ore are thrown against the screens through which they are discharged when ground sufficiently fine to pass the mesh, which ranges

FIG. 26.—Ore-Grizzly.

in fineness from 60 to 120. Very little slime results from the operation, and the pulp or pulverized ore is delivered in good condition for concentration. The rollers are suspended so as to leave a space of about one inch between them and the bottom of the mill, thus allowing them to pass freely over the quicksilver and the amalgam without grinding it or throwing it from the mill, while at the same time the agita-

tion of the pulp is sufficient to make amalgamation perfect.

They are built in sizes ranging from three and a half to six feet in diameter, and from 7,000 to 44,500 pounds in weight. They require from 5 to 15 horse power to drive them at pulley speeds ranging from 120 to 150 revolutions per minute, to give capacities ranging from 10 to 75 tons of ore for 24 hours.

The principal machinery used in the processes of separation are of the following classes:

**Preliminary washers**, which are employed for the purpose of disintegrating and floating off the adhering fine clayey substances from the coarse particles, by the use of running water aided by some form of stirring device.

**Sieves and screens** are used for separating the finer from the coarser particles of ore. They are of two classes, (1) "stationary screens," which include the wire-cloth gravel screens, and the perforated plate screens, and (2) "moving screens," which include the oscillating bar screens, the plain shaking screens or riddles and the revolving screens or trommels.

**Classifiers** are used for obtaining a series of products of diminishing size by means of currents of water.

When the process of separation is accomplished by "hand-picking" methods, the work of separating the valuable ore from the waste material is usually done on "tables," of which there are at least five classes in general use: (1) Stationary horizontal tables; (2) stationary sloping chutes; (3) shaking tables; (4) belt, rope or plate conveyors, and (5) revolving circular tables.

Other methods of separation employ "hydraulic jigs," which perform their work through the alternating upward and downward action of two currents of water upon a bed of sand supported by a screen; "vanners" or endless belts which are shaken rapidly either endwise or sidewise, and have a continuous slow motion up hill; "bumping tables"; "film sizing tables," and various forms of magnetic separators.

Fig. 26 shows an ore-grizzly, which represents the various forms of metal bar screens. See AIR-COMPRESSOR; BLOWING MACHINE; POWER TRANSMISSION; PULSOMETER; PUMPS.

Revised by RICHARD FERRIS.

**MINISTER**, a high officer of state entrusted with the administration of any department of state government. Collectively, the persons who constitute the administration are called in Europe the ministry, and also the cabinet. The term minister is seldom applied in the United States to members of the cabinet, but is used, as in Europe, to designate diplomatic officers who differ from ambassadors in that the latter hold power as personal representatives of the head of the government. The technical title of ministers is envoy extraordinary or minister plenipotentiary. In Great Britain the term is used to

designate the entire body of secretaries which is called the ministry. The executive government of France is divided into 10 departments or "ministries." See also AMBASSADOR; CABINET; ENVOY; CONSUL; DIPLOMACY.

**MINISTER'S WOOLING, The**, a novel by Harriet Beecher Stowe, first published in serial form in the *Atlantic Monthly* in 1859. The scene is laid in New England, and deals with the habits and traditions of the close of the 18th century. The "minister" in the tale is the famous Samuel Hopkins (q.v.) 1721-1803, the founder of "Hopkinsianism." The central purpose in this story is to show the sternness and inflexibility of the New England conscience, which clings to the Calvinistic doctrines through all phases of life. The struggle that goes on in the heart of the heroine and her mother when the brother and son, James, is supposed to be drowned and unconverted is a graphic delineation of the moral point of view at that time.

**MINIUM.** See LEAD.

**MINIVER**, the Siberian squirrel, which has fine white fur; also the fur itself.

**MINK**, a circumpolar species of weasel (family *Mustelidae*), valuable as a fur-bearer, known in North America as *Putorius vison*, and in the Old World as *P. lutreola*, although substantially the same animal. The mink is a true weasel, with 34 teeth and not a marten with 38; but it is of larger size, being 24 to 27 inches long, one-fourth of which belongs to the tail, and has a stouter form and bushier tail, more like the martens. Males are much larger than females. The mink differs greatly from both weasels and martens, and in those points in which it is modified toward this mode of life, namely, the half-webbing of the toes, short ears and close-set, bristly, glistening pelage, it makes an approach toward the others. In color the mink ranges from dull yellowish-brown to a rich blackish chocolate-brown. The ordinary color is a dark reddish-brown, growing blackish on the tail and marked by a white patch on the chin of variable extent. The pelage consists of a dense, soft, matted underfur, mixed with long, stiff, lustrous hairs on all parts of the body and tail. The gloss is greatest on the upper parts; on the tail the bristly hairs predominate. Northern specimens have the finest and most glistening pelage; but the rough treatment given its coat by the animal in scrambling through holes and crevices in rocks, rotten logs and broken ice so rapidly damages its fur that only the pelts taken in early winter show the fur to perfection and yield full value to the trapper. Both sexes are extremely odorous, due to the secretion, equally in both sexes, of a fetid musky scent in small perineal sacs opening near the orifice of the rectum, on each side; the smell is powerful, penetrating and lasting, and is under voluntary control of the animal, but it cannot be discharged like that of the skunk, and is by no means so overpowering. The purpose of this secretion is undoubtedly the attraction of the sexes, and it is used to advantage by trappers as a scent-bait for their traps.

Minks occur in all parts of North America, and are so prolific, so well supplied with food and so secretive that they survive numerously

even in the more thickly settled parts of the country. They abound near the coast and in the neighborhood of the larger lakes, rivers and marshes, but are to be found along almost every stream, even in the driest portions of the interior. The minks cling to the water-courses, where they find plentiful food in the form of meadow-mice, frogs, mussels, fishes (especially eels) and insects. In New England, at least, they feed largely on earthworms, getting them in plenty even in midwinter; and when very hungry, or a good opportunity offers, do not hesitate to attack larger animals, as muskrats—which they are able to pursue through underwater ways into their houses,—rabbits partridges, ducks and poultry. They search the stream-banks for prey, diving and swimming long distances with ease, go about under loose ice and snow, climb rough-barked trees and penetrate crevices and hollows almost with the ease of a serpent, so that nothing is safe from their inquisitive ferocity, and in winter they wander widely.

Their own homes are made in burrows, usually but not always opening in the bank of a stream, and are more often accidental than carefully contrived. In some such retreat the female brings forth in early spring her litter of four or five young, which she guards with great care and courage from all enemies, including the males of her own species. The kittens, and the older ones indeed, exhibit the same playfulness in and out of the water which characterizes otters.

No fur-bearing animal is so unsuspecting of traps and so easily caught as the minks; and they are the victims of boys and amateurs as well as of professional trappers in all parts of the country. The value of the pelts varies with their color, condition, size and the varying demands of changing fashion, but good ones are always of sufficient worth to make them reward the trouble of taking. When captured young they are easily habituated to confinement in suitable pens, and are tamable to a certain degree. They will breed in captivity, and several temporarily successful attempts have been made to rear them in large numbers for the sake of their pelts. They are fed upon fish, coarse meat, etc. The sexes are kept separate except during the month of March, and reproduction begins when the female is one year old. Tame minks make excellent ratters, doing the duty of ferrets.

Consult Audubon and Bachman, 'North American Quadrupeds' (Washington 1851); Coues, 'Fur-bearing Animals' (1877); Cram, 'Little Beasts of Field and Wood' (New York 1899); Stone and Cram, 'American Animals' (ib. 1902); Hollister, 'A Synopsis of American Minks' (Washington 1913); Seton, 'Life Histories of Northern Animals' (New York 1909).

**MINK FROG** (*Rana septentrionalis*), a small frog inhabiting the northwestern United States. It measures two and one-quarter inches from nose to vent and is dark olive-green above with sooty brown bars and spots and is pure white beneath. In general effect the hue resembles that of the mink, whence its name. Its habits are quiet and solitary. Consult article by H. Garnier in *The American Naturalist* (Vol. XVII, Philadelphia 1883).

**MINNA VON BARNHELM.** Lessing's 'Minna von Barnhelm or The Soldier's Fortune,' a comedy of five acts in prose—begun 1763, published 1767—is most important for the rise of modern German literature since it was the first dramatic work of timely interest growing out of great national events (consult Goethe, 'Dichtung und Wahrheit' (Book 7). It takes place at a hotel in Berlin about six months after the conclusion of the Seven Years' War (1756-63), and, according to Goethe, purposes to relieve in a simile, as it were, the hostile tension between the defeated Saxons and the victorious Prussians. The Prussian Major von Tellheim desires to be guided above all by his rigid sense of honor, which forbids him to owe his entire good fortune to a woman or to make a woman share in a life which, as far as appearances go, may be exposed to contempt. Minna von Barnhelm, his fiancée, a beautiful and rich young lady of Saxony, fixes her eyes steadily upon Tellheim's sterling character, disregards the opinion of the world and by a well-meant artifice makes him realize that love's highest gratification is to stand by the beloved person in trouble. Minna conquers. True love proves superior to an extreme feeling of honor, although the value of the latter is by no means denied. In 'Minna von Barnhelm' a deep moral problem is proposed and carried almost to a tragic turn. But the charm of Minna and the naturalness of Franziska and the sergeant captivate the spectator; the rascals are easily seen through, the atmosphere is conciliatory, the jokes to the point. For all this the genuine spirit of comedy is ever present, and 'Minna von Barnhelm' can maintain its place among the best specimens of the higher type of comedy. Consult edition of Lessing's works in 'Deutsche National-Literatur' (1882-98, Vol. II); English translation in Harvard Classics, Vol. XXVI; Kettner, G., 'Ueber Lessings Minna' (Berlin 1896; Kettner, G., 'Lessings Dramen in Lichte unserer Zeit' (Berlin 1904); von Stockmayr, 'Die deutschen Soldatenstücke des 18. Jahrhunderts seit Lessings Minna von Barnhelm' (Weimar 1898).

EWALD EISERHAPDT.

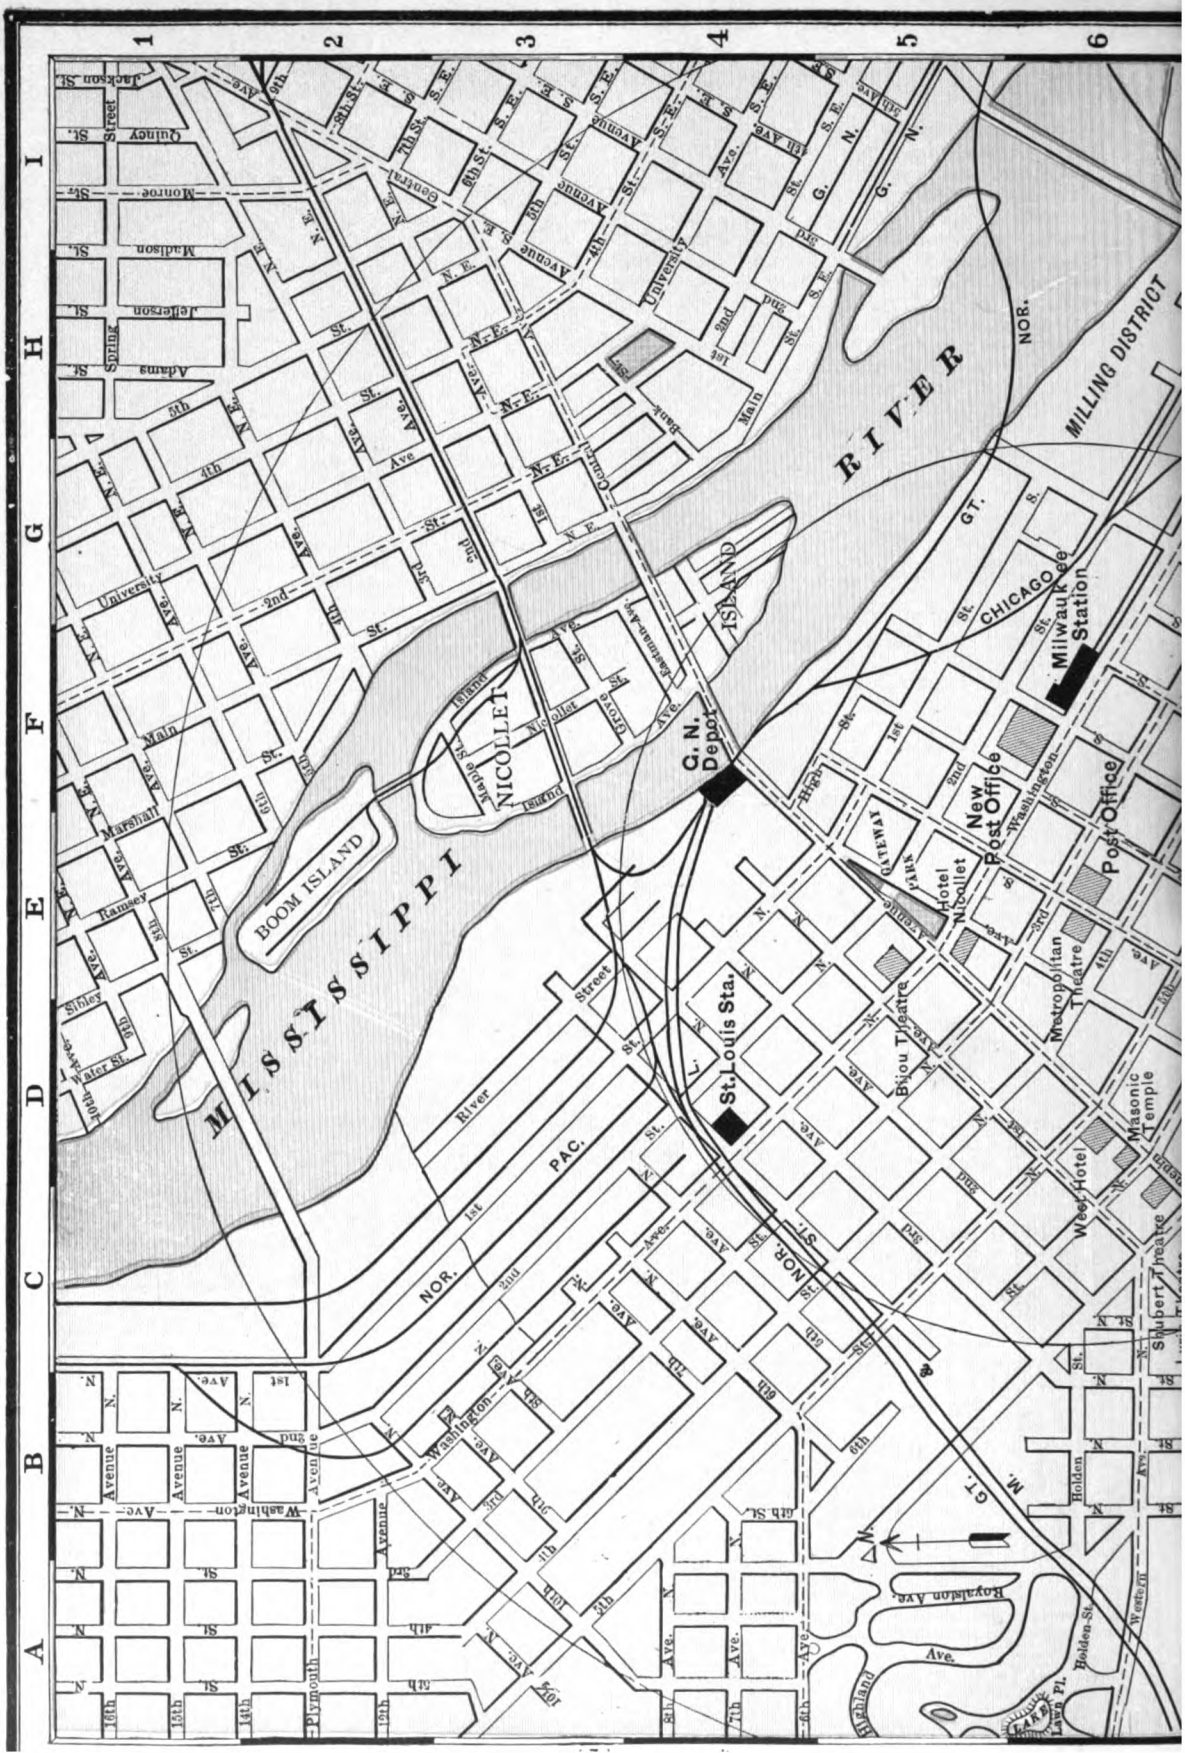

**MINNEAPOLIS,** the county-seat of Hennepin County and the metropolis of Minnesota, situated at the Falls of Saint Anthony, on the Mississippi River. On the east the city is contiguous to Saint Paul for half its length, the two being known as the Twin Cities. Minneapolis lies on both banks of the river which crosses it diagonally from northwest to southeast. Passing just above the falls Hennepin avenue divides the portion of the city on the west bank into North and South Minneapolis, and the portion on the east bank into Northeast and Southeast Minneapolis. Nicollet avenue, branching off from Hennepin a block west of the river, runs southwest for a mile and then south to the city limits. Both of these two avenues are broad and well developed, and Nicollet is clear of street-car tracks. Crossing these avenues are numbered streets and Washington avenue, which make the business district. The river is crossed by seven railroads and nine highway bridges, the finest of which is at Third avenue south, a beautiful structure of concrete costing \$3,000,000. From the Falls

of Saint Anthony south to the city limits the river runs between banks over 100 feet high covered with a great variety of trees and shrubs that present a very picturesque appearance. The total area of the city is 53 square miles.

**Manufacturing and Commerce.**—Minneapolis was founded by men who sought to utilize the power of Saint Anthony Falls for milling. The lumber industry, at first of prime importance, gave its place to flour milling upon the introduction of patent devices that made it possible to manufacture flour quickly and cheaply; and this industry has increased its importance until it produces nearly \$200,000,000 annually, making Minneapolis the chief flour milling city in the world. The annual output is over 17,000,000 barrels. By its situation near the great American grain fields the city has become the greatest primary wheat market in the world, its elevators having a capacity of 52,500,000 bushels. In 1917, 181,898,480 bushels of grain were received by the mills and elevators of the city. The second industry of importance is the manufacture of machinery, especially of gas tractors and other farm implements. This industry with allied iron and foundry work amounts to \$25,000,000 annually. The city is the shop headquarters of three railroads, the Chicago, Milwaukee and Saint Paul, the Minneapolis and Saint Louis and the Soo Line. The third industry is that of lumber, with sash and door manufacturing, cooperage and other woodworking crafts. Although the city does not now rank high as a lumber milling centre, it is still first in sash making; and on account of its early pre-eminence it remains the chief lumber market in the United States, being the meeting ground of Eastern buyers and representatives of the great coast companies. The fact that Minnesota still leads in the manufacture of white pine lumber and contains numerous wood-pulp plants besides cutting 500,000,000 feet of various kinds of lumber annually also contributes largely to the importance of Minneapolis as a lumber centre. The total value of the annual woodworking product is \$12,000,000. The fourth industry is the making of linseed-oil and meal. This has grown rapidly during the last decade until it produces \$12,000,000 annually. The proximity of Minneapolis to the flax fields of Minnesota and the Dakotas, makes it the natural centre of this trade. Besides these activities there is a diversification of manufacturing that has steadily increased during the past decade—food products of many kinds, including bakery goods, ice cream and confectionery, clothing, especially knit goods and laborers' wear, blank-books and other publishers' products and a wide variety of articles used in the construction of buildings, bridges, elevators, automobiles and electrical machinery. In fact the outstanding feature in the history of manufacturing in Minneapolis is the growing diversity of industry. In 1890 there were in the city 384 firms producing an annual value of \$78,617,170, of which \$39,000,000 was reported by the flour and lumber industries. In 1917 there were 1,512 firms producing \$275,000,000, of which \$200,000,000 was the value of flour and lumber. During the past 10 years the value of Minneapolis manufacturing has increased 55 per cent, and the city has become the 14th in rank of manufacturing in the United States. With Saint Paul, Minneapolis

shares in a jobbing and wholesale trade that covers a very large territory, including Wisconsin, Iowa, North and South Dakota, Montana, Wyoming and Canada. Considerable business from the Pacific coast comes to the Twin Cities. In 1917 for Minneapolis alone this wholesale and jobbing trade amounted to over \$300,000,000. Besides general merchandise this business includes drugs, hardware, machinery, building material, lumber, paper and automobiles.

**Power and Transportation.**—For this manufacturing there is available 40,000 horse power from Saint Anthony Falls. Saint Croix Falls, 70 miles distant, supply 30,000, and Coon Creek, on the Mississippi, 20 miles north of the city, 15,000. A new government dam in the Mississippi near Minnehaha, constructed to make the river navigable to Minneapolis, it is estimated will produce another 40,000; and other projects yet undeveloped promise considerable more electric power. The city is well connected with the great coal docks at Duluth, so that its industries can easily use steam as well as electric power. Altogether the city uses in all of its industries over 90,000 horse power. By virtue of its position the city early became a railroad centre. The Chicago, Milwaukee and Saint Paul; Chicago, Saint Paul, Minneapolis and Omaha; Chicago, Burlington and Quincy; Chicago and Rock Island; Chicago and Great Western; Minneapolis and Saint Louis; Minneapolis, Saint Paul and Sault Sainte Marie operate some of the finest trains in the world between Minneapolis and Chicago, and provide for the shippers of Wisconsin, Iowa and Minnesota. With the grain fields of the Dakotas and with the Pacific Coast States the Great Northern, Northern Pacific, Soo Line and Chicago, Milwaukee and Saint Paul make excellent communication. Duluth, the tonnage of which is not exceeded by that of any port in the world, is closely bound to Minneapolis by four of these lines. A system of trolley lines is being developed that promises to greatly increase the trade of the city with its immediate territory. The completion of the government dam in the Mississippi, that makes Minneapolis the head of navigation on the river, has already persuaded the city to construct its own wharves suitable for the landing of freight from barges.

**Finance.**—The city has four national, 33 State, four savings banks and three trust companies. In these the total capital invested is \$16,560,000; the total deposits, \$194,463,611. In 1917 the bank clearings amounted to \$1,662,078,303.37. The city is the centre for the Ninth Federal Reserve District. It is connected on the one hand with the rural banks of the great agricultural territory of the Dakotas, Montana, Minnesota and parts of Iowa and Wisconsin that are tributary to Minneapolis, and on the other with the powerful financial institutions of the East. Thus it not only serves to finance the crop moving, but also to guide capital to the best investment. The Minneapolis banks have done a great deal to forward education among the farmers of the Northwest, especially encouraging expert training in agriculture.

**Revenue.**—The total assessed valuation of Minneapolis is \$216,000,000, the total taxable wealth \$864,000,000. This produces a revenue of \$8,640,000, of which \$2,226,188 is spent for

current expenses; \$2,898,500 for education; \$1,002,188 for interest; \$587,799 for police protection; \$542,540 for parks; \$500,000 for fire protection and \$329,700 for library equipment and support. The bonded indebtedness of Minneapolis is \$29,000,000; and for the retirement of bonds an annual allowance, or sinking fund, of \$635,000 is provided. Miscellaneous expenses make up the total budget. It should be understood that the Tax Law of Minnesota provides that assessments be made on a 40 per cent valuation of all property. On this basis the total taxable wealth of the city is \$864,000,000. In addition to the rate for city purposes a State and county tax amounting to nine mills is levied, so that altogether \$10,584,000 is raised within the city.

**Buildings, Parks, etc.**—In the late eighties many handsome buildings were erected, including the Public Library, Guaranty Loan (now Metropolitan Life) Building, West Hotel and several churches, notably the First Baptist. The city hall and courthouse, begun in 1887 and finished in 1909 at a cost of \$3,000,000, post office, Security Bank, McKnight, First National-Soo Line, Plymouth and Metropolitan Bank buildings and the Andrews, Dyckman, Leamington and Radisson hotels are good types of modern architecture. The Art Institute, Immaculate Conception Pro Cathedral, Plymouth (Congregational), Hennepin Avenue, the costliest Methodist church in the world, and Saint Mark's Pro Cathedral, said to be the best example of pure Gothic in the United States, are recent additions to the beauty of the city. The great variety of landscape has made possible the building of many houses of fine architectural design. The city has taken advantage of its variety of scenic features in its planning of an extensive park system. Altogether there are 3,820 acres in the system, of which 1,211 are water. The largest park is Glenwood, containing 586 acres. Other popular resorts are Lake Harriet, Minnehaha Falls and Riverside, the last named of which is being enlarged to include land bordering on the lake formed by the widening of the Mississippi above the new government dam. One unique feature of the system is the connection by canals of Brownie, Lake of the Isles, Cedar and Calhoun lakes making possible a canoe or launch trip of nine miles. Another is the Grand Rounds, a system of boulevards bordering the lakes on the western boundary, crossing the Mississippi near the northern city limits, paralleling Shingle Creek, and descending to enter Glenwood Park on the western edge of the city, completing thus a circuit in which every possible variety of landscape, save ocean view, is presented. From the centre of the city the Grand Rounds is entered through the Parade on the west, and through the grounds of the University of Minnesota on the east, of the river. In all there are 55 miles of drives. In the past decade recreational facilities have been greatly increased to accommodate all classes of people, until now the city supports golf, tennis and other pastimes in 39 playgrounds, canoeing, bathing and skating. Calhoun Beach accommodated 166,830 persons during the season of 1917 and other lakes 130,000. The board also provides for fishermen and maintains a regular launch service. It conducts 35 ice-skating and hockey rinks. Minneapolis owns its own

water system, including a filtration plant valued at \$1,000,000. It has 580 miles of water main, 409 miles of sewers, 135 miles of straightway and 255 miles of 27 feet paving. Of its 881 miles of streets only 94 are still ungraded. The streets lighted by electricity total 469 miles, those lighted by gas, 96. All lighting, except for the two wards adjacent to the municipal garbage consumer, is done by private ownership; and the street car service is similarly conducted. On account of the absence of steep grades and natural obstructions to traffic it has been relatively easy to provide the city with through lines that materially reduce the cost of operation and keep the service uniform. A five-cent fare with transfer privileges prevails. Four lines connect the centre of the city with that of Saint Paul.

**Education.**—Minneapolis has 50,000 pupils in her public schools. There are 75 buildings worth \$3,200,000. Six of these are high schools and three junior high schools. The high school enrolment is 7,000. Parallel to the work for girls in the Girls' Vocational High School is that for boys in the Dunwoody Institute, a privately endowed institution, co-operating with the public school system. There are 1,700 teachers in the public schools subject to automatic salary increase and retirement on pension. Stanley Hall and Northrup Collegiate School, for girls, and Blake School for boys prepare for college. Saint Margaret's Academy, De La Salle Institute (Catholic), Minnehaha Academy and Minnesota College (Lutheran) are prominent in the educational life of the Northwest. The city is the seat of the University of Minnesota and of Augsburg Seminary. Besides these institutions the Minneapolis School of Music and Dramatic Art, the Northwestern Conservatory of Music, the McPhail School of Music, the Minneapolis School of Fine Arts and the Handicraft Guild (affiliated with the University of Minnesota), together with several business colleges and other technical schools, provide instruction for several thousands of students. The Public Library, its 17 branches, 20 stations and 437 distributing points, circulated 1,566,000 volumes in 1917 in addition to over 125,000 pictures, lantern slides, pieces of music and other material. It owns 334,763 books. Minneapolis has made great progress in the arts, especially during the past 15 years. The Minneapolis Symphony Orchestra, the Philharmonic and Apollo clubs and the Thursday Musical with the various conservatories, and 400 music teachers whom the advantages of the city as a musical centre attract to Minneapolis are chiefly responsible for giving the city its leadership. The choral work in the public schools is of a high quality. The Institute of Art, one unit of which was completed in 1913 at a cost of \$500,000, with the art schools and the art departments of the public schools exerts a great influence in the building and decorating of the Northwest. The Walker Art Gallery is well known for its collection of originals.

**Government.**—Minneapolis is governed by a mayor, who appoints a chief of police, and by a council of 26 aldermen, two from each ward, elected alternately for a term of four years at the time of the State elections. The council chooses an engineer, attorney, fire chief and health officer. The schools are under the

charge of a board of seven, each elected from the city at large, for a term of four years. The board elects a superintendent and business superintendent, appoints teachers and other employees, not under civil service provisions, and administers affairs in general. The park and library boards are similarly independent of council control, but the mayor is *ex officio* a member of both. The board of corrections and charities controls the poor department, municipal lodging-house, city workhouse and four hospitals. The civil service commission examines candidates for clerkships and other positions. The board of tax levy, consisting of the mayor, president of the council, chairman of the council ways and means committee, city comptroller, the presidents of the school, library and park boards, the chairman of the board of commissioners of Hennepin County and the county auditor, at a meeting held on the second Monday in September fixes the rate to be levied in the city and county. The city treasurer and comptroller are elected by the people as are also municipal judges. All candidates for office run on a non-partisan ticket, at a primary election held in June, the two candidates for each office receiving the highest number of votes being declared nominees to contest at the general election on the first Tuesday after the first Monday in November of the even-numbered years. The city has a patrol limit system that confines saloons to a restricted district in the centre of the city and within certain other boundaries.

**History.**—Minneapolis is built about Saint Anthony Falls which Father Hennepin, the first white man to view them, so far as is known, named in 1680. No settlement was made until the establishment of Fort Snelling, first called Fort Saint Anthony. Then in 1823 the government built a mill to saw lumber on the west bank of the river just below the falls. Later this mill also ground flour. Settlers, however, were rigorously excluded from the Fort Snelling reservation until after the Indian lands east of the Mississippi had been relinquished. This was in 1837. The following year squatters from the fort built log cabins on the east bank of the river in attempting to claim the water-power rights as soon as the government should permit settlement. It was not until 1848 that Franklin Steele and William Cheever laid out the village of Saint Anthony. The former also built a sawmill to cut the pine that Daniel Stanchfield and other Maine woodsmen, whom news of the inexhaustible supply had attracted to the settlement, sent down the river; and the village grew rapidly to importance, becoming a city in 1855. The pioneers were interested in education and general upliftment as well as in material things; and it was one of their first moves to found a university, which after a period of hardships became the University of Minnesota, and to establish lecture courses and lyceums. In 1851 Col. John Stevens, acting for Steele, crossed to the west bank and laid claim to a quarter section of land, upon which the business portion of Minneapolis was later built. He gave lots to those who would build; and in consequence many settlers were attracted. A ferry, first, and then a suspension bridge, served as the connecting link between the two villages. In 1855 the plot of the western set-

**COURT HOUSE AND CITY HALL, MINNEAPOLIS**

tlement was validated by the government; and from then on it began to lead, taking the name, Minneapolis, a compound of the Indian Minnehaha (Curling Water), and the Greek, polis (city), upon a suggestion of Charles Hoag, a schoolmaster and public-spirited citizen. In 1867 it became a city. In 1872 the two cities became one under the name Minneapolis.

With the advent of the railroad and the period of prosperity that followed the Civil War, the city grew rapidly. It was stimulated by the installation of the Swiss Roller System in place of the buhr stone with which the first flour-mills were equipped and by the introduction of a bolter process that purified middlings, thus making it possible to save as flour that which had formerly been wasted. These two inventions, the construction of an apron to prevent the wearing away of the limestone ledge of the falls, and the completion of sluiceways, made it possible to produce flour swiftly and cheaply so that Minneapolis became known as the Flour City. At the same time the cutting of lumber kept increasing until 1890 when 500,000,000 feet were produced. At the Republican National Convention in 1892 Minneapolis was justly advertised as the chief lumber and flour city in the world. After a brief period of comparative inactivity caused by the panic of 1893 and the depression that followed, the city began to attract new ventures of various kinds and to reflect their influence on the Northwest as suggested in the discussion of her trade. The growth in population has been as follows: (1860) 5,000; (1870) 18,079; (1880) 46,887; (1890) 164,739; (1900) 202,718; (1910) 303,000; (1918) 385,000.

*Instructor in English, West High School, Minneapolis.*

**MINNEAPOLIS**, Kan., city, county-seat of Ottawa County, on the Solomon River and on the Atchison, Topeka and Santa Fé and the Union Pacific railroads, about 130 miles west of Topeka. It is in an agricultural and stock-raising region. Its chief industrial establishments are flour-mills, grain elevators, foundry, carriage shops and creamery. Stone quarries in the vicinity contribute to the industries of the city. Pop. 2,000.

**MINNEAPOLIS SYMPHONY ORCHESTRA**, founded in 1903, consists of 80 players, all under regular salary. The orchestra is maintained by a guarantee fund. The conductor, Emil Oberhoffer, has had charge of the orchestra since its organization. The standard of programs and performance are high and the orchestra ranks with the best musical organizations of the United States.

**MINNEDOSA**, Canada, town 135 miles northwest of Winnipeg, in the Marquette Electoral Division, Manitoba, and on the Little Saskatchewan River and on the Canadian Pacific Railway. Minnedosa, being a railway centre, is growing rapidly. It is in a fine agricultural country and possesses a sash-factory and a grist-mill. Pop. 1,378.

**MINNEHAHA**, min-ě-hä'hä, Falls of (Sioux, *Mini-haha*, "laughing water"), a cascade in the Minnehaha River, now in the Minnehaha Park, which belongs to Minneapolis, Minn. The cascade has a fall of about 60 feet and is in a picturesque glen which extends to the Mississippi River. Just below the falls the river is spanned by a rustic bridge. The name has become world-known through Longfellow's 'Hiawatha.'

**MINNESINGER**, min-ě-sing-er, or **MINNESÄNGER** (from old German *minne*, love), the name given to the German lyric poets of the 12th and 13th centuries on account of love being the chief subject of their poems. The cradle of German lyric poetry was Upper Austria. The earliest German poetry was chiefly narrative, and this not only when past events formed the poet's theme, but also when he celebrated present occurrences. But this contact with the present naturally gave occasion to the expression of the poet's feelings and gradually led to the lyric pure and simple. Such was the origin of the oldest extant poems of Dietmar von Aist (1143-70) and others. But the development of German lyric poetry was greatly hastened by the influence of the French poetry of the same class, which at that time flourished in Champagne and Flanders. The immediate effects of this French influence were greater strictness and variety in the versification, a greater preponderance of the subject of love and a more purely lyrical treatment. The minnesingers were generally of noble birth, and like the troubadours who preceded them wandered from place to place. The Westphalian Heinrich von Veldeken, afterward regarded by the minnesingers as the true father of their art; Friedrich von Hausen, a native of the Palatinate; the Thuringian Hugo von Salza; the Saxon Heinrich von Morungen; the semi-mythical Heinrich von Otterdingen; and the two Swabians Heinrich von Rucke and Ulrich von Gutenberg, were the chief minnesingers of the latter half of the 12th century. The 13th century witnessed the highest cultivation of the minnesong, and also the beginning of its decay. Its greatest masters are Walther von der Vogelweide, Wolfram von Eschenbach, Gottfried von Strassburg and Hartmann von Aue. After the art had ceased to be practised by the minnesingers, it was taken up by the artisans of the towns under the name of meistersingers (q.v.).

**MINNESONG** (German *Minnesang*, *Minnegesang*, from *minne*, "love," and *sang*, "song"), a mediæval type of German love-lyric, written chiefly by knightly poets in the 12th, 13th and 14th centuries, in the Middle High German dialect. The earliest of the 300 or more names of minnesingers that have been preserved are Kürnberger, Memlo von Sevelingen, Dietmar von Aist, etc., but only about 160 of them have left poems that are still accessible. Some groups of minnesingers were very distinctly under the influence of French (Provençal) and Italian models, such as Friedrich von Hausen, Rudolf von Fenis, Ulrich von Gutenberg, Heinrich von Ruge und von Morungen, etc. The flower of the type blossomed in Walther von der Vogelweide and Reinmar von Hagenau about the year 1200, coincident with the great mediæval German epic, the 'Nibelungenlied.' Most of these songs

were intended for musical performance and are divided into classes, distinguished by the names *lied*, *leich* and *spruch*. Rüdiger Manesse (d. Zürich 1325) and his son are said to have collected them in the Great Heidelberg Manuscript, which was taken to Paris in the course of the Thirty Years' War, and later returned to Heidelberg. It contains 137 miniatures and over 7,000 strophes; published by von der Hagen (Leipzig 1838), Pfaff (Heidelberg 1899), Mathieu (Paris 1850). But many poems not in the Manesse manuscript are found in other manuscripts. Later minnesingers, such as Ulrich von Lichtenstein, began to regard the occupation of producing such poems as a sort of sport or handicraft and the art passed out of the hands of the lower nobility into those of the burgher "masters" (see MEISTERSINGERS) and roaming minstrels. Consult Lachmann, K., and Haupt, M., 'Minnesangs Frühling' (Leipzig 1884); Lyon, O., 'Minnesang und Meistergesang' (Leipzig 1883); Grimme, F., 'Geschichte der Minnesinger' (Paderborn 1897).

JACOB WITTMER HARTMANN.

**MINNESOTA** (Dakota, "sky-tinted water") is bounded on the east by the Mississippi River, the Saint Croix River and a line running north from the western bend of this stream for 40 miles until it strikes the extreme western end of Lake Superior, and by the curving north-west shore of the lake. These boundaries separate Minnesota from the State of Wisconsin. On the north the State is separated from the province of Ontario in Canada by the Pigeon and Rainy rivers, by a line passing northward and westward through Lake of the Woods, then southward to the 49th parallel which, for 100 miles until it is intercepted by the Red River of the North, forms the boundary between Minnesota and the province of Manitoba. The Red River from its source in Lake Traverse and a line running southward from the Big Stone Lake, separated from Lake Traverse by a mile of land, to the northern boundary of Iowa, divides Minnesota from North and South Dakota on the west. The line between Minnesota and Iowa, on the south, is 275 miles long. Within these boundaries the State has an area of 87,196 square miles, of which 6,338 is of water. It is 408 miles long from north to south, and from 357 miles, the distance from the Red River to Pigeon Point, on Lake Superior, to 180 miles, the distance from Big Stone Lake to Saint Croix Falls, or an average of something over 200 miles wide.

**Topography.**—The most important fact about the surface of Minnesota is that its north-central part forms the divide from which water flows northward to Hudson's Bay, eastward by way of the Saint Lawrence River to the Atlantic and southward through the Mississippi to the Gulf of Mexico. This divide is the old Laurentian highland which slopes steeply to Lake Superior, gently to the south and west. Two-thirds of the State is a rolling plain, well drained and easily cultivated. The average elevation is 1,275 feet, this figure involving calculations of such low altitudes as 616 feet in the southeastern part of the State and the heights of the Mesabe Range and the Sawteeth Mountains in the northern part, the greatest of which attains 2,200 feet. The valley of the Red River is 800 feet above sea-level and the Twin Cities have the same altitude.

**Rivers and Lakes.**—The early explorers found in Minnesota wonderful canoe highways. From Lake Superior they could ascend the Saint Louis River, then cross over to the Mississippi, by which, with short portages, they could easily reach the Red; or they could descend the Mississippi, carry around the Falls of Saint Anthony, enter the Minnesota, ascend to Big Stone Lake, carry to Lake Traverse and enter the Red from that direction. Again they could enter the Saint Croix at its confluence with the Mississippi and ascend to the Wisconsin divide, on the northern slope of which they found numerous streams leading to Lake Superior. With the exception of a short portage the way from Lake Superior to the Red River was open along the northern boundary and it was easy to get from the Minnesota River into the Des Moines River, and thus travel through what is now the State of Iowa. Each of the larger rivers is fed by numerous goodly tributaries—the Mississippi by the Crow Wing, Rum, Minnesota, Saint Croix, Cannon, Zumbro and Root; the Minnesota by the Blue Earth, Cottonwood, Redwood, Chippewa, Pomme de terre and Lac Qui Parle; the Red by the Red Lake and Wild Rice; the Rainy by the Vermillion, Big Fork and Little Fork; the Saint Croix by the Little and the Snake. All of these are wholly within the State. The Mississippi and Minnesota, with their branches, drain 48,700 square miles of territory; the Red, 15,100; and the Rainy, 10,300. The Missouri drains about 1,700 square miles.

There are over a thousand lakes in the State, with a total area of 3,000 square miles. They range in size from a few acres to the great expanses of Red Lake, 400 square miles; Leech Lake, 200, and Mille Lacs, 200, and include such resorts as Minnetonka and White Bear, near the Twin Cities, Vermillion, 90 miles north of Duluth, the Otter Tail and the Chisago lakes. Within the limits of Saint Paul and Minneapolis there are 13 lakes of notable size and excellent beaches. No portion of the State, except the extreme southeastern and the lower Red River Valley, lacks the advantages for recreation afforded by a good lake.

**Climate.**—Stories of Minnesota climate are based on the extraordinary experiences of explorers and settlers rather than on the weather records; but even these experiences show a wide divergence. For instance Le Seuer's secretary reports that in 1700 the rivers were frozen in September, and Carver declares that the winter of 1766 was so warm that he could live in the open without discomfort. Plowing has been accomplished in February and snow has blocked trains in October. It is of record that the mean annual temperature of the southeastern part of the State is 46° F., at the Twin Cities 44° and 36° in northern Minnesota. The coldest month is January, during which the mean temperature is 14° in the southeast, 12° at Saint Paul and 0° in the north. July is the warmest month, the temperature varying from 76° in the southern part, 74° at Saint Paul and Minneapolis to 68° in the north. It is seldom that extreme temperatures prevail for more than a day or two at a time and the State has been remarkably free from destructive storms. In fact since its settlement in the fifties only four dangerous tornadoes and three blockading snows have occurred. The rainfall is 22 inches

in the lower Red River Valley, 28 at the Twin Cities, Rainy Lake or Lake Superior, and 34 in southeastern Minnesota. The elevation of the State, its fine drainage system and the dryness of its atmosphere, especially in the winter, contribute to make it one of the most healthful regions in the world. At the Twin Cities the death rate is only 10 per thousand annually.

**Soil.**—The prevailing soil is a black loam underlaid by clay. This soil is deep and rich in the southern part of the State and in the Red River Valley. It is somewhat more shallow and sandier in the belt that skirts the pine woods, and quite sandy in the northeastern part. In the northern part are swampy tracts which, as they are being drained, add largely to the fertile acreage. The heavy soil produces all the varieties of grains and grasses, the sandy soil, clovers and potatoes, vegetables and fruit. With the exception of some rocky land in the northern part, a great deal of which is being reserved for a permanent white pine forest, there is scarcely any land in the State that is not productive or that does not promise to be productive as soon as it can be reached with the necessary improvements, either ditching or clearing.

**Geology.**—The surface of Minnesota, excepting the southeastern corner, is of glacial drift. Under this drift are found rocks of all ages. On the international boundary extending east to Lake Superior from Lake of the Woods and thence southwestward to the Minnesota River between Big Stone and New Ulm but terminating southwest of the river occur the gneisses, schists and granites of the Archaean, or earliest, geologic age. Granite Falls in the upper Minnesota is formed by a granite outcrop. Of the second geologic period, the Paleozoic, the earliest, or Cambrian, limestones and sandstones occur from Taylor's Falls on the Saint Croix and Kettle rivers southwest to the Minnesota and Blue Earth rivers, and along the Saint Croix and Mississippi to the southeastern part of the State. Lower Cambrian, or red sandstone conglomerate and trapezoidal rocks, are found on the border of Lake Superior and in Pine, Chisago and Kanebec counties in the eastern part of the State. In southwestern Minnesota this formation is found as red quartzite, or the pipestone and jasper of which the Indians were very fond. Rocks of the second system of the Paleozoic Age, Silurian limestones and shales are found from Minneapolis south to northeastern Iowa, and those of the Devonian, or third system, extend through Fillmore and Mower counties into Iowa. Of the Mesozoic, or third geologic age, including Carboniferous, or coal-bearing limestones, Minnesota has none; but of the Cenozoic, or fourth great system, rocks are found over the western two-thirds of the State. These belong to the Cretaceous, or earliest period of this age and are the basis of the Coteau des Prairies in the southwestern part.

The glacial sheet, which covered almost the entire State, receding, left its drift to an average depth of 100 feet. Twelve marginal moraines marking the successive outlines of the front of the ice sheet have been mapped. These cross Minnesota. Their ridges and knolls contain large boulders. In the Red River Valley, sloping southward in the direction of the ice recession, a great ice-dammed

lake—called Lake Agassiz by the geologists—was formed and held by the waning ice sheet. This lake attained a length of 700 miles and extended into Montana with a width of over 200 miles. It thus had an area of about 110,000 square miles. Many ridges of sand and gravel reveal the beach lines of the lake, which, as it was lowered, ceased to drain southward through the Minnesota and Mississippi rivers and was finally reduced in size to Lake Winnipeg, leaving behind the present Red River Valley, the most fertile wheat land in the world.

**Minerals.**—Minnesota produces more iron ore than any other district in the world. In 1884 the first mines were opened in the Vermillion Range and for the first 20 years produced 1,000,000 tons annually. In 1892 the Mesabe Range was opened and in 10 years averaged 5,000,000 tons a year. During the next 15 years these ranges averaged nearly 25,000,000 tons a year. In 1910 the Cuyuna Range, extending southwestward from the Mesabe for 50 miles, was opened. It has yielded an annual output of approximately 1,000,000 tons. From the beginning of mining in the State a grand total of 500,000,000 tons have been shipped. In 1917 the production was 45,398,787 tons. The school of mines of the University of Minnesota estimates that there are 1,500,000,000 tons of merchantable ore remaining on the different ranges. This estimate does not provide for possible discoveries still to be made by which a great deal of ore may become merchantable. A great deal of the mining is of the open-pit character. Steam shovels load the ore on trains that are run directly to the docks at Two Harbors or Duluth where steamers wait to carry it to the steel centres at Chicago, Gary or Erie. See article on DULUTH.

Minnesota also quarries its valuable building stone. Mankato and Saint Peter limestone and Kettle River sandstone are prized. In 1916 stone worth \$1,492,341 was produced. Clay, sand and gravel for tile and brick making and for concrete work and road building are found in large quantities.

**Flora and Fauna.**—In Minnesota are found all of the plants and animals of the north temperate zone. Along the streams of the southern part thickets of oak, elm, ash, maple, poplar, basswood, plum and cherry trees in great variety are found festooned with grape-vines and sheltering the small fruits and other shrubs, especially the hazel-bush. Scattered over the prairies are strawberries and the northern woods produce blueberries for many markets. These woods, after more than 50 years of arduous lumbering, contain more white pine than is found elsewhere in the Union, besides other varieties of pine, balsam and spruce and hemlock. The State flower is the dainty lady-slipper found along the marshes that also shelter the fringed gentian, and glow with marigolds and golden-rod in 36 varieties. The snow no sooner leaves the prairies than the pasque-flower appears and the anemone shows through the leaves soon after. Violets, columbines, bloodroots, geraniums, buffalo-beans, roses, tiger and pond lilies and sun-flowers follow through the summer until the aster succumbs to the September frost. Clovers, especially persistent, have invited extensive dairying and many varieties of grasses have been introduced to supplement them. In

fact the climate and soil of Minnesota have made possible the introduction of many plants once looked upon as exotic but now showing everywhere on the lawns and farms of the State without being protected against the winter.

The French explorers found the beaver working along every stream, and they, with succeeding trappers, almost exterminated this animal; but of late years under the protection of the State the beaver is multiplying rapidly. Marten, otter, mink, muskrat and other furbearers have always been numerous. In the wilder parts of the State coyotes and timber wolves, black bears, foxes, lynx and various rodents, including the gopher, for which Minnesota has been called "The Gopher State," are prevalent, except where care has been taken to prevent their becoming a nuisance to stock or to crops. Deer and moose attract hunters to the northern part of the State. The streams and lakes are well stocked with pickerel, pike, bass, crappies and sunfish and some trout are caught.

**Forestry.**—The pine of Minnesota seemed inexhaustible to the pioneers. It stretched from the Rum River, 20 miles north of Minneapolis, to the international boundary and covered two-thirds of the State in width. Mills at Minneapolis, in one year cutting 500,000,000 feet of lumber, made that city the first lumber centre of the world. Gradually the lumbering operations have moved northward, following the diminishing timber, until they are confined to a comparatively small area. Within this area, however, mills, notably at Virginia, are promised logs for 20 years; that is regardless of fresh supplies guaranteed by scientific forestry. In 1917 the total lumber cut in the State was 1,500,000,000 feet. Beside this, 800,000,000 feet of pulp-wood, 425,000,000 feet of ties, posts, poles and mining timber, and 225,000,000 feet of box-lumber were cut. Balsam, hemlock, spruce and even the once despised jack-pine are used for the coarse grades of lumber as well as for these other purposes. Of white pine 20,000,000-000 feet remain, of other woods, 70,000,000,000.

Minnesota, through its forestry commission which employs the State forester and his rangers, is taking steps to protect the timber that remains and to replant large areas unfit for agriculture that will grow merchantable white pine in 40 years. It has passed laws to control the operations of lumbermen, so as to prevent fires from accumulations of waste, to safeguard timber from locomotive and camp fires, to assist lumbermen through laboratory experiments and to ensure to the State a permanent supply of lumber. The State owns 400,000 acres in forest reserves; and the United States government 1,000,000. To patrol this territory and to carry on the other work of the forestry commission 50 men are employed. It is estimated that 15,000,000 acres can profitably remain in forest, or about half of the original timber area. With the development of the plans outlined by the commission Minnesota will be able to produce 4,000,000,000 feet of lumber annually.

**Agriculture.**—Minnesota has been called "the Bread and Butter State," for its yields of wheat and dairy products have been its chief claim to agricultural distinction; but other crops are gaining in importance. Corn-growing has advanced northward until Aitkin

County, 250 miles north of the Iowa line, once supposed to be the limit beyond which corn could not be ripened, enters prize-winning ears at the Minnesota State Fair. The growing of corn in the southern part of the State, and the corresponding increase of stock-raising, has restored the soil to profitable wheat land, although the great wheat fields are in the Red River Valley. Potatoes are the chief crop in the district between the upper Saint Croix and the Mississippi rivers; and are entering into the calculation of farmers in other parts of the State. While Minnesota cannot be called a fruit-growing State in the sense that New York and Michigan are held, its State Horticultural Society and experiment stations have made it clear to the farmers that they can count on good crops of strawberries, raspberries and plums, each of which have been greatly improved in yield, appearance, keeping quality and cold-resisting ability. Apples are produced in all parts of the State, although a good winter apple is still to be found. Vegetables of all kinds are easily produced and grow to a great size, especially in the sandy parts of the State. The dairying industry shows a constant gain over the State year by year. Poultry-raising is also on the increase. A striking movement is that toward the improvement of stock. Bee-keeping has received an impetus through the appointment of State inspectors to ensure the health of the colonies and to suggest the best methods of obtaining results. It is significant that as the cut-over lands are brought under cultivation by the assistance of the United States and Minnesota agricultural stations, the most efficient men are sent out as county agents to prevent the waste and loss that were inevitable in the days of the first prairie farms, so that surprising improvement takes place in the shortest possible time. A comparison between the statistics for 1910 and 1917 follows:

	1910	1917	Value, 1917
Acres in farms.....	14,731,464	27,675,823	\$45.62*
Improved land.....	16,643,533	19,643,533	.....
Number of farms.....	156,137	156,137	.....
Acreage per farms.....	.....	177.3	.....
Number of cattle.....	2,347,435	2,506,281	\$ 75,090,531
Horse and mules.....	760,000	902,925	101,720,636
Swine.....	1,520,257	879,946	8,776,980
Sheep.....	637,582	235,300	1,170,849
Poultry.....	11,862,787	15,000,000	3,065,868
Creameries and cheese factories....	784	922	.....
Pounds of butter and cheese.....	35,000,000	138,816,826	\$ 37,196,349
Bushels of wheat.....	57,057,412	57,965,000	117,089,000
Corn.....	67,897,051	90,000,000	99,000,000
Barley.....	34,927,773	37,800,000	41,958,000
Oats.....	93,897,717	120,250,000	75,758,000
Rye.....	4,426,028	7,583,000	12,667,000
Potatoes.....	26,802,948	33,600,000	30,576,000
Tons of hay.....	6,036,747	5,224,000	60,619,000
Flaxseed, bushels.....	3,277,238	1,980,000	5,841,000

\* Value per acre.

The total value of the 1917 crop, according to the United States government, was \$447,498,000. The value of the machinery and implements used on the farms is \$52,329,000. Of all the crops, onions show the largest returns per acre, yielding 504,600 bushels on 1,400 acres with a total value of \$732,000, or \$504.60 per acre.

The State still holds 2,000,000 acres of farm land and the United States 800,000. The proposed special government aid in developing public lands and a law already in force that pro-

vides for the clearing of a portion of each 40-acre tract sold by the State, will greatly stimulate agricultural improvement in Minnesota.

**Manufactures.**—The raw materials close at hand—breadstuffs, livestock, lumber and iron—are the basis of most of the manufacturing done in the State. Flour- and grist-mill products are of prime importance. Beginning with the government mill at Saint Anthony Falls in 1821 the industry has thrived enormously. By the substitution of steel rolls for buhr stones, and by the invention of the bolting process that purifies and saves the middlings that once were largely waste, Minnesota millers in the seventies took first place in the world, and in 1917 mills to the number of 286 made flour valued at \$300,000,000. (See MINNEAPOLIS—*Manufacturing*). The second industry is the slaughtering of cattle, sheep and hogs. South Saint Paul is the centre of this trade. Extensive yards receive the stock from the ranches and farms of Montana, Wyoming, the Dakotas and Minnesota, and the packing-houses produce an annual value of \$47,710,000. The third industry is the manufacture of lumber and other timber products, such as sash and doors, cooperage and boxes. In these interests there are 481 firms, and they produce an annual total of \$47,000,000. Foundry products, machinery and car repairs together make a fourth industry of importance. In all 450 concerns produce goods valued at \$39,000,000. The gas tractor is a rapidly increasing figure. Although farm machinery is chiefly made there is apparently growing diversity in this industry. At Duluth, steel mills are turning the ore of the Mesabe and other ranges into ingots for Eastern shipment, and are making some steel, although the Western market for this product is necessarily limited. Other products of Minnesota manufacturers are butter and cheese (see *Agriculture*); other foods, including confectionery, ice cream and bakery products, valued at \$32,350,000; clothing, including knit goods and boots and shoes, \$20,000,000; printing and publishing, \$20,200,000; linseed oil and meal, \$12,356,000, and malt liquors, \$14,300,000. There are 5,794 firms in the manufacturing trade. They employ 92,834 persons and produce annually \$493,354,136 worth of goods. For this manufacturing there is already available 100,000 horse power in the streams that have been exploited, and, by government estimate, another 100,000 awaiting development. Saint Anthony and Saint Croix Falls, Thompson Dam, in the Saint Louis River, and Coon Creek in the Mississippi are the chief points of contact with an electric system that promises to complete many other projects in the near future. Coal enters the State over Lake Superior, and is stored, pending shipment to various manufacturing points, at the Duluth docks. See DULUTH—*Commerce*.

**Banks and Banking.**—Minnesota has carefully drawn laws governing banking operations. There are no private banks. All State banks are subject to inspection of the bank examiner. In 1917 there were 1,125 of these banks. Their capital was \$23,612,500; their deposits, \$259,277,135. The list of State banks includes nine savings banks, capitalized at \$350,000, with deposits at \$36,719,749. There are 294 national banks with a total capital of \$32,506,000 and deposits of \$289,031,000; and 12 trust companies, capitalized at \$4,260,000. At Minneapolis is the

Federal Reserve bank for the Ninth District; and at Saint Paul is the Federal Farm Loan Bank for the Northwest territory.

**Finance.**—Under the direction of the Minnesota Tax Commission all assessments in the State are reviewed, first by the local board, then by the county board to adjust differences between districts, and finally by the commission to arbitrate between counties. Personal property of the first class, including iron ore, in stack piles, is assessed at 50 per cent of its value; personal property of the second class, including livestock, manufacturers' materials and automobiles, bears an assessment on 33½ per cent of its value; and personal property of the third class, or household goods beyond exemption of \$100, is assessed at 25 per cent of its value. All credits and money is assessed at full value. Rural real estate is taxed at 33½ per cent and urban real estate at 40 per cent of its value. Railroads and telegraph and telephone lines pay a gross earnings tax of 5 per cent and 3 per cent respectively. On this basis the State assessed in 1917 its personal property, \$263,193,685; its real estate, \$1,403,409,459; and its money and credits, \$284,968,875. The true and full value of its real estate was \$3,684,054,371, and of its personal property, \$778,612,283. In 1896 the State treasurer reported receipts from all sources of \$5,482,876; in 1916 of \$20,061,320. For defraying the general expenses of the State government and activities there was of this sum \$17,800,000 available; the remainder was credited to various school funds, certificates of indebtedness and the prison revolving fund in amounts of \$3,645,225, \$3,275,930 and \$2,077,813 respectively. Of each dollar received by the treasurer for defraying general expenses, 35.47 cents came from general property taxes, 30.80 from railroad taxes, including freight lines and sleeping-car companies, 9.89 from interest on State lands, State loans and trust funds, 6.80 from various State institutions, 6.64 from departments, 3.78 from inheritances, 2.86 from insurance companies, 1.42 from the State prison and 2.34 from miscellaneous sources. The present rate of State taxation is 3.80 for general expenses, and 2.23 for school and university.

A great asset of the State is its land which is held in trust for the school, university and for permanent improvements. The State owns 2,000,000 acres which, by law passed by the first State legislature, may not be sold for less than \$5 per acre, and are actually being sold at a minimum price of \$10. The accumulation of the funds received for land already sold amounts to \$36,288,569, which is invested under the direction of the State board of investment. The income derived from this investment is apportioned among the schools of the State according to their status (see *Education*). The State owns buildings worth \$19,000,000.

**Transportation.**—Owing to the early settlement of the Saint Croix and Mississippi valleys, the Twin Cities became the railroad centre of the State. Later Duluth developed in commercial importance. A glance at the map shows two great wheel-like systems radiating from these centres, and so intersecting as to provide all parts of the State with transportation. Entering the Twin Cities through Wisconsin are the Minneapolis, Saint Paul and Sault Sainte Marie (Soo Line), two lines; the Chi-

cago, Saint Paul, Minneapolis and Omaha and the Chicago, Burlington and Quincy. On the west bank of the Mississippi the Chicago, Milwaukee and Saint Paul, two lines, Chicago, Rock Island and Pacific, Chicago and Great Western, Minneapolis and Saint Louis and the Chicago, Saint Paul, Minneapolis and Omaha. Westward from the Twin Cities run lines of the Chicago, Milwaukee and Saint Paul, the Minneapolis and Saint Louis and Great Northern, and northward to the Red River Valley and Manitoba, the Great Northern, Northern Pacific and Minneapolis, Saint Paul and Sault Sainte Marie. These last three systems, each with two lines, connect Duluth with the Twin Cities; and also put it within easy communication with the Dakotas and Canada. Two short lines connect Duluth with the iron ranges, and the Canadian Northern gives it additional advantages for both Western and Eastern trade. The Chicago, Milwaukee and Saint Paul, Great Northern and Northern Pacific are transcontinental lines, and hence put Minnesota within reach of the great Western Territory with its rapidly increasing commerce and industry. Electric and other lines are developing the more closely populated districts. In all there are 42 companies listed in the report of the railroad and warehouse commission with a total mileage of 9,102, a capitalization of 1,509,349,088, gross earnings of \$121,821,203 and net earnings of \$54,988,303. These companies in 1916 paid dividends from net earnings of \$56,997,194, and from surplus of \$33,260,818. They paid to the State in gross earnings a total of \$5,436,572. Their bonded indebtedness is \$2,034,479,307; their total investment \$4,159,487,932.

Water transportation is due to become more of a factor in solving the commercial problem of the State now that the government high dam at Minneapolis is completed, making possible navigation on the Mississippi to that point. For statistics on river navigation and lake trade see articles on SAINT PAUL and DULUTH.

Under the direction of the State Highway Commission and with the aid of laws that take the building of roads from limited local jurisdiction the highways of the State are being greatly improved. The stone and gravel that are easily accessible are being used in road construction with the result that districts in the remote parts of the State are now reached by permanent roads. This is especially true of the northern part of the State. The legislature of 1919 adopted an amendment to be voted on in 1920 allowing the State to issue \$10,000,000 a year to a total of \$75,000,000, allowing counties to issue up to \$250,000. This promises to give the State \$109,000,000 for roads within a few years.

**Education.**—With an annual income of over a million and a half dollars from the permanent school fund, Minnesota is able to encourage all of the local school districts to sustain a high educational standard; at the same time care has been taken to conserve the initiative of these districts by withholding State aid from all that do not meet certain requirements. An attendance of 100 days must be credited to each pupil counted in the number attending a school for a year on which the apportionment is based; a sanitary building properly equipped and teachers graduated from

a normal course are other requirements for general aid. Special aid is given to schools that sustain normal courses, agricultural instruction, manual training and domestic science departments. One of the most recent and most effective movements in education is the consolidation of rural schools to provide for grading and more efficient teaching. In 1916 there were 139 such schools in the State, and the number is rapidly increasing. The schools are classified as either rural, consolidated, semi-graded, graded and high. Districts are either common, independent or special, the last being a classification for cities such as Minneapolis. Common school districts are governed by the voters in mass meeting who elect and direct a board of three members how to administer the affairs outside of the detailed management of the school. The independent district is somewhat freer of control by the people, but cannot spend money for sites or buildings except as directed by vote. A consolidated district may be either common or independent.

There has been a great growth during the past few years. In 1912 the number of men teaching in the State was 1,720; in 1916 it was 1,952, an increase of 14 per cent despite a loss of 20 per cent in men teaching rural schools due to consolidation. The increase of men in graded and high schools in the four years was 46 per cent. Similarly wages increased from \$54 for men and \$45 for women in the rural schools, and \$109 for men and \$57 for women in the graded and high schools, to \$113 for men and \$64 for women in the rural schools and \$145 for men and \$78 for women in the graded and high schools. Of the teachers employed in 1916 in the rural districts 3,777 had had a high school training, 3,076 a high school and normal course, 682 a normal training and 191 college training. In the high and graded schools 2,132 were high school graduates; 172 had had high school normal training, 4,684 normal and 2,414 college training. In four years the number of normal graduates had increased 18 per cent, the number of college graduates 40 per cent. In all there were employed during 1916 17,793 teachers. The total enrolment was 481,583. The schoolhouses numbered 9,400, valued at \$47,459,317. There were 7,630 libraries containing 1,824,832 volumes. In 1916 \$21,821,468 was expended in the State for education.

Higher education is carried on in the five normal schools and in the University of Minnesota. These normals are located at Winona, Mankato, Saint Cloud, Moorhead and Duluth, the university at Minneapolis. The normals enrolled 4,208 pupils and in 1916 graduated 728 pupils, a gain of 147 over 1912. The university enrolled 13,279, of whom 5,725 were in the colleges of liberal arts, engineering and mechanic arts, mining, agriculture, law, medicine, dentistry, pharmacy and education; and in the schools of analytical and applied chemistry, school for nurses and graduate school. In the various agricultural courses and in the extension division there were 7,554 enrolled. Like the common schools the university has invested funds derived from the sale of lands amounting to \$1,647,059. On 6 May 1915 the regents adopted a recommendation to establish at Rochester graduate research in co-operation with the Mayo Foundation. This provides a

**MINNESOTA**

**State Capitol at Saint Paul**

fund of \$1,500,000, free use of laboratories and clinical facilities and pays all salaries of instructors.

**Religion.**—From the time that the Episcopalians and Presbyterians organized services for the soldiers at Fort Snelling, that the Congregationalists labored with the Indians at Lake Harriet, the Catholics built their chapel at Mendota and the Methodists preached to the first settlers along the Mississippi, missionary effort and church organization in Minnesota has been a great agent in the development of the commonwealth. The Catholics are the strongest numerically, with 480,535 communicants. Saint Paul is the centre of their work. Here is the beautiful cathedral erected in 1913 at a cost of \$3,000,000. Here are also the Hill Seminary, and Saint Thomas College with an enrolment of 800. Saint John's College is at Saint Cloud. It enrolls 365. This Church supports parochial schools, both grade and high, in the Twin Cities; and at other places orphan asylums, relief agencies and hospitals, especially Saint Mary's at Rochester, connected with the Mayo Foundation. In all it controls 66 institutions. The Lutherans, Norwegian, Swedish, Danish and German are the second denomination in point of numbers. Altogether there are 300,000. They also support hospitals and colleges. At Saint Paul are Concordia College (German), Luther (Norwegian) and Luther (German) seminaries; at Minneapolis, Augsburg Seminary and Minnesota College (Swedish); at Saint Peter, Gustavus Adolphus College (Swedish), and at Northfield, Saint Olaf's College (Norwegian). Altogether the Lutheran colleges and seminaries enroll 5,000 students. They control 60 institutions. The Episcopal cathedral is at Faribault, where are also Saint Mary's school for girls and Shattuck Military Academy for boys, and the Seabury Divinity School. The Episcopalians have 16,000 members and support 10 institutions. Enrolled in its higher institutions of learning are 800. The Presbyterians number 30,000. They support Macalester College at Saint Paul, which enrolls 400 students. The Methodists are 50,000 in number. Hamline University at Saint Paul and Parker College at Winnebago City, with a total enrolment of 600, are their colleges. The Congregationalists number 25,000. Carleton College at Northfield and Windom College at Montevideo enroll 600. There are 25,000 Baptists and 35,000 of other faiths in the State.

**Charities and Correction.**—Under the direction of the State board of control are five asylums and hospitals for the insane, schools for the blind, deaf, feeble-minded, dependent children, delinquent boys and delinquent girls, reformatory, prison, sanatorium for consumptives, hospital for crippled children and hospital for inebriates—in all 16 institutions. To support them the State appropriated \$3,864,900 for the year 1917-18. The number of insane is 5,839; of defectives, 3,585; of dependents, 655; of delinquent children, 400; of adult prisoners, 1,300; of patients, 1,200. Probation officers reported 5,863 cases during the year 1914 and 1915 in which children have been helped. Jail inspectors reported that 11,822 cases had been disposed of during 1915; and there were in the various county poorhouses of the State 1,910. The total cost of the various

county charities during the year of 1915 was \$1,317,477. The income from various poorhouses was \$29,290 and the income from the work of the State prison twine and farm machinery factories was \$556,591. Besides this there was received \$125,000 worth of farm and garden produce used or sold by the various institutions. The twine is sold to Minnesota farmers at a slight reduction in price from outside factory products.

**History.**—The first white men known to have been in Minnesota were Radisson and Grosseileurs, two French adventurers and traders who made treaties with the Dakota and Chippewa Indians in 1656 and 1659. It seems that they were on Prairie Island in the Mississippi near Red Wing and in what is now Kanabec County. In 1680 Father Louis Hennepin, dispatched by La Salle to explore the upper Mississippi, was captured by the Dakotas and held as a prisoner at their village at Mille Lacs until released by Daniel Greysolon Du Lhut, who had made his way to Fon du Lac in the year previous and had heard of the capture of the other Frenchman. Hennepin descended the great river in August 1680 and named the falls after his patron saint, Saint Anthony. Nine years later Nicholas Perrot, another trader, established himself on Lake Pepin, and in 1700 Pierre Le Seuer ascended the Minnesota and established Fort L'huillier, near the present city of Mankato. He returned to France with some of the peculiarly colored earth of the vicinity which he falsely presumed to be copper ore. In 1732 Captain Verandrye traveled along the northern border of the State, going as far west as the Missouri River. None of the French settlements, however, were permanent.

The English, on the other hand, were interested in the extension of empire rather than merely trading adventures. Jonathan Carver, a native of Connecticut, in 1766 made a considerable inquiry into the extent and the resources of Minnesota, and sought earnestly to form friendships with the natives. He traveled on the Mississippi as far as the Saint Francis River, and on the Minnesota nearly to its source. After his return home he went to England, where his journal was published. The English established trading-posts on the principal waterways and developed an important trade in furs. The Hudson Bay, and later, the Northwest Fur, companies were strongly entrenched in the confidence of the Indians. In the War of 1812 Dakotas served against the American troops.

Upon the purchase of Louisiana, which included Minnesota west of the Mississippi, the eastern part belonging first to Michigan, then to Wisconsin, the United States government determined to explore the territory. Accordingly Lieutenant, afterward Captain, Pike was sent up the Mississippi to make such treaties with the Indians as would guarantee a permanent peace between the Dakotas and Chippewas, hereditary enemies, and thus make possible a profitable trade with both nations. Pike procured from the Dakotas a "strip nine miles long from the Minnesota River on both sides of the Mississippi," and a similar strip on the Saint Croix River, the Indians reserving the right to pass freely through the ceded territory on their hunting expeditions. In 1817 Major Long of the United States Engineers selected

a suitable site for a fort, and two years later Colonel Leavenworth led a body of soldiers to construct the work, first called Fort Saint Anthony, then Fort Snelling, after the commandant relieving Leavenworth, at the junction of the Minnesota with the Mississippi. In 1821 the government built a mill on the reservation opposite the falls and sawed lumber and ground flour for its use. In 1837 the lands east of the Mississippi were opened to settlement by treaty with the Indians; but the government would not permit the settlement of the reservation. Franklin Steele, sutler at the fort, however, built a squatter's cabin on the east bank of the river, intending to lay claim to the water rights. In 1848 he and others were allowed to develop their holdings, and consequently the village of Saint Anthony was platted. Steele built a saw mill, and soon the lumber industry, stimulated by the arrival in Minnesota of experts from Maine, was in full process of development. Similar was the development of the Saint Croix Valley, especially in the neighborhood of Stillwater. Meanwhile other explorations had extended the knowledge of the State. In 1832 Henry Schoolcraft had discovered, or rediscovered after William Morrison, the source of the Mississippi in Lake Itasca. A little later Beltrami, an Italian count, explored the country between the Red and Mississippi, and Major Long, G. W. Featherstonaugh and Catlin, the artist, had advertised the picturesqueness and the possibilities of southwestern Minnesota by their tours along the Minnesota River.

These explorations and the beginning of lumbering operations drew the attention of the nation to Minnesota, so that immigration increased rapidly. Saint Paul, at first but a collection of cabins about the home of a whisky trader named Parrant, or "Pig's Eye" in mockery of a defect, afterward enlarged by Swiss refugees from Lord Selkirk's colony at Pembina and dignified by Father Gaultier's building of Saint Paul's Chapel in 1841, became the leading town in the territory; and in 1849 was made the capital of the Territory of Minnesota, organized in that year with Alexander Ramsey governor. Saint Paul was not only the practical head of navigation in the Mississippi, but was the natural outfitting point for pioneers to the rich Minnesota Valley which was opened to settlement in 1851 by treaty with the Dakota Indians. For this reason it grew rapidly. Stillwater on the Saint Croix and Saint Anthony also received large numbers of people. The latter overflowed to the west bank of the river, and Minneapolis (Dakota, "Minnehaha"—Laughing Water—and Greek "Polis," city) was born, and received official recognition as a village in 1855. Townsites were plotted in various inaccessible parts of the State, real estate values became badly inflated, credit was overstrained, until in 1857, in common with other parts of the country, the Territory suffered from financial panic. Nevertheless, 12 May 1858 a bill giving statehood to Minnesota was signed by the President, and Henry Sibley, who as fur factor for the American Fur Company, had been a unique figure in the life of the Territory for a quarter of a century, and who had been its first delegate in Congress, was made the first governor.

Upon the outbreak of the Rebellion, Ramsey, the second governor, had the honor of offering President Lincoln the first troops, and during the war 11 regiments of infantry, two regiments of artillery, two battalions of cavalry and a company of engineers were sent from Minnesota—27,000 men in all. Part of these troops were also employed to put down an uprising of the Dakotas under Chief Little Crow. These Indians, resentful over the failure of the United States government to keep its engagements with them, and excited by the prospect of seizing their land while the government was engaged in war, made a sudden attack in August 1862 upon the settlers of the upper Minnesota Valley, and not until 800 whites had been killed were the Dakotas subdued. In September, General Sibley succeeded in capturing the leaders, of whom 38 were executed at Mankato. The tribal life of the Dakotas in the State was broken up so that they never threatened the peace of the State again.

At the close of the war Scandinavians came into the State in great numbers, as Germans had done in the early fifties, and began to open up the central and western parts of the State. Railroad building, delayed by the war, progressed rapidly. The introduction of rolls to take the place of buhr stones and the invention of the bolting process to purify middlings made Minneapolis a great flour centre, as the proximity to immense tracts of white pine had made it a great lumber centre. Saint Paul became a railroad centre of importance and the wholesale and jobbing market of the Northwest.

These advantages and the rapid rise of values produced another period of speculation that culminated in the panic of 1893. The hard times that followed were severely felt in the Twin Cities and in Duluth; but, owing to the substantial development of the rural districts, there was little, if any, retardation in the growth of the State. Lands in the Red River Valley and in southwestern Minnesota produced increasingly, and were in demand. By 1898 the cities were recovering from the effects of the panic, and were beginning to grow conservatively and to improve sanely. For this reason as well as because the riches of the State have been gathered and distributed by most efficient methods the history of Minnesota since 1900 has been one of unbroken prosperity.

**Government.**—The seat of government is at Saint Paul in a capitol building designed by Cass Gilbert and decorated by LaFarge and other artists, and costing \$4,000,000. The distinctive features of Minnesota government are the School Land Law (see *Education*), the Railroad and Warehouse Commission, elected by the people, and designed to adjust rates and other details of transportation in the interests of the public; the administration of State institutions under a board of control appointed by the governor; the Non-partisan Election Law, making all candidates for office within the State, except those running for State executive offices, appeal to the electors on their ability to perform the work required by the office, instead of making the work a political issue, and the Primary Election Law, which takes the place of the convention system of naming candidates. The State

has adopted effective measures for road-building, preservation of resources, including Game, Fish and Forest, a Workmen's Compensation Act and a Minimum Wage Law that prohibits the employment of women for less than \$8.75 per week. The legislature meets for the first 90 days in each odd-numbered year. Terms for the lower house are two years; for the senate, four. A voter must have lived in the State a year, in his precinct 30 days and be a citizen of the United States. The governor, lieutenant-governor, secretary of state, auditor and treasurer are each elected on a partisan ticket for a term of two years. There are 10 Congressional districts.

