PROCONSUL and **PROPRÆTOR**, functionary of the ancient Roman Empire, to whom the administration of the provinces was entrusted; proconsul or proprætor being one whose term of office had expired as prætor or consul. The first consul who received the title of proconsul, was Q. Pubilius Philo in 327 B.C. This was done in order that he might conclude a campaign successfully begun in southern Italy. It was afterward provided by a law of C. Sempronius Gracchus that, at the consular and prætorial elections the senate should distribute the provinces into two consular and six prætorial provinces, for which the consuls and prætors should cast lots or divide them among themselves by agreement, a few days after their entrance upon their term of office, on the expiration of which they took the provinces allotted them. But in 55 B.C. it was provided by a decree of the senate that no consul or prætor should enter on the government of a province till five years after his surrender of office. As the number of provinces increased, proconsuls were appointed who had not previously held the office of consul. The duties of proconsuls or proprætors were the administration of justice, the supervision of provincial affairs, and the command of the troops. They were assisted in their duties by quæstors and legates. Within 30 days after his return to Rome the provincial governor was bound to make a report of his government. The Lex Julia in 61 B.C. further required that a copy of his report (*rationes*) should be deposited in the two chief cities of his province. He was liable to impeachment for extortion, peculation or embezzlement of the public money or for abuses in regard to the army. Nowithstanding these precautions the provinces were subjected to various oppressions and exactions. From the time of Augustus the government of some provinces was taken out of the hands of the proconsuls and proprætors, and entrusted to legates called procurators, or stewards of the Imperial household, who governed under the immediate direction of the emperor. See PROVINCE; PROCURATOR.

PROCOPIUS, prō-kō'pĭ-ŭs, Byzantine historian: b. Cæsarea, Palestine, about 500 A.D.; d. Constantinople, about 565 A.D. After practising as a rhetorician and advocate at Constantinople for a short time he brought himself so much into public notice that in 527 Belisarius made him his legal adviser and private secretary. He found abundant opportunity for seeking the making of history at first hand, for he accompanied Belisarius and counseled him on his most important campaigns. He was with him in Italy, Africa and Persia. About 542 he returned to Constantinople. The emperor Justinian made him senator and in 562 præfect of the city. He is the historian in chief to the reign of Justinian, to which his three most important works were devoted. These are the ‘History of the Wars’ (Historiæ) in eight books, the first two relating to the Persian War, the two following to the war with Vandals, and the rest to the Gothic War; the 'Secret History' (Anecdota), a secret and more personal history supplementing the more formal 'History'; the 'History of the Edifices, built or repaired by Justinian' (Ctismata). Doubt has been thrown on the connection of Procopius with the 'Anecdotes.' They are the repository of the scandals of Justinian's reign, filled with accusations, often of a ridiculous and improbable nature against Justinian and Theodora. On the other hand the histories are of great value, characterized by accurate personal observation and truthful presentation of conditions. The best edition of the complete works is that contained in Dindorf's 'Corpus Scriptorum Historiæ Byzantinæ' (Bonn 1833–38). A more recent edition is that published by J. Haury, 'Procopii Cæsariensis Opera Omnia' (3 vols., Leipzig 1905–13). The publication of the original Greek text with an English translation by H. B. Dewig has been begun as part of the Loeb Classical Library under the title 'Procopius' (Vol. I, New York 1914; Vol. II, New York 1916). Consult Dahn, F., 'Prokopius von Cæsarea' (Berlin 1865); Haury, J., 'Procopiana' (Augsburg 1891); 'Zur Beurteilung des Geschichtschreibers Prokopius von Cæsarea' (Munich 1896–97).

PROCOPIUS, Andrew, Hussite chief: b. about 1380; d. Böhmisch-Brod, 30 May 1434. He was distinguished as Procopius the Great, or the Bald, from as contemporary at times associated with him known as Procopius the Lesser or Prokupek. He received a good education, traveled extensively and upon his return entered the priesthood, receiving the tonsure from which was derived his nickname, the Bald. He fought with the Hussites under Ziska, and in 1425 after Ziska's death was chosen commander of the Taborites, the main division of the Hussites, and quickly made himself master of a larger part of Bohemia. Defeating the German troops at Aussig in June 1426, he burned that town and soon after drove the Austrians across the Danube. Burning and laying waste large portions of Austria he led his bands toward Silesia; defeated a German army near Mies (1427); and in the next two years ravaged Silesa, Hungary and Saxony. The bands under the leadership of Procopius had by this time made the name of Hussites a terror throughout the provinces through which they pursued the armies of the Emperor Sigismund. Strife, however, ensued between the extremists, and the more moderate division known as the Calixtines, who in 1433 accepted the terms offered by the Roman Catholics. In a factional fight between the two parties Procopius was killed. In the same battle perished Procopius the Lesser, leader of a section of the Hussites called the Orphans, which had co-operated with the Taborites since 1427. Consult Sand, Georges, 'Procope le Grand' (in Œuvres illustrées,' Vol. I, Paris 1855); Wolf, J. H., 'Leben der beiden Prokope' (Prague 1784).

PROCRUSTES, prō-krŭs'tēz, Attic robber, surnamed Polypemon of Damastes. He possessed a bed upon which he forced his guests to sleep, and if they were too tall to fit it he had their limbs chopped off, whereas, were thev too short he had them stretched. The monster was outwitted by Theseus, who made him suffer of the same bed and slew him at Erineiis. The "bed of Procrustes" has thus become a proverbial expression. Another version represents him as having two beds, one short and one long, the first for tall visitors and the second for short ones. Consult Plutarch, 'Lives' (in 'The Loeb Classical Library,' Vol. I, London and New York 1914).

PROCTER, prŏk'tėr, **Adelaide Anne,** English poet, daughter of Bryan Waller Procter (q.v.): b. London, 30 Oct. 1825; d. there, 3 Feb. 1864. Her first verses were published in the 'Book of Beauty' in 1843. In 1853 she began to contribute to *Household Words* under the pseudonym "Mary Berwick," and attracted much attention, gaining in particular the favorable notice of Dickens, who did much to aid the young poet. While her work is not great it is marked by deep feeling and tenderness. Her poems with few exceptions first appeared in either *Household Words* or *All the Year Round*. She became a Roman Catholic in 1851. In 1859 she was appointed by the National Association for the Promotion of Social Science a member of a committee to consider new ways of providing employment for women, having always been interested in social questions affecting women. Her collected poems were published under the title 'Legends and Lyrics' (1858), the 10th edition of which (1866) contains a biographical sketch of the author by Charles Dickens. Many of her poems have received a musical setting, the most famous being 'The Lost Chord,' which was set to music by Sir Arthur Sullivan.

PROCTER, Bryan Waller, "BARRY CORNWALL," English poet: b. Leeds, 21 Nov. 1787; d. London, 5 Oct. 1874. He was educated at Harrow, subsequently studied law in London, and in 1831 was called to the bar of Gray's Inn. For many years he held the office of commissioner of lunacy, resigning in 1861. He had a particularly amiable disposition and a wide acquaintance among literary men of his day, being especially friendly with Leigh Hunt and Charles Lamb. His first appearance in literature was in 1819, when he published 'Dramatic Scenes and Other Peoms,' under the pseudonym of "Barry Cornwall," which he afterward retained. Later works were 'A Sicilian Story' (1821); 'Marcian Coloma' (1820); 'Mirandola' (1821), a tragedy performed with great success at Covent Garden; 'The Flood in Thessaly' (1823); 'English Songs and Other Small Poems' (1832). His prose includes 'Effigies Poeticæ, or the Portraits of the British Poets' (1824); 'Life of Edmund Kean' (1835); 'Essays and Tales' (2 vols., Boston 1853); 'Charles Lamb; a Memoir' (1866). He will be longest remembered as a song writer, but even so his work has been somewhat overrated. He edited 'The Works of Ben Jonson, with Memoir' (1838); 'The Works of Shakespeare, with Memoirs and Essay on his Genius' (1843); 'Essays of Elia, with a Memoir of Lamb' (1879), and together with J. Foster 'Selections from Browning' (1863). Consult 'Bryan Waller Procter, an Autobiographical Fragment and Biographical Notes' (ed. by Coventry Patmore, 1877).

PROCTER, John Robert, American civil service reformer: b. Mason County, Ky., 16

March 1844; d. Washington, D. C., 12 Dec. 1903. He was educated at the University of Pennsylvania, but left there to join the Confederate army in 1863 and served until the end of the war. In 1873 he became assistant in the Kentucky geological survey, and in 1880 State geologist. In this office he was brought into contact with the spoils system, to which his opposition was so uncompromising that he finally lost his position in 1893. In the same year, however, he was appointed president of the Civil Service Commission, a post which he held till his death. His criticism of the spoils system was based not only on its evil moral and social effects, but also on its absurdity as a method of conducting business and this view he constantly presented most effectively. His work as president of the commission was the means of increasing the effectiveness of the civil service, and of gaining for it recognition in political life. He served as a member of the Jury of Awards at the Chicago World's Fair and was a frequent contributor to magazines and journals on geologic, economic and political subjects.

PROCTOR, prŏk'tŏr, **Alexander Phimister,** American sculptor: b. Ontario, Canada, 27 Sept. 1862. Soon after his birth his parents moved to Colorado where he was educated, studying later in New York art schools. He was the pupil of Puech and Ingalbert at Paris, and was awarded the Rinehart Paris scholarship. He has been a frequent exhibitor at expositions and has been awarded the following medals: Designers Medal, Chicago Exposition, 1893; Gold Medal, Paris 1900; Gold Medal, Saint Louis 1904; Gold Medal, Panama Pacific Exposition 1915. In 1904 he was made a member of the National Academy. Most of his works are representations of wild animals of which he has made a very close study by spending since early youth much time in hunting on the western plains and mountains. As a producing sculptor and as a critic of sculpture his reputation is high and he was appointed a member of the sculpture jury at the Paris Exposition of 1900 and at the Pan-American Exposition of 1901 at Buffalo, and a member of the New York Art Commission in 1903. Among his works were the quadriga which he furnished for the United States pavilion at the Paris Exposition of 1900 and which was much admired. Others of his sculptures may be seen in the parks of New York, Denver and Pittsburgh. The lions on the McKinley Monument in Buffalo were designed by him. Other works by him are in the Saint Louis Art Gallery and in the New York Metropolitan Museum of Art. Consult Nelson, W. H. de B., 'Phimister Proctor: Canadian Sculptor' (in *Canadian Magazine,* Vol. XLIV, p. 495, Toronto, 1915); Taft, L., 'A. Phimister Proctor' (in *Brush and Pencil,* Vol. II, p. 241, Chicago 1898).

PROCTOR, Edna Dean, American poet: b. Henniker, N. H., 18 Sept. 1829. She was educated in Concord, has traveled extensively in Europe, and has achieved a considerable reputation as a poet. Her most notable poems are 'Heroes' and 'Shenandoah.' Among her works are 'Poems' (1866); 'Poems' (Boston 1890); 'The Song of the Ancient People' (Boston 1893); 'Mountain Maid and Other Poems of New Hampshire' (Boston 1900); 'Songs of America and Other Poems' (Boston 1905); 'The Glory of Toil and Other Poems' (Boston 1916). Her only prose work, 'A Russian Journey' was first published in 1872, but revised editions of it have been brought out in 1890 and 1899. She has also contributed to various magazines.

PROCTOR, Redfield, American politician: b. Proctorsville, Vt., 1 June 1831; d. Washington, D. C., 4 March 1908. He was graduated from Dartmouth in 1851, and from the Albany Law School in 1860. He practised law a short time and in 1861 entered the Federal army as lieutenant; was soon promoted major and was mustered out as colonel. After a few years' law practice he devoted himself to business, acquiring large interests in marble quarries in Vermont. He began political life as a Republican member of the lower house of the Vermont legislature, being first elected to that body in 1867, and again in 1868 and 1888; he was a member and president *pro tem.* of the State senate in 1874 and 1875; in 1876 he was elected lieutenant-governor, and in 1878 governor of the State. During his administration he brought about several reforms in the State finances and system of taxation. In 1888 he was chairman of the Vermont delegation to the Republican National Convention, and again in 1896. In 1889 he was appointed Secretary of War by President Harrison, and gave especial attention to the improvement of coast and border defense. In 1891 he resigned his secretaryship to accept the appointment to the United States Senate for the unexpired term of Senator Edmunds, resigned, and in 1892 was elected to the Senate for the six years' term. In 1898 and 1904 he was re-elected. In 1898 he visited Cuba to investigate conditions in the island, and on his return delivered a speech in the Senate in regard to the reconcentrados, which aroused the attention of the whole country. The facts presented by him were also influential in determining the policy of intervention in Cuba by the United States. Consult Proctor, W. L., and Mrs. W. L. Proctor, 'A Genealogy of Descendants of Robert Proctor of Concord and Chelmsford, Mass.' (Ogdensburg, N. Y., 1898); 'Redfield Proctor, Memorial Addresses' (in Senate Document, No. 764, 60th Congress, 2d Session, Washington 1909).

PROCTOR, Richard Anthony, English astronomer: b. Chelsea, 23 March 1837; d. New York, 12 Sept. 1888. He was educated at King's College, London and Cambridge, and began to read for the bar, but in 1863 took up with enthusiasm the study of astronomy and mathematics. In 1866 he was elected a Fellow of the Royal Astronomical Society, and in 1872 one of its honorary secretaries and editor of its publications. He resigned these positions in 1873 and made a lecturing tour in this country. As a lecturer he became at once popular, having in eminent degree the gift of lucid exposition. A second tour to the United States in 1879 and a tour to Australia were followed by a second marriage and his settling at Saint Joseph, Mo., in 1881. In the same year he founded at London *Knowledge,* a scientific weekly, which in 1885, became a monthly. In 1887 he moved to Florida. He did much to popularize astronomy. His works include 'Saturn and His System' (1865); 'Handbook of the Stars' (1866); 'Half-hours with the Telescope' (1868); 'Other Worlds Than Ours' (1870); 'Light Science for Leisure Hours' (1871); 'The Sun' (1871); 'Elementary Astronomy' (1871); 'The Orbs Around Us' (1872); 'Essays in Astronomy' (1872); 'The Expanse of Heaven' (1873); 'The Borderland of Science' (1873); 'The Moon' (1873); 'The Transit of Venus' (1874); 'Our Place among Infinities' (1875); 'Myths and Marvels of Astronomy' (1877); 'The Universe of Stars' (1878); 'Flowers of the Sky' (1879); 'The Poetry of Astronomy' (1880); 'Easy Star Lessons' (1882); 'Familiar Science Studies' (1882); 'Mysteries of Time and Space' (1883); 'The Great Pyramid' (1883); 'The Universe of Suns' (1884); 'The Seasons' (1885); 'How to Play Whist' (1885); 'Other Suns Than Ours' (1887); 'Half Hours with the Stars' (1887).

PROCTOR (Lat., *procurator*), one who acts on another's behalf. It has in England these special significations: (1) In the convocations of the two ecclesastical provinces, Canterbury and York, respectively, the official who represents the lower clergy and the capitular bodies of cathedral and collegiate churches; (2) a person who manages another cause in an ecclesiastical court or in a court of admiralty; owing to changes in the administration of law, made in 1873 and 1875, the business formerly confined to proctors may now be conducted by solicitors; (3) in the universities of Oxford and Cambridge, two proctors in each are charged with the duty of preserving the peace and repressing disorder among the students; to this end they are empowered to inflict summary punishment and are assisted by a number of pro-proctors and special constables. The rights and duties of the proctors are more extensive at Oxford than at Cambridge, inasmuch as at Oxford they are ex officio members of all important committees and supervise all business transactions of the University. Both at Cambridge and at Oxford they are elected by the officials of the several colleges.

PROCTOR, Vt., village in the township of the same name, Rutland County, five miles northwest of Rutland on the Rutland Railroad. Some of the largest marble quarries in the world are located in the district and there are marble finishing works. Pop. township, 2,871; village, 2,756.