In politics the State has been regarded as solidly Republican, and in Presidential elections can be counted on for good Republican majorities. There has been, however, a decided tendency toward independence in politics within the last two decades, especially in the choice for governor. Below is the list of governors since the territory was organized in 1849:

TERRITORIAL.		
Alexander Ramsey	1849-53	
Willis A. Gorman	1853-57	
Samuel Medary	1857-58	
STATE.		
Henry H. Sibley	1858-60	Democrat
Alexander Ramsey	1860-64	Republican
Stephen Miller	1864-66	Republican
William A. Marshall	1866-70	Republican
Horace Austin	1870-74	Republican
Cushman K. Davis	1874-76	Republican
John S. Pillsbury	1876-82	Republican
Lucius Hubbard	*1882-87	Republican
Andrew McGill	1887-89	Republican
William R. Merriam	1889-93	Republican
Knute Nelson	1893-95	Republican
David M. Clough	1895-99	Republican
John Lind	1899-1901	Democrat-Populist
Samuel R. Van Sant	1901-05	Republican
John A. Johnson	1905-09	Democrat
Adolph O. Eberhart	1909-15	Republican
William S. Hammond	1915-17	Democrat
Joseph A. A. Burnquist	1917-	Republican

\* Inauguration changed to odd-numbered years by legislature.

**Population.**—The population of the State by decades is given herewith: 1850, 6,077; 1860, 172,023; 1870, 439,706; 1880, 780,773; 1890, 1,301,826; 1900, 1,751,394; 1910, 2,075,708; 1917 (estimated), 2,500,000. Of this population 11,000 are Indians, mostly Chippewas on White Earth Reservation; 9,000 are negroes; the rest are whites. Of the white population 74 per cent are native-born, 26 per cent are foreign. Of the foreign-born 250,000 are Scandinavians, 200,000 Germans, 40,000 Canadians, 35,000 British, 18,000 Russians, 42,000 Austrians, 27,000 Finns, 3,000 Italians and 15,000 from other countries.

E. DUDLEY PARSONS,  
Author of 'The Story of Minnesota.'

**MINNESOTA**, a river, which rising in the northwestern part of South Dakota flows through Big Stone Lake on the boundary between Minnesota and South Dakota, then continues southeast in Minnesota a distance of about 350 miles, to where it receives the waters of the Blue Earth, when it turns and flows northeast to the Mississippi River. It enters the Mississippi just south of Minneapolis and opposite Saint Paul. The head waters of the Minnesota rising on the eastern slope and those of the Red River of the North rising on the northern slope of the Coteau des Prairies—the Hill of the Prairies—of Dakota, are but a short distance apart. The Minnesota is navigable to a rapids about 40 miles from its mouth, and for small vessels nearly 300 miles above the rapids. Its whole length is about 475 miles.

**MINNESOTA, University of.** A coeducational State institution of higher learning on the east bank of the Mississippi River in Minneapolis, Minn., established by an act of the Territorial legislature in 1851 and confirmed by the State constitution adopted in 1857. The present charter was adopted in 1868, and the first collegiate work was begun in the following year under the direction of the first president, William Watts Folwell, LL.D., a graduate of Hobart College, and a faculty of nine members. In September 1884 Cyrus Northrop, LL.D., a graduate of Yale and professor of English at that institution, succeeded to the presidency. In 1911 he was succeeded by George Edgar Vincent, LL.D., a graduate of Yale, and dean of the faculties of arts, literature and sciences of the University of Chicago. Its government is vested since the death in 1901 of the life regent, John S. Pillsbury, in a board of 12 regents, 9 appointed by the governor of the State and holding office for six years, and three ex-officio members, the governor, the State superintendent of public instruction and the president of the university. The university comprises the following colleges, schools and departments: (1) The Graduate School, with advanced courses in all branches. (2) The College of Science, Literature and the Arts, offering four-year courses; largely elective, leading to the degree of bachelor of arts; a four-year course in arts and music leading to the degree of bachelor of arts in music; courses in which the senior work is offered conjointly with the Schools of Law, Medicine, Dentistry and Chemistry, leading to the same degree; also a four-year course in science and medicine leading to the degree of

bachelor of science. (3) The College of Engineering and Architecture is offering five-year courses in civil, mechanical and electrical engineering, and architecture, leading to the degrees of civil, mechanical and electrical engineer and architect. The degrees of bachelor of science in engineering and architecture are conferred at the end of the fourth year. (4) The Department of Agriculture embracing (a) the colleges of agriculture (including agricultural and home economics courses), and forestry, offering four-year courses leading to the degrees of bachelor of science. (b) The schools of agriculture, offering three-year courses adapted especially to the need and opportunities of farm boys and girls. (c) Short courses in dairying, farm management and traction engineering. (d) The experiment stations, offering research advantages. (e) Extension work in agriculture. (5) The law school giving a three-year course leading to the degree of bachelor of laws. (6) The medical school with (a) the five-year course, including one year of hospital internship leading to the degree of doctor of medicine; (b) the School for Nurses, offering a three-year course leading to the degree of graduate in nursing; and (c) the School of Embalming, offering an annual eight-weeks course, leading to the State embalmers' license. (7) The College of Dentistry with a four-year course leading to the degree of doctor of dental surgery. (8) The College of Pharmacy offering a three- and a four-year course leading to the degrees of pharmaceutical chemist and bachelor of science in Pharmacy respectively. (9) The School of Mines, offering three five-year courses leading to the degrees of engineer of mines, engineer of mines in geology and metallurgical engineer. (10) The School of Analytical and Applied Chemistry with two five-year courses, the Applied Course leading to the degree of chemical engineer, the other offered conjointly with the College of Science, Literature and the Arts, leading to the degrees of bachelor of arts and bachelor of science in chemistry; and a four-year course in analytical chemistry leading to the degree of bachelor of science in chemistry. (11) The College of Education for the training of teachers and supervisors, with a two-year course leading to the degree of bachelor of arts in education. (12) The University Extension Service offering educational opportunities to the people of the State through (a) correspondence courses, (b) evening classes, (c) lecture courses, (d) field debates on public questions, (e) reference bureau. The university also has charge of the geological and natural history survey. The degrees conferred for graduate work are the master's degree in arts, science and pharmacy, and the doctor's degree in philosophy and medicine. No honorary degrees are conferred. The departments of law, medicine and education require two years of collegiate preparation. In all other departments students are admitted on examination or on certificate from accredited schools of the State. Tuition ranges from \$30 to \$175 a year. In 1914-15 the faculty numbered 608 and the attendance was 13,252, of whom 5,076 were women. Of this number 4,752 were of college grade, 5,606 sub-collegiate and 2,894 extension. The general library contained 175,000 volumes and there are special libraries

in connection with the various departments of instruction. The laboratories are extensive and well equipped. There are dormitories for the School of Agriculture and one dormitory accommodating 90 women on the main campus. The main university grounds comprise about 109 acres and are valued at \$2,000,000. The buildings of the entire institution are valued at \$5,700,000, and their equipment at about \$2,416,654.35. The university farm, located between Saint Paul and Minneapolis and connected with the main campus by private car line, consists of about 420 acres and is valued at \$413,000. The buildings and equipment of the department of agriculture are estimated at \$2,374,386.35. The university is supported by the income of its permanent endowment, a State tax of three-hundredths of a mill, and special legislative appropriations for maintenance, buildings and equipment. The gross income for 1914-15, exclusive of special appropriations, was \$988,206.56. The endowment was \$1,605,356.62, and the value of all the university property, \$12,800,205.55.

**MINNESOTA HISTORICAL SOCIETY.** This society was organized in 1849, the same year with the beginning of Minnesota as a Territory. Its objects are to collect and preserve the history of Minnesota and the Northwest. Membership is open to all who are interested in the work of the Society, on their nomination by any of the present members. At present membership includes 22 honorary members, 80 corresponding members, 255 life members and 68 annual members, in total 425. The life and annual members represent, more or less fully, all large districts of Minnesota. The library now comprises 114,425 books and pamphlets, including 10,042 bound volumes of newspapers. The number of individual portraits, historical pictures and framed documents is about 700, besides 40 group pictures, which comprise about 1,500 portraits. The museum has 30 large cases filled with historical and archaeological relics, including about 40,000 specimens of aboriginal implements, weapons and ornaments.

**MINNEWAUKON**, *mīn-nē-wā'kōn*, N. Dak., village, county-seat of Benson County, on Minnewaukon Lake, on the Great Northern Railroad, about 115 miles northeast of Bismarck. It has lumber-mills, a grain elevator and a large trade in their manufactured products and agricultural supplies. Pop. 500.

**MINNEWAUKON**, *mīn-nē-wā'kōn*, or **DEVIL'S LAKE**, North Dakota, one of a group of salt lakes which have no apparent outlet. It is about 45 miles long and from 2 to 13 miles in width; area, 750 square miles. The color of the water is darker than that of the fresh waters south. The water is too brackish to be used by human kind, but not for the wild animals of the surrounding region. Several villages, exploiting lumber and agricultural products, are on its shores.

**MINNOW**, a small fresh-water fish; originally a small European fish of the carp family (*Leuciscus phoxinus*). In the United States most of the minnows are of the same family (see *CYPRINIDÆ*), and are widely known as "shiners" on account of the silvery character of the scales. "The spring or breeding dress of the male is often very peculiar, the top of the

head and often the fins and portions of the body are covered with small tubercles, out-growths from the epidermis; the fins and lower parts of the body are often charged with bright pigment, the prevailing color of which is red, although in some genera it is a satin-white, yellowish or even black." — Jordan. These little fishes live in clear brooks for the most part and go about in companies furnishing food for larger fishes. Many of them afford good sport to young anglers; and all are sweet pan-fish; but very bony. They are of value and largely used as live-bait. Most of the Eastern examples belong to the genus *Notropis*. (See **TOP-MINNOWS**). Consult Jordan, 'Vertebrates of the Northern United States' (11th ed., Chicago 1914).

**MINO DA FIESOLE**, mee-no dah fee-ay-so-lay, Florentine sculptor: b. Poppi in the Casentino in 1431; d. Florence, 11 July 1484. His real name was Mino di Giovanni. He began work as a stonemason for Desiderio da Settignano, who always remained his master and friend. His home was Florence, but he worked in Rome in 1454, 1463 and 1464. Of Mino's early works the best are in the Duomo of Fiesole—altarpiece and tomb of Bishop Salutati executed before 1466. In the Badia of Florence are an altarpiece and the tombs of Bernardo Giugni (1466) and the Margrave Hugo (1481). These are carved in white marble with life-size sleeping effigies and attendant angels all in the beautiful Renaissance style. After finishing the pulpit in the Prato Cathedral, in collaboration with Antonio Rossellino in 1473, a work remarkable for its delicately sculptured bas-relief depicting the life of the Virgin, he went to Rome where he executed the tomb of Pope Paul II (now in the crypt of Saint Peter's); the tomb of Francesco Tornabuoni in Santa Maria sopra Minerva; and a much-admired little tabernacle for the holy oil in Santa Maria in Trastevere. He is also thought to have been the sculptor of several monuments in Santa Maria del Popolo, particularly those of Bishop Gomial and Archbishop Rocca. The marble reeredos here presented by Pope Alexander VI is also said to have been the work of his hands. There are several tabernacles by him in Santa Croce, Florence, and in the Muzio Nazionale are busts of Piero de' Medici (1453); Giuliano de' Medici and Rinaldo della Luna (1461). Other portrait busts and profile bas-reliefs are preserved in the Bargello, Florence. They are full of life and expression. The Museum of Berlin possesses a female bust and a portrait of Niccolò Strozzi. The Louvre contains a San Giovannino. Consult Vasari, 'Lives of the Painters' (Vol. II); Perkins, C. C., 'Handbook of Italian Sculpture' (1883); Bode, Wilhelm, 'Denkmähler der Renaissance Skulptur Toscanus' (1892-1905); Angeli, 'Mino da Fiesole' (1905); Winckelmann and D'Agincourt, 'Storia della Scultura' (1813); Semper, 'Architekta der Renaissance' (1880).

**MINOR**, mē'nōr, Jakob, Austrian scholar: b. Vienna, 15 April 1855; d. 1912. He was educated at Vienna and Berlin, and became professor of German language and literature at Prague (1884) and of Teutonic philology at Vienna (1885). Besides numerous editions of texts, he published 'Neuhochdeutsche Metrik'

(1893), an excellent study in prosody, and a valuable although unfinished work on Schiller (2 vols., 1890).

**MINOR**, mī'nōr, Lucian, American lawyer and writer: b. Louisa County, Va., in 1802; d. Williamsburg, Va., in 1858. He was graduated at William and Mary College in 1823, and five years later became commonwealth attorney for Louisa County, Va., holding this office until 1852. In 1855 he was made professor of law in William and Mary College, which post he held until his death. He was a strong advocate of temperance and wrote much on the subject. His tract, 'Reasons for Abolishing the Liqueur Traffic,' reached a sale of 30,000 copies. He wrote a portion of John A. G. Davis' 'Guide to Justices' (1838); added notes to Daniel Call's 'Virginia Reports' and condensed the four volumes of Hening and Mumford's 'Reports' into one volume. His interesting notes of 'Travel in New England' were edited by James Russell Lowell for the *Atlantic Monthly* after his death.

**MINOR**, Robert Crannell, American artist: b. New York, 1840; d. 1904. He studied at Barbizon and became a pupil of Diaz. He subsequently went to Antwerp and was taught by Van Luppen and Boulanger, making a specialty of landscape. His student travels led him through Germany and Italy, and on returning to New York he was elected to the National Academy of Design and the Society of American Artists. He exhibited in the salons of Antwerp and Paris, in the Royal Academy of London, as well as in New York, Boston and Chicago. Among his best-known works are 'Dawn'; 'Sundown'; 'The Stream'; 'October Days'; 'Morning in June'; 'The Vale of Kennet'; 'Sunrise on Lake Champlain'; 'Cradle of the Hudson'; 'Cloudy Moonlight'; and 'A Mountain Path.'

**MINOR**, *in law*, a person under age of legal capacity, either for any or all acts. Sometimes, as in Scotland, the word is distinguished from the term infant by being more intensive, including those under age but above 14 for male and 12 for female. Usually minor is synonymous with infant (q.v.).

**MINOR**, a musical term applied to intervals and modes (or scales). I. *Interval*: For purposes of art certain relative distances of height and lowness have to be definitely determined and maintained. The sounds so chosen are notes of the system and the distances between them are intervals. Various national scales present great diversity in this respect; for instance, the ancient Gaelic and the Chinese scales (the ladder of notes is called a scale), were constructed so as to avoid any intervals as small as a semitone. The intervals of the ancient Greeks were calculated to develop the resources of melody without harmony. On the other hand the intervals of modern scales are calculated for the development of the resources of harmony rather than melody. The modern scale system is a product of artistic invention; and the determination of the intervals took many centuries to establish. By the time of Bach it was clearly settled. The interval between one note and another is named according to the number of degrees between them on the scale, both notes included; but some intervals, — thirds, for example, — have four semitones

and some have three semitones. The former is, therefore, called a major interval and the latter a minor interval; or in other words, a major third and a minor third.

II. *Modes*: When the immediate predecessors of Bach and Handel succeeded in establishing a stable key-system, that key-system took two forms, in both of which the three chords of tonic, dominant and subdominant occupied cardinal points. In one form, or mode, the tonic chord was natural, that is to say, major. In the other form the tonic chord was artificial, that is to say, minor. In the minor mode so firm is the position of the tonic and dominant (the dominant chord being always major) that it is no longer necessary to conclude with a major chord as was the custom in the 16th century. The effect of the minor mode is normally plaintive, because it centres round the artificial concord instead of the natural; and though the keynote bears this artificial triad, the ear, nevertheless, has an expectation (which may be intensified into a powerful emotional effect) that the final conclusion of the harmonic scheme may brighten out into the more sonorous harmonic system of major chords. On the modern sense of the identity of the tonic in major and minor rests the whole distinctive character of modern harmony and the whole key-system of classical composers. The minor mode recognizes two forms of scale, the harmonic and melodic. See SCALE.

**MINORCA**, *mí-nór'ka* (Sp. **MENORCA**, *mā-nōr'kā*), an island in the Mediterranean, belonging to Spain, the second largest of the Balearic group; greatest length, northwest to southeast, 35 miles; average breadth, about 10 miles; area, 260 square miles, and with dependent islands 293 square miles. It is situated northeast of Majorca, from which it is separated by a strait of 27 miles broad. The coast is much indented on all sides except the south, and generally presents a succession of bold headlands, enclosing small creeks and bays, of which several form good harbors. Of these the best and most frequented is Port Mahon, the capital of the island. The coasts are rugged, and the surface broken and mountainous. Mount El Toro in the centre attains a height of 1,207 feet. The soil is not generally fertile; still, in good seasons the quantity of wheat and barley grown is sometimes equal to the consumption. The other principal products are oil, wine, hemp, flax, oranges and lemons. Some good cheese is made, and considerable attention is paid to the rearing of bees. There is an abundance of small game on the island. Iron, copper, lead, marble, porphyry and alabaster abound in several districts. The inhabitants make excellent sailors, but generally are indolent, ignorant and bigoted. At an early period Minorca was under the Carthaginians, who drew from it a number of excellent slingers, who distinguished themselves during Hannibal's wars in Italy. It afterward passed successively into the hands of the Romans, the Vandals and the Moors. The last were expelled in 1285 by the Spaniards. During the greater part of the 18th century it belonged to the British, who finally ceded it to Spain at the Peace of Amiens (1802). Its exchange with Great Britain for Gibraltar has been frequently

discussed. Pop. about 41,939 Consult Markham, Sir C. R., 'The Story of Majorca and Minorca' (London 1908).

**MINORCA**, a breed of large black and white domestic fowls. See POULTRY.

**MINORITY**. See ELECTIONS; PRIMARY DIRECT; VOTE, VOTERS, VOTING.

**MINORITY AND PROPORTIONAL REPRESENTATION**. Under prevailing election methods the views of large numbers of voters are not represented by men of their choosing. Minority parties get a voice in legislative assemblies only by the haphazard preponderance of their members in a few localities. In every voting district that group of electors which is in the minority has no direct representation, and sometimes for a generation its members will go to the polls in vain. Though Norway, in its Constitution of 1814, appears to have been the first country to make an attempt to change this, the subject did not attract general attention till toward the middle of the century. In 1844 Thomas Gilpin published in Philadelphia a pamphlet that led a long train of literature, and in 1857 appeared the first of several books by Thomas Hare, in whose idea of "personal representation" J. S. Mill thought he discovered "the greatest improvement of which the system of representative government is capable." Since then many plans to accomplish the same end have been suggested. All presuppose that more than one place is to be filled at a time, as a board of aldermen to be elected on a general list, or several representatives from one district. The simplest plan is the single-vote system, where each elector has but one vote and the candidates receiving the largest number of votes are declared elected. It has been used in Philadelphia by the Republican party in the election of ward executive committees, and by the Democratic party in choosing inspectors of election. It is the method justified by the theory that no voter is entitled to be represented in any representative body by more than a single representative and would seem admirably adapted to the conduct of the internal affairs of parties. On the other hand, where the supremacy of party views is the issue, it is manifestly objectionable, as without an impracticable degree of party machinery and discipline, the majority party, if it has nominated as many candidates as there are places to be filled, may so scatter its votes that less than half of them will be elected, and in any event cannot allot its votes so as to ensure a result proportionate to its preponderance. Systems based on the "limited vote" theory meet this objection to some extent. Under them each voter may vote only for some fixed number of candidates less than the number to be elected. In operation this secures representation to the minority party second in rank, but with no relation to its numerical importance and smaller minority parties get no representation at all. With the next group of systems, those known as "cumulative," arithmetical complications grow. The first practical test of the idea came in 1870, when it was adopted as the method of electing English school boards, and in the same year it was put into the constitution of Illinois by the proviso that "each voter may cast as many votes for one candidate

as there are representatives to be elected, or may distribute the same or equal parts thereof among the candidates as he shall see fit." To each legislative district were allotted three members, so that a voter could cast his three votes for one, a vote and a half for each of two or one vote for each of three. The chief objection comes from the chance and temptation for members of the majority to "plump," that is, cast all three votes for one man; sometimes this permits the minority to elect two men, when the bulk of the majority vote is concentrated on one popular candidate; therefore, it invites to contests between party colleagues instead of political antagonists, breeds jealousies and disrupts organizations. These evils have been more conspicuous in the choice of English school boards, for the more men to be elected the greater the dangers from "plumping." Apparently the projectors of the minority representation plan in Illinois expected that the two great parties would continue to nominate three candidates in each district, but the politicians soon discerned the folly of nominating candidates for certain defeat, and each party nominated only two candidates for the three positions to be filled; hence all the nominees except one were practically certain of election. Furthermore, in districts strongly Republican, the Republicans would nominate only two candidates and the Democrats one and the reverse would occur in strongly Democratic districts, with the result that the voter had no choice whatever and a party nomination became equivalent to an election. Public opinion in Illinois has long called for the abolition of this system, but owing to the difficulty of securing constitutional amendments the efforts have been unavailing.

Several systems of proportional representation of minorities have been devised, each of which has its variations in different countries or sections. The first, known as the "free list" plan, provides that the lists of candidates shall be made up by the parties before the election and that the seats to be filled shall be divided between the parties in the proportion of the total votes cast by each, the higher men on each list to be declared elected to the number their party proportion warrants. This system has been in use in some of the Swiss cantons and Belgium enacted it into law in 1899. Its weakness is that it makes election wholly a party matter, practically preventing independent candidacies. A "freer list" plan advocated by William H. Gove of Salem, Mass., provides that the lists shall be made up by the candidates, rather than by the parties. In advance of the election the candidates are to designate who shall get the benefit of any ineffective votes cast for them. When the votes are counted, the first step is to divide the total number of ballots by that of the places to be filled; the quotient determines the number of votes a candidate must get in order to be elected,—his "quota." Votes cast for any one man beyond his "quota" are ineffective and are ignored, so far as he is concerned, but are to help some other candidate, and the same is true of votes for candidates receiving so small a number that they must fail of election. The "freest list" system, the Hare plan, has the list of preferences made up by neither the party nor the candidate, but by the voter, who designates

on his ballot the order of his choice. In the counting, as soon as it appears that a first-choice candidate needs no more votes, the second-choice candidate moves up into his place, being credited with the ballots until he in turn has reached his quota, and so on. Theoretically the smallest possible number of votes is wasted but in practice difficulty is experienced in large districts, since the ballot boxes must be brought to a central bureau to count the vote. There is also a considerable amount of chance in the order of counting the ballots. See also DISTRICT; APPORTIONMENT; CONGRESS; SENATE, UNITED STATES; HOUSE OF REPRESENTATIVES. Consult Commons, J. R., 'Proportional Representation' (New York 1907); Humphrey, J. H., 'Proportional Representation' (London 1911) and authorities cited under article ELECTIONS.

JAMES W. GARNER.

**MINOS**, mī'nōs, in Greek mythology, (1) a ruler of Crete, said to have been the son of Zeus and Europa. He was celebrated as a wise lawgiver and a strict lover of justice. (2) A grandson of the preceding son of Lycastus, son of the elder Minos and of Ida. This second Minos was the husband of Pasiphaë, whose unnatural passion gave birth to the Minotaur. He was king of Crete, but is not represented as having succeeded to the kingdom, but by one tradition as having acquired it through the favor of the gods, and by another as having conquered it over his brother Sarpedon. He is said to have made war upon the Athenians to revenge the death of his son Androgeos, who was killed at the festival of the Panathenæa by the candidates whom he had defeated at the games. Minos, having defeated the Athenians, exacted from them every year a tribute of seven youths and seven maidens, who were devoured by the Minotaur. Theseus delivered the Athenians from the burden of this tribute.

**MINOT**, mī'nōt, Charles Sedgwick, American scientist: b. West Roxbury, Mass., 23 Dec. 1852; d. 19 Nov. 1914. He was graduated from the Massachusetts Institute of Technology in 1872, studied also at Leipzig, Paris, Würzburg and Harvard, was lecturer on embryology and instructor in oral pathology and surgery in the Harvard Medical School in 1880-83, instructor in histology and embryology in 1883-87, assistant professor in 1887-92 and professor from 1892. He invented two forms of the microtome, an instrument for the automatic preparation of sections for microscopical study. He was elected president of the American Society of Naturalists in 1894, and president of the biological section of the American Association for the Advancement of Science in 1901. Among his works are 'Bibliography of Vertebrate Embryology' (1893), and 'A Laboratory Textbook of Embryology' (1903).

**MINOT**, mī'nōt, George, American lawyer: b. Haverhill, Mass., 5 Jan. 1817; d. Reading, Mass., 15 April 1856. He was graduated at Harvard in 1836 and at the Harvard Law School in 1838. He completed his legal studies with Rufus Choate and was admitted to the bar in 1839. He became a noted Boston lawyer and was for many years solicitor of the Boston and Maine Railroad Company. Mr. Minot edited 'Digest of the Decisions of the Supreme Court of Massachusetts,' 45 volumes with sup-

plement (1844-52); with Richard Peter, Jr., eight volumes of the 'United States Statutes at Large' (1848), and was for 10 years subsequently editor of that work. He was also associate reporter of the decisions of the first circuit and edited 'English Admiralty Reports' (9 vols., 1853-54).

**MINOT, George Richards**, American jurist: b. Boston, Mass., 22 Dec. 1758; d. Boston, 2 Jan. 1802. After graduation at Harvard in 1778, he studied law with Fisher Ames and was admitted to the bar of Boston, where he practised his profession. From 1781 to 1791 he was clerk of the Massachusetts House of Representatives. In 1792 he was appointed probate judge for the county of Suffolk, also serving at the same time as secretary of the convention that adopted the United States Constitution. In 1799 he was made chief justice of the Court of Common Pleas, and judge of the Municipal Court of Boston on its establishment in 1800, holding this office until his death. One of the founders of the Massachusetts Historical Society, he edited three volumes of its *Collections*. He delivered the oration on the anniversary of the Boston Massacre (5 March 1782). He published 'History of the Insurrection in Massachusetts in 1786' (Worcester 1786) and a 'History of Massachusetts Bay,' a continuation of Hutchinson's 'History of Massachusetts Bay' (2 vols., 1798-1803).

**MINOT, N. Dak.**, city and seat of Ward County on the Mouse River, 196 miles west of Grand Forks. It is situated on the Minneapolis, Saint Paul and Sault Sainte Marie and the Great Northern railroads. Minot is an important trading centre. Here the time is changed from "Central" to "Mountain" time, according to the system adopted in 1883. Minot has a fine hospital and a United States land office. A term of the District Court is held here. Pop. 6,188.

**MINOTAUR**, mīn'ō-tār, in Grecian mythology, the son of Pasiphaë, wife of Minos and a bull sent by Poseidon, having the body of a man with the head of a bull, or the head of a man and the body of a bull. He ate human flesh, on which account Minos confined him in the labyrinth built by Dædalus, and at first exposed to him criminals, but afterward the youths and maidens yearly sent from Athens as a tribute, until at length Theseus killed him, and freed the Athenians from this tribute.

**MINOT'S LEDGE, or COHASSET ROCKS**, in Massachusetts, a promontory and lighthouse in Boston Harbor. See LIGHTHOUSE.

**MINSK**, mīnsk, Russia, city and government of Lithuania, West Russia. Minsk, the city and capital of the government, is on the Svisloch, 420 miles by rail southwest of Petrograd. It is the see of a Greek archbishop and of a Roman Catholic bishop. It has some manufactures of woolen cloth, hats, leather and a considerable general trade. Pop. 117,600. The government, bounded on the north and east by Vilna, Vitebsk and Moghilen; on the south and west by Chernigov, Kieff, Volhynia and Grodno, has an area of 35,220 square miles. Pop. 3,070,900.

**MINSTER** (Anglo-Saxon, *Mynster*, from *monasterium*) anciently signified the church of

a monastery or convent. In Germany and in Great Britain this title is given to several large cathedrals, as York Minster, the minster of Strassburg, etc. It is also found in the names of several places, which owe their origin or celebrity to a monastery, as Westminster, Leominster, etc.

**MINSTREL**, a name introduced into England by the Normans, and which comprehended singers and performers of instrumental music, together with jugglers, dancers, sleight-of-hand performers and other similar persons. See NEGRO MINSTRELS; TROUBADOUR UNDER PROVENÇAL LANGUAGE AND LITERATURE.

**MINT**, a genus of perennial herbs (*Mentha*) of the family *Menthaceæ*. Many species have been described, of which 12 are either native or naturalized in America, characterized by square stems, opposite simple leaves, small, purple, white or pink, two-lipped, axillary flowers, in whorls which often form terminal spikes. All are noted for the fragrance of their foliage, due to the presence of an essential oil, for the production of which half a dozen species are more or less cultivated. The following are the most important ones: Spearmint (*M. spicata*), peppermint (*M. piperita*), pennyroyal (*M. pulegium*), bergamot-mint (*M. citrata*) and Japanese mint (*M. arvensis*, var. *piperascens*). Spearmint is the species most used as a culinary herb in the form of mint sauce served mainly with roasted lamb. Peppermint is largely employed in flavoring candy and for the production of menthol. Bergamot-mint is chiefly used in perfumery. Medicinal properties have been attributed to all of them, and they have all been cultivated upon a commercial scale to supply the various demands. Besides these cultivated species, which are frequently found as escaped plants near gardens, there are several other species, of which the following are perhaps best known: Round-leaved mint (*M. rotundifolia*), a native of Europe, naturalized rather interruptedly in the coast States from Maine to Texas; water mint (*M. aquatica*), with hairy stems, rather rare in wet places in New England and southward to Maryland; whorled mint (*M. sativa*) and its close relative, corn mint (*M. arvensis*), which are found in damp fields in New England; and wild mint (*M. canadensis*), which extends northward from the Northern States across the continent. All are recognizable by their resemblance to other members of the genus, especially by their odor. Several other related plants of other genera are called mint, among them being mountain mint (*Koellia* spp.), also popularly known as basil. The numerous species are widely distributed throughout the United States and Canada, and have a mint-like flavor and odor. Catnip (*Nepeta cataria*) is often called cat mint, and several species of *Monarda*, especially *M. punctata*, are known as horse-mint.

The half-dozen cultivated mints are managed alike. They will grow on any soil that will produce good crops of potatoes, but since they are considered exhausting crops are included in the rotation only once in five or more years. Upon reclaimed swamps, however, which are considered best adapted to their cultivation, they are generally allowed to remain consecutively for five years or even more without

change of crop. The land having been plowed, harrowed and otherwise fitted, small pieces of the root-stock are dropped at intervals of a few inches in shallow furrows about 30 inches apart. All through the season the land is kept scrupulously free from weeds, especially of smartweed, fireweed, ragweed and horseweed, which seriously injure the product if included in the "hay" from which the oil is distilled. Hand-weeding is commonly practised after horse cultivation is stopped by the luxuriant vines. About midsummer, or when the earliest flowers appear, the tops are cut, either with scythes of sometimes with mowing machines, and cured like hay. They are then stored under cover for distilling. This process is usually conducted with steam, which enters the still below, passes upward through the mass of hay, carrying the essential oil with it, and condenses in coils of pipe chilled by running water. After condensation, the oil and water separate by gravity. After standing for a greater or less length of time, crystals of menthol (q.v.) appear in the oil of peppermint. The annual yield of oil per acre sometimes exceeds 50 pounds, and sometimes a second profitable cutting of the crop may be made in autumn. Having once been planted the crop takes care of itself from year to year. The most important producing centre is in southwestern Michigan and northwestern Indiana. Perhaps next is Wayne County, N. Y. Other important mint fields are at Mitcham, Surrey and Lincolnshire, England, and in Saxony, Germany.

**MINT**, a government establishment for the coining of lawful metallic money. The United States mint was established in 1791, and remained an independent department of the Federal government until 1873, when it became subordinate to the Treasury Department under the title of "The Bureau of the Mint." This bureau is controlled by the Director of the Mint, who has general supervision of all the mint and assay offices in the country. He is the active manager, and formulates the rules of operation under which the bureau is run, but these rules require the approval of the Secretary of the Treasury before they become effective. Besides making the coined money of the country the United States mint makes metallic money for foreign nations, and also does considerable business in the line of supplying fine gold and silver in bars for industrial uses, and in making assays of bullion and ores of the precious metals for private owners.

During the fiscal year ended 30 June 1916, coining operations were carried on at the mints of Philadelphia, San Francisco and Denver. The mints at New Orleans and Carson City and the assay office in New York were operated as assay offices. The assay offices at Seattle, Boise, Helena, Salt Lake City and Deadwood were operated only as purchasing agencies for the active institutions. Refining was carried on at New York, Denver and San Francisco. The value of the gold acquired by the United States government at the mints and assay offices during the year cited was \$508,083,262.92. The value of the silver purchased was \$6,545,161.96 fine ounces, costing \$3,348,642.49.

The United States coinage for the year amounted to \$37,209,062.83, of which \$31,077,409

was gold; \$3,328,882.50 silver; \$1,790,468.15 nickel; and \$1,012,303.17 bronze. These figures include the 19,534 one dollar gold pieces coined for the Panama-Pacific International Exposition. There were also coined for foreign nations, at the Philadelphia mint: For Cuba, 3,092,890 gold pieces; 11,574,450 silver pieces and 25,912,150 nickel pieces; for Colombia, 852,663 silver pieces; for Ecuador, 1,000,000 silver pieces; for Salvador, 1,000,000 nickel pieces; for Venezuela, 2,000,000 nickel pieces; and for Peru, 100,000 gold planchets and 500,829 silver planchets. The mint at San Francisco coined for the Philippines 1,435,000 silver pieces and 5,500,000 bronze pieces. No other minting institution in the world turns out annually so large a number of pieces of money nor an amount of money of so great a value as the United States mint.

The seigniorage for the year cited amounted to \$4,046,740.26; the profits in the handling of old metal amounted to \$280,259.72, and other profits amounted to \$658,174.91, making the total receipts, \$4,985,174.89. The operating expenses were \$1,228,029.06. The net profits to the government from the mint were, therefore, \$3,757,145.83.

The total value of money coined by the United States mint since 1793, the first year of its active operation, has been \$4,494,094,087.68. Of this, \$3,422,949,938.50 has been in gold; \$995,956,436.30 in silver; and \$75,187,712.87 in minor coins.

The process of manufacturing coins comprises several distinct operations: (1) melting the metal bullion and casting it into bars; (2) rolling the bars into strips or ribbons; (3) cutting out the round discs or planchets; (4) adjusting the weight of the individual planchets; (5) rolling the rim of the planchet; (6) annealing and cleaning the planchets with acid; (7) striking the impressions on the planchets; (8) weighing each finished coin. In the rolling machines the rollers are adjustable and the space between them is governed by the operator. About 200 ingots are run through per hour on each pair of rollers. When the rolling is completed the strip is about six feet long. As it is impossible to roll perfectly true it is necessary to "draw" these strips, after being softened by annealing. The drawing benches resemble long tables, with a bench on either side, at one end of which is an iron box secured to the table. In this are fastened two perpendicular steel cylinders. These are the same distance apart that the thickness of the strip is required to be. It is drawn between the cylinders, which reduces the whole to an equal thickness. These strips are now taken to the cutting machines, each of which will cut 225 planchets per minute. The press now used consists of a vertical steel punch. From a strip worth \$1,100 about \$800 of planchets will be cut. These are then removed to the adjusting room, where they are adjusted. After inspection they are weighed on very accurate scales. If a planchet is too heavy, but near the weight, it is filed off at the edges; if too heavy for filing, it is thrown aside with the light ones to be remelted. The planchets, after being adjusted, are taken to the coining and milling rooms, and are passed through the milling machine. The planchets are fed to this machine through an upright tube, and as they

descend are caught on the edge of a revolving wheel and carried about a quarter of a revolution, during which the edge is compressed and forced up. By this apparatus 560 half-dimes can be milled in a minute; for large pieces the average is 120. The massive but delicate coining presses coin from 80 to 100 pieces a minute. These presses are attended by women. After being stamped the coins are taken to the coiner's room. The light and heavy coins are kept separate in coining, and when delivered to the treasurer they are mixed in such proportions as to give him full weight in every delivery. By law, the deviation from the standard weight, in delivering to him, must not exceed three penny-weights in 1,000 double eagles. See COINAGE.

The mint at Philadelphia was the sole United States mint from 1792 to 1833. It was located at 37 and 39 North Seventh street, and the actual coining was done in a brick building in the rear, which was erected by the government. These buildings were sold at auction in 1836. In 1835 the New Orleans mint was established. This was suspended in 1861, and was not reopened until 1879. Coining was again suspended there in 1909. The mint at Charlotte, N. C., was organized in 1838; suspended in 1861; and abolished in 1913. The San Francisco mint was established in 1853, and the Denver mint in 1862. The mint at Carson City was organized in 1870, but coinage was suspended there in 1893.

In Great Britain there was formerly a mint in almost every county. Besides the sovereign, barons, bishops and the principal monasteries exercised the right of coining. From the time of William the Conqueror the great bulk of the coining of Great Britain was done in London, but it was not till the reign of William III that all the provincial mints were abolished. The present mint on Tower Hill, in London, was erected between the years 1810 and 1815. The furnaces of the British, or Royal, Mint number 16 and are gas fired, consuming 15,000 cubic feet of gas per hour. In the five-year period 1911-16 there was melted in these furnaces precious metals to the amount of 9,900 tons. The London mint supplies the whole of the coinage of the British Empire, except Australia and the East Indies, which are supplied from branch mints at Sydney, Melbourne, Perth, Calcutta and Bombay. In France the number of mints was at one time considerable, and in the earliest times indefinite. Before the Revolution there were 27 mints, each of which had a letter or letters of the alphabet for its sign. In 1857 there were still seven French mints, namely, Paris, Bordeaux, Lille, Lyons, Marseilles, Rouen and Strassburg. In 1858 those of Lille, Marseilles and Rouen were abolished, and in 1860 that of Lyons, so that there were only three mints remaining in 1870, when Strassburg was taken by the Germans.

Consult Director of the United States Mint, 'Annual Reports'; Watson, D. K., 'History of American Coinage' (New York 1899).

**MINT GERANIUM.** See COSTMARY.

**MINTON, Thomas**, English pottery manufacturer: b. Wyle Cop, Shrewsbury, 1765; d. 1836. He was originally an engraver, having learned his art from John Turner, who had paid special attention to the process of printing on delft or chinaware. He settled at

Stoke upon Trent in 1791 and founded a pottery factory with the object of producing glazed pottery in the highest style, which should compete with the productions of foreign countries. He was completely successful and the range of his manufactures was increased by his son, Herbert Minton (1793-1858), who succeeded him in 1836, and manufactured the famous "Parian" porcelain and the encaustic tiles, with which the name Minton is now most commonly associated.

**MINUCIUS FELIX, Marcus**, probably the earliest Latin apologist of Christianity. Although he is mentioned by Lactantius and Saint Jerome, practically nothing is known of his life except what may be gathered from his one known work, 'Octavius,' a popular defense of Christianity in dialogue form. Almost all modern critics agree in putting the date of its composition before that of Tertullian's 'Apologeticum' (197) which bears a close resemblance to it, although the matter has been the source of great controversy. Waltzing, who has published the best and most recent edition (Leipzig 1912) and made many other valuable contributions to the literature of the subject, places it between 160 and 185. There is an English translation in the 'Ante Nicene Fathers.' The dialogue, which is modeled chiefly on Cicero's 'De natura deorum,' takes place between three lawyers: the author (who acted as judge), Cæcilius Natalis (a pagan and native of Citra), and Octavius Januarius (like the author, a Christian convert and native of Africa). The three had left Rome during the autumn vacation for a sojourn at nearby Ostia, where on a walk along the strand the discussion was provoked by the saluting of a statue of Serapis by Cæcilius. By agreement he begins, giving an arraignment of Christianity which alleges the impossibility of man arriving at truth, the inexpediency of disturbing long-established religious beliefs (especially those which have been the cause of Rome's greatness), the want of culture among the Christians, the indecency of their worship and the inherent absurdity of their doctrines. Refuting these allegations point for point, Octavius, upon purely philosophical grounds and therefore without explicitly quoting the Holy Scriptures or mentioning the name of Christ or the mysteries of Christianity, treats of the creation, Providence, the unity of God, the absurdity of paganism, the resurrection and the reward after death. Cæcilius acknowledges himself vanquished, but wishes some further explanations to be made later. The dialogue, in spite of the inevitable traces of the general decadence of taste, attains a rare degree of elegance, grace and limpidity. The introduction especially is a masterpiece because of the naïveté and naturalness with which the stage is set. Saint Jerome speaks of another work appearing under the name of Minucius Felix, 'De fato vel contra mathematicos,' but believes that it is not genuine because of the difference in style. Minucius in his dialogue had promised a special work on fate and it may be that this inspired the publication under his name of a work that was not his.

HERBERT F. WRIGHT.

**MINUET**, mīn'ū-ēt', a graceful and stately dance of French origin, the name of which, derived from *menu*, small, was suggested by the little steps. It developed from the *bricole* of Poitou and was introduced into Paris in 1650. It was at first a gay and sprightly dance; but after appearing at court it became grave and very dignified. It is mentioned by Beauchamps, father of dancing-masters, who flourished in the reign of Louis XIV, and also by Blondy, his pupil; but it was Pécour who gave the minuet popularity. The first known minuet tunes of artistic value were written by Lully (composer of ballets and operas) in 1653. The minuet was a great favorite at the court of Louis XIV, and was equally popular in the contemporary court of Charles II in England, where it continued in vogue into the reign of George II. The minuet reached perfection in the reign of Louis XV. It was then a dance for two persons, in moderate triple time, and was generally followed by the *gavotte* (q.v.). Afterward the minuet was considerably developed, and, with the *gavotte*, became chiefly a stage dance and a means of display. The original court minuet was a grave and simple dance, although it did not retain its simplicity for long. It was elaborated and molded into a beautiful form,—the perfect expression of an age in which deportment was carefully cultivated, manners were polished and bodily grace developed to the highest degree. The many slow graceful movements, the bows, the pauses to be filled with pretty compliments and the opportunity the dance gave for the display of beauty and bravery of costume made the minuet a factor in the polite world on both sides of the Atlantic. These court minuets were written in three-quarter time and consisted of two eight-bar phrases, each of which was repeated. Mozart's beautiful minuet in 'Don Giovanni' shows the form exactly. The form was soon extended. As a complement to the first movement, a second minuet was added, similar in form but contrasted in feeling. This, being usually written in three-part harmony, received the name of *Trio*, a name retained to the present time, long after the restriction as to the number of parts has been abandoned. A further enlargement of the form of the minuet consists of the extension of the number of bars to 16. Bach and Handel introduced the minuet into their suites and Handel also used it frequently as a concluding movement for the overtures to his operas and oratorios. Bach's minuets are remarkable for their variety of form and character. The historic importance of the minuet arises from the fact that it still holds its place in the symphony, the descendant of the suite. The first composer to introduce the minuet into the symphony appears to have been Haydn. Examples are also found in Haydn's string-quartets. Haydn, however, while retaining the form, changed the spirit and introduced a light-hearted humor. The form of Mozart's minuets

is identical with Haydn's, but Mozart again changed the spirit and in his hands tenderness and grace take the place of mere exuberance. It is in Mozart's concerted instrumental works that his minuets are chiefly to be studied. Beethoven continued the popularity of the minuet. First he followed the form and general characteristics of Mozart, but gradually he transformed the minuet into the Scherzo; and in the great majority of symphonies since Beethoven, the Scherzo replaces the older form. Occasionally the minuet appears as in Mendelssohn's 'Italian Symphony' and in Schumann's 'E-flat Symphony.' The Italian composers were most successful in their use of this form. Among them was Boccherini (1743-1805), whose quintets contain gems that are still popular. The beautiful minuet in the last scene of Verdi's 'Falstaff' is a most happy adaptation of the old form to modern music.

**MINUIT**, mīn'ū-it, **MINUITS**, or **MINNEUIT**, mīn'ē-wīt, Peter, German colonist in America: b. Wesel, Rhenish Prussia, about 1580; d. Fort Christiana, New Sweden (Delaware), 1641. He was an official in America in the service first of the Dutch West India company and then of the Swedish West India Company. Appointed governor of New Netherlands by the Dutch West India Company on 19 Dec. 1625, he landed on Manhattan Island on 4 May 1626, purchased the island from the Indians for trinkets valued at approximately \$24, built Fort Amsterdam and governed with a great degree of success until his recall in August 1631. The vessel on which he sailed was forced to put in at Plymouth, and he was imprisoned for some months on a charge of illegal trading. In 1633 the charter of the Swedish West India Company, originally granted in 1626, was renewed, and in 1637 Minuit, under the direction of the company, set sail from Gothenburg with 50 Swedish and Finnish colonists to found a colony in North America. He arrived at Delaware Bay in April 1638, purchased from the Indians the territory between the falls of the Delaware at Trenton and Cape Henlopen, called this region New Sweden, and built Fort Christiana, near the site of Wilmington, Del. The establishment of the colony aroused the resentment of the Dutch, by whom it was taken in 1655. Consult Mickle, 'Some Account of William Usselinx and Peter Minuit' (in 'Delaware Historical Society Papers,' Wilmington 1881).

**MINUTE**, a division of time and of angular measure; the 60th part of an hour, and the 60th part of a degree. In astronomical works minutes of time are denoted by the initial letter *m*, and minutes of a degree or of angular space by an acute accent ('). In architecture the 60th part of the diameter of a classic column, measured at the base.

**MINUTE MEN**, in the American Revolutionary War, the militia, who were prepared for service at a minute's notice. They were principally civilians, resident in Massachusetts, who were enrolled in accordance with an act of the provincial congress, passed 23 Nov. 1774. There were in Boston alone 16,000 minute men ready for service.

**MINYAS**, mīn'ī-as, in Greek mythology, the son of Chryses, the hero of the *Minyas*, from

whom were descended most of the Argonauts. His three daughters, Clymene, Iris and Alcithoë, or Leuconoë, Leucippe, Alcithoë, were changed into bats for having made light of the mysteries of Dionysus.

**MIOCENE**, in geology, the third epoch of the Tertiary period, intermediate between the older Oligocene and the newer Pliocene. Considered in respect to its invertebrate (fossil) fauna the earlier part of it ("lower" iocene) forms a part of the Oligocene (q.v.); but no such distinction can be made when the period is judged by its vertebrate remains. (See TERTIARY). Marine beds of Miocene Age are known on the Atlantic and Gulf Coastal Plain of the United States, showing that the eastern edge of the continent was under water. Marine Miocene is also known on the Pacific Coast, the western margin of the continent also being submerged. In the Rocky Mountains and Great Plains, terrestrial gravels, sands and clays accumulated, in part in lakes, in part on flood plains. The great lava flows of the Columbia Plateau and the Yellowstone Park Region are of this age. In Middle or Late Miocene came the folding of the Coast Ranges, and probably simultaneously came the uplift of the Alps, the Apennines, the Caucasus and the Himalayas.

**MIOHIPPIUS**, a fossil horse of later Miocene time. See HORSE, EVOLUTION OF.

**MIOTIC**, a word that notes or characterizes the stage in the life-history of an organism at which miosis, or reduction, occurs; in other words it is the suppression of an entire whorl of floral organs. The term is also applied to vegetable alkaloids used in medicine to cause contraction of the pupil of the eye, mydriatics being the designation of drugs which cause dilation. Consult Mann, A., 'Preparation of unbroken Mother-cells and other Cells for Studies in Miosis' (in *Science*, Vol. XXXVI, n. s. 1912).

**MIQUELON**, mēk-lōn, an island in the Atlantic Ocean, near the southern coast of Newfoundland, at the entrance of Fortune Bay, with SAINT PIERRE (q.v.) forming a French colony. The southern part of it is called Little Miquelon (*Petite Miquelon*) or LANGLEY ISLAND, and was once a separate island, but since 1783 has been connected with it by a sandbank. The island was discovered by Sebastian Cabot in 1497, and is a French possession. It is under the direction of the commandant of Saint Pierre and is occupied only by a few families engaged in the fisheries. The area of Miquelon is 83 square miles. Pop. about 600.

**MIR**, mēr, in Russia, a name given a commune, consisting of the inhabitants of one or more villages, who are as a community owners of the surrounding land which is redistributed to the members from time to time, and who are mutually liable for the taxes. The mir is self-governing as a community, with elective officers, but is subject to bureaucratic control.

**MIRA**, mī'rā or mē'rā, or **STELLA MIRA** (the wonderful star), in astronomy, the star Omicron Ceti, a remarkable variable, situated in the neck of "the whale." Its variability was discovered in 1596 by Fabricius. The period is somewhat irregular, but averages about 331 days. During the greater part of this time the star remains of about the 9th magnitude, but

during about 100 days it rises to a maximum which may vary from the 2d to the 5th magnitude, remains for a week or 10 days there, and then sinks to its minimum again. When shining with a brightness of the 2d magnitude, it is giving out more than 600 times as much light as when at the 9th magnitude. Its greatest recorded variation occurred between the years 1779 and 1783, when, after attaining a brightness equal to that of the first magnitude star, Aldebaran, it sunk so low that it was invisible, even in telescopes showing stars of the 10th magnitude. The period of its changes is also irregular, sometimes varying to the extent of two months. Thus, neither the times of greatest brightness nor the amount of the brightening can be accurately predicted.

As to what occurs in this and similar long period variables to occasion so great an outburst of light at the approximately constant interval of about 11 months, we are ignorant. As the time of greatest brightness of Mira approaches the spectrum gives evidence of powerful disturbance, and the outburst is from the depths of the sun, the outlying strata of vapors remaining comparatively cool. A periodical surging of the material of the ball of the sun is thus suggested, and this so widespread as to amount to a real bodily distortion rather than to a mere tide, but the cause of this disturbance we do not know.

**MIRABEAU**, Gabriel Honore Riquetti, gā-brē-ēl ō-nō-rā rē-kēt-tē mē-rā-bō, or mī'rā-bō, COMTE DE, French orator and Revolutionary leader: b. Bignon, near Nemours, 9 March 1749; d. Paris, 2 April 1791. In 1767 he entered the Berry cavalry regiment, was promoted 2d lieutenant, but on account of misconduct was later imprisoned on the island of Ré until March 1769. He then joined the expedition to Corsica, in 1771 was commissioned captain of dragoons and in 1773 was married. In 1774 he was imprisoned in the Castle of If, owing to debts and quarrels with his wife and father, and the next year was transferred to the Castle of Joux, near Pontarlier. Here he fell in love with the young wife of the Marquis de Monnier; trouble ensued and Mirabeau finally escaped to Switzerland, where he was joined by his mistress, Sophie, as he called her, and in October 1776 they settled in Amsterdam. In May 1777, however, they were arrested, brought to Paris and Mirabeau was imprisoned for three years and a half at Vincennes, being released in December 1780. After Mirabeau had forsaken her, Sophie committed suicide in 1789. Having secured the revocation of the death sentence imposed upon him for the seduction of Sophie, and being legally separated (1783) from his wife, he left France for a few months.

Upon Mirabeau's return he began his lifelong intimacy with Henrietta van Haren, known as Mme. de Nehra, whose influence was undoubtedly exerted to his great benefit. In August 1784 he was forced to flee to London to allow more trouble to blow over, and while there wrote the 'Considérations sur l'ordre de Cincinnatus.' About 1784 he began to devote himself to politics, visited London, was entrusted by Calonne with a secret mission to Prussia, and published various treaties, which made him sufficiently well known to the tiers

that to be elected by the town of Aix to be its representative in the States-General of 1789. Here he speedily eclipsed all the other orators of the Assembly, and became the centre round which gathered all the men of greatest mark and force of character in the third estate. He was the immediate cause of the French Revolution, by the resistance which he offered to the demand of the king after the royal sitting of 23 June 1789, that the third estate should vote separately from the other two orders. It was on this occasion that he gave the vigorous reply to the grand-master of ceremonies, who had communicated to the Assembly the royal will, concluding with the words, "Go and tell your master that we are here by the will of the people, and that no one shall drive us out except by the force of bayonets." Both before and after this occasion he delivered many eloquent speeches, which obtained for him the title of the "French Demosthenes." Among the most remarkable of these are his address to the king demanding the removal of the troops encamped at Versailles, speeches on the national bankruptcy, on the civil constitution of the clergy, on the royal sanction, on the right of peace and war, and his reply to the Abbé Maury on ecclesiastical property. After having shown himself a bold reformer, and the most dangerous adversary of the court, Mirabeau ended by offering his support to the throne; the court paid his debts and supplied him with funds, although he continued to make a show of opposition to royalty in order to uphold his popularity. This state of matters dates from May 1790. It appears to be true that in this change of position he acted from conviction, foreseeing the imminence of a great catastrophe, which he desired if possible to avert. Whatever may have been his motives, this conduct, when it became known, naturally raised up against him numerous enemies. But on 30 November he was elected president of the Jacobin Club, and on 29 Jan. 1791 of the National Assembly. His remains were buried with great pomp in Sainte-Geneviève Church (the Pantheon), but three years later they were exhumed to make room for those of Marat. Mirabeau's aim was to make France a constitutional monarchy after the English pattern. Statesmanship and oratorical powers were marvelously combined in him. Mme. de Staël said of him that his speech was "like a powerful hammer, wielded by a skilful artist, and fashioning men to his will." His speeches, however, were not his own altogether: a group of his friends united to supply him with the framings, and these he suffused and sublimated with his own genius.

**Bibliography.**—*Mémoires biographiques, littéraires et politiques de Mirabeau*, by his adopted son, Lucas de Montigny (1834-35); and *Correspondance entre le Comte de Mirabeau et le Comte de la Marck pendant les années 1789-91* (1851). **MIRABILITE.** A mineral consisting of hydrous sodium sulphate or glauber salt,  $\text{Na}_2\text{SO}_4 \cdot 10\text{H}_2\text{O}$ , occurring in the United States in Arizona, California, Oregon, Wyoming. Used to some extent for manufacture of soda.

**MIRACLE PLAYS.** The earliest dramatic representations of religious themes grew up within the Church itself. At certain seasons of the year, tableaux of gospel scenes were shown to the people, a practice which still survives in the representations of the Nativity in modern Catholic churches. The introduction of action and music into these tableaux is easy to understand, particularly in view of the dramatic elements in the celebration of the Mass, and in the ritual for special occasions, like the consecration of a church. Tropes or simple texts set to music were added to the regular service, and gave a further opportunity for dramatic scenes. In time these tropes grew more elaborate, passages in the vernacular were introduced and popular elements not taken from the Bible were added. Meanwhile, the little plays, which in the beginning had been given in the choir, were transferred to the nave, and set up against the pillars. So popular did these representations become, and so great was the concourse of spectators, that a move outside the building into the churchyard had to be made. Secular elements crept in very rapidly, and the plays were finally transferred to open spaces in the cities and towns. The liturgical drama reached its height in the 13th century; by the beginning of the 14th century it had largely passed out of the hands of the clergy, although representations continued to be given in many churches.

The growth of the miracle play in England is due to the influence of the Normans. There are almost no evidences of dramatic impulse in England before the Conquest. The earliest play of which there is mention by name is a 'Play of Saint Katherine,' at the beginning of the 12th century, produced under the direction of a Frenchman who afterward became abbot of Saint Albans. To the same century belongs the work of Hilarius, a pupil of Abelard, and perhaps of English birth. He wrote Latin plays on subjects taken from the Scriptures, and diversified them with refrains in Old French. It seems probable that French plays may have been acted in England at this time, but none are extant.

The term "miracle play" is properly applied to the religious plays which developed in England out of liturgical beginnings. They have sometimes been called "mysteries," but this term, which is more generally and rightly used of productions in France, does not antedate the 18th century in England, the mediæval name being *miraculum*, or *miracle*. A great impetus was given to the plays by the institution of Corpus Christi Day, with its elaborate processions and outdoor ceremonial, and many came to be presented at this season, when the conditions of weather were likely to be favorable. In time the procession served as a mere preliminary to the dramatic performances to follow. A desire for more elaborate stage effects and a greater

number of incidents within the plays was constantly increasing, until they developed out of the relatively simple early pieces long groups of plays of cyclic character, covering the principal events of the Scripture narrative, in both the Old and the New Testament. The series given at York in 1415 begins with the Creation, and ends with the glorification of Mary and Jesus in heaven, embracing 48 separate pieces in all. These cycles were often not all given on one day, but extended over two or more days, or they were divided, and presented in succeeding years.

After leaving the churches, the plays soon passed into the hands of the guilds, or associations of tradesmen. In the 13th century clerics were forbidden by papal edict to appear on the stage, but these prohibitions were frequently disregarded. The control of the plays by the guilds marks a period of great importance in the history of the English drama. Much care was devoted to the production and acting of the various pieces. The corporation of the city had general charge of the matter, deciding when the performances should be given, and dividing the various scenes among the several companies. An effort was made to have the play suit the character of the guild that gave it; the shipwrights showed the building of the Ark, the waterman the Flood, and so forth. The plays were given on movable stages called *pageants*, which consisted of "high scaffoldes with two rowmes," one beneath which was used as a dressing-room, and one above, open on all sides to give a better view, and occasionally provided with a canopy. These wagons moved from place to place, repeating the performance at different stations. The number of these stations varied with the size of the town; there were sometimes a dozen or more. The pageant wagons were gaily painted and decorated. They were generally rectangular, but special shapes were required for the Ark, or for Hell-Mouth, a huge painted head with open jaws belching fire and smoke. The scenery was of a rude sort. Palaces, temples and castles were sometimes represented by boxes or wickerwork covered with cloth. Occasionally the actors made use of the open space in front of the pageant; Herod's "raging" appears to have been partly done in the street. The costumes were often expensive, but frequently grotesque. Herod was attired like a Saracen, with red gloves. Pilate always wore a green cloak and wielded a huge club. God the Father was represented in person, and dressed all in white, with a gilt wig. The devils and the Evil One were made very realistic, and came to furnish a great deal of low comedy. Various accounts of sums paid for properties and costumes are still preserved.

Four cycles of miracle plays are still extant, the York, Chester, Coventry and Towneley or Woodkirk plays. The Towneley series, so called from the family who long owned the manuscript, much resembles the York cycle, and like it displays much vigor and humor. The Chester plays perhaps appeal most to modern taste. The religious passages are more reverent, the humor less coarse and the versification less harsh. The Coventry plays are full of didacticism, and this, with the introduction of personified abstractions, relates them more closely than the others to the Moralities. Fragments of other cycles

have also survived. The Vulgate and the Apocrypha are the chief sources of the texts. In places some tragic elevation is reached, marred, however, by repetition and moralizing. Melodramatic and ranting scenes were popular. The comic scenes are often very spirited, and clearly based upon observation of the life of the people. Anachronisms are common, and the supernatural is treated with great naïveté.

The miracle plays were at their best in the time of Chaucer. In the 15th century the Moralities arose to compete with them for favor, but never equaled them in dramatic achievement. The miracle plays continued to be given until the beginning of the 16th century, but in the reign of Elizabeth they had ceased to be a vital force. Their influence in preparing the way for the Elizabethan drama was very great, however. They introduced elementary types of comedy and tragedy, farce and melodrama, and accustomed the people as a whole to dramatic conventions. They made a national drama possible in the time of Shakespeare, and kept the theatre from being a mere amusement for the nobility, or a diversion for a small group of literary people.

WILLIAM WITHERLE LAWRENCE,  
*Professor of English, Columbia University.*

**MIRACLES**, works which excite wonder, because they are beyond ordinary human experience and appear to contravene the known laws of nature.

The well-known argument of Hume against the credibility of a miracle has often been refuted. A miracle, he said, was contrary to experience, but false witnesses in history are not contrary to experience; it is less probable that the miracle is true than that the witness is false. There are two fallacies in this reasoning; it begs the question by the use of the words contrary to experience, for the point at issue is

whether miracles are contrary to experience or no. If they are contrary to Hume's experience, may it not be because his experience is limited? He has not lived at an age when a new religion was instituted and extraordinary guarantees demanded in order to accredit it with a hostile world. Even mankind's experience in nature is becoming widened every year, and many wonderful things take place at this moment which our ancestors of a century ago would have looked upon as magical or miraculous, such as wireless telegraphy, communication by telephone, the effects of the Roentgen rays, the power of radium, etc. For miracles are not to be looked upon as a violation of the laws of nature, but merely as the interposition of a higher law overruling a lower one. To those who believe in an intelligent creator and conserver of the world there can be no difficulty in apprehending the possibility of the miraculous; even those who like Herbert Spencer have a vague belief in what they style Force or Power underlying all the operations of nature should not hesitate in admitting that the force which keeps up the multitudinous activities of the universe may manifest itself at times in unprecedented fashions, even as the new discoveries and combinations of science are constantly revealing new powers in the domain of natural law.

Pascal has said that the certainty and genuineness of certain miracles is proved by the falsity of others, meaning presumably that the very fact that general human consent has been given to the idea of miracles proves that such idea has a counterpart in reality. There are of course certain concomitant circumstances which may be taken as affecting the credibility of a miracle. Most of the miracles of history may be put aside as inventions; such are many of the stories told by Livy and Herodotus, and the wild fables of Hindu history, as well as many miraculous incidents in the life of Mohammed. Christian apologists lay particular emphasis on the moral aspects of the miracle. To those who deny or doubt the existence of a supreme being, the moral ruler of the universe, a miracle is an impossibility. On the other hand, without miracles the revelation of God is impossible. Hence, a miracle with a moral object is most in accordance with the character of a Supreme Being governing the world with a moral end. All idle or superfluous miracles are to be rejected as at variance with the character of such a being. Equally to be rejected are miracles which are merely tentative, that is, sometimes successfully accomplished, sometimes ending in failure; as well as others which are doubtful in their nature and those which are merely exaggerations of natural events.

In the early Church those who defended Christianity against the attacks of those outside laid great stress on the evidence of miracles, and claimed that miraculous power still existed among Christians. Irenæus asserted that this power was universal among Christian churches. Saint Augustine asserts the reality of the miraculous on the testimony of his own experience. He makes the acute remark that a miracle is not contrary to nature but to what we know of nature. The schoolmen did not agree with Augustine on this point. Thomas Aquinas defines a miracle as "something out of the order of nature." Albertus Magnus

declares that God has implanted the possibility of miracles in the very nature of things, although denying that he can do anything contrary to nature. Luther puts the miracle of grace in the heart far above any physical miracle, while he assigned the Bible miracles their proper place in the development of the faith. The Roman Catholic Church has always claimed the possession of miraculous powers and continues to do so to this day. The Socinians and Arminians maintain that God has always revealed himself by means of supernatural works, and Grotius in his defense of Christianity makes miracles the foundation of his argument. There has always, however, been a school of rationalists or philosophers who have opposed or attacked the belief in miracles, although Leibnitz admitted this belief into his philosophical system. He defines a miracle as an event inexplicable by natural causes. The laws of nature, he says, are not necessary and eternal; God can for his own purpose suspend them; the miraculous is included in the divine plan and forms a part of "the pre-established harmony." Spinoza made the statement that miracles are impossible. In his pantheistic philosophy nature and her laws are identical with the will, intelligence and nature of God, who cannot work contrary to the laws of material nature. Kant like the English Deists did not deny the possibility of miracles, for they might be wrought by powers and in accordance with laws of nature with which we are unacquainted, but believed that such laws were never exercised. Schleiermacher contests the apologetic value of miracles and endeavors to eliminate the miraculous from the Christian scheme, which he thinks is lowered by this supernatural element. The modern agnostic claims that the advance of science has made a belief in the miraculous impossible. Some have tried to explain the recorded miracles of Scripture by a reference to natural causes; others would treat them as allegories or legendary accretions or folktales, or attribute them to self-deception, or fraud, or the credulous exaggeration of bystanders and witnesses. Miracles are regarded by conservative theologians as an essential part of Christianity which cannot be explained away or eliminated without destroying its authority. The more advanced theologians claim the right to question the reality of miracles, even including the virgin birth of Christ and the resurrection, and they regard as the matter of supreme importance the fact that Christ spiritually still lives and is transfiguring the life of mankind. Certain it is that miracles no longer hold the place they once did as Christian evidences; conversion, the "expulsive power of a new affection" vivifying and transforming the soul, the divine response to prayer, communion with God and the supreme miracle of Christ himself as the spiritual regenerator of mankind—these have placed outward signs and evidences into a subordinate place.

**Bibliography.**—There is an inexhaustible list of works on the subject; but in addition to authorities named in the article consult Arnold, Matthew, 'Literature and Dogma' (new ed., London 1902); Balfour, A. **MIRAGE**, *mī-rāzh'*, the name given to certain illusory appearances due to the bending of rays of light in the atmosphere. The earliest attempt to explain the mirage seems to be that of Monge, who accompanied Bonaparte's Egyptian expedition; he thus describes what was observed by the French soldiers: "The villages seen in the distance appeared to be built upon an island in the midst of a lake. As the observer approached them the boundary of the apparent water retreated, and on nearing the village it disappeared, to recommence for the next village"; he attributed the phenomenon to the hot sand of the desert keeping the lower layers of the atmosphere at a less density than the upper ones; the rays of light from the lower parts of the sky and objects in the distance arrive at the surface separating the less dense layer of air from those above, and are there subjected to total reflection; the eye sees the sky in the direction of the received rays, and this gives rise to the idea of a lake.

It is often assumed that rays of light pass through the atmosphere in straight lines; this is approximately true for short distances, but astronomers and surveyors have to correct their observations for refraction. By the laws of optics it is easy to see why a ray passing obliquely through the atmosphere, when this is arranged in horizontal layers of equal density (those of greater density being lowest), should bend, and that a vertical ray should not bend; but optics does not tell us why a horizontal ray is much more refracted than an oblique one. The explanation (first given by Dr. James Thomson) is easy on the undulatory theory of light. The wave front of a horizontal ray of light is at right angles to the ray, and is a vertical plane; now light is less rapidly propagated in the lower layers of air, hence the lower part of the wave front is retarded, and when the light has proceeded some distance its wave front is no longer vertical, and the ray has bent downward (the ray is always supposed to be normal to the wave front). Thus, in the atmosphere in its normal state the path of a ray of light is always slightly concave downward. Professor Everett thus explains the appearance of "castles, obelisks and spires,"

cities with many buildings, forests of naked trees and great basaltic precipices sometimes assumed by irregularities in cakes and fields of ice. It sometimes happens that several inverted images of an object are seen in the same sky; these may be accounted for by assuming that there are several layers of air, in each of which there is a rapid variation (an increase upward) of the index of refraction. Mirages are not uncommon in California, Nevada and Alaska.

**MIRAMICHI**, *mīr'a-mī-shē'*, Canada, a river of New Brunswick formed by the junction of the northwest and southwest Miramichi, about 35 miles above its mouth in Miramichi Bay on the Gulf of Saint Lawrence. The northwest affluent rises in the highlands east of the Nepisiquit and is about 90 miles long, 16 miles of which are influenced by the tides. The southwest or main headstream flows from a lake near the Tobique, and fed by numerous rivulets draining a lake district becomes a considerable river 185 miles long to its confluence with the northwest branch. The Miramichi is navigable 40 miles from its mouth. Salmon, trout and other varieties of fish abound in the river and its tributaries.

**MIRAMON**, *Miguel, mē-gēl' mē-rā-mōn'*, Mexican soldier: b. City of Mexico, 29 Sept. 1832; d. Querétaro, 19 June 1867. He was educated in the military school of Chapultepec in 1846; was a volunteer in the war with the United States; became a colonel in the Mexican army; deserted with his regiment to take part in the revolt at Puebla in 1856; and for that was degraded when Puebla was taken by Comonfort. In October 1856 he headed another revolt at Puebla, in 1856-58 was conspicuous in the party of the reactionists and was chosen by the electoral junta to succeed Zuloaga as President 2 Jan. 1859 (entered office 2 February). He continued to take part in the "war of reform" in 1859-60, but was defeated at Calpulalpam, near Mexico, 22 Dec. 1860, by Ortega, and fled to the coast, sailed to Europe and probably was concerned in the plans of Napoleon III for an invasion of Mexico. Maximilian appointed him grand-marshal and Minister to Berlin. Later he was given a high command in the imperial army and conducted with Maximilian the defense of Querétaro. He was captured on the surrender of the city and shot with the emperor.

**MIRANDA**, *mē-rān'dā*, **Francisco Antonio Gabriel**, Venezuelan revolutionist: b. Caracas, 9 June 1756; d. Cadiz, Spain, 14 July 1816. In 1773-82 he was an officer in the Spanish army and then served with the French allies in the colonies in the Revolutionary War (1779, 1781). A general of division in the French republican army (1790-93), he was tried, but acquitted, on a charge of treachery at Neerwinden. He began a scheme for obtaining the independence of Spanish South America, founded the important society Gran Reunión Americana, which included many names later prominent in the South American revolution, and in 1806 made a futile attack on the Venezuelan coast. In 1810, on the breaking out of the revolution in Venezuela, he returned; in 1812 he was made President, but on 25 July capitulated to the royalists. He was sent to Spain and there remained a prisoner. Con-

sult Biggs, 'History of Don F. Miranda's Attempt to Effect a Revolution in South America' (1809); Baralt, 'Historia de Venezuela' (1841); Robertson, 'Francisco de Miranda and the Revolutionizing of Spanish America' (Washington 1909).

**MIRANDOLA**, mē-rān'dō-lā, Italy, town in the province of Emiliana, 17 miles northeast of Modena. It was the home of the Pico family, who held the town from the 14th century to 1710, when Joseph I of Austria took possession. The Pico castle is now in ruins. The cathedral, dating from the end of the 16th century, has been restored. The Palazzo del Comune is a Gothic building of the 15th century. The church of Gesu is also interesting. The chief industries are silk, rice and cattle-raising. Pop., commune 16,740.

**MIRBEAU**, mē'bō, Octave Henri Marie, French novelist and playwright: b. Trevières (Calvados), 16 Feb. 1850. He was educated in a Jesuit school at Vannes, studied law in Paris and became dramatic critic on the Bonapartist paper, *L'Ordre*. For a time he was *sous-préfet* and then *préfet* of Saint-Girons; but after 1877 he devoted himself to literature. His journalistic career was stormy and his attacks on established reputations involved him in several duels. He gradually developed extreme views. In 1890 he wrote for the *Revolte* and he was one of the first and most persistent defenders of Capt. Alfred Dreyfus. He was also one of the earliest supporters of the Impressionist painters. In 1887 he married the actress, Alice Regnault. Mirbeau first attracted attention as a fiction writer by his series of tales of the Norman peasantry, 'Lettres de ma chaudière' (1886), although he had previously published a novel, 'Jean Marcellin' (1884). He then published 'Le Calvaire' (1887); 'L'Abbé Jules' (1888); 'Sebastien Roch,' a bitter picture of the Jesuit school in which he had passed his youth (1890); 'Le Jardin des supplices,' a Chinese story (1899); 'Les Mémoires d'une femme de chambre' (1901); 'Les Vingt-et-un jours d'un neurasthénique' (1902); and 'Dans l'antichambre' (1905). In 1897 'Les mauvais bergers,' a five-act drama, was played at the Renaissance by Sarah Bernhardt; and he gained a great success with his next play, 'Les affaires sont les affaires' (1903), represented in New York under the title 'Business is Business' (1905). Some of his short plays appear in his book, 'Farces et Moralités' (1904). 'Le foyer' (1909) was suppressed by the censor. 'Dingo' was published in 1913.

**MIRFIELD**, England, town and district five miles northeast of Huddersfield, on the Calder, in the West Riding of Yorkshire. It is one of the chief railway centres in the country and has manufactures of woollen and cotton goods, carpets and blankets. In the vicinity are coal mines. The church of Saint Mary's was completed in 1874 from designs of Sir Gilbert Scott. The tower of the ancient church remains. Pop. 11,702.

**MIRIAM**, the sister of Moses and the eldest of the family, is first mentioned as being stationed by her mother to watch her brother's cradle among the sedges on the river's brink. Later she procured her mother as nurse for

the child when found by the princess. After crossing the Red Sea she is mentioned as "Miriam the Prophetess," and she takes the lead with Aaron in the complaint against Moses for his marriage with a Cushite. For this action she was stricken with leprosy, but later the curse was removed and she died toward the close of the wandering in the desert. She was buried in Cadesh.

**MIRKHOND**, mēr'kōnd, Haman Ed Din, Persian historian: b. 1433; d. 1498. He was the son of a pious and learned man of an old Bokhara Sayyid family, direct descendants of Mohammed. From an early age he devoted himself to history and literature; and in Herat, where he spent the greater part of his life, he gained the favor of a famous patron of letters named Mir Alishir. About 1474, in the quiet convent of Khilasiyah, which his patron had founded in Herat, he began his great work on universal history, the 'Rauzat-us-safa' (Garden of Purity), a collection of biographies of prophets, kings and caliphs from mythical times to 1523. Although written in a flowery and bombastic style and with no attempt at critical examination, the 'Rauzat' is ranked as one of the most remarkable of literary achievements. It is composed of seven large volumes and a geographical appendix. As the seventh volume contains accounts of events after Mirkhond's death, it is supposed to be the work of his grandson, the historian Khwandamir (1475-1534), who probably finished the appendix. The entire 'Rauzat' has been lithographed in folio (Bombay 1853 and Teheran 1852-56), and with Turkish translation (Constantinople 1842). The 'Rauzat' has been translated by various hands: 'The Early Kings of Persia' by D. Shea (London 1832); the Sassanids into French by S. de Sacy, 'L'histoire de la dynastie des Sassanides' (Paris 1793) and also by faubert (Paris 1843); 'Histoire des Samanides,' by Defrémery (Paris 1845); 'Histoire des Sultans Ghurides,' by Defrémery (Paris 1844); Seljuks into German by Vullers (Giessen 1837); and the story of Mohammed by Kehatsek, into English (5 vols., London 1891-94), the latter was rendered from English into French by Lamaisse (Paris 1894). For the life of Mirkhond, consult De Sacy, 'Notice sur Mirkhond' in his 'Mémoires sur diverses antiquités de la Perse' (Paris 1793); Jourdain, 'Notices et extraits' (Vol. IX, Paris 1812); and Elliot, 'History of India,' Vol. IV.

**MIRROR**, a smooth surface usually of glass, capable of regularly reflecting rays of light. A mirror may be (1) a polished surface of glass; (2) a surface of tin-foil on the further side of a sheet of glass (as in the common looking-glass); (3) the surface of a deposited film of silver or platinum on a polished glass surface, so that rays of light to and from the metallic reflecting surface do not pass through the glass; (4) a polished surface of silver, gold, platinum or speculum metal (a bronze composed of about 32 parts of copper to 15 of tin, small quantities of lead, antimony and arsenic being sometimes added).

The use of a reflecting surface would become apparent to the first person who saw his own image reflected from water; and for primitive man the only mirrors were probably his

own reflection in the still water of ponds and lakes. The use of mirrors of brass by the Hebrews is mentioned in the Pentateuch; and bronze mirrors were used by the Egyptians, Greeks and Romans. The use of silver in the manufacture of mirrors was taught by Praxiteles in the 4th century before Christ. Looking glasses were first made in Venice in A.D. 1300, and in 1673 were introduced into England. They were a great improvement on the more ancient speculum metal mirrors, whose reflecting surfaces were liable to oxidation from exposure to the air, but they have the disadvantage that there are two reflecting surfaces, one of glass, the other of metal. Polished metals reflect nearly all rays of light at all incidences; glass reflects very few rays at the normal incidence, but the amount of reflection becomes greater and greater as the incidence becomes more and more oblique. Mirrors are usually either "plane" or "spherical." Spherical mirrors are small portions of the surface of a sphere. In a spherical mirror, concave or convex, the line through the centre of the spherical surface of which the mirror is a part and the middle point of the mirror is called "the axis." From a concave mirror rays parallel to the axis converge after reflection to a point called the "principal focus," which is half-way between the centre of the sphere and the mirror. (See LIGHT.) Rays from a luminous object outside the spherical centre of a concave mirror form a small, real, inverted image of the object between the centre and the principal focus; when the object is between the centre and the principal focus the image is beyond the centre, and is large, real and inverted.

Prior to 1835 mirrors were almost universally made by applying a coat of tin-foil amalgamated with mercury to the surface of plate-glass. In 1835 Baron Liebig observed that on heating aldehyde with an ammoniacal solution of nitrate of silver in a glass vessel, a brilliant deposit of metallic silver was formed on the surface of the glass. To this observation the more recent process of silvering glass is really due. In 1849 Drayton made known a method in which he employed as a backing composition two ounces of nitrate of silver, one ounce of ammonia, three ounces of alcohol and three ounces of water. The defects of these two modern processes are that the deposit of silver on glass is not so adherent and unalterable under the influence of sunlight and sulphurous fumes as the old amalgam of tin and mercury; besides, the newer processes give the glass a slightly yellowish tinge. These disadvantages have been obviated by applying to the silver coating a weak solution of cyanide of mercury, which immediately forms a kind of amalgam and renders the deposit at once much whiter and more adherent. The silvering is protected from mechanical abrasion and the chemical action of gases and vapors by a coating of shellac or copal varnish, which when dry may receive a further covering of red-lead paint. A method of coating glass with platinum has been recently introduced. A solution of bichloride of platinum is spread over the surface of the glass with a fine brush, and the metal is precipitated with oil of lavender. As this summary process produces a somewhat gray lustre it is used only for cheap mirrors, the lids of ornamental boxes, toys and the like.

**MIRROR CARP.** See **CARP.**

**MIRROR OF KNIGHTHOOD, The,** Spanish romance of chivalry. It was one of the books in Don Quixote's library and of it the priest said to the barber: "In this same 'Mirror of Knighthood' we met with Rinaldo de Montalban and his companions, with the Twelve Peers of France and Turpin the historian. These gentlemen we will condemn only to perpetual exile, as they contain something of the famous Bojardo's invention, whence the Christian poet Ariosto borrowed the groundwork of his ingenious compositions; to whom I should pay little regard if he had not written in his own language (Italian)." 'The Mirror of Knighthood' is identified with the 'Cavallero del Febo' (Knight of the Sun), a romance belonging to the Amadis de Gaul Cycle. It seems to have been the work of several hands and was unfinished. An English translation was printed in 1578.

**MIRROR FOR MAGISTRATES, The.** This once popular work, the first part of which was published in 1555, and the last in 1620, was the result of the labors of at least 16 persons, the youngest of whom was not born when the oldest died. It probably owed its inception to George Ferrers, master of the king's revels at the close of the reign of Henry VIII; and he associated with himself William Baldwin. Richard Niccols is responsible for the book in its final state; and in the interim, it was contributed to by Thomas Newton, John Higgins, Thomas Blennerhasset, Thomas Chaloner, Thomas Sackville (who wrote the poetical preface called the Induction and the life of Buckingham), Master Cavyll, Thomas Phaer, John Skelton, John Dolman, Francis Segar, Francis Wingley, Thomas Churchyard and Michael Drayton. It is a "true Chronicle Historie of the untimely falles of such unfortunate princes and men of note, as have happened since the first entrance of Brute into this Iland, until this our latter age." It was patterned after Lydgate's 'Fall of Princes,' a version of Boccaccio's poems on the calamities of illustrious men, which had been very popular in England. The stories are told in rhyme, each author taking upon himself the character of the "miserable person" represented, and speaking in the first person. The first one told by Ferrers is that of Robert Tresilian, chief justice of England.

**MIRROR OF PERFECTION, The,** is a most intimate and exceedingly illuminating account of the son of Peter Bernardone, cloth merchant of Assisi. Christened John he was nicknamed by his father "Francisco" and is known to the world by no other name than that of Saint Francis of Assisi.

The volume, small enough to be attractive—there are only about 50,000 words to it—was written by Leo of Assisi who is often spoken of as the "beloved disciple" of Saint Francis. "Brother Leo, was not merely a fellow-townsmen, 'companion,' disciple, and dear friend of Francis of Assisi. He was also his sick-nurse, secretary and confessor during the last six years of his life. None knew Francis so intimately, or remembered him so well. None could be more scrupulously conscientious in recording what he believed to be the exact truth about the not yet canonized Saint." The character and fashion of the record tempts one

to speak of him as Saint Francis's Boswell. It is the "oldest life of the Beloved Francis," being "done," so a note at the end of the volume informs us, "in the most holy place of S. Mary of the Little Portion, and completed this fifth of the Ides of May in the year of Our Lord 1228." Saint Francis died 3 Oct. 1226.

The significance of the title is disclosed in these words of the author: "Here endeth the Mirror of Perfection of a brother Minor; to wit, of the Blessed Francis, wherein we may most sufficiently behold as in a glass the perfection of his calling and profession." Without a doubt a less scrupulous writer would have said also the perfection of the life of the Blessed Francis. He refrained from saying this most likely because he knew that Saint Francis would most flatly resent being spoken of as perfect.

The style in which the book is written is singularly in keeping with the spirit and character of the subject, and of the type of life he represented — simple, direct, homely, shorn of all scholarly vanities and conceits as the life of the subject was shorn of all worldly comforts. There is an indescribable charm and power of revelation to this narrative that is simple and homely even almost to the point of bluntness. Narrative is hardly the correct word. Perhaps it is better described as "a chaplet of immortelles set upon the head of the Saint on the morrow of his death to typify the crown of glory achieved by this beatified Spirit."

It is hardly a disinterested picture or biography. Some of it has been written with a distinct purpose, the intent being to show not merely what kind of a man Saint Francis was and the kind of life he lived but what principles and "Rules" he laid down as the foundation of the famous Order which takes its name from him, and it is plainly also the purpose to show what obedience to these principles is the true path of the perfect Christian. Sometimes Brother Leo becomes controversial, taking vigorous issue with those, and they were many, who "desired to ignore certain of the wishes and to modify certain of the injunctions of Francis in what they believed to be the interests of the Order." All this however does not lessen the value of the book as a carefully drawn and wholly reliable picture of the founder of the order of Franciscans. By his scheme of minutely, yet briefly, telling what Saint Francis did on those occasions when it seemed best that by example he should make clear to those concerned what doctrines he believed should govern their conduct, and of repeating what reply was made to those who came to Saint Francis seeking information or to question his ideals, the author gives the reader a very impressive picture of this noted religious character. With the devotion of one who is wholly of the same mind and spirit as the subject of his writing Brother Leo with painstaking accuracy repeats in "what wise the Blessed Francis declared the will and intention which he had from the beginning to the end as regards the observance of poverty" and of "maintaining poverty in books, and beds, buildings and appliances," and "how he did induce and teach his brethren to go forth for alms," thus disclosing what manner of man he was. He recounts instances showing with what unswerving zeal Saint Francis carried out to the

very limit of perfect example his ideals of absolute poverty in all things, of humility, charity, compassion and condescension. There may be much more to the life of the Blessed Francis than is here given, but the author has without doubt in these pages pictured Francis in the fashion in which he most desired to appear before his fellow-men. It is a book one must read if he would know the real Saint Francis and appreciate the ideas and ideals which moved him to fashion his life after the manner of the rules he made for the order that grew up about him.

Rev. CHARLES GRAVES.

**MIRYACHIT**, mēr-yā'chit, a peculiar nervous disease prevalent in Siberia and some other countries, the chief characteristic of which is mimicry by the patient of everything said or done by another person.

**MIRZA**, mēr'zā, Persian title, equivalent to "Prince."

**MIRZA**, Husain Ali Nuri, Persian religious reformer: b. Mazadran, Persia, 12 Nov. 1817; d. Akka, 28 May 1892. He was of noble family, joined the Bahai movement in 1850 and was imprisoned during the fierce political and religious persecutions which the sect suffered shortly after the death of Mirza Ali Mohammed. (See BAHAIISM). His property was confiscated and he himself, with his family, was banished from Persia to Bagdad (Turkey) in 1852. Many Bahais followed him, most of them fleeing from the fierce persecution at home. Mirza Ali organized these into a compact, well-governed and self-sustaining community which soon became wonderfully prosperous, growing steadily in wealth and numbers. He was early looked upon as the great leader foretold by the founder of the faith; and new adherents came from all over Asia to study under him or to join the colony in Bagdad. This prosperity of the colony and the popularity of Mirza Ali, the "Bab" (gate or door), excited the jealousy of the Persian government and church, and the prophet and the whole colony were extradited and brought back to Constantinople. During the exodus, Mirza Ali proclaimed himself the expected prophet and took the name of "Baha'o'llah" (the Glory of God), by which designation he has ever since been known among his followers (1864). As the Bahai movement continued to grow with great rapidity in Constantinople, Mirza Ali was banished to Adrianople. Thousands of the faithful followed him there and he was removed to Akka (Palestine), a Turkish penal settlement, with 70 of his most active disciples (1868). They were all subject to the most rigorous imprisonment and treated with great harshness for seven years. At the expiration of this time the Bahais were allowed to form settlements in the town of Akka. To these settlements came people of all sects and creeds, and the penal colony became the centre of an intense religious movement which proclaimed the brotherhood of man, the unity of the race and the identity of all true spiritual aims and thought. There Mirza Ali remained from 1868 to 1892, writing his doctrinal books, working out plans for the government of the society and studying moral, social, political and economical questions and applying the lessons thus learned to the illustration of the gospel of

the unity of mankind, of religion, of society and of government. He boldly attacked the problems of the day and attempted to solve them through the application of his own religious views. Among the works of Mirza Ali are 'The Hidden Words'; 'The Most Holy Book'; 'The Book of Certainty' and 'The Seven Valleys.' See **BAHAISM**; **ABDUL BAHÁ**.

**MIRZAPUR**, mēr-zā-poor', India, a city and district of the Benares division of the United Provinces. Mirzapur, signifying the Prince's Town, the capital of the district, is on the right bank of the Ganges, 56 miles by rail southeast of Allahabad and 509 from Calcutta. It presents an imposing appearance from the river, with fine ghats leading down to it, and numerous mosques, temples and handsome European houses occupying some of the most conspicuous sites, but the interior is disappointing. It has the largest mart in Upper India for grain, cotton and other raw produce, but with the railway era and the rise of Cawnpore to commercial importance, much of its trade has migrated elsewhere. Shellac, brassware and carpets are manufactured. There are imports of grain, sugar, cloth, metals, fruit, spices, tobacco, lac, salt and cotton; and exports of the same articles with manufactured lac-dye, shellac and ghee butter. Pop. 32,232. The district has an area of 5,238 square miles, and a population of about 1,100,000, chiefly Hindus. The chief products are wheat, barley, cotton, oil-seeds and fruits.

**MISAMIS**, mē-sā'mis, Philippines, a province of the island of Mindanao, situated on the north central coast, bounded on the east by Surigao; area, 3,406 square miles, with dependent islands, 3,521 square miles. The province is crossed by two mountain ranges, one on the east side with three summits of over 5,000 feet elevation, and the other on the west side with a peak that rises 8,560 feet. It has a number of rivers, and is crossed by the Grande de Mindanao, or Pulangui, which rises in the northeast; Lake Lanao also extends over the southern boundary within its limits. The staple agricultural products are hemp, chocolate, coffee, cotton, sugar, rice, tobacco, corn and sweet potatoes; the forests contain woods valuable for building as well as resinous trees. The chief industry is the manufacture of fabrics used for dress for home consumption and sacks for packing purposes. There are no good roads of any importance; the inland towns and villages are reached by river or trail, and the trade between coast towns is by native craft. The population is mostly Visayan, with some Moros in the western part. Pop. 175,683.

**MISANTHROPE**, *Le*, lē mē'zān'trōp', a comedy of Molière in five acts in verse, presented for the first time in the Theatre of the Palais-Royal, 4 June 1666, when the author was 44 years old. Molière played the title-rôle and his wife the part of Célimène. This play, which is Molière's nearest approach to tragedy, concerns one Alceste, who rails at the insincerity of mankind and yet is in love with a coquette, Célimène—a stroke which art is incapable of without genius. Alceste excites at once our admiration, pity and laughter. An upright and sincere man even to an unreasonable degree, he is made miserable by a letter of Célimène which seems to justify his righteous indignation. Notwithstanding that these

fears seem to be well founded, Alceste remains in love with Célimène, but wishes her to withdraw with him from human society—which she of course refuses to do. The splendid emptiness of the life in a Parisian salon of the 17th century is placed vividly before us. There is no place for a natural and honest character in such society. Everything is artificial, deceptive and shallow. Molière's own experience had been so painful that the accent of truth pervades his treatment of the character which so nearly resembled his own. His life, saddened by hostile criticism, ill-health and an unhappy marriage, had become embittered, and some have attempted to prove therefrom that Molière himself is the real Alceste. It is true that he revealed more of his real self in this play than in any of his other plays, but he was too much of an artist to depict merely his own character. His unhappy domestic life probably did influence him to some extent, but the germ of the play is to be found in his earlier but unsuccessful play, 'Dom Garcie de Navarre' (4 Feb. 1661), from which he borrowed freely both scenes and verses. The Duke de Montausier, the character of Mégabate in Mlle. de Scudéri's 'Le Grand Cyrus' and Boileau may also have been, as has been claimed, in Molière's mind in his delineation of Alceste. As a foil for the rigorous Alceste, the author presents us with the indulgent Philinte, who bears with men's faults from the necessity of living among them. So likewise with the coquette is contrasted the virtuous Éliante. The prude Arsinoé, and the marquis, typical of the large class of nobility whom Molière suspected of using their influence at court against him, constitute the other principal characters. Sheridan has imitated a scene of 'Le Misanthrope' in his 'School for Scandal' and Wycherly has imitated the entire play in his 'Plain Dealer,' but in a comparison between the imitation and the original the difference is seen between genius and brutality. The idea behind 'Le Misanthrope' may perhaps be best rendered in the words of Philinte: "All these human defects give us opportunity in life of exercising our philosophy. 'Tis the most amiable employment virtue finds; and if every place were full of honesty and all hearts were frank, just and docile, the greatest part of our virtues would be useless to us, since the use of them is placed in this, in the power of bearing the injustice of another in respect to our property, without being ruffled." From this it is evident that Molière in his characterization does not discredit virtue, as such critics as Rousseau and Fénelon claimed, but merely the austerity of virtue not tolerant enough of human weakness. The public of the time was not prepared for such a fine distinction and did not appreciate the humor which reigns throughout. Consequently, in spite of its purity and elegance of style, the play was coldly received. It is said that at the first presentation, after the reading of Oronte's sonnet, the pit applauded, but Alceste afterward in the same scene contended that the sonnet was mere trash, whereupon the audience, through embarrassment at having approved it, became prejudiced against the entire play. Subsequently, it has become to be almost universally acknowledged as the most perfect piece of French comedy and the masterpiece of

Molière. There is an extremely clever translation of 'Le Misanthrope,' with the French text *en regard*, in the fourth volume of the works of Molière published by John Watts (London 1748).

HERBERT F. WRIGHT.

**MISCARRIAGE**, literally a failure, a going astray. I. A miscarriage of justice is a failure of the law to attain its ends; or a breach of legal duty. Such is the significance of the term as employed in the fourth section of the English Statute of Frauds and in similar statutory provisions in the United States. II. Miscarriage in medical jurisprudence is employed in the sense of abortion (q.v.).

**MISCEGENATION**, from the Latin *miscere*, to mix, and *genus*, race, a mixture of races. The word is usually applied to the amalgamation of the white and negro races in America, and came into general use toward the middle of the 19th century, when certain publicists advocated absorption of the blacks by intermarriage with the white race. Consult Davenport, C. B., 'Hereditary of Skin Color in Negro-White Crosses' (Washington 1913). See MIXED RACES.

**MISCHIANZA**, *mîs-kę-ăn'tsą*, The, in American history, an entertainment given in Philadelphia, 18 May 1778, during the war of the Revolution, by officers of the British army, in honor of Sir William Howe, about to return to England after his supersession. The entertainment was given at the country home of Thomas Wharton and comprised a dinner, dancing, a regatta, mock tournaments and various games. Major André was prominent in planning the entertainment. Consult Sargeant's 'Life of Major André' (New York 1902).

**MISDEMEANOR**, *in law*, any offense below felony; the least offense by English common law: In the United States, the different States vary widely in defining misdemeanor, so that what is misdemeanor in one State may be indictable felony in another. Among the offenses commonly classed under this heading are malicious mischief, assault and battery, etc.; criminal proceeding on such charges may be dropped, in many States, if the injured party acknowledge satisfaction, which suggests a distinction between felony. The historic line between the two classes of offenses was based on the outcome of conviction; in the case of felony the convicted person forfeited his property, real and personal, if the felony was capital, personal only if the felony was not capital. But no forfeiture of property ensued upon conviction for misdemeanor.

**MISE OF AMIENS**, *męz*, ov *q'mę'ăn'*, (*mise*, Anglo-French term meaning judgment, from the French *mettre*, to place), is the name given to the decision of Louis IX of France in the controversy between Henry III of England and his barons (23 Jan. 1264). Henry went in person to Amiens to attend the arbitration; but an accident prevented Simon de Montfort from doing the same. Louis had his idea of the dignity of royalty and was too scrupulous not to credit another king with a desire of doing his duty. He, therefore, decided all points in favor of Henry and annulled the Provisions of Oxford and all engagements founded

upon them, leaving Henry a free hand to appoint his ministers and to enjoy his royal power as fully as he had done before the enactment of the Provisions of Oxford. See MONTFORT, SIMON DE; HENRY III; BARONS' WAR.

**MISE OF LEWES**, *lū's*, a treaty made by Henry III after the battle of Lewes (14 May 1264), where he was defeated and captured by the Barons under Simon de Montfort. The Mise of Lewes contained seven articles. By the first and second, after a reconfirmation of the Provisions, a new body of arbitrators was named—the archbishop of Rouen, the bishop of London, Peter, the chamberlain of France, and the new legate the cardinal-bishop of Sabina, with the Duke of Burgundy or Count of Anjou as umpire when necessary; the third directs that the arbitrators shall swear to choose only English counsellors; by the fourth the king is bound to act on the advice of his counsellor in administering justice and choosing ministers, to observe the charters and to live at moderate expense; by the fifth Edward and his cousin Henry are given as hostages; by the sixth is provided the indemnity of the earls of Leicester and Gloucester, and the seventh fixes the next Easter as the time for the completion of the compromise. Peace was declared on 25 May and published at London on the 11th of June. See HENRY III; MONTFORT, SIMON DE; BARONS' WAR.

**MISENO**, *mę-să'nő*, Cape, Italy, a promontory forming the west side of the Bay of Pozzuoli (ancient Cumæ), 10 miles southwest of Naples. On it are the ruins of the ancient city of Misenum, destroyed by the Saracens, 890 A.D., which Augustus made one of the principal naval stations of the Romans.

**MISÉRABLES**, *Les, lâ mę'zã'rã'bl*, by Victor Hugo, is by universal consent one of the great novels of the world. Heralded since 1854 as designed to be a sort of social gospel, written almost wholly in exile by one whose political intransigence had attracted general regard, the work, extending to 10 volumes, appeared simultaneously in as many languages (3 April to 30 June 1862) and has since been in constant and wide circulation in many lands. It was Hugo's first novel since 'Notre-Dame,' 31 years before. That had been an evocation of the past. Here his eyes were on the present, his heart in the future. To profound compassion for the sufferings of the unfortunate he joined a sturdy faith in the possibilities of moral regeneration and social reform through a realizing sense of human brotherhood. "So long," he says, in a preface, "as there shall exist, through the fault of our laws and customs, a social condemnation that creates artificial hells in the midst of our civilization and complicates a divine destiny by human fatalism; so long as the three problems of the century,—the degradation of man by the proletariat, the fall of woman by hunger, the arrested development of the child by ignorance,—are not solved; so long as social asphyxia is possible in any place—in other words and in a wider aspect, so long as there shall be on earth ignorance and misery, books like this cannot be useless." The first of the three problems is here impersonated in Jean Valjean,

the second in Fantine, the third in her unfathered daughter, Cosette.

In structure 'Les Misérables' is loose-jointed, discursive, straying too readily into by-paths of antiquarian lore, political reminiscence, philological speculation, scientific conjecture, sociological visions. Hugo is apt to proclaim some commonplace with oratorical emphasis, as though it were a revelation of social salvation. He is apt to overcharge his characters till they become hardly human embodiments of some abstract quality, it may be mercy and forgiveness as in Bishop Myriel, untempered social justice as in Javert, political intransigence as in Enjolras, unmitigated cunning and cruel greed as in Thérnadier. But through all there is a sincere and intense if vague emotion, a deep pulsing sympathy, a splendid indignation at the ignoble and base degradations of outworn institutions and conventions, an unfailing force of moral conviction, a glowing eloquence, that make it easy to pass by, if not to forget, the occasional cyclopean lack of humor and the passages of puerile insipidity that are in strange contrast to others of impassioned and beautiful lyric appeal.

Hugo is a social optimist, often grand, never petty, though sometimes grandiose. Its foibles apart, 'Les Misérables' is a noble plea for more practical recognition of the brotherhood of man, for more charity in judging the tempted, the wretched and the fallen. Jean Valjean, whose struggle for social reintegration is the connecting thread of the 10 volumes, is a discharged convict contending against social and legal proscriptions that must have driven him back to the galleys whence he came, had not Bishop Myriel redeemed him with the gift of the silver which he had stolen. He makes himself respected and beloved. But a petty theft remains unexpiated, and rather than see another suffer on account of it he surrenders himself again to prison. But first he lightens the last hours of Fantine, once a symbol of joy, "innocence floating on error," now the dying mother of Cosette, whom she has in desperation consigned to the mercies of Thérnadier and now commits to the heart of Valjean. Here ends "Fantine," the first of the novel's five parts, to be remembered especially for Bishop Myriel, said to be essentially Monsignor de Miollis, a former bishop of Digne. The second part, "Cosette," opens with a justly famed picture of Waterloo, whence the scoundrel camp-follower Thérnadier, a plunderer of corpses, had saved for his own base ends Colonel Pontmercy, father of Marius, the romantically predestined husband of Cosette, and apparently reminiscent of Hugo's own. Then it tells of Valjean's life in the galleys and of his escape, how he was pursued by justice incarnate in Javert, how he rescued Cosette from Thérnadier and himself found refuge as a convent gardener, with reminiscences of Hugo's own childhood at Les Feuillantines. "Marius," the third part, is concerned mainly with the restless political agitation among those dissatisfied with the results of the Revolution of 1830. Marius is what Hugo thought he himself might have been. The charm of this part is in the very genial account of the Parisian *gamin*, Gavroche. Part 4, "Saint Denis," has a brilliant account of the great

barricade and riot of 5 June 1832, with the touching death of Gavroche and the first bud-dings of the love of Marius and Cosette. "Jean Valjean," the fifth part, is especially notable for its account of the rescue of the wounded Marius by Valjean and their passage through the sewers, of the despairing suicide of the baffled Javert, of Thérnadier's unintentional enlightenment of Marius as to his real debt to Valjean and for the very beautiful picture of the redeemed convict's august end.

'Les Misérables' has been abridged by O. B. Super (Boston 1903), and well translated by C. E. Wilbourn ('Everyman's Library,' 1909) and others. Consult Biré, 'V. Hugo après 1852' (Vol. I, pp. 126-153), and, for summarized contemporary criticism, Bersaucourt, 'Les Pamphlets contre V. Hugo' (pp. 227-279, 1912).

**MISERERE**, miz-ε-rē-rē (Latin, "have mercy"), the name (taken from its first word) by which the 50th psalm in the Vulgate (or Latin version) is known, corresponding to the 51st of the authorized version. It is the fourth of the seven Penitential Psalms. The *Miserere* forms part of certain liturgies, and various great composers have taken it as a subject. The *Miserere* of Allegri is particularly famous.

The name *Miserere* is also given to a projection on the underside of the seats of the stalls of mediæval churches and chapels. They are usually ornamented with carved work, and are so shaped that when the seats proper are folded up they afford a small seat at a higher level sufficient to afford some support to a person resting upon it, and were thus used by priests suffering from bodily infirmity.

**MISERICORDIA**, or **MISERICORDE**, a narrow-bladed Italian dagger used in giving the *coup de grâce* or finishing stroke to a wounded foe. Also the name of a society in Florence, founded in the 13th century, who tend the poor sick, carry victims of accidents or disease to the hospitals and the dead to their burial.

**MISFEASANCE**, mis'fē-zānc', from the French *méfaire*, to do wrong, signifies the doing of a lawful act in a negligent, or improper, manner. Misfeasance is, in some cases, punishable by law. It should be contrasted with malfeasance, the doing of a wrongful act, and non-feasance, the failure to perform a promised act.

**MISHAWAKA**, mish'ā-wā'ka, Ind., city in Saint Joseph County, four miles east of South Bend, on the Saint Joseph River and on the Grand Trunk and the Lake Shore and Michigan Southern railroads. It takes its name from an Indian village formerly on this site, was settled in 1828 and was chartered as a city in 1899. Saint Joseph Iron Works, laid out on the south side of the river in 1835, was made a village in 1839; Indiana City was laid out on the north side in 1836; and these two towns were combined and incorporated as the town of Mishawaka, in 1839. Two miles up the river is the Hen Island dam which, with the Mishawaka dam nearer the city, supply Mishawaka with water power for many factories. The products include automobiles, wagons, plows, farm implements, machine-shop and foundry products, pipe organs, rubber boots and shoes, furniture, beer, pulleys, ladders, cement blocks, iron beds, aluminum castings, curtain stretchers, pearl

battons, felt shoes and slippers, cigars and leather goods. The city owns three fine parks, a public library, high school, hospital and orphans' home and an electric-light plant. Three bridges cross the Saint Joseph River at this point. In the surrounding country corn, wheat, oats, rye and peppermint are produced. Pop. 14,500.

**MISHNA**, *mish'na*, the first part or text of the Talmud, the second part or *Gamara* (supplement) consisting of a commentary on or elucidation of the Mishna, which consists of oral traditions and glosses on the Pentateuch, made in Galilee by the Rabbi Jehudah or Judah Hakkodesh, who completed the work 220 A.D. A commentary was rendered necessary by the extreme terseness and conciseness of style with which the Mishna is composed. It is written in Hebrew, but it contains a number of Greek, Latin and Aramaic words, which had become naturalized in the Hebrew, and bears traces also of Aramaic idiom. The traditions set down in the Mishna were held by the Pharisees to be of equal authority with the written law of Moses, and were supposed to constitute an oral law delivered to Moses by God and by Moses delivered to Joshua, by Joshua to the elders, by the elders to the prophets and by the prophets to the men of the Great Synagogue. Such is the statement of the Mishna itself, which the Pharisees accepted. The Sadducees, however, rejected this doctrine, although in many cases they followed in practice "the traditions of the elders" with much fidelity. See JEWS AND JUDAISM—*The Talmud*.

**MISIONES**, *mê-sê-ô'nês*, Argentine Republic, a territory bounded on the north, east and south by Brazil, on the east by the rivers San Antonio and Pepiri or Pepiri-Gauzu, separating it from Brazil, and on the west by the province of Corrientes and Paraguay. Area, 11,511 square miles. Three low mountain chains radiate from the centre, and the greater portion of the surface is covered with forest, producing building and dye-woods, oranges, medicinal herbs and the *yerba maté* or Paraguay tea. The country is well watered and fertile, and there are valuable granite quarries. The Iguazu Falls, 196 to 200 feet in height, are more than twice as broad as Niagara. Maize is largely grown and sugarcane to some extent, and several sugar-mills are in operation. There are interesting and other ecclesiastical remains of the early Jesuit missions. Posadas, the capital, on the Parana, was founded in 1865. The territory had a population of about 53,563. A railway is projected to run through the centre of the territory.

**MISKOA** (from Greek, meaning hair-foot), an order of the *Chaetopoda*, fossil marine worms (*Annelida*), discovered by Walcott in the Middle Cambrian rocks of British Columbia at Misko Pass, whence their name.

**MISKOLCZ**, *mish'kôlts*, Hungary, capital of the comitat of Borsod, 24 miles northeast of Erlau. The inhabitants are chiefly employed in the cultivation of cereals and the vine, and there is an important trade in wine, corn, leather, stone, etc. Among the churches is a Gothic one of the 13th century, and it has also a fine hospital, several gymnasias and other edu-

cational institutions and a theatre. Pop. about 51,459.

**MISNOMER** (from the French *ménomer*, misnaming), an error in naming a person in a pleading, deed or other written instrument. See PLEA AND PLEADING.

**MISPICKEL**. See ARSENOPYRITE.

**MISPRISION**, (1) the concealment of a crime, as felony or treason; called also *negative misprision*. (2) High misdemeanor or contempt, as maladministration by a public official or inducing a witness to refuse to testify; called also *positive misprision*. Misprision of felony is still punishable in the English law, but is practically obsolete elsewhere. Misprision of treason was formerly punished in England by forfeiture of goods and imprisonment for life, but to-day the maximum penalty is penal servitude for life. In the United States it is a Federal offense, punishable by imprisonment not to exceed seven years and a fine not to exceed \$1,000.

**MISREPRESENTATION**, *in law*, any act, whether verbal or tacit, tending to create or creating a false impression on another, such that by acting upon this impression he is injured. Misrepresentation falls under two heads, deliberate and unwitting. Deliberate misrepresentation is either deceit or fraud. Unwitting misrepresentation is legal mistake, and its treatment by the law depends largely on circumstances, but is unfortunately too much influenced by the principle that "ignorance does not excuse," which should strictly be confined to the application suggested by its original form, "ignorance of the law."

**MISRULE**, Lord of, a whimsical title given to the leader of the Christmas revels in the Middle Ages. He is a descendant of the king of the ancient Roman Saturnalia who impersonated Saturn. His duties were to lead the multifarious revels of the season; or, in other words, to act as master of ceremonies. Stow in his 'Survey' gives the following account of him: "In the feast of Christmas there was in the kings' house, wheresoever he lodged a Lord of Misrule or Master of Merry Disports, and the like had ye in the house of every nobleman of honor or good worship. The mayor of London and the sheriffs had their several Lords of Misrule ever contending without quarrel or offence, who should make the rarest pastime to delight the beholders. These lords beginning their rule at Allhallows Eve continued the same till the morrow after Candlemas Day, in which space there were fine and subtle disguisings, masks and mummeries, with playing at cards for counters in every house, more for pastimes than for gain."

In the University of Cambridge the functions of the Lord of Misrule were performed by one of the masters of arts who was regularly elected to superintend the annual reproduction of Latin plays by the students besides taking a general charge of their games and diversions during the Christmas season, and was styled the Emperor, or *Præfectus Ludorum*. A similar Master of Revels was chosen at Oxford. It seems to have been in the Inns of Court in London that the Lord of Misrule reigned with the greatest splendor, being surrounded with all the parade and cere-

mony of royalty, having his lord-keeper and treasurer, his guard of honor, and even his two chaplains, who preached before him on Sunday in the Temple church. On Twelfth Day he abdicated his sovereignty. In the year 1635 this mock representative of royalty expended in the exercise of his office about £2,000 from his own purse; and, at the end of his reign, he was knighted by Charles I at Whitehall. The office was regarded among the Templars as most honorable and was generally conferred on young gentlemen of good family. The Lord of Misrule was always costumed extravagantly and carried a fool's bauble as badge of office. A favorite form for his lordship to enter upon his duties was to absolve the company of all their wisdom, leaving them "just wise enough to make fools of themselves." Fealty was sworn to the merry monarch and the reign of fun and folly began.

In Scotland this character was called the Abbot of Unreason; in France, he was the Abbé de Liesse and Abbas Stultorum—the Abbot, or Pope of Fools. Scott gives a description of one of these mock-ecclesiastics in 'The Abbot.'

**MISSAL** (Latin *missale*, from *missa*, mass), the book which contains the prayers, rubrics, antiphons, etc., of the mass. It was formed by comprising in one volume the separate books formerly used in different parts of the service, namely the Oratorium, Lectorium, Evangelium, Antiphonarium, the Canon, etc., for the convenience of the priest. Variations and corruptions in the course of time crept into the text of the Missal, and the Council of Trent suggested a revision of it. This was accordingly accomplished by order of Pius V (1570), who required the new Missal to be used by the whole Church, with the exception of those societies which for more than two centuries had followed another ritual. Subsequent revisions made under Pope Clement VIII (1604), Urban VIII (1634) and Leo XIII (1884, 1898) extended little beyond alterations of single expressions, and the addition of new masses, both obligatory and permissive, universal and local. In the ancient and mediæval Church there were missals in use, varying according to the various rites. Thus, in England, there were missals of the Sarum use, Hereford use, Lincoln use, Bangor use, etc. There are also missals of the Greek Church, the Church of the Maronites and other Christian bodies. The earliest printed missal is the 'Missale per totius Anni Circulum More Ambrosiano compositum' (Milan 1475, folio), which was followed by the 'Missale secundum Consuetudinem Romanæ Curie' (Rome 1475).

**MISSI** (Latin, meaning those sent), name given to officials sent on special errands by the Frankish kings. Their institution dates from Charles Martel and Pepin le bref; but Charlemagne made them a regular part of his administration. Under Charlemagne the *missi dominici* were most important. Into each district of the great empire were sent each year two *missi*: one a lay nobleman and the other an officer of the Church. It was their business to hold court, hear complaints, redress grievances and report all this to the emperor. By this means Charlemagne controlled the courts and centralized the government. The *missi*

*dominici* disappeared from France and Germany in the 9th century and from Italy in the 10th century. Consult Thompson, J. W., 'Decline of the *Missi Dominici* in Frankish Gaul' (Chicago 1903).

**MISSING LINK**, a term used to designate the gap in the scheme of evolution between the ape and man. See APE; EVOLUTION; DARWIN; PITHECANTHROPUS ERECTUS.

**MISSION INDIANS**, a general name given the Indians of southern California who in the 18th century were Christianized by the Spanish Franciscan missionaries. The Mission Indians were originally of many tribal families and dialects, but chief among them were the Yumas and the Shoshones. Father Junipero Serra (q.v.) and the other friars who followed him succeeded in gathering the Indians into communities, mission houses and chapels were built and vineyards planted. The work began about 1776 and continued successfully until 1831. In this latter year they numbered 19,000, but with the overthrow of the Spanish power by the Mexicans a period of confiscation and destruction began, which continued to 1840. The friars were banished, the mission abandoned and the Indians driven back to the deserts and the mountains. Under the American rule in California, both Indians and missions were neglected until after the Civil War, when, principally at the instigation of Helen Hunt Jackson (q.v.), the government took steps to care for the unfortunate natives. They now occupy about 30 small reservations, which in the aggregate contain 180,000 acres. The remaining Indians number about 2,600. They are partly civilized and fairly industrious. Within recent years an organization in Los Angeles has endeavored to rebuild the ruined missions and preserve them in remembrance of the historic past. (See PIOUS FUND). Consult Englehart, Z., 'Missions and Missionaries of California' (San Francisco 1908); Wetmore, C. A., 'Mission Indians of Southern California' (Washington 1895).

**MISSION SOCIETY, American Baptist.** See MISSIONS, PROTESTANT FOREIGN.

**MISSIONARY RIDGE.** See CHATTAHOOGA, BATTLE OF.

**MISSIONARY SOCIETY, Methodist.** See METHODIST CHURCHES OF THE WORLD.

**MISSIONS, Protestant Foreign.** Foreign missions were not seriously undertaken by Protestants until more than 200 years after the Reformation. This curious fact is sufficiently explained by the circumstances that the reformers were involved at the outset in a struggle not only for liberty but for life itself; that Christendom did not yet control the whole of Europe; an aggressive Mohammedan power with its foot in Hungary and its fleets in the Mediterranean being still active in its purpose of conquest; and that the state alone commanded resources sufficient for enterprises of any kind in remote regions like the Indies, Africa or America. These circumstances of life in Europe in the 16th century materially lessen the importance of the question whether Luther and his followers did or did not see that a Christian Church must die which is not actively missionary in principle.

The first Protestant missions, perhaps naturally, were state enterprises, unless we reckon as a mission the single effort of Heiling (1634) in Abyssinia, which ended with his murder 20 years later. In 1556 the Council of Geneva sent missionaries to Brazil with Coligny's colony, who perished with the colonists. In 1635 the Duke of Gotha sent a mission to Persia, and in 1663 again a mission to Abyssinia; both unpractical embassies were quickly forgotten. The Dutch government, after gaining possession of the East Indian Archipelago in 1602, made a serious effort to Christianize the Malays, and the people of Ceylon and of Formosa, producing permanent results in Java and the adjacent islands of the East Indian Archipelago only. The Dutch government published in 1685 the New Testament in Malay (the second of modern translations of Scripture into heathen languages; Eliot's translation into Mohican in 1663 having been the first), and the whole Bible in 1701. It has also maintained a Malay Protestant Church in Java, the Moluccas and Celebes, which now has about 400 ministers and 250,000 adherents, of whom probably one-half are descendants of the 17th century converts. A similar state missionary enterprise undertaken by a Protestant government of Europe was the Danish mission to South India, founded by King Frederick IV of Denmark in 1706. The king sent out as the first missionaries to Tranquebar, Ziegenbalg and Plutschau, Germans from Francke's school at Halle. Other Germans from the same surroundings followed, notably Schulze and his later associate, Schwartz, making this Danish mission the first serious Protestant mission in India. Ziegenbalg translated the New Testament into Tamil (the third of modern translations of Scripture into heathen language), and before the end of the century from 30,000 to 50,000 Tamils had become Christians.

Another mission maintained by Frederick IV of Denmark was that commenced by Hans Egede in Greenland in 1721, and later transferred to the care of the Danish Missionary Society. This mission Christianized the whole Eskimo population in the vicinity of the Danish trading stations.

The British government showed a similar sense of responsibility for missionary work in its colonies, and the duty of preaching to the North American Indians was laid down in the charters of Virginia (1584) and Massachusetts (1628). Parliament even went so far as to consider in 1648 the endowment of a state foreign missionary enterprise. It voted a grant in aid of the "Society for the Propagation of the Gospel in New England," formed in 1649 and still existing under the name of the New England Company, which educates Indians in Canada with the revenues of the ancient government grant. John Eliot of Roxbury, Thomas Mayhew of Martha's Vineyard, and others through this government solicitude received state support in their missionary work for Indians. The British East India Company, moreover, was required by its charter in 1698 to maintain chaplains at its stations, and to instruct its Hindu servants in Christian doctrine.

All of these state enterprises in the line of foreign Protestant missions were uncertain in method and precarious in stability. They served, at least, to show the possibility of prosecuting missions in the colonies, but were sufficiently

barren to suggest the formation of those voluntary societies for missionary effort which proved to be the effective form in which the missionary idea among Protestants was to express itself.

Unsatisfactory religious conditions in the East India Company's trading posts led in 1698 to the organization of the "Society for the Promotion of Christian Knowledge," with the purpose of providing books and schools for neglected English communities, and in 1701 to the appearance of the "Society for the Propagation of the Gospel in Foreign Parts," intended to provide for the religious culture of Englishmen residing in foreign lands. Both of these societies were directed by the Church of England, although voluntary in form and in the sources of their revenues. Neither of them were foreign missionary societies. But the first now publishes books in Oriental languages, and it saved the Danish Mission in South India from dying with its royal founder, and supported it during a century, until it was taken over by the Society for the Propagation of the Gospel. This latter society, too, has gradually taken up the work of evangelizing pagans until it has (1915) 1,005 missionaries in India, China, Japan, Korea, Malaysia, Africa and the West Indies, with nearly 3,500 native clergy and laymen in the various departments of its work. These two societies then, founded about the beginning of the 18th century, may be considered as the pioneers of the voluntary foreign missionary societies of Protestant Christendom.

It was not until the 19th century was about to dawn, however, that a general movement toward missionary enterprises began among Protestants in Europe and America. This movement grew out of that revival of personal religion in the 18th century which was fostered by the writings of Spencer and Francke, the Pietists of Halle, and by the devoted lives of men like David Brainard of Connecticut, and Zinzendorf, the patron and leader of the Moravians, and was stimulated by the exhortations of Whitefield, the Wesleys and Jonathan Edwards, and by the example of the "Unity of Brethren" (*Unitas Fratrum* or *Brüder Unität*) as the Moravians call themselves. The Moravians, not as a church that begs men to volunteer, but as a community in which every member has equal interest in evangelism, were the first decided champions of Protestant missions. They held it the duty of all Christians to tell men what benefits they had received from Jesus Christ. They established missions between 1732 and 1770 in the West Indies, in Greenland, in the Indian settlements of North America, among the Hottentots of South Africa, and in Labrador. They (1913) support 359 missionaries and 2,157 native preachers and teachers in their various mission fields which include, besides those already named, Alaska, Australia and the border lands of Tibet. The English Wesleys should also be reckoned with the Moravians as having taken up missions in advance of the general movement of the Protestant churches. They did not formally organize the Wesleyan Methodist Missionary Society until 1814. But in 1779 they employed missionaries among the North American Indians, and in 1786 they began an important work among the slaves of the West Indies. The Society has (1915) 807 missionaries, and

5,756 native workers and teachers in India, Ceylon, South Africa, China, Polynesia and the West Indies.

Before this extension of Wesleyan missions took place a surprising outburst of zeal for the missionary idea appeared almost simultaneously in England, in the United States and on the Continent of Europe. It was a revolution, since formalism had made the Protestant churches almost forget that to be a Christian means to be always in some sense a missionary. The characteristic feature of the movement was its origin in the conscientious convictions of isolated individuals, from whom the Church did not expect initiative and whom it sometimes regarded as unsteady enthusiasts. William Carey, a cobbler and a Baptist minister in England, made the first move in 1786 and was frowned down by his elders. But in 1792 his earnest conviction carried the day; 12 men united to form the Baptist Missionary Society (England), and Carey and Thomas went to India as its first missionaries. There is no space here to describe the marvelous activities of Carey and his associates Marshman, Ward and others, at the Danish trading post of Serampur near Calcutta, where they were given asylum when the East India Company refused to tolerate their presence in its territories. The great school buildings which these missionaries erected at Serampur stands to-day, and their press added to the then slender stock of Bible translations passably good versions of Scripture in 34 Oriental languages and dialects. The Baptist Missionary Society has (1915) 477 missionaries and 2,000 native preachers and teachers in India, Ceylon, China, Africa and the West Indies.

This example was contagious. In 1795 "The Missionary Society" was formed in London by the union of notable men of four different denominations. Its name was afterward changed to "The London Missionary Society." It is (1915) substantially composed of Independents (Congregationalists) alone, and has 480 missionaries and 7,000 native preachers and teachers, in Polynesia, New Guinea, Madagascar, Africa, India and China. In 1796 two similar societies were formed in Scotland which at first aided the London Society, but later took up independent work in the West Indies and in South Africa, and finally (1824) became merged in the Church of Scotland Foreign Missionary Committee, of which a later (1843) offshoot was what has now become the Foreign Missionary Society of the United Free Church of Scotland. The Church of Scotland Foreign Missionary Committee now has 120 missionaries and 1,200 native workers, and the United Free Church has 541 missionaries and 5,093 native preachers and teachers in India, China, Africa, Arabia, the New Hebrides, Manchuria and the West Indies. The same impulse led in 1797 to the formation in Holland of the Netherlands Missionary Society. This was first an auxiliary of the London Missionary Society but soon undertook independent work. In 1913 it had 63 missionaries and 154 native workers in the Dutch East Indies.

The same conviction of responsibility together with realization of the extent and condition of the heathen world led in 1797 to the organization in London of 26 men belonging to the Church of England as the "Society for

Missions to Africa and the East." This name later gave place to the familiar one of the "Church Missionary Society." Among its founders were William Wilberforce, Henry Venn and Charles Simeon; but the Church of England gave the Society no encouragement until the successes of nearly 50 years compelled recognition. Hence the first missionaries of this Society were commonly Germans; for the most part men of the highest ability and attainments. The fields of the Church Missionary Society are India, Ceylon, China, Japan, Africa, Mauritius, New Zealand, Persia, Palestine, Egypt, the Sudan and the Arctic regions of British North America. It has (1915) 1,369 missionaries and 11,181 native preachers and teachers.

Missionary enterprises next began to spring up in Germany and in America. The marked characteristic of the movement in every case was the same profound conviction of individuals, commonly not officials of the churches to which they belonged. Five students of Williams College in Massachusetts furnished the initiative that resulted in the organization of the "American Board of Commissioners for Foreign Missions" in 1810. This was at first an interdenominational society. Its first missionaries, Newell, Judson, Hall, Rice and Nott, were sent to India and were ordered out of the country by the East India Company the moment they landed. Judson and Rice took refuge with the English Baptists at Serampur, while the others succeeded in effecting a lodgment at Bombay and in Ceylon. The fields of this Society in 1915 were India, China, Japan, Ceylon, Africa, the Balkan States, Turkey, Austria, Spain, Mexico, the Philippines and Micronesia. Its missionaries number 656 and its native laborers 4,777. After 40 years of existence as an interdenominational society, it handed over its missions in Persia, Syria and the Gabun region of West Africa to the Presbyterians, and part of its field in South India to the American Reformed (Dutch) Church, and has become substantially a Congregationalist body. Judson and Rice of the earliest missionaries of this Society decided on arriving in India that they would prefer to serve under a Baptist organization and this decision led to the formation in 1814 of what is now the American Baptist Foreign Mission Society of Boston. Burma was the field selected for its first efforts and the heroic work of Adoniram Judson in that land made his name great among modern Protestant missionaries. The Society had in 1915 701 missionaries and 8,589 native laborers in Burma, Siam, Assam, India, China, Japan, the Philippines and Africa.

Meantime, in Germany, Jannicke of Berlin, whose brother was a missionary of the "Danish Halle" band in South India, opened a Missionary Training School at Berlin in 1800. This school during the next 25 years furnished about 80 missionaries to the service of the English and Dutch societies, and served to arouse interest in missions among the Germans. Its influence led in 1815 to the establishment of a Missionary Training Institute at Basel in German Switzerland. The latter institute furnished many admirable men to the service of other societies and in 1822 began to send out missionaries of its own. The fields of the Basel Missionary Society are in India, China and Africa,

and graduates of its institute are pastors of Protestant churches in Turkey. In 1913 it had in the field about 475 missionaries and 624 native workers.

In 1824 10 strong men in the Lutheran Church, among whom were Neander and Tholuck, formed the Berlin Missionary Society; beginning operations, according to the wise continental practice, by opening a training school for missionaries. It began to send out missionaries in 1834 and now carries on missions in Africa and China. It had in 1913 about 150 missionaries (wives of missionaries not counted) and 1,000 native preachers and teachers. Other missionary societies sprang up in Germany during the first quarter of the 19th century. Of these the Rhenish Missionary Society is perhaps the largest. Its fields were in South Africa, China, Sumatra, Borneo and New Guinea. It has 382 missionaries and 1,340 native laborers. There are a score, at least, of other German missionary societies of which the chief are the Gossner Society, the Hermannsburg, the Leipzig, the North German and the Breklum societies, working in the Dutch East Indies, Africa, India, China, Australia and Turkey.

The same period saw the formation in France of the Paris Evangelical Missionary Society (1824), designed at first merely to aid existing enterprises, but quickly beginning to send out missionaries of its own. In 1913 it had 173 missionaries, men and women, and 1,274 native workers, in Madagascar, Senegambia and the Barotse and Basuto regions of Africa. With the development of French colonial expansion it has also taken the place of the London Missionary Society's missionaries in Tahiti and in parts of Madagascar, and of American missionaries in the French Kongo region. Protestant missionary societies in Holland, Denmark, Sweden, Norway and Finland sprang later from the same causes and are doing good work with 831 missionaries and about 4,000 native workers in Africa, India, China, Chinese Turkestan and Madagascar.

The same spiritual awakening of widespread effects gave rise also to the British and Foreign Bible Society (1804), the American Bible Society (1816), the Netherlands Bible Society, and Religious Tract Society of London (1799) and the American Tract Society of New York (1820). The Bible societies do true foreign missionary work in publishing the Scriptures as soon as missionaries have translated them into the languages of non-Christian peoples and in disseminating the Scriptures in these languages. Some 500 modern translations have been published. The British and Foreign Bible Society in 1915 employed about 2,000 colporteurs and Bible women and its total issues of Bibles, New Testaments and lesser parts of Scripture amounted to 11,059,617 copies. The American Bible Society has about 1,500 colporteurs in foreign mission fields and issued in 1915 7,150,911 copies. The Scottish National Bible Society issued in the same year over 2,500,000 copies, besides joining with the first named societies in providing finances for translating and publishing the Bible in various languages.

The tract societies aid missions in a similar manner; providing funds for the publication of undenominational Christian literature in the languages of non-Christian peoples. The Reli-

gious Tract Society of London at its centennial anniversary was able to report that it had given for this purpose to English and American foreign missions aid equivalent to \$100 per day during the whole period of its existence.

In the second quarter of the 19th century the American Methodist Episcopal Church and the American Presbyterian Church began their missionary work in foreign lands. The two great branches of the Methodist Episcopal Church in 1915 had 1,199 missionaries and 10,800 native laborers. The Presbyterians North and South have 1,551 missionaries and 6,866 native laborers. Almost all denominations in the United States and in Great Britain now have foreign missionary organizations of their own. Interdenominational and international missionary societies, like the China Inland Mission, the North Africa Mission, the Christian and Missionary Alliance and other bodies of greater or less importance have been formed to carry on missionary enterprises by methods more free from machinery than the older societies sometimes seem to require. The total number of Protestant missionary societies now existing probably exceeds 500. The World War has interfered with collection of statistics, but in 1912 these societies reported 24,092 missionaries, men and women, and 111,862 native workers.

Four points are noteworthy, in the history of the development of these missionary societies, as each marking an epoch of expansion of their scope. These are: (1) The adoption of education as a missionary agency; (2) The general adoption by women of mission work for womankind; (3) The establishment of medical missions; (4) The opening of industrial departments in many missions.

**1. Education.**—The aim of foreign missions is to tell of Jesus Christ to those who do not know Him. The aim is to lead them to surrender self-will to the control of Jesus Christ so completely that converts shall be true Christians, who, if the missionary leaves to-morrow, will stand immovable in their devotion and their impulse to teach others the truth that has benefited themselves. At the outset the task seemed simple enough. To preach and preach again was all that was necessary. As a result of the first half century of experience, the discovery was made that common schools are essential in all missions which urge the reading of the Bible. Rev. Dr. Alexander Duff, a missionary from Scotland who left ineffaceable marks upon India, was a leader in championing the thesis that education in all grades is also an essential department of missionary effort. This principle is now established with all that it means of general enlightenment for backward races, and in 1912 there were in the Protestant missions throughout the world 35,000 educational establishments of all grades from kindergarten to university, attended by about 1,670,000 young people of every form of religious belief.

**2. Woman's Work.**—As early as 1825 missionaries undertook the education of girls in India, Africa, Turkey and elsewhere. In 1835 a Woman's Missionary Society was formed at Berlin, Germany, for the instruction of women in the East; and later schools for girls were opened in several non-Christian lands by different missionary societies. It was not until 1860 that the women of Christian lands began

to take the matter into their own hands. Beginning with the Woman's Union Missionary Society of New York (1860), mission boards of women were organized in almost all the Protestant denominations of Great Britain, Canada and the United States. These missionary societies of women are for the most part closely allied to the general missionary boards of the denominations to which they belong, but they send out women as missionaries and have produced vast extension of the scope of the missionary enterprise. The impossibility of carrying on successful missions without women missionaries to win and instruct their own sex is now fully recognized. There were in 1912 about 2,968 unmarried women working as missionaries in all parts of the non-Christian world. No mission field is so dangerous or so repellent in its barbarism as to be denied the ministering service of devoted women of Christendom.

**3. Medical Missions.**—At the outset physicians were sent to the missions with the primary duty of caring for the health of missionaries. They could not, however, fail to use their knowledge for the relief of suffering in lands where surgery was unknown and the science of medicine parodied. It was not until about 1885 that the Medical Mission was fairly established as a recognized channel of missionary influence. Since that time the number of missionary physicians, both men and women, and of missionary hospitals and dispensaries has increased every year. In 1912 there were 800 men and women physicians and surgeons, with 1,638 hospitals and dispensaries in connection with foreign mission fields.

**4. Results of Foreign Missions.**—It used to be common for critics of missions to picture bewilderment among pagan hearers as a necessary result of denominational differences among missionary preachers. But the gospel preached to pagans by Protestant missionaries of different denominations is one in essence, and the problems of missionary effort in all fields are much alike. Sixty years ago missionaries of different denominations at work in India conferred together on the more efficient prosecution of the common work. The advantage of such conferences was so clear that the solidarity of the different missions may be set down as one result of the missionary enterprise. Conferences between the different missions are now held regularly in many foreign lands. Moreover general conferences of the societies of different nations have been held with notable advantage to the cause of missions. Such was the Conference of London in 1888, the Ecumenical Conference on Foreign Missions held in New York in 1900 and the World Foreign Missions Conference of Edinburgh in 1910. The Latin America Mission Conference of 1916 was a gathering of the same nature which brought together at Panama almost 500 missionaries and friends of missions from 21 nations. An annual assembly of the same class is the Foreign Missions Conference of the United States and Canada which brings together representatives of more than 40 missionary societies. Similar annual conferences are held in Great Britain and in Germany. Fruits of such gatherings are increase of sympathy and comity and diminution of possible causes of friction between different denominations and a steady advance in efficiency and economy on the foreign field. At

home this unification of missionary interest has produced such interdenominational enterprises for the support of foreign missions as the Missionary Education Movement, the Student Volunteer Movement and the Laymen's Missionary Movement.

In 1912 the stations of foreign missionaries numbered 12,123 besides about 38,000 other places more or less regularly visited. The organized congregations were 15,396. In connection with these congregations the number of persons in full church membership was 2,644,170. Figures are proverbially uncertain agents for setting forth facts and their meaning. In any general statement such as is here attempted it should be remembered that before statistics can be gathered from the wide areas concerned many of the details will not be up to date. One thing that should be clear to the reader of this article, however, is the widening of the scope of foreign missions since the first fruition of the missionary idea in the modern Christian Church. This expansion of the scope of missions is not due to any modification of their fundamental purpose. It is due to experience of the needs of non-Christian peoples and especially of their need of a future nurture similar to that enjoyed by Christians at home. Let no one forget that no miraculous short cut exists by which a pagan savage can be transformed into a Christian gentleman of culture. The planting of the aspiration is a miracle, but a majority of converts remain children in development. Some may use this fact to belittle the moral change seen in multitudes. The number of converts who do become leaders in the mission churches is not thus to be set aside. Men from the lowest classes have risen through devotion to Jesus Christ to the highest ability, like the slave-boy Crowther of Yorubaland and Constantian of Turkey who became eminent among Bible translators; or like Abdul Masih and Imaduddin of India, whose work among their own people as Christian ministers was that of masters of apologetics; or like Dr. Saleeby of the Philippine Islands, once a village boy in Mount Lebanon, whose fitness for good service was grounded on the instruction received in American mission schools in Syria. The clean and kindly lives of converts in the mission fields, their sincerity and stability influence their people. Of the 150,000 persons received into Church membership in foreign missions during 1912, it is not rash to estimate one-half as having been won to a serious study of Christianity by the subtle influence of the lives of Christian acquaintances. Furthermore the high qualities discovered in Christians often produce a gradual moral uplift among those who have not accepted the religious message of the missionary. It is a significant fact that in 1912 the missionary societies reported as income from the mission field \$7,902,256. This money came in part, of course, from church collections, but a large part came from non-Christian patrons of mission schools and patients in mission hospitals. The Bible is widely circulated in mission fields. Some of the people decline to admit its authority as containing the principles of life on which must depend the stability of the universe; but they do regard it as a repository of experiences of men, wise and unwise, through many ages of time. These records sharply touch their own problems of life and

character. In 1915 a Chinese official, not a Christian, bought in Peking several thousand copies of the New Testament in Chinese which he gave to friends and subordinates as containing the noblest scheme of moral conduct which the world has ever known.

Add to such by-products of foreign missions the direct fruits of missionary effort in endowing illiterate languages with alphabet and writings, in purifying literary thought and expression in languages which already have literature, in enlightening womankind, hitherto guarded against culture, in training children and youth, in teaching an industrial efficiency which touches the world's commercial interests, and one gains fuller comprehension of the results of foreign missions. This vast enterprise so reaches the source of social development among those masses with whom is the reserve vitality of every nation that it must be reckoned among the great agencies by which Europe and America are shaping the destinies of backward races throughout the world.

The outbreak of the Great War in 1914 created a reaction against Christianity throughout the mission fields of the world which prevailed until the East understood that the British Empire, and later the United States, were both fighting for justice and righteousness and for the rights of unprotected humanity. German foreign missions naturally suffered during the defeat of the nation which had violated the fundamental principle of Christianity, "Peace on Earth—God's will to men," and the interdenominational, international missionary organizations which reached their culmination at the Edinburgh Missionary Conference in 1910 were, for the time, disorganized. The continuation committee there launched had been remarkably successful in binding under one organization the Protestant missionary forces of the world.

By the stand of the British Empire and America, North and South, a reaction occurred which increased the endeavors of Protestant foreign mission work as shown in the statistics presented at the Foreign Mission Conference of North America at Garden City, N. Y., in 1918. Gratifying increase was shown along all lines of foreign missionary endeavor and was best exemplified by the grand total of the incomes of the affiliated societies, representing as far as it was possible to be ascertained the amount given in Canada and the United States for carrying on foreign Protestant missionary enterprise. Of the total amount, \$18,500,000 were given by living donors, a balance of nearly \$2,000,000 representing the incomes from legacies, endowments and other sources. Exclusive of the income of the societies derived from the mission fields themselves, the total income amounted to \$20,400,000 as compared to \$16,939,741 in 1915 and \$11,946,218 in 1910. Officially advanced by the National Missionary Society of Sweden in a communication to Secretary James L. Barton, chairman of the American National Committee, representing the mission societies of North America, the suggestion is to be acted upon, although many difficulties appear in the way of the achievement: "Whether plans should not be inaugurated by the Protestant missionary bodies of the world to put all foreign work upon a supernatural basis so that in case of any future war, no

matter what countries were involved, their institutions and their work should remain absolutely undisturbed?"

**Bibliography.**—The literature of foreign missions is enormous. Only a few standard works can here be suggested. Dr. S. M. Jackson's 'Bibliography of Foreign Missions' (1891) may well be consulted. *General Surveys and Statistics*: Warneck, 'Outlines of a History of Protestant Missions' (1907); Dennis, 'Centennial Survey of Foreign Missions' (1902); 'World Atlas of Christian Missions,' Student Volunteer Movement (1917); Bliss, E. M., 'Encyclopedia of Missions' (2 vols., 1891); Dwight, Bliss and Tupper, 'New Encyclopedia of Missions' (1904); Dwight, H. O., 'The Blue Book of Missions' (1907); Barnes, L. C., 'Two Thousand Years of Missions before Carey' (1901). *Missionary Societies*: Lovett, R., 'History of the London Missionary Society' (2 vols., 1895); Stock, E., 'History of the Church Missionary Society' (3 vols., 1899); Hamilton, L. T., 'Moravian Missions' (1901); Pascoe, C. F., 'Two Hundred Years of the Society for the Propagation of the Gospel' (1901); Merrjam, E. F., 'History of the American Baptist Missions' (1902); Strong, W. E., 'Story of the American Board of Commissioners for Foreign Missions' (1910); Canton, 'History of the British and Foreign Bible Society' (5 vols., 1904); Dwight, 'Centennial History of the American Bible Society' (1916); Report of the Centenary Missionary Conference (London 1888); Report of the Ecumenical Conference (New York 1900); Reports of the World Missionary Conference (Edinburgh 1910); Dennis, 'Christian Missions and Social Progress' (3 vols., 1897-1906). *On Special Fields*: Reports of the great Shanghai Conference (1907); MacGillivray, 'China Missions' Year Book' (1915); Gibson, 'Mission Problems and Mission Methods in South China' (1893); Inglis, 'India's Protestant Missionary Directory' (1915); Jones, 'India's Problem' (1903); Dearing and others, 'The Christian Movement in Japan' (1915); Stewart, 'Dawn in the Dark Continent' (1903); Stock, 'The Story of Uganda' (1894); Curtis, 'The Laos of North Siam' (1903); Brown, 'The New Era in the Philippines' (1903); Zwemer, 'Mohammed or Christ?' (1916); Wilson, 'Modern Movements among Moslems' (1915); Dwight, 'Constantinople and its Problems' (1901); Beach and others, 'Protestant Missions in South America' (1900); St. John, B., 'A Comparison in Missionary Statistics' (in *The Missionary Review of the World*, Vol. XLI, pp. 356-359, New York 1918).

HENRY O. DWIGHT,

Author of 'Blue Book of Missions,' etc.

**MISSIONS, Protestant Home.** Home missionary effort in the United States is older than its organized form. Before the War of the Revolution individual churches in New England and New York were sending their pastors, for weeks or months at a time, into the new settlements, to preach the Gospel and administer the ordinances of religion. Connecticut pastors received for this service \$4 a week, and \$4 more were allowed for the supply of their pulpits, the money being raised by voluntary subscriptions among the home churches. These

desultory efforts continued more or less intermittently for 25 years; they were warmly welcomed by the struggling settlements and were influential in preparing the way for better organized endeavors.

Organized American home missions began with the establishment of the "Missionary Society of Connecticut," 21 June 1798, by the Congregational churches of that State. Massachusetts Congregationalists followed one year later, 1799, with the "Massachusetts Missionary Society." Both of these Societies, bearing the names of the States where they originated, and supported by the States whose names they bear, were not primarily for the benefit of Connecticut and Massachusetts. The object of the Connecticut Society, as stated in its charter, was "to Christianize the heathen (Indians) of North America and to support and promote Christian Knowledge in the New Settlements of the United States." The charter of the Massachusetts Society describes its object as being "to diffuse the Gospel among the heathen (Indians) as well as other peoples in the remote parts of our country." Both Societies, therefore, while local in their origin and support, were truly national in spirit and aim. Other New England States followed the lead of Connecticut and Massachusetts in organizing similar societies; New Hampshire in 1801; Rhode Island in 1803; Maine and Vermont in 1807, all of them under Congregational auspices. They all continue to the present time with but slight changes in name, and with increasing devotion to home missions, State and national. The first organized movement on the part of the Baptist churches was made in 1802, when the "Massachusetts Domestic Missionary Society" was established at Boston, with the same broad object as its Congregational predecessors, namely, "to furnish occasional preaching and to promote the knowledge of evangelistic truth in the new settlements of these United States, or further, if circumstances should render it proper." To the same year 1802 belongs the first systematic effort of the Presbyterians of New York, Pennsylvania and New Jersey, acting under the same broad charter with those of the Congregationalists and Baptists of New England; "to send forth missionaries well qualified to be employed in mission work on the frontiers, for the purpose of organizing churches, administering ordinances, ordaining elders, collecting information concerning the state of religion in those parts, and preparing the best means of establishing a Gospel ministry among the people." Meanwhile the Reformed Church of America had not been idle. Sporadic missionary work began with it as early as 1786, culminating in 1822 in the organization of the "Missionary Society of the Reformed Dutch Church," differing nothing in spirit from its forerunners, but with a wider scope, as it included home and foreign missions under a single organization. Methodist and Episcopal missions, as well as the Lutheran and those of the Disciples of Christ, belong necessarily to a later period.

It is important, historically, to remember that all these early missionary bodies were called into being by one motive and for one object. Barbarism in the new settlements was the common dread of the East, and to prevent such a disaster by pre-empting those rapidly gathering communities with religious institutions was the

motive of all early home missionary organizations. At the opening of the 19th century, what was known as the new settlements were found mainly in northern New England, eastern and central New York and northern and southern Ohio, and these were the first points of home missionary attack. The opening of the Northwest Territory and the passage of the Ordinance of 1787 attracted a stream of emigration from the East, mingling with which was a considerable element from Great Britain, Holland, Scandinavia, Germany and Moravia, Belgium and Switzerland. The earlier settlers in New York, Ohio, Indiana and Illinois were generally Protestant in their sympathies, but unable at once, with a new country to subdue and new homes to be built, to provide themselves with the institutions of worship. To the help of these hopeful but destitute settlers came the missionary organizations of the East. Their missionaries were hurried forward to every needy point, not only in the wilds of New York and Ohio, but to the remoter settlements of Indiana, Illinois, Kentucky and Tennessee. They even found their way down the Mississippi to New Orleans and crossed the northern borders to Canada. A specially promising field of effort was a section of Ohio, bordering on Lake Erie, settled chiefly by emigrants from Connecticut and for this reason commonly known as "New Connecticut." At the beginning of the century the tract contained about 1,400 inhabitants. In 1804, it had 400 families; one year later the 400 had become 1,100, one-half of them from New England. In less than 30 years from the beginning of organized home missions 90 churches had been planted, all of them by home missionaries sent out and supported by Connecticut and Massachusetts. To sum up in a sentence the work of the Missionary Society of Connecticut at the end of 30 years, 200 missionaries had been employed whose joint labors were equivalent to 500 years of ordinary service by one man, and 400 churches had been established in the new settlements of the land. With what wear and tear of body, with what sacrifice of comforts in the wilderness, with what patience of hope and courage of faith and labors of love, no words can fitly portray. Not a mile of railroad had been built. The river and the canal, the stage coach, the emigrant wagon and the saddle, were the only conveniences of travel, and to these the missionary added foot-sore and weary tramps from settlement to settlement. During the same period 125 Puritan churches had been gathered in the growing settlements of New York State, supported in whole or in part by home missionary funds.

All these earlier efforts were marked by a commendable absence of the sectarian spirit. A common danger threatened the nation. The problem presented to the churches of the East was how to overtake the new and rapidly multiplying settlements with the means of Christian civilization. No rivalry entered into the struggle but only a strong sense of the need of prompt, united action. In their love of humanity and of country every thought of denominational supremacy was buried under the all-absorbing issue whether the New America should be heathen or Christian. This spirit was particularly active between Presbyterians and Congregationalists which were then the strongest church bodies in the land; for 50 years, be-

tween 1801 and 1851, they carried on their missionary work in the new settlements under a "Plan of Union," mutually agreed to, by which the churches of either order, wherever formed, might worship in the same house, listen to the same pastor and profess the same creed, while at the same time they were left free to govern themselves by the polity they loved and preferred.

In 1826 Congregational, Presbyterian, Reformed and Associated Reformed churches united at New York City in organizing a National Society. Such change of policy had become necessary. Hitherto, State societies had been doing national work, each in its own way. But several missionary organizations working independently had resulted in an unequal distribution of men and money. Some sections had been over-supplied and others were left destitute. Moreover, the laborers themselves came into conflict with each other. The time had arrived for federation and co-ordination of effort, and to this end the American Home Missionary Society was organized, as above stated, with headquarters in New York City, the various State societies making themselves auxiliaries to the national organization. Perhaps nothing more potential in the progress of American Home Missions belongs to its history than this act. For years the churches making alliance labored together in fraternal unity, contributing to a common treasury and governed by a single board of direction. Receipts rapidly increased, the missionary force doubled and trebled, and instead of being an itinerant preacher, the home missionary became a settled pastor, dwelling among his people. It was only when these allied church bodies had grown strong that they withdrew one by one to organize separate societies, leaving the Congregationalists to inherit the name and traditions of this honored organization. Indeed, it was not until many years later that "American" was dropped from its charter name and the designation of "Congregational" was substituted. Meanwhile the Methodists had organized their "Missionary Society" (national) in 1819, including home and foreign work; the Episcopal Church, its "Domestic and Foreign Missionary Society," in 1821; the Baptists, their "American Baptist Home Mission Society" in 1832, also national; the Lutherans, their "Home Missionary Society of the General Synod" in 1845, and the Disciples, their "American Christian Missionary Society," in 1849. The Southern Presbyterians, Southern Baptists and Southern Methodists have also their home missionary organizations which are doing a great religious work in the Southern States. Thus, by natural evolution, all the leading Church bodies of America have gradually become organized for home evangelization and a movement, which began in 1798 for the Christian enlightenment of the new settlements, has developed into a system as broad as the national domain, by which the stronger churches of the land are sharing the burdens of their weaker brethren and strengthening those forces of Christian civilization upon which the safety of the nation depends.

The purchase of Louisiana (q.v.) in 1803 imparted a mighty impulse to the missionary movement. That expansion gave us the mouth of the Mississippi and undisturbed possession of its entire course. It carried our western

boundary from Lake Superior to the Rocky Mountains, doubling the national area by a stroke of the pen. Fourteen States and Territories have been carved out of the Louisiana Purchase. They include the great corn and wheat belts of America, and their underground treasures are among the richest of the world. Emigration from the East and Middle West began at once and has reached enormous proportions. It is rivaled in volume only by the millions of foreign birth that have poured and are still pouring into this new and mighty West. By these movements a great missionary problem was presented which the organized home missionary army welcomed with zeal and have never wearied in their efforts to solve. The order of missionary progress through the Louisiana Purchase was strictly along lines of immigration. There is not a State in that vast tract which the home missionary did not enter while it was yet a Territory, and always in the first and feeblest stages of settlement. From Missouri to Iowa, from Iowa to Minnesota, Kansas and Nebraska, thence to the Dakotas, and on from these points to Wyoming, Colorado and Montana, and last of all, when the door was opened to Oklahoma, until every State in this imperial purchase has been leavened with Christian institutions. Something of the volume of this work may be gathered from the fact that in 1916 over 30,000 Protestant churches were enumerated within the Louisiana Purchase, holding property to the value of \$80,000,000 and having 2,700,000 communicants, and, with rare exceptions, this church growth is the fruit of home missionary culture, begun, maintained and supported until the need ceased, by the missionary revenues of these Eastern societies. The same process was repeated when about midway in the century the Oregon Treaty made sure our possession of the Northwest and the discovery of gold opened the Californias to the world. Home missionaries ordained in the East promptly started for the Pacific Coast reaching their fields by the way of Cape Horn and the Sandwich Islands. The strategic position of the far West and Northwest as related to the work of foreign missions in China and Japan was keenly appreciated by the churches and their missionary boards at the East. Money was contributed freely and many of the ablest preachers of the East went forth cheerfully to lay the foundations of Christian society on the sunset shores of the republic. "The Mexican Cession," including Texas, New Mexico, Arizona and Utah, was another belt of peculiar missionary need, which in spite of ancient superstitions and modern delusions has proved a rich field of rewarding home missionary effort.

The close of the Civil War introduced, at the South, a home missionary problem that was absolutely new, and which continues to absorb the interest of Northern churches to an extraordinary degree. Four million slaves were suddenly set free. Government opened its bureaus of relief, and the churches of the North through their missionary boards, hurried forward preachers and teachers. The greatness of the opportunity quickened the home missionary spirit of the whole country. Several of the boards opened freedmen's departments and the churches magnified the privilege of responding to their appeals. To the missionary, himself,

there was in this call an element of peril which, so far from deterring him, only stimulated his zeal. The Yankee preacher and teacher were not well received at first by the white South. Social ostracism was not the only penalty they had to face for their devotion. Violence to their persons and destruction of their property were not infrequent in the early years of this missionary endeavor. An ugly spirit of caste included the negro teacher with the negro and young women delicately reared in the best homes of the North suffered from neglect or open indignity. These conditions have mostly passed away; respect and even gratitude, on the part of the South, have been won, as the fruits of this vast home missionary effort have become more apparent. These fruits appear not only in organized churches for the negro race, but in a long array of universities, colleges, academies, normal, common and industrial schools, planted exclusively for the benefit of the blacks, all of them specifically Christian, and all of them originally supported by the free-will offerings of Northern churches. Howard, Hampton and Fiske, Atlanta and Tugaloo, Talladega and Straight, Shaw and Richmond, Wayland and Leland, Nashville and Bishop, and a host besides, are names as familiar to the educational world as Harvard, Yale or Princeton. They are all the fruit of negro emancipation and all of them are the creation of home missionary interest and enterprise.