PROCURATOR, among the ancient Romans, an agent, steward, or overseer of an estate; at a later period the title of a provincial officer (see PROVINCE and PROCONSUL), who managed the revenue. In some of the small provinces, or in a part of a large province, the procurator discharged the office of a governor, and had the power of punishing capitally, as was the case with Pontius Pilate in Judæa, which was attached to the province of Syria. Procurator, in monasteries, is the conventual to whom is entrusted the care of the temporal concerns. *Procurator di San Marco* was the title of the chief officers or senators in the Venetian republic. Besides the nine actual *procuratori*, from among whom the doge was chosen, there were also many titular procurators, who paid a great sum for his title, which was much coveted by the Venetian patricians on account of the rank it conferred.

PROCURATOR-FISCAL, the public prosecutor in criminal cases which come up in Scotland before the sheriff, magistrates, or justices of the peace belonging to his district. He also performs duties corresponding to those usually performed by coroners. Only when the public interest is concerned must he originate a prosecution; and when complaint is made by a person in a case in which the private interest of the complainant is rather at stake than the public interest, the procurator-fiscal must merely give his concurrence to the prosecution, and not institute the proceedings. He may, however, act as the complainant's agent; but even when he does so, if he only gives his concurrence, he is not liable to an action for malicious prosecution.

PRODICUS, Greek sophist: he came from Julis in the island of Ceos and was a contemporary of Socrates. He is known only as the author of an apologue of 'Hercules and the Two Paths,' quoted by Xenophon, in which the young hero chooses the hard path of duty and turns his back on the flowery but dangerous path of pleasure. The Greek text of this work is to be found in 'Epicteti Euchridion' (pp. 99–107, Oxford 1804). There are also two English translations of it: 'The Choice of Hercules' (translated by Bishop Lowth, in Roach, J., 'Roach's Beauties of the Poets, etc.' London 1794); and 'The Judgment of Hercules' (translated by Layng, P., Eton 1748). Consult Conguy, E., 'De Prodico Ceio, etc.' (Paris 1857); Kleemann, A. R. von, 'Platon und Prodikos' (in 'Wiener Eranos,' p. 38, Vienna 1909); Welcker, 'Prodikos von Keos' (in 'Rheinisches Museum der Philologie,' Vol. I, pp. 1–39 and 533–545).

PRODUCER. See INTERNAL COMBUSTION ENGINE.

PRODUCTION, in political economy a division covering the source and progress of the creation of wealth as constituted in the production of articles having an exchangeable value; the word in this sense covering one of three divisions of which the others are distribution and consumption. The division deals with the process of production, circumstances favorable or unfavorable to it and the factors governing it, labor, land and capital. See POLITICAL ECONOMY.

PRODUCTION, Cost of. See POLITICAL ECONOMY.

PRŒTUS, prē'tŭs, in Greek mythology, king of Tiryns. According to Ovid he founded the kingdom after making peace with his twin-brother, Acrisius, who had driven him out of Argos. The tragic legend concerning him deals chiefly with the fate of his three daughters, the Prœtidæ. These, rendered mad by Hera or Dionysus, wandered through the Peloponnesus, in time communicating their frenzy to other women, so that they killed their children. One of the three sisters died, the other two were healed by the seer Melampus, who married one and was given a share in the kingdom, his brother, Bias, receiving also a share and marrying the other daughter.

PROFANITY. See BLASPHEMY; SWEARING, PROFANE.

PROFERT, *in law,* an exhibition of a record or paper in open court. When either party alleges any deed, he is generally obliged, by a rule of pleading, to make profert of such deed; that is, to produce it in court simultaneously with the pleading in which it is alleged.

PROFESSIONAL EDUCATION. See EDUCATION, PROFESSIONAL.

PROFESSIONAL AND TECHNICAL SCHOOLS. See EDUCATION, HIGHER; EDUCATION, PROFESSIONAL.

PROFESSIONAL WOMAN'S LEAGUE, The, an association founded and incorporated in New York in 1893, and composed of women engaged in the dramatic, musical, and literary professions. The dues are $7.50 per annum; the league holds a bazaar each year, gives occasional entertainments during the winter season and holds four regular meetings each month. Its headquarters are in New York City.

PROFESSOR, The, a novel by Charlotte Brontë, published in 1857. It was the first fiction that she produced but it failed to find a publisher until after her death. "The plot in itself is of no great interest," remarks Mrs. Gaskell, the biographer of Charlotte Brontë, but "she never excelled one or two sketches of portraits which she has given in 'The Professor,' nor, in grace of womanhood, ever surpassed one of the female characters there described." Consult MacDonald, F., 'Charlotte Brontë's Professor' (in *Cornhill Magazine,* n.s. Vol. XXXV, p. 519, London 1913).

PROFESSOR AT THE BREAKFAST TABLE, The, a work by Oliver Wendell Holmes (q.v.), first published serially in the *Atlantic Monthly* in 1859. It was published in book form in 1860 and has run since then into many editions. It furnishes a sequel to the well-known 'Autocrat of the Breakfast Table,' which it resembles in tone and construction. Consult Ives, G. B., 'A Bibliography of Oliver Wendell Holmes' (Boston 1907); Morse, J. T., Jr., 'Life and Letters of Oliver Wendell Holmes' (2 vols., Boston 1896).

PROFIT. See CAPITAL.

PROFIT SHARING, a method by which wage-earners receive a share of the profits of an industry in addition to wages. Strictly speaking, profit sharing implies that the bonus shall be given to workmen individually; but benefits and insurance, social and educational funds maintained out of the profits of a business are modified forms of profit sharing. Many systems of profit sharing also provide for the employees obtaining share in the capital stock on special terms, thus becoming part owners of the industry. Profit sharing differs from co-operation (q.v.), in that it is not democratic; both the initiative in establishing a system of profit sharing and the control of the industry rests with the employer. It is regarded, however, as a step toward co-operation. The International Congress on profit sharing in 1889 defined profit sharing as "an agreement freely entered into by which the employed receives a share of profits determined in advance." The arguments advanced in favor of profit sharing are: (1) Its justice; inasmuch as labor is equally necessary with capital to the welfare and success of an industry, it should justly receive a part of the profits; (2) its practical effect; it tends to interest employees in their work, to increase their efficiency and their care of property. There are two lines of opposition to profit sharing: (1) From the employers, who claim that it is unjust that labor should share in the profits, when it does not share in the loss or risk of the business; and that profit sharing does not necessarily result in increased efficiency; and (2) from the workmen who claim that their freedom is restricted, especially as in many instances a long term of employment and sometimes restriction of labor organization are involved in a profit-sharing system; and that they obtain no compensating share in the management or control of the industry. Profit sharing has been successful in many industries, especially where the labor is skilled and wages large in proportion to total cost of production; on the other hand, many attempts to establish a profit-sharing system have failed, owing sometimes to industrial depression, sometimes to a trial too short to give fair results and sometimes to change in management. In the United States between 1889 and 1896, 50 firms had made trial of profit sharing; in the latter year, only 12 continued it permanently and five had abandoned it temporarily; in 1900, there were 23 firms with a system of profit sharing, 12 of which had adopted it within the year 1899–1900. In 1916 there were in operation in the United States 60 industrial and mercantile establishments with profit-sharing plans.

France formerly outranked other nations in the number and importance of successful profit-sharing enterprises. Among the more important ones are Maison Leclaire (1842) (painter), the Godin Familistère at Guise and the Bon Marché (q.v.). France can still claim to have been the leader in the establishment of profit-sharing. In numbers, however, it is now outranked by Great Britain. In 1913 there were 141 profit-sharing plans in existence in the latter country, against about 115 in France in 1912. Other countries having establishments with profit-sharing plans of one type or another are Germany, Holland, Switzerland, Italy, etc. Among the most important profit-sharing establishments of the United States are the Nelson Manufacturing Company of Saint Louis, Mo., the Eastman Kodak Company of Rochester, N. Y., the Underwood Typewriter Company of New York City, the Ward Baking Company of New York City and Sears, Roebuck and Company of Chicago, Ill. The Nelson Company established its system in 1886, which, besides the direct sharing in profits by the employees, provides for the payment of sickness and accident benefits by the company as a part of the costs of the business; the employees are also encouraged to buy stock in the company. In 1896 an agreement was made by which the employees of the cabinet-making shop were to gradually purchase and take the management of that department; by 1902 they had sole control. The Proctor and Gamble Company introduced profit-sharing in 1887; the arrangement was that the employees should receive a share in the net profits in the proportion that wages bore to the whole cost of production. The fact that the employees were largely unskilled labor with low wages and received the new arrangement with indifference made the management of the system particularly difficult. An improvement was made by classifying the employees into four groups in regard to interest in work, excellence of work and care of machinery and tools; the best in accordance with this classification received double the regular dividend, the second group, including the greater number of the employees, the regular dividend, the third group one half the dividend, and the fourth none at all. Since then various other changes have been made so that this concern cannot be any longer called a true profit-sharing establishment. In 1903, the United States Steel Corporation adopted direct profit sharing for its more responsible employees and a system whereby any of its employees may acquire stock on easy terms and as long as they remain in the employ of the company, may receive a bonus of $5 a year extra for each share after the first five years. Many other important industrial concerns in the United States have introduced modified or limited profit-sharing plans, among them being the Ford Motor Company, the Studebaker Corporation, etc. The most exhaustive study of profit-sharing in the United States was published by the United States Department of Labor, Bureau of Labor Statistics, Bulletin No. 208, Miscellaneous Series No. 13 (Washington 1916). It also contains a very full bibliography of the very extensive literature on the subject. Consult Adams, H. B., ed., 'History of Co-operation in the United States' (in *Johns Hopkins University Studies in Historical and Political Science*, Vol. VI, Baltimore 1888); Adams, T. S. and Sumner, H. L., 'Labor Problems' (New York 1905); Aves, E., 'Co-operative Industry' (London 1907); Böhmert, V. PROGRESS, the advancement of the world, moral, mental and material, as exhibited in history. Physical science, which has so recently demonstrated the gradual improvement of material types in the animal and vegetable world, has compelled metaphysical speculation to conform its general principles to the axioms formulated by physical observation and experiment. The result of science, of historical inquiry, of inductive activity in every area of investigation may favor neither optimism nor pessimism. They have brought into philosophy a third term, and that is meliorism, a term employed to denote a doctrine so firmly based on fact that none can controvert it. Meliorism embodies the truth that as far as human experience and observation can extend there has been improvement in things, progress in the universe, advancement in the world. Pessimism becomes a contradiction in terms; for the physicist in his laboratory, the historian in his study, the sociologist in his inquiry among men, declares that things have been once worse than they are now, and that from the flower in the field to the beast in the stall, and from the beast in the stall to the working man, the ruler and the general condition of nations, things have been growing better. The lapse of centuries shows a sensible amelioration in the lot of humanity. The slave has been enfranchised, woman has been raised and enlightened, the rights of labor have been more and more recognized. These, however, are only social and political examples of that universal amelioration and progress by which a nebula is changed into a star, and a star into a peopled and conscious world. Meliorism is the principle that underlies all existence, organic or inorganic, and comprehends in its widely extending connotation the discovery of drugs that abolish pain, of economic institutions that diminish poverty, of intellectual institutions that make ignorance and incompetency more and more rare and of tolerance and enlightment which give more and more freedom to the creeds, tastes and idiosyncrasies of individual men. In whatever direction we look over the field of human activity we see this improvement manifesting itself, and the phenomena which are the basis of meliorism furnish the best argument for that hopeful optimism which, as many believe, alone can give the mind a philosophical creed that renders life tolerable.

Meliorism is the doctrine of the positivist, because it is no metaphysical system which interprets facts by *a priori* assumption; it is simply an induction from a summary of those facts which physical science has most recently set forth as the proud results of the newest, the most unbiased, and the most uncontrovertible deductions from experiment and observation, in the whole world of material, social and political phenomena. See MELIORISM.

PROGRESS OF POESY, The. 'The Progress of Poesy,' by Thomas Gray, was published, together with 'The Bard,' in a volume entitled 'Pindaric Odes,' printed at Horace Walpole's famous Strawberry Hill Press in 1757. Both poems are odes in the strict Pindaric form, consisting of strophe or turn, antistrophe or counterturn, and epode or stand, twice repeated. Gray has made the three corresponding parts of each of the three divisions identical in metrical form, thus giving the poems a symmetrical though complicated verse structure. In the piece under discussion Gray sings in exalted language first of the various sources of poetry, then of the power of harmony to lull the fiercer passions, to impart all graces of motion to the body, to compensate for the ills of life, and to arouse the mind to virtue. He then traces in scholarly fashion but always with the rapt "enthusiasm" of the ode, the progress of poetry from Greece to Italy and from Italy to England, describing in picturesque and suggestive language the three greatest English poets, who were his predecessors, viz.: Shakespeare, Milton and Dryden, alluding modestly to his own effort to wake the loftier tones of verse which have long been silent. The Pindarics were censured in their own time for their obscurity, and Gray was compelled to add explanatory notes. Even so they fell upon deaf ears. To-day they are recognized as indubitable classics, the carefully wrought work of a true poetic genius in whom learning and critical judgment go hand in hand with inspiration. Consult 'Selections from Gray' (edited by W. L. Phelps, The Athenaeum Press Series); 'English Poems of Gray' (edited by D. C. Tovey); essay on Gray by Matthew Arnold, 'Essays in Criticism' (2d series).

JAMES H. HANFORD.

PROGRESS AND POVERTY, a famous work by Henry George, written in 1877–79. The manuscript was declined by publishers, but finally D. Appleton and Company agreed to publish the book if the author would bear the cost of making the plates. The latter were made under the author's personal supervision in San Francisco. Before being shipped east, late in 1879, an 'Author's Proof Edition' of 500 copies was struck off. The first regular edition was brought out in January 1880. It soon went through many editions, both in the United States and England. It has also been translated into almost every modern language and it is claimed that more than 2,000,000 copies have been sold. The best recent edition is the 25th anniversary edition (New York 1916). The author seeks in this work to solve a problem and prescribe a remedy. The problem is: "Why, in the midst of a marvelous progress, is grinding poverty on the increase?" The remedy is to nationalize the land,— make it public property; leaving that already in use in the possession of those holding it, but confiscating the rent and abolishing all other forms of taxation. Though the principles established by the book were not altogether original, but more or less similar to those of the French economic school known as Physocrates (q.v.), they had never before received an equally lucid and popular treatment in the English language. They gave origin to the so-called Single-Tax movement (q.v.), a school of economic philosophy which has still many adherents. Consult Dixwell, G. B., 'Progress and Poverty: A Review of the Doctrines of Henry George' (Cambridge 1882); George, H., Jr., 'The Life of Henry George' (New York 1900); Longe, F. D., 'A Critical Examination of Mr. George's "Progress and Poverty"' (London 1883); Miller, J. B., 'Trade Organizations in Politics; also Progress and Robbery' (New York 1887); Stebbins, G. B., 'Progress from Poverty, etc.' (Chicago 1887); Taylor, E. R., 'Henry George, the Man' (in *20th Century Magazine*, Vol. VI, p. 13, Boston 1912); Toynbee, A., '"Progress and Poverty:" A Criticism of Mr. George' (London 1883).

PROGRESSION, *in mathematics,* a series or sequence of terms such that each quantity bears the same mathematical relation to the preceding. This relation may be either that of a difference or of a ratio; the first case is that of the *arithmetical progression,* the second that of the *geometrical series.*

In an arithmetical series each term is derived from the preceding by adding to it a constant, called the difference, which may have a plus sign or a minus sign, so that the series may either increase or decrease. In the accepted notation of the arithmetical progression, a is the first term, n the number of terms, d the difference, and l the last term. The value of the last term or of any (the nth) term may be determined from the formula, $l = a + (n-1)d$, which is merely a notational statement of the evident fact that the coefficient of d in any term will be less by one than the number of term, so that the nth term must be the sum of the first term and of the difference taken $(n-1)$ times. Letting s stand for the sum of n terms we may write in ascending or descending order:

$$s = a + (a+d) + (a+2d) + \ldots\ldots + (l-d) + l, \text{ or } s = l + (l-d) + (l-2d) + \ldots\ldots + (a+d) = a.$$

Adding these two equations we get the equation, $2s = (a+l) + (a+l) + (a+l) + \ldots + (a+l) + (a+l)$, or $2s = n\,(a+l)$, it being evident that the factor $(a+l)$ occurs n times in the second term of the preceding equation. The formula for the sum will then be $s = \frac{n}{2}\,(a+l)$. Hence, if three of data are given as to an arithmetical series, that is, three of a, d, n, l, s, the fourth (and the fifth, in general) can be found by the regular processes of algebra. Moreover the *arithmetical mean* between two numbers, being the mid-term in a series in which the number of terms is odd, will be one-half the sum of the two numbers.

A geometrical progression is a series in which each successive term is derived from the preceding by multiplying it by a constant, called the ratio, which may be less or greater than unity, so that the series may decrease or increase, or may be either plus or minus, so that the terms may be either similar or constantly changing in sign. In the accepted notation of the geometrical progression, a is the first term, r the common ratio, l the last (or nth) term and s the sum of the series of n terms. The formula for l, the nth term, since the exponent of r increases by one in each term will be $l = ar^{n-1}$.

To derive the formula for the sum of n terms, get the difference of the two self-evident equations,

$s = a + ar + ar^2 + \ldots + ar^{n-1}$, and
$rs = ar + ar^2 + \ldots + ar^{n-1} + ar^n$.

The difference is $rs - s = ar^n - a$, or $(r-1)s = a(r^n - 1)$. The formula then is $s = \frac{a(r^n - 1)}{r - 1}$ or $\frac{rl - a}{r - 1}$

With any three of the quantities given in these two formulas the other two may be derived by the use of quadratic equations (and in one instance of logarithms). An interesting variation of the problem of the summation of a geometric series is to find the value of a repeating decimal or repetend; as, for example, to find the value of .545454 .... (or $.\dot{5}\dot{4}$). Here $a = .54$, $r = .01$, and $n = a$. As n increases without limit, the value of l approaches zero; hence in the formula for the sum, $\frac{rl - a}{r - 1}$, rl becomes negligible, and the formula takes the form $\frac{-a}{r - 1}$ or $\frac{a}{1 - r}$. Substituting the values above we have $\frac{.54}{.1 - .01} = \frac{6}{.11}$.

A *harmonical progression* is a series in which the reciprocals of the terms form an arithmetical series. Any problem relating to harmonical progressions may therefore be treated as problems in arithmetical progression by the mere inversion of each term. See SERIES.

PROGRESSIVE PARTY, The. In the half century following the Civil War four serious disagreements threatened to break up the political homogeneity of the Republican party. In the order of their occurrence these were the Liberal Republican movement of 1872, the Mugwump party of 1884, the silver issue of 1890 and the progressive movement of 1912. The last named was by far the most serious and took its rise in the nineties, being at first largely an agrarian movement in the Middle West. Many prominent members of the Republican party felt that their party in the State and national legislatures was dominated to a dangerous degree by the great corporations, including the railroad companies. The progressive spirit first took concrete form in the energetic protests voiced by Western Republicans against the tariff legislation enacted by their party in 1890, 1897 and in 1909. The Populists and Democrats secured several seats in Kansas and Minnesota upsetting for the first time the solid array of Republican States. Friction was constant within the old party and in 1910 the strength of the new movement was apparent in Congress when the Progressives secured the election of the Congressional Committee on Rules by the House itself and discarded the old method of appointment of the committee by speaker. The elections of 1910 showed the older Republicans of the «stand pat» type that they might no longer treat the Progressives as a factious, troublesome and uninfluential minority. The Progressives, foremost among whom were La Follette of Wisconsin, Cummings of Iowa, Dolliver of Iowa and Beveridge of Indiana were now most aggressive and their influence was felt by both Democrats and Republicans alike. When the presidential campaign of 1912 approached the movement had acquired such momentum and strength that its leaders thought seriously of wresting the control of the Republican party from its old-time leaders, of dictating its platform and running the party machinery generally. No leader of sufficient strength as a presidential possibility having been developed within the ranks of the Progressive Republicans, the majority declared for Theodore Roosevelt, ex-President of the United States. Delegates instructed to vote for the latter as Presidential candidate were sent to the Chicago Convention of 18-22 June 1912. The supporters of President Taft, however, by controlling the National Committee, were enabled to pass upon all contested seats in the convention, with the result that the majority of the Progressive delegates were unseated and the remainder, led by Roosevelt, withdrew. The call for an independent convention signed by the ablest of the Progressives was soon sent forth, and on 5 August Theodore Roosevelt of New York and Hiram Johnson of California were unanimausly chosen as candidates for the Presidency and Vice-Presidency respectively.

The objects of the Progressive party, as set forth in the incorporation papers issued at Albany, N. Y., on 31 July 1912, are as follows: «To promote by educational means and political action, social and industrial justice and political liberty in the State and Nation; to advocate such legislation and administration as will secure to the people the effective control of all of the agencies of their government; to promote such legislation as is demanded by the modern industrial revolution, and which will secure a better and more equitable diffusion of prosperity; and to take such political action as will result in the election to public office of candidates who are in accord with the policies and objects of the organization; and further, to unite in a common movement all associations and organizations formed for like purposes throughout the State of New York and the United States of America.» The preamble of the platform of the Progressive party states that «The conscience of the people in a time of grave National problems has called into being a new party, born of the Naticn's awakened sense of justice.»

The Platform.— The main recommendations of the platform are as follows:

Preferential primaries for Presidential candidates; direct primaries for nomination of State and national officers; direct election of United States senators; the short ballot; the initiative, referendum and recall.

A more expeditious method of amending the Federal Constitution.

National jurisdiction on those problems which have expanded beyond reach of the individual States.

Social and industrial justice to be secured by legislation for the prevention of industrial accidents, occupational diseases, overwork, involuntary unemployment; the prohibition of child labor; the minimum wage for working women, with prohibition of night work for women and an eight-hour day for the same sex; one day's rest in seven for all wage-workers; the abolition of the convict contract labor system; protection against the hazards of sickness, irregular employment and old age through a system of social insurance; establishment of public continuation schools; the organization of workers, men and women, as a means of protecting their interests.

National regulation of interstate corporations through a strong Federal administrative commission.

The appointment of diplomatic and consular officers solely with a view to their special fitness and worth.

A protective tariff to equalize conditions of competition between the United States and foreign countries, both for the farmer and manufacturer, and which shall maintain for labor an adequate standard of living; an immediate downward revision; a non-partisan scientific tariff commission; the repeal of the Canadian reciprocity act.

Full and immediate inquiry into the high cost of living.

The improvement of the national currency system.

Conservation and national control of natural resources.

Development of our rivers, especially the Mississippi and its tributaries.

Use of the Panama Canal for American benefit, free from control of American railroads, and American coastwise trade to be exempt from tolls.

Public ownership of the natural resources of Alaska.

Equal suffrage to men and women.

Limitation of campaign contributions and expenditures.

Registration of lobbyists; prohibition of Federal appointees from holding office in state or national political organizations.

Restriction of the power of the courts.

Restriction as to injunctions and contempt proceedings in labor disputes.

Establishment of a Department of Labor.

The re-establishment of the Country Life Commission; development of agricultural credit and co-operation.

Establishment of a centralized National Health Service.

Revision of the patent law.

Power to value the physical property of railroads by the Inter-State Commerce Commission; abolition of the Commerce Court.

Construction of national highways; extension of the rural delivery system.

A graduated inheritance tax, and ratification of the income tax amendment to the Constitution.

Judicial and other peaceful means for settling international differences; an international agreement for the limitation of naval forces.

Protection of the rights of American citizenship at home and abroad.

Increased care of our immigrant population.

A wise and just policy of pensioning American soldiers and sailors and their widows and children.

Creation of a parcels post.

Extension and strict enforcement of the Civil Service Law.

Readjustment of the business methods of the national government.

Protection against worthless investments by means of new legislation creating governmental supervision.

The campaign that followed will not soon be forgotten by the generation that witnessed it. Great numbers of Republicans allied themselves with the new party and at the election, Roosevelt, the Progressive, received 4,126,020 votes, as compared with the 3,483,922 votes cast for Taft, the candidate of the stand patters. California, Michigan, Minnesota, Pennsylvania, South Dakota and Washington were carried by the Progressives, totalling 88 votes in the electoral college, while only Utah and Vermont, with eight electoral votes remained in the Republican column. The elections of 1914 showed a drift of the Progressives back to the old party, with the exception of California where a heavy Progressive majority was rolled up. By 1915 many Progressives felt that their party had served its purpose by defeating the reactionary elements of the old party and the breach was almost healed during the presidential campaign of 1916, in which Mr. Roosevelt, the leading Progressive, supported Mr. Hughes.

That perfect harmony did not prevail, however, was shown when the electoral vote of California was thrown to Wilson because of differences between Hughes and Johnson supporters in that State. The Congressional elections of 1918, however, showed that the breach had been closed and the Republican party again presented a united front to its doughty enemy, the Democrats. (See REPUBLICAN PARTY). Consult Anon., 'The Progressive Party, its Record from January to July 1916' (New York 1916); De Witt, B. P., 'The Progressive Movement' (New York 1915); Duncan-Clark, S. J., 'The Progressive Movement' (Boston 1913); McCarthy, C., 'The Wisconsin Idea' (New York 1914); Payne, G. H., 'The Birth of the New Party' (New York 1912); Roosevelt, T., 'Progressive Principles' (New York 1913); id., 'The Progressive Party' (in *Hibbert Journal*, Vol. XII, p. 1, London 1913); Walling, W. E., 'Progressivism — and after' (New York 1914); White, William Allen, 'The Old Order Changeth' (ib. 1913).

EDWARD C. CARRINGTON.

PROGRESSIVES, The. The term "Progressives," or more popularly, "Insurgents," was applied originally to those Republican Congressmen who contended that The House should itself elect the Committee on Rules, instead of allowing the Speaker to appoint the committee. These efforts, continued through several years, were finally successful on 17 March 1910, when such a change was ordered and the committee enlarged from five to ten members.

The name "Progressives" then assumed new importance and was applied especially to members of the Republican party in both branches of Congress who took issue with the administration of President Taft on several questions, notably the tariff, or who took what was generally considered advanced or "progressive" ground on other leading public measures. They have therefore added to their repertoire of policies and achievements, and been considerd sponsors for, or at least leading advocates of, many important public measures. The success of the Progressive movement not only almost reversed the political control of Congress in the elections of 1910, but paved the way for the formation of the Progressive Party (q.v.) in 1912, and largely shaped the Democratic platform in the same year.

PROHIBITION, used in a special sense, means the interdiction by law of the manufacture and sale of intoxicating liquors for use as beverages. Various forms of regulation or control over the liquor traffic have been adopted from time to time, but prohibition is the most drastic of them all. A prohibition wave swept over the Northern States about the middle of the 19th century, beginning in Maine, where the first State-wide prohibition law was enacted in 1846. A more stringent law was enacted in 1851 in the same State, and subsequently a prohibition amendment to the State constitution was adopted. Up to 1906, 18 States had adopted State-wide prohibition, but the wave had receded so that, by that year, only three States — Maine, Kansas and North Dakota — still remained in the prohibition column.

The recession of the prohibition wave indicated that the movement had proceeded too rapidly and that the goal must be won by slower steps. State-wide prohibition in many States undoubtedly was contrary to the wishes of a considerable minority of the people throughout the State and probably of a majority of the people in certain localities of the State. It is axiomatic that, in a democracy, sumptuary legislation is difficult to enforce unless supported by public opinion. Consequently, the line of least resistance in the movement for effective prohibition lay in introducing it only in those localities where the majority of the people favored it. This plan is carried out through what is known as local option, which is found in all but a few States where State-wide prohibition has not been adopted. Local option represents an effort to adjust the State liquor law to the sentiments and wishes of the majority of the people in particular localities. It enables such local majorities to vote out the open saloon from their neighborhoods. In States allowing local option, some or all of the various political subdivisions, such as townships, precincts, cities, villages and counties, are given the privilege of voting out the saloon. Local official bodies, such as city councils, are also given by law in some States the authority to license, regulate or prohibit the sale of intoxicating liquor within their jurisdictions. As a result of the spread of local option, a number of States not having State-wide prohibition are largely dry. Such dry territory in local option States, however, is only relatively dry. Where wet and dry townships or counties exist side by side in the same State, the introduction of liquor into dry territory from adjoining wet territory is difficult to prevent. Open sale of liquor in dry territory is usually prevented, but clandestine sales undoubtedly continue to be made to a considerable extent.

The comparative failure of local option in bringing about thorough prohibition has been one influence affecting the movement for the enactment of State-wide prohibition laws and constitutional amendments. Various prohibitory liquor laws of a partial character have been enacted in a number of States. Thus, we find laws prohibiting saloons to remain open on Sundays, election days, or after certain hours, and prohibiting the sale of liquor within a certain distance of educational and religious institutions. Congress has also prohibited the sale of liquor in the District of Columbia and on Indian reservations. Partial laws, however, have not been considered sufficient, and recently a new movement for State-wide prohibition has been under way, beginning with the enactment of the Georgia law in 1907. This movement spread especially in the South and West, so that, by the year 1918, more than half of the States had in force State-wide prohibitory liquor laws or constitutional provisions.

Dry States have experienced difficulty in enforcing their prohibition laws for various reasons. Too often they have depended largely on local officers to enforce the State law and such officers have frequently been influenced by anti-prohibition sentiment in their localities either to ignore the law or to enforce it in a very lax and inefficient manner. This difficulty has to some extent been avoided in a few States by the provision of special State machinery of enforcement. But, in North Dakota, an act authorizing the governor to appoint an enforcement commissioner to enforce the prohibition law was declared unconstitutional by the Supreme Court of the State on the ground that it violated the reserved right of the people to have such laws enforced by officers of their own selection. Difficulty in enforcing the State-wide prohibition laws has also been experienced on account of the inability of the States to prevent the introduction of liquor from wet States through the channels of interstate commerce, over which the States have no direct control. Congress, however, has done what it could to remedy this difficulty and to enable the dry States to enforce their prohibition laws. Thus, under the Wilson Original Package Act of 1890, all intoxicating liquor transported into any State was made, upon its arrival, subject to the operation of the laws of such State enacted in the exercise of its police powers. The Webb-Kenyon Act of 1913 prohibited the shipment from one State into another of intoxicating liquor intended to be used in any manner in violation of State law. The Webb-Kenyon Act is strengthened by a recent act of Congress prohibiting the solicitation of orders for liquor in dry territory by sending advertising matter through the mails and forbidding any person to order or cause intoxicating liquor to be transported in interstate commerce for beverage purposes into any prohibition State.

For some time the Prohibition Party, the Anti-Saloon League of America and other organizations have been working for national prohibition. The outbreak of the European War and the entrance of the United States into it strengthened their efforts and brought the movement to a head. In order to increase the efficiency of the fighting forces, it was made a punishable offense to sell intoxicating liquor to soldiers or sailors. Since the successful prosecution of the war depends not only on the efficiency of the fighting forces but also on that of the civil and industrial population, it was argued that prohibition should be extended to the nation. Accordingly a resolution was introduced in Congress proposing a prohibition amendment to the Constitution of the United States. In December 1917 this resolution passed Congress by the necessary two-thirds majority in both houses. The language of the proposed amendment is as follows:

"Section 1. After one year from the ratification of this article the manufacture, sale, or transportation of intoxicating liquors within, the importation thereof into, or the exportation thereof from the United States and all territory subject to the jurisdiction thereof for beverage purposes is hereby prohibited.

"Section 2. The Congress and the several States shall have concurrent power to enforce this article by appropriate legislation.

"Section 3. This article shall be inoperative unless it shall have been ratified as an amendment to the Constitution by the legislatures of the several States, as provided in the Constitution, within seven years from the date of the submission hereof to the States by the Congress."