It was in 1840 that foreign immigration began to attract the attention of the friends of home missions. Up to that time its entire volume from all sources had not exceeded 500,000. Then began the flood. During the next 30 years the country received about 6,000,000 foreigners. Driven by famines and oppressions at home and drawn by the opportunities of labor in a new country and by our generous homestead laws, they were arriving, for continuous years, at the rate of 500 to 1,000 per day. Between 1865 and 1885 more than 7,000,000 were added to our foreign population, which means that in these 20 years foreign immigration exceeded that of the entire previous record of the country. It is needless to say that, as this vast problem began to be measured and sanely comprehended by the churches, the appeal of home missions was almost revolutionized. Hitherto that appeal came from our own people and often from our own kin. To follow close after them on the westward trail and to stand with them in planting the church and the school had been for years the whole of home missions. While this feature has never lost its claim and probably never will, another claim has entered to divide the attention and concern of the churches. To the peril of domestic heathenism has been joined the larger fear of imported barbarism, and thus for many years foreign missions at home has come to be a distinct interest of American home missions. All branches of the church have taken part, through their organized societies, in this effort to Christianize the alien. No nationality has been overlooked; Germans and Scandinavians, Bohemians, Poles and Russians, Hollanders and Hebrews, Spanish, French, Italians, Armenians, Chinese, every sort and condition of foreigners, however forbidding or hopeless, has been made the object of home missionary culture, with results that have astonished the

most sanguine believer and rebuked the most despairing doubter and which have all but silenced the prophets of evil who predicted the direst consequences from the infusion of so much foreign blood into the moral, social and political life of the nation. Many times over it has been demonstrated that every grade of foreign immigrant is susceptible to religious development and is entirely capable of being both civilized and Christianized, and is in fact being rapidly assimilated, through the agencies of education and religion, into the best types of American life. Great migrations are not feared to-day as they were in 1840. Fears have been quieted and the native American stock have come to view with less and less alarm what 50 years ago almost crazed them with apprehension.

To attempt any adequate summary of the results of home missions at the end of 120 years would require a survey of the development of 50 States and Territories so vitally have the home missionary and his work entered into the beginnings and the early history of all our Commonwealths. A few salient facts must suffice. The vitality of the home missionary idea has shown itself, first of all, in the growth of organizations. Beginning in 1798 with the Connecticut Missionary Society it has multiplied itself into more than 30 home missionary bodies, all Protestant, all evangelical and all national. These organizations have collected and disbursed \$150,000,000. Their chief agent has been the Church, with its ordained preacher and its divinely appointed ordinances, and for the Church, these millions have been given. This total, however, takes no account of co-operating agencies, which have been called into being to serve the missionary work of the churches. Add these: Sunday school planting; Bible and tract printing; church building and Christian education; which by careful inquiries are found to have expended \$150,000,000 more, and the grand total for home missions, root and branch, in organized form, is \$320,000,000. Not a dollar of this immense fund has been paid in any commercial sense for value received. All of it has been given, a free-will offering of Christian people to mark their intense conviction of the peril of a nation without the Gospel and their supreme faith in its leavening power. What have these millions accomplished and what of visible fruits remain to justify their cost? It is a fact not generally known, and when known not sufficiently appreciated, that the great evangelical bodies of the United States trace most of their church organizations directly to home missions. Congregationalists admit that four-fifths of their churches are of home missionary origin. The proportion would be larger but for the fact that hundreds of their churches were born before home missions began. Presbyterians confess that nine-tenths of their churches are of home missionary planting. Baptist, Methodist and Episcopal estimates range from five-sixths to nine-tenths. Such ratios can mean but one thing: that these far-spreading ecclesiastical bodies have become strong in church power, not by their own help, but by home missionary aid, the few, strong, bearing the burdens of the many, weak, and they answer the inquiry which suggests itself at once to a thinking mind: where and what would these ecclesi-

astical establishments be to-day but for the helpful agency of organized home missions? To the credit of home missions, therefore, should stand the undoubted truth, that an overwhelming majority of the evangelical churches of America owe their being to its nurture and care. What does such a fact mean in the religious development of the country? In the year 1800 the United States had one evangelical communicant in 14.50 of the population. In 1850 that ratio had grown to one in 6.57; in 1870, to one in 5.78; in 1880, to one in 5; in 1890, to one in 4.53, and in 1900, to one in 4.25. In other words, evangelical church membership increased three and one-half times faster than the population in less than 100 years. Between 1800 and 1890 population increased 11.8 fold; in the same period evangelical church membership increased 38 fold. To these figures Dr. Daniel Dorchester, their compiler, adds the comment: "This exhibit of religious progress cannot be paralleled in the history of God's kingdom in any land or any age." It is only 140 years since Voltaire in Geneva declared: "Before the beginning of the 19th century Christianity will have disappeared from the earth," and it is less than 100 years ago that American infidels were prophesying that the Church would not survive two generations in this country. In defiance of these dismal auguries the average yearly increase of evangelical communicants has fulfilled the prophecy of a larger average than ever for the 20th century. It is no vain boast, therefore, but the obvious truth, that by far the larger part of this remarkable growth is due to the direct agency of American home missions, since in its own carefully planted gardens most of this growth has taken place. But not the only, nor even the highest, fruits of home missionary efforts are contained in the numerical results. President Roosevelt, in a public address, declared: "It is such missionary work that prevented the pioneers from sinking perilously near the level of the savagery against which they contended. Without it the conquest of this continent would have had little but an animal side. Because of it, deep beneath and through the national character, there runs that power of firm adherence to a lofty ideal upon which the safety of the nation will ultimately depend." Thus home missions has been in a very true and high sense both the builder and the savior of the American nation. In a government of the people and by the people nothing counts for so much as high ideals of duty. With these enthroned in the thought and life of its citizens a nation may meet any shock from within or from without; and nothing has yet been discovered on earth or revealed from heaven that has the power to create higher ideals of duty than Christianity and the obligations it inculcates. It is thus that missionary societies, whose sole function is the planting of churches, enter into the hidden life of a nation in ways that political parties can never enter, and which even Christian men are sometimes slow to appreciate. Not only law, order, temperance, respect for the Sabbath, security of life and property and the claims of humanity are thus conserved and fostered, but the instinct of patriotism itself, in which the very life of the nation consists, finds its nursing mother in the Church of Christ. Many vic-

tories of a Christianly educated public sentiment might be cited in American history, but the Civil War of 1861 furnishes a typical example. When that inevitable conflict came the value of 65 years of church planting by American home missions in the East, the West and the Northwest began to appear. Every home missionary pulpit flamed with patriotic fire and summoned its worshipers to arms. Congregations and Sunday schools were decimated by enlistments. From a careful inquiry made near the close of the war it was ascertained that the home missionary churches of the entire West, on both sides of the Mississippi, "had sent into the army one in four of their entire male membership, including in the count old men, invalids and boys." Commenting on this fact that peerless interpreter of history, Richard Salter Storrs, was moved to declare in his Brooklyn pulpit, "Home missions saved this country once, and will save it again if necessary."

JOSEPH B. CLARK,  
*Secretary, Congregational Home Missionary Society.*

**MISSIONS, Roman Catholic Church, Home and Foreign.** A complete account of the missions in the Roman Catholic Church would be coterminous with the history of the growth and progress of Christianity, for the Church is essentially missionary. The commission that was given to the Apostles, by the Founder of Christianity, was not to establish a system of philosophy, nor even to maintain a ceremonial form of worship, but it was "Go ye into the whole world and preach the gospel to every creature." For the first time in the history of the world was there conceived a project of forming a world-wide institution, that would embrace all nations under one headship, no matter how divergent their ideas or their racial traits. The measure of the universality of the Redemption was the fact that the Church was not to be national or racial, but it was to be Catholic or Universal, for all peoples and for all ages. It was designed to be the continuation of the beneficent work of the Incarnation of the Son of God "unto the consummation of all things." To create this world-

wide institution, the primary business of the Apostles and their successors was to preach the gospel to every creature, and the highest vocation of the Church therefore is the missionary vocation.

It would be difficult, then, to give anything but a meagre sketch of the efforts that were put forth to widen the saving influences of the Church, and the ultimate crystallization of the fruits of these efforts into the marvelously complex organization, whose centre is in Rome and whose ramifications extend to the uttermost ends of the earth.

The history of the work of the missions begins on the first Pentecost in the market place of Jerusalem, wherein were gathered representatives from all the nations of the earth. The providence of God had prepared the time and the place through a thousand years of effort, first by preserving the monotheistic idea of God among the Jews, second by importing Greek culture and intellectuality (it was no mere accident that led to the translation of the sacred writings of the Hebrews into the Greek Septuagint), and third, by creating the great civil organizations of the Roman Empire, whose well-made roads led to the pillars of Hercules on the west and to the waters of the Danube on the east and beyond. The same providence of God that had prepared the soil selected the special psychological moment for the seed-sowing, and on the first Pentecost, Peter stood up in the midst of that throng in the market place and preached the first great missionary sermon, a verbatim report of which is given to us by Luke the Evangelist and in Greek, too, that all the world might read it (Acts ii). There were 3,000 converts made that day. The same chronicler tells later on of the missionary journeys of Paul and of the many neophytes that were baptized into the Church. Finally both Peter and Paul came to the city of Rome, and there the Prince of the Apostles set up his throne under the shadow of the throne of the imperial Cæsars, and there it has remained ever since, and out from Rome, and with the authority of the Roman pontiffs, have gone the missionaries that have converted the heathen world to Christianity. Into Italy they went, and beyond into Gaul and Hispania and into the forests of Germany, and along the Danube into the regions of eastern Europe. Before three centuries went by the missionaries with Roman Catholic ordination celebrated the divine mysteries and with Roman Catholic consecration exercised ecclesiastical jurisdiction, and after they had preached Roman Catholic doctrine and had gathered the fruits of their labors, they brought them to the feet of the Roman pontiff for his blessing. A good type of this work is seen in the conversion of Britain. Pope Eleutherius (178 A.D.) sent Fugatus and Damianus to Britain at the request of Lucius, a British chieftain, and an incipient hierarchy was established. (Bede, I, ch. iv); (Tertullian, 'Adv. Hær.' 1).

During the persecution of Diocletian (303 A.D.) many Christians in Britain were done to death and the British martyrology was headed by the illustrious Saint Alban. The happy effect of the change that was wrought by the edicts of Constantine was a source of joy in Britain, because Constantine's mother, Helena,

was the daughter of a British prince, and his father, Constantius, was converted and died in the faith at York in Britain. (Euseb. in 'Vitæ,' 17). When the Pelagian heresy began to disturb the faithful of Britain at the instance of the deacon Palladius, Pope Celestine sent Germanus of Auxerre, in his own stead, to drive out the heretics. (Saint Prosper's 'Chronicle,' 429 A.D.). So with more or less fervor of piety (Gildas, ch. vii) Britain preserved the faith of the Roman Catholic Church "entire and inviolate" and maintained the succession of British bishops up to the time of Saint Augustine, whom Pope Gregory the Great (597 A.D.) sent to England to convert the Anglo-Saxon, and for a thousand years afterward all spiritual jurisdiction was from Rome.

The same story is true in Ireland: Saint Patrick was sent by Pope Celestine; Saint Boniface went into Germany with a similar message and authority, and in a like way Denmark and the Scandinavian Peninsula were brought in subjugation to the yoke of Christ. The missionary went first, and as has been done in India and in China in the 19th century, then gradually the native churches began to grow in numbers, a bishop was sent with consecration and authority from Rome, and the nascent church assumed definite organization until in the course of time it grew into hierarchical perfection. Looking at the missionary work of the Roman Catholic Church from one point of view, there are no foreign missions, because she is a worldwide organization, at home in every land.

This work of evangelizing the countries of Europe went on with more or less ardor all through the Middle Ages. The barbarian races rushed in at the breaking up of the Roman Empire and while the military power was too weak to stem the onward rush, still the spiritual masters of the Church met them and chastened their fierce, warlike spirits, and made them submissive to law and order. The vast monastic system grew up. Canon Farrar says:

"Under the influence of Catholicism the monasteries preserved learning and maintained the sense of the unity of Christendom. Under the combined influence of both, grew up the lovely idea of chivalry molding generous instincts into gallant institutions, making the body vigorous and the soul pure, and wedding the Christian virtues of humility and tenderness to the national graces of courtesy and strength. During this period, the Church was the one mighty witness for light in an age of darkness, for order in an age of lawlessness, for personal holiness in an epoch of licentious rage. Amid the despotism of kings and the turbulence of aristocracies it was an inestimable blessing that there should be a power which by the unarmed majesty of simple goodness made the haughtiest and boldest respect the interests of justice, and tremble at the thought of temperance, righteousness and judgment to come."

The Crusades were but great witnesses to the missionary power of the Church, and they did not a little to break the power of Islam and save Europe from Mohammedan blight. In the 11th century came the great preaching orders, notably the Dominicans and the Franciscans, and for the next three centuries the voices of these missionaries were heard in every corner of the civilized world. The fall of Constantinople and the consequent spread of the city's learned men through the West was a new leaven to awaken the European mind, and the invention of the astrolabe, together with the art of printing from movable types, gave a new impetus to the missionary movement. Columbus was filled with this spirit, and one

or his deepest purposes was to find a shorter way to India and the East in order to bring the gospel to the people who sat in darkness and in the shadow of death. His expedition from Palos was a profoundly religious affair, and on his return from the newly-discovered continent he brought six dusky savages, who were duly instructed and baptized, and Queen Isabella stood at the font of baptism as their godmother. These six converts to Catholicism (1498) have become the 14,000,000 Catholics of the United States to-day. Other discoverers followed Columbus, and while their voyage was in many instances a search for the "Golden Fleece," yet they invariably brought with them missionaries, and wherever they landed their first act was to erect the cross and gather the natives to listen to the tidings of salvation. The Cabots planted the cross on Cape Cod 120 years before the landing of the Puritans at Plymouth Rock. Champlain, who, as Bancroft says, "considered the salvation of one soul more important than the conquest of an empire," opened the Northwest to civilization. Cortez introduced missionaries among the Indians of Mexico, and La Salle, who had been trained in a Jesuit novitiate, brilliant, restless, daring, went by the way of the Great Lakes and down the Mississippi and opened the West to missionary effort.

While the stories of the wonderful Western World were being whispered in Europe a little knot of ardent spirits gathered about Ignatius Loyola at Paris and plighted their vows to work for God. One of the number was Saint Francis Xavier, who within two decades preached and baptized hundreds of thousands in India and penetrated to the very gateway of China. During the 16th century fierce religious dissensions broke out in Europe, and the German and English nations were lost to the Church, but the Jesuit missionaries, together with the Franciscans and Dominicans, made a mighty recompense for the losses in Europe by the gains they secured in India among the Brahmans, in China among the Confucianists, in South America among the Indians and in North America among the savages.

The 16th and 17th centuries were marvelous in the record of missionary triumphs. China had been a sealed book for 2,000 years, but "Where neither merchant nor traveler has penetrated the Roman Catholic missionaries have found their way." (Gutzlaff, 'China Opened,' Vol. I, ch. 6). They brought to Europe exact knowledge of the hidden empire and they did it in defiance of every menace of torture and of death. In 1583 Father Ricci landed at Canton, and for 27 years, in the habit of a Bonze or a Literati, he pursued his way to the imperial throne and baptized many princes of the reigning family. When he died there were more than 300 churches in the different provinces (Gutzlaff, 'History of China,' Vol. II), and by his public interment, with the emperor's official sanction, Christianity was legalized in China (Abbe Huc, Tome II). He was succeeded by Father Adam Schaal, S.J., who taught the Chinese all they know of mathematical science, and later on by other missionaries. The storm of persecution came and "more than 300 churches were either destroyed or converted to profane uses, and more than 300,000 Christians were abandoned to the fury

of the heathen" (Du Halde). The story of their dreadful sufferings, their fierce tortures and their agonizing deaths read like the acts of the martyrs in the early Roman persecutions. In the meantime the evangelization of the Philippines was going on. Three centuries of effort has left 6,000,000 of the Malay race deeply imbued with the principles of Christianity, so that Peyton (Episcopalian) was able to write of them:

"I found in all the towns a magnificent church. I attended mass several times, and the churches were always full of natives, even under unfavorable circumstances, on account of the military occupation. There are almost no seats in these churches, the services lasting from an hour to an hour and a half. Never in my life have I observed more evident signs of deep devotion than those I witnessed there — the men kneeling or prostrated before the altar, and the women on their knees or seated on the floor. Nobody left the church during the services, nor spoke to any one. There is no sectarian spirit there. All have been instructed in the creed, in prayer, in the ten commandments, and in the catechism. All have been baptized in infancy. I do not know that there exists in the world a people as pure, as moral, and as devout as the Filipino people. (Report of Philippine Commission)."

South America, too, had been traversed by the missionary, and the Indians of the Andes as well as the wild tribes of Paraguay had accepted the religion of Christ. Whatever the races of South America and of Mexico know of Christianity to-day, they have learned it from the missionaries of the Roman Catholic Church.

Since the year 1622 the work of the "Missions" has been so specialized as to make it a department of Church administration. In that year Pope Gregory XV canonically instituted the Congregation de Propaganda Fide and gave to it the duties of Church extension. The cardinal prefect of the Propaganda is second only to the Pope himself in power, for he has jurisdiction over all so-called missionary countries. The present prefect, the venerable Cardinal Gotti, is assisted by 25 other cardinals and as many consultants, making a quasi-senate for the administration of Church affairs. Affiliated with the Propaganda there are a half a hundred colleges and seminaries for the education of the natives of the missionary countries, and in these colleges most of the languages of the civilized and uncivilized world are taught. The Propaganda had a polyglot press for the printing of literature.

In 1862 Pope Pius IX instituted a special congregation for the affairs of the Oriental churches, for the Roman Catholic Church exercises a jurisdiction not only in Europe but over portions of the ancient Eastern churches whose beginnings are traceable to the Apostles other than Saint Peter, and claims a jurisdiction over them all through the primacy of Saint Peter. These churches in communion with the Pope are united in a complete doctrinal life, that is, all and every one of the dogmatic teachings of the Roman Catholic Church are accepted by the adherents of these Eastern churches, though they are permitted to retain their ancient liturgies which may be peculiarly their own, and they are not obliged to conform in all matters of discipline, as, in some instances, a married clergy is permitted among them. A distinction has always been made between the acceptation of the dogmatic formularies and the toleration of varying rites and ceremonies. In the former the Church is most exacting, she never permits the least variation in the letter or the spirit of her teaching, but like an indulgent mother she permits her children to

maintain their time-honored customs, liturgies and languages.

The Oriental rites, under the administration of the Propaganda, are as follows:

1. The Ethiopian or Abyssinian Rite, principally in the Abyssinian Church, first planted by Saint Matthew, increased by Saint Frumentus, in the 4th century, was represented at Council of Florence 1445,—principal missionary of modern times Joseph Sapeto. It includes 30,000 souls.

2. Armenian Rite—gospel first preached by Gregory the Illuminator, though the modern Church was reorganized by constituting the bishop of Cilicia as patriarch of the Armenians. The liturgy is in ancient Armenian. It includes 109,000 lay members and 357 priests.

3. Coptic Rite.—Church first established by Saint Mark, disciple of Saint Peter and bishop of Alexandria in Egypt. The people went into schism under Dioscorus, but later on were restored to the unity of the faith. The bishop of Alexandria is the patriarch; 22,500 members with 44 priests.

4. Greek Rite—subdivided into (1) Pure Greek in which the Greek language alone is used; (2) Rumanian Greek; (3) Bulgarian Greek, using the Slav language; (4) Ruthenian Greek, and (5) the Melchite Greek. The entire Greek rite in communion with Rome numbers 4,645,803 members with 5,251 priests. They have numerous seminaries and educational institutions.

5. Syriac Rite subdivided into (1) Pure Syriac; (2) the Syro-Chaldaic; (3) the Syro-Malabaric, and (4) the Maronites. The Syrians number 626,029 with 1,171 priests. All these Oriental rites together make a total of 5,433,332 members under the administration of many bishops and 6,823 priests. Many of these Eastern churches have their seminaries for the training of their missionary priests in the city of Rome. Under the jurisdiction of the Propaganda, according to official statistics, there are:

Oriental churches—5,433,332 members, 6,825 priests.

Occidental churches—27,218,297 members, 33,148 priests.

The latter are distributed as follows:

	Members	Priests
England.....	1,362,489	2,674

\* 11,289,710 population and 12,968 priests.—Official Directory.

This list does not include the Philippine Islands, Porto Rico, Cuba, Mexico nor any of the South American countries, as these countries were ancient dependencies of Spain, and therefore not under the Propaganda. The total aggregate under both branches of the Propaganda or the Missionary department of the Roman Catholic Church at the close of the century was over 32,000,000 with about 40,000 priests.

This statement does not take into account the large army of teaching orders of brothers and sisters and native catechists, nor does it give any estimate of the educational institutions, hospitals and orphan asylums that are under the auspices of the Church in these countries. Some idea of the growth of the missionary work of the Church may be realized from the fact that at the beginning of the 19th century there were only 5,000,000 under the jurisdiction of the Propaganda; at the beginning of the 20th century there were over six times that number.

This account will be incomplete without some statement of the material resources by which the missions have been carried on. The Congregation of the Propaganda has vast funded resources amounting to \$135,000,000, the revenues of which are applied to the support of the work and the colleges under its care. Beside this there have grown up during the 19th century many auxiliary societies; the principal one is known as the Lyons' Society for the Propagation of the Faith. It began with the idea of assisting the poverty stricken missions in New Orleans under Bishop Dubourg, but it soon broadened its scope. It asked only a cent a week from its members, and during its existence (1822-1900) it has gathered and spent \$65,690,017. The *Annals of the Propagation of the Faith*, the official organ of this society, is now issuing 300,000 copies every two months and in 12 different languages. There are 58 different religious societies of priests engaged in the work of the missions, together with 82 orders of brothers who have no aspirations to the priesthood, yet are consecrated to missionary work, and 434 different orders of religious sisterhoods. These 574 different societies embrace a membership numbering very nearly 100,000 who have left all that this world holds dear, of houses, land, country and the pleasures of the domestic hearth, and have sacrificed their lives in poverty, celibacy and exile for the souls of the heathen and the unevangelized. Their consecration to this life is not for a few years, but they count it their greatest joy to spend and be spent till death comes, that the blessed name of Jesus Christ may be better known and more deeply loved.

Under the caption of Home Missions, a short account may be given of the missions to non-Catholics in the United States. The idea of the need of organized effort to present the teachings of the Catholic Church to the American people is what brought together five priests, Isaac Hecker, Augustine F. Hewitt, Clarence Walworth, Francis Baker and George Deshon, who founded the organization known as the Paulist Fathers (q.v.). This idea was practically systematized in its present form by Rev. Walter Elliott, in September 1893, when he began, in Michigan, a series of missions in public halls and churches for the purpose of ex-

plaining the doctrines of the Catholic Church. These missions to non-Catholics prohibited controversy and invited the spirit of inquiry by placing a "Question Box" at the door, into which were dropped all questions concerning the teachings of the Church which anyone desired to have answered. During the last 10 years the work has grown to vast proportions. While the Paulists inaugurated the movement in the United States, yet the work is the normal work of the Church, and therefore belongs to every branch of the service, particularly to the diocesan clergy. The leaders of the movement contemplate the placing in every diocese a band of talented preachers whose business will be extra-parochial and whose duties will be to go into the towns and country places where the Church is weak, or does not exist, and arrange for the inauguration or strengthening of Church organizations. This band of diocesan missionaries will largely do the duties of a Church extension committee in the spiritual and missionary sense. The growth of this "Home Missionary Movement," after 10 years, has been such as to necessitate the building of the Apostolic Mission House at the Catholic University at Washington. This institution will provide special lectures and instructions in missionary methods, and in this way will give training to the diocesan missionary. The legal organization which is financing the work is the "Catholic Missionary Union," incorporated under the laws of the State of New York. Its president is the archbishop of New York, ex officio, and there are six other directors. The practical effect of 10 years of this home mission work has been to give the American people a more correct view of the teaching and spirit of the Catholic Church, to eliminate antagonisms and to make Church relationships more harmonious. It has also tended to increase, and this in no small degree, the stream of converts that has been flowing into the Church.

The growth of the Roman Catholic Church under the jurisdiction of the home missions during the last 100 years has been one of the marvels of the 19th century. The following figures give some measure of it: In 1800 there were 40 priests; in 1830 the number increased to 232; in 1850 to 1,800; in 1906 to 15,177. In 1800 the Catholic population was 100,000, in 1910 it is estimated at not less than 14,000,000. In 1800 there were but 25 churches; in 1910 there are 17,000. The value of church property, as given by census reports in 1850, was \$9,256,758; in 1860 it was \$26,774,119, a ratio of increase of 189 per cent, while the aggregate wealth of the country increased only 125 per cent. In 1870 it was \$60,985,565. In 1906 value of church property had risen to \$292,638,000.

While this external growth indicated by numerical strength and material wealth is very remarkable, the internal growth indicated by evidences of maturing organization as well as by signs of increasing spirituality is none the less remarkable. The first flowering of the Church's inner life is the vocations to the religious orders whereby men and women accept the call to the life of the evangelical counsels. In 1790 there was one convent with less than 10 religious, in 1909 there were over 5,000 convents with more than 60,000 religious. This

army of men and women devote themselves without hope of worldly gain to the alleviation of the ills of humanity in the hospitals by the sick bed, in the tenements of the poor, in the slums among the depraved, in the asylums caring for the orphans and among the aged, who have been stranded on life's shore, without one cent of salary, contenting themselves with meagre fare, with short hours of sleep on a hard bed, and long hours of prayer and devotion to the sick and the poor and the wretched, because they know and are convinced that their reward will be very great in heaven. Many of these religious communities are offshoots of orders that have been established in the old country, but some are indigenous to the American soil. Noteworthy among the communities of men are the Paulist Fathers, founded by five converts, and among the women the Sisters of Charity, founded by Mother Seton, also a convert.

The growth in the Church in the United States of course is principally due to the great stream of immigrants, but not the least element of growth and present strength is the large number of converts who have been drawn to her through the conviction that she is the one Catholic and Apostolic Church. There are no accurate statistics of yearly conversions, but Cardinal Gibbons puts it in this way: "If the same ratio of conversions is preserved throughout the country as exists in the archdiocese of Baltimore, the yearly number of conversions would amount to 44,800 souls." To sum up the aggregate number of Catholics under the American flag is as follows: United States (Cardinal Gibbons' estimate), 14,000,000; Philippines, 6,600,000; Porto Rico, 980,000; Hawaii, 33,000; American Samoa, 3,000; Guam, 9,000, making a total of 21,625,000 souls under the jurisdiction of an apostolic delegate, a cardinal, 13 archbishops and 87 bishops.

On account of the world-wide events culminating in the Great War, 1914-18, for several years it has not been possible to obtain statistics of Catholic foreign missions. It may, however, be safely said that the numbers of converts have greatly increased, in many cases have been doubled.

REV. A. P. DOYLE, C.S.P.,  
Secretary, The Catholic Missionary Union.

**MISSISAGA** (mis'si-sâ'ā) INDIANS, an American tribe of the Algonquian family residing in Ontario, Canada. In 1746 the tribe was admitted to the Iroquois confederacy. The name refers to the "eagle" and also to "great mouth," signifying the outflow of the Missisaga River, near which they lived when first visited by French explorers. They signed a treaty in 1764 with an eagle as their tribal mark. There are upward of 600 of the Missisagas remaining. They inhabit small reservations in Ontario, are mostly Methodists and are progressive, industrious, self-supporting citizens.

**MISSISSIPPI**, one of the southern United States and the seventh admitted to the original Union, situated between lat. 30° 13' and 35° N. and long. 88° 7' and 91° 41' W.; extreme length, north and south, 332 miles; average breadth, 142 miles, varying from 78 miles below lat. 31° N., to 189 miles on that parallel, and 118 miles on the north line; area, 48,610 square miles, being 1.61 per cent of the territorial extent of the United States. It is bounded north by Tennessee, east by Alabama, south, between the Alabama line and Pearl River, by the Gulf of Mexico, and from the Pearl to the Mississippi on the parallel of 31° N., by the State of Louisiana; and west by Louisiana and Arkansas, having below lat. 31° N. the Pearl River, and above that line the Mississippi as the dividing lines. The Round, Horn, Ship, Deer, Cat, Petit Bois and several other islands lying outside of and forming the southern limit of the Mississippi Sound belong to this State. Mississippi was admitted to the Union 10 Dec. 1817 and takes its name from the river which forms its western boundary for a distance of over 500 river miles. There are 80 counties in the State. The capital city is Jackson.

**Topography.**—Mississippi lies in two principal hydrographical divisions, separated by a low broad watershed; the eastern rivers flowing into the Gulf of Mexico, and the western-most streams emptying into the Mississippi. East of the dividing broad ridge the surface of the State consists of broad rolling fertile prairies; the ridge itself is rolling and broken into narrow valleys where streams afford plentiful water supply, while to the west the land falls away into the low swampy lands of the Yazoo and Mississippi rivers. The State is very low, the highest altitude being but 1,000 feet. The coast has a shore line on the Gulf of Mexico of 88 miles, or including the irregularities and islands, of 287 miles. In the eastern part of the State the prairies are covered with grass the greatest part of the year. East of this prairie region extends a level but very fertile tract on the upper course of the Tombigbee River. In the northern district is a range of hills of moderate elevation, well-wooded but devoid of undergrowth. These hills find their western limit in the Walnut Hills; and west of them and between them and the Mississippi

River, in about lat. 32° 30', for a distance of more than 170 miles, north and south, and 60 miles extreme east and west, the country is occupied by immense bottom lands, produced and fed formerly by the inundations of the Mississippi, constituting the so-called "Delta." Nearly all of this low region has been now reclaimed by a system of levees and is rapidly being opened up and settled, and penetrated by railroads. The bottom-lands are about 7,000 square miles in extent.

**Rivers and Lakes.**—Mississippi is well watered by the Homochitto, Big Black, Yazoo, Sunflower, Coldwater and Tallahatchie rivers, all emptying into the Mississippi, and the Pearl, Pascagoula, Leaf and Tombigbee, all emptying into the Gulf of Mexico. There are many small streams in all parts of the State, which, though inferior in capacity to those already noticed, are locally important, watering extensive districts and giving fertility to the soil. In the bottom lands are numerous lakes, bayous and channels, and in this district, along the Mississippi, levees are built by the State partly from a fund derived from a special tax on the land, and partly with moneys derived from the sale of swamp lands. Drainage districts in the Yazoo-Mississippi Delta have been recently established, one project alone calling for the expenditure of \$3,000,000.

**Climate.**—The State lies in what is called the semi-tropic climate belt. The winters are short and mild, the mean temperature 45° F.; the summers are devoid of intense heat, the mean 81°, seldom reaching 100°. Ice from 1 to 2 inches thick forms in the northern part of the State. The elevation of the surface and the Gulf breezes render the climate delightful during most of the year. The annual rainfall ranges from 48 to 58 inches. The death rate is very low—12.9 in 1,000. The heaviest rains occur in late winter or early spring, when the warm Gulf winds meet the cold north winds. The average wind velocity for the whole year is seven miles per hour. The prevailing wind for January is from the north, while it is from the south for July.

**Geology.**—Mississippi is occupied wholly by deposits of the Tertiary and Upper Secondary formations, which, sweeping around from the southern Atlantic States, attain here their greatest width. Near the Gulf of Mexico the sands and clays of the largest periods are spread over the country, and further north the deposits gradually become of greater age. At Vicksburg the Eocene appears at the base of the river bluffs and the upper portion of these is covered by a deep deposit of yellowish loam or loess, containing fresh-water and land shells. This extends over the country eastward and attains a thickness of 60 feet or more. The Upper Secondary appears near Jackson and occupies the northern portion of the State. Fossil remains of a gigantic marine animal, resembling the alligator, are found in the prairie regions.

**Flora and Fauna.**—There are over 100 species of trees in the State, including 15 varieties of oak. There are cypress, poplar, long-leaved pine, tupelo, sycamore, persimmon, magnolia, holly, cucumber tree, sweet-gum, black-walnut and various species of hickory, elm and maple. Wild animals, such as the deer, puma, wolf, bear and wild-cat, are still occasionally

# MISSISSIPPI.

seen. Alligators occur in the Mississippi River as far north as the mouth of the Arkansas, and in some of the smaller rivers; and most of the streams abound in fish. Paroquets are seen as far north as Natchez and wild turkeys are still somewhat common.

**Forestry.**—There are about 32,000 square miles of timbered land in the State. The yellow pine ranks first among the forest trees, and extends northward from the coast for 150 miles. The hills or bluffs along the Mississippi Delta extend to the prairie lands on the eastward and affords numerous forests of oak, gum, poplar, tulip, ash, maple and hickory, and a few pine trees. The prairies of the southern part are covered with the long-leaved pine. Only within recent years has the timber product been important. Nearly all the timber cut consists of yellow pine and oak and other hard woods. Turpentine, resin and other naval stores are no small portion of the product from the timber belt.

**Agriculture.**—The fertility of the soil and a favorable climate give to Mississippi eminent advantages as an agricultural State. Nowhere in the world are there better alluvial lands than the Mississippi bottom or "Delta" contains—an alluvial plain in a mild climate, level as the surface of the ocean and of inexhaustible fertility; and this plain is only a small part of the fertile lands of the State. The table-lands of the north, the loams along the bluffs and banks of the Mississippi, the dark and heavy prairie lands of the northeastern section and the inland bottoms are of scarcely less fertility. The prairies, especially in the Tombigbee district, furnish excellent pasturage and, besides the common crops, produce fine alfalfa. Sugar is produced in the southern portion, besides molasses, but cotton and cotton-seed form the great staple of practically the entire State. Maize and oats are grown everywhere and wheat of fine quality is sometimes, though not commonly, produced in the northern parts. All the fruits of temperate climates grow in perfection, including berries and melons; plums, peaches and figs are abundant and, in the southern part, oranges and pecans. The farms of Mississippi, according to latest reliable statistics, numbered about 274,382 (average size 67.6 acres), total acreage 18,557,533 acres, of which 9,008,310 acres were improved land, valued at \$426,314,634. Of this, \$254,002,289 was value of land, \$80,160,000 was value of buildings, \$16,905,312 of implements and machinery and \$75,247,033 of domestic animals, poultry and bees. Of the farmers, 108,909 were native-born whites, 736 were foreign-born whites, 164,239 were negroes, 248 Indians and 11 Chinese. Of the whites, 67,040 were owners, 41,886 were tenants and 719 managers; of the non-whites, 25,026 were owners, 139,605 were tenants and 106 managers.

The principal crops with their acreage, production and value in 1910 were: Corn, 3,232,000 acres, 66,256,000 bushels, valued at \$41,741,000; wheat, 5,000 acres, 70,000 bushels, valued at \$81,000; oats, 175,000 acres, 3,360,000 bushels, valued at \$1,848,000; sweet potatoes, 56,045 acres, 4,427,988 bushels, valued at \$2,213,944; cotton, 3,400,210 acres, 1,127,156 bales, valued at \$47,340,000; cottonseed, 564,000 tons, valued at \$6,692,000; hay from cultivated grasses, 98,788 acres, 128,351 tons, valued at \$1,732,000;

cane sugar, 24,861 acres, 222,600 tons, valued at \$2,226,000; cane molasses, 2,920,519 gallons, valued at \$1,000,000.

The total value of Mississippi crops for 1910 was, including fruits, nuts and vegetables, \$147,315,621, with approximately \$9,008,310 improved land in farms. In 1915 the aggregate value of cotton, cotton-seed and cotton-seed products was \$82,000,000, and that of grain crops, hay and potatoes was \$57,496,000.

The total value of livestock on farms and ranges in 1910 was \$73,255,756, of which \$15,269,364 represented the value of cattle, \$20,303,851 horses, \$32,028,421 mules, \$4,913,166 swine and the rest asses, burros, goats and sheep. Of the cattle, \$429,587 represented the value of dairy cows.

In 1917 cotton was grown on 2,801,000 acres and yielded 895,000 bales, valued at \$127,538,000; maize yielded 84,050,000 bushels from 4,100,000 acres and valued at \$115,989,000. Oats in the same year yielded 5,700,000 bushels from 300,000 acres and valued at \$5,358,000. Potatoes were raised on 14,000 acres, yielded 1,092,000 bushels valued at \$1,835,000. The 1917 hay crop from 261,000 acres was valued at \$5,676,000. In 1918 the State had 253,000 horses, 307,000 mules, 508,000 milch cows, 644,000 other cattle, 174,000 sheep and 1,902,000 hogs.

Many counties are pressing vigorously the work of tick eradication and more than  $\frac{3}{4}$  of the territory of the State is now freed from that pest and from the Federal quarantine on cattle shipments. The value of the fruit product of the State in 1917 was about \$1,900,000, of this amount nearly 50 per cent was contributed by the peach crop; 10 per cent by apples, and 5 per cent each by figs and strawberries.

**Fisheries.**—This industry is centred at Biloxi, from which great quantities of oysters and shrimps are shipped annually. Buffalo fish, mullet, catfish, sea trout are the principal fishes sought. About 2,000 persons are engaged in the industry in which is invested capital to the extent of over \$500,000. The value of the annual catch is about \$550,000.

**Minerals.**—Mississippi is not a mining State. Clay is the principal product, being produced annually to the value of about \$800,000. Marl, phosphate rock, hydraulic lime, gypsum and lignite are also found in limited quantities. None of these are worked to any considerable extent. There are six mineral springs which in a recent year produced 257,200 gallons, valued at \$52,780.

**Manufactures.**—At the last industrial census, measured by the value of products of its manufacturing industries (\$79,550,095), Mississippi ranked 39th among the States and with an average of 46,702 wage-earners engaged in its industries, the State ranked 31st in this respect. The census reported 2,209 industrial establishments, employing 52,277 persons, of whom 2,386 were proprietors and firm members, 3,189 salaried employees and 46,702 wage-earners. The primary horse power required to operate these establishments aggregated 186,434, the capital amounted to \$81,005,484; the cost of materials aggregated \$41,340,122; the value of products \$79,550,095, making the value added by manufacture \$38,209,973. Of the latter sum only \$19,176,627 was paid in wages and \$3,831,133 in salaries, or an average

of \$410 per annum for each wage-earner, leaving over \$15,000,000 for rent and taxes (\$1,320,197), payments for contract work (\$2,075,852), interest on investment, depreciation, etc. The following table shows the relative importance of the leading manufacturing industries:

INDUSTRY	No. of establishments	Wage earners	Value of products	Value added by manufacture
Lumber and timber	1,296	29,640	\$38,537,743	\$23,681,893
Oil, cottonseed and coke	67	2,336	17,599,651	3,162,023
Cars and shop construction	15	3,278	3,682,100	2,189,199

Fertilizers	11	379	2,059,786	454,801
Turpentine and rosin	61	3,275	1,997,139	1,416,960
Canning	18	1,052	1,654,772	777,577
Wood preserving	4	241	1,478,528	417,511
Printing and publishing	219	663	1,266,730	953,031
Mineral and soda waters	80	308	1,066,364	500,247
Ice	58	476	1,045,940	719,037
Bread and bakery products	83	306	919,007	404,681
Foundries and machine shops	43	423	699,444	437,042
Brick, tile, terracotta, etc.	38	551	512,777	325,234
Carriages and wagons	23	210	479,436	255,947
Flour and grist mills	17	48	410,332	66,054
Gas and heating	8	113	291,959	181,314
Food preparations	5	19		
Copper, tin and sheet metal	18	82	201,376	35,692
Marble and stone	13	58	190,945	100,490
Saddlery and harness	10	24	149,404	72,886
All others	111	1,231	146,914	48,770
			\$2,370,741	\$1,032,577

Of the 52,277 persons engaged in manufacturing industries, of whom 46,702 were wage-earners, as already stated, 46,069 were 16 years of age and over and 633 under 16 years; 1,904 were women and girls and 119 of the latter were under 16 years of age. Consult 'Census of Manufactures' (Vol. I, issued by Department of Commerce, Bureau of the Census, Washington, D. C., 1918).

The above statements do not include about 2,000 cotton-ginning plants.

**Finances.**—On 1 Oct. 1918, the total indebtedness of the State, including \$2,354,607.74 of debt for school funds, on which interest alone is paid, was \$5,102,991. Total bonded debt as of May 1, 1919 is \$8,301,607.74. The assessed valuation in 1917 was as follows: Real estate, \$417,164,293; personal property, \$117,551,983; public service corporations, \$91,580,335; total, \$626,296,611; and the State tax rate \$4 per thousand. The total receipts for the year 1917-18 were \$9,485,790.68, total disbursements, \$8,301,526.57. The main source of income is a direct State property tax, which yields almost 45 per cent of the total income. Of the disbursements in 1918, 15 per cent were for common school purposes and 5 per cent for redemption of the State debt.

**Banks and Banking.**—The first bank in the State was opened in Natchez in 1809. On 31 Dec. 1918, there were 33 national banks in operation with \$30,310,811.87 of deposits, including

savings deposits; and 288 State banks with \$83,891,325.59 of deposits, including \$8,301,526.57 of savings accounts. A comparative statement of the State banks, not including national banks, is: On 30 June 1900, resources, \$19,345,840; on 25 Aug. 1905, \$50,620,811; on 2 June 1910, \$66,688,649; on 31 Dec. 1918, \$149,198,055.78. In this State the Uniform Negotiable Instruments Act has been adopted.

**Education.**—Nearly all the cities and towns in the State maintain graded schools for 10 months in the year. The country free schools are maintained four months. Separate schools are conducted for the two races. In 1915 the children of school age numbered 737,356; the enrolment in public schools were 575,653, and the average daily attendance was 312,650. There were 6,656 licensed teachers, 7,500 public school buildings, and school property valued at \$2,500,000. The State appropriation for common schools in 1915 was \$1,695,651, in addition to which the counties and the towns levy additional taxes for schools, and there are other sources of public revenue for schools. For higher education, there were 115 graded public schools, 17 private secondary schools, 3 public and 2 private normal schools, 8 universities and colleges for men and 6 colleges for women. The men's colleges include the Agricultural and Mechanical College (State) at Starkville; the Mississippi College (Baptist) at Clinton; Millsaps College (Methodist) at Jackson; Jefferson College (at Washington) near Natchez; Chamberlain-Hunt (Presbyterian), Port Gibson; Rust University at Holly Springs. Among the most notable women's colleges are the Industrial Institute and College (State) at Columbus; Blue Mountain College (Baptist) at Blue Mountain; East Mississippi Female College (Methodist) at Meridian; Belhaven College (Presbyterian) at Jackson; Hillman College (Baptist) at Clinton; Whitworth College (Methodist) at Brookhaven; Grenada College (Methodist) at Grenada; Stanton College at Natchez. The University of Mississippi at Oxford is a coeducational institution, as also the Alcorn Agricultural and Mechanical College at Rodney, a State technological institute for colored pupils; also the Tougaloo University, a Baptist missionary industrial institution, at Tougaloo, near Jackson. Normal schools are established at various points.

In 1916 there were 227 newspapers issued in the State, including 16 daily, 183 weekly, 7 semi-weekly, 2 fortnightly, 5 semi-monthly and 14 monthly; 2 agricultural and 13 religious.

**Religion.**—The Baptist Church claims over half the church population of the State; and then follow the Methodist Episcopal, South; the African Methodist, the Methodist Episcopal, the Roman Catholic, the Southern Presbyterian, the Cumberland Presbyterian, the Disciples of Christ and the Protestant Episcopal. At present there are 6,500 Sunday schools conducted by church organizations, with over 33,000 officers and teachers and about 300,000 pupils.

**Charities and Correction.**—There is a State penitentiary, the prisoners being employed at labor on State farms. There are State hospitals for the insane at Asylum and Meridian. The State Deaf and Dumb Institute, for white and colored, and the School for the Blind (white) are located at Jackson. The Beauvoir

**MISSISSIPPI**

**State Capitol at Jackson**

Home is located at Beauvoir. There are charity hospitals supported by the State at Jackson, Natchez and Vicksburg. There are altogether 17 benevolent institutions, of which about 12 have been founded by private or church authorities. At present there are about 435 paupers in institutions, being 24.3 per 100,000 population, and about 2,300 prisoners in penal institutions, being 127 per 100,000 of the population.

**Government.**—The State is governed under a constitution adopted in 1890, with some later amendments. The governor is elected for a term of four years, and receives a salary of \$5,000 per annum. He is not eligible for re-election. Other executive officers are the lieutenant-governor, auditor, attorney-general, secretary of state and treasurer. Legislative sessions are held biennially, beginning on Tuesday after the first Monday in January; but only those sessions held in the leap years are unlimited as to scope and duration; the other sessions can deal only with revenue and appropriations and such other matters as the governor shall submit to them by message. The legislature and entire State government are Democratic. Each member receives \$400 per annum and mileage. There are eight representatives in the United States Congress. The legislature is composed of 138 representatives and 45 senators. There are six supreme judges, elected by the people for eight years; and circuit judges and chancery judges, also elected by the people for four years. Voters must have resided in the State for two years and in the election district for one year. Registration is necessary, and the voter must be able to read any section of the Constitution of the State, or be able to understand the same when read to him, or give a reasonable interpretation thereof. He must also have paid taxes for two years and must pay a poll tax of \$2 for school maintenance.

State and county officials are nominated at primary elections, the expenses being paid by the political parties interested. The commission form of government is permitted to municipalities, which enjoy a large measure of home rule. The initiative and referendum is allowed in municipal charters and is called into operation by petition of 10 per cent of the voters. A commission charter may be abandoned by any city by a vote of the electors after it has been six years in operation. Among the special statutory provisions is one according to which a public service corporation forfeits its charter for intrastate commerce in case it removes a suit from the State to the Federal courts. Contributory negligence is not recognized as a bar to a suit for damages for injuries, etc. Women may make contracts and dispose of or acquire property on equal terms with their husbands.

**Transportation.**—The total length of railroads within the State in 1916 was 4,242 miles; besides 44 miles of electric interurban railways. The most important lines were, the Yazoo and Mississippi Valley, having 1,143 miles within the State; the Illinois Central, 679 miles; the Gulf and Ship Island, 305 miles; the Kansas City, Memphis and Birmingham, 143 miles; the Mobile and Ohio, 315 miles; the Southern, 377 miles; the Alabama and Vicksburg, 141 miles; the Louisville and Nashville, 74 miles;

the New Orleans and Northeastern, 153 miles; the New Orleans and Great Northern, 106 miles; the Mobile, Jackson and Kansas City, 370 miles; and the Mississippi Central, 164 miles. Vicksburg, Greenville and Natchez are the principal ports on the Mississippi River; and Gulfport, Biloxi and Pascagoula, on the Gulf of Mexico. The various counties are spending a great deal of money improving the roads by graveling to the extent of many hundreds of miles in the aggregate.

**Population.**—The total population in 1910 was 1,797,114, or 38.8 to the square mile, of which 908,000, or 58 per cent, were colored. There were 1,253 Indians and 9,389 foreign-born inhabitants, of whom 1,665 were German, 2,137 Italian and 747 Irish. The estimated population on 1 July 1916 was 1,951,674. Until 1830, and later, the white population was somewhat in excess of the colored; but in the decade 1830 to 1840 the cessions of Indian Territory within the State made by the Chickasaw and Cherokee Indians, and the opening for occupancy of the lands so ceded, constituting more than half the State, invited an immediate and immense inflow of settlers, with very many slaves because of the fine cotton lands; the colored population at once ran over the white, and it has so remained since. The history is shown by this table:

YEARS	Whites	Free colored	Slaves	Total
1800	5,179	182	3,489	8,850
1810	23,024	240	17,088	40,352
1820	42,176	458	32,814	75,448
1830	70,443	519	65,659	136,621
1840	179,074	1,366	195,211	375,651
1850	295,718	930	309,878	606,326

The total population in 1860 was 791,305; in 1870 was 827,922; in 1880 was 1,131,597; in 1890 was 1,289,660; in 1900 was 1,551,270; in 1910 was 1,797,114. The largest cities are Meridian 25,378; Jackson, 21,262; Vicksburg, 23,264; Natchez, 12,670. Other important towns are Hattiesburg, Greenville, Laurel, Biloxi, Yazoo City, Gulfport and McComb City—named in order of population.

**History.**—Hernando de Soto (q.v.) and his companions first visited the Mississippi region in 1539. They made no settlements, however, and the death of the leader in 1542 put an end to the expedition. In 1682 La Salle descended the Mississippi, took formal possession of the adjacent country for the king of France and called it Louisiana. In 1698 M. d'Iberville was authorized by the French king to colonize the regions of the lower Mississippi. He landed near Ship Island and, from this point, setting out with two large barges, explored the coast, discovered the mouth of the Mississippi, reaching the bend at the mouth of the Red River, and returning to Ship Island erected a fort at the Bay of Biloxi, about 80 miles east from the site of New Orleans. He then embarked for France, leaving the fort in command of his two brothers, Sauvolle and Bienville. In December 1699, Iberville returned, and soon after built a fort on the banks of the Mississippi. In 1700 the Chevalier de Tonty

arrived at Iberville's fort with a party of Canadian French from Illinois. Availing himself of de Tonty's knowledge of the country, Iberville dispatched a party under his lead to explore the river and its banks. They ascended to the Natchez country, 400 miles above the French fort, and here selected a site for a fort and called it Rosalie. A settlement was also made in 1703 on the Yazoo River, which was called Saint Peter's. The colonies thus planted grew but slowly, and New Orleans, being founded soon after, drew off a large portion of the colonists from the interior, besides attracting the new immigrants. In 1728 the settlers and the Natchez Indians became enemies and, as a result, the latter massacred the settlers, and over 200 persons were killed and 500 taken prisoners. The captives were, however, released, and new and stronger forts were erected. Aided by the Choctaw tribes, the French succeeded in destroying the tribe, the greater part of which fell in battle. In 1733 the colony went to war with the Chickasaws, allies of the English, and the conflict continued for several years. There was a peace, followed in 1752 by another Indian war. In 1762 when Florida was ceded to Great Britain, that part of the present State lying south of a line drawn eastward from the mouth of the Yazoo River (practically from Vicksburg) was claimed to be part of Florida; and when in 1781 Spain conquered Florida, that part of the State came under Spanish rule. In 1798 the Mississippi Territory was created by Congress. Its boundaries were the Mississippi River on the west, the 31st parallel on the south, the Chattahoochee on the east and a line drawn from the mouth of the Yazoo due east on the north. The Territory having been surrendered to the United States as part of Georgia, the consent of that State had been previously obtained to the establishment of a territorial government. This consent was followed in 1802 by the further cession by Georgia of all her lands south of Tennessee, and these by an act of Congress in 1804 were attached to the Mississippi Territory, which thus comprised the whole of what are now the States of Alabama and Mississippi from the 31st to the 35th parallel. The territory between the Pearl and the Perdido rivers was added in 1811, having been wrested from Spain under the plea that it had originally formed a part of Louisiana. In March 1817, Alabama was separated from Mississippi and organized under a territorial government of its own; and on 10 December of the same year Mississippi was admitted into the Union as an independent State. In 1861 it passed an ordinance of secession, took a prominent part in the Civil War, and finally, in January 1869, was readmitted to representation in Congress, after ratifying the 15th amendment. The principal battles fought here during the Civil War were those of Corinth, Baker's Creek, Holly Springs, Iuka and the siege of Vicksburg. The several State constitutions have been those of 1817, 1832, 1869 and 1890; the latter, with certain amendments, being now in force. The State has had four territorial governors, two provisional governors, one Union Democrat, three Republican and 30 Democratic governors.

## GOVERNORS OF MISSISSIPPI

TERRITORIAL		
Winthrop Sargent		7 May 1798
William C. C. Claiborne	(Recess appointment)	25 May 1801
William C. C. Claiborne	(Appointed on confirmation)	26 Jan. 1802
Robert Williams	(Appointed on confirmation)	1 March 1805
Robert Williams	(Appointed on confirmation)	14 March 1808
David Holmes	(Appointed on confirmation)	7 March 1809
David Holmes	(Appointed on confirmation)	31 March 1812
David Holmes	(Appointed on confirmation)	10 Dec. 1814
STATE		
David Holmes	Democrat-Republican	7 Oct. 1817, to 5 Jan. 1820
George Poindexter	Democrat	5 Jan. 1820 to 7 Jan. 1822
Walter Leake	"	7 Jan. 1822, to 17 Nov. 1825
Gerard C. Brandon <sup>18</sup>	"	17 Nov. 1825, to 7 Jan. 1826
David Holmes	"	7 Jan. to 25 July 1826
Gerard C. Brandon <sup>2</sup>	"	25 July 1826, to 9 Jan. 1832
Abram M. Scott <sup>3</sup>	"	9 Jan. 1832, to 12 June 1833
Charles Lynch	"	12 June to 20 Nov. 1833
Hiram G. Runnels	"	20 Nov. 1833, to 20 Nov. 1835
John A. Quitman <sup>4</sup>	Whig	3 Dec. 1835, to 7 Jan. 1836
Charles Lynch	Democrat	7 Jan. 1836, to 8 Jan. 1838
Alexander G. McNutt	"	8 Jan. 1838, to 10 Jan. 1842
Tilghman M. Tucker	"	10 Jan. 1842, to 10 Jan. 1844
Albert G. Brown	"	10 Jan. 1844, to 10 Jan. 1848
Joseph W. Matthews	"	10 Jan. 1848, to 10 Jan. 1850
John A. Quitman	"	10 Jan. 1850, to 3 Feb. 1851
John I. Guion <sup>5</sup>	"	3 Feb. to 4 Nov. 1851

Settlements in the Mississippi Valley' (1890); Tracy, 'Mississippi as It Is' (1895); Wall, 'The State of Mississippi' (1879); Winsor, 'The Mississippi Basin' (1895); 'Publications of the Mississippi Historical Society' (16 vols.); Rowland, 'Encyclopædia of Mississippi History' (2 vols., 1907); Reports of the Executive Departments of the State; Rowland, 'Official and Statistical Register of the State of Mississippi' (Centennial ed., Madison, Wis., 1917).

<sup>1</sup> Governor Leake died 17 Nov. 1825, and was succeeded by Lieutenant-Governor Brandon.

<sup>2</sup> Governor Holmes resigned in July 1826, and was succeeded by Lieutenant-Governor Brandon.

<sup>3</sup> Governor Scott died 12 June 1833, and was succeeded by Charles Lynch, president of the senate.

<sup>4</sup> Governor Runnels vacated the executive office 20 Nov. 1835, and was succeeded by John A. Quitman, president of the senate.

<sup>5</sup> Governor Quitman resigned 3 Feb. 1851, and was succeeded by John I. Guion, president of the senate.

<sup>6</sup> Governor Guion's term as senator expired 3 Nov. 1851. The senate met 25 November and elected James Whitfield, president, who served as Governor until 10 Jan. 1852.

<sup>7</sup> Governor Foote resigned 5 Jan. 1854, and was succeeded by John J. Pettus, president of the senate.

<sup>8</sup> Governor Clark was removed by Federal soldiers 22 May 1865, and was succeeded by Judge William L. Sharkey as provisional governor by appointment of President Johnson.

<sup>9</sup> Governor Humphreys was removed by Federal soldiers 15 June 1868, and was succeeded by Adelbert Ames as military governor.

<sup>10</sup> Governor Alcorn resigned 30 Nov. 1871, and was succeeded by Lieutenant-Governor Powers.

<sup>11</sup> Governor Ames resigned 20 March 1876, and was succeeded by John M. Stone, president of the senate, the lieutenant-governor having been impeached.

EDWARD MAYES,

Author of 'Educational History of Mississippi.'

**MISSISSIPPI**, University of, at New Oxford, Miss., was chartered 23 Feb. 1844, and the Lyceum building, two dormitories and residences for four professors, built from the plans of William Nicholl, elected supervising architect, were ready for the opening of the first session which took place 6 Nov. 1848, with a faculty of four members and 50 students. From its opening until 1880 the university was maintained by annual appropriations made by the legislature. In 1856 a special appropriation of \$100,000, to be paid in five yearly instalments, was made by the legislature and with the aid of this the university made its first large growth in facilities and equipment. Since then commensurate with the growth of the institution the legislature has provided the necessary funds. The departments besides the collegiate comprise governmental science, law, engineering, pedagogy, medicine and pharmacy. The liberal appropriations made by the legislature have enabled the university to enlarge its facilities with fine new buildings, including a commodious dormitory for women students, who were welcomed to the university courses upon equal conditions with men in 1882, and a new library building, in part a gift from Andrew Carnegie, erected in 1911. The tuition fees are \$60; annual living expenses amount to \$130. The faculty now numbers 30; the average annual attendance of students is 400. From its inception to 1917 the number of graduates was 2,200, of whom 1,700 were living; during the World War, 1914-18, 400 of the students were enrolled with the colors.

**MISSISSIPPI AGRICULTURAL AND MECHANICAL COLLEGE**, founded in 1880, at Agricultural College, Miss. The regular four years' courses offered are the agri-

cultural, mechanical and textile, leading to the degree of B.S.; a short course (10 weeks for two years) is given in the winter; graduate courses are also provided; and there is a preparatory department. Women are admitted to all courses. The experiment station is connected with the college, and receives special Federal appropriation; and farmers' institutes are organized by the college and attended by members of the faculty; in 1910 such institutes had an attendance of 2,000. The college was endowed by the Federal land grants of 1862 and 1890, and receives also State and Federal appropriations; no tuition is charged to residents of the State. Military instruction is given. In 1918 the students numbered 1,207; the instructors, 72; and the library contained about 36,200 volumes.

**MISSISSIPPI BUBBLE**, a celebrated financial scheme projected by John Law (q.v.) at Paris in 1717. Law issued shares for a vast company to be called the *Compagnie d'Occident*, and to be engaged in the colonization and cultivation of the banks of the Mississippi. Reports skilfully spread as to gold and silver mines discovered in these parts raised in the people the hope of great gains. The company soon absorbed those of the Senegal and the East Indies, and took the new title *Compagnie des Indes*. Such were the hopes raised by this undertaking that the shares originally issued at \$100 were sold at 10, 20, 30 and 40 times their value. Law had promised to the regent that he would extinguish the public debt. To keep his word he required that the shares in this company should be paid for one-fourth in coin and three-fourths in *billets d'état* or public securities, which rapidly rose in value on account of the foolish demand which was created for them. In October 1719 the shares mounted as high as \$4,000. The state took advantage of the popular frenzy to issue increased quantities of paper money, which was readily accepted by the public creditors and invested in shares of the *Compagnie des Indes*. This went on till the value of the paper money in circulation was more than three milliards, while the value of coined money was no more than 700,000,000. Before this stage was reached Law himself who had originated the idea of paper money had endeavored to check the issue, but his efforts were unavailing. A catastrophe was now inevitable. About the end of 1719 the more prudent speculators began to sell out. In payment of their shares they received, of course, in great part, *billets d'état*, and with these bought gold, silver, diamonds, lands or anything else having a real value. As the *billets* became depreciated such articles as tallow, soap, etc., were often bought at fabulous prices. Law struggled desperately against the fall in the value of these shares, but all his devices to check their downward course were futile or had only a temporary success, and when the state finally declared that it would receive no further payments in paper, he perceived that all attempts to bolster up the scheme were in vain, and made his escape from France (December 1720). The affairs of the company were wound up by the state acknowledging itself debtor to the creditors of the company to the amount of \$340,000,000. The public debt was augmented by \$2,600,000 of "annual rentes."

**MISSISSIPPI CATFISH** (*Ictalurus furcatus*, or *Ictalurus ponderosus*), the largest of American catfish (so called from the purring sound it makes when taken out of the water). It is chiefly found in the Mississippi River, but it also inhabits the Great Lakes, the larger waters of the Saskatchewan and the Missouri valleys. In color it is greenish slate with paler sides. The fish grows darker as it ages. The flesh is firm, flaky and of fine flavor. The fish sometimes reaches 150 pounds in weight. It spawns in April or May. It is caught with a hook and prefers live bait. It is called "mud cat" and "flannel mouth" in the South.

**MISSISSIPPI COLLEGE**, Clinton, Mass., founded in 1826 under the auspices of the Presbyterian Church, came under control of the Baptists in 1850. It has an academy and collegiate department. The college courses lead to the degrees of B.A., B.S and M.A. In 1915 the school had 17 professors and instructors, and 430 students. The library had 5,000 volumes. The property was valued at \$405,000, exclusive of the productive fund of \$130,000. The annual income is \$25,000.

**MISSISSIPPI RIVER** (Ind. *Missi Sepe*, "father of waters," "great river"), the main stem of the greatest drainage system of North America, and one of the greatest in the world (1,257,000 square miles); draining the entire western slope of the Allegheny-Appalachian range, and all the eastern slope of the United States Rockies save a small southern portion, with all between—19 States and two Territories in all, from New York to Montana, but narrowing considerably in the lower basin. The Mississippi extends nearly the entire length of the United States, from within 100 miles of Canada to the Gulf of Mexico, in a watercourse of about 2,550 miles, varied slightly by the lower river bends and cut-offs; and forms the boundary, total or partial, of 10 States—Minnesota, Iowa, Missouri, Arkansas and Louisiana, on the west, and Wisconsin, Illinois, Kentucky, Tennessee and Mississippi, on the east. On its banks are four cities with from 200,000 to 600,000 inhabitants (Saint Louis, New Orleans, Saint Paul and Minneapolis), and 17 others of over 10,000—Winona, Minn.; La Crosse, Wis.; Dubuque, Clinton, Davenport, Muscatine, Burlington and Keokuk, Iowa; Rock Island, Quincy, Alton and Cairo, Ill.; Hannibal, Mo.; Memphis, Tenn.; Vicksburg and Natchez, Miss.; and Baton Rouge, La. It is navigable over 2,000 miles from its mouth to Minneapolis (Falls of Saint Anthony), though the end of regular navigation is Saint Paul, 13 miles below; and is brokenly navigated by smaller steamers to Leech River, 415 miles farther on, along different reaches. It has about 100,000 tributaries, 240 large enough to figure on small-sized statistical charts, 45 of them navigable for distances varying from 2,300 to 50 miles, and aggregating some 15,700 miles of inland navigation; steamers can go upon it and its tributaries some 4,000 miles east and west without breaking bulk—from Great Falls, Mont., on the Missouri, to Olean, N. Y., on the Allegheny. The greatest of the affluents, the Missouri, is usually considered the main stream, being about 1,600 miles longer than the upper Mississippi above the mouth (4,200 miles from the Gulf, the longest river course on the globe), having

a basin more than three times as great, and discharging a considerably larger volume of water annually; nevertheless the upper Mississippi has so much steadier a flow—the Missouri shrinking at low water to 1-48 the volume in flood, and practically unnavigable then—that the former as between the two maintains the permanent navigability of the joint stream, and is justly enough held the main body in popular estimation; besides that the axial valley is continuous. Moreover, the Ohio with its great rainfall (41.5 inches, against 35.2 for the upper Mississippi and 20.9 for the Missouri) discharges far more than either, and if that were valid ground, should itself be held the main stream.

The chief tributaries of the lower Mississippi are as follows, in order of contribution to the volume of water in the lower river: Ohio, 1,300 miles long (to source of Allegheny); width 1,200 feet at Pittsburgh, 3,000 at mouth; basin, 207,111 square miles; annual discharge, about 5,000,000,000 cubic feet; per second, 158,000. Missouri, 2,908 miles long; width, 1,500 feet at Fort Benton (head of large-steamer navigation), 3,000 at mouth; basin, 527,690 square miles; annual discharge, 3,780,000,000 cubic feet; per second, 120,000. Upper Mississippi, 1,330 miles long; width, 1,200 feet at Saint Paul (head of large navigation), 5,000 at junction with the Missouri, basin 179,635 square miles; annual discharge, 3,300,000,000 cubic feet; per second, 105,000. Arkansas, 1,514 miles long; width, 1,500 feet at Fort Smith (head of large navigation), and about the same to its mouth; basin, 184,742 square miles; annual discharge, 2,000,000,000 cubic feet; per second, 63,000. Red, 1,200 miles long; width, widely varying from log dams, etc.; annual discharge, 1,800,000,000 cubic feet; per second, 57,000. The three next greatest basins are the White, Yazoo and Saint Francis. The total annual discharge, including three outlet bayous, is 21,300,000,000 cubic feet, or 675,000 per second.

The following are the distances from the farthest sources on the main stem to the chief landmarks on its course, and the mean-water elevations above sea-level at the end of the reaches:

	Dist., Miles	Elev., Feet
Mississippi Springs, above Itasca, and 64 miles from outlet	.....	1535
Outlet at Itasca to outlet at Winnibigoshish Lake	114	1292.8
To Falls of Saint Anthony (Minneapolis)	546	782
To Saint Paul, Minn.	559	680.5
To La Crosse, Wis.	715	621.2
To Prairie du Chien, Wis.	787	597.5
To Dubuque, Iowa	849	578.2
To Rock Island, Ill.	957	533.7
To Burlington, Iowa	1,039	505.1
To Keokuk, Iowa	1,086	472.3
To Quincy Bridge, Ill.	1,127	453.8
To Hannibal, Mo.	1,147	444.9
To mouth of Illinois River	1,249	399.4
To Saint Louis, Mo.	1,288	384.8
To mouth of Ohio River (Cairo, Ill.)	1,470	275
To Memphis, Tenn.	1,695	201

(Or 2,553 miles from ultimate sources).		

The "source" of a great river is often a term of little import, as its waters may gather from the drainage of a large district; but taking it in its current sense, of the ultimate reservoir of its farthest extension, the Mississippi rises in the basin draining into Itasca Lake (q.v.) in northern Minnesota. Into the west arm flows from the heights, through a couple of small ponds, a stream of considerable power and fullness, called by its discoverer Nicollet the "Infant Mississippi," and now confirmed as such so far as there is one ultimate stream; and out of it, from the north arm, flows the Mississippi. Nicolett in 1836 found it 16 feet wide and 14 inches deep at the outlet. Government Commissioner J. V. Brower in 1893 found it 50 feet wide and three or four feet deep in mid-channel, with a muddy bottom and a current of about two miles an hour. As the current increases it narrows to some 30 feet; is filled with debris, shoals and boulders; and for some distance down the stream free passage with canoes is impeded by reeds, flag and water grass. It continues northward with slight falls and rapids to Lac Travers or Bemidji, about 10 miles long by 4 feet wide, set in a basin surrounded by forested hills and with a beach of perfectly white sand. Thence it issues on the east, and for 25 miles southeastwardly brawls over a series of rapids, from whose foot it flows in a clear even stream 120 feet wide and four or five feet deep to Cass Lake, twice as large as Bemidji; thence on the east six miles to Winnibigoshish, still larger, whence it issues again on the east 172 feet wide, and as before grows narrower, deeper and of swifter current as it drains the marshes and meadows below. Just above the junction with Leech River, the outlet of the noble Leech Lake, the largest in this region—25 by 15 miles—it strikes a bed of sandstone with a fall of 20 feet in one-sixth of a mile, and is ruffled into rapids called the Falls of Pokegama, in a channel 80 feet wide. This is about 130 miles from the source; small steamers run to the foot of the rapids. Thence it runs crookedly with a general south trend, about 120 feet wide, through hardwood forests, swamps and sandhills, covered with glacial gravel and boulder drift. From the entrance of Swan River to that of the outlet of Sandy Lake there are six rapids; the latter lake has a small stream running from a small pond to the eastward, not far from Saint Louis River, emptying into Lake Superior at Duluth, and forms the old canoe route from Minnesota to the Great Lakes. Thence to the entrance of Pine River, about 150 miles from the Pokegama Falls, it has numerous rapids and is broad enough to enclose several islands; it receives several smaller tributaries; and the powerful Crow Wing River, 47 miles below Pine River, also fed from a district of lakes, contributes almost as much volume to the joint stream as the Mississippi itself. At the Sauk Rapids, a mile long, 133 miles below the Crow Wing and at the entrance of Sauk River, begin the first rocky banks of Potsdam sandstone, extending down to Rock Island.

At the Falls of Saint Anthony, 80 miles below, the river descends about 65 feet in three-fourths of a mile, forming rapids interrupted in the middle by a precipice 18 feet high, over

which the river, now 1,200 feet wide, formerly plunged in a cataract of great beauty and fame. An island divided it into two channels, the western being the larger. Here the water power has been used to build up the immense manufacturing interests of Minneapolis. Thirteen miles below a convenient landing has established Saint Paul as the head of continuous navigation for large steamers and made it the great wholesale distributing point for the Northwest, and onward the valley is richly fertile, very beautiful and often of much grandeur. Below Saint Paul the river widens into the island-studded "Lake" Pepin. From Davenport, Iowa, 943 miles from the source, to Rock Island, 14 miles below, there are rapids of 22 feet fall, formerly obstructing the navigation; the government has now cut a channel in the solid rock. The formation of the bed is peculiar; it consists of stratified limestone, crushed into folds which form a series of six or seven parallel bars across the channel, one to three miles apart. From this point onward the formation is carboniferous and the banks rise into picturesque rocky bluffs sometimes 300 feet high, as far down as nearly to the beginning of the alluvial region, 140 miles below Saint Louis. At the mouth of the Des Moines River, 130 miles below Rock Island, is another rapid of 24 feet fall, now avoided by a ship canal; and between Muscatine and Keokuk is one 12 miles long, with 23 feet descent. Nearly 200 miles below Keokuk the first great change comes to the river. Into this clear placid stream is poured a swift, muddy, red torrent, at high water of far greater volume than its own, that of the enormous Missouri, creating turbulent eddies, and for many miles flowing side by side with the white northern stream without mixing of waters. The bends and winds of the river, making the current cross from side to side, finally mingling them within 100 or 150 miles. Not quite 200 miles farther on comes in the mighty Ohio, with a volume over two-thirds as great as that of the other two united.

But 30 miles above here and three miles above the great geological landmark of Cape Girardeau, Mo., begins a still greater change: the vast northern upland, mainly elevated rock with a moderate soil covering it, which has been drained by the river, ceases. The remaining 1,100 miles of its valley is the creation of its own silt, through which it meanders in deep curves and loops and narrow horseshoes, shifting its channel capriciously, continually building up one side and cutting away the other, but rarely twice the same side. Cape Girardeau is an ancient headland of an ancient ocean, into which the silt-laden river poured its deposits as the present river does into the Gulf, and which has receded, leaving more than 1,000 miles of the garden of the world. And the relation of the river to its bottoms is reversed also. From the Falls of Saint Anthony to the end of the uplands are deep strips of bottom land overflowed at high water; but except at such periods they are above the river. But in the lower bottoms made by the river itself, the surface of the latter is normally above that of the bordering lands. The friction of the current on the sides and bottom causes the water held back to keep depositing fresh layers of the heavier sediment on the edges and in the channel; so that as the depth of water

remains the same and the channel continually shallows, the surface of the water must rise and would at last empty itself did not the same process elevate its retaining walls. The river therefore runs in a groove, cut into a ridge considerably above the surrounding country, its surface much higher and its bed much lower than the region for many miles back; it slopes away with a gradient at first of about seven feet to the mile, decreasing regularly to the outer edges of the flood plain—which at the Ohio is about 10 miles wide and 50 to 70 in lower Louisiana, widening to 150 at the Delta—and ending at about six inches per mile in the swamps and bayous at the outer edge. The natural method of discharging the waters at flood seasons is to overflow the banks and flood the adjacent country, part of the waters flowing off through semi-river channels (bayous) in the soft earth, the rest remaining in pools and swamps and gradually evaporating; and the attempt to keep it in the same channel which suffices for low water, to comport with the needs of civilized occupancy, has produced an excessively costly battle with nature, of which the success is by no means yet assured or assurable.

The junction of the Red introduces us to still another phenomenon. That great river formerly discharged its main waters to the Gulf through the Atchafalaya "Bayou," roughly parallel with the Mississippi; but that and the Mississippi both sent their surplus waters through an amazing network of lesser bayous, which still penetrate southern Louisiana with thousands of miles of navigable channels. The head of the Atchafalaya silted up and became choked with logs and rubbish, and the Red opened a channel into the Mississippi; later in the 19th century the government dredged out the head of the bayou to make a navigable channel; it rapidly widened to a great river, became again the main channel of the Red and threatened to ruin a great district of fertile plantations, so that works had to be undertaken to prevent its enlargement. As we approach the place where the Mississippi plain merges in the great coastal plain of the Atlantic, the surface grows lower and the soil spongier; and the river (which above the Mississippi is about a mile wide, thence to the Red half a mile to a mile, with occasional reaches of a mile and a half, and below the Red narrows to a width of about 3,000 feet, which it retains with curious persistence) widens to about a mile and a half and enters the Gulf—through the Delta, a quaking, impassable, finally half liquid salt marsh land in process of making—by three great arms or "passes," of which two ramify still further. These are known as the Southwest Pass, the South Pass (with two arms near the Gulf) and an eastern arm soon dividing into North Pass and Pass à l'Outre.

It should be said, however, that these alluvial bottoms do not quite monopolize the space from the Ohio to the Gulf. Here and there on the east bank there are spots where high solid ground, old capes and peninsulas of the antique ocean, come down to the river side; as at Columbus, Ky., Randolph and Memphis, Tenn., Vicksburg, Grand Gulf and Natchez, Miss., and Baton Rouge, La. With one exception, each of these spots has been utilized as a considerable

road for the commerce of the interior to the great waterway.