In 1919 this proposed amendment had been ratified by 45 States. See PROHIBITION PARTY.

Consult Committee of Fifty, 'Liquor Problem in its Legislative Aspects'; Reinsch, P. S., 'Readings on American State Government' (Chap. 7, New York City); Anti-Saloon League Year Book; Franklin, F., 'Prohibition and the States' (*North American Review*, 1918, pp. 231-238).

J. M. MATHEWS.

PROHIBITION PARTY, The. When the Prohibition idea rose to prominence, prior to the Civil War, the idea of its support through political action was not wholly absent. When the Republican party was formed, it was by many regarded as the party of Prohibitionists, and James G. Blaine so speaks of it in one of his early editorials. Myron H. Clark was elected governor of New York in 1856, almost directly on the prohibition issue, and there was in that campaign in New York State an "anti-dramshop party." With the Civil War the prohibition question was largely pushed out of the public mind and, during the war or the years which immediately followed it, a large number of States which had adopted prohibition went back to the license policy. Further, the liquor power was organized by the revenue taxation policy adopted by the Federal government, and the brewer for the first time appeared as a political factor in American affairs. The result was that, when the temperance element of the country began to turn its mind again to the anti-alcohol reform, it discovered that a new condition existed in American politics and that by far the greater part of the political leaders of both parties were unwilling to give any toleration to the prohibition idea. This resulted in an agitation, which began in the Independent Order of Good Templars and centred chiefly around the Rev. John Russell, a Methodist clergyman of the State of Michigan, beginning as early as 1867 and culminating in 1869, in May of which year the Right Worthy Grand Lodge, in session in Oswego, N. Y., took action which resulted in the calling of a convention to consider the advisability of forming a political party upon the basis of the prohibition issue. The call was signed by residents of some 20 States and resulted in the meeting of a convention of about 500 people in Farwell Hall in Chicago, 1 Sept. 1869. There were representatives present from 20 States, by far the greater part of them people who had never before taken part in political affairs and few of them widely known. Perhaps the most famous individual among them was Gerrit Smith of New York State, who had been prominent as an Abolitionist and had been a member of Congress. One of the few remaining survivors, when this is written, is Col. John Sobieski, an exiled Polish prince, who served in the Federal army during the Civil War and against Maximilian in Mexico. Women sat in this convention on equal terms with men, probably the first political convention of history in which that was the case. The convention was by no means a unit in deciding to form a new party and its formation was decided upon by little more than a majority vote.

The basis of the action taken, as deduced from a study of the literature of the party, may be briefly stated as follows:

I. Since the government of this country is administered and must be administered by means of political parties, it is obligatory upon honest citizens so to associate themselves politically that the administration of government shall attain the ends for which government is ordained.

II. The legalization of the liquor traffic, which robs, debauches and kills a vast multitude of the citizenship of this nation, together with the innocent who upon them depend and the unborn who will follow them in life, is in contravention of the first duties and the fundamental principles of government and repugnant to every right doctrine of political science.

III. Therefore, and the more urgently since the existing legalization of such traffic presents an issue which overtowers in its importance all of the other issues of the age, it is the duty of honest citizens to associate themselves together in a political party pledged to the enactment and the enforcement of laws which shall take away from this traffic the protection of legality and shall place it under the ban of legal prohibition.

The Prohibition party first appeared at an election in Ohio, in the fall of the year when it was organized, and Republican-Prohibition candidates were voted for in both Maine and Minnesota that fall. In 1870 Prohibition tickets were nominated in six States and more than 20,000 Prohibition votes cast, not including 21,000 received in Massachusetts by Wendell Phillips, who, beside being the Prohibition candidate for governor, was also the candidate of the Labor party.

The first presidential election in which the Prohibition party appeared was in 1872, and from that time it has nominated candidates for every presidential election.

Much of the history of the party, so far as it is of general interest, may be best told in tabular form.

NATIONAL CHAIRMEN.

1869-72. John Russell.	1887-99. Samuel Dickie.
1872-76. Simeon B. Chase.	1899-1904. Oliver W. Stewart.
1876-80. James Black......	1904-12. Charles R. Jones.
1880-84. Gideon T. Stewart.	1912. Virgil G. Hinshaw.
1884-87. John B. Finch.	

PRESIDENTIAL CANDIDATES.

1872. James Black, Pennsylvania.
1876. Gen. Green Clay Smith, Kentucky.
1880. Gen. Neal Dow, Maine.
1884. Ex-Governor John P. St. John, Kansas.
1888. Gen. Clinton B. Fisk, New Jersey.
1892. Gen. John Bidwell, California.
1896. Joshua Levering, Maryland.
1900. John G. Woolley, Illinois.
1904. Silas C. Swallow, Pennsylvania.
1908 and 1912. Eugene W. Chafin, Wisconsin.
1916. Ex-Governor J. Frank Hanly, Indiana.

Of these men, six were lawyers; two, St. John and Hanly, had served their States as governors; one (General Smith) was an early governor of Montana; three (Smith, Dow and Fisk) were generals in the Federal army in the Civil War, in which St. John was also a colonel; and Bidwell commanded the militia of California during the Civil War. Smith also served in the Mexican War. Both Smith and Bidwell were members of Congress before joining the Prohibition party. Swallow was a clergyman, as was also Smith in the closing years of his life.

VICE-PRESIDENTIAL CANDIDATES.

1872. John Russell, Michigan.
1876. Gideon T. Stewart, Ohio.
1880. Henry A. Thompson, Ohio.
1884. William Daniel, Maryland.
1888. John A. Brooks, Missouri.
1892. James B. Cranfill, Texas.
1896. Hale Johnson, Illinois.
1900. Henry B. Metcalf, Rhode Island.
1904. George W. Carroll, Texas.
1908 and 1912. Aaron S. Watkins, Ohio.
1916. Ira Landrith, Tennessee.

The votes cast for the presidential candidates of the Prohibition party during this period are recorded as follows:

1872	5,607	1896	130,617
1876	9,737	1900	209,469
1880	9,678	1904	258,205
1884	149,772	1908	253,231
1888	249,918	1912	207,828
1892	263,480	1916	221,329

The party may be said first to have attracted general attention in 1884, when the wide popularity of John P. St. John, who had left the Republican party because of its refusal to adopt prohibition, first resulted in an appreciable party vote and when votes were first cast for the party in almost every State of the Union. The fact that the vote nearly doubled in the next election created some political apprehension; but it remained practically stationary in 1892, and in 1896, owing to a split in the party and its desertion by those Prohibitionists who advocated the free coinage of silver (among whom John P. St. John was a leader) the vote was cut in half. In 1900, however, under the leadership of Oliver W. Stewart and with John G. Woolley, who ranked among the greatest of American orators, as a presidential candidate, the vote largely increased again and in 1904 came practically back to its high point.

But a bitter factional fight breaking out in the party during the 1904 campaign and the gaining of control in the party management, immediately thereafter, by the faction which regarded the mission of the party not specifically to win political victory but to support prohibition as an abstract principle ended, in the minds of most political students, the possibility that the Prohibition party should ever become a considerable political factor.

It should be noticed that there have always been two schools of thought in the Prohibition party, one of which may be called the strictly political, which insisted always upon absolutely independent political action and refusal to give support to non-partisan measures of any sort; the other might be called a "co-operative" school, which, while retaining political organization, was always willing to join hands in non-partisan efforts of all kind.

No history of the Prohibition party is complete without some notice of the large number of political ideas which had their first introduction to the world in Prohibition party platforms.

The first of these is Woman Suffrage, for which the Prohibition party began to declare in 1872 and has declared in every one of its national platforms. Of equal importance is the direct election of United States senators, for which the Prohibition party declared in the platform of its first nominating convention in 1872. Prison reform, lower railroad rates, postal savings banks, parcel post, regulation of interstate corporations, protection of government lands, civil service reform, cheap letter postage, are among the things for which the Prohibition party spoke before any other party gave them consideration. The tariff commission idea began with the Prohibition party, as did also the income tax; and the Prohibition party was the first to attack polygamy and the only political party that opposed the system of protected vice, for years so common in American cities.

It should be added that the Prohibition party built, in its entirety, the argument upon which the prohibition issues finally won. It is a popular error to suppose that the Prohibitionists were chiefly concerned with the moral aspects of the liquor problem. Their literature is strong upon that subject but they were the foremost students of the economic phases of the problem and as well of its relations to practical civics. The latest writers upon the movement have added almost nothing to the argument that was formulated by the Prohibitionists as early as 1888.

WILLIAM P. F. FERGUSON.

PROHIBITIVE DUTIES, the taxes or system of tariff imposed by a government on imported articles for the protection and encouragement of domestic industries, or as a retaliatory measure in the case of a nation thus discriminating against the productions of another, or favoring those of other countries. Protective duties in their various mutations present problems of great commercial and political importance, affecting, as they do, the value of the markets of one country in regard to those of another. See FREE TRADE; PROTECTION; UNITED STATES — HISTORY OF THE TARIFF.

PROJECTILES. To accomplish the damage or destruction of a target a projectile should have certain hardness, tenacity and weight. If it be soft and weak compared with the body struck, it will spread out laterally or break into pieces, and presenting an increased surface will meet with a greater resistance, and consequently will penetrate less than if it had retained its original form. High density gives to the mass the least possible volume, whereby the effect of the resistance offered by the air and by the body to be penetrated is diminished. Different materials have been used for projectiles. Stone, lead, wrought-iron steel, cast-iron, and chilled iron possess peculiar properties which render each advantageous according to the object to be attained.

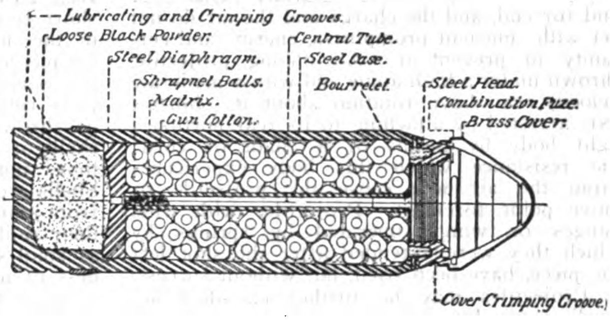
Prior to the invention of gunpowder, large masses of stone without regard to form were thrown from machines constructed for that purpose. This material was very generally employed until the year 1400; but its want of strength and density, qualities required in a projectile propelled by powder, necessitated its use in large masses and with comparatively small charges. Such projectiles were destructive against unbacked walls of masonry, but broke if ricocheted on earth. As late as 1807, stone balls of enormous calibre were used by the Turks in defending the passage of the Dardanelles.

Lead, as a material for projectiles, possesses the essential quality of density; but it is too soft to be used against very resisting objects, since it is flattened even against water. From its softness and fusibility, large projectiles of this material are liable to be disfigured, and partially melted, by the violent shock and great heat of large charges of powder. Its use is chiefly confined to small-arms and case-shot, which are generally directed against animate objects. These defects of lead may be corrected, in a measure, by alloying it with tin, antimony, etc. From the first introduction of cannon wrought-iron projectiles have at different times been tried. This metal has great density and tenacity, but has not a hard degree of hardness, cannot be easily worked into the necessary shapes, and where used in large masses becomes very expensive. Steel possesses the qualities required in a projectile, but is very costly and difficult to manipulate.

The adoption of cast-iron for projectiles caused an important advance in artillery. It has great hardness, sufficient density and tenacity; is cheap, easy to mold, and can at slight cost be given exact forms. Recent improvements in the manufacture of this metal have so greatly increased the strength of projectiles made from it, that they can be used effectively against heavy armor. Cast iron, chilled by being cooled rapidly, has its hardness, crushing strength and density increased. Projectiles so prepared are now employed with excellent results against the most powerful armor, and are found about as effective as those of steel and very much less costly. Compound projectiles, uniting the good and correcting the bad qualities of different metals, have sometimes been used. Thus, at the siege of Cadiz, cast-iron shells filled with lead, forming projectiles of great strength and density, were thrown from mortars to a distance of three miles and three-quarters.

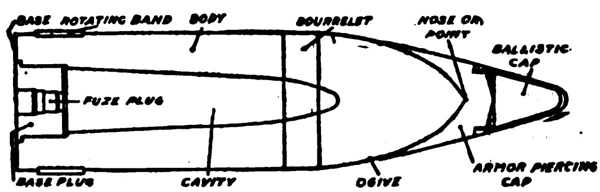
Projectiles may be either *spherical* or *elongated*. Spherical projectiles are commonly used in smooth-bored cannon, and for this purpose have certain advantages over those of oblong form: (1) They touch the surface of the bore at only one point, and are therefore less liable to wedge in the bore and endanger the safety of the piece; (2) the centres of figure and inertia coincide; (3) the mass is embraced in the least possible colume; (4) as they turn over in their flight, the surface presented to the resistance of the air is uniform and a minimum; (5) in ricocheting on land or water, their rebounds are more certain and regular, and less derivation occurs from the plane of fire.

In order that any advantage may be gained from an oblong projectile, it must move through the air in the direction of its length; numerous unsuccessful attempts have been made to ensure accuracy in its flight when fired from a smooth-bored piece. One of the simplest plans for this purpose is to place the center of gravity, or inertia, in advance of the



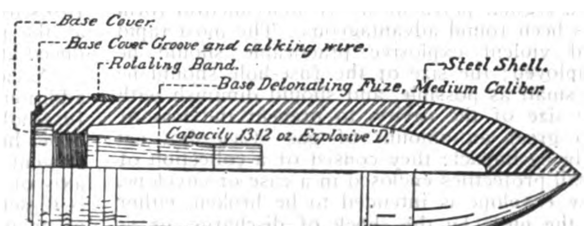
COMMON SHRAPNEL.

centre of figure, or resistance. As these points should be in the longer axis of the projectile, the force of inertia and the resistance of the air, acting along the same right line and in opposite directions, will tend to preserve the line of light. This was tried on a hollow,



ARMOR-PIERCING PROJECTILE.

pointed projectile in the time of Louis XIV; the cavity was divided into two compartments; the front one was filled with leaden balls and powder, and the rear one with powder only. The flight of these projectiles was uncertain and irregular, some of them bursting in the



COMMON STEEL SHELL.

air, and others striking the object sidewise. Another plan of this kind, proposed by Thiroux, is to make the projectile very long, with its *rear* portion of wood, and its point of lead or iron, somewhat after the manner of an arrow.

Attempts have also been made to give an elongated projectile a motion of rotation around its longer axis: (1) By cutting spiral grooves on the base for the action of the gas from the charge; (2) by forming such grooves on the forward part for the action of the air; (3)

combining the preceding methods in the same projectile; (4) by causing the air to enter a cavity at the front end, pass through nearly the length of the cylinder, and escape by radical openings at the sides. None of these plans have succeeded in practice, for the reason, perhaps, that the projectile naturally turns over end for end, and the charge and the air do not act with sufficient promptness, energy, and certainty to prevent it. An oblong projectile, thrown under a high angle and with a moderate velocity, can have rotation about its shortest axis arrested by attaching to its rear portion a light body by means of a chain or cord; the resistance which this body experiences from the air will cause the projectile to move point foremost. Projectiles with wide flanges or wings, operated by springs by which they were extended after the shot left the piece, have been tried, but without success.

Projectiles may be further classified according to their construction and mode of operation, as *solid, hollow* and *case shot.* Solid projectiles produce their effect by impact; they are used in *guns* and in *small-arms;* those for guns are known as *solid shot* or *shot,* and those for small-arms as *bullets.* Such projectiles are required when great range, accuracy and penetration are sought; they must, therefore, possess great strength and density, and be fired with large charges of powder.

Shells are hollow shot which act both by impact and explosion, for which purpose they contain an explosive and a fuse to ignite it at the proper time. As they have less strength, they are fired with smaller charges of powder than solid projectiles, and are used against animate objects and such inanimate ones as will not cause them to break on striking. The thicker the sides of a shell, the greater its ability to resist the shock of discharge, and the greater the penetration and accuracy; on the other hand, a shell should be capable of containing sufficient explosive or incendiary material to accomplish the proposed end. The number of pieces resulting from an explosion varies with the brittleness of the metal, and is increased by giving to the interior the form of a regular polyhedron. A dodecahedral form has been found advantageous. The most rapid and violent explosive practicable should be employed; the size of the fuse-hole should be as small as possible, and should diminish with the size of the cavity, to prevent the loss of too great an amount of gas. Case-shot act only by impact; they consist of a collection of small projectiles enclosed in a case or envelope. The envelope is intended to be broken, either in the piece by the shock of discharge, or at any point of its flight, by a charge of powder, inclosed within it; in either case, the contained projectiles continue to move on after the rupture, but cover a large surface, and attain a greater number of objects. These projectiles can be used with effect only against animate objects situated at a short distance from the point of rupture; they are divided into *grape, canister* and *shrapnel.* Grenades are projectiles that are commonly thrown by hand, propelled by the rifle or otherwise. Larger projectiles of a similar type, designated as bombs, are propelled at low velocities by mortars or other forms of bomb throwers, or are rolled down the slopes of a work. They are designed to act only by the force of their own explosion. *Hand grenades* are thrown against troops in mass; for this purpose any spherical projectiles filled with powder only and weighing not over six pounds are suitable; these can be thrown from 20 to 30 yards; they are provided with a short fuse which is ignited with a match, or, in the act of throwing, by a special device. Projectiles have been designated especially for this service. *Rampart grenades* are intended to be rolled down a breach in its defense, or to be thrown over the rampart, etc. Spherical shells of any size will answer for this purpose; those unfit for firing may thus be utilized. Shells are fired from guns, from howitzers and from mortars. They are made of cast-iron and their calibre is expressed in the same manner as solid shot of an equal diameter, the thickness of metal in spherical shells is about *one-sixth* of the diameter, and their weight, when empty, is generally about *two-thirds* of that of the corresponding solid shot. In the United States service there are two kinds of spherical shells; one for guns and another for mortars. Each consists of the *sides,* the *cavity,* the *fuse-hole* and the *ears;* and, in gun-shells, the *reinforce.* The sides are thicker in gun-shells than in mortar shells of the same size, to withstand the high charge of powder with which they are fired. The fuse-hole is used for inserting the charge and to hold the fuse for communicating fire to it. All shells of eight inches or more in diameter have to receive the "hooks" used in lifting the projectile to the muzzle of the piece in loading. The reinforce of metal about the fuse-hole of the gun-shell gives a greater bearing surface to the fuse and prevents it from being driven in by the force of the discharge; this reinforce also serves, in a measure, to compensate for the metal taken out of the fuse-hole, and thereby render the shell more nearly concentric. In some services shells have in the upper hemisphere, a *charging-hole,* placed at an angle of 45° with the fuse-hole, through which the charge is poured immediately before the shell is used and after the fuse has been inserted. This is not necessary with the fuses used mostly in the United States service as the powder and fuse can be readily introduced at the moment of loading.

A carcass is a thick shell which has three additional holes of the same dimensions as the fuse-hole, pierced at equal distances apart in its upper hemisphere, their exterior openings being tangent to the great circle perpendicular to the axis of the fuse-hole. The object of a carcass is to set fire to wooden structures by the flame of an incendiary composition issuing from the holes. This shell has no fuse, and it is not intended to be exploded, although a charge of powder may be placed beneath the composition to prevent it from being approached by the enemy.

A stand of grape-shot is composed of nine small cast-iron balls, disposed in three balls each. The diameter of the balls for grape-shot varies with the size of the piece; being used at long distances, they are larger than the shot for the corresponding canister. Grape-shot are employed only in the siege and sea-coast services; as now constructed, they cannot be used in rifled pieces.

The envelope for a stand of canister-shot consists of a tin cylinder, closed at the bottom by a thick plate of cast-iron, and at the top by one of sheet-iron. The plates are kept in place by cutting the ends of the cylinders in strips about 0.5 inch long, which are turned down over the plates. A wire handle is attached to the top plate. To give more solidity to the mass, and to prevent the contained balls from crowding upon each other when the piece is fired, the interstices are closely packed with sawdust. For a gun 27 small cast-iron balls are used, arranged in four layers, the top of six and the remainder of seven each; this makes the diameter of the balls about one-third that of the bore. For howitzers the envelope contains 48 balls, in four layers of 12 each, the balls being smaller than those in a canister for the corresponding gun. Grape-shot and canister are no longer or seldom used, having been displaced by shrapnel.

Shrapnel are cast-iron shells, in which, besides the bursting charge of powder, is placed a number of small balls. Their sides are much thinner than those of ordinary shells in order that they may contain a greater number of bullets; the thickness must be such that, when supported by the bullets, the case will not be broken by the force of discharge, but will yield readily to a small bursting charge. The weight of the case, empty, is about one-half, and, when filled, about equal to that of the solid shot of the same diameter. This projectile is prepared by filling the case with leaden musket-balls well packed in; the interstices are then filled with melted rosin; this prevents the fracture of the envelope by the bullets when the piece is fired. The *chamber* for the powder is afterward bored out. The case is strengthened by a *reinforce,* and to increase the effect of the bursting-charge, the lower portion of the fuse-hole is closed by a *disc* of wrought-iron, perforated with a small hole for the passage of the flame from the fuse. A shrapnel may be made to explode at any point of its flight, and, as the bursting-charge should be only sufficient to open the envelope, without scattering the bullets too much, the execution depends on the velocity which the case has at the moment it is broken.

The advantages to be derived from the use of elongated projectiles having once been established, it became necessary that some means should be decided to make their flight accurate. It has been found that to do this with certainty a motion of rotation about its longer axis must be communicated to the projectile, and this end has been satisfactorily attained only by cutting spiral grooves, or "rifles" in the surface of the bore of the piece, with which the projectile is connected, and by means of which it starts with a motion about an axis parallel to or coincident with that of the bore. The rotation continues during the flight of the projectile. Without this rotation an elongated projectile will naturally turn over end for end and present a constantly varying surface to the resistance of the air. This "rifle-motion," therefore, tends to cause the projectile to move through the air in the direction of least resistance, thereby increasing the range and the effect of impact, and, furthermore, giving steadiness to the projectile by distributing the deviating forces uniformly around its line of flight. The more important advantages of elongated projectiles are that the form may be altered at any time, and the centre of gravity can be placed at any desired point; the projectile may be elongated so as to oppose, for an equal weight, a diminished surface to any resting medium; by this the range is extended, and a flatter trajectory with greater accuracy and penetration obtained. The chief disadvantages are increased strain on the gun; greater probability of jamming and injury to the bore irregularity of ricochet; increased complication and expense of manufacture and the liability of any soft metal on the exterior to be accidentally injured.

The different systems of projectiles for rifled pieces are classified according to the manner in which they are caused to follow the grooves. The systems are distinguished by some peculiarity of construction and are generally known by the name of the person by whom designed or by the place at which first made. The same principles are applicable to different systems, and the same precision of fire may practically be obtained from several. All systems are comprised under three classes: (1) Projectiles with projecting ribs or studs, or having a peculiar cross-section. (2) Projectiles having a portion that is expanded by the action of the gasses in the bore. (3) Those more or less of whose surface is compressed by the charge into the form. The first and second classes are applicable to muzzle-loading pieces; the third to breech-loaders only. The principal points to be considered, as regards the piece and the projectile, are the *surest* and *safest* means of causing the projectile to follow the grooves of the piece. To fulfill these conditions the projectile should be simple in construction and of sufficient strength to admit of its use with the largest charge that may be desired; it must not be liable to jam in the bore in loading or firing, and must produce a moderate and uniform strain on the gun. The system that most nearly complies with these requirements, and gives insured accuracy of fire with uniform and high velocities, should be the best. In many systems, one or more of these considerations have been sacrificed to some extent, to secure a closer compliance with others thought to be of greater importance or of easier attainment.

1st Class.— Solid flanges, projecting from the body of a projectile, and so shaped as to fit the rifling of the bore, were the means first used to communicate the rifle-motion in cannon. In some cases there was for each groove a rib extending the entire length of the cylindrical portion of the projectile, while in others sets of rounded buttons were employed. These projections were of the same material as the body of the projectile, and, being of a very unyielding nature, frequently led to the bursting of the piece; buttons of zinc, copper or bronze, firmly secured in mortises in the projectiles, were therefore adopted. The buttons are arranged in rows or two or more so that each row enters freely into a corresponding groove, in loading. When the bore of a gun is a twisted prism, with any plane figure for its base, the projectile, if shaped to it, will receive the rifle-motion when fired. The Whitworth cannon is rifled in this manner, the cross-section being a hexagon with rounded corners. Guns have also been constructed with ribs projecting from the bore, fitting into corresponding grooves in the projectile. To the last system belongs the Vavasseur gun, which has given good results. The principal advantages of systems of the first class are that the projectiles are strong and that the required motion is communicated to them with great certainty and regularity. The escape of gas around the projectile, as it causes injury to the bore, is an objection to the class; various experiments have been made to overcome it, one being by the attachment of a metal cup to the rear of the projectile, which, by the action of the powder, is expanded and presses against the sides of the bore. The French studded projectile, employed with muzzle-loading cannon, and the Woolwich system, similar to it are the best representatives of this class.

2d Class.— In projectiles of the second class the body is composed of a hard metal, as cast-iron, and there is attached to it, generally at the base, a cup, band or other arrangement of softer metal, which is expanded by the action of the charge into the grooves of the gun, when fired. Expanding projectiles are easy to load, are not liable to overstrain the piece, and those of different systems can generally be fired from the same piece — a point of great importance. Such projectiles do not always withstand the heaviest charges of powder, and are not certain to receive the rifle motion. The use of projectiles of this class is confined more particularly to the United States.

3d Class.— In breech-loading cannon the receptacle for the charge is of a larger diameter than the bore of the piece. The projectile is of the same size as this chamber, and must be reduced to enable it to pass into the bore. Such projectiles are embraced under the third class; the body has a coating of soft metal, which is compressed as the projectile is driven through the bore, the grooves compelling it to follow the direction of the rifling. The same result is sometimes accomplished by one or more rings of soft metal. The chief advantages of this class are that the projectile is generally certain to take up the rifle-motion; that its axis is steady on leaving the bore, and that the wear of the bore, from gas passing the projectile or from any irregular movement of the latter, is prevented. The objections are that the necessary compression of the coating, the sudden closing of windage and the fouling of the bore produce undue strain upon the piece; that the velocity of the projectile is reduced by the force expended in compressing it; and that the soft metal forms an extra weight, which is useless in penetrating resisting objects.

EDWARD S. FARROW,
Consulting Military and Civil Engineer.

PROJECTION. (From the Latin *projicere,* to throw forward). In its general sense, the term signifies the representation of the form of a given figure upon a given surface by means of a pencil of visual, light, or other rays in such a manner that the figure in the projection corresponds point by point to the given figure. For example, shadows are the projections of objects upon different surfaces which intercept the rays of light from any source, not already intercepted by the objects themselves. They represent the most elementary forms of plane projections, and while corresponding in general outline to the objects projected, yet differ from them to a greater or lesser extent according to the distance of the object from the source of light, the distance of the plane of projection from the object, the angle between the plane of projection and the direction of the rays of light, the position of the observer's eye, etc.

In the mathematical construction of projections, however, instead of a single plane being used to intercept the projecting rays, another surface, such as one formed by two planes at right angles to each other, is taken and the various points of any object, plane or in space of three dimensions, projected to that surface from any point assumed as the center of the projection.

When the projection shows three dimensions of the object projected, it is commonly known as perspective, the mathematical theory of which together with the various classes of such projections employed in mechanics and for solving the problems of applied mathematics, will be found under the title PERSPECTIVE in this Encyclopedia. The present article is confined to the consideration of the various projections used in connection with geographical and geodetical work in general, and to their employment in the construction of maps for special purposes.

In general the word «projection,» when used with reference to maps, has nothing whatever to do with geometrical projection from a point. It simply refers to a transformation of latitude and longitude on the spherical or spheroidal earth into planer magnitudes. A suitable introduction to this particular phase of the subject is given under the title MAP in this Encyclopedia, wherein the three principal perspective projections of the sphere — the orthographic, the stereographic and the gnomonic, are clearly explained and illustrated. Of these, the orthographic and the stereographic are rarely used at the present time except in the construction of what may be called pictorial maps; but, the gnomonic and several of its modifications are extensively used for the construction of star charts in general, and especially for charts showing the apparent tracks of shooting stars on account of the facility in determining the radiant point, the great circles on the celestial sphere appearing as straight lines on the projection. For similar reasons it is used in the construction of sailing charts showing steamship routes, and is much more satisfactory for this purpose than Mercator's projection, which although almost universally used for nautical charts, is specially applicable for those used by sailing ships.

The chief value of the perspective projections lies in their adaptability for representing large areas of the earths surface. Usually, they represent a hemisphere; but, by the employment of the projection first proposed by Lahire in 1701 and subsequently modified by Lieut. Col. H. James of the Ordnance of Great Britain and Ireland, fully two-thirds of the sphere can be shown within the bounding circle. This is accomplished by assuming the eye above the sphere at a distance equal to half the radius and perpendicular over the center of the plane of projection. The plane of projection is not that of a great circle, but is parallel to it and removed from it nearer to the eye by 23 degrees.

A simple and easily constructed projection which can be effectively used in representing a hemisphere may be briefly described as follows: Draw a circle and bisect it by horizontal and vertical diameters; divide the circle into equal parts representing degrees of latitude; divide the vertical diameter into a corresponding number of equal parts; and divide the horizontal diameter into equal parts representing degrees of longitude. This will establish three points in every parallel of latitude, i.e., two in the circumference and one in the vertical diameter, through which the arc of a circle may be drawn representing the corresponding parallel of latitude, and also three points in every meridian, i.e., one at each pole and one in the horizontal diameter or equator, through which the arc of a circle may be drawn representing a meridian.

The general method of constructing developed projections has been briefly described under the title MAP in this Encyclopedia; but, as all modern maps representing data obtained from precise trigonometrical surveys are based upon some form of developed projection, the mathematical theory and the practical methods of construction of such will receive more extended treatment herein.

The various projections form three definite groups—(1) those possessing straight meridians and parallels, (2) those of mixed systems of straight and curved meridians and parallels, and (3) those in which both meridians and parallels appear as curved lines.

Of the first group, the one most extensively used is Mercator's projection. It was devised to satisfy the following condition: That the loxodromic curve or the course of a ship on the surface of the sea, under a constant bearing or intersecting the successive meridians at the same angle, shall appear on the projection as a straight line having the same angle of bearing

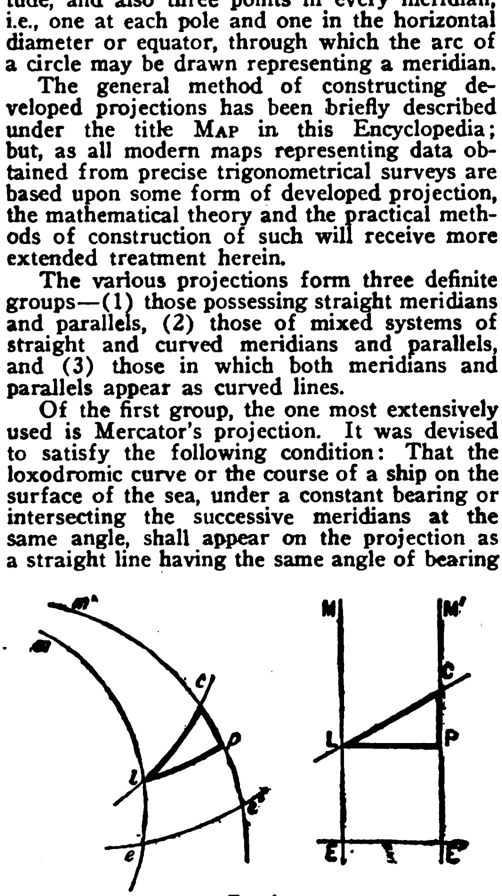


FIG. 1.

with respect to the meridians intersected as that of the loxodromic curve.