**Improvements of the River.**—These are broadly divisible into two classes: those designed to improve navigation and those designed to prevent overflows. From 4 March 1789 to 30 June 1886, a period of 97 years, in the improvement of the Mississippi and its 44 navigable tributaries, the Federal government expended a total sum in round numbers of about \$57,000,000. The control of the waters of the Mississippi so as to make the navigation of the river safe and so as to make the immediately surrounding country fit for agriculture has been an economic problem of more than merely local interest. The problem is national historically, for to the control of the Mississippi as much as to any other one thing the historical growth of the country is due. It is even more strikingly true that the problem is of national significance from the commercial point of view, simply because this vast river drains the richest territory in the world, 70 per cent of the area of the United States. Among the older methods of control was that of narrowing the channel to deepen the available water. This operation involved closing off side channels around islands, etc.—stopping up the heads, diking off small bays and inlets, strengthening caving banks and obstructing the side current by solid spur dikes, set obliquely out into the stream nearly to the channel line. After the entrance of the Missouri, the mass of sediment furnishes a new and effective weapon. Between here and Cairo hurdles of piles and brush are laid along the banks, jetty fashion; the sediment packs into the brush and speedily becomes solid, and the results in creating new banks to narrow the channel have been most gratifying, besides reclaiming large tracts of overflowed bottom lands. Caving banks are protected by mattresses; the depth of water being slight, they are made lighter than in the lower river. Below Cairo the work is of the same nature, but more difficult, from the volume of water and the alluvial lands easily crumbling. Here the channel is narrowed, where it exceeds about 3,500 feet, by mattresses from 800 to 2,000 feet long and 200 to 300 feet wide, weighted down with rubble stone. But the immense weight of water, which may be from 60 to 100 feet deep at flood, has forced their continual increase in weight and strength of construction. The brush and small saplings have been replaced by fascines (solid rods tightly withed together), the binding poles by strong wire; the cost per foot of bank protection trebling in 25 years, from about \$10 to \$30. For closing off side channels and water-courses, rows of piles are driven in, 8 or 10 feet apart and the rows 20, and the upper row interwoven with brush. Caving banks are graded down to a slope and faced with mattresses; of late, however, rubble stone has been used with better success. On the lower river, where stone has to be brought from long distances, concrete has been experimented with.

Another system is that of levees. Formerly, under the slave system, each planter along the rivers liable to overflow had rude dikes erected for himself; the importance of the work to neighborhoods led to common town action, then to county and State action. These levee systems, of course, were broken

through in floods, but the water rose only to its natural height in the channel and soon subsided; and to furnish absolute security against overflow would cost not only an enormous sum but would exceed a hundredfold the capital value of the districts imperiled. When in 1879 Congress appointed the Mississippi River Commission, it forbade them to consider the protection of lands from overflow as part of their work. Nevertheless a majority of the commission believed that the levee system could be used efficiently to improve navigation, and estimated that \$11,443,000 below Cairo would furnish a complete protection for the banks and double the depth of permanent river channel, by the natural scour of the water as with jetties. The level of the river has risen with the levees over six feet and is estimated to ultimately reach 11 when the levee system has made a smooth solid bank all the way, with no place for overspill. These levees are from 8 to 14 feet high, with a width on top of eight feet and a side slope of one-third; they project three feet above high water, but need to be raised every few years as the river rises. They have to be placed near the banks to protect riverside plantations and avoid the slope away from the river; and very large amounts of them have to be replaced yearly from cave-ins.

The Act of 28 June 1879, by which the commission was created, defines its duty in part as follows:

To direct and complete such surveys of said river, between the Head of the Passes near its mouth to its headwaters as may now be in progress, and to make such additional surveys, examinations, and investigations, topographical, hydrographical, and hydrometrical, of said river and its tributaries as may be deemed necessary by said commission to carry out the objects of this act. To take into consideration and mature such plan or plans and estimates as will correct, permanently locate, and deepen the channel and protect the banks of the Mississippi River; improve and give safety and ease to the navigation thereof; prevent destructive floods; promote and facilitate commerce, trade, and the postal service;

Under the authority of this and subsequent acts making appropriations and relating to the subject, surveys and observations have been carried on and works of improvement under the authority and direction of laws making appropriation for that purpose have been undertaken and executed. The original project contained in the report of the Mississippi River Commission dated 17 Feb. 1880 contemplated the permanent fixing and improvement of the channel to a depth of at least 10 feet at extreme low water by the construction of the low-water width to about 3,000 feet, the protection of the banks against caving and the control of the flood water by means of levees. This report was the one upon which Congress made its first appropriation for the improvement of the Mississippi River under commission plans, thereby officially adopting such plans for the inauguration of this work.

When the Mississippi River Commission began the work of improvement there were few, if any, precedents of practical value to serve as guides in a project of such magnitude. But very meagre data as to the regimen of the river were available, and a thorough knowledge of its many varying phases was essential before satisfactory comprehensive plans of improvement could be developed. Exhaustive surveys and observations of the physics of the river

from the headwaters to the mouth were therefore inaugurated and carried on until the data needed were secured and experiments with various kinds of plant and material were also made in order to develop the equipment and type of construction needed for efficient work. This work occupied several years. During these years the appropriations were comparatively small, and sometimes failed altogether, with disastrous results to the channel works, so progress was necessarily slow. As a result of the knowledge of the regimen of the river acquired and the lesson taught by the experimental work, definite projects are now entered upon with confidence of success, but efforts looking to improved methods to secure greater efficiency and economy will be continued.

The earlier works were designed primarily for the rectification and improvement of the channel, and were confined to the Plum Point Reach, 147 to 186 miles, and Lake Providence Reach, 517 to 552 miles below Cairo. These reaches were selected because here the shifting sand bars and deficient depths were most pronounced and the low-water navigation most difficult. Highly beneficial results were obtained in the improvement of the channel depths in those reaches, and the work done in them confirmed the soundness of the theory upon which it was based, but also demonstrated that more substantial types of construction were needed and that the permanent improvement of the channel by contraction and revetment works would consume a long period of time, while the pressing needs of commerce called for immediate relief. The development in hydraulic dredging machinery had reached such a stage at this time as to hold out the hope that an immediate and economical solution of the problem of temporarily deepening the channel for navigation purposes might be found in the opening and maintenance of channels across the obstructing bars at each low-water season by means of dredging. After extended studies and experiments, hydraulic dredges of large capacity adapted to the peculiar service required were developed by the commission and this method of temporary improvement of the low-water channel was adopted with a view of maintaining a navigable channel not less than 250 feet in width and 9 feet in depth, and has been applied with success.

Since the adoption of dredging, the permanent work of channel improvement has been confined to the revetment of banks, and a type of revetment has been developed which successfully withstands the scouring action of the river. Concrete has been largely substituted for the upper bank revetment, and its use for sinking the present type of willow mat, as well as a possible substitute for the mat itself, is being tried out with a view to further economy and increased efficiency.

The extent of bank revetment is, however, relatively so great when compared to the funds available for its construction that it has been necessary to confine the work to cases of urgent necessity, such as caving banks which threaten cut-offs or the safety of large levees which could only be replaced at excessive cost, and the harbor fronts of cities. Substantial revetment for the purpose of fixing the banks of the river is essential to any successful scheme of improvement, and as the project adopted by

Congress requires that the commission shall "correct, permanently locate and deepen the channel and protect the banks of the Mississippi River," large increase in expenditures for revetment construction are urgently needed.

An important item in the operation of the commission is the construction and general repair of levees, which was first authorized without qualifying restrictions by the Act of 19 Sept. 1890; and since that date about one-half of the appropriations made by Congress have been devoted to that purpose.

Briefly stated in general terms and quoting in part the several acts of Congress under which the project is being carried out, the work now in progress covers the Mississippi River from Rock Island, Ill., to the Head of the Passes, 1,568 miles, "the Ohio River from its mouth to the mouth of the Cache River," and "the Arkansas River between its mouth and the intersection thereof with the division line between Lincoln and Jefferson counties," and it includes:

1. Flood protection by construction, extension, and repair of levees from Rock Island, Ill., to Head of the Passes, 1,568 miles; along the Ohio River below the mouth of the Cache River and the Arkansas River up to the Lincoln-Jefferson County line, in co-operation with the several States and levee boards, to "prevent destructive floods."

2. Continuation of improvement below the mouth of the Ohio River so as to "give safety and ease to navigation" of the Mississippi River at flood stages by facilitating the interchange of traffic, "commerce, trade, and the Postal Service with a view to securing a permanent channel depth of 9 feet" by means of:

(a) Revetment of caving banks to "correct, permanently locate, and deepen the channel, and protect the banks of the Mississippi River," and for the preservation of harbors and the security of levees.

(b) Dredging for the purpose of maintaining at all stages a "navigable channel 250 feet in width and 9 feet in depth," including construction, operation and maintenance of suitable dredge boats and auxiliary devices and appliances therefor.

3. The maintenance of a navigable channel between the waters of the Mississippi, Red and Atchafalaya rivers.

4. Physical investigations, maintenance of gauges and discharge measurements of the Mississippi River and its tributaries; preparation and publication of maps and physical data; surveys and investigations covering all phases of river regimen governing the work of channel improvement and flood control "from the headwaters of the Mississippi River to the Head of the Passes."

5. Other miscellaneous details incident to the execution of the general project.

Since the creation of the Mississippi River Commission in 1879 there has been appropriated and allotted for expenditure under it on the Mississippi River and its tributaries to 1917, \$96,375,610.68.

D., 'The Mississippi and its Forty-four Navigable Tributaries' (Washington 1890); Chambers, J., 'The Mississippi River and its Wonderful Valley; Twenty-seven Hundred and Seventy-five Miles from Source to Sea' (New York 1910); Ocken, 'The Mississippi: Some of its Physical Characteristics' (1900); Clemens, 'Life on the Mississippi' (1883); 'Mississippi River Commission' in *Annual Report*, Chief of Engineers, United States Army, War Department (Washington, D. C., 1879-1918).

FORREST MORGAN.

**MISSISSIPPI SCHEME.** See **MISSISSIPPI BUBBLE.**

**MISSISSIPPI SOUND,** an arm of the Gulf of Mexico, extending along the coasts of Mississippi and Alabama from Bay Saint Louis on the east to Mobile Bay on the west and connecting with the latter by Grant's Pass. It is about 100 miles long, from 7 to 15 miles wide,

from 6 to 10 feet deep and is formed by a chain of low, narrow, sandy islands, chief of which are Daphne, Petit Bois, Horn, Ship and Cat. It is traversed by steamers and coasting vessels trading between New Orleans and Mobile.

**MISSISSIPPIAN.** See **CARBONIFEROUS.**

**MISSOLONGHI,** *mis-sō-lōng-gē*, or **ME-SOLONGI,** *mā-sō-lōng-gē*, Greece, a north-western town, capital of the nomarchy of Acarnania and Ætolia, on the marshy site on the north side of the Gulf of Patras, 24 miles west of Lepanto and the seat of an archbishop. Missolonghi is the most important strategical point of western Greece and is famous for the sieges it has undergone. In 1804 it came under the rule of Ali Pasha. In the Greek revolt against the Turkish conquerors in 1821 it was brilliantly defended by 400 men against a Turkish army of 14,000 for two months; when reinforced, they again for over a year resisted the Turks, who raised the siege 6 Jan. 1823. The town was hastily fortified, and from September to December 1823 was again besieged by the Turks, who were defeated by a small Greek force under Marcos Bozzaris (q.v.), but with the loss of their patriotic general. In 1825-26 it stood a long siege by the Turks. A body of its defenders cut their way through the Turkish force and escaped; the remainder determined to sell their lives as dearly as possible, and when the Turks forced their way in, the powder magazine was exploded, thus overwhelming besiegers and besieged in one common catastrophe. Lord Byron, who went to Missolonghi 5 Jan. 1824 to aid the Greeks, died there 19 April 1824; his heart was interred in the church of Saint Spyridon, and a monument was erected by the Greeks in his honor. Here also is the tomb of Bozzaris. Pop. about 10,702.

**MISSON, Francis Maximilian,** French traveler and author: b. Lyon, about 1650; d. London, England, 12 Jan. 1722. He was a Councillor in the Parliament of Paris, but at the revocation of the Edict of Nantes, as a Protestant, fled to England. There, in 1685, he became tutor to Charles Butler, afterward Earl of Arran, whom he accompanied on his travels. In 1691 he published 'Voyage d'Italie,' in which his comments on the customs of the Roman Catholic Church led to a celebrated controversy with Father Freschot. In 1698 he published a volume of 'Mémoires et observations,' which constitutes a humorous descriptive dictionary of London life in Queen Anne's reign. His other chief work is 'Théâtre sacré des Cévennes' (1707).

**MISSOULA,** *mi-zoo-la*, Mont., city, county-seat of Missoula County, situated on both sides of the Missoula River, a tributary of the Columbia River, in a beautiful and fertile valley, called by the early settlers Hell Gate Ronde, on the main line of the Northern Pacific and the Chicago, Milwaukee and Saint Paul railroads. The city has an elevation of 3,201 feet above sea-level and is situated in 46° 52' N. lat., and 113° 50' W. long., 120 miles by rail northwest of Helena. The city is noted for its mild and salubrious climate, the winters being mild and the summers and fall offering a really delightful climatic condition. The city has many attractions for summer tourists on account of the beauty of its environ-

ment and the fine outing advantages of the surrounding country. Hunting and fishing are exceptionally good in this vicinity. The first log cabin was built at Hell Gate, a short distance from Missoula, in 1864. Worden and Company were the pioneer merchants of this district. In 1865 they built a grist and saw mill and opened a general store. The city was at that time known as Missoula Mills. It was incorporated in 1883 and the name changed to Missoula. Radiating from this city are numerous valleys which have developed into wonderfully productive agricultural sections. Missoula is the natural distributing centre for this rich and growing territory. The chief resources of this district are diversified farming, lumbering, dairying, horticulture and mining. There has been much development in this district during the past few years. Five branch lines running out of Missoula increase the distributing possibilities of this section. This section contributed a large amount of the prize winning grain and apples at the Panama-Pacific Exposition and is noted for the quality and quantity of its products per acre. The city itself is modern in every respect. The street-car system, sanitary and storm sewers, pavements, up-to-date lighting system and handsome public buildings make this one of the leading and most substantial cities of its size in the Northwest. From an educational standpoint it is exceptionally well equipped. Missoula is the seat of the University of Montana and in addition has one of the most efficient public school systems in the State. The county high school is in every way first class. There is also a Catholic academy and high school which ranks high among the accredited high schools of the State. Practically every religious denomination of consequence is represented in the city and the majority own handsome church buildings. The Missoula Business and Normal College gives an opportunity for business training and has a high standard. Among Missoula's public buildings are the Federal building, Land Office and Federal court, courthouse, Elk's temple, Masonic temple, Knights of Pythias, Montana block, opera house, library, Chamber of Commerce building and many other structures creditable to a city of much larger size. Fort Missoula is located four miles to the south of the city and Bonner — noted for its large lumber mills — six miles to the east.

From the standpoint of the historian Missoula is of exceptional interest. The city is located in a district noted for its intimate connection with the important facts in the early history of the State. The first gold in Montana was discovered within a few miles of this city and there is considerable mining activity throughout this district. The Flathead Indian Reservation, about 15 miles north of the city, contains approximately 1,750,000 acres of fine agricultural, grazing and timber lands. This body of land has been surveyed by the United States government, and thrown open to settlement. Practically all of the available land has been taken up. Over 2,000,000 bushels of grain were raised there last year. Missoula is situated in the heart of the country formerly occupied by the Flathead tribe of Indians which was ceded to the United States by a treaty made in 1855, known as the Stevens

Treaty. Missoula is a Flathead Indian name or word, meaning or signifying "At the stream or water of surprise or ambush." In the olden days prior to the advent of white men amongst the Indians of this section, the Blackfeet, who were very numerous, and occupied the country on the waters of the upper Missouri, and the Flatheads, who occupied the country in the vicinity of Missoula, were hereditary enemies and engaged in a continuous warfare one against the other. The place where the city of Missoula is now located, being at the western foot of the mountains, and near the mouth of a long and deep cañon, with a beautiful stream of water near by, was a favorite camping place for the Flatheads with their lodges and families. The Blackfeet, having a knowledge of this fact, would often take advantage of it, and when on the warpath would secrete themselves in the willows and rocks, and from this ambush attack their unsuspecting enemies, hence the name, "at the stream or water of surprise or ambush." Missoula is known throughout the State as the "Garden City" because of its magnificent gardens and the abundance of flowers grown here. The city is supplied with an abundance of electricity generated at its power plant on the Big Blackfoot River and transmitted by cable a distance of seven miles. Among its industrial establishments are a beet-sugar factory, creamery, flour mill, sash and door factory, potato-chip works, vinegar and cider factories, brick and tile plants, book-binders and a lithographing establishment. It also has an abundance of water of the best quality, supplied by a water company from a never-failing stream coming direct from the snow-clad mountains to the northeast of the city. Pop. 18,214.

D. D. RICHARDS,

*Secretary Missoula Chamber of Commerce.*

**MISSOURI**, *mī-zoo'ri*, State of the North American Union, geographically the central commonwealth of continental United States. Sometimes called a Southern State and again a Western State, it is neither southern nor western, in history, population nor location. Though it extends farther south than Virginia, it extends farther north than Kansas. It is practically well-tigh equally divided between the two great parties. Its negro population is small, only 5 per cent of the total. Though an original slave State, Missouri abolished slavery by its own act. It may be properly classed not as northern or southern, eastern or western, but as a central State. The State is bounded on the north by Iowa, on the south by Arkansas, on the east by Illinois, Kentucky and Tennessee and on the west by Nebraska, Kansas and Oklahoma. Its capital is Jefferson City. In area it is 69,415 square miles (693 of water). It is larger than any State east of or bordering on the Mississippi except Minnesota. The census of 1910 gives the population of the State as 3,293,335. In 1917 it was estimated at 3,429,595.

**Physiography.**—Missouri has three distinct physiographic regions: the Upland Plain of the northern and western part of the State, the Ozark Plateau of the southern half of the State and the lowland area in the southeastern corner of the State. The upland area and the Ozark regions are separated from Saint Louis to Boonville by the Missouri River. At Boonville the line turns to the southwest and passes

out of the State to the north of Joplin. There is a well-marked escarpment between the Ozark Plateau and the southeast lowlands. The lowlands have an altitude of little more than 300 feet above sea-level. The upland area is marked by broad rolling hills and wide valleys. Much good farming land is in this region. The Ozark region of the southern part of the State is distinctly different in its topography from the upland region of northern Missouri, though at their junction they grade into each other. The Ozark region has a mature topography, nearly every bit of the region being in a slope. The crests of the ridges are very narrow and only the largest streams have developed river flats to any extent. The ridges have about the same altitude. The region is densely forested.

**River Systems.**—Missouri has possibly more miles of navigable rivers than any State in the Union. Along the eastern shore of the State flows the Mississippi, which affords transportation 10 months of the year. The Missouri River forms the northern half of the western border, and turning east cuts the State into halves and unites with the Mississippi at a point 12 miles north of Saint Louis. From the Ozarks flow the Osage, the Gasconade, the White and other smaller streams north and east into the Missouri. The Meramac flows through a hilly, wooded country northeast and empties into the Mississippi near Saint Louis. North of the Missouri are smaller tributaries, principal among which are the Grand, the Chariton and the Platte rivers. All small rivers in the northern half of the State east of Macon flow into the Mississippi. The largest of these is the Salt River.

**Climate.**—Missouri is in the central portion of the United States far from either ocean and unprotected by mountain ranges. The climate is, therefore, one of extremes both in warm and cold weather, moisture and drought. The highest range of mountains in the State, the Ozarks, is not sufficiently lofty to affect the climate of the State at large and influences the climates of the neighboring counties only to a slight degree. The mean summer temperature, as shown by the observation of the United States Weather Bureau, for the portion of the State north of the Missouri River for a period of 27 years is 74° and for the southern portion 78.5°. The maximum temperature, however, is often more than 100°. The winter temperature during this period averaged 33.9° for the State, varying from 28.5° in the northern half to 39.5° in the southern half. The winter climate is variable. Often the temperature falls below zero. During other winters the temperature scarcely reaches zero. In the winter months of 1915 a temperature of 30° and slightly more below zero was registered in several sections of the northern half of the State. The Mississippi River is frequently frozen over at Saint Louis and other river points. Ice gorges form about the piers of the bridges, blocking all river traffic. In some winters the Missouri River is frozen over during the entire season. The Mississippi often remains open until the middle of the month of February and at other times closes early in December. The mean annual temperature of the State varies from 53° to 57°. In spite of abundant rains the climate is, generally speaking, a dry one. The evaporation is so rapid that the atmosphere is seldom overloaded

with moisture. A clear sky, a fertile, productive soil and fair weather are among the chief natural advantages of the State. Thunderstorms are of frequent occurrence, especially in the month of June.

**Farming and Stock Raising.**—The staple products of Missouri are wheat, oats, Indian corn and rye, but in the southern portions of the State cotton, hemp and flax are raised to some extent. Thirty bushels of wheat to the acre is an average yield but is often far exceeded. The flour from Missouri wheat is in great demand in foreign as well as home markets, and is regarded as of a high quality. All kinds of grass which favor stock raising grow luxuriantly, such as blue grass, timothy, red top and red and white clover. The raising of pork is a large industry, due to the cheapness of feed. All kinds of fruits are successfully cultivated, not only the more hardy fruits, such as the apple, pear, plum and cherry, but those which require a softer climate, such as apricots and many varieties of grapes. Apples and peaches grow well in all parts of the State. In the southern portion of the State, particularly in the southwest, are grown many varieties of grapes. In the southern counties of Missouri sheep raising has been carried on at a profit, the mild climate, the quality of grass and the abundance of good water being especially favorable here to this particular branch of stock raising. There are in Missouri 24,581,186 acres of improved land. The land surface of the State is approximately 43,985,280 acres. Much of the unimproved land is in forests. The value of farms, including land and improvements, not buildings, as estimated by the Census Bureau is \$1,441,529,000; the value of the buildings, \$268,976,000; of the implements and machinery, \$50,769,000, and of livestock, \$160,540,000. There are on farms throughout the State 1,040,000 horses, 2,000,000 mules, asses and burros, 2,692,000 milk cows and other cattle, 1,466,000 sheep and 4,708,000 swine. Missouri ranks high among the corn-producing States of the Union. No State in the Union raises as many mules. The annual production of the State in cereals, as shown in the 1915 yearbook of the State Board of Agriculture, for the year of 1914 was: Corn, 175,158,072 bushels; wheat, 36,933,501 bushels; oats, 18,534,533 bushels; rye, 116,560 bushels; flax, 61,467 bushels; buckwheat, 14,406 bushels; barley, 9,270 bushels. The hay yield for the year was 1,877,402 tons of tame hay and 121,404 tons of prairie hay. Other products were: Broom corn, 591,175 pounds; cotton, 26,847,360 pounds; potatoes, 2,500,000 bushels; tobacco, 2,726,760 pounds; sorghum syrup and seed, syrup yield, 902,410 gallons; seed yield, 203,360 bushels; clover seed, 14,141 bushels; timothy seed, 10,522 bushels. Reports for an average year in fruit production are: Apples, 8,698,170 bushels; peaches, 61,006 bushels; grapes, 13,783,656 pounds, and cherries, 62,708 bushels. The surplus dairy production of 1914 was valued at \$18,000,000. The annual butter output is estimated at \$12,000,000. The State is well adapted to the dairy industry. Strawberries are grown to the amount of about 15,000,000 quarts annually. Poultry raising is an important industry. The annual production of eggs is estimated at 100,000,000 dozens.

The 1917 corn crop amounted to 252,000,000

MISSOURI.

Estimated population, 3,410,692

bushels, wheat to 27,540,000 bushels and cats to 59,200,000 bushels. In the same year 140,000 acres were planted to cotton, which yielded 51,000 bales, valued at \$7,012,000; 6,000 acres were planted to flax, yielding 51,000 bushels of flax-seed; 3,000 acres were planted under tobacco, which yielded 2,820,000 pounds valued at \$598,000. The aggregate value of the corn, wheat, oat, rice, potato, cotton, tobacco and hay crop of 1917 was \$461,729,000.

**Lumber.**—Missouri is one of the few middle States that yet markets ties, lumber, laths and shingles in large quantities. The State annually markets about 10,000,000 railroad ties, worth about \$4,000,000 to the producer. More than 1,000 sawmills had an output of 60,159,000 feet of lumber in one year, according to the last census report, the approximate value of which was, in round numbers, \$30,000,000. This production, however, has now begun to diminish.

**Mineral Resources.**—Missouri has the largest deposits of lead, zinc, coal and clay of the Middle Western States. The principal lead district is in southeastern Missouri in Saint Francis, Madison and Washington counties, but an important production of lead is made in the Joplin zinc district of southwestern Missouri. The lead, in the form of mineral galena, occurs disseminated through the sedimentary rocks of the region, especially in the dolomites of the Bonne Terre formation of the Cambrian Age. The average ore contains about 3.5 to 4 per cent of lead, but the large scale upon which the deposits are worked gives a good profit. This district is one of the most important lead-producing areas in the world. Lead was discovered in southeastern Missouri about 1720 and the region has produced the mineral more or less continuously ever since. Missouri's total production of lead is about \$15,000,000 annually, the larger part of which comes from the southeastern district. In the war years the production reached the value of \$32,000,000. The chief ore mineral of zinc in the Joplin district is sphalerite, or zinc blende, but there is also an important production of zinc, silicate, calcimine and zinc carbonate, smithsonite. The ores are found in runs or circles and in sheet ground of limestone. The runs and circles may be 10 to 50 feet wide and are respectively shallow. The sheet ground may be from 10 to 70 feet thick and reaches a depth of 200 feet. The recent high price of both lead and zinc has greatly stimulated the mining industry and led to the opening up and development of new areas, as well as the extension of the older ones. The clay resources of Missouri are large and especially suited for the manufacture of common and fancy brick, tile, sewer-pipe, fire-brick and terra-cotta. While clays are found in all parts of the State, they are not all equally adapted to the specific uses given above. Missouri ranked eighth in this industry in the United States in 1914. Missouri originally had an estimated available tonnage of 79,362,000 tons of coal. Since 1840, which is the first recorded production, 115,000,000 tons have been mined and an additional 60,000,000 tons destroyed in mining the above quantity, thus leaving about 79,187,000,000 tons, of which not more than 60 per cent will be recovered. The coal occurs in the lower part of the Pennsylvania formation. The beds are

rarely over four feet and most of those mined average about three feet or less. The Bevier bed furnishes about 60 per cent of the coal in Missouri. Other important coal-producing centres are at Rich Hill and Lexington. Missouri has long been famous for her "iron mountain," but the total amount of iron produced at this locality was only about 4,000,000 tons. There are many scattered deposits of hematite and limonite over the Ozark region. Missouri's total production is probably not more than 10,000,000 tons. The State also has many excellent building stones, notably the granite of southeastern Missouri and the limestone at Carthage and Phenix, as well as stones in other parts of the State. Missouri has produced 60 per cent of the annual production of barite for the United States for many years and still has large reserves of this valuable mineral in Washington and other counties of the State.

PRODUCTION AND VALUE OF THE CHIEF MINERAL INDUSTRIES IN 1915 AND 1916.

YEAR	Mineral	Production	Value
1915	Coal.....	3,811,593 s. t.	\$6,595,918
1915	Iron.....	40,290 l. t.	99,853
1915	Zinc.....	136,300 s. t.	33,802,400
1915	Lead.....	210,440 s. t.	19,781,360
1915	Limestone, sand and granite.....		2,145,501
1915	Brick, tiles, pottery.....		5,431,569
1915	Portland cement.....	4,628,484 bbl.	4,007,679
1916	Lead.....	233,088	32,166,144
1916	Zinc.....	155,960	41,797,280
1916	Coal.....	4,742,146	9,044,505

s. t. = short tons. l. t. = long tons.

**Manufactures.**—Outside the city of Saint Louis, the leading manufacturing counties are Jackson, Buchanan, Saint Charles, Marion, Jasper, Franklin, Greene, Cole, Cape Girardeau, Platte, Pike, Ralls, Boone and Lafayette. According to the summary of the United States Census Bureau for 1914, the value of the manufactured products of the State was \$637,952,000 and the number of persons engaged in manufacturing, 188,266. Saint Louis is the largest manufacturing centre of the State. The chief manufacturing industries of that city, according to a 1913 report of the State Bureau of Labor, are:

Boots and shoes.....	\$35,865,261
Carriages and wagon material.....	6,347,352
Railroad and street cars.....	19,582,231
Clothing.....	13,136,594
Foundries and machine shops.....	14,276,715
Grocers' sundries.....	11,791,967
Malt liquors.....	22,419,289
Slaughtering and meat packing.....	25,007,634
Drugs and chemicals.....	9,981,539
Tobacco in various forms.....	22,912,535

Next in importance as manufacturing cities are Kansas City and Saint Joseph. The valuation of the manufactured products of Kansas City in 1912 totaled \$71,854,885, including:

Bakeries.....	\$7,948,699
Bags and bagging.....	3,227,000
Cars and general shop construction.....	2,100,708
Liquors, malt.....	4,661,367
Liquors, rectifiers.....	4,333,041
Clothing (factory products).....	2,286,850
Planing mills.....	2,502,876
Confectionery.....	2,012,247
Printing and publishing (book and job).....	7,916,915

In 1912 the value of products in Saint Joseph was \$81,752,571, principal among which is the packing industry. Here is a partial list of the most important industries:

Candy and confections.....	\$2,834,857
Clothing (factory product).....	1,778,615
Flouring and grist-mill products.....	2,659,749
Slaughtering and meat packing.....	62,438,553

Springfield, Joplin and Hannibal lead in manufacturing among the smaller cities of the State.

The following partial list of factory products shows the varied character of the manufacturing industry: Cob pipes, pearl buttons, soap, glass, musical instruments, lime, electrical instruments, spelter, zinc oxide, white lead, drugs, street and railway cars, motor vehicles, rubber goods, flags and banners, books, furniture, brick, tile, bed springs, stoves, cement, dynamite, coffins, surgical and mathematical instruments, chemicals, dyes, engines, boilers, farm implements, carriages, wagons, stoneware, pottery, paper, paint, clothing, leather goods, millinery, wire, gas, jewelry, confectionery, food preparations, brooms and brushes.

**Finances.**—In 1915, according to the records of the State auditor, the assessed valuation of all taxable property in Missouri was \$1,856,885,145.47. The bonded debt of the State, 1 Jan. 1913, was \$3,500,000—bonds issued to erect a new capitol. The rate of taxation in 1915 was two cents on the \$100 for the capitol, one cent for the school certificates of indebtedness, five for the public schools and 10 for all other purposes. The bonded debt of the State on 1 Jan. 1918 was \$2,384,000. According to the Council of the Corporation of Foreign Bondholders the State has a defaulted debt of about \$7,000,000, the remnant of the \$27,370,000 railroad debt assumed by the State in 1862, after the disastrous era of speculative railroad construction. In 1917 the State revenue amounted to \$15,585,244 and the expenditures to \$16,102,946. On 1 Jan. 1918 the treasurer had a balance on hand of \$2,991,111.

**Banks.**—There are 131 national banks in Missouri, according to the official manual of the State for 1915-16, with a total of demand deposits of \$124,929,599.90, and over 30,000 depositors. The incorporated State banks number 1,281 and have individual deposits of \$140,810,534.01. There are also 20 private banks and, in the larger cities, 67 trust companies with a combined capital of \$465,623,000. There are in Saint Louis 40 banks and trust companies with a total capital and surplus of \$57,998,000. In the year of 1872 there were 58 banks in the State with a capital and surplus of \$20,196,098, showing that during the last 46 years the number of banks and their capital and surplus has increased many times. The total number of banks in the State is 1,499, with a total capital and surplus of \$131,906,429.51. Missouri is the only State in the Union which has two Federal Reserve banks, one located at Saint Louis and the other at Kansas City.

**Railroads.**—Many of the important trunk lines of the United States traverse the State of Missouri and other systems connect with them giving excellent transportation facilities to the northern parts of the State, but there are a few counties of the southern tier without railway. Approximately 30 railroads have

their entrance into the Union station of Saint Louis and about 20 into Kansas City's Union station. In addition to these, many electric roads and branch lines have been constructed or are in the process of construction throughout the State. The leading trunk lines with eastern branches are the Wabash, the Pennsylvania, Baltimore and Ohio and the Big Four. Running directly to Chicago are the Illinois Central, Chicago and Alton, Chicago, Burlington and Quincy, Wabash, Rock Island and the Santa Fé. Feeding the West and Southwest are the Santa Fé, the Missouri Pacific, the Union Pacific, the Wabash, the Missouri, Kansas and Texas, the Chicago, Burlington and Quincy, the Frisco and the Rock Island. River transportation, which was neglected for many years following the Civil War, is now being developed and large quantities of cereals and other products are taken from Saint Louis to New Orleans by river and transferred to ocean-going liners. The Missouri is open to merchant crafts from Saint Louis to Kansas City. There are 66 railroad systems in the State, with 8,274 miles of main track and 26 electric roads with 928 miles.

**Education.**—The public school system of education in Missouri was adopted in 1839. The system consists of district schools, graded and ungraded; city schools, graded and with high school courses; five normal schools, Lincoln Institute for negroes and the University of Missouri. The University of Missouri is supported by what is designated as a permanent endowment consisting of certificates of indebtedness amounting to a total of \$1,235,839, and by appropriations from the general assembly. The total amount of the funds for the use of public schools, as given in a recent report of the state auditor, is \$15,162,665.77. From the income on this amount there was paid in 1915 for teachers' wages \$1,064,525 in the city, town and village schools. Free public schools are required by law for children, white and negro, between the ages of 6 and 20 years in every district in the State. Besides these State schools, there are also many private institutions for both sexes. Among the larger institutions of this kind are Saint Louis University, founded in 1829, under the control of the Jesuit order of the Roman Catholic Church, with buildings worth approximately \$1,000,000; Washington University, Saint Louis, which has an endowment fund of several millions of dollars; William Jewell College at Liberty, a Baptist school; Drury College, Springfield, Congregational; Central College, Fayette, Southern Methodist; Westminster College, Fulton, Presbyterian; Missouri Wesleyan, Cameron, Northern Methodist; Missouri Valley College, Marshall, Presbyterian; Hardin College, Mexico, Baptist; William Woods, Fulton, Christian; Stephens, Baptist, and Christian, Christian, Columbia; Lindenwood, Saint Charles, Presbyterian; Christian University, Canton, and other smaller institutions. The value of buildings and grounds of private educational institutions is approximately \$7,000,000 and the amount of their endowments approximately \$9,000,000. At the time of the last census there were within the State 111,116 illiterates of 10 years and over, a percentage of illiteracy of 4.3. Among native whites of

**MISSOURI**

**State Capitol at Jefferson City**

native parentage the percentage was 3.4, among native whites of foreign parentage, 1.2, and among Afro-Americans, 17.4. In 1915 the total public school enrolment was 711,355, and the average daily attendance 528,153; there were in the same year 19,826 teachers. Male teachers received an average annual salary of \$603 and female teachers \$511. In the same year \$19,700,000 were expended on education.

**Religion.**—Missouri's earliest settlers were Roman Catholics. The first Protestant church was the Christ Church (Protestant Episcopal) which was founded in Saint Louis in 1819. Soon after various religious bodies established themselves in various parts of the State. The Roman Catholic Church has retained its strength in the cities and towns along the great rivers, and its members are numerous throughout the entire State. The Methodists (Northern and Southern), the Disciples of Christ, the Baptists, the Presbyterians and the Episcopalians are the leading Protestant churches. Each of these churches supports a college with the exception of the Episcopalian. The Roman Catholic has one large university, a number of preparatory schools and many parochial schools located largely in the cities.

**Government.**—The present constitution of the State was adopted by popular vote in 1875 after it had been framed and recommended by a convention called for that purpose. The general assembly of the State, consisting of the senate and house of representatives, meets biennially on the Wednesday after the first day of January following the election of the members. The senate is composed of 34 members and the house 142. The pay of the members is not to exceed \$5 a day for 70 days and if the session is further prolonged, an allowance of \$1 a day is made until the body adjourns. The members are also allowed mileage to and from the meetings of the assembly. In the executive department are the governor, the lieutenant-governor, the secretary of state, the state auditor, the state treasurer, the attorney-general and the superintendent of public schools. The governor, in whom is vested supreme executive power, is chosen for four years, as are all of the other members of the executive department. The governor is given a qualified veto upon acts of the assembly. The judicial system of the State is composed of the Supreme Court, the Saint Louis, Kansas City and Springfield courts of appeals, the circuit courts, criminal courts, probate and municipal courts. The judges and officers of the Supreme Court are elected for a term of 10 years; of the Saint Louis and Kansas City courts of appeals for a term of 12 years and of the circuit courts of the State for six years. The house of representatives is given the sole power of impeachment of executive and judicial officers. The senate tries all cases of impeachment. Every male citizen of the United States and every male person of foreign birth who may have declared his intention of becoming a citizen of the United States according to law, not less than one year and not more than five years before he offers to vote, who is over the age of 21 years, is entitled to vote at all elections by the people if he has resided in the State one year immediately preceding the election, and has resided in the county, city

or town where he shall offer to vote at least 60 days immediately preceding the election. In 1908 the initiative and referendum were adopted by constitutional amendment. Capital punishment was abolished in 1917.

**Charitable and Penal Institutions.**—The State of Missouri has four hospitals for the care of the insane, a colony for the feeble-minded and epileptic, a State sanatorium for the tubercular, a school for the deaf and dumb and a school for the blind as its charitable institutions maintained by appropriations and the labor of the persons within them. The penal institutions are a penitentiary, a reform school for boys, and girls' industrial school and an industrial school for negro girls. In addition to these, the State maintains a home for Federal and a home for Confederate veterans. The hospitals for the insane are located at Fulton, Saint Joseph, Nevada and Farmington, and have a total property valuation of approximately \$2,725,000. Marshall is the home of the colony for the feeble-minded and epileptic. The State sanatorium for the tubercular was established in 1905 at Mount Vernon, Lawrence County, on the crest of the Ozark Mountains. The 48th assembly appropriated \$175,700 for the use of the institution. The school for the deaf and dumb is located at Fulton and has 300 students who are given an industrial training peculiar to their needs. The school for the blind is located in Saint Louis. The penitentiary of the State is at Jefferson City and the official manual of Missouri for 1915-16 gives the total number of its prisoners, 1 April 1915, as 2,585 males and 55 females. Its property valuation is \$1,987,113.87. The reform school for boys at Boonville has 339 inmates. At Chillicothe is the industrial school for girls which has 225 girls in its care. The State industrial school for negro girls was established at Tipton, 14 June 1909, by an act which appropriated \$20,000 for its beginning. A total appropriation of \$199,742.19 has been made for the completion of the buildings of the school and the support of the institution. The Confederate veterans home is at Higginsville. The Federal soldiers home is at Saint James and has 296 veterans who make their home there. According to the last census there were 2,388 paupers in almshouses, being 72.5 per 100,000 of population, and 3,523 prisoners in penal institutions, being 107 per 100,000 of population.

**Politics.**—Missouri for more than 30 years has been usually a Democratic State. The vote of the State for presidential electors in 1880 was: Democratic, 208,609; Republican, 155,567; other parties about 80,000. In 1892 the Democratic vote was 268,398; Republican, 226,918; other parties about 85,000. In 1908, however, the Democratic vote was 346,574; the Republican, 347,203; other parties, about 19,000. In 1912 the Democratic vote was 330,746; Republican, 207,821; the Progressive, 124,821. In 1916 the Democratic presidential vote was 398,032 and the Republican, 369,339.

**Population.**—The State of Missouri is composed of 114 counties and the city of Saint Louis. The number of the inhabitants of the State since 1850 is shown in table on following page.

The last census of the United States, 1910, gives the foreign-born population of the State

as 229,779. There were also 157,452 persons of negro descent. The early settlers of the State were foreign, coming from France, and the population of what is now Missouri remained French for 50 years after the first settlement. Many descendants of these earlier French families are to be found in Saint Louis and other of the older river towns. A large part

YEAR	Males	Females	Total	Density per square mile
1850	357,832	324,212	682,044	14.37
1860	622,201	559,811	1,182,012	18.08
1870	896,347	824,948	1,721,295	26.34
1880	1,127,187	1,041,193	2,168,380	31.55
1890	1,385,238	1,293,946	2,679,184	39
1900	1,595,710	1,510,955	3,106,665	45.2
1910	1,687,813	1,605,522	3,293,335	47.9

of the population of the State is of German extraction having settled especially in Saint Louis and along the Missouri River. A large percentage of the population is also composed of Irish, 23,290; English, 13,751; Canadians, 7,961; Swiss, 6,141; Russians, 21,401, and 5,654 Swedes. The native American population until a generation ago was mostly descended from immigrants from the States of Kentucky, Tennessee, North Carolina and Virginia, but during the last 40 years a large accession of the population has come from the Eastern and Northwestern States. Saint Louis, the largest city in the State and one of the most important in the Mississippi Valley, had a population of 687,029 according to the last official census. Kansas City, the next largest city in the State on its western border, had a population of 248,381, but is growing more rapidly than any other city in the State. Saint Joseph, in the northwestern part of the State, is given by the same census a population of 77,403; Hannibal, a river town in the eastern part of the State, 18,341; Springfield, in the central southern portion, 35,201; Joplin, in the extreme southwestern part of the State, 32,073; Sedalia, in the central part of the State, 17,822; Jefferson City, the capital, 11,850.

**History.**—Missouri is a part of the territory taken possession of by the French adventurer and discoverer, La Salle, 9 April 1682, which he named Louisiana in honor of the reigning king, Louis XIV, of France. The exact dates of the first settlements are unknown. Some historians give 1763 as the date of the first settlement and others, supported by traditions, place it as early as 1735. Saint Louis was settled by Pierre Laclède Liguist, a Frenchman. The site was selected in 1763, and in 1764 August Choteau, at the order of Liguist, began the erection of a village. Other earlier settlements were for years confined to the banks of the rivers. The French governor's official residence to 1701 was at Fort Biloxi; from 1701 to 1723 at Mobile, and then at New Orleans. On 3 Nov. 1762, France ceded Louisiana to Spain, but the Spanish authorities did not take possession of Upper Louisiana, of which Saint Louis was the capital, till 20 May 1770. Spain retroceded Louisiana to France by treaty of 1 Oct. 1800, ratified 21 March 1801, but the actual transfer of Upper Louisiana

was not made until 9 March 1804. France ceded for a cash consideration the province of Louisiana to the United States, 30 April 1803, the actual transfer of Upper Louisiana being made at Saint Louis on 10 March 1804. Under act of Congress, approved 31 Oct. 1803, President Thomas Jefferson appointed Wm. C. C. Claiborne (who was at the time governor of the Mississippi Territory) governor, and invested him "with the powers heretofore exercised by the Governor and Intendant of Louisiana." Governor Claiborne assumed the government at New Orleans, 20 Dec. 1803. Capt. Amos Stoddard was appointed agent and commissioner of the French republic 12 Jan. 1804. In that capacity he had received the province from Delassus at Saint Louis 9 March, and the following day delivered it to himself for the United States, having been authorized to do so by Wm. C. C. Claiborne, ex officio governor of the Territory of Louisiana. From 1 Oct. 1804, the district of Louisiana consisted of all that part of the territory purchased from France, except that portion lying south of what is now the State of Arkansas. The government was assigned to the officers of the Territory of Indiana, of which William Henry Harrison was governor until 3 March 1805. On this date the Territory of Louisiana was erected with the same limits as the district of Louisiana. The capital was Saint Louis, and from 3 March 1805, until the last part of 1806 James Wilkinson was governor. The Territory of Missouri was erected 7 Dec. 1812, and had the same limits, government and capital as the Territory of Louisiana. From 7 Dec. 1812, to July 1813, Frederick Bates was secretary and acting governor. From July 1813, to 1820 William Clark was governor. Under act of Congress, passed 6 March 1820, the State of Missouri was organized. The Constitutional Convention met in Saint Louis, 19 July 1820. The State officers assumed their duties, 19 Sept. 1820, proclamation was issued by President James Monroe, admitting Missouri as a State, 10 Aug. 1821. By act of Congress 7 June 1836, which took effect by proclamation 28 March 1837, the western boundary was extended to include the "Platte Purchase," area of which was 3,168 square miles. The application for statehood and admission into the Union of Missouri on 8 Jan. 1818, was followed by two years of controversy which excited the entire country. The controversy raged about the question as to whether or not slavery should be permitted in Missouri. It was finally brought to an end by the admission of Missouri into the Union upon what is known as the "Missouri Compromise" (q.v.), which forbade the existence of slavery in that part of the Louisiana Purchase north of 36° 31' except in Missouri. The constitution adopted upon the admission of the State remained practically unchanged until 1865. The first governor of the State was Alexander McNair. Saint Charles was first fixed upon as the seat of the government, but in 1826 the capital was removed to Jefferson City, where it remains. The official census of the State, taken in 1821, showed that there were 70,647 inhabitants, of whom 11,254 were slaves. The Missouri troops came in for due recognition in the Indian wars, such as the Black Hawk War of 1832, the Florida War of 1837 and afterward in the

Mexican War of 1846. Besides being a border State and a slave State as well, in all troubles preceding the outbreak of the Civil War, Missouri was deeply concerned. In many parts of the State, the sentiment was strongly in favor of secession. Governor Jackson on 3 Aug. 1861 declared that Missouri must take its stand by the side of the slave-holding States whatever they might desire to do. In a convention called to consider the affairs of the nation sentiment was found hostile to secession and the convention refused to commit the State to secession. United States troops were gathered at Saint Louis. Attempts made to take possession of the United States arsenal at Saint Louis, with its equipment, by the Secessionists were defeated and within a few months after the outbreak of the war the greater part of the State was under the control of the Federal forces. Governor Jackson declared the State out of the Union, and Confederate forces were assembled in the southwestern part of the State. The State Convention which had convened before the war again convened and declared the executive officers and the seats of the members of the general assembly vacant. The executive offices were then filled by appointment by the convention. At the battle of Wilson's Creek, near Springfield, General Lyon, who had been a strong Union leader, was killed and General Frémont, who had been placed in charge of the Department of the West, declared martial law throughout the State. At the beginning of 1862 the Confederates held nearly half of the State, but their strength gradually waned. The State furnished to the United States during the Civil War 108,773 troops, and to the Confederate army more than 50,000, keeping the State's quota full without draft or enforced enlistment not merely in one but in both armies, a record unexampled among the States North or South. In 1865 a new constitution was adopted by the people, and in 1869, by a large majority, the 15th amendment to the United States Constitution was adopted. In 1875 a convention framed and the people adopted a new State constitution, omitting many of the drastic provisions of the constitution of 1865 which had been ratified in Reconstruction days. This constitution has since been the fundamental law of the State, modified in minor details by several amendments adopted from time to time.

LIST OF GOVERNORS.

TERRITORIAL PERIOD.		
*William C. C. Claiborne.....	Acting Governor-General and Intendant of Louisiana.....	1803-04
Amos Stoddard.....	First Civil Commandant of Upper Louisiana.....	1804
William Henry Harrison (Gov. of Ind. Ter.).....	Governor " District of Louisiana "	1804-05
James Wilkinson.....	Governor Territory of Louisiana.....	1805-07
Joseph Browne.....	Acting Governor.....	1807
Frederick Bates.....	Acting Governor.....	1807
Merrwether Lewis.....	Governor.....	1807-09
Frederick Bates.....	Acting Governor.....	1809-10
Benjamin Howard.....	Governor.....	1810-12
Frederick Bates.....	Acting Governor " Territory of Missouri "	1812-13
William Clark.....	Governor.....	1813-20

\* Claiborne was Stoddard's superior.

† Governor of Territory of Louisiana, 1810-12; Governor of Territory of Missouri.

Frederick D. Gardner.....	Democrat.....	1917-

WALTER WILLIAMS,

Professor of History and Principles of Journalism, University of Missouri.

MISSOURI, a river in the United States, the largest tributary of the Mississippi. Its headwaters are in southwestern Montana, and the Missouri River proper begins at the confluence of the Jefferson, Madison and Gallatin rivers. The Madison has its source in Yellowstone Park, near the headwaters of Yellowstone River and the geysers in the western part of the park. The Gallatin also has its rise in the same park and not far from the source of the Yellowstone and Madison rivers. The Jefferson rises farther west; its headwaters are near the source of the Snake River. The Missouri from the confluence of the three rivers flows north and east to the Bear Paw Mountains, when it turns and flows south and east a distance of about 50 miles, when again the course changes toward the east, from the 108th meridian to about 107° 30' northeast, then east to North Dakota, which State it enters at 49° N. It has a very irregular course in the northwestern part of North Dakota, but it is generally southeast to South Dakota, which State it enters at 100° 20' W. It crosses the State of South Dakota, marking an irregular course, generally in a southeasterly direction to the boundary of Nebraska at 42° 45' N. From here it forms the boundary between South Dakota and Nebraska to Iowa at 42° 20', when it turns south and forms the boundary between Nebraska and Iowa, Nebraska and Missouri, and Kansas and Missouri to Kansas City, where it enters the State of Missouri, flows east by north to Brunswick, then east by south, making two large curves, to the Mississippi which it enters 20 miles north of Saint Louis and three miles below Alton, Ill. The length of the whole course from the source of the Madison River is about 2,915 miles, from the source of the Jefferson about 3,000 miles. From its source to the mouth of the Mississippi River is a total length of

4,200 miles, the longest continuous water-way in the world. There are some peculiar irregularities along its course, one in Montana, where the Musselshell River enters, is in the form of a "V," its opening toward the north, and the sides about 12 miles long. Along the course in each State there are long narrow loops, enclosing lands which are almost islands; across the State of Missouri the river forms three crescents, one pointing north and two pointing south.

The Missouri is noted for the great amount of suspended silt it always carries and which has given it the name "Big Muddy." This silt is deposited in reefs which change the current, and frequently much damage results. In 1903 considerable damages were sustained by the washing away or grinding away of portions of Decatur, and Covington in Nebraska, Sioux City in Iowa and Yankton in South Dakota. The river follows no known rules as to when or where it will deposit its burden of silt, change its current and begin to destroy a solid shore line. Dikes and stone walls have been constructed in many places. In the upper part of its course the Missouri passes through the "Gate of the Rocky Mountains," a gorge about six miles long and having perpendicular walls about 1,200 feet in height. At Great Falls, Mont., there are a series of falls making vertical descent of 350 feet in 16 miles. The highest falls is 87 feet.

The chief tributaries are in Missouri, the Osage and Kansas; in Nebraska, the Platte and Nibrara; a large number of short streams in Iowa; the Big Sioux, White, James and Cheyenne, in South Dakota; the Little Missouri in North Dakota; and the Yellowstone and Milk in Montana. The extent of country drained by the Missouri and its tributaries is about 500,000 square miles or nearly two-fifths of the whole Mississippi Basin. The northern point of the basin of the Missouri extends almost to the Saskatchewan River. The Missouri is a swiftly flowing stream in its upper course, and for a distance of about 500 miles it presents scenes of almost unequalled grandeur. It forces its way through narrow gorges, foams over cataracts and winds around mountains. In the lower part of its course the waters move more slowly on its journeys across the vast plains. It is navigable in summer, during the flood period, to Great Falls, Mont., and in low water as far as Buford at the mouth of the Yellowstone River. The flat-bottomed steamboats are necessarily those used for navigation on the Missouri.

The principal cities on the river from the upper course to its mouth are Great Falls and Fort Benton in Montana; Bismarck, the capital of North Dakota; Pierre, the capital of South Dakota; Sioux City, Iowa; Omaha, Neb.; Atchison, Leavenworth and Kansas City, Kan.; Kansas City, Saint Joseph and Jefferson City, Mo. That portion of Iowa lying near the mouth of the Little Sioux and north for about 70 miles, between the Missouri and the Little Sioux, is below the level of the Missouri from 8 to 32 feet. The area of the tract below water level is about 840 square miles, and embraces some of the finest farms and most prosperous towns of the State.

The history of this river is connected with the history of the early explorers and mission-

aries and with the lives of the miners and settlers of the latter part of the 19th century. The possibilities in the unused water power of its upper course are enormous. The great prairies through which the river passes on its lower course contain the most productive lands in the United States.

**MISSOURI, University of**, a higher educational institution established by an act of the general assembly of the State of Missouri, approved 11 Feb. 1839, two days after the approval of the act establishing the public school system of the State. In June of the same year the university was located at Columbia, Boone County, which is near the State's geographical centre. Boone County was selected as the home of the State's highest educational institution because its people offered the most liberal bid of the six central Missouri counties. The cornerstone of the main building was laid 4 July 1840, and in the following spring, April 1841, instruction in academic courses was begun. The first class, consisting of two members, was graduated in 1843. Something of the growth of the university is indicated by the fact that in 1917 it awarded 838 degrees and certificates. Women were admitted to the teacher-training department of the university in 1869. Since that time all other departments have been opened to them on the same terms as to men, and gradually the proportion of women students to men has grown, until in 1917 women numbered about one-third of the total enrollment. The government of the University of Missouri is vested in a board of curators, consisting of nine members appointed by the governor of the State, the terms of three members expiring every two years. The student enrollment in 1916-17 was 4,349. The faculty consisted of 208 members of the rank of instructor or higher. Its foundation was made possible by the enlightened policy of the national government with reference to Territories seeking admission into the Union. In admitting Missouri in 1820, Congress set aside two townships of land—46,080 acres—for the support and maintenance of "a seminary of learning." From the income of this national grant, from the gifts of Boone County people and from student fees, the university received its entire support for the first 28 years of its existence. The first State aid was given in 1867, when \$10,000 was appropriated by the general assembly for building and repairs. The university is now supported and maintained by appropriations from the State treasury, by Federal appropriations, income from its endowment funds and by the fees and deposits received from students. Tuition is free to residents of Missouri; students from other States pay a tuition fee of \$10 a semester.

The national character of the early University of Missouri has been strengthened by the continuing Federal appropriations and the coming each year of students from more than three-fourths of all the States and nearly all the non-contiguous possessions of the United States. In its former student body of 7,000 graduates and about 25,000 non-graduates, every State and nearly every leading nation of the world has representatives. The university has extended its educational scope to include in the curricula of its various schools and colleges

theoretical instruction and practical training in all the leading activities of its constituents. Starting in 1841 with only an academic department, it is now composed of the following colleges and schools: College of Arts and Science, College of Agriculture, School of Education, School of Law, School of Medicine, School of Engineering, School of Mines and Metallurgy, School of Journalism, School of Business and Public Administration, Graduate School and the Extension Division.

The School of Mines and Metallurgy is at Rolla, Phelps County, Mo.; the other divisions are at Columbia. In addition to the work of the above schools and colleges, emphasis is given in particular lines of study by the establishment of minor divisions, chief of which are the Agricultural Experiment Station, the Engineering Experiment Station, the Missouri State Military School and the Mining Experiment Station at Rolla. The university also holds a summer session. In all the divisions of the university the laboratory method is followed. The university grounds at Columbia cover more than 800 acres. The main divisions are in the West Campus, the East Campus, the athletic fields and the university farm. A 20-acre tract of timber land near the university is used for experimental work in forestry and a demonstration forest. About five miles south an 80-acre tract is used for experimental work in horticulture. On a 90-acre tract two miles north of the university is a new plant for the manufacture of hog cholera serum. The university also has a forest of 50,000 acres in the Ozark Mountains of southern Missouri. On the grounds at Columbia are about 50 university buildings. The libraries of the university are the general library; law library; medical library; engineering library; agricultural library; collections in the observatory, chemical, geological and zoological buildings; and the library of the School of Mines at Rolla. These libraries contain about 200,000 volumes and pamphlets, and 1,400 publications are received currently in Columbia. The general library is now housed in a separate building, erected in 1915.

Students' expenses average \$300 a year for men and \$375 for women. Material reductions from these figures may be accomplished by living at the university dormitories and eating at the Commons.

Scholarship at the university is promoted by the offering of a large number of fellowships, scholarships and prizes. These yield from \$50 to \$400 a year. Each school and college also has its honorary organizations, and there are local branches of several national, scientific and professional societies.

**MISSOURI COMPROMISE**, in American politics, a term given to a compromise under an act of Congress passed in February 1821, at which time Missouri was admitted into the Union as a slave State, declaring that all territory west of Missouri and north of lat. 36° 30' should forever be free from slavery. This compromise was virtually repealed in 1854, when territorial governments were established for Kansas and Nebraska. Consult Woodburn on 'Historical Significance of the Missouri Compromise' (in Annual Report of the American Historical Association, 1893); and Hodder,

'Side Lights on the Missouri Compromise' (ib. 1909). See KANSAS, *History*; KANSAS-NEBRASKA BILL; MISSOURI.

**MISSOURI**, or **GOURD-SEED**, **SUCKER**, a fish. See **BLACKHORSE**.

**MISSOURI VALLEY**, Iowa, city in Harrison County, on the Chicago and Northwestern Railroad, about 120 miles west of Des Moines, the capital of the State, and 20 miles north of Council Bluffs. It is in a fruit growing and stock raising district and has large railroad shops, machine-shop, flour-mills, dairy products, bricks, coffins, grain elevators and stock yards. The fair grounds of the County Agricultural Society are located here. It has a Carnegie public library and the city owns and operates the waterworks. Pop. about 4,000.

**MISSOURI VALLEY COLLEGE**, in Marshall, Mo., a coeducational institution, founded under the auspices of the Cumberland Presbyterians in 1889. The courses lead to the degrees of A.B. and Ph.D. The faculty comprises 13 instructors and professors and the average attendance of students is over 200. The library and the grounds, buildings and apparatus are valued at \$125,000; the productive funds at \$113,000, and the annual income about \$19,000.

**MIST**. See **Fog**.

**MISTAKE**, a term commonly used as the equivalent of blunder, error, erratum and particularly employed in law of a misconception affecting action. In general the law, by an extension of the rule that ignorance is no excuse, makes a mistake without remedy. This does not apply, however, in any misapprehension which may be brought under the law of contracts or the principle of quasi-contract. So, too, in equity there is a possibility of relief for mistake and its consequences.

**MISTASSINI**, mis-tās-sē'nē, Canada, a lake in Quebec province, about 300 miles north of Quebec, and due east from the southern point of James Bay in Hudson Bay. It consists of two parallel narrow portions separated by a chain of islands, the western and larger portion being about 100 miles long, and a maximum breadth of 20 miles. Area, 975 square miles. It has a depth of between 300 and 400 feet. It drains by Rupert River into James Bay. The waters of Mistassini teem with fish, while its shores are densely wooded. The lake was first visited by French missionaries in 1671, but was not surveyed until 1884. The Hudson's Bay Company maintains a trading-post on the lake.

**MISTLE-THRUST**, or **STORMCOCK**, British names for a large European thrush (*Turdus viscivorus*), whose fine song is heard for a longer season than in the case of most birds, and on rainy days as well as sunny. Its common name is due to its unusual fondness for the berries of the mistletoe. In plumage it resembles the American wood-thrush.

**MISTLETOE**, a popular name for several related shrubs parasitic upon various deciduous trees, such as apple, thorn, maple, poplar, locust, linden, but rarely oak. The European or common mistletoe (*Viscum album*) of the natural order *Loranthaceæ*, is the one referred to in

poetry and prose but a relative named *Phoradendron flavescens* is the species most commonly found at Christmas time in the markets of America. The former, which is common almost throughout Europe, is an evergreen, bifurcately branched shrub, with opposite, almost sessile, oblong, leathery leaves; inconspicuous flowers in small terminal heads or in the angles of the branches, the pistillate and staminate flowers upon separate plants; and whitish, translucent, glutinous berries about a quarter of an inch in diameter. The stickiness serves to attach the berries to the host plant until germination is complete, the sprout, it is said, always turning toward the point of attachment. The American or false mistletoe is similar in habit and appearance, and has fallen heir to some of the traditions and functions of its European cousin, especially the Christmas practice of kissing under a suspended sprig. Anciently the European species was held to be sacred by the Druids and the Germans, and by the Celts was credited with magical properties, references to all of which are frequent in literature. Its formerly reputed value in medicine has also passed away. Several other species are well known, especially the fragrant flowered *Loranthus odoratus*, and *L. europæus*; the latter being distinguished for its racemes of flowers and its frequent appearance upon oak trees. The common American species mentioned above ranges from New Jersey to Indiana and southward to Florida and Texas. Several related species are found on the Pacific coast.

**MISTRAL**, mēs-trāl, Frédéric, French poet: b. Maillane, Bouches-du-Rhône, 8 Sept. 1830; d. there, 25 March 1914. He studied law for a time, but abandoned it and gave his attention to writing in Provençal, the dialect of southern France, which, under the influence of Jasmin, the "barber-poet," had entered on a renaissance as a literary medium. In 1854 he, with six others, founded the well-known Society of the Félibrige; and in 1859 he published his 'Miréio,' a narrative poem in the recovered language, which was crowned by the Académie in 1861. A second work in verse, 'Calendau,' came out in 1867; a volume of poems, 'Lis Isclo d'Or' (The Isles of Gold), in 1875; 'Lou Trésor dou Félibrige,' a dictionary of modern Provençal, in 1878-86; and the historical poem 'Nerto,' in 1884. 'La Rèino Jano' (1890) is a tragedy, and 'Le Poème du Rhône' (1879), another narrative poem. There are English renderings of 'Miréio' by Grant (1867), Crichton (1868) and Preston (1872). In 1904 he was awarded, jointly with José Eshegaray, the Nobel prize in literature. Consult Downer, 'Frédéric Mistral' (1901).

**MISTRAL**, the local or provincial name of a strong northwest wind, which, blowing from the Alps, forms one of the scourges of Provence and the valley of the Rhône. It is caused by low atmospheric pressure in the Gulf of Lyons with high pressure in the north, and corresponds with the "bora" of southern Russia. It blows with great violence during the winter and spring months. Its approach is indicated by a sudden change in the temperature from warmth to cold; the air becomes purer and more invigorating, light fleecy clouds are seen in the sky and at night the stars shine

with extraordinary brightness. The tempest it causes in the Mediterranean from Ebro to the Gulf of Genoa is very dangerous to small vessels.

**MISTRETТА**, mē-strēt'ta, Sicily, town in the province of Messina, 34 miles northeast of Caltanissetta, 50 miles northwest of Catania and about 11 miles from the sea. It is in the most fertile region of Sicily and is 3,200 feet above sea-level. Lignite is mined in the vicinity. The chief industries are farming and cattle-raising. An annual fair is held here. The name was anciently Aniestratus. Pop. 18,000.

**MISTRIAL**, a trial which is erroneous on account of some defect in the persons trying, as if the jury come from the wrong county, or because there was no issue formed, as if no plea be entered, or some other defect of jurisdiction. Where a jury is discharged without a verdict, the proceeding is properly known as a mistrial. Consent of parties cannot help such a trial, when past. It is error to go to trial without a plea or issue, in the absence of counsel and without his consent, although an affidavit of defense be filed in the case, containing the substance of a plea, and the court has ordered the case on the calendar for trial. On an indictment for perjury, an infant under the age of 21 years, and not otherwise qualified, not having, in fact, been summoned, personated his father as a juror. Here was a mistrial, because the verdict in the case was the verdict of but 11 jurors. A mistrial leaves the parties to an action *in statu quo ante*, and in criminal cases the indicted person may be retired as at a mistrial such a person is not considered to have been placed in jeopardy. See TRIAL.

**MISU**, Nicholas, Rumanian diplomat, represented his country (with M. Bratiano) at the Peace Conference in Paris. By origin a Macedonian Ruman, M. Misu adopted Rumanian citizenship and served for many years in Balkan capitals. In London he carried on the negotiations with the British government relating to Rumania's entry into the war. He was called home when the conclusion of peace with Germany became inevitable to negotiate terms with the conquerors. He possesses a remarkable knowledge of European and Balkan languages.

**MITANNIANS**, a race dwelling in Mesopotamia in the 2d millenium B.C. and that came to light by the discovery of some cuneiform tablets found in the rock tombs of Tell-el-Amarna in Upper Egypt (between Memphis and Thebes) in 1887-88. These clay tablets contained Egyptian correspondence with Babylonia, Assyria and other ancient nations. In these tablets, through the scholarship of learned Orientalists, it was discovered that there was a kingdom of Mitanni in northern Mesopotamia which had important relations with Egypt. Moreover, this country was identified as Aram-Naharayim (Aram of the Two Rivers), called in Syriac, Beth-Nahrin, i.e., "the land of the rivers"—Euphrates and Tigris—and meaning particularly the northern portion of Mesopotamia. Aram-Naharayim, in other words Mitanni, was the home of Balaam and probably his famous animal, for in Deut. xxiii, 4 Balaam is called a native of Aram-Naharayim and Numbers xxiii, 7 reads that

Balaam was brought "from Aram out of the mountains of the east."

The Mitannian kings whose names have been discovered seem to have belonged to the Hittites or Harri, whose capital was at Boghaz Keui, North Cappadocia, explored in 1907. One of these kings, Dushratta whose letters were discovered in the Tell-el-Amarna tablets, was the father-in-law of Amenhotep III of Egypt (1411-1389 B.C.). He was also a contemporary of Subbiluliuma, the Hittite monarch, who seems to have obtained lasting dominion in Syria by subduing Dushratta. Three kings of the same dynasty, Saushshatar, Artatama I and Sutarna I, preceded Dushratta and Ortatama II Artashshumara, Mattuaza and Sultarna II followed him. Some authorities think that this dynasty took possession of the native Mitannians; other authorities find grounds for believing the Mitannians to have been the Hittites, who in 1932 B.C. put an end to the Amoritic dynasty in Babylon and established themselves in Mesopotamia thereafter. Hittite hieroglyphics and cuneiform script were both used among the Mitannians. The gods of this race were the same as in the Babylonian and Assyrian pantheons.

"The discovery of the Tell-el-Amarna tablets revealed to us," writes Dr. A. H. Sayce, "the existence of a new language, once spoken in northern Mesopotamia in the kingdom of Mitanni, the Aram-Naharayim of the Old Testament. One of the letters addressed to Dushratta, king of Mitanni, to the Egyptian Pharaohs is in the native language of his country and its length is such that a comparison of it with those of his letters which are written in Assyrian makes a partial decipherment of it possible. Shortly after the publication of the cuneiform text by Winckler and Abel in 'Mittheilungen aus den orientalischen Sammlungen' (I No. 27) attempts at the decipherment of the language by Professor Brünnow, Professor Jensen and myself appeared simultaneously in the *Zeitschrift für Assyriologie* (Vol. II and III, 1890.) The cuneiform text has recently been subjected to a very careful re-examination by Dr. Knudtzon and the result of his labors is given in the *Beiträge zur semitischen Sprachwissenschaft* (IV, pp. 134-153). In one of the letters of Dushratta one of his envoys is called Tunip-ippi" (Tell-el-Amarna Tablets in the British Museum, 9, 47) "the king of Tunip. This raises a presumption that the power of Mitanni extended as far as Tunip, the modern Tennip, and that the Mitannian language was spoken there. The presumption is confirmed by a letter sent to the Pharaoh by the people of Tunip in which the native words added to the Assyrian translation, where the latter did not seem quite clear or literal enough, all belong to the language of Mitanni. In the Mitannian letter of Dushratta itself the meaning of a few words and forms is cleared up by the ideographs attached to them.

"It is clear that Mitannian is in its general structure a Caucasian language. It resembles Georgian in its habit of piling suffix upon suffix, pronoun upon pronoun, until the verbal forms become almost impossible to analyze. Like Georgian, also, it occupies a middle position between inflection and agglutination. In

this respect it resembles the ancient languages of Asia Minor, so far as we know them, though it is to be noticed that it illustrates the fact that, as we pass eastward, agglutination is more prominent, while westward, as in the case of Lycian, inflection is more pronounced." See HITTITES: Consult Tell-el-Amarna Tablets in the British Museum (1892); Davies, 'Rock Tombs of Ell-Amarna' (1903); Bezold, C., 'Oriental Diplomacy: the transliterated text of the Cuneiform Despatches discovered at Tell-el-Amarna' (1893); 'The Tell-el-Amarna Letters,' English translation by M. Winckler (Berlin 1896); Knudtzon, J. A., 'Die El-Amarna Tafeln' (Leipzig 1907-09); Petrie, W. M. F., 'Syria and Egypt from the Tell-el-Amarna Letters' (1898); Bork, Ferdinand, 'Die Mitannis sprache' (Berlin 1909); Winckler, 'Vorderasien im zweiten Jahrtausend' (Leipzig 1913), and Sayce, A. H., 'The Language of Mitanni' in Proceedings of The Society of Biblical Archæology (June 1900).

MITAU, mē'tou (Russian Mitava), Russia, town and capital of the government of Courland, on the right bank of the river Aa, 26 miles southwest of Riga, on the Riga-Orel Railroad. The town is supposed to have received its name from the German *Mitte in der Aue* and is said to have been founded in 1266 by Conrad Mandern, grand-master of the Order of the Brethren of the Sword. When the Lithuanians plundered it in 1345, it had become an important town. In 1561 the Duke of Courland made it his residence and the palace became the seat of government. This castle, which was situated on an island in the river, was destroyed by Duke Biren, who erected in its place (1738-72), a fine palace, now the official residence. Mitau was captured three times by the Swedes in the 17th century and in 1795, when Russia annexed Courland, Mitau was included. The Duke of Provence (afterward Louis XVIII) made Mitau his home in 1798-1801 and again in 1804-07. Napoleon I captured it in 1812. Mitau is only 12 feet above sea-level and at high water the town is sometimes inundated. A canal surrounds the town in the place of the old fortifications. The streets are broad and regular and many contain handsome residences of the German nobility. Mitau possesses a museum with a library, a gymnasium and a theatre and is the home of the Lettish Literary Society. The chief manufactures are chocolate, oilcloth, ink, flour, iron products and hats; and the town also possesses saw-mills, tanneries and iron-works. The trade is large in grain, cattle and wood. Germans outnumber the rest of the races, which include Poles, Letts, Russians and Jews. Most of the inhabitants are Protestant and a general superintendent of the Lutheran Church has his seat there. Pop. 39,200.

MITCHAM, England, a suburb of London, on the river Wandle in Surrey, four miles northwest of Croydon on the London, Brighton and South Coast Railway. It is 10 miles south of London Bridge. The neighborhood abounds in market-gardens and plantations of roses, lavender, peppermint and other herbs for the manufacture of perfumes and essences. Mitcham Common, covering 480 acres, has one of the best golf courses near London. Pop. 30,000.

**MITCHEL**, mīch'ēl, John, Irish patriot: b. Dungiven, County Derry, 3 Nov. 1815; d. Drumalane, 20 March 1875. He was graduated from Trinity College, Dublin, in 1836, and practised several years as an attorney at Banbridge. Soon after the starting of the *Nation* in 1842, Mitchell began to contribute to that journal and after the death of Thomas Davis, in 1845, became assistant editor. In 1848 he began the publication of the *United Irishman*, for his articles in which he was sentenced to 14 years' transportation for felony. He was sent to Bermuda, and next to Tasmania, whence he made his escape to the United States in the summer of 1853. Here he published a series of short-lived newspapers, the *Citizen* (at New York), the *Southern Citizen* (Knoxville, Tenn.), the *Inquirer* (Richmond, Va.) and the *Irish Citizen* (New York). An advocate of slavery, he favored the Confederates in the Civil War, on which side his three sons fought, and he was at one time under arrest by the Federal authorities. In 1874 he returned to Ireland. He was elected to Parliament from Tipperary, was declared ineligible, but was re-elected. Among his writings are 'Life of Hugh O'Neill' (1845); 'Jail Journal; or Five Years in British Prisons' (1854), and a 'History of Ireland from the Treaty of Limerick' (1868). Consult Dillon, W., 'John Mitchel' (London 1888).

**MITCHEL**, John Purroy, American public official: b. Fordham, N. Y., 19 July 1879; d. near Lake Charles, La., 6 July 1918. His grandfather was the Irish patriot, John Mitchel, who with his three sons fought in the Confederate army during the Civil War. John Purroy was educated at Fordham College (now Fordham University) and in 1899 was graduated at Columbia University. Two years later he was graduated at the New York Law School and was admitted to the bar the same year. One of his early cases involved a mining claim in South America. His work there in an unhealthy tropical region resulted in a fever and peculiar headaches, one of which is thought to have been responsible for the accident which resulted in his death several years later. His entrance into public life was his appointment by Mayor George B. McClellan as special counsel to the city of New York in December 1906. In April of the following year he was made commissioner of accounts and in this capacity he investigated the office of the borough president of Manhattan, John F. Ahearn. The latter was removed and many grafters were made to feel the heavy arm of the law. All advocates of good government in New York were pleased with the ability and integrity of Mitchel and in 1909 he was elected president of the board of aldermen on a fusion ticket, William J. Gaynor being elected mayor at the same time. In August-September 1910 Mitchel was acting mayor while Mayor Gaynor was recovering from a wound inflicted by a maniac. On 7 June 1913 President Wilson appointed Mr. Mitchel collector of the port of New York and in the autumn of the same year he became the fusion candidate for the mayoralty in opposition to C. S. Whitman, then district attorney of New York County. Mitchel won the nomination and after a bitter campaign defeated Judge Edward E. McCall, the regular Demo-

cratic nominee, at the November election of 1913. Mitchel's administration passed its first year in comparative peace, municipal markets were established, but on a wholly inadequate scale. Storms came in 1915, 1916 and 1917. On the whole the city administration did much to relieve the increasing number of the unemployed. Sections of the city press began to attack the administration for its failure to curtail expenditures, for its attempt to place the city public schools on an undemocratic basis, and above all for its supineness in dealing with certain railroad corporations who were seeking valuable franchise privileges. Other disclosures in regard to the Rockaway land deals and the Brooklyn terminal project further alienated popular support. Mitchel also angered a great and powerful section of his fellow-citizens through the alleged biased and unfair investigation of Catholic charitable institutions sponsored by him, and in which city officials resorted to the illegal method of wiretapping in an unsuccessful effort to involve certain Catholic clergymen and prominent laymen. As a result, at the close of his administration Mitchel found himself strongly supported by all corporation and big moneyed interests in the city, and heartily despised among the masses of the city's toilers. In 1917 he was again a candidate for mayor. By lavish expenditures of money at the primaries his friends endeavored to secure him the nomination but he was defeated by Bennett. Over 21 persons were indicted for fraud in connection with Mitchel's primary campaign. After defeat at the primaries he stood for re-election as an independent candidate, but at the November election he received 149,260 votes, while the Socialist Hillquit received 141,739, and Hylan, the regular Democratic candidate, received a grand total of 298,149 votes, the greatest plurality in New York's history and an emphatic repudiation of Mitchel's administration. On 11 Jan. 1918 Mr. Mitchel was commissioned major in the Aviation Corps of the United States army. He received his cadet training at San Diego, Cal., and soon became noted for his daring in the air. He was transferred to Gerstner Field, near Lake Charles, La., to receive the finishing stages of training necessary for service at the war front. On the morning of 6 July Mr. Mitchel fell from a single-seater scout plane at a height of about 500 feet and was killed. A few days later a public funeral was held from Saint Patrick's Cathedral.