The formula used in computing a table of «meridional parts» or the «increased latitudes» for determining the distances of the various parallels of projecting latitudes from the equator, is obtained as follows: (Modified extract from Projection Tables published by the United States Hydrographic Office).

Referring to Fig. 1, let $l\ c$ be an element of the loxodromic curve between two consecutive meridians $m\ e$, $m'\ e'$; and let L C represent the corresponding element on the projection between the corresponding meridians M E, M' E'. Let $l\ p$ and L P be taken parallel to the corresponding equatorial elements $e\ e'$ and E E' between the same meridians.

Then, the condition that the angles of bearing $l\ c\ p$ and L C P shall be equal requires that

$$\frac{C\ P}{c\ p}=\frac{L\ P}{l\ p}$$

or since L P = E E' = e e' the element on the terrestrial equator, it is necessary that

$$\frac{C\ P}{c\ p}=\frac{e\ e}{l\ p}.$$

Hence, putting $d\ s$ for the meridional element $c\ p$ of the terrestrial spheroid, $d\ m$ for the meridional element C P of the projection, a for the equatorial radius of the earth, and r for the radius of the parallel represented by the element $l\ p$; then, on account of the proportionality of the elemental arcs $e\ e'$, $l\ p$, to their respective radii a, r, we have the fundamental equation

$$\frac{d\ m}{d\ s}=\frac{a}{r}$$

which expresses the law of the Mercator projection.

Then, if L be the latitude of the terrestrial parallel under consideration, R the radius of curvature of the terrestrial meridian at its point of intersection with the parallel, c the compression of the earth, and e its meridional eccentricity; we have the folowing expression for the properties of r, R, and e of the terrestrial spheriod considered as an ellipsoid of revolution:

$$r=\frac{a-\cos L}{(l-e^2\sin^2 L)^{\frac{1}{2}}}$$

$$R=\frac{a\ (l-e^2)}{(1-e^2\sin^2 L)^{\frac{3}{2}}}$$

$$e=\sqrt{2c-c^2}.$$

Now, since the radius of curvature varies inversely as the angle between consecutive normals, the element of the terrestrial meridian at its intersection with any parallel of latitude is equal to the product of the radius of curvature and the element of latitude at that point, and

$$ds=R.\ dL,$$

which being substituted in the fundamental equation gives us the expression

$$dm=\frac{a\ R.\ dL}{r}$$

for the element of the projected meridian, or by substituting the preceding values of r and R, we have

$$dm=\frac{a\ (1-e^2)\ dL}{(1-e^2\sin^2 L)\cos L},$$

which when integrated between the proper limits give required length of any finite portion of the projected or chart meridian corresponding to the meridional arc on the terrestrial spheroid within the same limits.

For this integration, multiplying e^2 in the numerator by $\sin^2 L+\cos^2 L$, we have

$$dm=\frac{a.\ dL}{\cos L}-\frac{ae^2\cos L.\ dL}{1-e^2\sin^2 L},$$

again, multiplying the numerator and denominator of the first term by cos L, substituting $1-\sin^2 L$ for $\cos^2 L$, and resolving both terms into partial fractions, we have the expression

$$dm=\frac{a}{2}\left(\frac{\cos L}{1+\sin L}+\frac{\cos L}{1-\sin L}\right)dL-\frac{ae}{2}\left(\frac{e\cos L}{1+e\sin L}+\frac{e\cos L}{1-e\sin L}\right)dL,$$

whence, by performing the integration or the limits of O and L, we find for the length of that part of the meridian of the projection included between the equator and the parallel of latitude L, the expression

$$m = \frac{a}{M}\left(\frac{1}{2}\log\frac{1+\sin L}{1-\sin L} - \frac{1}{2}\,e\log\frac{1+e\sin L}{1-e\sin L}\right),$$

in which the logarithms belongs to the common system, of which M is the modulus.

Substituting for

$$\frac{1+\sin L}{1-\sin L}$$

its trigonometrical equivalent, and for

$$\log\frac{1+e\sin L}{1-e\sin L}$$

its algebraic development, we have the final expression

$$m = \frac{a}{M}\log\tan\left(45^\circ + \frac{L}{2}\right)$$
$$-\,a\,(e^2\sin L + \tfrac{1}{3}e^4\sin^3 L + \tfrac{1}{5}e^6\sin^5 L.)$$

which is the formula required for computing the meridional parts for the terrestrial spheroid.

This formula consists of two parts — the first term being the ordinary formula for computing meridional parts with the earth regarded as a sphere, while the second term consists of a series of negative terms, and represents the correction which must be applied for the meridional eccentricity of the earth under the hypothesis that it is an ellipsoid of revolution.

In using the formula to compute the accompanying table, the following numerical values with their respective logarithms have been employed for the several constants.

The equatorial radius is expressed in minutes of arc, therefore, the unit of measure of the meridional part m becomes a minute of the equator or a geographical mile.

$$a = \frac{10{,}800'}{\pi} = 3437'.74677 \ldots\ldots\ \log 3.5362739.$$

The reciprocal of the modulus of the common logarithms,

$$\frac{1}{M} = 2.3025851 \ldots\ldots\ldots\ldots\ \log 0.3622157.$$

Bessel's determination of the compression,

$$c = \frac{1}{100.1528} = 0.003342773 \ldots\ldots \log 7.5241069.$$

The meridional eccentricity of the earth,

$$e = \sqrt{2c - c^2} = 0.0816968 \ldots\ldots \log 8.9122052.$$

The values of the several coefficients with their logarithms deduced are as follows:

$$\frac{a}{M} = 7915'.7055 \ldots\ldots\ldots\ldots\ \log 3.8984896$$
$$ae^2 = 22'.9448 \ldots\ldots\ldots\ldots\ \log 1.3606843$$
$$\tfrac{1}{3}ae^4 = 0'.05104731 \ldots\ldots\ldots\ \log 8.7079734$$
$$\tfrac{1}{5}ae^6 = 0'.000204425 \ldots\ldots\ldots\ \log 6.3105351$$

On account of the rapid convergence of the series of coefficients involving the eccentricity, two terms are generally sufficient for practical use, and the formula becomes

$$m = 7915'.7055 \log\tan\ 45^\circ + \frac{L}{2} - 22'.9448$$
$$\sin L + 0'.05104731\ \sin^3 L.$$

TABLE OF MERIDIONAL PARTS OR INCREASED LATITUDES FOR THE TERRESTRIAL SPHEROID — COMPRESSION $\frac{1}{299.1528}$.

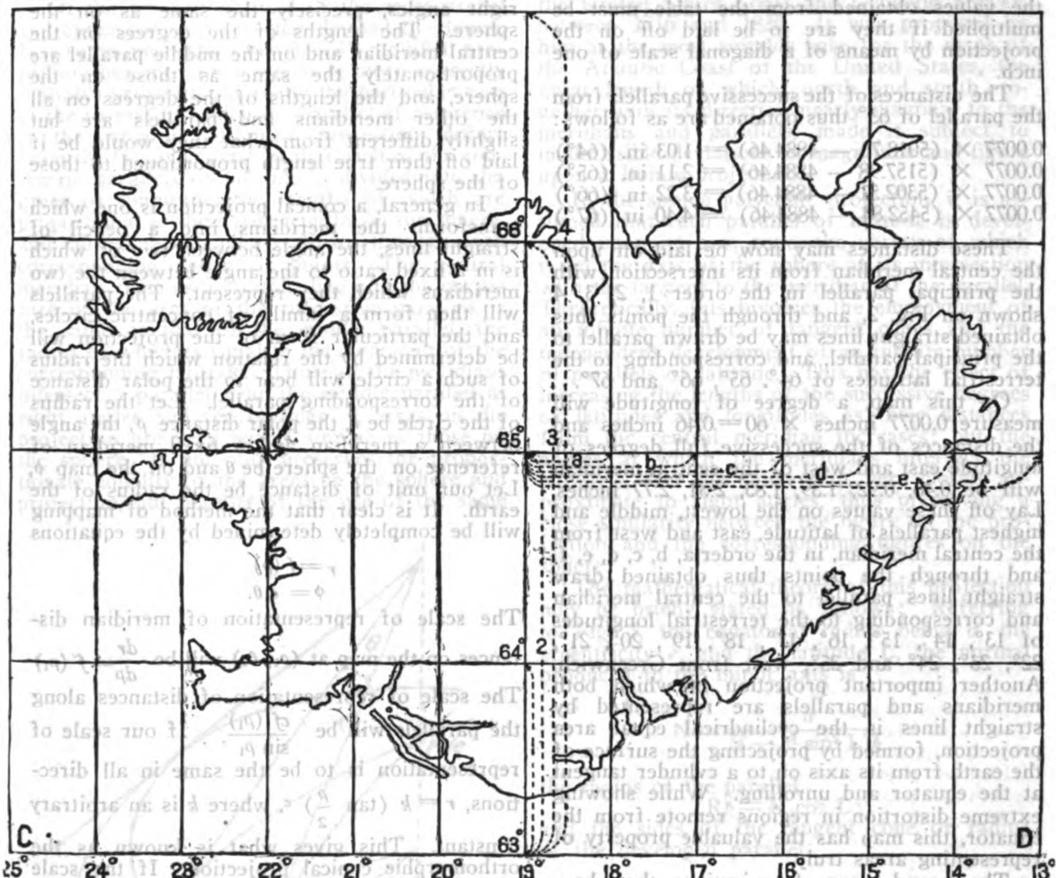
On account of the space limitations the table gives the meridional parts for even degrees of latitude only; the values for intermediate minutes or seconds of arc may be computed by the formula.

If the chart for which the projection is made includes the equator, the values given may be measured off for the successive degrees of latitude directly from the equator; but, if the equator is not included in the map, the parallels of latitude to be projected should be successively measured from a principal parallel, preferably the lowest parallel drawn upon the map, and the distance of any parallel from the principal parallel will be the difference of the values given for the two in the table.

These values, given in minutes of arc, may be converted into their equivalents in inches, yards, meters, etc., and laid off on the projection by means of properly divided corresponding scales, proportionately to the scale adopted for the map, or the values given may be laid off without previous numerical conversion, by means of a diagonal scale constructed on the map.

For example — suppose a Mercator projection is required to embrace the coasts of Iceland, on a scale of 1-inch = 150 statute miles. This island lies between latitudes 63° and 67° north, and between longitudes 13° and 25° west from Greenwich. The projection will include four degrees of latitude and 12 degrees of longitude. The central meridian will correspond to longitude 19° W., and the lowest parallel will correspond to latitude 65° N. See Fig. 2.

Draw in the centre of the sheet a vertical straight line A B, for the central meridian, and near the bottom of the map construct very carefully a horizontal line C D, at right angles to



B

Scale 1-inch=150 Stat. Miles.

FIG. 2.

A B, for the parallel of 63° N., and assume it as the principal parallel of the map. From the table obtain the value 4884′.46 for lat. 63° and 5452′.84 for lat. 67°, the difference of which or 5452′.84 — 4884′.46 = 568′.38, the value of the meridional arc included between the lowest and the highest parallels of latitude of the map, for which one minute of arc of the equator = 1.012 statute miles is taken as the unit of measurement. Converting this value to its

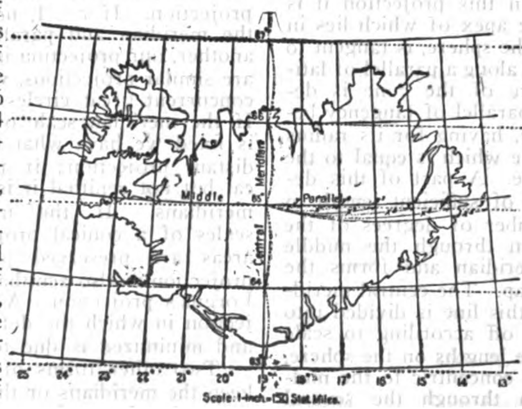


FIG. 4.

equivalent in statute miles and reducing it to the scale of the map, gives 568′.38 ÷ 60′ = 9°.47; 9°.47 × 69.77 statute miles (equivalent to a degree of longitude on the equator) = 660.72 statute miles; 660.72 ÷ 150 = 4.40 inches or the distance of the parallel of 67° from the parallel of 63° on the map, on a scale of 1-inch = 150 statute miles. It is obvious that this measurement may be laid off on the map by means of any scale divided to the decimals of an inch, and the distance of each of the other parallels from the principal may be obtained by the same method of conversion, and laid off in a similar manner; but, having obtained the value 4.40 inches equal to the vertical extent of the map, we are enabled to determine a constant multiplier by the use of which the tabular values may be laid off directly by means of a diagonal scale (q.v.) of one inch without previous numerical conversion. As 1′ of arc of the equator is taken as the unit of the meridional arc, 1′ of arc of latitude will measure 4.40 inches ÷ 568′.38 = 0.0077 inches, which corresponds to the scale of the map and by which all the values obtained from the table must be multiplied if they are to be laid off on the projection by means of a diagonal scale of one inch.

The distances of the successive parallels from the parallel of 63° thus obtained are as follows:

0.0077 × (5018.76 — 4884.46) = 1.03 in. (64°)
0.0077 × (5157.98 — 4884.46) = 2.11 in. (65°)
0.0077 × (5302.51 — 4884.46) = 3.22 in. (66°)
0.0077 × (5452.84 — 4884.46) = 4.40 in. (67°)

These distances may now be laid off upon the central meridian from its intersection with the principal parallel in the order 1, 2, 3, 4 shown on Fig. 2, and through the points thus obtained straight lines may be drawn parallel to the principal parallel, and corresponding to the terrestrial latitudes of 64°. 65°, 66° and 67°.

On this map, a degree of longitude will measure 0.0077 inches × 60 = 0.46 inches and the distances of the successive full degrees of longitude east and west of the central meridian will be 0.46, 0.92, 1.39, 1.83, 2.31, 2.77 inches. Lay off these values on the lowest, middle and highest parallels of latitude, east and west from the central meridian, in the order a, b, c, d, e, f, and through the points thus obtained draw straight lines parallel to the central meridian and corresponding to the terrestrial longitudes of 13°, 14°, 15°, 16°, 17°, 18°, 19°, 20°, 21°, 22°, 23°, 24° and 25°, west from Greenwich. Another important projection in which both meridians and parallels are represented by straight lines is the cyclindrical equal area projection, formed by projecting the surface of the earth from its axis on to a cylinder tangent at the equator and unrolling. While showing extreme distortion in regions remote from the equator, this map has the valuable property of representing areas truly.

The second group of projections, those having mixed systems of straight and curved meridians and parallels, including various kinds of «equal surface» and «conic» projections, of which the «simple conic» is the most valuable for general purposes. In this projection it is assumed that a cone, the apex of which lies in the axis (produced) of the sphere, is tangent to the surface of the sphere along a parallel of latitude. When the surface of the cone is developed on a plane, the parallel of tangency becomes an arc of a circle, having for its radius the slant side of the cone which is equal to the cotangent of the latitude. A part of this developed arc of a circle, of sufficient length to include the desired number of degrees of the proposed map, is drawn through the middle point of the central meridian and forms the middle parallel of the map. The central meridian north and south of this line is divided into degrees of latitude laid off according to scale proportional to their true lengths on the sphere, and parallels of latitude concentric to the middle parallel are drawn through the several points thus obtained. In a similar manner, the middle parallel is divided into degrees of longitude east and west of the central meridian and straight lines representing meridians are drawn through those points to the centre from which the concentric parallels were swept. In the system of co-ordinates thus established, the parallels and meridians intersect each other at right angles, precisely the same as on the sphere. The lengths of the degrees on the central meridian and on the middle parallel are proportionately the same as those on the sphere, and the lengths of the degrees on all the other meridians and parallels are but slightly different from what they would be if laid off their true length proportioned to those of the sphere.

In general, a conical projection is one which transforms the meridians into a pencil of straight lines, the angle between two of which is in a fixed ratio to the angle between the two meridians which they represent. The parallels will then form a family of concentric circles, and the particular form of the projection will be determined by the relation which the radius of such a circle will bear to the polar distance of the corresponding parallel. Let the radius of the circle be r, the polar distance ρ, the angle between a meridian and a fixed meridian of reference on the sphere be θ and on the map ϕ, Let our unit of distance be the radius of the earth. It is clear that the method of mapping will be completely determined by the equations

$$r = f(\rho)$$
$$\phi = c\,\theta.$$

The scale of representation of meridian distances on the map at (ρ_1, θ_1) will be $\frac{dr}{d\rho} = f'(\rho_1)$ The scale of representation of distances along the parallels will be $\frac{cf(\rho_1)}{\sin \rho_1}$. If our scale of representation is to be the same in all directions, $r = k\,(\tan \frac{\rho}{2})^c$, where k is an arbitrary constant. This gives what is known as the orthomorphic conical projection. If the scale representation at a point ρ remains fixed, while c decreases toward O, the map will approach a mercator projection. If $c = 1$, the angles between meridians on the map will equal those on the earth, and we shall have the stereographic projection. If $c = 1$, no matter what relation the meridian and parallel scales bear to one another, our projection is said to be zenithal, as are similar projections, where other families of concurrent great circles replace the meridians. If the meridian scale of a zenithal projection is fixed we have what is known as the equidistant projection; if the projection is conical but not zenithal it is said to have rectified meridians. If the meridian and parallel scales of a conical projection are reciprocals, areas are preserved proportionally. If the projection is also zenithal it is sometimes called Lorgna's projection. A form of zenithal projection in which the deformation is distributed and minimized is due to Sir George Airy.

Two other forms of projection which may keep the meridians or the parallels straight are that of Mollweide, in which parallels are straight lines and meridians ellipses, and areas are retained, although with great deformation of the peripheral parts of the map, and the projection which simply plots in cartesian co-ordinates the spherical or spheroidal co-ordinates of points on the surface of the earth with reference to any given great circle or ellipse.

Of the projections, one of the most useful and extensively used is that devised by Bonne. It is sometimes called Flamsteed's modified projection, but the latter, which is more correctly Sanson's projection, is really the particular case of the former, in which the parallel of reference is the equator. Bonne's projection differs from the «simple conic» in that each of the concentric parallels of latitude is divided into degrees of longitude, the lengths of which are proportional to their true lengths on the sphere, and curved meridians are drawn through each corresponding series of points. The central meridian remains a straight line and the curvature of the arcs of the successive parallels is the same as that of the middle parallel, the radius of which is equal to the cotangent of the corresponding latitude. Thus, all the meridians intersect a parallel near the middle parallel at right angles and the outlines of areas on the projection are very nearly similar to those on the sphere. It not only preserves the proportionate equality of the areas on the sphere and projection, but permits of the use of the same

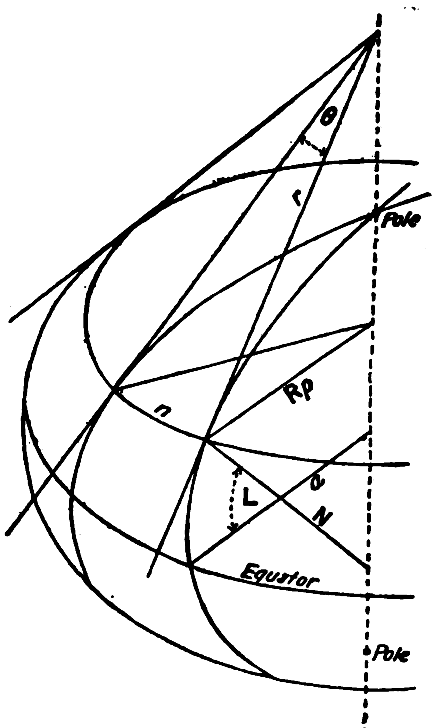

FIG. 3.

linear scale for all parts of maps of only a few degrees in extent. This projection was adopted as the base for the important map of France constructed by the depôt de la Guerre in 1803.

The step from the simple conic to the Bonne was an important one; but, the great obliquity of the meridians and parallels in the higher latitudes made it unsuitable for maps of large extent and led to the invention of the «polyconic» projection, which appears to have been conceived by F. R. Hasler, superintendent of the United States Coast and Geodetic Survey, between 1816 and 1820. It was proposed by him as the most suitable base for the maps of the Atlantic Coast of the United States, the great length of which, north and south, together with its direction nearly diagonal to the meridians and parallels, made it subject to inadmissible deviations in magnitude and figure upon a Bonne projection.

In the simple polyconic projection, it is assumed that each parallel of latitude is developed upon its own cone, the vertex of which is on the axis of the sphere at its intersection with the tangent to the meridian at the parallel. Theoretically, this involves the employment of an infinite number of tangent cones and the independent development of an infinite number of parallels of latitude. This has the effect of increasing the lengths of the successive degrees of latitudes and longitudes as their distances from the central meridian increases; but the angles at which the meridians intersect the parallels, over the entire map, very closely approximate to right angles, thus preserving a close similarity between the figure on the projection and the corresponding figures on the sphere.

The mathematical theory of this projection may be briefly stated as follows: Referring to Fig. 3, the equatorial radius being a, the eccentricity e, and the latitude L, the normal produced to the minor axis is

$$N = \frac{a}{(1 - e^2 \sin^2 L)^{\frac{1}{2}}}$$

the radius of the parallel

$$Rp = N \cos L;$$

and the sides of the tangent cone or radius of the developed parallel

$$r = N \cot L.$$

If n be any arc of the parallel to be developed, and Θ the angle which subtends it at the vertex when developed

$$\Theta = n \sin L;$$

and as the developed parallels are circular arcs, the co-ordinates of curvature are

$$x = r \sin \Theta,$$
$$y = r \operatorname{versin} \Theta = 2r \sin^2 \tfrac{1}{2}\Theta = x \tan \tfrac{1}{2}\Theta.$$

The radius of curvature in the meridian is

$$Rm = \frac{a(1 - e^2)}{(1 - e^2 \sin^2 L)^{\frac{3}{2}}} = \frac{N^3 (1 - e^2)}{a^2};$$

whence the length of a degree of latitude is

$$3600\, Rm \sin 1''.$$

and that of a degree of longitude is

$$3600\, Rp \sin 1''.$$

For maps of large extent on a small scale, it is sufficient to compute r and Θ, x and y, for every whole degree, but for those of small extent, on a large scale, a more detailed projection becomes necessary and these values have to be computed to every minute or fraction of a minute according to the nature of the data to be represented, and the value of the scale adopted.

To make a projection from the data furnished by a polyconic projection table, draw a straight vertical line for the central meridian and lay off thereon the distances corresponding to the intervals between the successive latitudes required, and through the points thus obtained draw horizontal lines at right angles to the central meridian. These horizontal lines will be tangent to the developed parallels.

Now suppose, that as in the case of the Mercator projection hereinbefore illustrated, the polyconic projection is required to embrace the coast of Iceland, which lies between lat. 63° and 67° north, and between long. 13° and 25° west from Greenwich, and that the scale of the map is adopted at 1-inch = 150 statute miles.

Referring to Fig. 4, inserted under Fig. 2, the central meridian of the map will correspond to long. 19° west, and the middle parallel will correspond to 65° north. On the central meridian lay off to the north from its intersection with the middle parallel, according to the adopted scale, 69.268 miles for lat. 66°, and 69.277 miles for lat. 67°, and in a similar manner lay off to the south, 69.258 miles for lat. 64°, and 69.248 miles for lat. 63°. Through these points draw horizontal lines at right angles to the central meridian, and upon each of them set off to the east and to the west of the central meridian the values of x given in the table for the corresponding parallels of latitude. Through the points x, x^1, x^2, etc., thus obtained, draw perpendiculars toward the pole, and on them set off the proper tabular values of y. Through the final points thus obtained, draw continuous curves for parallels of latitude and meridians.

Space limitations in this Encyclopedia make it absolutely impossible to insert a polyconic table computed to even full degrees only, and one giving the values of x and y for greater latitudinal and longitudinal intervals would be more or less useless. Tables of this kind may be readily obtained from the United States Coast and Geodetic Survey, and the United States Hydrographic Office, Navy Department.

Fig. 4 is placed under Fig. 2 in order to afford a direct comparison of the two projections.

In the rectangular polyconic projection, while the parallels are the same as in the simple polyconic projection and the central parallel retains the same graduation, the meridians are orthogonal trajectories of the parallels.

PROLETARIATE, prō-lĕ-tā'rĭ-āt, a general term applied to those Roman cities who stood in the sixth class, possessing less than 1,500 asses, or nothing at all. They were ever afterward distinguished by the name of *capite censi*, apparently because they were taxed only by head. The term has been revived in modern times as a designation of the lowest class of the community who possess no capital and is frequently used in socialistic literature. PROLOGUE, in dramatic poetry, (1) in the Greek drama, that part of a tragedy preceding the first appearance of the chorus. (2) In the Roman and English drama, an address to the audience preceding the piece itself. It may be either in prose or verse, and is usually pronounced by one person. Among the Romans the player who delivered this address was called the *prologus*, and usually considered as a person of the drama. Thus in the 'Amphitryon' of Plautus (q.v.) Mercury appears as *prologus*. Prologues sometimes relate to the drama itself, and serve to explain to the audience some circumstances of the action, sometimes to the situation in which the author or actor stands to the public, and sometimes have no immediate connection with either of these persons or subjects. Shakespeare makes use of the prologue, as in 'Henry V' and the Restoration drama almost invariably employed it. Amongst other famous dramatists who have used the prologue may be mentioned Goethe, Schiller, Molière, Racine, Ben Jonson and Dryden. It long since fell into disuse, but is occasionally revived for the effect of quaintness. Consult Archer, W., 'Play Making' (London 1912); B. G. S., 'A Study of the Prologue and Epilogue in English Literature from Shakespeare to Dryden' (London 1884); Dryden, J., 'Dramatic Pœsie' (in 'Essays,' Vol. I, Oxford 1900); Freytag, G., 'Technique of the Drama' (Chicago 1908); Griffith, A. PROME, prōm, India, (1) a town of Lower Burma, capital of a district of the same name, on the Irrawaddy, about 160 miles north of Rangoon by rail. It is a large town surrounded by a wall, with extensive suburbs; owing to the flat ground on which it is built it is subject to inundations from the river. It has silk-weaving, lacquer and other industries, and exports silk, rice, cotton, etc. On one of the many hills near the town stands the Schwe-Tsan-daw Pagoda, one of the most famous pagodas of India. Pop. about 30,000. (2) The district has an area of 2,914 square miles, and a pop. about 375,000. In ancient times there was a kingdom of Prome which is known to have flourished for many years, but regarding the history of which next to nothing is known now. At the end of the Second Burmese War in 1853, Prome together with the balance of the province of Pegu became British territory. Consult Beylie, L. M. E. de, 'Prome et Samara, Voyage Archéologique en Birmanie et en Mesopotamie' (in *Société Francaise des Fouilles Archéologiques. Publications*, No. 1, Paris 1907).

PROMESSI SPOSI, I, prō-mĕs'sē spō'zē ē, an Italian romance by Alessandro Manzoni (q.v.), written between 1821 and 1825 and published in Milan in 1827, dealing with Milan under the Spanish rule of the 17th century. In fidelity to life, the interest of its principal characters and the beauty and truth of its descriptions, it stands as the greatest Italian historical romance, and its author as the creator of a school of historical novelists. A revised edition was published in 1842. Many other editions have been published since then, the best being that prepared by P. Bellezza (Milan 1908). A condensed edition was brought out by J. Geddes and E. H. Wilkins (Boston 1911). It has been translated widely, the best English translations having been published as part of 'Bohn's Novelists' Library' (London 1883) and 'Collier's Harvard Classics' (New York 1909). A number of dramatizations of the story have been made, none of them, however, approaching in importance the original. Consult D'Ovidio, F., 'Le Correzioni ai Promessi Sposi e la Questione della Lingue' (Naples 1895); Holland, R. S., 'Builders of United Italy' (New York 1908); Howells, W. D., 'Modern Italian Poets' (New York 1887); Negri, G., 'Sui Promessi Sposi di Alessandro Manzoni' (Milan 1903–06).

PROMETHEUS, prō-mē'thūs, in Greek mythology, son of Iapetus the Titan and Clymene (according to Hesiod), or Themis (according to Æschylus), or Asia (according to Apollodorus). He is the legendary giver of fire and all its benefits to men. In Athens Promethus had an altar in the academy and a special festival was devoted to him. Hesiod and Æschylus (q.v.), the latter of whom made his story the subject of a trilogy of which one tragedy, 'Prometheus Bound' (q.v.), is alone extant as a whole, are our chief authority for the myth concerning Prometheus. He is represented as the brother of Atlas, Menœtius and Epimetheus. According to Æschylus, Prometheus took part with Zeus against his brother Titans and by his craft and sage counsel rendered Zeus victor and enabled him to ascend his father's throne. Later, objecting to the plan of Zeus to destroy mankind and create a new generation of beings, he helps the weak race of mortals by stealing fire from the lightnings of Zeus and giving it in a hollow reed to men, to whom it had been till then denied. In revenge Zeus has Prometheus chained to a rock in the Caucasus by Hephæstus and his helpers Kratos and Bia, and sends a vulture to tear forever at his vitals, not allowing him to end his pain by death. Steadfastly Prometheus bears his doom, aware that in time Zeus will fall by the hand of a son born to himself and Thetis. Heracles, with the consent of Zeus, slays the vulture and releases Prometheus, who returns to Olympus and thereafter is the wise counsellor of the gods. It is in the above form that the myth has been most generally accepted, but it was varied in many ways by different poets and philosophic interpreters. His Greek name, meaning "Forethought" (that of his brother Epimetheus, signifying "Afterthought"), makes the underlying allegory apparent. Prometheus, as the friend of men, the wise helper in necessity, and in some interpretations as a rebel against unjust authority, has been much referred to in literature, and in modern times was made the subject of Shelley's lyrical drama 'Prometheus Unbound,' and of the fragment of a tragedy by Goethe. He has also been frequently represented in plastic art. The most famous English rendition of Æschylus' tragedy is Mrs. Browning's 'Prometheus Bound.' Another more recent translation has been published by R. Whitelaw (Oxford 1907).

PROMETHEUS BOUND, The, of Æschylus, has been called «the most sublime poem in the world.» Macaulay declares that by the principles of dramatic writing we shall instantly condemn, but if we think only of the poetry we must admit that it has never been surpassed in energy and magnificence.

The chief character comes from a remote past. Æschylus was merely the conscious artist that gives the impressive figure final and immortal form. The play is the perfect type of the primitive tragedy, which Aristotle designated «simple.» It has one feature possessed by no other tragedy; it transports us to a marvelous and fantastic sphere, to the most primitive period in the history of the world. The god that seeks to elevate man, that gives him the light of understanding, engrosses our attention. From the beginning to the end of the play the illusion is not broken. A god suffering for humanity is before our eyes; deities live and move in visible presence.

Zeus desired to create a new race after his own design. He was not satisfied with ephemeral man, a creation of the crude Titan world. But Prometheus, pierced by our human miseries, champions the old race: he steals fire from heaven and teaches the arts to insensate creatures. But Zeus will brook no infringement of his laws and resolves to punish the recalcitrant. So he commissions his two satellites, Might and Force, to drag the rebel to a steep rock in Scythia, «whose rugged brows are bent upon the swelling main.» Here the play begins.