**MITCHEL**, Ormsby McKnight, American astronomer: b. Morgansfield, Ky., 10 July 1810; d. Hilton Head, S. C., 30 Oct. 1862. He was graduated from West Point in 1829, and was made assistant professor of mathematics there, which post he held for two years. From 1832 to 1834 he was counsellor-at-law in Cincinnati, Ohio; from 1834 to 1844 professor of mathematics, philosophy and astronomy at Cincinnati College; and 1836-37 chief engineer of the Little Miami Railroad. He lectured in various parts of the United States on astronomy in 1842-48, raised funds for the building of an observatory at Cincinnati, the cornerstone of which was laid 9 Nov. 1843, and was its director in 1845-59. In 1859 he became director of the Dudley Observatory at Albany, N. Y. He was known as a popular lecturer on astronomy, and

scarcely less distinguished for his mechanical skill. He perfected a variety of apparatus of great use to astronomy. One of the most important of his constructions was an apparatus for recording right ascensions and declinations to within  $\frac{1}{1000}$  of a second. He also invented an instrument for the measurement with great accuracy of large differences of declination, such as the ordinary method by micrometer was unable to reach. In 1861 he entered the Federal army as brigadier-general of Ohio volunteers, and on 11 April 1862 was promoted major-general. From 17 September he commanded the Department of the South and the Tenth corps, operating in South Carolina. He was known in the army as "Old Stars." He was a Fellow of the American Academy of Arts and Sciences and an associate of the Royal Astronomical Society of London. He published and edited *The Sidereal Messenger* (1848-58), and wrote 'The Planetary and Stellar Worlds' (1848); 'The Orbs of Heaven' (1851); 'Popular Astronomy'; 'A Concise Elementary Treatise of the Sun, Planets, Satellites and Comets' (1860), both republished (London 1892), and 'The Astronomy of the Bible' (1863). Consult Mitchell, F. A., 'Life of Ormsby McKnight Mitchell' (Boston 1887).

**MITCHELL**, mitch'el, Anthony, Scottish bishop: b. Aberdeen, Scotland, 24 Oct. 1868; d. there, 17 Jan. 1917. He was educated at Aberdeen University, where he won prizes for his ability in classic studies, and at Edinburgh University and the Episcopal Theological College, and was ordained in 1892. After serving as rector of Saint Mark's Church, Portobello, he became principal and Pantonian professor of theology at the Theological College of the Episcopal Church in Scotland in 1905. He was appointed canon of Saint Mary's Cathedral in 1905, and chancellor in 1912. He was well known in the United States, having come here in 1914 to deliver lectures on theology and on the history of Scotland. His published works are 'Tatters from a Student's Gown' (1890); 'History of the Episcopal Church in Scotland' (1907); 'Story of the Church in Scotland' (1908); 'Biographical Studies in Scottish Church History' (1914).

**MITCHELL**, Charles, English pugilist: b. Birmingham, 1861; d. Hove, near Brighton, April 1918. He first took to fencing, of which science he became a teacher before he was 20. Adding boxing to his repertory, he had passed through several successful bouts with amateurs until he distinguished himself in 1882 by winning a competition open to all English heavyweights. Although he was little more than a lightweight himself, he had already won a similar competition for middleweights. He was then brought to America to meet John L. Sullivan, who then weighed 204 pounds against Mitchell's 150 pounds. In the second round at Madison Square Garden the Englishman knocked his opponent off his feet, and at the close of the third round the fight was stopped by the police. Mitchell's two-handed blows were so accurate and severe that for a long time Sullivan declined his challenge to a contest under Prize Ring rules in a 24-foot arena. On 10 March 1888, however, they met at Chantilly in France, and after a struggle of 39 rounds, lasting 3 hours, 10

minutes, 55 seconds, the fight was declared a draw. Fought in the open air, in a pouring rain, that battle formed one of the strangest chapters in the annals of old-style pugilism. The rounds varied in duration from 7 minutes, 7 seconds to 10 seconds, Mitchell often going down at the slightest tap to economize his strength. In the earlier stages, Sullivan, with 42 pounds advantage in weight, had much the best of the fighting, but he could never really corner his elusive opponent, who seemed little the worse for the punishment he had received when the draw was mutually agreed to. Mitchell practically retired from the ring after the fight, but returned in 1894, past his prime and out of form, only to be knocked out in the third round by J. J. Corbett after an exciting contest. Mitchell had never been knocked out before. He was married to a daughter of George Washington Moore, popularly known as "Pony" Moore, formerly a circus rider and one of the founders of the Moore and Burgess Minstrels. In temperament Mitchell, though a most brilliant and courageous boxer, was extremely sensitive and quick to take offense.

**MITCHELL**, Clifford, American physician: b. Nantucket, Mass., 28 Jan. 1854. He was graduated at Harvard in 1875; studied medicine in the Chicago Medical College and the Chicago Homœopathic Medical College; began to practise in Chicago in 1878; and devoted himself to diseases of the kidneys. He was for many years professor of chemistry, toxicology, and renal diseases at the Chicago Homœopathic Medical College, and after 1905 of clinical urinalogy and renal diseases at Hahnemann Medical College, Chicago. He is associate editor of the *Clinique* and of the *Phi Alpha Gamma Quarterly*. Has established a diagnostic laboratory in the Marshall Field Annex, and invented a stain for urine sediments and a rapid test for albumin in urine. He is author of 'Student's Manual of Urinary Analysis' (1879); 'Physician's Chemistry' (1884); 'Dentist's Manual of Special Chemistry' (1887); 'Renal Therapeutics' (1898); 'Diseases of the Urinary Organs' (1903); 'Modern Urinology' (1912).

**MITCHELL**, Donald Grant, American author ("IK MARVEL"): b. Norwich, Conn., 12 April 1822; d. Edgewood, Conn., 15 Dec. 1908. He was graduated at Yale in 1841; studied law in New York; was United States consul to Venice in 1853; and in 1855 settled on his farm, "Edgewood," near New Haven. He has written much, on various themes, and always with a genial charm and ease of style. His best-known works are the idyllic sketches called 'Reveries of a Bachelor' (1850), and 'Dream Life' (1851). He also wrote 'French Gleanings' (1847), descriptive of his first European trip, as 'The Battle Summer' (1850) was of his stay in Paris in 1848; 'The Lorgnette' (1850), a satiric novel of New York life in the forties; 'Fudge Doings' (1855), another New York society novel; 'The Seven Stories with Basement and Attic,' a series of tales of travel (1864); 'Dr. John' (1866), a religious story contrasting life in Connecticut and in the French Midi; and the more characteristic papers on men, books and outdoors, such as 'My Farm at Edgewood' (1863); 'Wet Days at Edgewood' (1865); 'Rural Studies' (1867);

'English Lands, Letters and Kings' (1889), and 'American Lands and Letters' (1897).

**MITCHELL, Edward Page**, American journalist: b. Bath, Me., 24 March 1852. He was graduated at Bowdoin College in 1871 and joined the staff of the *Boston Advertiser*. Since 1875 he has been engaged on the editorial staff of the *New York Sun*, of which he became editor in 1911. In 1913 he was special lecturer at the Columbia School of Journalism. In 1909-11 he was president and after that date vice-president of the Sun Printing and Publishing Company. Mr. Mitchell's writings on the editorial page of the *Sun* have attracted wide attention for their brilliancy. He has also contributed to magazines. He is an overseer of Bowdoin College and a member of numerous clubs.

**MITCHELL, Elisha**, American scientist: b. Washington, Conn., 19 Aug. 1793; d. on Mount Mitchell, N. C., 27 June 1857. He was graduated at Yale in 1813; four years later became professor of mathematics in the University of North Carolina; and in 1826 was made professor of chemistry, mineralogy and geology in the same institution. The Olmsted-Mitchell Geological Survey (1824-28) did important work under his supervision. He discovered that a peak in North Carolina is the highest in the Eastern States and during a storm he was killed by a fall from this height. It is now called in his honor Mount Mitchell or Mitchell's High Peak, and on its summit he is buried.

**MITCHELL, Henry**, American civil engineer: b. Nantucket, Mass., 16 Sept. 1830; d. Boston, Mass. 11 Dec. 1902. He was a son of William Mitchell (q.v.), was educated at the Normal School in Bridgewater, Mass., and in 1851 was appointed to government service as a civil engineer under the United States Coast Survey. He acted as assistant to the commissioners on harbor encroachments in New York in 1859 and discovered the underflow of the Hudson. He was later engaged in Boston harbor and assisted in the improvement of the mouth of the Mississippi in 1874. He made an investigation of the Panama Canal scheme under De Lesseps and held many government commissions to investigate the principal harbors along the Atlantic Coast, including Portland, Me., Providence, R. I., Norfolk and Portsmouth, Va., and Philadelphia, Pa. He was appointed professor of physical hydrology at the Massachusetts Institute of Technology in 1869. In 1874 he was the representative of the United States Coast Survey on the board of engineers for the improvement of the mouth of the Mississippi, and later a member of the James B. Eads advisory board and of the Mississippi River Commission. In 1879 he visited the Suez Canal and inspected it under the authority of Ferdinand De Lesseps. He published many reports of surveys, etc.

**MITCHELL, Hinckley Gilbert**, American biblical scholar: b. Lee, Oneida County, N. Y., 22 Feb. 1846. He was graduated at Wesleyan University in 1873 and in the theological department of Boston University 1876, and Leipzig University 1879. From 1879 to 1880 he was pastor of the Methodist Episcopal Church at Fayette, N. Y. In 1880-83 he was instructor in Hebrew and Latin in Wesleyan University, and in 1883-1905 professor of Hebrew and

biblical exegesis in Boston University; 1905-06 instructor in the Semitic languages in the same institution. Since 1910 he has been professor of Hebrew and Old Testament exegesis in Tufts College. In 1901-02 he served as director of the American School of Biblical Research in Jerusalem; in 1914 for the summer quarter he was supplying professor in the University of Chicago and lecturer at two sessions of the Summer School of Theology, Harvard University. His most important publications are 'Hebrew Lessons' (1884); 'Amos' (1893); 'The Theology of the Old Testament,' a translation from Piepenbring (1893); 'Isaiah, chapters i-xii' (1900); 'The World before Abraham' (1901); 'Tales Told in Palestine,' in collaboration with J. E. Hanauer (1904); 'Genesis' (1909); 'Haggai and Zechariah' (in the *International Commentary* 1912); 'The Ethics of the Old Testament' (1912), and numerous articles in *The Journal of Biblical Literature* and various theological publications.

**MITCHELL, John**, American labor leader: b. Braidwood, Will County, Ill., 4 Feb. 1870. He entered the mines at Braidwood at the age of 13, and in 1885 joined the Knights of Labor. The next few years he spent coal mining in different States of the West and Southwest, and in 1890 settled at Spring Valley, continuing his work at his trade. He read and studied constantly and was a member of several debating societies and reform clubs; he was also active in the labor movement and was president of the Knights of Labor local at Spring Valley. On the formation of the United Mine Workers in 1890 he became a member of that organization, was frequently delegate to district conventions and in 1895 was elected secretary-treasurer of the northern Illinois subdistrict; in 1896 he was chairman of the Illinois mine workers' legislative committee, and in 1897 was made a national organizer of the United Mine Workers. In January 1898 he was elected vice-president of that organization and in September of the same year became acting president; he was elected president in 1899, but retired in March 1908; he was also a vice-president of the American Federation of Labor from 1898 to 1914. During his term of office as president of the United Mine Workers the union was enlarged, wages were increased and the eight-hour day extended; he conducted the strikes of the anthracite miners in 1900 and 1902, and brought the latter to a close by his offer in behalf of the miners to accept the decisions of a commission appointed by the President of the United States. After serving for nearly three years as active head of the Trade Agreement Department of the National Civic Federation, he spent two years on the lecture platform, speaking in all parts of the country. He served on the New York State Commission on Employers' Liability and Workmen's Compensation, which drafted the first compensation law enacted by the State of New York. In March 1914 he was appointed to membership on the Workmen's Compensation Commission of New York State, then created, and when in May 1915 this commission was merged with the State Department of Labor, under the administration of the Industrial Commission, he was made chairman of the Industrial Commission of the State of New York.

**MITCHELL, John Ames**, American editor and author: b. New York, 17 Jan. 1845; d. 29 June 1918. He was educated at Harvard and studied in Boston and Paris, and was an architect in Boston in 1870-76, after which he became interested in decorative art and studied art in Paris, 1876-80. Returning to New York he engaged in journalism as artist, illustrator and writer, and in 1883 founded and edited *Life*, one of the very best periodicals of its kind in the United States. He was a member of the National Institute of Arts and Letters. He published 'Croquis de l'Exposition' (1879); 'The Romance of the Moon' (1886); 'The Last American' (1889); 'Amos Judd' (1895); 'The Pines of Lory' (1901); 'The Villa Claudia' (1904); 'The Silent War' (1906); 'Pandora's Box' (1911).

**MITCHELL, John H.**, American lawyer and senator: b. Washington County, Pa., 22 June 1835; d. Portland, Ore., 8 Dec. 1905. He was educated at Witherspoon Institute, Pa., and was admitted to the bar of Pennsylvania and went to California, where he established a law practice, but in 1860 removed to Oregon and engaged in practice there. He was State senator in 1862-66 and president of the senate in 1864. In 1867-71 he was professor at Willamette University, Salem, Ore. In 1873-79 and 1885-97 he was United States senator from Oregon and was returned to the Senate in 1901. He acquired a considerable fortune as lawyer to the great Western railroads.

**MITCHELL, John Kearsley**, American physician: b. Shepherdstown, Va., 12 May 1798; d. Philadelphia, Pa., 4 April 1858. Returning from Ayr and Edinburgh, Scotland, where he had been sent at the age of eight, he studied medicine under Dr. Nathaniel Chapman and was graduated at the medical department of the University of Pennsylvania in 1819. He made three voyages to China and the East Indies as ship-surgeon and then settled in Philadelphia as general practitioner. In 1824 he lectured on the institutes of medicine and physiology at the Philadelphia Medical Institute, and in 1826 became professor of chemistry there. He was given the chair of chemistry at the Franklin Institute in 1833 and for five years delivered annual courses of lectures on chemistry as applied to medicine and the arts. From 1841 to 1858 he was professor of the theory and practice of medicine at Jefferson Medical College. Dr. Mitchell was visiting physician to the Pennsylvania and City hospitals. In addition to numerous papers published in medical and scientific journals, he wrote 'Saint Helena, a poem by a Yankee' (1821); 'Indecision, a Tale of the Far West and Other Poems' (1839); 'On the Wisdom, Goodness and Power of God as illustrated in the Properties of Water' (1834); and 'On the Cryptogamous Origin of Malarious and Epidemic Fevers' (1849), a theoretical anticipation of modern views. His 'Five Essays on Various Chemical and Medical Subjects' were published after his death by his son, Silas Weir Mitchell (1858).

**MITCHELL, Langdon Elwyn** (pen-name 'JOHN PHILIP VARLEY'), American author and playwright: b. Philadelphia, Pa., 17 Feb. 1862, son of Dr. Silas Weir Mitchell (1829-1914). He was educated at Saint Paul's School, Con-

cord, N. H.; and in Europe. He studied law at Harvard and Columbia, and in 1886 he was admitted to the New York bar. From 1883 he devoted himself to literature and the drama. He is a member of the National Institute of Arts and Letters and of the Players Club, New York. His most successful plays are 'Becky Sharp' and 'The New York Idea.' His books are 'Sylvian and Other Poems' (1884); 'Poems' (1894); and 'Love in the Backwoods' (1896).

**MITCHELL, Maggie.** See MITCHELL, MARGARET JULIA.

**MITCHELL, Margaret Julia** ('MAGGIE MITCHELL'), American actress: b. New York, 1832; d. 22 March 1918. She made her first appearance on the stage as an infant and before she was five had taken child parts. She made her debut as Julia in 'The Soldier's Daughter' at Burton's Chambers Street Theatre in New York, and as Fanchon, the Cricket, produced in 1860, she made herself famous. She was married to Henry Paddock, her manager, 15 Oct. 1868, and continued her career on the stage, playing in many famous rôles: 'The Pearl of Savoy'; 'Jane Eyre'; 'Little Barefoot'; 'Mignon,' etc. She divorced Mr. Paddock in 1888 and married Charles Abbott, her leading man, in August 1889. Her last public appearance took place in April 1892.

**MITCHELL, Maria**, American astronomer: b. Nantucket, Mass., 1 Aug. 1818; d. Lynn, Mass., 28 June 1889. She was the daughter of William Mitchell (q.v.), an astronomer of some note, and when a girl frequently assisted him in his observations. She taught for a time in a private school, and was for 20 years librarian of the Nantucket Athenæum, but continued to carry on her astronomical studies and observations. She first became known as an astronomer by her discovery of a comet in 1847, and for this discovery she received a medal from the king of Denmark. She later discovered several nebulae and was engaged in computations for the 'Nautical Almanac' and on work for the Coast Survey for several years. In 1848 she was elected an honorary member of the American Academy of Arts and Sciences, the first woman to receive this honor, and in 1857 went to Europe, visited the principal observatories and was received with honor by Herschel, Humboldt and other noted scientists. In 1865 she was appointed professor of astronomy and director of the observatory at Vassar College. She went to Burlington, Iowa, with some of her students to observe the total eclipse of the sun in 1869 and on other eclipse expeditions; but for the most part she gave up her research and observation work to devote herself to teaching and building up her department. She was an inspiring and original teacher and deeply interested in the advancement of the interests of the college; during her later years there she endeavored to raise a fund to endow the chair of astronomy; this fund (\$50,000) was completed after her death and was named in her honor the Maria Mitchell Endowment Fund. She resigned from her position at Vassar in 1888 and was made professor emeritus. She was a member of the American Association for the Advancement of Science and was given the degree of LL.D by Hanover in 1852 and by Columbia in 1887. She was a believer

in woman's suffrage, but not active in the suffragist movement; she was, however, a member and for several years president of the American Association for the Advancement of Women. In 1908 the Maria Mitchell Observatory was dedicated at Nantucket. The Maria Mitchell Astronomical Society was named in her honor. Consult Babbitt, M. K., 'Maria Mitchell as Her Students Knew Her' (Poughkeepsie 1912); Kendall, P. M., 'Life, Letters, and Journals of Maria Mitchell' (Boston 1896); Mitchell, Henry, in 'Proceedings of the American Academy of Arts and Sciences' (Vol. XXV, Boston 1889-90); Whitney, M. W., 'In Memoriam' (Poughkeepsie 1889).

**MITCHELL, Peter**, Canadian statesman: b. Newcastle, New Brunswick, 4 Jan. 1824; d. Montreal, 25 Oct. 1899. He studied law and was admitted to the bar in 1848. Shipbuilding and other business pursuits soon engrossed his attention and he abandoned law, but in 1856 he entered political life as Liberal member in the provincial assembly of New Brunswick, and in 1860 was appointed to the legislative council, and five years later was appointed a life member of the legislative council and was premier 1865 to 1867. Mitchell was one of the foremost in the organization of the Canadian confederation, and was a delegate to the Charlottetown and Quebec conferences, and to London in 1866. He was appointed to the Canadian Senate in 1867, and resigned in 1873. He was Minister of Marine and Fisheries, 1867-74, and was chiefly instrumental in settling the negotiations between the United States and Canada over the Bering Sea fisheries. He sat in the House of Commons, 1874-78 and 1882-96. He purchased in 1885, and for some years edited, the Montreal *Herald*. In 1897 he was appointed inspector of fisheries for the Atlantic provinces. He was the author of a review of President Grant's message to Congress relative to the Canadian fisheries (1870).

**MITCHELL, Samuel Alfred**, American astronomer: b. Kingston, Ontario, Canada, 29 April 1874. He was graduated at Queen's University, Kingston, in 1894 and took his Ph.D. in Johns Hopkins in 1897, where he had been Fellow in astronomy in 1896. He was tutor and instructor in astronomy at Columbia in 1899-1908 and became professor of astronomy at the McCormick Observatory, University of Virginia, in 1913, which post he now (1918) holds. He was a member of the United States eclipse expeditions to Georgia (1900), to Sumatra (1901), to Spain (1905) and to Oregon (1918). In the summers of 1907, 1909, 1910 and 1911 he was research associate at Yerkes Observatory, University of Chicago. In 1909-12 he was editor of the *Monthly Evening Sky Map*. He is a member of various scientific societies.

**MITCHELL, Samuel Augustus**, American geographer: b. Bristol, Conn., 30 March 1792; d. Philadelphia, 20 Dec. 1868. His early life was devoted to teaching in which he was very successful, but the inadequate treatment of geography by the textbooks then in use induced him to turn his attention to the making of satisfactory ones and he spent 40 years in Philadelphia in the preparation of textbooks on that subject. So general was their adoption that they reached a total sale of 400,000 annually.

Besides his geographical textbooks, of which there were 24, he edited a new edition of John James Audubon's 'Birds of America' and wrote 'General View of the World, Physical, Political, and Statistical' (1846), and 'New Traveller's Guide through the United States' (1850).

**MITCHELL, Silas Weir**, American physician, inventor of the "rest cure," poet and novelist: b. Philadelphia, 15 Feb. 1829; d. 4 Jan. 1914. He studied at the University of Pennsylvania, was graduated from Jefferson Medical College in 1850, entered practice in Philadelphia, during the Civil War was in charge of the Turner's Lane United States hospital (Philadelphia) for diseases and injuries of the nervous system, and subsequently was president of the Philadelphia College of Physicians. In his professional capacity he became known for his researches in connection with nervous diseases, and in physiology and toxicology. A bibliography of his publications would supply the titles of some 150 medical papers, recounting investigations of high scientific importance. To a wider degree, however, he is known through his literary work, composed principally of poetry and fiction. He was elected to the American Academy of Arts and Sciences and the National Academy of Sciences, and was also made associate corresponding or honorary member of foreign scientific societies. His works in medical science include 'Researches on the Venom of the Rattlesnake' (1860); 'Gunshot Wounds and other Injuries of Nerves'; 'Reflex Paralysis' (1864); 'On Injuries of the Nerves and their Consequences' (1872); and 'Fat and Blood, and How to Make Them' (1877). Among his other writings are, in verse, 'The Hill of Stones' (1882); 'The Masque' (1887); 'The Psalm of Death' (1890), and 'The Wager' (1900); in fiction, 'Roland Blake' (1884); 'Far in the Forest' (1888); 'A Madeira Party' (1895); Hugh Wynne' (1897); 'The Adventures of François' (1899); 'The Autobiography of a Quack' (1900); 'Circumstance' (1901); 'Collected Poems' (1896); 'Memoir of Owen Jones' (1896); 'Constance Trescot' (1905); 'Doctor and Patient.' Consult Oberholtzer, E. P., 'Personal Memories of Weir Mitchell' (in the *Bookman*, Vol. XXXIX, New York 1914); the *Book News Monthly* (Vol. XXVI, Philadelphia 1907); Tucker, B. R., 'S. Weir Mitchell' (Boston 1914); Williams, Talcott, 'Dr. S. Weir Mitchell' (in the *Century Magazine*, Vol. LVII, New York 1898). Consult also 'A Catalogue of the Scientific and Literary Work of S. Weir Mitchell' (Philadelphia 1894).

**MITCHELL, Sir Thomas Livingstone**, Scottish explorer: b. Craigend, Stirlingshire, Scotland, 16 June 1792; d. Darling Point, Sydney, Australia, 5 Oct. 1855. He served in Wellington's army in the Peninsular War from 1808 until the end of the campaign, obtaining the rank of major in 1826, and was sent to survey the battlefields afterward. His map of the Lower Pyrenees is still valued. This led to his publishing 'Outlines of a System of Surveying for Geographical and Military Purposes' (1827) and the appointment of deputy surveyor-general of New South Wales (1828). Between 1831 and 1846 he made four exploring expeditions discovering the Peel, the Namoi, the Gwyder and other rivers and traced the

course of the Darling and the Glenelg. He was also the first to penetrate into the district that he named Australia Felix. On his last expedition, devoted to the discovery of a route between Sydney and the Gulf of Carpentaria, he explored the Fitzroy Downs, and discovered the Balonne, Victoria, Warrego and other rivers. Visiting England in 1838-39 he was knighted and made D.C.L. by Oxford. He took with him some of the first specimens of gold and the first diamond found in Australia. In 1851 he was sent to the Bathurst goldfields to make a report. In 1853 he again visited England where he patented his boomerang propeller for steamers. His publications chiefly relate to his explorations: 'Three Expeditions into the Interior of Eastern Australia' (2 vols., London 1838); 'Journal of an Expedition into the Interior of Tropical Australia' (1848); 'Australian Geography' (1850); and 'The Lusiad of Camoens Closely Translated' (1854).

**MITCHELL, Walter**, American Protestant Episcopal clergyman: b. Nantucket, Mass., 22 Jan. 1826; d. 1908. He was graduated from Harvard in 1846 and admitted to the bar in 1849, but deciding to enter the Episcopal ministry, received ordination to the priesthood in 1860. He held many important charges and was for a time chaplain of Kenyon College, Gambier, Ohio, until he retired from active service. He published 'Two Strings to His Bow'; 'Bryan Maurice,' etc.

**MITCHELL, William**, American astronomer: b. Nantucket, Mass., 20 Dec. 1791; d. Poughkeepsie, N. Y., 19 April 1868. He taught for a time, became cashier of the Pacific Bank in Nantucket, and interested in astronomy and mathematics, made a long series of investigations in connection with the United States Coast Survey studies of the figure of the earth. Besides lecturing on astronomy in Boston and elsewhere, he contributed to the *American Journal of Science*, and supplied time to whaling vessels. He received academic honors from Brown and Harvard universities and was elected to the American Academy of Arts and Sciences.

**MITCHELL, Ind.**, a city in Lawrence County, 43 miles southwest of Columbus on the Chicago, Indianapolis and Louisville and the Baltimore and Ohio Southwestern railroads. Lime-kilns are among the chief industries. There are also mills for flour and timber. Pop. 3,438.

**MITCHELL, S. Dak.**, city and county-seat of Davison County, is located on two divisions of the Chicago, Milwaukee and Saint Paul Railway, and 68 miles east by north of Sioux Falls. It was settled in 1879, incorporated as a city in 1883, and is governed under the general law charter of 1890 by a mayor who holds office for two years, and a council of eight members, four of whom are elected each year. The territory surrounding Mitchell is an agricultural district, producing principally corn and alfalfa, fruits and vegetables, while hogs, cattle, sheep and all stock, especially dairy herds, are found in great numbers. The city's grain products, etc., reach all of the Eastern terminals, Southern markets and Southern export markets and considerable stuff goes to the west coast and much to export via Puget Sound cities. The wealth of the city and county is reflected in its

banks and trust companies, which have a combined capital, surplus and undivided profit of \$934,479.84, with deposits over \$4,000,000. Mitchell is the seat of Dakota Wesleyan University, a Methodist Episcopal Church State University and has well-equipped schools and churches. Pop. about 8,800.

**MITCHILL, mich'li, Samuel Latham**, American scientist: b. North Hempstead, L. I., 20 Aug. 1764; d. New York, 7 Sept. 1831. He was graduated M.D. at the University of Edinburgh in 1786, and in 1788 was a commissioner for treating with the Iroquois Indians for the purchase of land. In 1792 he was appointed professor of chemistry, natural history and philosophy in Columbia College, where he first introduced the system of nomenclature invented by Lavoisier. In 1797 he founded with Dr. Edward Miller and Elihu H. Smith the quarterly *Medical Repository*, of which he continued the editor for 16 years. It was the first scientific periodical published in the United States. In 1801 he became a representative in Congress, and in 1804 was chosen to the United States senate. At the expiration of his term of office he was again elected to the House of Representatives. On the establishment of the College of Physicians and Surgeons he was appointed (1808) professor of natural history, becoming in 1820 professor of botany and materia medica. The institution in 1826 gave place to the Rutgers Medical School, of which Dr. Mitchill became vice-president. Though widely respected in his lifetime as a man of extraordinary learning and styled the "Nestor of American science," he was occasionally the butt of the satirical wits of New York, and the poems of "Croaker & Co.," to which Fitz-Greene Halleck was a contributor, contain records of some of his eccentricities. He proposed to change the name of this country to "Fredonia," and wrote in 1804 'An Address to the Fredes, or People of the United States.' He was one of the early supporters of Robert Fulton, whom he accompanied in 1807 in the first steamboat journey on the Hudson. He was the author of 'Observations on the Absorbent Tubes of Animal Bodies' (1787); 'Nomenclature of the New Chemistry' (1794); 'Life, Exploits, and Precepts of Tammany, the famous Indian Chief,' a half historical, half fanciful address before the Tammany Society of New York (1795), etc. Consult Francis, 'Reminiscences of Samuel Latham Mitchill' (1859).

**MITE**, formerly a term applied to a very small coin worth about one mill. The name was used for a small coin current in Palestine in the time of Christ.

**MITES**, small parasitic members of the Arachnid order Acarina, which also contains the ticks (q.v.), mange-insects and similar forms. The body is compact, not divided into separate regions, as head, thorax and abdomen; and they appear, as they are, greatly inferior to the spiders. They have eight legs, eyes useless, or nearly so, two spiracles only, and mouths with sharp, beak-like mandibles, fitted for biting or for piercing the skin of the animal on which they reside or prey by imbibing its juices. The mites undergo a metamorphosis, the larva passing through a series of changes varying with the species. The species are many, and are parasitic on a large variety of animals, and

on mankind. In America, for instance, no less than 18 kinds infest poultry, of which the red mite (*Dermanyssus gallinae*) and the chicken itch-mite (*Sarcoptes nutans*), attacking the feet, are the most commonly met with. A contagious disease among chickens is caused by a sort of mange-mite (*Cytodites nudus*) that flourishes in the air-passages, setting up inflammation of the lungs. The most serious disease of sheep is caused by the scab-mite (*Psoroptes communis*), varieties of which also produce "scab" in horses, cattle, goats and rabbits.

Household pests are the cheese-mites of two species that now have a world-wide distribution; but they will flourish equally well in other sorts of stored goods. A cheese once attacked will speedily be reduced to a powdery mass of mites, cast-off skins and excrements, the result of the amazingly rapid multiplication of the mites, and the fact that they produce living young. The new generation matures quickly and at once continues the production. When the stock of food is wholly consumed the youngest and oldest mites die, but those in vigorous middle age assume a scale-like quiescent form, called the hypopus stage, which is able to subsist indefinitely without activity or food. Finally a cockroach, mouse or some other small creature comes near enough to be seized by the hypopus, when it clings to a hair, crawls to the surface of the skin, begins to feed and sets up a new colony.

Of the mites inhabiting the human body the itch-mites (*Sarcoptes scabiei*) is the most important and fortunately is disappearing. It affects a large number of hairy kinds of animals in all parts of the world, as well as man, and lives continuously on its host. The itching sensation denoting its presence is caused by the female mites burrowing beneath the skin, where the eggs are laid, and by the young feeding on the tissues before making their way to the surface in search of breeding-mates. Mange (q.v.) in dogs is the result of the presence of a similar mite (*S. canis*). Workers in copra are annoyed by related mites; and soft sugar is sometimes infested with mites of the genus *Tyroglyphus*, which cause "grocer's itch" in those who handle it. A common mite whose presence gives little if any trouble is the one (*Demodex*) found in the "blackheads," or blackish follicles that disfigure the noses of some of us.

That desperately annoying pest of autumn in some places, the minute red "harvest-bugs" of the genus *Leptus*, inhabit vegetation whence they attach themselves to man and other animals and begin to burrow in the skin causing an intolerable heat and itching, often resulting in bad sores. Consult authorities in Economic Entomology and Hygiene: especially Ealand, 'Insects and Man' (New York 1915). See Tick.

**MITFORD**, mit'förd, **Mary Russell**, English writer: b. Alresford, Hampshire, England, 16 Dec. 1787; d. Swallowfield, near Reading, Berkshire, 10 Jan. 1855. Her education was obtained largely through her very wide reading. She won a lottery prize of £20,000 when three years old, with which her spendthrift father built a house at Reading. Owing to his extravagance, the family had to move to a laborer's cottage, and she to earning by her pen. Her

first published work was 'Miscellaneous Poems' (1810). With the sketches 'Our Village,' descriptive of English rural life (first appeared in *Lady's Magazine*, 1819; collected 1824, 1826, 1828, 1830, 1832), she may be said to have originated a branch of literature. Among her dramatic works, five in number, 'Rienzi' (1828) was most successful; in America it became popular with Charlotte Cushman as Claudia. Included in her further writings are 'Recollections of a Literary Life' (1852), and the works of fiction 'Belford Regis' (1835) and 'Atherton' (1854), the latter highly praised by Ruskin. Her correspondence (published 1870) has been by some ranked almost with her books. Consult the 'Life' by L'Estrange (1870); ib., 'The Friends of Mary Mitford as Revealed in Letters from her Literary Correspondents' (1882); the correspondence with Boner and Ruskin, edited by Elizabeth Lee (1915); and Roberts, W. J., 'Mary Russell Mitford: The Tragedy of a Blue Stocking' (1913).

**MITFORD**, William, English historian: b. London, 10 Feb. 1744; d. Exbury, 10 Feb. 1827. He was educated at Oxford, and obtained a commission in the Hampshire militia, of which he became colonel. His early fondness for Greek led him to the study of Greek historians, and he was induced, partly through the advice of Gibbon, a fellow-officer in the same regiment, to undertake a 'History of Greece.' The first volume appeared in 1784; the fifth and last, bringing the narrative down to the death of Alexander the Great, in 1818. With considerable critical acumen and diligent research he elucidated many obscure points, and until the appearance of the works of Thirlwall and Grote, his history was considered of the highest authority. A strong prejudice against democracy leads him to speak of the Athenians as a horde of treacherous miscreants, of Demosthenes as a malignant demagogue and of Philip as a perfect statesman and warrior. Mitford was professor of ancient history in the Royal Academy, and member of Parliament for three boroughs in succession 1785-1818. Besides his principal work he published an 'Essay on the Harmony of Language' (1774) and lesser works.

**MITHAN**. See GAYAL.

**MITHRAS**, mith'ras, in Perso-Iranic divinity, first the god of the heavenly light and the lord of all countries, afterward the sun, or the genius of the sun, which was worshiped as a deity by the Persians, and at a later period also in Rome. Mithras stands as a mediator between Ormuzd and the world, and was involved in the struggle with Ahriman, the evil power. He is commonly represented as a handsome youth, wearing the Phrygian cap, tunic and cloak, and kneeling on a bull, into whose throat he is plunging the sacrificial knife. The bull is at the same time attacked by a dog, a serpent and a scorpion. As the monuments of this worship were destroyed during the Mohammedan conquests, knowledge of its doctrines and rites is necessarily vague and uncertain; but it had some remarkable resemblances to Christianity. The worship of Mithras was formally suppressed in the 4th century. In Germany many tokens of its former existence are still to be found, as the monuments at

Hedernheim, near Frankfort-on-the-Main, and other places.

**MITHRIDATES** (mīth-rī-dā'tēr) VI, surnamed EUPATOR, and also styled commonly THE GREAT, king of Pontus: b. Sinope, 134 B.C.; d. Pantacapeum, 63 B.C. He ruled from 121 B.C. until his death. He early entered on his career of conquest, which ultimately involved him in war with Rome. He subjugated the peoples on the northern shore of the Euxine (Black) Sea, attacked Cappadocia and Bithynia, and since these were allies of Rome, they encountered Roman opposition. After the death of Sulla, 78 B.C., Mithridates levied another army to expel the Romans from Asia. Being defeated by Lucullus, appointed consul 74 B.C., he was followed by the victorious Romans into his own states, and driven to seek refuge in Armenia, then ruled by Tigranes, who refused to deliver him up. Here Mithridates raised a third great army, and in 67 B.C. completely defeated the Romans; and, following up his success, rapidly recovered the larger part of his dominions. The Romans now invested Pompey with absolute power in the East, and by him, in 66 B.C., the forces of Mithridates were completely routed near the Euphrates. The king retired to Bosphorus (the Crimea), where his troops headed by his son Pharnaces, broke out in mutiny, and Mithridates killed himself. He was considered by Rome its most formidable enemy. He was a patron of art and science, and is said to have spoken 22 languages. See POMPEY; SULLA.

**MITLA**, mē'lā ("the place of the dead"), Mexico, a village of the state of Oaxaca, on the Mixtecan Plateau, 26 miles southeast of Oaxaca. It is celebrated for its extensive ancient ruins which comprise five great groups of temples, palaces, tombs and other edifices covering about 2,000 feet square and respectively known as (1) the Catholic establishment; (2) the Columns; (3) the Arrows; (4) the Abode; and (5) the South Side. They were elaborately decorated with admirable mosaic work in geometrical designs and with pictographic mural paintings. The ruins of a fort of the same architecture dominate a hill a short distance west of the city and in the vicinity are the quarries whence the stone for building the city was obtained. See MEXICAN ARCHAEOLOGY, Consult Saville, 'Cruciform Structures near Mitla' (1900).

**MITLAG-LEFFLER**, mī'tāg-lēf'lēr, Magnus Gustaf, BARON VON, Swedish mathematician: b. Stockholm, 16 March 1846. After studying mathematics in Upsala, Paris and Berlin he began to teach in Upsala where he obtained a degree in 1872. In 1877 he became professor of mathematics in Helsingfors and in 1881 at the University of Stockholm. Under the patronage of King Oscar he founded the *Acta Mathematica*, one of the leading mathematical journals in the world. He was several times rector of the University of Stockholm and became a member of the Academy of Sciences of Sweden in 1883. His mathematical writings deal chiefly with the theory of functions.

**MITO**, mē'tō, Japan, a town in the island of Hondo, seven miles from the east coast and 73 miles by rail northeast of Tokio. It is a town of considerable antiquity and has played an important part in the history of the country.

There is an old castle and some fine public gardens. The manufactures include cloth, paper, for which it is famous, cigarettes, etc. Pop. about 35,000.

**MITO, Doctrine of**, said to be the creed of the Mito school of Japan from the middle of the 17th century to the overthrow of absolute power in the 19th century. This doctrine rested on the revival of the old learning of Japan, the honoring of the emperor and the expulsion from the country of "the barbarians" or foreigners.

**MITO, or MYTHO**, French Indo-China. See MYTHO.

**MITOSIS**, or **KARYOKINESIS**, the process of indirect nuclear division of cells undergoing growth or beginning those changes in the egg which bring about the growth of an embryo. This is almost universal, but "amitosis," or direct cell-division occurs in pathological tissues and a few of the lowest organisms. The first stages are characterized by a rearrangement of the nuclear network into a series of loops or V-shaped bodies. Meanwhile a minute body in the cytoplasm, or extra-nuclear cell-contents, has divided into two, and the portions have arranged themselves at opposite poles, with the nucleus between them. Each of the two portions forms a star-like aggregation consisting of a centrosome with a radiating mass. The V-shaped bodies, or chromosomes, of the nucleus arrange themselves with their open ends outward and their closed ends near the centre, and they then separate along the central or equatorial plane, one-half proceeding to each centrosome, with whose rays it becomes incorporated and is firmly held. The cell then becomes constricted between the centrosomes, and in each of the two portions a new nucleus is developed by a process essentially the reverse of that just described. The final result is the formation of two daughter-cells out of the original mother-cell, each of which contains an exact half of the essential chromatin elements not only in respect to equal quantities, but in respect to those qualities, chemical or other, which constitute the inheritable individuality of the organism. For fuller information see CELL; EMBRYOLOGY; and consult the authorities cited under those titles.

**MITRA**, mē'trā (Sanskrit, meaning friend), an Indian god of light, belonging to the Vedic period. Mitra is the Friend, the personification of Daylight, a bright being beloved of man. His name is coupled with that of Varuna, another bright being. The association between them is so close that they present themselves to the mind as an inseparable pair—Varuna-Mitra or Mitra-Varuna,—who drive the same golden chariot and think the same thoughts. Together they are the keepers of the Cosmic Order and the Law of Righteousness, and together they watch the deeds and hearts of men, equally all-seeing and all-knowing. The sun is often called the eye of Mitra-Varuna as well as Varuna's alone; and Light is the chariot on which these two inseparable gods ride through space on their appointed path. They are also avengers and forgivers of sin. It is Mitra's particular business to wake men and call them to the duties of a new day. Only one hymn is addressed to Mitra alone.

The general character of the hymns of the Rig-Veda is as follows: "Mitra and Varuna, you mount your chariot, which is golden when the dawn bursts forth and has iron poles at the setting of the sun; from thence you see what is boundless and what is limited, what is yonder and what is here." Varuna and Mitra are both Adityas, that is, sons of Aditi, who, in consequence, is called "Mother of the Gods." She probably designates boundless space (*aditi*, space). Varuna and Mitra are, therefore, Sons of Boundless Space, Sons of Eternity, Sons of Beauty and Brightness, forgivers of sin, guardians of purity and truth, givers of health. They are thoroughly practical and beautiful deities. Mitra is identical with the Iranian Mithra, or Mithras, also a solar deity and the central figure of a special cult. See MITHRAS; AVESTA, and VEDIC LITERATURE.

**MITRA, Rajendra Lala**, Indian Orientalist: b. near Calcutta, 15 Feb. 1824; d. Calcutta, 26 July 1891. He came of the writer caste of Bengal and educated himself in his father's library, where he studied particularly Sanskrit and Persian. In 1846 he was made librarian of the Asiatic Society and devoted the rest of his life to this body, working as philological secretary, vice-president and president from 1885. The University of Calcutta gave him the degree of LL.D. in 1875 and he received the Companionship of the Indian Empire when that Order was founded in 1878. He became Raja in 1888. Besides numerous contributions to the *Journal of the Asiatic Society* and a series of Sanskrit texts entitled 'Bibliotheca indica,' he published three important works, 'The Antiquities of Orissa' (2 vols., 1875 and 1880); 'Bodh Gaya,' the hermitage of Sakya Muni (1878); and 'Indo-Aryans,' dealing with the manners and customs of the people of India from Vedic times (2 vols. 1881).

**MITRAL VALVE.** See HEART, THE.

**MITRE**, mē'trā, Bartolomé, Argentine soldier, politician and author: b. Buenos Aires, 26 June 1821; d. there, 19 Jan. 1906. In early manhood he found it discreet to leave the country, as his political poems were offensive to the dictator, Rosas, and he engaged in newspaper work in other parts of South America. He became the leader in the movement in which Buenos Aires proclaimed itself independent, 11 Sept. 1852, and was successively Minister of the Interior and of War in the Buenos Aires government. The force commanded by him was defeated by Urquiza at Capeda, 23 Oct. 1859, and Buenos Aires was reunited with the Argentine Confederation. In May 1860 he was elected governor of Buenos Aires. New troubles with the Confederation arose, and he defeated Urquiza at Pavon, 11 Sept. 1861. In 1862 he was elected President of the New Argentine Republic to serve for six years, and after a very prosperous administration became Minister to Brazil. He was defeated for the Presidency in 1874 and 1898, and was afterward elected to the Senate, of which he became president. He was the founder of an influential newspaper, *La Nacion*, and is one of the most noted writers Argentina has produced. His chief works are 'Historia de Belgrano' (1857); and 'Historia de San Martin' (1884), of which there is an abridged English translation (1893).

**MITRE**, in ecclesiastics, a sacerdotal head-dress worn by bishops and certain other Church dignitaries on solemn occasions, being a sort of cap pointed and cleft at top. There has been much controversy regarding the date at which the mitre became part of the official dress of bishops, but the general view is that it was not in use in the Church till the beginning of the 11th century. Some have contended that the early Christian Church adopted with little change the head-dress of the Jewish priests. Three kinds are worn in the Roman Catholic Church, namely, the precious mitre, of gold or silver and ornamented with jewels; the *mitra auriphrygiata* of gold cloth, without jewels (except pearls); and *mitra simplex* or plain mitre, of white silk or linen. Bishops and mitred abbots receive their mitres from the bishop who consecrates them. The Greek Church has no mitre properly so called. Since the Reformation the mitre has rarely formed a part of the costume of an English Church dignitary until within recent years, when it has been adopted by many bishops. See COSTUME, ECCLESIASTICAL.

**MITRE-SHELL**, the shell of a gastropod mollusk of the genus *Mitra* and family *Mitridæ*, closely allied to the *Muricidæ*, so called because of its resemblance in form to a bishop's mitre. The shells are thick, somewhat fusiform, with the spire very high and acute, and a small aperture and operculum. The genus is a very large one, comprising several hundred species mostly from shallow, tropical seas and especially abundant in the Malayan region. *Mitra episcopalis* is abundant on the tidal flats of the Philippine Islands. During the day, especially at low water, they burrow beneath stones or hide in crevices, but are active at night. They secrete a purple fluid having a nauseating odor and act as scavengers. Consult Cooke, 'Cambridge Natural History' (Vol. I, 1895).

**MITROVICZ**, mī'trō-vīts, Hungary, also called Mitrovicz and Mitrowitz, town in Croatia-Slavonia, on the river Save in the county of Syrmia, 43 miles west of Belgrade. Roman remains have been discovered in the neighborhood and the city occupies the site of Sirmium, or Syrmium, the chief city of lower Pannonia under the Roman rule. The Emperor Probus (232-282) was born and buried at Sirmium; and here, according to some authorities, the noble emperor, Marcus Aurelius (121-180), died. Ecclesiastical councils of importance met in 351, 357 and 358 at Sirmium, which became an episcopal see in 305. In 1773 it was united with the diocese of Bosnia. The Huns sacked Sirmium in 441 and the Turks ravaged Mitrowitz completely in 1396 and 1521, destroying all the old buildings. A few ruins of the ancient Roman city are still to be seen. The country-side produces fruit, wine and grain, and the industries are chiefly the culture of silk-worms and tanning leather. Pop. about 12,909.

**MITSCHERLICH**, mīch'ér-lik, Ellhard, German chemist: b. Neuende, near Jever, Oldenburg, 7 Jan. 1794; d. Schönberg, near Berlin, 28 Aug. 1863. He was the son of a clergyman and nephew of the celebrated scholar, Christophe Wilhelm Mitscherlich (1760-1854). Going to Heidelberg in 1811, he devoted him-

self to philology and more particularly to Persian. In 1813 he went to Paris, hoping to obtain permission to join the embassy which Napoleon I was about to send to Persia. Political changes ended this plan and Mitscherlich then determined to study medicine in order to have the privileges accorded to physicians traveling in the East. He went to Göttingen to study medicine, and while there published a book on 'Persian History,' compiled from manuscripts in the university library. It was printed in Persian and Latin (1814). While studying medicine in Göttingen, his attention was attracted to geology, chemistry and physics, and in 1818 he went to Berlin to work in the laboratory of H. F. Link (1767-1851). His researches led to the discovery of the law of Isomorphism (1819). Berzelius invited him to Stockholm (1820), whence he returned in 1822 to fill the chair of chemistry in Berlin. One of his earliest discoveries in Berlin was that of the double crystalline form of sulphur, one of the first observed cases of dimorphism. His investigations regarding the production of artificial minerals and his memoir on benzine and the formation of ether were also important. His principal work is 'Lehrbuch der Chemie' (2 vols., 1829-1835, 4th ed., 1840-48). After his death his notes were published in the 'Memoirs' of the Berlin Academy (1868). Consult Rose, 'Eilhard Mitscherlich' (Berlin 1864) and 'Erinnerungen an Eilhard Mitscherlich' (1894).

**MITSUI**, mēt-soo'ē, a name which has in Oriental financial circles a prestige similar to that of Rothschild in those of the West. The mercantile house of Mitsui and Company was established by Takatoshi (1633-1706), and has been identified with almost every large concern of industrial and economic interest in Japan.

**MITSUKURI**, mit'sū-kū'ri, **Kakachi**, Japanese zoologist: b. Edo, Japan, 1857; d. 1909. He came to the United States in 1873, received his Ph.D. from Yale in 1879 and Johns Hopkins in 1883; and, returning to Japan, became professor in College of Science, University of Tokio, in 1882. In 1893 he was made councillor of this university and in 1901 dean of the College of Science. In 1896 he was placed at the head of the fur-seal commission and signed a treaty with the United States and Great Britain. In recognition of his public service the Order of the Sacred Treasure was given to him in 1907. He was one of the leading zoologists of Japan and published a very important series of papers on the embryology of turtles (1886-96).

**MITTERMAIER**, mit'er-mi'er, **Karl Joseph Anton**, German jurist: b. Munich, 5 Aug. 1787; d. Heidelberg, 28 Aug. 1867. He was educated at the universities of Landshut and Heidelberg. After serving as professor in Bonn in 1819-21, he became professor of law and jurisprudence in Heidelberg, which he held for the rest of his life. His greatest work is a complete manual of criminal law, 'Das deutsche Strafverfahren in der Fortbildung durch Gerichtsgebrauch und Landesgesetzbücher' (Heidelberg 1845-46). He published a number of books and treatises on important questions relating to jurisprudence, trial by jury and the penal code. Many of those were translated into various languages. He was a

member of the Baden legislature for many years; president of the Frankfort vorparliament; and representative of the city of Baden in the German National Assembly. Consult Mittermaier, 'Bilder aus dem Leben von K. J. A. Mittermaier' (Heidelberg 1886).

**MITTIMUS** (from the Latin, we send), the name of a written warrant issued by an official and directing a proper officer to convey safely the body of a prisoner to jail or any other place of confinement until released by the due process of the law.

**MITTWEIDA**, Germany, a town in the kingdom of Saxony, 30 miles southwest of Dresden and 12 miles north of Chemnitz, on the Zschopau. It possesses a handsome Evangelical church, a classical, modern and technical school, cotton and spinning mills, and engineering and furniture works. Cigars and cement are also produced here. The town is chiefly Protestant. Pop., including Rössgen, about 17,800.

**MITYLENE**, mīt-i-lē'nē, **MYTILENE**, or **LESBOS**, a historic island of the Ægean Archipelago, off the northwest coast of Asia Minor, since 1913 belonging to Greece, and called by the Greeks *Mitilini* or *Mytilene*, from its capital. In shape it is nearly triangular, but on the south there are two deep and nearly land-locked bays; area, 675 square miles. It is mountainous (the highest peak, Mount Olympus, is 3,077 feet) but fertile and is one of the finest islands of the archipelago. The cultivated fruits include the olive, vine, fig, orange, pomegranate, apricot, pear and apple. The olive is the most important crop, large quantities of oil being produced. Wine, for which the island was anciently famous, is still made, but after antiquated methods. The chief exports are oil, hides, wool, valonia and fruits. There is excellent marble, deposits of iron, copper, alum, etc., and thermal springs utilized in the cure of rheumatism and nervous diseases. There are some tanneries, soap-works, numerous oil-mills, earthenware works, etc. The chief town is Castro, near to which are the ruins of Mitylene, the ancient capital. Pop. (estimate of 1914) 182,167.

The island anciently known as Lesbos was famous as a centre of Greek life and civilization. It formerly contained six cities, by far the most important being Mytilene and Methymna. It was early inhabited by Greeks of the Æolian race. Its inhabitants made an active resistance to the Persians, but were finally obliged to submit (about 540 B.C.). After the defeat of the Persians by the Greeks at the battle of Mycale (479 B.C.) it became the ally of Athens. During the Peloponnesian War it revolted from Athens, whereupon an Athenian fleet was sent against it, the walls of Mytilene were demolished and a thousand of the richest inhabitants put to death. The island itself was divided into 3,000 parts, of which 300 were devoted to the service of the gods, and the rest divided among the Athenians, by whom they were rented to the ancient proprietors. The cities, nevertheless, soon rebelled again. Alexander the Great made a treaty with the Lesbians after the battle of Granicus; the island was afterward reduced by the Macedonians and subsequently became part of the Roman province of Asia, and it was placed by Con-

stantine in the Provincia Insularum. Saint Paul passed through the channel between the island and the mainland on his way from Corinth to Jerusalem (Acts xx, 14). In 1462 A.D., after belonging to a Genoese family, the island was taken by Mahommed II. During the War of Independence, the Turkish and Greek squadrons fought a battle off Mitylene 7 Oct. 1824, on which occasion the Turks were defeated and their fleet was destroyed. In consequence of strained relations between France and Turkey a French fleet was sent to Mitylene 5 Nov. 1901 and remained there till the Porte agreed in full to the demands made. As one of the islands occupied by Greek forces during the Græco-Turkish War of 1912-13, it fell to that power on the conclusion of peace.

The Lesbians in ancient times were notorious for their dissolute manners, and the whole island was regarded as the abode of pleasure and licentiousness. At the same time they had the reputation of the highest refinement and of the most distinguished intellectual cultivation. Poetry and music made great progress there. The Lesbian school of music was celebrated and is said to have produced musicians superior to all the other musicians of Greece. Among these the most distinguished were Arion of Methymna and Terpander of Antissa. Alcæus and Sappho, both Lesbians, were esteemed the first in lyric poetry. Pittacus (one of the seven wise men), the philosophers Theophrastus and Theophanes (the bosom friend of the great Pompey) and the historians Hellicus, Myrtilus, etc., were also natives of this island. It was often chosen as a place of residence by distinguished foreigners. Epicurus and Aristotle taught there. Consult Tozer, 'Islands of the Ægean' (London 1890).

**MIVART**, miv'art, **Saint George Jackson**, English naturalist: b. London, 30 Nov. 1827; d. there, 1 April 1900. He was educated at Harrow and King's College, London. Having joined the Roman Catholic Church in his 17th year, he thereafter received his academic training in Saint Mary's College, Oscott. In 1851 he was called to the bar at Lincoln's Inn, but the possession of ample means enabled him to gratify his taste for natural history. He was appointed lecturer on zoology in Saint Mary's Hospital Medical School in 1862, and from 1874 till 1877 was professor of biology in the Roman Catholic University College at Kensington. On the invitation of the Belgian bishops he accepted, in 1890, the chair of the philosophy of natural history in the University of Louvain. He was vice-president of the Zoological Society in 1869 and 1882, secretary of the Linnæan Society 1874-80 and its vice-president on two occasions (1880 and 1892). Among Mivart's contributions to reviews, etc., are those on 'The Structure of the Fins of Fishes,' 'The Osteology of Birds,' 'The Zoology, Anatomy, and Classification of Apes and Lemurs,' and his 'Memoir of the Insectivora.' He also published several important works on natural history subjects and the philosophical questions arising out of them. His best-known work is 'The Genesis of Species' (1871), in which, while fully admitting organic (though not mental) evolution, he argues against Darwin's theory of natural selection and attempts to explain the production of new species as due to

an innate plastic power. Among his other works may be enumerated 'Lessons in Elementary Anatomy' (1873); 'Man and Apes' (1873); 'The Common Frog' (1874; new ed., 1881); 'Lessons from Nature' (1876); 'Contemporary Evolution' (1876); 'The Cat' (1881), a good introduction to the study of the vertebrate animals, especially the mammals; 'Nature and Thought' (1882); 'A Philosophical Catechism' (1884); 'On Truth: A Systematic Inquiry' (1889), in which he discusses the ultimate basis of science; 'The Origin of Human Reason' (1889), in which he insists on the fundamental distinction between man and all other animals; 'Monograph of the Canidæ' (1890); 'Birds: The Elements of Ornithology' (1892), a musical introduction; 'Essays and Criticisms' (1892); 'Types of Animal Life' (1893), all vertebrate and mainly mammalian; an 'Introduction to the Elements of Science' (1894). The articles in the 9th edition of the 'Encyclopædia Britannica' on Apes, Reptilia (Anatomy) and Skeleton were from Mivart's pen. He published anonymously a novel, 'Henry Standon,' republished shortly after his death under the title 'Castle and Manor.' Mivart's contributions to the study of the vertebrate animals, though not of epoch-making importance, were always valuable and luminous. In the latter part of 1899 and the beginning of 1900 he expressed himself with considerable freedom regarding certain doctrines of the Roman Catholic Church, and on his refusal to sign a declaration of faith submitted to him was inhibited by Cardinal Vaughan from taking the sacraments of the Church.

**MIWOK STOCK.** See **MOQUELUNAN**.

**MIXED MARRIAGES**, a name applied to marriages between persons of different religions. In the United States the term generally refers to a marriage between a Roman Catholic and a Protestant. In England a marriage between a baptized and an unbaptized person is ecclesiastically unlawful; one between a member of the Catholic Church and of any other Christian community is civilly valid, but ecclesiastically unlawful unless a dispensation is first obtained. If a Roman Catholic and a Protestant desire to marry, they must, according to Roman Catholic practice, promise that the children shall be brought up in the Roman communion; the bishop may then grant a dispensation and the marriage, without the nuptial benediction, must be performed by a Roman Catholic priest, no repetition of the ceremony by priest or clergyman of any other communion being tolerated. See **NE TEMERE DECREE**.

**MIXED PROPERTY.** That which is not altogether real or personal, but a compound of both, such, for example, as heirlooms, tombstones, etc.

**MIXED RACES.** Racial amalgamation, or crossing of the races, which begun in prehistoric times, has been continued into our own era with ever-increasing speed and complicity of results. Broadly speaking, any two races can unite to form a third race. As the process of amalgamation has been going on for so many thousands of years, an exhaustive classification of the existing mixed races is impossible. The types that stand out most prominently are the mulatto, the cross between the

white and the negro; the mestizo, the cross between a European and the American Indian; the Eurasian, or Anglo-Indians, the mixture of English and natives; and the complex mixture found in the East Indian Archipelago, in which Chinese and Malayan types predominate. The results of racial intermarriage have been exceedingly variable. Sometimes it has produced a better race. This is the case when the crossing has been between different but closely allied stocks. "The Englishman," writes Dr. J. G. Wilson, "who has resulted from the commingling of so many Teutonic tribes with the native Briton and Celt and the composite molded and directed by Roman culture, is, perhaps, the very best example of a good result from extensive crossing. Likewise the cross which has taken place in Ecuador, Mexico and Peru has produced a race of great promise. It is not so much a question of the possibility of producing a vigorous cross race under favorable conditions, as whether such a cross is, in itself, a desirable thing. The vital question is whether this inevitable amalgamation is worth the fostering care and regulation of our government. The answer to this question depends altogether upon what will be the results of this immigrant blood upon our own individual selves and upon our social and political institutions. When we come to consider the question of the influence of racial amalgamation upon our habits of thought, upon our morals and upon our institutions — upon our spiritual selves — we are confronted with a much graver problem. History is replete with instances where nations have lost their own peculiar form of civilization and political institutions on account of overwhelming alien influences. That the influence of the alien in the United States is enormous, and that it is yearly becoming more and more important, is almost a self-evident proposition. Whatever the race of people from which the immigrant comes, the final result is not to be feared so long as he does not come in overwhelming numbers. If he trickles in slowly we shall take care of him. Let him be what he will, the amalgamation will finally be complete. On the other hand, if we continue to let him come in what is practically unlimited numbers, we cannot take care of him. He will take care of us. We shall lose our inherited Anglo-Saxon ideals, and instead of a perfect amalgamation we shall confront the danger of a complete racial substitution." It has been the misfortune of white civilization in its contact with the colored races in America, Africa and Australasia that both its worst products and its least desirable representatives were the ones first in the field. This has been an important factor in shaping the early relations of the races. It is the rover, the outlaw and the irresponsible trader who come first, and it is too often the contraband goods of civilization that they carry. It has been the rougher type of white also who has intermarried with native women and become the father of a hybrid progeny. There is a varying degree of adaptability and fusing power among the different branches of the white race in their relations with backward peoples. The Latin peoples in Europe have shown peculiar capacity for successful intermarriage with tropic races. Spaniards have crossed with fair success with both Indians and negroes in America and with Malays in the Philippines, as

have the Portuguese with the two former types in Brazil. In the Spanish and French West Indies there is a greater proportion of mixed marriages than in the British West Indies and there are fewer evidences of social friction. Prejudice against the blacks is not confined to Europeans and Americans. The Chinese, the most cosmopolitan of peoples, sometimes exhibit a striking aversion to taking black wives, but manifest no particular aversion to the native women of Java or Borneo. East Indian laborers imported into the British West Indies and the British Guiana have sometimes interbred with blacks; but in British Guiana they are generally said to despise the negroes. Prof. U. G. Weatherly writes: "It is an unquestionable fact that the yellow, as well as the negroid peoples possess many desirable qualities in which the whites are deficient. From this it has been argued that it would be advantageous if all races were blended into a universal type embodying the excellencies of each. But scientific breeders have long ago demonstrated that the most desirable results are secured by specializing types rather than by merging them."

The color line is evidence of an attempt, based on instinctive choice, to preserve those distinctive values which a racial group has come to regard as of the highest moment to itself. Although sometimes based on a blind prejudice surviving from the primal instincts of periods of isolated savagery, it invariably has in it the core of a sound scientific truth, which is, that specialization is the law of efficiency. The fact that it is always the lighter race that puts the taboo on the colored and that the latter is every where eager to mix with the whites, is only an evidence of the general trend of choice towards the higher efficiency of the white race." Consult Weale, B. L. Putnam, 'The Conflict of Color' (London 1910); Bryce, James, 'The Relations of the Advanced and Backward Races of Mankind' (Oxford 1902); Boas, Franz, 'The Mind of Primitive Man' (New York 1911); *Popular Science Monthly* (pp. 474-495, 1911).

**MIXITE.** A rare mineral, basic hydrous copper bismuth arsenate,  $20\text{CuO} \cdot \text{Bi}_2\text{O}_3 \cdot 5\text{As}_2\text{O}_5 \cdot 22\text{H}_2\text{O}$ . Occurs in very slender bluish green acicular radiating crystals and tufts in Tintic district, Utah.

**MIXOGAMY** (from the Greek words meaning mixed marriage), a term describing the breeding habits of fishes. Günther, in his 'Introduction to the Study of Fishes' (London 1880), describes mixogamous fishes as follows: "The males and females congregate on the spawning beds, and, the number of the former being in excess, several males attend to the same female, frequently changing from one female to another. Some Teleostei (*Ophiocephalus*), and probably all chondropterygians are monogamous; and it is asserted that the connection between the pair is not merely temporary, but lasts until they are separated by accident."

**MIXOPHYTE**, a term applied to plants that are capable of living independently or dependently upon dead organic matter. It is now definitely established that all green plants take up minute proportions of organic food. Many species attach themselves to the bodies of other organisms and derive all of their food supply

from their host. Consult Macdougall, Daniel Trembly, 'Practical Text-book of Plant Physiology' (New York, London, Bombay and Calcutta 1912).

**MIXOSAURUS**, a genus of small fish-lizards (*Ichthyopterygia*) from the Triassic formations of Europe, differing from typical ichthyosaurs by their fewer teeth and some minor characters.

**MIXTEC**, mēs'ták, or **MISTEC** ("cloud people"), a Mexican tribe of Indians of the Zapotecan stock occupying the coast of Guerrero and the northwest of Oaxaca. They are highly skilled in agriculture and the simpler arts, have built cities and temples of hewn stone and possess a hieroglyphic literature, keeping a calendar like the Aztec tribes. They are noted for their pottery and woven products. Pop. about 200,000.

**MIXTURE** (from the Latin *mixtura*), a product of mixing, i.e., the amalgamation of different ingredients mutually diffused through one another. It also means the action of becoming mixed such as a mixing or blending of races. Mixture is, moreover, used to denote a preparation for medicinal purposes and in pharmacy is applied to potions of liquid medicine. Mixture is also used to denote "type-setting that calls for the use of two or more distinct faces, or faces and bodies of type." Mixture is the opposite of solution.

**MIXTURE**, an organ stop. It is ordinarily furnished with from three to six small metallic pipes to each key and is compounded of the higher sounding and therefore shorter members of the foundation and nutation classes of stops, combined or mixed and arranged to draw together as in practice they are seldom required to be used separately. "The mixture," writes an authority, "represents or corroborates the higher consonant harmonic sounds suggested by nature, and in the bass produces tones to the third or fourth octave above the major or chief foundation tone. As the musical scale ascends the higher harmonics become weak and inaudible to the ear; hence in a mixture stop it is customary to discontinue the higher ranks as they ascend, one or more at a time, and insert in lieu a rank of a lower tone than was previously in the stop but appearing as a separate stop." This alteration is called a "break."

**MIZPAH**, miz'pā, or **MIZPEH**, the name of several places in Palestine. The word signifies a high place or lookout mentioned in the Bible. Mizpeh of Gilead (Gen. xxxi, 45) marks the site of the pillar and heap of stones put up by Jacob and his brethren in the mountains of Gilead in token of God being a witness to the covenant made between him and Laban. The "Mizpah ring" takes its name from this episode (see verse 49). The site is still pointed out with its group of rough stone monuments in the village of Süf.—The Mizpeh of Benjamin (Josh. xviii, 26, etc.) lay north of Jerusalem on an unknown site.—That of Judah (Josh. xv, 38) stood north of Hebron and 20 miles south of Jerusalem. Nothing is positively known of the Mizpeh of Moab (1 Sam. xxii, 3).

**MJÖSEN**, myé'sën, Lake, Norway, situated in a picturesque and fertile valley, 36 miles

northeast of Christiania, is the largest lake in the country. It is 62 miles long, with a maximum breadth of 10 and an average breadth of two miles. It is exceptionally deep, having a maximum depth of 1,460 feet. It is fed by the Laugen River and drains through the Vormen and Glommen into the Skager Rack. There are numerous popular summer resorts on its shores.

**MLAWA**, m'lā'vā, Russia, district town in the Russo-Polish government of Plozk, located on the river Mlaum, at the junction of the Marienburg-Mlawā and the Kowel-Mlawā railways. It has five churches, a 16th century town-hall, a custom-house of the first class and has importance as a trading point. It was founded in 1429 and was a wealthy city till the Swedish invasion. In 1910 it had a population of 18,652. In the World War the town fell into the hands of the Germans.

**MNEMONICS**, nē-mōn'iks, a system of artificial aids for assisting the memory. Such methods have been in use for many years. They consist in the main of some mechanical scheme or framework which, by association, is linked with what one desires to memorize. One of the oldest forms of verbal mnemonics is contained in the familiar lines, "Thirty days hath September, April, June and November," etc.; and many similar devices are known. The medical student has an unlimited number of mnemonic aids whereby to remember the names of the muscles, to call to mind the relation of important viscera and to determine accurately the order of the cranial nerves. Students of logic have for years made use of mnemotechnic devices to remember the parts of the syllogism. (See LOGIC). Some of these devices are based on topical association, whereas others depend on number and letter relations, and a great many which have been in vogue in recent years are based upon sound and rhyme relations. A general criticism that can be made of most of these memory-schemes is that the processes are purely mechanical, and that one of the fundamental features in memory, that is, memorizing for the sake of idea-relation, is given up for the sake of word-relation. For certain classes of students and for certain lines of work these mechanical schemes may be of much service; for salesmen, for instance, who need to bear in mind immense quantities of goods with their wholesale, retail and discount prices. But as a process of general culture, improving mind-facilities, so called, mnemotechnics are mechanical. See MEMORY.

**MNEMOSYNE**, nē-mōs'ī-nē, in Greek mythology, the goddess of memory; the mother of the nine muses of Zeus. She was a daughter of Uranus.

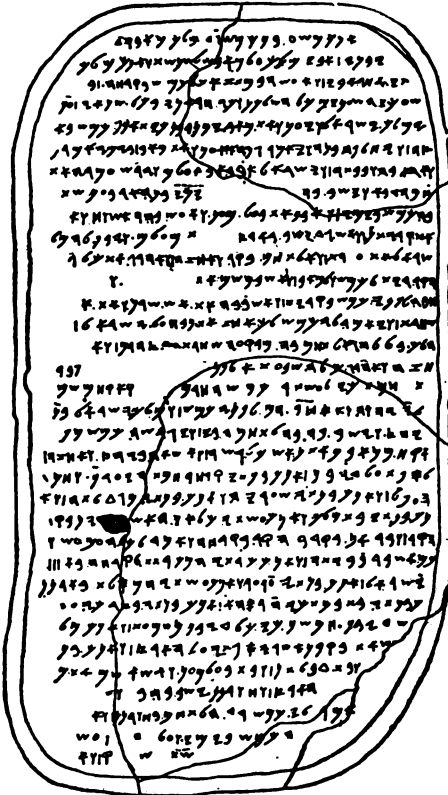

**MOA**, one of a race of extinct ratite flightless birds of New Zealand, forming the family *Dinornithidæ* and composed of several genera (see DINORNITHES) ranked between the apteryx and the epiornis. They had comparatively small heads, small eyes, bills of varied form, great legs, wings almost or quite wanting, and the head and neck bare. The feathers of the body were rounded, loose in part, downy, with great aftershafes. Some of the feathers were black with red-brown bases and white, others blackish brown or yellowish. They varied in size from

that of a turkey (*Anomalopteryx parva*) so that of the huge *Dinornis maximus*, 12 feet in height. The remains of these birds are found in sand-dunes, bogs, caves and places where the aborigines had fed upon their flesh. Not only bones, but pieces of skin, ligaments, feathers and eggs have been recovered. It is probable, indeed, that these birds became extinct only four or five centuries ago. The Maori traditions recount the wars of extermination which their early ancestors waged with the moa; and the natives profess to show the spot where the last one was killed. Clearer traditions say that the habits of the birds were sluggish, but their disposition fierce. They lived in pairs, fed upon green shoots and fern-roots and made rude nests on the ground. Their anatomy was elaborately described in a memoir by Owen, 'Extinct Birds of New Zealand' (London 1879), and a general account of them may be found in Newton's 'Dictionary of Birds' (ib. 1896); and Rothschild's 'Extinct Birds' (ib. 1907).

**MOAB**, mō'āb, the ancestor of a Semitic people who occupied a region east of the Dead Sea and the Jordan (its other boundaries varying) from an early period till the Christian era. In the Old Testament (Gen. xix, 37) he is said to be the son of Lot by his elder daughter. The "plains of Moab" spoken of in Numbers are the hot plains of the Jordan Valley. The region to which the Moabites were confined by the Amorites was strongly fortified on every side by nature, and was noted for its rich pastures and its wine. The institution of monarchy was of much earlier introduction among the Moabites than among the Israelites, but the religion of Moab seems to have been very similar to that of their more celebrated neighbors and kinsfolk. Their supreme god was Chemosh, who held among them much the same position as Jehovah among the Israelites and they seem to have had something akin to the priesthood and general theocratic organization of the Israelites, only that the inhabitants of conquered cities were massacred in his honor. The Moabites were for a time tributary to Israel, but regained independence in Rehoboam's reign. They were afterward harassed by the Assyrians, but at one period they assisted the latter against the Jews. Moab is mentioned about the 6th century A.D., but the people, as distinct from their neighbors, have long passed out of existence. The extensive ruins which now cover their country bear witness to their former greatness. The language of Moab was closely akin to that of Israel. Consult Tristram, 'The Land of Moab' (New York 1874); and Smith, George Adams, 'The Historical Geography of the Holy Land' (London 1897).

**MOABITE STONE**, in archaeology, a monument of black basalt, about 3 feet 8½ inches high, and 2 feet 3½ inches wide, and 1 foot 1¾ inches thick, with rounded top but square base, on which there is an inscription of 34 lines in Hebrew-Phœnician characters, discovered in 1868 by F. A. Klein at Dhiban in the ancient Moab, just north of the river Amon. An attempt made to purchase it led to a quarrel among the Arabs of the district, who thought to make more money out of it by selling it in pieces, and the stone was de-

stroyed partially by being heated and then by throwing water upon it, which caused it to break into three large and several small pieces. The larger pieces were secured for the Louvre by M. Clermont Ganneau, an official connected with the French embassy at Constantinople, who was also fortunate in obtaining a paper impression of the inscription before the stone was broken. The inscription dates about 850 B.C., and is the oldest known in the Hebrew-

Moabite Stone.

Phœnician form of writing. It was erected by Mesha, king of Moab, and is a record of his wars with Omri, king of Israel, and his successors. The narrative also treats of Mesha's wars against the Edomites. Consult Ginsburg, 'The Moabite Stone' (1870), and Bennett, W. H., 'The Moabite Stone.'

**MOBANGI**, mō-bāng'gē. See UBANGI.

**MOBERLY**, mō'bér'li, Mo., city, in Randolph County, on the Wabash and the Missouri, Kansas and Texas railroads, about 125 miles northwest of Saint Louis. It is an agricultural region, with valuable deposits of fire-clay and extensive coal fields. Some of its industrial establishments are the machine-shops of the Wabash Railroad, flour and lumber mills, ice factory, grain elevator, foundry and machine-shops, brick and lumber yards. The trade is chiefly in livestock, poultry, wool, tobacco, dairy products, hides and the local manufactures. It is the seat of Saint Mary's Academy, and has public and parish schools, a public library, a Young Men's Christian Association

building and the hospital of the Wabash Employees Association. Moberly was laid out in 1866, incorporated as the county-seat in 1868, received in 1873 a city charter revised in 1889. Pop. about 12,000.

**MOBILE**, mō-bēl, Ala., city and county-seat of Mobile County, situated on the western side of Mobile Bay, at the mouth of the Mobile River, 30 miles from the Gulf of Mexico and 50 miles below the junction of the Alabama and Tombigbee rivers. Mobile is 139 miles by rail from New Orleans; 179 from Montgomery on the Louisville and Nashville; Mobile and Ohio; Mobile and Bay Shore; Gulf, Mobile and Northern; Alabama, Tennessee and Northern; Southern; Pensacola; Mobile and New Orleans railroads.

**General Plan.**—The city is built upon a level, sandy plain from 6 to 35 feet above the river, rising gradually to the table lands 200 to 300 feet above sea-level, six miles west of the river, thus giving the fall required for efficient drainage. The streets are rectangular, many of them broad and shaded with live oak, magnolia, crepe myrtle, camphor and in some sections with pecan, dogwood, holly, sweet and black gum and sycamore trees. Government street noted for its fine homes, broad lawns and oaks. Dauphin street—West End—Reed and Ann, Georgia and Rapia, Old Shell road, Hall's Mill, Fulton, Cedar Point and other roads together with tours through the citrus, fig, pecan and trucking section surrounding the city are among the many inviting and interesting drives.

**Public Parks.**—Mobile has 13 public parks; Bienville, in the heart of the city; Monroe, fronting the bay; Washington, Oakleigh, Bay Shore, Arlington, Ryan, with statue of Father Ryan, the poet priest; Gulf Coast Fair Grounds and Race Track, Monroe Ball Park, Dixie, Eureka, Fearway, the site of the monument commemorating the death of Eli Frohlichstein, who fell in the taking of Vera Cruz, Mexico, in April 1914; and Lyons, this latter fitted with all modern means for recreation. The Bay Shore Park acquired in 1915 has great natural resources and scenic beauty. In addition to the public parks, there are private parks open to visitors, Ashland place—the home of the late authoress, Augusta Evans Wilson—Flo Claire, Monterey place, Creighton, together with the children's public playgrounds on Church street, Duncan, on lower Government street, on which is Admiral Semmes' monument, also the Monterey and Reed lots for neighborhood children; while at Springhill is the fully equipped and popular Country Club.

**Public Buildings.**—The chief structures are the government building erected in 1852 at a cost of \$379,564; the new post office, completed in 1916, constructed of Alabama marble at a cost of \$425,000; county courthouse and jail, city buildings, including the city market, armory and drill hall. Mobile also has three modern railroad stations, Barton Academy, Masonic Temple, cathedral of the Immaculate Conception, McGill Institute, Springhill College, City Bank and Trust Company building, Christ Episcopal Church, Southern, Inge-Bondurant and Mobile infirmaries, Battle House, several theatres and modern hotels, Medical College of Alabama and Jewish Temple.

**Educational and Charitable Institutions.**—Mobile has 24 graded public schools for white and seven for colored children. For secondary and higher education it offers Barton Academy and Conti Street High School, Wright's University Military School and the Emerson Institute for colored pupils. In addition there are several Catholic and Protestant private schools, the most important being Springhill College, a Jesuit institution founded in 1830. There are five libraries, the Y. M. C. A., Mobile, Mobile public, Cathedral and Mobile County Medical Association. Charitable institutions include the Hannon Home for the Aged, Colored Old Folks Home, Protestant Orphan Asylum, Saint Mary's Catholic Female Asylum, Salvation Army Lodging House, Church Home, Benevolent Home for Old Ladies, Seamen's Bethel, etc.

**Commerce.**—Mobile is one of the leading cotton markets and shipping points of the country, the natural centre of the Alabama-Tombigbee cotton region, the nearest tide-water shipping port for the soft coal, iron, cement, lime, lumber, turpentine, resin and agricultural products of the southern, central and northern sections of Alabama and large amounts from upper Mississippi and lower Tennessee. A weekly line of large freight and passenger steamers plies the Mobile and Alabama rivers to Montgomery (410 miles) and to Demopolis, at the junction of the Tombigbee River (231 miles) and smaller vessels ascend the Warrior to Tuscaloosa (360 miles) and at high water to Columbus (380 miles) on the main stream navigable the year round. In addition to the regular lines, there are power barge lines which bring coal, iron and other products to Mobile, New Orleans and other Gulf ports. It is the third largest tropical importing city in the United States; has steamship connection with Europe, Cuba, Central America, Mexico, Windward and all Caribbean Sea islands, Brazil, the Pacific Coast of the United States, western coast of South America, Australia, New Zealand, Hawaiian Islands, Japan and China, via the Panama Canal, to which Mobile is the nearest, deep, fresh water railroad connected city in the United States, situated far enough inland to be beyond the reach of any gun fire from ships on the high seas. Mobile's imports for the calendar year 1913 were valued at \$3,675,180. Its exports were \$44,238,747. For the calendar year 1915, the total imports were \$3,443,228, and the exports \$21,317,683, the export figures not including the 84,798 long tons of bunker coal furnished vessels at this port and valued at \$256,133. It will be noted above that the exports for the year 1915 are less than half those for the year 1913. This was mainly due to the European War, the calendar year ending 31 Dec. 1916 showing exports to be \$30,627,633 and the imports \$3,997,317, showing still the effects of the war, though trade is rapidly being recovered, the trade with Cuba, West Indies and Central America, increasing by leaps and bounds, beyond all former ratios, its trade with Cuba being second only to that of the port of New York. The calendar year ending 31 Dec. 1917 shows Mobile's imports to have been \$2,873,680, and its exports \$35,010,182. Mobile's trade territory from which to draw materials for export, is rapidly being extended and the

**MOBILE, ALABAMA**

**Bienville Square**

same is true as to imports. The above figures include for exports cotton and subsidiary products, coal, coal oil, crude oil and by-products, iron, iron pipe, cement and cement products, lime, whitening, fuller's earth, lumber and allied products, tar, turpentine, resin, live-stock, canned foods and other canned products, flour, lard, salted and pickled pork, salt, soap, cotton goods and notions, gun shells and other ordnance stores, general foundry and machine-shop products, agricultural and mill machinery, belting and other mill supplies, fire and burglar-proof safes, scales, talking, typewriting, computing and other machines, also store and office furniture and fixtures, electrical supplies, hardware, cordage and ship supplies, hay, grain, garden, flower and field seed, household furniture, sewing machines, musical instruments. Among its imports, are Cuban magnetic iron ore, zinc, ammonia sulphate, sulphur ore, iron pyrites, sodium nitrate, fire brick, tropical fruits and other products, coffee, molasses, sugar, sisal grass, chicle gum, mahogany logs and lumber, iron, satin, sandal, lignum vitæ woods, dye woods, cork, cigars, Cuban tobacco, Peruvian bark, opium and other drug materials, camphor, sponges, bird lime, dried bone, phosphate rock, asphalt, lemons, limes, olives and olive oil, raisins, currents, nuts, orunes, matting, bamboo poles and rods, together with a miscellaneous line of embroideries, laces, rugs, toys, etc. The importation of Cuban molasses or black strap, as it is now called, used in the making of stock feed and explosives, has increased to a greater extent than any other article of late years.

**Industries.**—The city's industries include manufacturing jewelries, lithographing, engraving, printing and book-binding establishments; newspapers, the *Mobile Register*—morning daily—established in 1812; the *News-Item*—evening week day; the *Advocate* and the *Press*, these two being colored weeklies. There are three cotton compress warehouses, one having two of the most powerful and rapid presses in the world, two cotton mills, one with 10,000 spindles, making knitting and weaving yarns, the other mill running 16,000 spindles and making a wide range of cotton goods; a knitting mill, overall and clothing factory, several saw mills, the output of which ranks Mobile as the third largest exporter of mill production in the South, a cottonseed-oil mill, cotton pickery, black strap stock feed mill, abattoir and packing-house, fertilizer plants, turpentine distilling plants, wood working plants, cooperage, sash, door and blind factories, two of the largest cedar, cigar box and veneer mills in the world, making 80 per cent of the entire output of the country, metal working machine shops and foundries, hoe factory, oxy-acetylene welding works, aeroplane and motor factory, saw and brass works, copper workers, corrugated conduits, containers, resin recovery works, metal box factory, steam boiler works, stove, car wheel, pulley and gunshell foundry and machine shop, trolley and steam railroad car shops, ship and boat repair plants and slips, floating dry docks, one of the latter being the largest marine dock south of the government dock on Chesapeake Bay and another of sufficient capacity to take in government ships of the greatest size. The Chickasaw Shipbuilding Company—a sub-

siary of the United States Steel Corporation—has established a \$10,000,000 plant upon the Mobile River, where ways have been set up and ships of iron and steel are under construction. In addition to this, there are five other large shipbuilding companies, three ice factories, ice cream, candy, fruit products company, broom and brush factory, coffee and spice mills, creamery, chewing gum and proprietary medicine manufactures, peanut butter factory, trunk, bag, leather and carriage factories, leather belting company, art glass and tile works, terracotta, brick, drain pipe and pottery plant, paint mills, roofing and cornice work, brass foundries. Mobile has two electric light and power companies, one operating 60 miles of street car service, the other furnishing light, heat and power, two telephone companies and one gas company, these being privately owned, the Mobile and Ohio Railroad Company owning and operating the grain elevator, having a 250,000-bushel capacity. The International Harvester Company has long been importing, through this city, its sisal grass with which it has made its binder twine and has also established a cordage factory for the manufacture of ropes of all kinds and sizes. The fish and oyster, crab and turtle industries are also important and growing industries.

**Revenues, Banking, etc.**—For the year 1916 the revenue of the city of Mobile—other than receipts of paving assessments, from waterworks and other than special tax for the payment of the refunding bonds—was as follows: Taxes for general purposes, \$258,474.71; business licenses, \$109,684.49; city wharves, \$24,382.31. Receipts from various other sources not specified above, \$106,292.45, making a total of \$498,834.96. The city is living within its income and even anticipating its obligations, at the same time steadily improving in all departments; the funds obtained from the issue of bonds amounting to \$600,000 are being used in constructing docks and terminal railway connecting these docks with railroads entering the city. These bonds, authorized by an election held 13 Aug. 1917, draw 5 per cent per annum interest, payable semi-annually, May and November, and run for 30 years. In addition to this municipal increment to the city's enterprise, is a freight handling device known as the Telfer system, in which the city has a financial interest, with option to take it over at a later specified date. The assessed valuation for 1915-16 amounted to \$35,911,654 and the city is authorized to issue bonds aggregating 7 per cent of this amount to be expended for purposes other than schools, waterworks, sewers, etc. The total bonded debt of the city under this provision is \$1,664,950. The city has five banks; the First National, established 1865 and the oldest in the State, capital \$300,000, resources \$9,271,121.36, surplus and profits \$658,363.38; the People's Bank, capital \$200,000, resources \$5,000,000, surplus (earned) \$200,000 and undivided profits \$100,000; Merchants' Bank, capital \$150,000, resources \$3,478,530.41, surplus and undivided profits (earned) \$262,909.51; Union Savings Bank, capital \$35,000, resources \$305,054.74, surplus and undivided profits (earned) \$19,215; The Farmers' and Mechanics' Bank of Mobile, capital \$100,000, surplus paid in \$10,000, organized 1917.

**Government.**—Mobile is under the com-

mission form of government, which went into operation 14 Aug. 1911, and three commissioners were elected to serve one, two and three years respectively; the terms of all having expired, they have been re-elected, the time of service being extended at each election, the elections in the future to be for a term of six years, the time of one commissioner expiring at the end of every second year. The commission form of government has proved to be in every way more satisfactory than the former method of a mayor and council. Pop. about 51,521, or including the suburbs Creighton, Pritchards, Plateau and Whistler, about 63,000. Pop. in 1917 estimated to be 72,000.

**History.**—Mobile Bay was visited by the Spaniards in 1511 and was the original seat of French colonization in Louisiana. The illustrious brothers Le Moyne d'Iberville and Le Moyne de Bienville in 1699 founded a temporary settlement on the back bay of Biloxi, Mississippi, but in 1702 moved it to Mobile River, 27 miles north of the bay, where occurred the "petticoat insurrection" of the women against too much corn meal diet. On the western façade of the city buildings, on South Royal street, is a bronze tablet with the following inscription: "The city his monument. Jean Baptiste le Moyne. Sieur De Bienville 1680-1768. Who on this spot began building Fort Louis De La Mobile. The First Capital of the Province of Louisiana. May A.D. 1711. Erected by the city of Mobile May 1911." In 1711 a flood and hurricane nearly destroyed the place and the settlement was removed to the present site. The origin of the word Mobile is obscure, Judge Hamilton thinks it of Choctaw derivation and means "paddling." Mobile remained the capital until 1722 when New Orleans was given that designation. In 1763 Mobile passed into British hands and the name of Fort Condé was changed to Fort Charlotte. In 1780 the Spanish General Galvez captured it and the right of possession was confirmed to Spain by the treaty of 1783. On 13 April 1813, it was captured by the American General Wilkinson, then in command in New Orleans and for the first time the flag of the United States waved over Mobile. Fort Bowyer at the mouth of Mobile Bay was retaken by the British but again given up. Mobile was incorporated as a town 20 Jan. 1814; as a city, 17 Dec. 1819. In 1818 the Bank of Mobile was founded, which in the panic of 1837 was one of the four United States banks which did not fail. In 1818 steamboats were operated on the rivers and in 1839 the city was nearly destroyed by fire and ravaged by yellow fever and again in 1852 by flood and in 1853 by fever. On 4 Jan. 1861 the State authorities took possession of Forts Morgan and Gaines at the mouth of the harbor, though the State did not secede from the Union until 11 January. On 5 Aug. 1864 Farragut entered the harbor, bombarded the forts and destroyed the bulk of the Confederate fleet, including the ram *Tennessee*. Farragut captured the forts and Mobile surrendered to General Canby on 12 April 1865. Upon the re-establishment of Federal control, the government inaugurated great improvements in the harbor, widening and deepening the channel from 13 to 23 feet by 1903 and up to 1916 the channel had been deepened to 30 feet over the bar and up to the city, with a width of 250

feet. During the "Reconstruction Period" the city became bankrupt and on 11 Feb. 1879 its charter was canceled and its name changed to "Port of Mobile." On 10 Dec. 1886 a new charter was given and the old name restored. Since the close of the Civil War, the city has been called the "City of Five Flags," that of the Confederacy being the fifth to wave over the city. The lower part of the city was inundated in 1906, when a severe gale from the sea caused the water to back up in the bay. A number of lives were lost and much property ruined. Pop. about 51,521; with suburbs 63,000; (1918 est.) 72,000. Consult Hamilton, P. J., 'Colonial Mobile' (Boston 1910); id., 'Founding of Mobile 1702-18' (Mobile 1911); Powell, L. P., 'Historic Towns of the Southern States' (New York 1900).

EDWARD QUINCY NORTON.

**MOBILE**, a bay on the southeast coast of Alabama, forming an estuary into which, through the deltaic mouths of the Mobile and Tensaw branches, flow the waters of the Tombigbee and the Alabama rivers. That part of the estuary to which the name of Mobile Bay is applied is about 30 miles long and from 9 to 12 miles wide. At the entrance to the bay are long narrow strips of land, almost obstructing the entrance. On the east, at Mobile Point, is a revolving light; on the west, on Dauphin Island, are Forts Morgan and Gaines. Between Dauphin and the mainland is Grant's Pass, a strait connecting Mobile Bay with Mississippi Sound. The United States government has improved the harbor, and from a shallow entrance, which was a hindrance to navigation, there is now a channel through which vessels drawing 23 feet and over can enter, and vessels drawing 17 to 23 feet can ascend to the wharves of Mobile city.

**MOBILE**, a river in Alabama, the name given to the western stream or mouth of the river formed by the junction of the Alabama and Tombigbee rivers. The eastern stream or mouth is called the Apalachee or Tensaw. From this junction of the rivers to the head of Mobile Bay is, in direct line, about 25 miles, but the winding of the stream makes its course about 50 miles long. The Mobile and Tensaw communicate at several points, but the two streams enter the Mobile Bay at the city of Mobile, by the same delta.

**MOBILE BAY, Battle of**, a battle of the Civil War fought 5 Aug. 1864. Mobile Bay is divided from the Gulf of Mexico by Mobile Point east and Dauphin Island west, about three miles apart; but the ship-channel of less than 2,000 yards, narrowing to 750 outside, closely skirts Mobile Point. The latter was defended by Fort Morgan; the island by Fort Gaines, too far from the channels to be very formidable. Between them stretched a line of piles and torpedoes, but leaving a narrow channel for blockade-runners, marked off by a red buoy. Within was the Confederacy's most powerful ram, the *Tennessee*, and three small unarmored paddle-wheel gunboats. Farragut's Federal fleet (in order of battle) comprised the monitors *Tecumseh*, *Manhattan*, *Winnebago* and *Chickasaw*, forming an inshore column; and the wooden sloops of war *Brooklyn*, *Hartford* (flagship), *Richmond*, *Lackawanna*, *Monongahela*, *Ossipee* and *Oneida*, forming an

outer one, each with a smaller mate lashed to the port side, to ensure passage through if the starboard vessel's machinery should be disabled. Farragut would have led in the *Hartford*, but the *Brooklyn* had machinery for picking up torpedoes. The advance began at 5.30 A.M., and firing at 7.05; the instructions were to keep east of the red buoy, but the *Tecumseh* went west and was sunk by a torpedo. The *Brooklyn* stopped in fear of a like disaster, and the *Hartford* with Farragut passed her and led the fleet into the bay. Each vessel received much damage from Fort Morgan, but they silenced its guns by destructive fire, and all succeeded in anchoring three miles up. One Confederate gunboat was then sunk, one captured and one took refuge next the fort; the *Tennessee* was to be attacked after dark, but itself assailed the flagship, and after a desperate fight was disabled and surrendered. The *Lackawanna* collided with the *Hartford* and nearly sunk her. The Union fleet lost 52 killed, 170 wounded and 113 drowned in the *Tecumseh*; the Confederates 10 killed, 16 wounded and 280 prisoners, besides the casualties in the fort. Both forts surrendered a few days later. The Union fleet carried 159 guns, and the officers and crews numbered 3,000 men. The Confederate fleet carried 22 guns and 470 officers and men.

**MOBILE BILL.** See BOUNDARIES OF THE UNITED STATES.

**MOBILIER, Crédit.** See CRÉDIT MOBILIER.

**MOBILIZATION**, the act of bringing an army to a war footing, before the concentration of troops along the hostile frontier in such a manner that they may be available for action. Mobilization consists in the call for men and the requisitioning of animals, the assembly of men and animals in mobilization camps and their division into field, depot and garrison troops. The mobilization of the German Army in 1870 is typical of the processes involved. In the first place, a plan of mobilization was drawn up for each year, and all the superior officers were supposed to keep on file all orders necessary for carrying this plan into effect. Tables of transportation were also kept in readiness, and on the declaration of war nothing was necessary but to carry the orders and tables into effect. Since the disposition of recruits and the distribution of the various forces at points of mobilization was determined in advance, it was possible to mobilize much faster than the enemy and to gain the advantage of the first blow. When the order of mobilization was issued, it was to be immediately telegraphed to the commanders of districts, from which the landwehr battalions were recruited. The landwehr soldiers, according to the scheme, were immediately notified to report within 24 hours. By the end of five days they reached the points of mobilization. By that time the purchase of remounts was accomplished in a similar manner. The distribution and equipment of troops consumed another day or two, and by the seventh day of mobilization, the infantry and cavalry were ready to take the field. The artillery and the train were ready by the eighth day. Instructional organizations were preserved as far as possible. This was the plan of mobilization: the result was that infantry regiments were mobilized in from seven to nine days;

cavalry, in from 9 to 11 days, and the other services in 15 days.

It will be seen that speed and system were the two guiding principles of the German mobilization of 1870. This method of a rapid mobilization according to schemes prepared in time of peace has been adopted by all the armies of the world, and most especially by the great conscript armies. Armies such as the British and American were at the beginning of the Great War require a much longer and consequently more dangerous process before they can enter the field. The United States could only avail itself of its regular army for anything like immediate use, and even that did not enter the field for over six months. The militia had to be recruited up to strength, reorganized and trained. There was not a sufficient supply of officers, and so officers' training camps for civilians were opened. Ammunition, ordnance, uniforms and other equipment had to be manufactured. Large bodies of civilians were drafted and trained in great cantonments. At the end of a year the mobilization was only partial and did not seem likely to be completed for a considerable period. This is to be contrasted with the German mobilization in 1914, which rendered 1,850,000 men ready for service in six days, the French mobilization, which produced an army of 1,380,000 men in two weeks, and even with that of Russia, which increased the regular army of 1,200,000 by 650,000 men in a month. Consult the field service regulations of the various great armies of the world.

**MOBY DICK**, or 'The White Whale,' by Herman Melville, is a strange, conglomerate book, embodying much lore that the author had acquired during whaling voyages in almost every ocean, and by long study of almost everything directly or indirectly concerned with whales and the whale fisheries. As a romance, it tells of the cruise of a Nantucket ship commanded by a crazed captain whose one thought is the capture of the ferocious monster that had maimed him on an earlier voyage. Relatively few, however, of the 135 chapters are occupied with the account of Captain Ahab and his search for the white whale, Moby Dick. The author gives exciting accounts of the pursuit and capture of whales under various conditions. He describes in detail the equipment of a whaling vessel and traces the complicated processes of cutting up the carcass, trying out the blubber and securing the sperm oil. He gives much scientific information regarding the habits and the anatomy of whales, intermixed with ingenious and sometimes facetious speculations of his own, and he has much to say of the whale in legend and in literature. He also portrays vividly many members of a whaling crew that included American Indians, negroes, East Indians and South Sea islanders, as well as Europeans of several nationalities. The book will prove disappointing to the reader who is impatient of delays and digressions in a story, but it contains few pages that are not interesting in themselves; and the effect produced by the mixture of erudition, speculation, poetical rhapsody and narrative of real and imagined occurrences is most impressive.

WILLIAM B. CAIRNS.

**MOCCASIN, MOCCASON, MOCASSIN,** or **MOCCASSIN**, originally a deerskin sandal,

the sole and upper of which are formed of one piece of leather. It was formerly the ordinary foot-covering worn by the North American Indians. In recent times fancy moccasins are made for the general shoe trade, all kinds of leather being utilized for the purpose.

**MOCCASIN-FLOWER**, a name for the American orchids (q.v.) of the genus *Cypripedium*, especially the large pink *C. acaule*, given to them by the Indians in allusion to the shape of the inferior part of the flower. Lady's-slipper is a common English name of the same import. See ORCHID.

**MOCCASIN SNAKE**, or **COTTON-MOUTH**, a large venomous serpent (*Ancistrodon piscivorus*) of the rattlesnake family, but having no rattles, the tail ending only in a horny spike, like that of its near relative, the copperhead (q.v.), sometimes called "upland moccasin." The body is stout in proportion to length (about 4 feet); the head is chunky and distinct from the neck. It inhabits river-banks, swamps and fresh-water marshes throughout the southern half of the United States, swarming in some regions, like the Everglades of Florida, or the half-flooded woods of lower Louisiana, and constantly invading the rice-fields. Elsewhere it is not greatly to be feared, as it rarely leaves the edge of the water, where it is fond of lying upon some low overhanging bush or floating log, ready to drop upon the fishes and frogs, which form its principal food, and which it pursues with great speed in and under the water. It often reaches a length of four feet, and its bite is deadly, the widely opened mouth in the act of striking showing cottony white. Its color is a dark reddish brown, obscurely marked with blackish, and with white blotches on the lips and abdomen. Seven to 12 young are produced annually, viviparously; these are frequently captured, and though they thrive in captivity, never yield any of their native sullen ferocity. One of the most complete biographies of this snake is that by Stejneger in the 'Annual Report' of the Smithsonian Institution for 1893. Consult also Ditmars, 'The Reptile Book' (New York 1914).

**MOCHA**, mō'kə (Arabian, mō'hā), or **MOKHA**, Arabia, a fortified seaport, the former capital of Yemen, on the Red Sea, 130 miles northwest of Aden. During the 16th and 17th centuries Mocha was the chief port and emporium from which the coffee of Yemen was exported, whence the proverbial term "Mocha coffee." The trade has been diverted to Hodeida and Aden. Pop. about 4,800.

**MOCK ORANGE**, a name applied in England to the *Syringa* (q.v.), and in the United States to the *Prunus caroliniana*, a small evergreen resembling the cherry-laurel.

**MOCKER-NUT**, a species of hickory (q.v.)

**MOCKING-BIRD**, a familiar and celebrated songster of the southern part of the United States (*Mimus polyglottus*), representing a genus of thrush-like wrens, many other species of which are known in Mexico, Central America and West Indies. North of Delaware it is seldom seen outside a cage; but even in winter they are sometimes seen in Central Park, New York, and they are fond of human society. The plumage of all is bluish-gray

and white, with no striking ornaments but much elegance of outline and tint. Their habits differ little from those of thrushes and other migratory, insect-eating birds, but they show great courage in defending their nest (generally of four to six eggs), placed usually in a bush or small tree, against cats, snakes and similar enemies. The young, when taken from the nest for domestication, should be removed at an early period; or if taken later, they are generally removed by means of trap-door cages. The ordinary song notes of the mocking-birds are clear, bold and varied. They sing during the night, like the nightingales, and appear to begin their song with the rising moon. The imitative notes of these birds are, however, still more varied than their natural tones. They mimic with success the songs of their feathered neighbors and with such exactitude as to deceive the ear of the most experienced sportsman. When they are kept in confinement all the sounds of the household, as well as the mewling of cats, the barking of dogs, the cry of an injured chicken and the screech of the hawk are all exactly imitated. They are hardy and require only ordinary care and attention to live contentedly for many years in any moderate climate. The mountain mocking-bird (*Oroscoptes montanus*) of the Rocky Mountain region and the various "thrashers" (q.v.) are relatives not greatly inferior in song; while the mocking-wren (see WREN) is a more distant relative highly gifted in imitative powers.

**MOCKLER-FERRYMAN**, Augustus, English military expert and author: b. Ireland, 1856. He was educated at Cheltenham College and Sandhurst, and entered the army in 1876. From 1900-03 he was professor of topography at Sandhurst Military College, and he acted as map editor on the British official history of the South African War (1903-07). He was employed as General Staff Officer, 1st Grade (1914-16). He has published 'Up the Niger: Narrative of Maj. Claude Macdonald's Mission' (1892); 'In the Northman's Land' (1896); 'British West Africa' (1898); 'Annals of Sandhurst' (1900); 'British Nigeria' (1902); 'Oxfordshire Light Infantry Chronicle' (21 vols., 1892-1913); 'Military Geography of the Balkan Peninsula' (1905); 'Regimental War Tales' (1915).

**MOCQUEREAU**, mōk'kē-rō', Dom André, French musician: b. La Tessouale, near Cholet, 6 June 1849. He was educated at Paris, where he appeared as cellist in the chamber-music concerts given by Charles Dancla. He entered the Order of Benedictines at Solesmes (1875), studied there, under Dom Pothier, Gregorian melody and was soon appointed instructor. He was the originator (1889) and is director of *Pabéo graphie musicale*, a periodical devoted to the research and publication of photographic reproductions of the oldest important examples of church melodies and their history (10 vols. by 1915). Other works of his are 'Livre d'orgue' (1898); 'Petit traite de psalmodie' (1897), translated into several versions; 'Methode de chant grégorien' (1899).

**MODDER**, or **KAIBA**, RIVER, South Africa, a tributary of the Vaal River, joining the latter about 30 miles above its confluence with the Orange River. It has an eastward course of over 180 miles. It came into con-

siderable prominence during the Boer War of 1899-1902; along its banks at Maagersfontein the British were driven back with great loss in 1899, and at Paardeberg the Boer general, Cronje, surrendered in 1900.

**MODE**, in music, (1) the manner of arranging the tones and half-tones in a scale, this general designation being always accompanied by a qualifying adjective, as Dorian mode, minor mode. Greek music, from which our modern music has been evolved, had an elaborate system of nine modes, which were afterward extended to 15. Authorities vary considerably as to the differences between the modes; it is certain, however, that they were the outgrowth of an earlier Greek music, the basis of which was the tetrachord. A tetrachord is a short scale of four notes, one of the intervals being a half-tone and the others whole tones, for example:

(A) Dorian tetrachord, half-tone, ♯; (B) Phrygian tetrachord, half-tone, ♯; (C) Lydian tetrachord, half-tone, ♯. The slur indicates the half-tone.

The tetrachords were probably named after the people that originated them.

Until the time of Terpander (7th century B.C.) all Greek music seems to have been confined to the limits of a tetrachord. The lyre, which was then used merely to give the singer the pitch, had but four strings, each capable of sounding but one note. It was tuned in one of the ways shown above, though the notes written should be understood to be merely relative, each singer tuning his lyre to suit his own voice.

Terpander increased the compass of the lyre by adding a second tetrachord to the first, using the highest note of the first for the lowest of the second, thus making an incomplete scale of seven notes.

Terpander's Seven Note System.

The middle note, A, belonging to both tetrachords, was called *Mese* (middle) and had somewhat the function of our modern keynote. It will be noted that the two tetrachords are both Dorian, which was the characteristic and favorite Greek tetrachord rather than the foreign Phrygian or Lydian.

Pythagoras (582 B.C.) is the reputed author of the octave system (the foundation of our modern system). He probably learned it during his visit to Egypt, where it is said to have been in use for many centuries before. By this system the two tetrachords, instead of having a note in common, were separated by a whole tone, called the diazeutic tone or tone of disjunction.

Pythagoras' Octave System.

A was still the keynote or *Mese*, though no longer the middle or connecting note. Terpander's was called the conjunct system and Pythagoras' the disjunct system. The latter as above printed constituted the Dorian mode, which may be defined as two Dorian tetrachords separated by the diazeutic tone, embracing the compass of an octave. Terpander's system, not having this compass, cannot strictly be called a mode. Music seems to have developed on both these systems simultaneously in Greece, though finally that of Pythagoras supplanted Terpander's and became universal.

By replacing the two Dorian tetrachords with two Phrygian or two Lydian the modes of the same name were formed.

These three were the principal modes. Each had two auxiliary modes, one commencing a fourth below and distinguished by the prefix *hypo*, the other commencing a fourth above with the prefix *hyper*. The complete list of the nine original modes is as follows:

- I. Dorian.
- II. Phrygian.
- III. Lydian.
- IV. Hypodorian or Æolian.
- V. Hypophrygian, or Ionian.
- VI. Hypolydian.
- VII. Hyperdorian or Mixolydian.
- VIII. Hyperphrygian or Locrian.
- IX. Hyperlydian.

A convenient way to remember them is to imagine a series of scales, all of natural notes, and an octave in compass, beginning on each of the seven natural notes. It should be remembered that the pitch is entirely relative; each of these modes might begin on the same actual sound. The *Mese* or Keynote is the fourth note of each scale.

On examination it will be seen that the three Dorian modes are each formed of two Dorian tetrachords, the three Phrygian modes of two Phrygian tetrachords and the three Lydian modes of two Lydian tetrachords. In the three principal modes the diazeutic tone separates the tetrachords. In the hypo-modes it is the

lowest note and in the hyper modes it is the highest note. In all the hypo and hyper modes the tetrachords are conjunct like those of Terpander. It will be seen that two of the hypos

correspond exactly with two hypers, namely, the hypophrygian and the hypodorian are the same as the hyperlydian and the hyperphrygian. It will be observed, however, that the arrangement of the tetrachords and the diazeuctic tone are not the same.

**Hypophrygian Mode.**

**Hyperlydian Mode.**

**Hypodorian Mode.**

**Hyperphrygian Mode.**

Each mode was said to have its characteristic quality or sentiment; the Dorian seems to have been the favorite one for heroic utterance, while the Lydian was said to be languishing and erotic.

The modes were afterward increased to 15, at least three of which were mere transpositions by octaves of earlier modes. In fact some theorists hold that the later development of the Greek modes completely changed their original significance and that instead of their being different arrangements of whole and half tones in a scale they were all identical in formation and were in fact merely Dorian modes of different pitch. If this is so they should not be called modes at all, but keys, as in modern music. The modern system of equal or even temperament (see TEMPERAMENT) adopted and developed by Johann Sebastian Bach early in the 18th century and in general use since the middle of the 19th century, would thus appear to have been known to some extent among the ancient Greeks. The titles of the modes seem to contradict this theory, but the subject is so confused and the different theories so difficult of proof that wide differences of opinion will probably always exist. The complete list of the 15 modes is as follows, the pitch given being said to be the accepted one for each mode (or key):

Fourths below	Originals	Fourths above
Hypodorian (A)	Dorian (D)	Hyperdorian or Mixolydian (G)
Hypoionian (B $\flat$ )	Ionian or Iastian (E $\flat$ )	Hyperionian (A $\flat$ )
Hypophrygian (B)	Phrygian (E)	Hyperphrygian or Locrian (A)
Hypoæolian (C)	Æolian (F)	Hyperæolian (B $\flat$ )
Hypolydian (C $\sharp$ )	Lydian (F $\sharp$ )	Hyperlydian (B $\sharp$ )

The Greeks had in addition three kinds of chromatic modes and an enharmonic mode. They were all modifications of one or both of the interior tones of the tetrachord, the outer tones of which were never allowed to change their relative pitch. These modes had no significance in the history of music and were not adopted by the Romans.

The following are examples of Pythagoras'

original Dorian mode changed to (a) chromatic and (b) enharmonic:

The X is used to represent a sound one-quarter of a tone higher than the one preceding it.

The Gregorian or ecclesiastical modes are based on the Greek modes, though many errors and changes of names were made in arranging the system. Saint Ambrose, bishop of Milan, chose four of the ancient modes which he named Authentic. Gregory the Great is said to have added four others called Plagal. Six more were afterward added, making 14, two of which were declared imperfect and rejected. There are two kinds of Gregorian modes, the Authentic and the Plagal. The final or keynote of the authentic modes is the lowest note of its scale. Each authentic mode has an attending plagal mode, a fourth below it, the keynote of which is the same as that of the authentic mode. The plagal modes are therefore similar in this sense to the Greek modes, the fourth notes of which were said to be keynotes. The Gregorian modes are numbered, the authentic receiving the odd and the plagal the even numbers. In addition, the old Greek names are used, the plagal modes receiving the prefix hypo, but unfortunately the Gregorian and Greek titles do not correspond, causing great confusion in all references to the modes. Thus, the Gregorian Hypophrygian is the same as the Greek Hyperdorian and the Gregorian Hypomixolydian with the Greek Phrygian.

As in the Greek modes it is convenient to remember the Gregorian modes by imagining a series of scales, all of natural notes and an octave in compass, beginning on each of the seven notes. These are the authentic modes from which the plagal with their prefix hypo can be readily counted. (It should be remembered that the pitch is entirely relative as in the Greek scales).

The Gregorian modes are still in use in the Roman Catholic Church, to the services of which it adds a remarkable effect of antiquity and solemnity.

In modern music but two of the old modes remain; the major, equivalent to the Greek Hypophrygian (or Hyperlydian) and the Gregorian Ionian, and the minor, equivalent to the Greek Dorian and the Gregorian Æolian.

The choice of these two modes took many centuries and must have been made by entirely unconscious perception of their greater value, especially of that of the major scale. A comparison of the major scale with the favorite Dorian mode of the Greeks shows that the modern ear desires the half tone at the top of a tetrachord instead of the bottom, as they did. Whether the favor in which the Dorian tetrachord was held by the Greeks is a proof that they thought their music *downward* and were therefore doing just the same as we do when we think ours *upward* is very doubtful, though a well-known theorist has advanced this clever idea. It is much more likely that the introduction of harmony caused a greatly increased recognition of the true function of the keynote, which, as we understand it, was unknown to the ancients. To us the keynote (in any octave) is the only rest point to the ear; all other notes of the scale trend toward it more or less strongly, and in the instance of an ascending major scale the seventh note (the so-called leading note) demands it more than any other note. This quality of motion and rest led to the greater importance of the major mode over the minor, the seventh note of which, being a whole tone distant from the keynote, lacked the great desire to progress these which is so important a characteristic of the major. Finally, probably by accident at first, the seventh note of the minor was raised so as to be but a half tone below the keynote; this form of the minor key is now known as the "harmonic minor," and is the only one recognized in harmony.

But the distance from the sixth to the seventh being thus made a tone and a half, a very difficult interval to sing or treat melodically, the sixth was raised to secure smoother and easier passage upward and as the double change had made the upper part of the minor mode identical with the major it was argued that neither leading note nor raised sixth was necessary in descending, so both were restored to their original position in descending. This is known as the "melodic minor."

(2) A term used in mediæval music to indicate the relative value of the Large, the Long and the Breve. Two kinds of mode existed, great and less, the first deciding the relation of the large to the long and the second that of the long to the breve. Both kinds could be perfect or imperfect. In great mode perfect the large is equal to three longs. In great mode imperfect it was worth but two longs. In less mode perfect the long was equal to three breves, in less mode imperfect it was equal to two breves. During the end of the 15th century and the beginning of the 16th musicians made extraor-

dinary difficulties in their compositions by means of mode and prolation. See GREEK MUSIC; MEANTONE; DIAZEUIC TONE; TEMPERAMENT.

GEORGE GORDON THUNDER,  
Revised by C. LEONARD STUART, *Editorial Staff of The Americana.*

**MODELING.** The production of a temporary plastic form to be later executed in permanent condition copying this original, or the forming of a facsimile of an original shape. Modeling can be done in reduced, enlarged or true proportions (*to scale*) according to their purpose. Modeling is usually done in clay, plaster of paris, wax, wood or other plastic material. The sculptor almost invariably makes a model of his creation before treating it in the permanent medium. Gold and silver smiths and jewelers reduce their conceptions to plastic models before going to the expense of evolving the design in the precious metals. The ship-builder usually works from a reduced facsimile or model of the desired construction. The artist, in producing the effect of relief or solidity in a plane (flat) surface, terms his shading and perspective manipulation "modeling."

**MODENA**, mō'dē-nā, Italy, a city and province, part of a former duchy now comprised partly in the compartimenti of Emilia and Tuscany.

The city, capital of the province, pleasantly situated in a fertile plain, between the Secchia and the Panaro, 25 miles northwest of Bologna, is built with great regularity, and has spacious streets and fine promenades on the site of its former ramparts. It consists of three parts—the citadel, the old town and the new town. The most remarkable edifices and establishments are the cathedral, a fine specimen of Romanesque, adorned in front with numerous curious sculptures; the Campanile, erected in 1224-1319, 335 feet high, and one of the finest in North Italy; the church of San Francisco, a handsome Gothic structure, containing a fine terra cotta group of the Descent from the Cross, by Begarelli; several other churches; the ducal palace, begun in the 17th century, but enlarged by numerous modern additions, and forming a splendid structure, now used as a military school; the Albergo Arti or building containing the municipal collections, especially the Estense Library of over 150,000 works, including several thousand MSS., and the picture-gallery embracing a large collection of paintings, several of them by the first masters; the theatre, the baths, the university, several other important educational institutions and charitable endowments. The manufactures consist chiefly of silk goods, silk twist, woolen and hempen cloths, leather and glass; the trade, however, is unimportant. Modena is the see of an archbishop, and possesses various important public offices. It existed under the Etruscans, and as Mutina rose to great splendor under the Romans. It afterward was repeatedly sacked by the northern invaders, whose ravages left few vestiges of its ancient grandeur. Pop. 71,000.

The former duchy bordering on Tuscany, Lucca, Bologna, Mantua and Parma, had an area of 2,573 square miles which in 1901 contained a population of 785,930. It is now divided into the provinces of Modena and Reggio in the compartimento of Emilia, and the province

of Massa e Carrara in the compartimento of Tuscany. Modena was made a duchy in 1452, the ruler being Duke Borso of the house of Este, to which noble family Modena had belonged since 1288. In 1796 the French took possession of the country and Modena afterward was included in the Cisalpine Republic. By the Treaty of Vienna in 1815 it was restored to the Este family. The duchy took an important part in the turbulent proceedings of the 19th century, which led to the consolidation of the Italian kingdom in 1860, when Modena proper was formed into a separate province with an area of 1,002 square miles. Pop. about 325,000.

**MODERN INSTANCE, A**, by Mr. William Dean Howells, was published in 1882. The action takes place in Maine and in Boston, with one scene in Indiana, and the time is fixed by reference to events of the Hayes-Tilden presidential campaign of 1876. The story is one of domestic infelicity, and the tracing out of the gradual coarsening, physical and moral, of the husband, Bartley Hubbard, is a masterly piece of character delineation. The social and business life of a small town and the every-day experiences of a provincial couple embarking on life in Boston are presented with the author's happiest realism, and save the book from gloom or morbidness. Indeed, it is only after the reader has finished with the story, and finds himself impelled to reflect upon it, that he realizes how great a moral tragedy it portrays. 'A Modern Instance' raises more ethical questions than do most of Mr. Howells' novels, but the author is in no sense a propagandist. It may be his disinclination to commit himself on one of these questions that leads him to leave unsettled the fate of two of the chief characters. This indeterminate ending is condemned by those readers who complain that Mr. Howells' novels get nowhere, and the limitations and unheroic qualities of Marcia Hubbard are disapproved by those women who maintain that the author is never fair to their sex; but his kindly, photographic reproduction of the little things of modern life and his insight into social conditions lead those who sympathize with his ideas of fiction to rank this novel among his best.

WILLIAM B. CAIRNS.

**MODERN LANGUAGE ASSOCIATION OF AMERICA.** A society for the advancement of the study of modern languages and their literatures, through the promotion of friendly relations among scholars, the presentation and discussion of papers at meetings and the publication of results of investigations by members. It was incorporated in Baltimore in 1883, and membership is open to all persons on payment of \$3 annual dues. For geographical reasons a central association was incorporated in 1903, which holds meetings in the Western States independently of the parent body. A New England branch holds meetings annually. The association issues an annual volume of publications in quarterly instalments. There are about 1,250 members.

**MODERN MACCABEES, Knights of the.** See MACCABEES, THE.

**MODERN PAINTERS**, by John Ruskin (5 vols., 1843, 1846, 1856, 1860), was begun in order to vindicate the landscape painting of J. M. W. Turner against adverse criticism.

For this purpose Ruskin set forth systematically and extensively what he conceived to be the æsthetics of visual art—not of landscape painting only, but of painting in general and sculpture as well, with lengthy illustrations from their supposed analogues in literature—the whole in an elaborate a priori analysis of the "Ideas Conveyed by Art" and of the several "Faculties" which produce or appreciate them. Incidental to the defense of Turner, however, come appraisals of other painters, and refutations of critics, which confuse the theoretical treatment; this, as the work goes on, becomes more and more arbitrary, digressive, desultory, and wilful, at the same time that it retires more and more from the reader's attention; until, though formally preserved throughout, it has lost, long before the end, all effectiveness as an organization of the subject.

The key to 'Modern Painters' lies much less in its systematic structure than in its theory—pervasive across all divisions and subdivisions, and persistent throughout Ruskin's 17 years of conscientious modification of opinion by study—concerning the general relation of man and art to nature. The notion that art can improve upon nature seemed to Ruskin presumptuous—a part of the pagan and Renaissance tendency to magnify man and his works. His own faith taught that man is depraved and fallen, and that there is no good in him. Hence Ruskin would minimize man's function in art; he is definitely opposed to human tradition, and is ready, with Wordsworth, to throw away the books and discard the schools. Greatness in art, moreover, commonly assumed to be an effect of human powers, is nothing of the sort; it is a divine gift. "Composition," "imagination," "idealization," and the like—which rearrange actuality to the ends of art—are not achievable by any amount of conscious effort; given humble labor, these things may, perhaps, be added unto it by God; they are a grace vouchsafed to the elect. Such is the evangelical tinge given by Ruskin to the ancient theory of the artist's divine inspiration, and to the modern preoccupation with the functioning of the subconscious. This Calvinism as regards man is supplemented, as regards nature, by that strange "natural religion"—Platonistic rather than Platonic—which so fascinated impulsive hearts in the late 18th and early 19th centuries. Nature, never having fallen, is sinless, pure and perfect; nature is the copy of a divine pattern; let man, then, follow nature; for

. . . every prospect pleases,  
And only man is vile.

Marking the belated arrival in art criticism of the naturalistic revolt against the humanistic tradition of the Renaissance, 'Modern Painters' is to the criticism of painting very much what Wordsworth's 'Prefaces' and many of his poems—which Ruskin quotes continually—are to the criticism of poetry.

So understood, it becomes, historically, a document in that romantic anti-humanistic "return to nature" which, for thoughtful persons of the newer generation, was ended by the publication of Darwin's 'Origin of Species' in 1859. We know now that nature is perfectly wasteful and unintelligent, perfectly cruel and unmoral, that her beauties cover up a million

festering murders; and that to the human demand for ethical values her answer is silence. Moreover, even could nature be held to be a copy of divine ideas, many modern readers would yet believe, with the Aristotelian æsthetics of classicism and the Renaissance, that art, embodying human concepts of perfection, can shape things actually nearer to their ideal than they ever occur in nature. But Ruskin had grown up in the old "natural religion," and he never shook it off, though he long survived Darwin's exposure of nature's ways. His books are probably the last great monument to the belief—which Butler, Paley, Wordsworth, Emerson, and the Bridgewater Treatises illustrate in various modes—that nature, being the copy of a divine archetype, is always right; that all her phenomena are intended by God to teach man something; hence, that she is full of symbols, providential adaptations, and final causes, is analogous to morals and religion, exists for man's ethical discipline, and is his mistress and preceptress, ever lessoning him for his good. The worship of nature is with Ruskin literally a part of religion; and he feels that the whole duty of art is to praise God by recording nature's works with the utmost possible fidelity to their supposed ethical ends.

Ruskin's criticism of art thus treats almost exclusively the representation of natural objects—a representation unmodified except upon considerations moral or religious. In the place of æsthetic standards he unblushingly substitutes on the one hand religious or ethical standards, and on the other hand standards which may be called "physical." In accordance with the first, he looks to art for a didactic content, for assertions or statements as explicit as those of literature; commends this "literary" quality in pictures like Tintoretto's, whose real excellence lies elsewhere; and makes many excursions into the field of poetics and literary criticism: discussing at length, for example, that distinction which had exercised the romantic school of literary critics in the early 19th century—the distinction between *Imagination* and *Fancy*; discussing, again, in a celebrated passage, the "Pathetic Fallacy" of the poets, based as it is upon the assumption that men's moods have a sympathetic analogue and symbol in nature. Again, from Ruskin's assumption that nature is morally perfect arise his impatience of classical and Renaissance attempts to improve upon her by "idealization" or "generalization," and his inconsistent condemnation of Salvator Rosa and of the Dutch and Flemish realists because when they might have painted to edification, they chose to record "ugly" or "base" things.

In fact, ultimately even the religious and ethical standards fail to modify Ruskin's insistence upon representation; he uses them rather, as in the cases just noted, to confirm his preferences, glorifying as accordant with the divine scheme whatever art appeals to him, and denouncing whatever art does not as tainted with sin. Likewise, though in his theoretical analysis he allows a considerable place to "idealization" and "imagination"—once even speaking of "over-fidelity"—yet practically he is always minimizing their functions and explaining them away. It is with distinct relief, and with a certain unctiousness and fervor, that he always returns to representation pure and

simple, detailed and loving and humble, which after all is his religion of art.

This ultimate triumph of the "physical" criterion has several interesting results. Engrossed in representation, Ruskin disregards or contemns abstract design and spatial pattern, and is almost insensible to Oriental art, which so largely depends upon these. Hence his later disparagement of Whistler and of "le Japonisme." Hence also his commendation of the Pre-Raphaelite movement, whose mediævalist revolt against the Renaissance, and whose love of detailed naturalistic representation ("foreground"), coincided with his own, but which he rather reinforced and championed than originated or even decisively influenced. Hence, finally, the net historical effect of 'Modern Painters' in making for sincerity and humility against the sentimentality, cockiness, prettiness, and *emphase* of contemporary British art.

These evils, thought Ruskin, were traceable, as has been suggested, to the Post-Raphaelites of the Renaissance tradition, with their supposed tricks and insincerities and "rules of composition" and "practice of the schools." He must clear all that away, old masters and all—especially the Bolognese eclectics, and Claude, Poussin, and Hobbema—and establish in their place nature and Turner. The underlying assumptions of his method have been shown; its most important and most bulky actual product remains to be mentioned: the remarkable collection of observations of natural phenomena which Ruskin adduces to illustrate Turner's rich and various fidelity to nature. Large portions of the first, third, fourth, and fifth volumes, are given to description, in word and in picture, of nature's endless phases—the effects of wind and mist, the structure of rocks and the radiation of light, the organization and appearance of mountains, of clouds, of tree-trunks, boughs, and leaves, of waves and foam and reflections in water.

The reader who is interested in 'Modern Painters' for its place in Ruskin's life or for its own evolution in time as a piece of writing will of course read it as it was written; but if he approach it for pleasure he will be well advised to begin with the third volume. The first two volumes, to be sure, contain some of its most gorgeous passages—like the celebrated word-pictures of Aricia and of Turner's 'Slave-Ship.' Yet these, after all, are purple patches; and the body of the text is undistinguished, or distinguished chiefly by a crude parallel structure in couplets—a parallelism often both forced in thought and actually bungled in execution. Ruskin's early fondness for inordinately long sentences, again here, too often leads him to jumble into a single perfervid period the material that should have formed a paragraph: instead of ordering it from sentence to sentence into separate articulated stages of thought, he pours it all volubly out into one heavy lump of a sentence loosely glued together by *and*, *but*, *for*, *only*, *as*, *so* and *so that*.

But in the 10 years between the publication of the second and the publication of the third and the fourth volumes Ruskin's style underwent a sobering and clarifying change. He had had much practice in writing—had meanwhile published 'Seven Lamps of Architecture' (1849), 'The Stones of Venice' (1851-53), 'Pre-Raphaelitism' (1851), and 'Lectures on

Architecture and Painting' (1854); and his ideas having gained acceptance, he now spoke with more of authority and plainness, and less of the hot rhetoric of controversy. Here also he virtually abandoned the dreary scholasticism of the æsthetic system he had so aridly set forth in the second volume. The reader, then, who plunges in *medias res* is more likely to reach at once the heart of 'Modern Painters.' He will feel at once the essential nobility of a book which, often wilful and mistaken, is never mean and is often tonic. He will realize it as the outcome of many years' disinterested study both of nature and of painting, as a whole-hearted appreciation of Turner, who would be great upon any theory however arid, and as a valuable collection of natural facts and appearances, recorded by a loving observer, indefatigable students, and exquisite draughtsman, whose wilfulness vanishes when he is face to face with nature. Here lie its real strength and lasting value: it will probably stand as a great appreciation of a very great painter and, as a veritable treasury of things observed.

SAMUEL LEE WOLFF.

**MODERN SCHOOLS OF DRAMA.** See SCHOOL OF DRAMA, MODERN.

**MODERN WOODMEN OF AMERICA.** See WOODMEN OF AMERICA, MODERN.

**MODERNISM,** the designation applied to the advanced opinion of publicists and lecturers which in recent times were at variance with traditional orthodox doctrines. Official restraint was laid on them when Pope Pius X during his pontificate (1903-14) enunciated the following doctrines in his famous encyclical "Pascendi gregis" issued in 1907. Dealing with the "modernist" movement and propaganda, and, speaking of it he laid down the following conditions and regulations, which he ordered Catholics to follow. He said in part:

"In the first place, as regard to studies, we shall not ordain that scholastic philosophy be made the basis of the sacred sciences. It goes without saying that if anything is met with among the scholastic doctors which may be regarded as an excess of subtlety, or too carelessly stated; if there is anything which does not square with later discoveries, or which is altogether destitute of probability, we have no desire whatever to propose it for the imitation of present generations. And let it be clearly understood above all things that the scholastic philosophy we prescribe is that which the angelic doctor has bequeathed to us. . . . In the vast and varied abundance of studies opening before the mind desirous of truth, everybody knows how the old maxim describes theology as so far in front of all others that every science and art should serve it and be to it as handmaidens. . . . Anyone who in any way is found to be imbued with modernism is to be excluded without compunction from these offices, and those who already occupy them are to be removed. . . . Equal diligence and severity are to be used in examining and selecting candidates for holy orders. . . . It is also the duty of the bishops to prevent writings infected with modernism, or favorable to it, from being read when they have been published, and to hinder their publication when they have not. No book or paper or periodical of this kind must ever be permitted to semi-

narists or university students. . . . The Holy See neglects no means to put down writings of this kind, but the number of them has now grown to such an extent that it is impossible to censure them all. . . . It is forbidden to secular priests, without the previous consent of the ordinary, to undertake the direction of papers or periodicals. . . . Let priests hold as sacred the authority of their prelates, let them take it for certain that the sacerdotal ministry, if not exercised under the guidance of the bishops, can never be either holy, or very fruitful or without blemish. . . . It is impossible to approve in Catholic publications of a style inspired by unsound novelty which seems to deride the piety of the faithful and dwells on the introduction of a new order of Christian life, on new ordinances of the Church, on new aspirations of the modern soul, on a new vocation of the clergy, on a new Christian civilization. . . . Ancient relics are to retain the veneration they have always enjoyed, except in those individual instances when there are clear arguments that they are false." Consult Marchesan, A., 'The Programme of Modernism: Reply to Encyclical of Pius X' (New York 1908).

**MODESTO,** Cal., city, county-seat of Stanislaus County, on the Tuolumne River, and on the Southern Pacific Railroad, about 80 miles south by east of Sacramento. It is in a productive agricultural region, the system of irrigation contributing greatly to its prosperity. The trade consists chiefly of wool, grain, fruit and wine. The prominent buildings are the county courthouse, county hospital and churches. Pop. 4,034.

**MODICA,** mō'dē-ka, Italy, capital city of the province of Syracuse, Sicily, located between rocky declivities, on the Syracuse-Licata Railway and 33 miles distant from Syracuse city. It contains a beautiful 17th century church, an ancient castle on the heights, a monastery with 15th century ruins of a church, a lyceum and gymnasium, seminary, technical school and institute. Its chief industries are cattle-raising, cultivation of southern fruits and trade in agricultural products. Its population in 1911 was 55,924.

**MODJESKA,** mōd-jēs'ka, Helena, Polish actress: b. Cracow, 12 Oct. 1844; d. Bay City, Cal., 8 April 1909. Her father was a musician. In 1860, having married a theatrical manager, Modrzejewski, whose name she has since softened to Modjeska, she began to act, and soon gained local fame. After her husband's death she appeared in Warsaw in 1868, after marrying Count Bozenta Chlapowski in September of that year. In 1876 she came with the latter to America. In July 1877, at San Francisco, she made her American debut as Adrienne Lecouvreur in an English version of the play by Scribe and Legouve. Three years later she was seen in London as Camille, and from that time she was one of the foremost actresses of the English-speaking tragic stage. She starred with Booth in 1889-90. Her best rôles were Shakespearean, notably Lady Macbeth, Cleopatra, Ophelia and Viola. Consult 'Helena Modjeska: Memories and Impressions' (New York 1910).

**MODJESKI,** Ralph, American civil engineer: b. Cracow, Poland, 27 Jan. 1861. He

came to the United States with his mother in 1876 and, for American naturalization, he changed his name to Modjeski, his mother being the celebrated tragedienne, Helena Modjeska. He was graduated at the College des Ponts et Chaussées, Paris, at the head of the class and with honors. He has designed and built many bridges in the United States, the largest among them being the government bridge at Rock Island over the Mississippi; the Mississippi River bridge at Thebes, Ill.; the McKinley bridge at Saint Louis; the new Bismarck bridge over the Missouri; bridges over the Columbia River at Vancouver, Wash., and Celilo, Ore.; two bridges over the Willamette River at Portland, Ore. He has recently constructed two bridges over the Mississippi River, — one at Memphis, Tenn., and one at Keokuk, Iowa, and is also consulting engineer on the design and construction of the Ohio River bridge at Metropolis, Ill., for the Chicago, Burlington and Quincy Railroad and of the Thames River Bridge at New Haven, Conn., for the New York, New Haven and Hartford Railroad. He was one of the three members of the commission on the Quebec bridge, which has the longest span in the world. He received an honorary degree of doctor of engineering at the University of Illinois in 1911; is a past director and member of the American Society of Civil Engineers; member of the British Institute of Civil Engineers and of the American Institute of Consulting Engineers; past president and member of the Western Society of Civil Engineers; member of the Franklin Institute and of the American Railway Engineering Association; also member of numerous engineers' and social clubs.

**MÖDLING**, *möd'ling*, Austria, a town located at the foot of the Wienerwald, Lower Austria, to the south of Vienna, on the Mödling stream, and junction of two railways. On account of the cool summers it is a favored summer resort and has three Catholic churches, among them the Early Gothic Saint-Othmar Church, dating from 1454, with its Romanesque baptistry, a Protestant church, town-hall, city park with theatre and Kurhaus, a military academy, high school and Obergymnasium, agricultural school with curricula in brewing, horticulture, etc.; also an orphan asylum with its church, chalybeate baths, sanatorium, etc. Its chief industries are wine growing, manufactures of iron and metal wares, tubular boilers, sash and door works, varnish and lacquer works. Pop. about 18,067.

**MODOC** (*mō'dök*) **INDIANS**, a tribe of northern California, which in 1872, after firing on the United States forces, retreated to the neighboring lava beds, and there defended themselves desperately till June 1873, murdering two peace commissioners sent to them and killing or wounding 132 of the troops. Their chief, Kintupash, commonly known as Captain Jack, and three others, were hanged in October; about 100 who had not followed him were permitted to remain in California, the rest (145) were transferred to Indian Territory. The Modocs originally made their home on the shores of Lost River and Klamath Lake. They called themselves the *Maklaks*, or "the people." They were always a warlike tribe, and when not fighting immigrants and settlers in the early days were warring with other tribes in their

neighborhood. Of the surviving Modocs, about 200 reside at the Klamath Reservation in Oregon.

**MODULATION**, *in music*, the act of moving through the sounds in the harmony of any particular key to those of another, or the transition from one key to another. The simplest form is the change from a given key to one nearly related to it, namely, its fifth (dominant), fourth (subdominant), its relative minor, or the relative minor of its fifth. Modulation into the dominant is effected by introducing in any of the parts (rarely in the bass, however) the sharp fourth, which becomes the seventh of the new key; thus, in the key of C, F would be sharpened to effect the transition into the key of G; to pass from that key into that of D it would be necessary to sharpen the C, and so on. In modulating into the subdominant the flat seventh is used, which becomes the fourth of the new key; thus, in passing from the key of C to that of F, the flat B is introduced, and from the key of F to that of B the E is flattened, and so on. The modulation into the relative minor is generally effected by employing the sharp fifth, which becomes the seventh or leading note of the new key; thus in changing from C to A minor the G should be sharpened. As almost every piece ends on the key in which it begins, a second modulation becomes necessary; this is effected by flattening the fifth of the new key if the first modulation is into the dominant and sharpening the fourth if in the subdominant. When a composer aims at a striking effect he may change from some given key to one quite unrelated, from C to E for instance; but such transitions should be sparingly employed. Modulation is generally resorted to in long compositions to please the ear with a fresh succession of chords. (See also **MODE**; **MUSIC**; **TEMPERAMENT**). Consult Groves, 'Dictionary of Music and Musicians' (Vol. III, pp. 232-240, New York 1910).

**MODULE**, from the Latin *modulus*, a small measure. A term used in architecture to designate an arbitrary unit of measurement on which to base the proportions of an order or the entire edifice. Architects have usually accepted either the diameter or half-diameter of a column at the base of a shaft as a unit or module for the order. This unit they divide into a graduated scale in minutes or parts according to individual selection. Vignola took a semi-diameter as his module and divided it into 12 parts for the Tuscan and Doric and into 18 for the other orders. Talladio, Cambria, Desgodetz, Le Clerc and others accepted a module in 30 divisions or minutes for all orders. Others have taken the entire height of the column and divided it into 20 parts for the Doric, 22½ for the Ionic, 25 for the Corinthian, and so on, one of which is taken for the module by which to regulate the other parts. Perrault's module was a third part of the diameter of shaft at base, to avoid a fraction. See **ORDERS OF ARCHITECTURE**.

**MODULUS**, *in mathematics*, a constant referring to properties of matter in certain equations. As stress is proportional to strain within the elastic limits, some constant quantity may be introduced, making this proportionality into an equality. In dealing with strength of mate-

rials, such a constant is called a modulus. Thus in Hooke's law, which says that extension, as of a bar, is proportional to the extending force, the constant which converts this proportionality into an equality is called the modulus of elasticity, or Young's modulus, and is denoted by *E*. Where the elastic limits are not exceeded, the transverse strain—i.e., the contraction per unit of transverse dimension—is from one-third to one-fourth the longitudinal strain. The symbol denoting the modulus of elasticity of bulk is *K*. It denotes the lessening of bulk per unit cube, usually per cubic inch, under hydrostatic stress. See ELASTICITY.

**MOE, mö, Jörgen Ingebretsen**, Norwegian folklorist and poet: b. Ringerike, 22 April 1815; d. Christiansund, 27 April 1882. He is most noted for collecting, in collaboration with his companion Asbjørnsen, Norwegian sagas and folklore published under the titles 'Norske Folkeeventyr' (1842-44; enlarged ed., 1882), in an English version by Dasent (1859); 'Samling af Sange, Folkeviser og Stev' (1840; enlarged ed., 1869, with melodies by Lindeman). His 'I Brønden og Kjaernet' (1851) containing juvenile stories and sermons are greatly admired, based, as they are, on folk poems. 'Samlede Skrifter' (Christiania 1877) is a collection of his works excepting the folk stories. Consult Halvorsen, J. B., 'Norsk Forfatter-Lexikon' (Vol. IV, Christiania 1896).

**MOEBIUS, me'bē-ooos, August Ferdinand**, German astronomer: b. Schulpforta, Germany, 17 Nov. 1790; d. Leipzig, 26 Sept. 1868. He was graduated from the University of Leipzig in 1815, and was for 50 years professor of astronomy there. Through his efforts the observatory was remodeled and by his writings he established a new principle concerning the affinities of figures and proved the close connection between statics and geometry. He published 'Der Barycentrische Calcul' (1827); 'Lehrbuch der Statik' (1837); 'Die Elemente der Mechanik des Himmels' (1843); 'Hauptsätze der Astronomie' (4th ed., Leipzig 1853), etc.

**MOELLER, mél'ler, Henry**, American Roman Catholic prelate: b. Cincinnati, Ohio, 11 Dec. 1849. His elementary studies were pursued at Saint Joseph's parochial school and he afterward attended Saint Xavier's College. In 1869 he went to the American College, Rome, where he followed a seven years' course in philosophy and theology. He was ordained priest in the church of Saint John Lateran, Rome, 10 June 1876, and after his return to Cincinnati was made pastor of Bellefontaine and later appointed to a professorship in Mount Saint Mary's Seminary, remaining there till 1879. In 1880 Archbishop Elder named him chancellor of the diocese of Cincinnati, and on 25 Aug. 1900 he was consecrated bishop of Columbus, Ohio. In April 1903 the Holy See appointed him titular archbishop of Areopolis and Coadjutor Archbishop of Cincinnati with right of succession, and on the death of Archbishop Elder, 31 Oct. 1904, he assumed charge of the archdiocese, the pallium being conferred upon him 15 Feb. 1905.

**MOELLER, Louis**, American genre painter: b. New York, 5 Aug. 1855. He worked with

his father, a decorator, for four years; studied in Munich with Dietz and Duveneck; and in 1883 returned to New York. He became a member of the National Academy in 1895, and has exhibited there since 1883. Among his works are 'Road to School' (1883); 'Puzzled' (1884); 'Short Measure' (1885); 'An Interior' (1886), etc.

**MÆRIS, mē'ris**, Egypt, an ancient artificial lake north of Medinet-el-Fayum, until recent years confounded with Birket-el-Keroon (q.v.)—lake of the horn—with which it was connected. According to Herodotus, Lake Mæris was 350 miles in circumference, and about 300 feet deep. He states it to have been entirely the product of human industry. Birket-el-Keroon, about 30 or 40 miles long and six broad, is a natural basin. The works, therefore, which Herodotus attributes to King Mæris (Amenemhat III) are the Bahr Jusuf (Canal of Joseph), which connected Mæris with the Nile, and the canal connecting with the Birket-el-Keroon. The fisheries of the lake were very productive. The revenue derived from them went to the Egyptian queens. The two colossal statues described by Herodotus were discovered at the end of the 19th century, at Biahmu, the site of Crocodilopolis, an ancient neolithic town on the lake near the Bahr Jusuf entrance.

**MÆRITHERIUM**, a large amphibious animal of primitive proboscidian character, whose remains are found in the Eocene rocks of Egypt, about the shores of Lake Mæris in the Fayoum. It is of special interest as the earliest known progenitor of the elephants, and it also has many anatomical resemblances to the sirenians or sea-cows.

**MÆSIA, mē'shī-ə**, a province of the ancient Roman Empire lying north of Thrace and Macedonia, and south of the Danube, corresponding to modern Serbia and Bulgaria. Its original inhabitants were, according to Strabo, a tribe of Thracians. In 227 B.C. a large body of Gaulish invaders entered Mæsia after the death of their leader, Brennus, and settled there under the name of Scordisci. The Romans first invaded it in 75 B.C., penetrating as far as the Danube. It was not, however, until 29 B.C. that it was finally subjugated. The Visigoths (Mæsogoths) settled here in the 4th century, and it was afterward conquered by the Slavonians and Bulgarians.

**MOFFAT, David Halliday**, American capitalist: b. Washingtonville, N. Y., 22 July 1839; d. 1911. He started life as a messenger for the New York National Exchange Bank (1854), became bank clerk (1855) at A. J. Stevens and Company, Des Moines, Iowa, then cashier at a bank in Omaha, Neb. In 1860 he joined the gold pilgrims for Pike's Peak but started a stationery business, in partnership with C. C. Woolworth of New York, at Denver. After six prosperous years he accepted the position of cashier at the First National Bank, Denver, becoming its president and staying in that capacity till his death. He was closely identified with the building of several railroads and was president of the Rio Grande Railroad from 1884 till 1891. His mining interests in Colorado were among the largest in the State.

**MOFFAT**, möf'at, Robert, Scottish missionary to South Africa: b. Ormiston, East Lothian, 21 Dec. 1795; d. Leigh, near Tunbridge, 8 Aug. 1883. He obtained an ordinary education; became a gardener; and about 1813, being deeply moved by the story of some Methodist missionaries, decided to go to Africa, whither he was sent in 1816 by the London Missionary Society. His first work was in Namaqualand, where he made a convert of Afrikaner, a Hottentot robber; later he settled among the Bechuanas in Kuruman, where his wife, daughter of his former employer, who married him in 1819, joined him and helped him greatly. He resided in England from 1839-42. His book, 'Missionary Labours and Scenes in Southern Africa' (1842), stimulated interest in the Dark Continent. Moffat, with the assistance of several other missionaries, translated parts and finally all of the Bible (1872) into the language of Bechuanaland. He returned to England in 1870, where his wife died in the following year, and he spent the last years of his life in rousing interest in South African missions. One of his daughters married Dr. Livingstone (q.v.), the missionary and explorer. He was the staunch friend of the native races. Consult 'The Lives of Robert and Mary Moffat,' by John S. Moffat, their son (1885).

**MOFFAT, William David**, American publisher and author: b. Princeton, N. J., 17 Jan. 1866. He was graduated from Princeton University in 1884 and entered the publishing business. In 1897 he became business manager of *The Book Buyer* and of *Scribner's Magazine*. In 1905 he became president of the publishing firm of Moffat, Yard and Company. He has written 'The County Pennant'; 'Brad Mattoon'; 'Not Without Honor,' etc.

**MOFFETT, Cleveland Langston**, American author and journalist: b. Boonville, N. Y., 27 April 1863. He was a member of the New York *Herald* staff in Europe (1887-91), then in New York (1891-92), becoming foreign editor of the New York *Record* (1893-94). From 1908 to 1909 he was Sunday editor of the New York *Herald*, but then became contributor to the magazines. He wrote 'Real Detective Stories' (1898); 'Careers of Danger and Daring' (1901); 'A King in Rags' (1907); 'The Battle' (1909); 'The Bishop's Purse' (1913); 'The Mysterious Card' (1913); 'The War Beautiful' (1917). Of his prose poems may be mentioned 'A Woman's Breed'; 'The Litany of Men'; 'A Vision of Christmas' (1917). Among his plays are 'Money Talks' (produced 1906); 'Playing the Game' (produced 1907); 'The Battle' (1908); 'For Better or Worse' (1910); 'Greater than the Law' (1912). He translated 'Cosmopolis' by Paul Bourget (1894).

✓ **MOGADOR**, mög-a-dör, Africa, a seaport town in Morocco, known to the Moors as Suera, the beautiful, and by the Berbers as Tassart. It is located on the Atlantic Coast on a projecting cliff and separated from the mainland by a region of dunes. It is strongly fortified by walls mounting cannon, with towers and bastions. It has wide, clean streets bordered by high houses, also an aqueduct. The town consists of the Kasbah or citadel and the outer town with its Jews' quarter (Mellah). The industries are restricted to Morocco

leather, tanneries and the making of beaten copper utensils, but there is considerable trading in such imports as cotton goods, sugar, tea, hardware and in exports of goats, oxen, sheep skins, almonds, beeswax, olive oil, rubber, etc. Most of the trade is with Great Britain and France. The population is about 22,000, over half of whom are Jews.

**MOGOLLON** (mög-y'ön) **MOUNTAINS**, a range in southwestern part of Socorro County, N. Mex., constituting the divide between the San Francisco and Gila rivers. It is over 30 miles long and the highest summit, Mogollon Peak, is 10,778 feet above sea-level. The range consists of a thick succession of Tertiary volcanic rocks with veins of silver and other ores mined near Cooney and Mogollon. It is largely forested and has been included in Gila National Forest.

**MOGOLLON PLATEAU**, the southern edge of the high plateau of Arizona extending from eastern Yavapai County to Apache County. Limestone in part covered by lava and averaging about 6,000 feet in altitude. It bears considerable pine forest and is included in Coconino and Sitgreaves National forests.

**MOGUL**, mö-gül', the same as Mongol, applied particularly to the sovereigns of Mongolian origin, called Great or Grand Moguls, descendants of Tamerlane, who ruled in India from 1526 to 1765, when the consolidation of British power in the peninsula reduced them to a position of tutelage. The last emperor joined the rebels during the Indian Mutiny in 1857, and died a prisoner in Rangoon in 1862.

**MOHÁCS**, mö'häch, Hungary, grand commune in the county of Baranya, on the Danube opposite the large Margaret Island. It is important on account of its steamboat and railroad lines, and has a castle, five churches and a monument to King Ludwig II. Considerable trade is done in wood and grain and it has among its manufactures silk factories, electric works, tile works, etc. It is noted on account of the battle between Ludwig II and the Turks under Sultan Soliman II which was lost (29 Aug. 1526) together with the lives of 24,000 Hungarians, the king and the liberty of most of Hungary. On the 12 Aug. 1687 Duke Karl of Lorraine and Margrave Ludwig of Baden fought a bloody battle near here which cost the Turks 16,000 men and hastened the end of Turkish rule over Hungary. In 1910 it had a population of 17,092. Consult Kupelwieser, L., 'Die Kämpfe Ungarns mit den Osmanen bis zur Schlacht bei Mohacs 1526' (Vienna 1895).

**MOHAIR**. Mohair is the commercial and technical name of the fleece of the Angora goat. The word comes to the English through the Old French *mohere*, from the Arabic *mukhayyar*, meaning mohair cloth. In color mohair is pure white, except in rare cases, and grows in ringlets. The hairs composing a fleece are of varying lengths, but the average annual growth of the long hairs, which largely predominate, is about 10 inches. The hairs are not composed of epithelia, as is the case with wool, and therefore the felting property characteristic of wool is wanting. In fineness mohair is variable with the individual animals, and is placed between the fine and coarse

wools; in lustre, durability and strength it has no equal among fibres.

The only vitiating feature of mohair as it comes from the animal is the intermixture of an undercoat of lustreless, chalky-white hairs which vary in length from one to three inches, and vary in total amount according to the breeding of the animal. This undercoat is known technically as "kemp," and the principal objection to it is that it does not take the fast dyes. It becomes necessary, therefore, to remove the kemp from the mohair used in the finest fabrics, and this work is done by a comb which, in removing the kemp, also takes out every mohair fibre of equal length or shorter than the kemp. This entails a loss ranging from 10 to 30 per cent, but the average is becoming smaller as better goats are developed.

The lustre of mohair is very pronounced, and no amount of washing, dyeing or other manipulation will dull it. Its durability is remarkable, and because of this fact it enters largely into goods of fine quality but which are subjected to hard usage, such as railway plush. Fast dyes have such an affinity for it that sunshine and storms have no effect on its brilliancy.

The uses of mohair are multifarious, and are capable of wider expansion as the supply of mohair becomes larger. Its largest use is in the manufacture of plush. Practically all of the railway plush of the world is made of mohair, and also large quantities of furniture plushes of varying qualities and numerous designs. It enters into brilliantine, zibeline and crepen dress goods, coat linings, so-called alpaca goods, imitation Astrakhan for capes, coats and muffs, and many other fabrics under trade names which do not show what the goods are.

There are about three countries producing mohair in appreciable quantities as yet: Turkey in Asia, with 10,000,000 pounds annually; South Africa, with 15,000,000 pounds annually; and the United States, with 2,000,000 pounds annually. (These figures are approximated). The prices ruling in the United States in ordinary times are from 25 to 45 cents per pound. In New England and New York there are mills which consume all of the American product, besides importing large quantities of Turkish and South African hair from Bradford, England.

**MOHAIR GOAT**, the Angora goat. See GOAT.

**MOHAMMED** ("The Praised One"; also written: Mahomet; Muhammad, the Arabic form; Mahmoud; Mehemet, etc.), Prophet and founder of Islamism, general called by Christians Mohammedanism (but not by the followers of the faith of Islam): b. Mecca, Arabia, probably in April 569 A.D. (according to some authorities 570 and 571 A.D.); d. Medina, Arabia, 7 June 632 A.D. Mohammed was not born in a lowly state as we might be led to believe by some of the tales of his early life. On the contrary his progenitor, Hashim, of the illustrious tribe of Koreish, was the great benefactor of Mecca and the guardian of the Caaba, an honor never conferred except upon those belonging to the most honorable tribes and families. Abdul-Muttalib, his son, succeeded to these honors, and the guardianship of the Caaba

was confirmed in the line of Hashim by his action in saving the sacred city from the onslaughts of the Christians of Abyssinia. Abdul-Muttalib had many children and Abdallah was the youngest and most beloved. He was remarkable for personal beauty and possessed the secret of winning the hearts of women. He married Amina, of the tribe of Koreish, and on the night of the wedding, we are told, 200 maidens died of broken hearts.

Mohammed was the only fruit of this marriage, and his father died two months after, leaving no other inheritance than five camels, a few sheep and a female slave. It is difficult to reconcile this fact with his former exalted position, but we are assured that it is true, as we are also asked to believe the statement that Amina suffered none of the pains of childbirth, and that Mohammed, on the moment of coming into the world, raised his eyes to heaven and exclaimed, "God is great! There is no god but God, and I am his prophet." Legend also tells us that signs and portents took place at the moment of Mohammed's birth. Lake Sawa dried up, and the sacred fire of Zoroaster which the Magi had kept burning uninterruptedly for over a thousand years was suddenly extinguished, and all idols fell down. The massive palace of Khosrau, king of Persia, shook to its foundations and several of its towers were thrown to earth.

When Abdallah died, Amina's grief was so great that it dried up her breasts, and she was forced to look for a nurse among the females of the Bedouin tribes. At length Halima, the wife of a Saadite shepherd, took him into the mountains and nursed him, but returned him to his mother at the end of two years because he had epileptic fits. His mother died when he was six years old, and his grandfather, Abdul-Muttalib, adopted him. On Abdul's death, an uncle, Abu Talib, took the lad and remained his closest companion and devoted protector throughout his life. He was a merchant and brought Mohammed up in the same line. On one of his trips to Syria he visited a Nestorian monastery and there imbibed many ideas. Even in his youth he carried religious contemplation to an extreme, and it is believed that his epilepsy had much to do with this morbid tendency. Wonderful mental faculties are ascribed to him but he was just as illiterate as most of his countrymen. When 25 years old he was employed by a rich widow, Kadajah, also of the tribe of Koreish. He displayed such good judgment and business qualities in caring for her caravans and other commercial interests that, in spite of the fact that she was already twice widowed, she married him. She was 15 years older than Mohammed, but bore him two sons and four daughters. Al-Kasim and Abd Allah, the two sons, who were respectively the oldest and the youngest of his children, both died in early youth; the four daughters survived — Fatima, Zainab, Rukaiya and Umm Kulthum. He lived with his wife in faithful and happy wedlock till her death.

With his marriage Mohammed acquired great wealth, and this gave him leisure to indulge the original bias of his mind; his old habits of contemplation were revived. His judgment and probity were widely respected. There was a steady growth in his zeal to abolish idolatry and other evils, and to substitute a

new and purer faith. This was fostered by his intercourse with Jews and Christians whom he was forced to meet in his journeyings. The idea of a new religion finally engrossed his whole mind and influenced his every action. He believed he saw the necessity for it; all sorts of new dogmas were creeping into and rapidly undermining the faith of his forefathers. During the first centuries of the Christian propaganda religious doctrines were more numerous than the stars in the sky; both Christianity and Judaism had crept into Arabia, Zoroastrianism was on the wane and people refused any longer to accept and conform to the old pagan superstitions. Othman, Zaid and even Waraka, one of his wife's relatives, who had embraced Judaism, were preaching against the futility of star-worship, and their followers were ridiculing fetishes, ceremonies and even the temples. Many were being exhorted to Judaism while others were embracing Christianity, and others still were falling away altogether. Everyone was looking for a religion which should embody the faith of their forefathers with the simple doctrine of the unity of the Deity. Something had to be done—the time was ripe, and Mohammed launched the faith of Islam. He went back to the beginning of things, and adopted as a hypothesis that God had inculcated in Adam the one and only true religion—the worship of one indivisible and only God, the Creator. He believed that this religion of Adam had been repeatedly debased, and almost forgotten at times, but that a succession of prophets was destined to come into the world to restore it from time to time and bring men's minds back to the original idea—such prophets were Noah, Abraham, Moses and Jesus Christ. These had all fulfilled their respective missions, but man now needed another guide. It is not to be wondered at that Mohammed looked especially to Abraham, the father of Ishmael, the progenitor of his own race, as one of the greatest of these. With the development of this idea of the oneness of God grew Mohammed's mission as he conceived it. We can scarcely doubt that he was honest in his convictions and in his purpose when he first undertook the reformation of the world, which he really began at the age of 40 years.

Mohammed's first convert was his wife, Kadijah, to whom he told the particulars of an interview which he claimed to have had in a vision with the angel Gabriel, who declared him to be the apostle of God. He was passing, as was his custom, the month of Ramadan in the cave of Mount Hara after fasting, prayer and meditation, when the angel Gabriel appeared to him, displaying a silken cloth covered with writing. "Read!" said the angel. "I know not how to read!" replied Mohammed. "Read," repeated the angel; and immediately he was illumined with celestial light and understanding, and read what was written upon the cloth, which contained the decrees of God as afterward promulgated in the Koran. Through his wife, her uncle, Waraka, was won back from Christianity and became serviceable to Mohammed on account of his great knowledge of the Old and New Testaments. The next to be converted were the fiery Ali, his nephew, and Zaid, his faithful servant; also Abu Bekr, a man of high position, at whose solicitation 10 of the best citizens of Mecca joined the faith.

Mohammed confided his revelations only to members of his household for a time, and was laughed at by some and reproached by others—Abu Lahah, an uncle, called him a fool, and Abu Talib, his adoptive father, while always protecting him, never actually confessed belief in his works. Mohammed personally instructed all his early converts in the doctrines of the new faith of Islam. After four years Mohammed's converts numbered but 40, and they were obliged to hold their meetings in secret in a cave near Mecca. Even here they were discovered and attacked by a rabble. Mohammed had much to contend with in these early days; many members of his tribe were against him, and Abu Lahib, his uncle, a rich and influential man, openly opposed what he called Mohammed's heresy.

In answer to a vision Mohammed now began to preach publicly, and summoned all the Koreishites of the line of Hashim to meet him on the hill of Safa. Scarcely had he begun his discourse when Abu Lazib attempted to hurl a stone at him. Mohammed turned, cursing the hand thus raised against him and predicting his doom, with the further assurance that his wife, Omm Jemil, would help build his death-fire. Mohammed soon called another meeting and this time boldly announced his divine command to impart his revelations received from heaven. At this meeting he called for a vizier or vicegerent; Ali was selected as he alone volunteered. He soon found a following among the people at large, threw off all reserve, proclaiming himself a prophet sent by God to put an end to idolatry. His favorite places of preaching were the sanctified hills of Safa and Kubeis; Mount Hara was his Sinai, whither he retired for contemplation and fresh revelations. He was often attacked with open force by his enemies, and in the 10th year of his prophetic office was deprived by death of his faithful wife, Kadijah, and Abu Talib. He then retired to the city of Taif but kept gaining numerous followers, among others many inhabitants of Medina. About this time occurred his famous vision in which he claimed to have made a nocturnal journey to heaven on the beast Al Borak, as referred to in the Koran. Shortly after, a conspiracy to murder him was set on foot, and he was obliged to flee to Medina. This took place in 622 A.D., and is known as the Hegira ("flight") and marks the beginning of the Mohammedan era.

Mohammed was accorded a warm reception in Medina. He organized his followers and provided set forms of worship and religious observances; he proselytized the Jews and other sects in the neighborhood and made many concessions to draw them to the new faith. As a result he was made judge and then ruler of Medina, and boldly assumed regal authority and dignity. After marrying Ayesha, the daughter of Abu Bekr, he announced his determination to take up the sword in furtherance of his doctrines. The hope of plunder thus held out brought him hordes of followers. His first expedition attacked a Koreishite caravan led by Abu Sofian, and rich booty was secured and divided. But Abu Sofian returned shortly with 3,000 soldiers and utterly routed Mohammed who had but 1,000. Mohammed, badly wounded, managed to escape. He rallied his troops, however, and gained new followers, by

seductive promises, explaining that the defeat was due to the sins of his adherents. In 627 Abu Sofian again brought an expedition against him and laid siege to Medina with a force of 10,000 men. After 20 days, however, his forces broke and dispersed on account of internal discord. Mohammed then led his army against the Jews who had sided with the Koreishites, and took a bloody revenge. Over 700 men were massacred, and the women and children were carried into slavery. From this time on Mohammed's thirst for warfare and blood seemed to be insatiable. His whole nature apparently underwent a change. He introduced a special chapter in the Koran to give himself permission to marry Zainab, the wife of his former slave Zaid. He followed this from time to time with numerous other marriages and amours and multiplied them to such an extent that at the time of his death he had no less than nine wives. All these affairs he explained by his divine mission, although diametrically opposed to his own laws as set forth in the Koran. His ambition and his views continued to expand with numerous successes in warfare and the tremendous growth in the number of his converts. He gradually conquered all the small surrounding tribes of Arabia; and then becoming still more ambitious and arrogant, sent deputations as missionaries beyond the frontiers. He sent to Khosrau Parviz, king of Persia; Heraclius, emperor of Constantinople; Mokawkas, ruler of Egypt; the king of Ethiopia, and the princes of various districts of Arabia, to embrace the new revelation of the divine law made through him. The stronger and more remote principalities rebelled, but the weaker at once adopted the faith of Islam. The king of Persia and Amru, the Ghassamite, rebelled, and Amru had the ambassador from Mohammed executed. This caused the first war between the Moslems and the Christians; the Moslems were beaten with great loss.

Mohammed now saw the importance of regaining the holy city and prepared what afterward came to be known as the "First Pilgrimage." In 629 he appeared before the gates with 1,400 of the faithful. He succeeded in making a peaceful entrance, telling the Koreishites that he was on a mission of peace and wished only to worship in the Caaba. He and his followers were granted three days for this purpose and left on the fourth day, but not without having won over many Koreishites to the new faith, among them being Amru, Othman and Khaled. Soon after this Mohammed nearly died from the effects of poison administered to him by a Jewess.

He now determined to wrest Mecca from the hands of the Koreishites; in 630, or the 8th year of the Hegira, he marched against the city with 10,000 soldiers. The inhabitants gave up the holy city into Mohammed's hands, receiving their life and liberty providing they accepted the faith of Islam. The Caaba was refinished, the idols thrown down, but Mohammed wisely refrained from destroying the ancient Black Stone, regenerating it with his own holy touch. Thus the temple became the sanctuary of the faith of Islam. This exercised a wonderful effect all over Arabia and the next year (9 of the Hegira) embassies arrived from all points of the compass to make submission. This is called "The year of Embassies."

In order to intimidate Heraclius, the emperor, Mohammed marched into Syria half way to Damascus, at the head of an army composed of 20,000 foot soldiers and 10,000 horse, but returned to Medina without making an attack. He then extended free worship to the Christians in consideration of tribute, added a new chapter to the Koran, revoking all regulations in favor of idolaters, and then promulgated his great and last pilgrimage to Mecca, known as the "Valedictory Pilgrimage." It was toward the close of the 10th year of the Hegira that he started this pilgrimage accompanied by a throng estimated at from 40,000 to 150,000 persons. He preached to them from Mount Arafat, exhorting the faithful to piety and righteousness, to abstain from sin and to protect the weak. On his return to Medina he fell sick and declined rapidly. He gave instructions that Abu Bekr and Usama, the son of Zaid, should be the leaders of the army, and expired in the arms of his favorite wife, Ayesha, 12th day, 3d month, year 11 of the Hegira (7 June 632 A.D.). He was buried in the house of Ayesha where he died. It afterward was annexed to an adjoining mosque which became a place of pilgrimage for generations of Mohammedans.

Mohammed's personal appearance, to judge from Arabic tradition, was neither imposing nor pleasing, but inspiring. He was not above medium height, but was broad-shouldered and deep of chest; he was strongly and compactly built; head, large; brow, high; face, round and ruddy; mouth, large; nose, long and aquiline. His eyes, large, black and fiery, were full of his peculiar magnetic personal power. He wore his black hair long and curly and his beard remained unwhitened at his death. A large birthmark between his shoulders was looked upon as the holy mark of prophecy. His personality was strong and dominant, but his domestic life was as simple as was his frugality at meals. He was kind and generous, a tender father and a loyal friend. Even at the height of his power he lived in a miserable hut, slept upon straw and his pillow was made of palm leaves covered with leather. His life was withal a strange contradiction, for at times he was deceitful, cunning and cowardly, and in his later years gave way to gross sensuality. His mind in spite of his religion contained a strong admixture of superstition; he believed in omens, charms and good and bad spirits. Spasmodic convulsions always accompanied his visions or divine revelations, and by many were attributed to his disease of epilepsy. At such times he would perspire profusely and remain in a weakened condition for some time after.

As a political leader and a religious reformer Mohammed undoubtedly ranks among the greatest. Whether a real prophet or a charlatan, or a mixture of both, we cannot strip him of the qualities of greatness. His name has survived 12 centuries and his followers to-day number over 175,000,000 living souls. (See ISHMAELITES; KARMATHIANS; KORAN; MOHAMMEDANISM; SUNNITES; WAHABEES; SUNNA, etc.). lam' (1887); Seyd Ali, 'Life and Teachings of Mohammed' (1891); Muir, 'The Caliphate' (1891); Pool, 'Studies in Mohammedanism' (1892); Margolionth, D. S., 'Mohammed and the Rise of Islam' (1905). Also consult other works quoted under MOHAMMEDANISM; KORAN, and kindred subjects.

**MOHAMMED I**, Turkish sultan: b. 1375; d. 1421. He was son of Bajazet I, after whose death (1403) he became prince of Asia Minor and rival of his three brothers for the throne, to which he came in 1413, as the successor of Mousa. During his reign of eight years he strengthened the empire, which was suffering from the recent assaults of Timur (or Tamerlane), pushed its boundaries as far as the Danube and fostered friendly relations with the Greek Empire abroad, and literature, arts and sciences at home.

**MOHAMMED II**, Turkish sultan: b. Adrianople, 1430; d. 1481. He succeeded his father, Murad II, in 1451; two years later undertook the siege of Constantinople, which he carried by storm after 53 days' siege; made the city his capital; made war on the Greek rulers in Morea and Trapezus, on Hunyadi of Hungary, on Scanderbeg in Albania and on Venice, winning for his empire the provinces of Bosnia and Serbia, as well as Eubœa and Scutari (from Venice) and Kaffa (from Genoa), and for himself the names el-Ghazi, "the Conqueror," and Buyuk, "the Great." His conquests had extended as far north as the Crimea, and in 1481 had seized Otranto as a preparatory step to war on Naples, when he suddenly died.

**MOHAMMED III**, Turkish sultan: b. 1566; d. 1603. He succeeded his father, Murad III, in 1595, assuring himself the throne by the execution of his 19 brothers. He captured Erlau in Hungary (1596), but was unsuccessful in his further movements in Europe, being attacked in Asia by Abbas the Great, Shah of Persia.

**MOHAMMED IV**, Turkish sultan: b. 1642; d. 1691. His father, Ibrahim I, was murdered by the Janizaries when Mohammed was only seven years old. He came to the throne under the nominal regency of his grandmother, which was soon exchanged for the actual control of the grand-viziers, the Kiuprili. Turkey's foreign policy was aggressive and successful under them; but in 1683 Kara Mustafa was defeated before Vienna. The Holy League, composed of Poland, Russia, Venice and Leopold I, Roman emperor, then steadily gained victory after victory over the Turkish army, which rose against Mohammed, imprisoned him in 1687 and let him die in chains four years after the accession of his brother, Sulciman II.

**MOHAMMED V**, 35th Turkish sultan in male descent of the house of Othman: b. 3 Nov. 1844; d. 3 July 1918. A son of Sultan Abdul Medjid (d. 1861), he succeeded his elder brother Abdul Hamid II (q.v.) on the latter's deposition and exile, 27 April 1909. From his early manhood until the day when he was unexpectedly placed on the throne in his 65th year, Mohammed Reshad Effendi—as he was called—had been a state prisoner in close confinement in a palace on the Bosphorus. By the law of succession observed in the reign-

ing family, the crown devolves according to seniority upon the male descendants of Othman (the founder of the empire) sprung from the Imperial Harem, whence all children, whether of free women or of slaves, are legitimate and of equal lineage. During his long captivity Mohammed had seen three sultans come and go—his uncle, the gloomy Abdul Aziz, and his two brothers, the insane Murad (d. 1902) and the "Great Assassin," Abdul Hamid (d. 10 Feb. 1918). All three had been deposed after reigning 15 years, three months, and 33 years, respectively. Of very limited education, totally ignorant of the world and inexperienced in the mysteries of state-craft, he had been dragged from obscurity in his old age and suddenly made the ruler of 20,000,000 people. Mr. Morgenthau, former United States Ambassador to Turkey, described him as "simply a quiet, easy-going, gentlemanly old man" of a "benevolent, gentle nature." Lacking the strength and cunning of his famous brother, he easily became a quiescent tool in the hands of the Young Turkey leaders. His personal share in the government of Turkey before and during the war may be described as *nil*. He was succeeded by Mohammed VI. See TURKEY.

**MOHAMMED VI**, 37th Turkish sultan of the house of Othman: b. Constantinople, 12 Jan. 1861. Wahid-ed-din (which was his former name) is a son of Sultan Abdul Medjid and the 14th child of that monarch. He is thus the youngest brother of his three immediate predecessors on the throne—Murad V, Abdul Hamid II and Mohammed V. He became heir to the throne on the death (by murder or suicide) of his cousin Prince Yussuf Izzedin in February 1916. On the death of Mohammed V on 3 July 1918, Wahid-ed-din succeeded him under the style of Mohammed VI. He found his country disorganized and at war, with the government in the grasp of Enver Pasha, Talaat Bey and German officials. Three months later the two virtual rulers of Turkey fled and the sultan was compelled to sue for peace in a note to the United States government dated 12 Oct. 1918.

**MOHAMMED AHMED**, äh'mëd (The Mahdi). See MAD MULLAH.

**MOHAMMEDAN ART.** The Mohammedan or Moslem culture, which from insignificant beginnings developed its military power with such extraordinary rapidity in the 7th century of our era, by subjugating nearly all western Asia, northern Africa, Spain and later Sicily and Sardinia, was at the outset almost wholly destitute of art. It was the Arabs who led in these conquests; the Moors who overran Spain were largely of Arabic blood, and the Arabs were not at first artistically gifted. Like the Mongols and the Turks, who were later concerned in the advance of Islam (as the Mohammedans call their faith), the Arabs and Moors were at first wholly dependent on the peoples they conquered for their art, and especially for their architecture; upon the Syrians, Assyrians, Armenians, Persians, Byzantine Greeks, the Copts of Egypt, the Christians of North Africa, the Spaniards and Sicilians, all of them Christians except the Persians. But the conquerors imposed upon their Christian and Persian builders and artists special programs and requirements due to their faith, and

in the course of centuries developed predilections and aptitudes wholly their own, which gave to all their arts an Oriental character wholly unlike that of the Western arts from which they were derived. The name "Saracenic," commonly applied to all Moslem art, is an unscientific inheritance from the age of the Crusades.

The development of this art took place during the early Middle Ages, when European culture was slowly and painfully emerging from the chaos of the centuries following the fall of Rome. It produced a civilization and an art that flourished with extraordinary brilliance. Bagdad, Cairo, Cordova, Granada, Toledo, Kairouan (Cyrene) and other cities of Arabia, Persia, Spain and North Africa, were for some centuries more splendid than any European city outside of Constantinople. Moslem universities were great centres of learning; the Arabs cultivated mathematics and philosophy with enthusiasm, and the textile arts, ceramics and metalwork were carried to so high a degree of perfection that they powerfully affected European art as late as the 16th century.

**Historical Development.**—During the first century after the Hegira (622–722 A.D.) the Arabs conquered Syria (634–642 A.D.); the Sassanian empire of Persia in 642; Armenia and Mesopotamia in 644, and part of northern Africa in 645–692. Sicily was occupied early in the 9th century. The Ommyad sultans subdued the rest of North Africa during the 7th century and extended their conquest into Spain (710–713), where they established the independent khalifate of Cordova, as a rival to the Abbassid khalifate of Bagdad. The 9th and 10th centuries were a period of exceptional brilliancy in Moslem history: the age of Haroun-er-Reshid, of El Mansur, of an almost fabulous splendor in Bagdad, of conquests in Sardinia and Malta and of widespread architectural activity. During the 7th and 8th centuries the original mosque of Omar at Jerusalem (of which the present so-called "Mosque of Omar," really the Kubbet-es-Sakhra, is a much later successor), and that called El Aksah in the same city; the mosques of Amrú at Cairo and of El Walid at Damascus and the Great Mosque at Cordova had been built; during the 9th and 10th centuries the celebrated mosque at Kairouan, the mosques of Ibn Túlún and of El Azhar at Cairo were built and that of Cordova greatly enlarged. Under the Fatimite dynasty, which succeeded the Toulúnids in Egypt in 969, there began the practice of erecting domes over tombs and sepulchral chambers, and the earliest minaret was built in Cairo. But the greatest architectural activity in that city occurred under the Ayubite and Mameluke sultans of the 13th and 14th centuries, to which belong the splendid mosques of Kalaún (1284), Hassan (1356–79), Barkúk (1384), Muayyad (1415) and Kait Bey (1465), and the remarkable group of domed and minareted tombs of the Karafah quarter, commonly known as the tombs of the Khalifs and of the Mamelukes.

The culmination of Hispano-Moresque architecture came somewhat earlier—singularly enough during the period of the disintegration of the Moorish power in Spain. The famous Giralda tower at Seville (1160), the Alcazars or castle-palaces of Seville and Mal-

aga (1181–1310) and the Alhambra at Granada (1248–1306), are the most noted extant products of this age.

Although Persia was so early subdued by the Arabs, and by the artistic proclivities of the people became the parent of Mohammedan art in Bagdad and Mesopotamia and later in Turkestan, nearly all the early monuments of Persian architecture were destroyed in the Mogul invasions of the 11th–13th century. The recovery in architecture was slow until the accession of the Sefavieh or Sufi dynasty in 1478, when there ensued a remarkable revival of all the arts in the cities of Ispahan, Tabriz, Aminabad, Hamadan, Shiraz, etc., with the building of great mosques, bazaars, caravanserais and bridges, and a great development of decorative art in rugs, printed fabrics, ceramics and manuscript-illumination.

The conquest of the Indian states by the Mohammedans was late, gradual and incomplete, and neither the Hindu religion nor the native Hindu art was ever extinguished, even in those regions longest subject to Islam. Northern India was conquered in part in 1192, and developed a style in which Persian and Hindu forms are inseparably blended, as in old Delhi and Ajmir. In other provinces during the next three centuries Mohammedan mosques and palaces were built in various local styles; but it was the Mogul sultans (1494–1706), who in India as in Persia developed the arts, including architecture, with the greatest splendor, especially in the magnificent mosques, palaces and tombs of Bijapur, Allahabad, Secundra, Delhi and Agra and their suburbs. In this period Persian conceptions and influences are dominant, but the Hindu traditions are also plainly manifest.

Turkey was the latest of the Moslem empires to develop a characteristic art. The Seljúk Turks who had settled in Asia Minor in the 11th century, and had built up a notable capital at Iconium (Konieh) under the influence of Persian art, were superseded by the Ottoman Turks in 1299 under Osman, the founder of the present dynasty. By the capture of Constantinople in 1453 (having captured Adrianople nearly a century earlier), the Turks became masters of the Byzantine Empire. The resulting development in the arts shows a mingling of Arabic, Persian and Byzantine elements, the latter predominating in the architecture of the mosques.

In China the Mohammedan element has been too feeble to produce any vital and characteristic Moslem art.

**General Characteristics.**—While in Mohammedan art five distinct style-developments are easily recognized—the Arabic, Moorish, Persian, Indo-Moslem and Turkish—certain common characteristics run through them all, due in part to the religion, in part to the Asiatic source of all the Moslem peoples. The Koran forbids all representation of living beings, and sculpture in all its forms is rigidly proscribed, while pictorial art, and even the use of pure nature-forms in ornament, are equally rejected except by the Persians, who belong to the Shiah sect, and the Moslems of India. Everywhere else decorative art has been restricted to purely conventional motives, or to nature-forms so conventionalized as to be hardly recognizable. In spite of this restric-

tion, it is in the arts of decoration that the Mohammedans have always been the strongest. In these arts the Asiatic love of color and of surface ornament is everywhere evident, in contrast to the European predilection for plastic decoration based on structure. In all Moslem styles minuteness of detail and intricacy of composition are preferred to the clarity and repose of the European styles, and brilliant color, broken up into minute elements and covering broad surfaces, is preferred to those effects of light and shade produced by sculpture and carving in varied relief. In the wall-decoration of the architecture the traditions of rug-design seem to dominate. Common to all the architectural styles are certain motives: the interlaced star ("star of Solomon"), the honey-comb or stalactite motive and decorative inscriptions in the Cufic, Persian or Arabic forms of lettering. Arches, of whatever form, are almost invariably enclosed in rectangular panels or decorative frames.

**Architectural Styles and Monuments.**—As Gothic architecture received form in the building of cathedrals, so the Moslems developed theirs in the building of mosques. A mosque is primarily a prayer-hall, the ceremonial prayer of adoration of Allah being the chief element in the Islamic worship. And since all prayer must be made toward Mecca, the holy city, the one prime essential of the mosque is the *mihrab* or niche in the side of the hall toward Mecca, indicating the *kibleh* or ritual direction of worship. To the right of this, in the larger mosques (Jami, Jouma or Jumma mosques), is a *mimber* or high narrow pulpit from which the Koran is read on Fridays. There is usually in front of the mosque an open court surrounded by arcades, entered by one or more lofty gates, and having in the centre a fountain for the ceremonial ablutions without which the worshiper is deemed unfit for prayer. To nearly all mosques are attached one or more minarets from whose exterior galleries the *muezzin* chants daily at the appointed hours the far-sounding call to prayer. These requirements permit of the utmost variety in plans and detailed arrangements, which differ widely in the five principal styles.

Of these five styles the *Arabic* has less unity than any of the others. It may, indeed, be divided into three sub-styles: the Syrian, based upon the Syrian-Byzantine architecture and later influenced by the Romanesque works of the Crusaders; the Mesopotamian, dominated by Persian influence, as at Bagdad; and the Egypto-Arabic or Cairene, springing from Coptic prototypes, and by far the most distinctive of the three. It is characterized by the pointed arch, the ovoid or pointed dome decorated in relief, with or without a drum; minarets square below, with two or more diminishing stages and much surface-ornament; the use of stalactite corbeling, of marble veneering internally and of carved and painted beamed ceilings. The buildings are seldom large in scale, even when covering large areas; height and spaciousness are not sought after, as a rule. The material of construction is usually brick, faced externally with stone or with stucco. The entrance doorway is made impressive by setting it in a deep and lofty niche. Vaulting is chiefly confined to the domes over sepulchral chambers, a feature introduced in

the Fatimite period from Mesopotamia, whence also came the minaret. The early mosques in Cairo, as generally elsewhere also, consisted of a court surrounded by arcades, and the prayer-hall was simply a multiplication of these arcades on the side toward Mecca. But the Hassan mosque (1356) is exceptional in its prayer-hall covered by a huge barrel-vault of 70 feet span, and the "Mosque of Omar" at Jerusalem in its concentric circular plan and vast wooden dome. Later it became customary to incorporate in the mosque not only one or more sepulchral chambers, but also hospitals and rooms for priests and for schools and other purposes. After the Turkish conquest by Selim in 1517, mosques were sometimes erected in Cairo after the Constantinople type, with broad domes over the prayer-hall (Boulak, 1520; Mehmet Ali, 1821). The Arab houses of Cairo, built on the street, are noted for their fronts of *mashrabiyyé* lattice-work. Woodwork of intricate star-paneling inlaid with mother-of-pearl and ivory appears in doors and *mimbers*, and decorative tile-work is freely used in interiors—an art imported from Persia.

The *Moorish* style, of which the Hispano-Moresque is simply the Spanish development, employs the horseshoe arch, often cusped; slender columns with carved capitals, often of cubical form above a high necking; massive square towers for minarets, and a system of wall-decoration in stucco, stamped or molded in intricate surface-patterns brilliantly colored, above a wainscot of colored tiles. Domes and vaults are very rare. Both stone and brick are used in construction, and external patterning in relief is a frequent feature of external brickwork, as on the Giralda at Seville. Both in Africa and Spain the decorative element predominates over the structural. The most noted monuments have been mentioned; others at Fez, Tangiers, Algiers, Tlemcen, both mosques and palaces, are of interest.

The *Persian* monuments differ in style from the Arabic and Moorish, alike in plan, construction, form and decoration. The bulbous dome, the round minaret with a roofed gallery and bulbous top, the four centred pointed arch, portal-niches of huge size, and the veneering of the whole exterior with figured tiles in brilliant colors, give the Persian mosques an aspect nowhere else to be met with. Brick is the universal material of construction, and vaulting of great intricacy is everywhere used, alike in mosques and in secular buildings. In palaces wooden posts and wooden ceilings are common, brilliantly painted; but otherwise columns are infrequent. The principal mosques belong to the Sufi period, though the ruined mosque at Tabriz and the tomb of Khodabende at Sultanieh are of the early 14th century. The great square or Meidan, the mosque and college and the Palace of the Mirrors, all at Ispahan, the caravanserai at Aminabad, and bazaars, bridges and mosques at Shiraz, Hamadan, etc., are notable examples of the style, to which may also be credited the fine though ruinous mosques at Bokhara and Samarcand, in Turkestan.

The various pre-Mogul Indian styles show a mixture of Hindu and Persian forms (e.g., mosque, gate and tomb of Altomsh at Old Delhi, mosques at Ajmir, Ahmedabad, Gujerat, Kalburgah, etc.). The Mogul conquest intro-

duced an entirely new architecture, Persian as to its forms, which include the bulbous dome, round minaret, great niche-portals and the four-centred arch. But it is an architecture of sandstone and marble, not of brick and tile, and is superior to the Persian in the scale, dignity and setting of its monuments. Among the most important of these are the mosques at Bijapur, Agra (Muti Masjid or Pearl Mosque), Delhi (Jumma Masjid), and Fathpur-Sikhri; the great palace groups at Delhi and Fathpur-Sikhri; the tombs of Akbar at Secundra and of Humayun at Agra, and the incomparable Taj Mahal near Agra, the tomb of Shah Jehan and of his queen, Mumtaz-i-Mahal.

The earliest *Turkish* architecture, the Seljukian, was an offshoot of the Persian. When the Ottoman Turks established their new capital at Brusa (1300), they employed at first the Seljuk style, as in the "Green Mosque"; but after the capture of Constantinople in 1453 the Byzantine influence became paramount in the plan and construction of mosques, while the details betray mingled Arab and Persian origins. Of all the Mohammedan styles this is the most purely structural in masses and conception, and the most imposing in scale. The great mosques follow the prototype of Santa Sophia (q.v.), covering vast interiors with a lofty central dome and a combination of half-domes and cupolas; the minarets are round, with one or more galleries and a slender lead-covered spire. The Turks employ the simple pointed arch with alternating voussours of light and dark marble, enclosed in a rectangular panel; marble columns with stalactite capitals; stalactite corbeling and cornices, and a combination of tiles and painted ornament for interior decoration. All their finest buildings are of white marble; they include the Mehmediye Mosque at Constantinople (1460), the great Selimiye at Adrianople (1512-30), the Suleimaniye Mosque and tombs and the Shah Zade Mosque (1556), the Valide and Ahmet I mosques (17th century) and the Nouri Osmaniye (1756), all at Constantinople, besides many fountains, and several palaces built in the 19th century of a showy but inferior type.

**The Decorative Arts.**—The Asiatic races have always excelled in surface-decoration, especially in the use of color. Among them the Moslem nations have displayed great skill not only in the application of surface-decoration to buildings but also in many forms of textile and ceramic art and in certain kinds of woodwork and metalwork and even stained glass. In *textiles* the place of honor belongs to the rug-weavers of Turkey, Persia and India, whose art in this field is descended from very ancient times when Babylonia led the world in decorative weaving. The Turkish rugs, including those from Mesopotamia and Turkestan, are distinguished by their purely conventional patterns, composed almost entirely of rectilinear and angular motives. The Persian and Indian rugs are esteemed the finest; in these the patterns are in flowing lines, with liberal use of leaf and floral forms semi-naturalistic in treatment. The Persians also produce remarkable hangings printed in colors by hand from engraved wooden blocks on cotton or linen. Both India and Turkey have produced remarkable needlework in colored silk on broadcloth or cotton; but this art has nearly

disappeared in Turkey. The Armenian and Syrian laces are of great beauty, but they are mostly the work of Christians, not Mohammedans. In *ceramics* the Persians have been from a remote antiquity the leaders among the Moslem nations. They inherited the art from the ancient Babylonians and in turn taught it to the Arabs of Egypt and the Moors of Spain, and later to the Turks of Asia Minor. (See CERAMICS). Their use of patterned tiles for veneering the exteriors of their buildings has been already referred to. In all the Persian ceramics, both tiles and glazed pottery, floral patterns are freely used; the cypress tree, the rose, carnation or pink, peony and other flowers appearing frequently, as well as birds, gazelles and other animals. The Arabs and Moors, on the other hand, avoided, as far as possible, such naturalistic representations. The Turkish tiles and pottery approach more nearly the Persian types. In *metalwork* the Indo-Moslems excel the other Mohammedans, especially in chased and perforated brass vessels, and in niello-work—the incrusting of patterns in gold or silver in or upon iron or bronze; but it is not possible to distinguish the Moslem from the Hindu handiwork except where the chasing or incrusting of Hindu emblems betrays its non-Moslem origin. The kindred art of damascening, or the insertion of gold, silver or brass wire into grooves cut in iron or steel, originated, as its name implies, in Damascus, and was carried to great perfection by the Arabs, especially in the decoration of armor and weapons. The *woodwork* of doors and of *mimbers* or pulpits in Cairo and in Turkey and the *mashrabiye* of Cairo houses have been previously referred to. A similar treatment of intricately-framed paneling and of spindle latticework is employed for both fixed and movable furniture. The Moslems of India also excel in perforated and carved woodwork for interior decoration. The art of *stained glass* was developed in Cairo, perhaps as early as the 14th century, and spread thence to Turkey in the 16th. The patterns are perforated in cement, and the perforations stopped with bits of colored glass, combined in harmonies of line and color.

**Manuscript-decoration** is in some respects the most distinctive of all the Moslem arts, and it is hard to decide which nation produced the finest works, though the palm would perhaps go to the Persians. The beauty of the Arabic lettering (of which the Turkish and Persian characters are mere variants) lends itself to decorative calligraphy in an eminent degree, while each of these nations has developed an art of supplementary adornments in color and gold, in borders, decorative panels and other forms of ornament, that rival the finest manuscript of western Europe. To these embellishments the artists of Persia and India add the resource of pictorial illustration in color, which the Arab and Turkish illuminators allow only in the rarest instances.

The decorative arts of Islam generally reached their highest attainment in the 15th-17th centuries, since when there has been a long and slow decline, though they are still practised with success in many parts of Turkey, Egypt, Persia and India.

**Bibliography.**—For the general subject the most important work is Saladin et Migeon,

'Manuel d'art musulman' (Paris 1907); also Franz Pascha, J., 'Die Baukunst des Islam' (Darmstadt 1887). For *Arabic art*, Bourgoïn, J., 'Les Arts arabes' (Paris 1873); Gayet, A. **MOHAMMEDAN LITERATURE.** The study of the traditions of Mohammed, in all their extended ramifications, comprises what might be termed Mohammedan literature; and as these are pre-eminently embodied in the Koran, that work, without striking literary art and mechanically constructed, became the incomparable classic of Islam, to give rise to schools of thought, to systems of theology and jurisprudence and to promote distinct branches of history, biography, criticism, science, grammar, philosophy, legend and poetry. It is curious how such a book, revealed in bits and scraps, arranged according to the length of the chapters, without uniform style, and whose text was not collated in the prophet's lifetime, should have been worshiped and idealized. But our Western mind cannot understand the Oriental point of view, and least of all the windings and complexities of the Semitic brain. Caliph Uthman had done away with all existing copies of the Koran except that of Abu Bekr, which itself was shortly afterward destroyed by Marwan, governor of Medina. All copies of the book to-day, wherever scattered, are reproductions of Abu Bekr's edition. Uniformity and authoritative text could apparently be secured in no other way. Out of the exegesis of the Koran sprang the most vital and varied elements in Arabic literary history, which began in primitive pre-Islamic times in the ceaseless caravan-marches across the deserts, where the camel's regular swing taught the Arab to sing rhymes. The more cultured Mohammedan of a later age is city dweller, and shares wider aspirations; but the Koran, not the desert, is still his starting-point, to which he always returns, whether he follows the simple monotheism of Mohammed or an agnostic mysticism.

It can readily be seen how history among the Arabs began with the *Maghazi*—books devoted to the study of Mohammed's wars. The deeds of that era were to be narrated, the chronicles and legends gathered, at second

hand generally. Efforts to obtain information as to the prophet's life gave birth to biography, which was to develop in later centuries. Parallel with histories of wars and events were written histories of famous cities, like Medina or Mecca, Bagdad and the rest, most of which works have perished. How this field was cultivated can be shown from what is recorded of Tabari, the most illustrious historian (828-923), who for 40 years wrote 40 sheets a day. The oldest biography extant is that of the prophet by Ibn Ishaq (d. 767). The beginnings of the historical romances go back to the first centuries of Islam when veneration for Mohammed gave rise to legend and fable that passed as genuine history.

The literature of jurisprudence sprang naturally from the study of the *hadith* or sources of tradition. The Koran had to be supplemented at an early date to provide laws for the Moslem world. The sayings of the prophet after his death, his usages and decisions, had to be collected, arranged and sifted. The Koran itself was absolute authority, if it contained a law applicable to the case in hand; otherwise the memories of the *Sahibs*, the companions of the prophet, were resorted to for his rulings. If these proved of no avail, recourse was had to the common law of Medina, and finally to the common sense of the judge. Hence a vast legal literature arose—collections of traditions, called *Musnads*, because each tradition was "supported" against the companion from whom it came. One of the first and greatest of these was the 'Misnad' of Ahmad ibn Hanbol (d. 863). It was printed a few years ago in Cairo in six quarto volumes of 2,885 pages and is said to contain about 30,000 traditions going back 700 years.

Another type of tradition-book was the 'Musannaf' or "arranged,"—chapters classified according to their subject matter. Al Bukhari (d. 879) made the most respected of all the collections, termed *Sahih*, which is so arranged as to form bases for a complete system of jurisprudence. Another is that of Muslim (d. 883). These were the two most honored authorities. Four other legal collections, 'Sunan' ("usages"), stand second to the two *Sahibs*. Different writers, however, give the number of canonical works as five, seven or even 10. It did not take long before the six great books were themselves abridged and explained—the rules of the faith were summed up into a selection of 40 traditions and these became the subject of endless commentaries. The Roman as well as the Rabbinical law had marked influence on Mohammedan law. Four schools of thought held sway, that of Abu Hanifa (d. 722), speculative jurist; of Malik (d. 801), historical jurist; of Ash Shafi'i (d. 826), reverent and conciliatory; and that of the pupils of Ahmad Hanbol (d. 863), reactionary. A fifth school, the Zahrite, whose discovery is due to Dr. Goldziher, founded by the Abu Sulaiman David ibn Ali (815-883) insisted on the external meaning of the Koran and the traditions and repudiated further tradition. "It never held rank," writes Macdonald, "as an acknowledged school of Mohammedan law."

With the deeper study of the Koran, two further branches arose—the science of reading the text and that of its interpretation. Oral tradition which was at first depended upon

was soon followed by written tradition and books were compiled on the various ways of reading, some of which dating from the 10th century are preserved at Berlin, Algiers and Leyden. One book, written by a grave jurist, and entitled 'Kitab Muhbarak' (Blessed Book) is a story of those who died listening to the reading of the Koran. In the line of exegesis, the array of books is overwhelming, the mystical in large number. Hence arose the increased study of grammar, most of the commentators being grammarians.

In the department of theology, whole libraries have been written. Ghazali, one of the most famous masters (1049-1111), wrote 69 works that are extant. Like its jurisprudence, Mohammedan theology could not begin until after the prophet's death. At first it was more political than religious but soon settled down to more or less logical wrangling between sect and sect. Christian, Jew, Persian, Greek alike had their influence, with developments now rational, now mystical, now radical, now pantheistic, giving birth to countless works, some of which are almost modern in their suggestions and implications. They prove the fertility and the intensity of the Mohammedan intellect and what marvelous power existed in the prophet to have supplied thought for so many ages and to so many minds.

**MOHAMMEDAN SECTS.** As Islam constitutes more than a religion and is in reality a combination of religion, politics and jurisprudence—elements which entered into the problem in the early centuries and have continued ever since—it is natural that schisms should occur and sects rise and decline from age to age with the varying national and historical conditions. The rise and development of doctrine among the Mohammedans cannot be separated from the rise and development of historical and national traditions. Many influences contributed to the consequent growth of sects and their distinguishing factors. The culture of neighboring lands, their literary and theological atmosphere, was an undeniable factor. Both Jewish and Roman law exercised a profound influence and led in time to much controversy. Just as the Koran illustrates three lines of influence—Christian, Jewish and what we term heathen, the prevalent customs or modes of thought of the peoples among whom they lived were reflected largely in the conceptions of the Mohammedans. Perhaps, too, it was necessary for the faith to assume such characteristics, to facilitate its diffusion and make its proselytes feel more at home. Here was a fruitful field for the growth of sects. Then must be considered the effect of extended geographical divisions. Islam embraced Arabia, Persia, Syria, Egypt, the coast of North Africa, central Asia to China, with Spain in Europe, India and the islands of Malay. What active sources for antagonism and division, what

favorable soil for mystic, ascetic, pantheist, rationalist with their ever-varying phases! Then, further, the Semitic races with their tendency to segregation have an innate militant spirit that leads if not otherwise checked to fanaticism and the formation of sects. The fact, too, that Islam grew so rapidly and wielded for so many centuries a remarkable sway in science and knowledge intensified the conflict of opinion, often to be decided by the sword within the fold.

The sects at the first glance seem endless from our point of view. An old tradition ascribes to Mohammed the saying that Islam would be divided in time into 73 parties. Arabian writers, with their different classes and divisions, multiply that number several times, the discrepancy being due to the want of system and the lack of a common basis of classification. Sharastani (d. 1153), whose account of religious sects and philosophical schools is chief source-book, arranges the sects under six headings: Mu'tazalites, Jabarites, Sifatites, Kharijites, Murpites and Shi'ites, upon which a list of a hundred names and more has been founded. Many of these have disappeared; four, however, continue to our day over large portions of the world of Islam and stand on the common basis of the *sunna* or orthodox traditions. These are the Hanafites, the Shafi'ites, the Malikites and the Hanfalites.

Before discussing more closely the names and history of these sects one must refer to the vital point in Arab law, philosophy and theology—the historical basis of creed and dogma in their widest sense. It was religion not politics that produced the first schism, which still remains unhealed. The point at dispute is the successor to the prophet and ruler of Islam (Imam). Here we have a sharp division between legitimist and illegitimist, orthodox and heterodox, with their endless disputes and antagonisms, more or less clearly enunciated. On the one side are the Sunnites, those who follow the *Sunna* or tradition to which belong the overwhelming majority; on the other the Shi'ites, from *Shia*, a party or sect, who constitute the largest numbers of dissenters. After the battle of Siffin (657) when Ali and Moawiya were rival claimants to the caliphate, and the former lost in the arbitration, the breach was made. The Shi'ites broke away and became the protestants or dissenters, holding that the succession belongs to the house of Mohammed and to Ali as his son-in-law, and ever after to the direct blood relations and descendants in the line of the prophet's daughter Fatima, the wife of Ali. The Shi'ites themselves are divided according to which branch of the descendants they recognize. Its high church or sect of the "Twelvers," called also Imamites (they prefer the term Imam to Khalifah) traces its claim to Ali and transmits from father to son until the 12th Imam, Mohammed b. Hasan 'ul Askari." In his eighth year he is said to have vanished and it is held by this sect of "Twelvers" that he has lived since then in secret, to appear at the last day as Imam Mahdi! The Fatimites, another branch of the Shi'ites, founded a dynasty of some strength for a time in North Africa and Egypt (909-1171). It can readily be imagined how theories of incarnation have arisen among the Shi'ites in their extravagant reverence for

Ali and his wife, who have become almost tutelary deities and endowed with superhuman dignities. It was only a short step to Gnosticism, which also developed in Islam, due largely to Babylonian and Persian ideas. The present day Druses constitute one of the sects that show the survival of these tendencies.

The dissatisfaction in the Eastern half of the caliphate with the Omayyad dynasty gave impetus to Shi'ites growth and many leaders founded sects of their own, with some of which obedience to a person not to law was inculcated as a religion. There is little doubt that the decline of the Omayyads and the success of the Abbasids was due in considerable measure to the aid of the Shi'ites, the early caliphs of that dynasty, until Motawakkil, belonging to that sect. The Shi'ites are divided by Shahrastani into five divisions, of which the Isma'rites, the followers of Isma'il, the sixth Imam, have given rise, owing to the propaganda of Abd Allah ibn Maimun, to the Carmathians, Fatimites, the Assassins and the Druses. In Persia the Shah is the temporary substitute for the vanished Imam. The differences of the Shi'ites apart from the question of the succession are due to adapting the rites of Islam to the Persian nationality and concern minor matters of ritual. They have their own collection of traditions, but the prayers are almost identical with those of the Sunnites, although there is no obligation to attend public worship in the lack of a legitimate Imam. Saints are zealously worshiped—religious feasts are multiplied. The Koran is also their source of law. Next to the clergy (*Mollahs*), the dervishes wield the greatest religious influence. New sects appear among the Shi'ites from time to time—the latest being Babism, founded in Persia (1844-45) by Mirza Ali Mohammed and his successors, who held to the view of progressive revelation and display a high intelligence and ethical strength—at least in later writings. The sects that have survived and represent the great majority in Islam have been briefly mentioned as followers of the Sunna. The Hanafites spring from the school of the Imam Abu Hanifah (767), predominating to-day in Turkey, central Asia and in India. The Shafites, called after Imam Al Shafii (d. 819), are to be met in Egypt, southern Arabia, the Dutch colonies and in German East Africa. The Malikites, named after Malik Ibn Anas, the famous Imam of Medina (d. 795), can be found in northern Africa and in Upper Egypt. The Hanbalites, rigid traditionalists, with the accompanying fanaticism, look back to Imam Ahmad ibn Hanbal (d. 855). Declining after the 15th century, the sect or school revived in the 18th, when the Wahabite movement arose in central Arabia, adopting its viewpoint of reform. Corresponding to the monastic orders in Europe, brotherhoods have arisen in Islam, which assume the importance of distinct sects, like the order of dervishes. The latest is the Brotherhood of As-Sanusi, established in 1837, of a "severely reforming and puritanic character," as Macdonald expresses it. Holding to the strictest monotheism, all customs and ideas that "do not accord with the view of the exact letter" of the Koran are prohibited. A theocratic state has been founded in the eastern Sahara, between Egypt and Tripoli, from which mis-

sionaries are sent to establish houses throughout North Africa and Morocco and far into the interior. Mecca is an important centre for the new cult, into which pilgrims and the Bedouin are initiated in large numbers. In marked contrast are the Ibadites, who take their name from Ibn Ibad, associated with one of the earliest Mohammedan sects. They are found in Zanzibar and the coast of East Africa and in Algeria, where they maintain a certain simplicity and hold their primitive theological and legal views. It is forbidden them to marry other Muslims. The Ibadites in reality go back to the more modern elements of the Kharijites, one of the earliest parties in Islam, who organized themselves after Ali's rejection for the caliphate as an independent body. Literally "goers out," as the name implies, they are opposed to all other parties, as renegades to be killed at sight. Their democracy was absolute—the caliph could be of any family, to be elected and deposed by the entire Muslim community. A picturesque if narrow sect, they have maintained themselves as an offshoot in a remote corner of the Islam world.

In the days of Ommayyad caliphate (661-750) the three centres of religious thought—Damascus, Medina and the East—were open to non-Mohammedan influences and two heretical sects arose—the Murjiites and the Qadarites. The former postponed—hence their name—the judgment of human actions until the day of judgment. They held, too, that no believer in the unity of God and his apostle Mohammed would meet everlasting death—a heresy in that day. The Qadarites opposed predestination and free will and claimed that man had power over his actions—heretical doctrine in the world of Medina to be punished by death. In the East, with the Christians, Buddhists, Zoroastrians and the rest in close contact with the Mohammedans, rationalism arose in the sect of Mu'tazilites or "separatists," who wielded great influence and shared the favor of the state until 849, when orthodox doctrines again held sway. The Koran, tradition, reason, custom, were pivots upon which both schools of law and of theology turned, but although the schools were many not all gave rise to special sects that had any lengthy existence.

The sect of the Mu'tazilites might have attained a much wider activity had not Ash'ari (873-935) in his 40th year changed from rationalist to orthodox and founded a scholastic theology of his own which was effective. Holding a mediate position between extreme views on most points, his platform became dominant among the Shafites. He asserted that God's attributes cannot be compared to human attributes. As to free will, he maintained man's responsibility, if denying his power. Despite occasional attacks and persecutions, this theology made its way East and West and is the prevalent system. The system of al-Matridi, a Hanifite (d. 945), is its only active opponent to-day, represented by the creed of an-Nasafi, still used as a textbook in schools. Of the 13 points of difference between Mataridi and Ash'ari, Macdonald states that Muslim theologians admit seven are not much more than combats of words. Even Ghazzali, in most respects the greatest and most representative of Muslim theologians, accepted the system of

Ash'ari. Apart from the Wahabite movement in Arabia and the more recent Babism in Persia, Muslim orthodoxy has not been disturbed by new sects of any significance.

ABRAM S. ISAACS,

*Professor of Semitic Languages and Literatures, New York University.*

**MOHAMMEDANISM** is the term frequently given to the religion taught by Mohammed, but not used by the followers of that religion. Abu-Bekr, the first caliph, is reported to have said that it is not Mohammed, but the God of Mohammed, that we worship. The term by which the religion is known, wherever professed, is Islam, "submission to the will of God." Those who embrace Islam are called Muslim (frequently written Moslem), a participle of the same stem from which the verbal noun Islam is derived. Still another term, used as the equivalent for Moslem, is Mumin, "believer." It, likewise, is a participle, formed from the stem that gives rise to the word Imān, "faith."

Islam is the religion professed by Turkey, Syria, Palestine, Arabia, Persia, Asia Minor, Afghanistan, Baluchistan, Turkestan and the Malay Peninsula. India has more than 57,000,000 Moslems. China has about 25,000,000. Owing to the great difficulty of securing exact figures, an accurate statement is impossible. It is generally estimated at 175,000,000.

Islam is divided by the theologians into two heads: Imān, "faith," and Din, "practice." The separate articles of both heads are determined by the Koran, the Traditions or sayings of Mohammed and the decisions of the learned officials. Under Imān are given six cardinal points of belief, as follows: belief in God and his unity; belief in angels, and good and bad spirits; belief in the Koran and revelation; belief in the Prophet; belief in the resurrection and the judgment day; belief in God's absolute rule of the world. "There is no god but Allah, and Mohammed is his envoy."

As to Islam's conception of the deity He is above all omnipotent. No phrase occurs more frequently than this: "and He is powerful over all things." He is omniscient; "And He knoweth all things," is a phrase equally often met in the Koran. "With Him are the keys of the secret things; none knoweth them besides himself: He knoweth that which is on the dry land and

in the sea; there falleth no leaf but He knoweth it; neither is there a single grain in the dark parts of the earth, neither a green thing nor a dry thing but it is written in the perspicuous book." (Sura 6, 59). "He is the ever-living, eternal God." "God! there is no God but he; the living, the self-subsisting; neither slumber nor sleep seizeth him; to him belongeth whatsoever is in heaven or on earth." (Ibid.). He is, moreover, the creator of all things. "His is the kingdom of heaven and earth; he giveth life and he putteth to death; and he is almighty. He is the first and the last; the manifest and the hidden; and he knoweth all things. It is he who created the heavens and the earth in six days, and then ascended his throne." (Sura 57, v. 2). His word alone creates, "When he decreeth a thing, he only saith unto it, 'Be, and it is.'" (Sura 3, v. 4), cf. (Sura 11, v. 9). As a creator he works not as man works, "We created the heavens and the earth and whatever is between them, in six days, and no weariness affected us." (Sura 50, v. 37).

He is not only creator of all things, but ruler of all things, and protector as well. "It is he who causeth you to sleep by night, and knoweth what ye merit by day; he also awaketh you therein, that the prefixed term of your lives may be fulfilled. . . . He is supreme over his servants, and sendeth his guardian angels to watch over you, until, when death overtaketh one of you, our messengers cause him to die; and they will not neglect our commands. . . . Say, who delivereth you from the darkness of the land, and of the sea, when ye call upon him humbly and in private, saying 'verily, if thou deliver us from these dangers, we will surely be thankful.' Say, God delivereth you from them and from every grief of mind." (Sura 6, v.). His care is always assured to those who follow his way. "Say, my Lord hath commanded me to observe justice; therefore set your face to pray at every place of worship, and call upon him, approving unto him the sincerity of your religion. . . . A part of mankind hath he directed." (Sura 7, 28). "Whoever therefore shall deny Tagut (error) and believe in God, he shall surely take hold on a strong handle, which shall not be broken; God is he who heareth and seeth. God is the patron of those who believe; he shall lead them out of darkness into light." (Sura 2, v. 257).

Though he is the ruler of all things and may do as seemeth good in his sight, yet is he a just God, and punishes only where punishment is due. "We will appoint just balances for the day of resurrection; neither shall any soul be injured at all; although the merit or guilt of an action be of the weight of a grain of mustard seed only, we will produce it publicly; and there will be sufficient accountants with us." (Sura 21, v. 48). Those who suffer have gone astray or are being prepared for better things. "Every soul shall taste of death; and we will prove you with evil and with good, for a trial of you." (Sura 21, v. 36). Of those sorely tried it is said: "I have this day rewarded them, for that they suffered the injuries ye offered them, with patience; verily they enjoy great felicity." (Sura 23, 113). As he is a just God, every creature is responsible to Him, and must answer for his choice of good or bad, "Did ye think that we had created

you in sport, and that ye should not be brought again before us? . . . whoever, together with the true God, shall invoke another god, concerning whom he hath no demonstrative proof, shall surely be brought to an account for the same before his Lord." (Ibid. v. 117).

Though God is just, he is also merciful. "We do not lay upon any soul more than it can bear." (Sura 6, v. 153). Like the God of the Hebrews he puts off the evil day in the hope that man may repent. "If God should punish men for their iniquity, he would not leave on the earth any moving thing; but he giveth them respite unto an appointed time." (Sura 16, v. 163).

God's absolute decree is a separate article (the sixth) of Iman. Everything that has happened or that will happen has been already fixed by God. "Say, nothing shall befall us, but what God has decreed for us." (Sura 9, v. 51). "No soul can die unless by the permission of God, according to what is written in the book containing the determination of things." (Sura 3, v. 141). "He hath formed his creatures; and . . . determined them to various ends, and directed them to attain the same." (Sura 87, v. 2). Mohammed was no theologian, however, so there arose no question about God's decree and man's free will. His attitude to the question may be shown by a quotation from sura 4, v. 80: "If good befall them they say it is from God; but if evil befall them, they say; this is from thee, O Mohammed: Say, all is from God; but what aileth these people that they are so far from understanding what is said unto them? Whatever good befalleth thee, O man, it is from God; and whatever evil befalleth thee, it is from thyself."

There is one more aspect of the Moslem's belief in God that must not be neglected. It is the most important attribute of the deity, and its statement is found in sura 112: "Say, God is one God; the eternal God; he begetteth not, neither is he begotten; and there is not anyone like unto him." In sura 19, v. 91, we read: "They say, the Merciful has begotten issue. Now have ye uttered an impious thing." In Islam there is no Trinity; there is no Fatherhood; God has taken to himself no son; but is alone in his glory and power. Christ, to the Moslem, is a prophet. He was the word of God "conveyed into Mary." Islam, failing utterly to grasp the significance of Christ's life, could not accept the idea of his crucifixion. They have therefore found an end that they deem more worthy of a prophet, and in the Koran we read that one in the likeness of Christ was crucified.

Joined to the statement of the first great truth of Islam, "There is no god but God," is another statement considered by Moslems to be just as important; "and Mohammed is the envoy of God." Concerning his divine mission, Islam knows no doubt. He was the last and the greatest of all the prophets—"The seal of the Prophets." Of prophets, thousands are recognized by Islam; but there are six, only, deemed great enough to be the holder of a title; they are Adam, Noah, Abraham, Moses, Jesus and Mohammed. As a prophet, Mohammed announced himself to the world when he first recited the 96th sura: "Read in the name of thy Lord who hath created all things." He never claimed to be more than the envoy or

prophet of God, and as such only is he revered by the intelligent Moslem. His tomb at Medina is an object of veneration to the Moslem world and should be visited by every pilgrim. His intercession may be asked in prayer; for he was the friend of God. Five times every day Islam testifies to its faith in God and its veneration for the prophet. Every Moslem must believe in revelation, "that which is sent down." (Sura 2, v. 3). Beginning from earliest times, there have been numerous revelations, each of which was a law for mankind, till superseded by the next. So each of the six prophets mentioned was the recipient of a revelation. Mohammed's revelation, the Koran, is the only one not to be abrogated. It is distinctly the Word of God as revealed to Mohammed and is on a higher plane than the Traditions or inspired sayings of the prophet. It was inscribed on tablets in heaven from eternity. From time to time portions of it were given to Mohammed by the angel Gabriel.

The Moslem must believe, furthermore, in angels, of whom there are great numbers. They were created long before the world was and are of a finer material. Every believer has two recording angels; one for his good, the other for his bad deeds. The angels are charged with intercession for mankind. Certain angels preside over hell. Two important angels are Munkar and Nakir. There are four arch-angels: Gabriel, the angel of Revelation; Michael, the patron of the Israelites; Izrafel, who, on the last day, will blow the trumpet, and Azrael, the angel of death. Besides these angels there are the ginn, good and bad spirits, in whom Mohammed believed. Sura 72 states that a band of them once passed Mohammed and paused to listen to him. What they heard caused them to exclaim: "Verily, we have heard a marvelous discourse." Some of them are believers in Islam and perform all the duties that devolve upon the true believer. They may assume various forms and are so numerous that the pious Moslem, in performing the most trivial act, such as building a fire, is apt to exclaim "with your permission, ye blessed." By many it is believed that all ginn are to be destroyed on the last day; others believe there is to be a special place, outside of paradise, where such as have been believers may dwell.

In the immortality of the soul, resurrection, judgment, paradise and hell, the Moslem believes most firmly. During the first night after death, the soul remains with the body, so that it may be questioned by the two angels Munkar and Nakir. It is a question as to whether the Koran refers to this belief or not; but nevertheless it is fixed in Islam. When the angels have finished their examination, they depart, leaving the believer in peace; the wicked in torment. This is the Moslem Hades. In Sura 23, v. 99, speaking of unbelievers who have died, it is said: "Behind them shall be a bar until the day of resurrection." The word translated by Sale "bar" is the Arabic *barzakh*, and is explained by the native commentators as a partition between the living and the day of judgment, or as an intervening state between death and judgment. Generally speaking, it denotes the state of the departed soul and must be entered by all. When the trumpet is blown on the last day all must appear. Mention of this day is very often made in the Koran, especially in

the earlier suras. It is the one subject of suras 75, 81, 82, 83 and 84. On this day all actions shall be weighed. "Those whose balances shall be heavy with good works shall be happy; but those whose balances shall be light are those who shall lose their souls and shall remain in hell forever." (Sura 23, v. 104). This great day the coming of which is known to God alone, is to be ushered in by certain signs, divided into the "lesser" and the "greater." Of the former there are eight, such as decay of faith, turmoils, wars, etc.; of the latter there are 16, the sun will rise in the west; the Antichrist will appear; Jesus is to come to earth, embrace Islam and slay the Antichrist. The last trial of this day is to be the crossing of the bridge Sirat, finer than a hair and sharper than a sword. Still, the believer shall cross in safety while the wicked fall to the gulf below. Should any who have professed Islam, yet lived wicked lives, be consigned to hell, they are not to remain there forever; but will be gradually purified and released. To the Moslem, hell is for the followers of other religions.

In paradise the Moslem is to enjoy all those things which to the mind of the desert Arab seemed most desirable. Here are gardens, trees ever green, rivers ever flowing, beautiful maidens, appetites that, so far from being satiated, increase as the delights are enjoyed. Here, too, he shall always see the face of (his) God and praise him, to whose mercy he owes his bliss; for his works alone are not enough to assure him entrance.

Islam is not, however, a religion of faith only; for there are certain institutions, constituting Din, or religious practice, the performance of which is obligatory. Prayer, almsgiving, fasting and the pilgrimage are duties that tax the Moslem to no small degree. Prayers are to be made to God five times every day, and are to be made with the utmost decorum. Preparatory to these prayers there are certain ceremonies of purification, consisting of ablution, either partial or covering the entire body; for the idea of an unclean person in the presence of God is intolerable to the Moslem. To facilitate these ablutions, every mosque is provided with a tank, whence issue many small streams of water. Should the worshiper be praying where there is no water, he may use sand or dust. As he ends this ceremony he is to testify that "There is no god but Allah, and Mohammed is his envoy," following this by reciting sura 97. Should the worshiper be conscious that he is clean, he may omit the ceremony. He then assumes a certain position, facing Mecca, and states softly that he intends to perform so many inclinations, following this by reciting the first sura. After this other expressions of praise are used. Though prayer is frequently mentioned in the Koran, the five periods at which it is enjoined are nowhere mentioned together. These periods are morning, noon, afternoon, sunset and night. The approach of these hours is heralded by the muezzin, who, ascending the minaret of the mosque, cries out: "Allah is most great (four times); I testify that there is no god but Allah (twice); I testify that Mohammed is the envoy of Allah (twice); come to prayer (twice); come to security (twice); Allah is most great (twice); there is no god but Allah." Prayers may be said wherever the believer happens to be at the time; but

on Friday they should be said at the mosque, where a sermon is also delivered.

Almsgiving is a very important duty in Islam. The Koran makes frequent mention of it, enjoining it in most emphatic terms. "O true believers, bestow alms of the good things which ye have gained, and of that which we have produced for you out of the earth, and choose not the bad thereof to give it in alms, such as ye would not accept yourself." (Sura 2, v. 269). "If ye make your alms to appear, it is well; but if ye conceal them and give them unto the poor, this will be better for you, and will atone for your sins." (Ibid. 272). How Mohammed considered alms may be seen from several passages of the Traditions, as quoted by Hughes: "Your smiling in your brother's face is alms; assisting the blind is alms." The Koran distinguishes between legal and voluntary alms; but this distinction has been done away with to a great extent. The necessity of giving, however, remains and alms are given regularly by those who neglect many of the other duties. In the early days of Islam legal alms were collected by officials appointed for that purpose; but their bestowal now is left to the individual conscience.

Fasting was considered of great importance by Mohammed, as thereby atonement might be made, and at the present day many who neglect their daily prayers perform all the duties of the fast. The month of Ramadan was chosen for the great fast, because in it revelation came to Mohammed. Throughout this month, during the entire day, drinking, eating, smoking and many other indulgences are forbidden. When night comes, however, restrictions are removed till the next day. This fast is very severe when it falls in summer (the year being lunar, each month passes through all the seasons) and many exemptions are provided for those unable to undertake its arduous duties. Other fasts, meritorious, but not obligatory, are also in favor with Moslems. The object of these fasts is not altogether concerned with the mortification of the body; the heart is to fast; it must abstain from worldly matters and commune with God.

Once at least in his lifetime the Moslem must make the pilgrimage to Mecca. "We appointed the holy house of Mecca to be a place of resort for mankind, and a place of security; and said, Take the station of Abraham for a place of prayer; and we covenanted with Abraham and Ismael, that they should cleanse my house for those who should compass it, . . . and those who should bow down and worship there." (Sura 2, v. 119). "And it is a duty toward God, incumbent on those who are able to go thither, to visit this house." (Sura 3, v. 91). Some further regulations are found in sura 2, v. 194, and in sura 22. Trade may be indulged in while on the pilgrimage, and sura 5, v. 2, gives direction for women who contemplate the performance of this duty. When the pilgrim nears Mecca he bathes and puts on the Ihram, pilgrim's robe, and advances to the city. Here there are certain ablutions to be performed before kissing the Black Stone. He must then encircle the Caaba, the temple, seven times; kissing the Black Stone each time. After other prayers and ceremonies he must run between Mount Al-Safa and Mount Al-Marwa seven times, with stated prayers. Later he must visit the Valley of Mina and Mount Arafat where

more prayers are performed. On the 10th day he proceeds to Mina and casts stones at three pillars which are set up there, seven stones at each. After this very ancient custom there is a sacrifice which ends the pilgrimage. The pilgrim may then be shaved and resume his usual clothing. He should, however, visit Medina and do homage at the tomb of Mohammed.

Though not reckoned as one of the pillars of Islam, still the obligation to wage holy wars has been so firmly held that it deserves mention here. In early days every Moslem looked forward to a world-wide conquest and by means of these holy wars expected to bring all countries under the banners of Islam. To a conquered country the terms were: Embrace Islam, pay tribute or die. These were harsh terms, but much of their severity is accounted for by the early history of Islam. Broken oaths of allegiance and unprovoked attacks are responsible, to a large extent, for Mohammed's uncompromising attitude. The Koran does state itself clearly on this point, yet no precept found there, when "taken with its context, can justify unprovoked war." At the present day a far more liberal policy is preached toward unbelievers and the subject is much debated by the learned in Islam.

Among the prohibitions of the Koran, the most important are those concerning wine and gambling. "They will ask thee concerning wine and lots; answer in both there is great sin and also some things of use unto men; but their sinfulness is greater than their use," and suras 2, v. 216; 5, v. 92, treat of the same. These verses are held by the Moslem to be an absolute prohibition. There might be, however, some doubt as to that if the verses alone and not their traditional interpretation were considered. Another prohibition of the Koran is murder. When one believer kills another intentionally he is to remain in hell forever. (Sura 4, v. 96). From this fate, however, popular belief rescues him. Should the killing be by accident, there are certain expiations that may be made. There are also many prohibitions in regard to eating, the most important of which is that in regard to swine-flesh. (Sura 5, v. 4). Such flesh as is eaten must be from an animal killed in a prescribed manner. Laws of marriage, divorce, testaments and many other civil and criminal laws are founded on the Koran and the Traditions. Mohammed founded not only a religion but a social system as well, wherein the religious and the political life are inseparable. This is the unique feature of Islam.

Mohammed is said to have told his followers that after him 73 sects would arise. His prophecy has been more than fulfilled. It is impossible to give more than a synopsis of a few of the more important divisions of Islam. The two great divisions of sectarian Islam are the Sunnites and the Shiites. Compared with the Sunnite, the Shiite is a small sect, numbering about 15,000,000, while the former has about 145,000,000 adherents. The Shiites believe Ali to have been the legitimate Caliph or Imam, that is, successor of Mohammed, and consequently reject Abu-Bekr, Omar and Othman. Ali, by his double relationship with the Prophet — he was cousin and son-in-law — as well as by reasons deduced from the Koran, and by traditions assigning him the appointment at the

hands of Mohammed himself, should have been Imam. When Omar died, Ali was offered the succession, but as he could not satisfy his opponents that he would rule in accord with their wish he did not receive it till the death of Othman. Ali, however, was soon murdered and his son Hasan abdicated in favor of Muawiyah on condition that he might resume his office at Muawiyah's death. Yazid, however, cheated Hasan of his rights and here starts the Shiite schism. They profess allegiance to a line of 12 Imams, beginning with Ali and ending with Al Mahdi, who disappeared, but is to return. In the meantime they receive religious and legal decisions from a class of learned men, called Mudjtahids, a class of authorities not recognized by the Sunnites except in the case of the founders of the four orthodox Sunnite schools. There are numerous subdivisions of the Shiites, but on certain points they agree. The Shiites also observe the ceremonies of Moharram in commemoration of Hasan and Hosen, who were sons of Ali and were both murdered. Their memories are sacred to the Shiites. They differ from the Sunnites in that they credit the fire worshipers with the possession of an inspired book or revelation. In the ritual and civil laws also many differences are found. They have a large collection of traditions, a fact often ignored by scholars, misled by the Sunnites' claim to be the Traditionists par excellence.

The Sunnites acknowledge the first four caliphs to have been the rightful successors of Mohammed. They are divided into four orthodox sects or legal schools, the first of which was founded by Abu Hanifa. This Abu Hanifa was a pupil of the sixth Imam of the Shiites; but separated from him to form the school of his name that now predominates in Turkey, central Asia and northern India. The second of these schools, that of Ash Shafia, prevails in southern India and Egypt. The third school, that of Malik, has its home in Morocco and Barbary. The last school, that of Ahmed ibn-Hanbal, is found in East Arabia and portions of Africa. The term *Sunni*, which they apply to themselves, is an arrogant title. It signifies "one who is on the path." They claim that they receive the six authentic books of tradition.

From the school of Ahmed ibn-Hanbal sprang the sect of the Wahhabites, who are named after their founder's father, the founder himself being named Mohammed. This Mohammed, born in Arabia, in the early part of the 18th century, having seen, in the course of his travels, that Islam had departed from its primitive faith, determined to restore to the religion of Mohammed its early purity. His zeal as a reformer received some temporary setback and he soon became the warrior-prophet. Many converts were made by his missionaries, and the movement grew till Turkey feared for her own safety. In 1803 Mecca, and a year later Medina, was captured. The political power of the Wahhabites was soon destroyed, however, though the principles are still a force in Islam. In India, too, the movement met with a similar fate.

The tenets of the Wahhabites are, practically, those held by the early Moslem. They arrogated to themselves the name of Unitarians, stigmatizing other Moslems as polytheists, inasmuch as the doctrine of the eternity of the

Koran meant two eternal beings, therefore, two gods. The reverence paid to saints and their tombs aroused to a high degree the antagonism of the Wahhabites. Even the tomb of Mohammed receives no reverence from them, and when they captured Medina, all the rich ornaments were stripped from this sacred spot.

Early in the history of Islam there arose a set of free-thinkers, whose theories are held at the present day. They are known as the Mutazalites and were founded by a Persian, Wasil ibn-Ata, who separated from the school of Hasan al-Basri. The Mutazalites hold that man is the governing factor in his own acts, and is perfectly free to choose; predestination being thus abolished from their tenets. They deny the eternity of the Koran, as well as the attributes of God, believing that each attribute would be a separate, eternal quality, and that, therefore, the unity of God would be destroyed.

Mokanna, "the veiled," is an interesting figure in the history of Islam, owing to his appearance in Moore's 'Lalla Rookh.' This fanatic proclaimed himself God incarnate and taught that religion consisted in faith, not works. He sent out many missionaries and quite a force collected under his banners. At the advent, however, of the caliph's forces, which were sent to crush him, he deserted his followers and finally committed suicide to escape capture. Persian and Indian sources are responsible for many of his doctrines. He had secret followers for many centuries after his death.

Hasan ibn-Sabah, founder of the order of the Assassins, is a figure well known in history, owing to his connection with the Crusaders. He was at first an adherent of another sect and taught the doctrines of that sect throughout Arabia and Persia; but having won the confidence of a powerful prince, he gained possession of a fortress in Persia. Here he constituted himself grand-master of an order with a large number of minor officials, repudiated many of the tenets of his sect and began to preach religious devotion and political assassinations. His followers were many throughout Syria and Persia and he soon announced himself as al-Mahdi, repudiated the Koran, and with it all moral laws. Under the title "Old Man of the Mountain," he became a terror not only to the Crusader, but to the Turk as well. They were finally overthrown. "Of these sects there are still scattered remnants in Syria and India, and as late as 1866 an English judge at Bombay had to decide a case of disputed succession according to the law of the Assassins."

There is a sect of Mystics in Islam known as the Sufis. They are Moslem in name only, for they deny the necessity of religion, though they admit that its practice is useful as a guide. Their chief doctrine is entirely pantheistic. God is all and is in all, consequently there is no good, no evil, only God. The only occupation of the Sufi is meditation, constant meditation; for by this he is made ready to return to God when his soul is released from captivity. They are divided into numerous sects, some of them believing themselves simply inspired of God, others believing themselves unified with God. Their belief, they claim, has always been professed. It obtained its chief hold in Persia, where it has stirred up much trouble. Though banished in 1797, "the whole country has been

so undermined by this insidious heresy that it can almost be said that Persia, throughout its whole extent, contains no real Moslem."

A few words may be added in regard to Islam's hope of a Messiah, Al-Mahdi, "the guided one." He is to come to restore the glory and power of Islam, and has been foretold by Mohammed, in many traditions. According to the Sunnites, he is still to come; but the Shiites believe he has already appeared in the person of the 12th Imam, who having disappeared for a time is to return. Many have announced themselves as the promised Mahdi. One, after proclaiming himself in 1881 as Mahdi and founding in the eastern Sudan his empire, was overthrown at Omdurman in 1898 by an Anglo-Egyptian army.