Unfeeling Might turns the criminal over to Hephæstus, the smith, who clamps Prometheus to the cliff, where he will never see a human form: broiled by the sun's bright flame, he will welcome the spangled-robed night, and again the sun as it breaks the hoar-frost of the morn. Prometheus bears the taunts of Might in silence. Then the Titan invokes inanimate nature to witness the intolerable indignity to which he has been subjected: the divine æther, the rivers, the innumerable laughter of the sea-waves, Mother Earth and the bright circle of the all-seeing Sun. Suddenly a rush of wings is heard and a troop of sea nymphs enter in a winged car — «maidens yet rosed over with the virgin crimson of modesty.» Prometheus appeals to their pity. They remind him that a new pilot is at the helm in Olympus. The Titan swears that he will do something yet, when times are ripe, to this raw, unthankful king. Exultantly he cries that threats will not make him cringe. Weak women that they are, replete with tenderness, the Oceanids cannot understand how one can dare resist the will of Zeus. They beg Prometheus to unfold his story. One faction of the deities determined to cast out Cronus and set up Zeus as their king. By the help of the resourceful Prometheus, Zeus gained the throne. But the new ruler did not give his supporter the recompense deserved. He resolved even to annihilate the human race. Prometheus alone opposed the sovereign. The sympathizing nymphs now exhort the sufferer to seek some release. They alight from the car to hear the details of the Titan's story, when their father, Oceanus, enters astride a winged horse. The old man of the sea remonstrates with his kinsman and bids him beg for pardon. But the Titan, like Satan, hardens in his strength.

From this homely scene Æschylus soars aloft to a height of poetry as beautiful as it is magnificent. The whole world makes moan: the daughters of Colchis, the Scythian hordes, Asia's martial glory, the surge of the sea, Hades in the abyss of the earth, and all the streams murmur and sigh in a pathos of woe. Prometheus then enumerates the benefits he has conferred on man: reason, house-building, taming of beasts, science, literature, mathematics, astronomy, navigation, medicine, divination, mining. The chorus admonish him that all these gifts were for naught, since weak, ephemeral man could not help him in return. Io enters. The only mark of her metamorphosis is her horns. In admirable verses the poet depicts her fatigue, her despair and the tender sympathy she manifests at the sight of the sufferer bound on the storm-beaten rock. Prometheus tells her that he recognizes the daughter of Inachus, who had set Jove afire with love and is now by vengeful Hera driven o'er the earth. In a melodiously plaintive narrative, full of charm and grace, Io relates how phantasms and dreams came to her at night and reached the organ of her fancy, urged her to go out to the meadow-land that Zeus might be lightened of his passion; how her father had driven her forth from home; and now by gadfly sharply stung, pursued by the immitigable Argus, «with frantic bound from land to land I fly.» Prometheus now tells the harassed maiden that she must traverse Europe, through a wild and dangerous country, to the Tauric Chersonese, cross the Thracian Bosporus to Asia and then proceed to the plains of Cisthene, where the Gorgons dwell, and to the land of the griffins and Arimaspians, through a region peopled by monsters. At last she will come to a far land, whence she must creep down the river Aethiops until she comes to the Delta. There in the city of Canobis Zeus will restore her to her pristine form with but the touch and gentle pressure of his hand; and she will bear a son, swarthy Touchborn, who is to rule over all the land watered by the Nile. In the fifth generation 50 maidens, fleeing the proffered marriage of their cousins, shall return to her home in Argos and shall in the watches of the night put their lords to death. But one of the maidens will spare her mate. From this pair will spring a royal race, one of whose descendants is destined to deliver Prometheus. With a cry of terror the demented Io darts away, and the chorus moralize on the inadvisability of unequal matches. A great change has now come over the Titan. He is reminded by the appearance of Io that he will find respite; and so he resolves to await the retributive hour. The æons which he contemplated a moment ago seem now but a pulse beat. The steadfastness with which he asserts his will in the face of disaster makes an impression of unusual grandeur. «Let him in calm assurance seat him sure, fixing his faith on the deafening crash reverberating in the sky, and holding in his hand the thunder-stone high poised. He shall find a flame more furious far than the livid lightning's flash, a deafening crash to drown the thunder's roar!» The chorus are horrified. They remind the Titan that those who bow down to Necessity are wise. He replies: «Cringe low, crook the knee, truckle to the ruler ever. Fawn upon Zeus, and if you will, but think not that I care aught for him. Homage may he have from all, but none from me.»

Heaven's winged herald, Hermes, now sails downward on the bosom of the air. He commands Prometheus to yield up his secret. But the Titan observes the menial of the new crowned king with some surprise and thrice as much disdain: Zeus shall soon know that the victim holds a power above his oppressor: «Let him hurl his red levin and with storms and subterranean shocks of thunder confound the universe — never will he be able to extort the secret by any pain or ignominy he may devise.» Deaf to all entreaties, Prometheus will never sue for grace or bend the suppliant knee, never implore the hated king with base spaniel fawning and womanish supplication of hands. Hermes replies that Zeus will smite the rock with a thunderbolt and hurl the prisoner down into the yawning chasm of the earth, and after a long sweep of time the Titan will come forth to the light again only to have his body torn to a shred by the winged hound of Zeus, the ravening eagle, which will cram his crop full on the captive's liver. The nymphs urge the obdurate god to yield, but their entreaties are vain: «Let the forked curl of flame be hurled upon my head, heaven and earth convulsed with thunder and quivering spasm of winds exasperate; let the billow of the deep with its boisterous surge confound the paths of the stars in the sky, let him hurl me into the vortices of necessity — he cannot destroy me.» Hermes soars aloft. A storm breaks. The ocean swells and foams, all the sway of earth shakes like a thing unfirm, thunder subterrane reverberates, fiery-zigzag flashes gleam, whirlwinds twirl the dust, the winds leap together in conflicting blasts and the threat of Hermes goes into sublime fulfilment.

The second play of the trilogy was the 'Prometheus Unbound.' The Titan reappears bound to the same rock, but on the Caucasus. The other Titans, now released from Tartarus, urge Prometheus to yield. The eagle has been glutting his maw on the captive's liver every thing unfirm, thunder subterrane reverberates, with his arrow. Mutual concessions are made, and Prometheus returns to his place among the gods in Olympus.

The third play was called 'Prometheus, the Fire Bearer.' The theme was doubtless the induction of Prometheus into his high office as an Attic god and the establishment of a festival, the *Prometheia*, a prominent feature of which was a torch-race.

Without fire there would be no art, no industry, no civilization. Fire humanized man. The earth-fire came from the heaven-fire. To primitive man the production of fire was a miracle — in volcanic countries subterranean, in others super-terrestrial. Among all nations there is a tradition that fire was stolen, either directly from the gods or from some other tribe on whom the gods had bestowed the blessing. These myths closely resemble one another — in New Zealand, North America, Greece, France, India. Five hundred of the 1,000 Rig-Veda hymns invoke Agni (Ignis) a common surname of whom is Pramati (Prometheus, Forethought). Among savages the thief is usually an animal, among barbarous races, a man, among civilized nations, a god, or demi-god. The myth of the Fire-Stealer is the most popular of all among the aborigines of the Northwest. In Greece the legend goes back to the oldest period of mythology. Hesiod conceived the condition of man in the primitive period as a happy one. Prometheus brings punishment on himself and troubles on mankind, whose cause he has espoused. Zeus sends Pandora, whose charms mortals cannot resist. The conception of Æschylus is higher than that of Hesiod. The tragic poet insists on the benefit of the gift, and shows how fire was really the starting point of civilization, how all human culture had its origin in the spark which Prometheus filched for us in the fennel stalk. Primitive man was plunged in a heavy stupor, but in his beast-nature was capability. Prometheus taught him every art and science. The Titan's greatest crime was

> "To render with his precepts less
> The sum of human wretchedness,
> And strengthen man with his own mind,"

so that the pining sons of earth uplifted their prostrate brows from the polluting dust.

JOSEPH E. HARRY,
Author of 'The Greek Tragic Poets,' etc.

PROMETHEUS UNBOUND: A Lyrical Drama is the greatest of Shelley's longer poems. «This poem, begun in the autumn of 1818, was chiefly written,» says Shelley, «in the mountainous ruins of the Baths of Caracalla. . . . The bright blue sky of Rome and the effect of the vigorous awakening spring in that divinest climate, and the new life with which it drenches the spirits even to intoxication, were the inspiration of this drama.» This was his first experience of an Italian spring, and the reawakening of nature gave impulse and imagery to a vision of the rebirth of justice and happiness, on which the poet often fondly dwelt. «That man could be so perfectionized,» Mrs. Shelley notes, «as to be able to expel evil from his own nature and from the greater part of creation, was the cardinal part of his system.» The drama depicts this process in symbolism borrowed from a Greek myth already dramatized by Æschylus in the 'Prometheus Bound.' In the Saturnian Age — or, as Rousseau would say, in a state of nature — men were innocent and happy. Prometheus gave them the arts of life — institutions social and political; these, however, growing obsolete, cramped progress, begot abuses, yet acquired a prescriptive authority which became tyranny. This prescriptive authority — to Shelley, the very principle of evil — is in the poem identified with Jupiter, the persecutor of Prometheus. The latter represents goodness, wisdom, progress. Act I reveals him in his agonies; these result from contemplating the world as it is, especially when evil originates from intended good (e.g., see the view of Christianity, ll, 107 ff.). The struggle against evil enthroned has hitherto failed because hatred and violence have been the weapons of revolt (so in the French Revolution, ll, 567 ff). Only when wisdom, abjuring hate, follows the dictates of love will the Golden Age return,— i.e., in the allegory, when Prometheus is united to the nymph Asia. Asia, like the other symbols, has varying significance; she is love, or the emotional nature; again, she is that ideal spirit to whom is addressed the «Hymn to Intellectual Beauty,» and who in the «Adonais» is called

Urania. The central figure of Act II, she seeks for truth, which she finally attains by the aid of Demogorgon. This mysterious personage perhaps symbolizes destiny as the result of law, or the fundamental constitution of the universe; the emotional nature penetrates to and accepts the ultimate truth. As Act I depicts the patient endurance which is the present lot of goodness, so Act II depicts future progress toward a true philosophy. When wisdom is wholly dominated by love, and love accepts truth, the consummation of things is at hand. In Act III the dénouement follows; Jupiter weds Thetis,— a union from which he expects some culminating advantage; instead, Demogorgon appears and drags him to the abyss. Prometheus is set free and united to Asia. The intellect having attained its ideal, the emotional nature being centred on the true, «the Golden Years return.» This act concludes with a description of redeemed humanity. Act IV (an after-thought written at the close of 1819), is wholly lyrical, and reveals universal nature joying in a regenerate world. «No modern poet,» says Professor Herford, «has come nearer making the morning stars sing together.» Act IV is a crowning example of tensity of emotion, tenuity of thought and poetic beauty. «The passages which are most thoroughly stripped of doctrine, of definite ideas, and even of humanity, are the most perfect of all, and Shelley is there most himself» (Elton).

This meagre outline, bare of all the beauty and passion of Shelley's poetry, is ludicrously incapable of suggesting the original. «Prometheus,» while in some measure modeled on Æschylus, is, unlike it,— «a lyrical drama,» an allegorical presentation of thoughts and feelings. It has no characterization, save perhaps in the hero, nor any plot interest; such action as it has is difficult to follow. Its merits are of another order, and may be indicated in the words of William Rossetti: «There is, I suppose, no poem comparable, in the fair sense of the word, to ‹Prometheus Unbound.› The immense scale and boundless scope of the conception; the marble majesty and extramundane passions of the personages; the sublimity of ethical aspiration; the radiance of ideal and poetic beauty which saturates every phase of the subject, and almost, as it were, wraps it from sight at times, and transforms it out of sense into spirit; the rolling river of great sound and lyrical rapture; form a combination not to be matched elsewhere, and scarcely to encounter competition.» Consult Mrs. Shelley's Notes; Wm. Rossetti's paper in Shelley Society's Publications, 1886; Todhunter's Study of Shelley; Miss Vida Scudder's annotated edition.

W. J. ALEXANDER,
Professor of English, University College, Toronto.

PROMISE, an engagement entered into by one person to perform or not to perform some particular thing. When there is a mutual promise between two parties it is termed a contract. A promise may either be verbal or written. See CONTRACT.

PROMISE, Breach of. See BREACH.

PROMISSORY NOTE, is an unconditional promise in writing for the payment of money in a sum certain, absolutely, and at all events; it is negotiable when it is transferable from one person to another by endorsement or delivery, so as to vest in the party taking it the legal title to the note and to the property it represents; they are of ancient origin and were in use by the Romans. Under the law, generally, notes are assignable, so that the assignee may bring an action thereon in his own name. The usual parties to a promissory note are the drawer, the payee to whom it is drawn and the endorser. The important characteristic of a negotiable note is that the person receiving it does so for value and without notice of any question of title of the previous holder. Anything on the face of a note sufficient to put a transferee upon inquiry subjects him to any defenses between all the original parties; one taking negotiable paper that is overdue does so under like conditions. Possession of a negotiable note which is payable to drawer, or which is endorsed in blank, or to the holder specially, is presumed to be legal in every respect. A note to which any signature is attached, through which the holder claims, that has been forged, is not good. The holder of a note can bring an action thereon, except that it is payable to another, especially a note endorsed in blank. If a note is made subject to any conditions as to demand or notice, same must be first complied with before action can be brought. Protesting of a note is the declaration by the holder against any loss on account of non-payment; its object is to give notice to the endorsers of their consequent liability; such notice is essential, and it is customary that protest be made by a notary public. Many important subjects in relation to the laws governing promissory notes are the subject of statutes, which differ in various jurisdictions. See also ENDORSEMENT; NEGOTIABLE PAPER; NOTE.

PROMOTER, *in law*, (1) one who promotes an undertaking or the like, as a corporation. In this sense the term is applied specifically to one who aids in the organization of a joint-stock company or corporation or (in Great Britain) to one who aids in the passage of an act of Parliament. In the United States it is used almost exclusively in the sense of one who aids in the organization of a corporation by soliciting subscriptions to its stock, planning its business operations and doing other similar acts in furtherance of that object. A promoter in this sense is held by law to act in the relation of a trustee to such corporation, is held strictly answerable for any fraudulent misrepresentations which he makes to intending investors and is precluded from taking a secret advantage over the other stockholders. A promoter is personally liable on contracts made by him for the intended company after its failure to incorporate and also for subscriptions paid into such a company. A promoter is not allowed secret profits as between himself and the corporation, but he may purchase property for the corporation and later sell it at an enhanced price. (2) One who prosecutes offenders in an ecclesiastical court.

PRONGBUCK, or PRONGHORN, the American pronghorned goat-antelope (*Antilocapra americana*), one of the two sole living representatives on the American continent of the large series of Old World antelopes (*Bovidæ*), the other being the Rocky Mountain goat (*Oreamnos montanus*), which is more nearly a true antelope than a goat. Although almost universally known as "antelope," the pronghorn differs so greatly from the true antelopes that it is made the type of a distinct family (*Antilocapridæ*), having affinities alike with the giraffes, deer and goats. The horns, while resembling those of the true antelopes and the *Bovidæ* generally in consisting of a bone-core covered by a horny sheath, differ from those of all *Bovidæ* in the presence of a short anterior spur or branch. Furthermore, they are more or less densely and extensively covered with hair, thus resembling the horns of the giraffe. But by far the most remarkable peculiarity of these horns is that they are shed annually like a deer's antlers. So skeptical were zoologists as to the possibility of a hollow-horned ruminant shedding its horns, that, although the fact was known to hunters for many years and had been repeatedly reported, it was not until 1865 to 1868 that the truth of these reports became fully established. The entire horn is not shed as in the case of deer, but only the horny sheath, the bony core remaining intact and permanent and its epidermal covering immediately beginning to regenerate a new horn.

The pronghorn is about three feet high and five feet long, with a very short tail, slender legs, pointed, erect ears and extremely large eyes. Two important characteristics are the absence of the small accessory hoofs from both fore and hind feet and the hairiness of the end of the muzzle except along a narrow median line. The color is a variable and somewhat mottled brown, with a chestnut colored mane and a brilliant white rump patch or so-called recognition mark. Both sexes have horns; but those of the female and young are smaller and simple. Since the disappearance of the bison, the prongbuck is the most characteristic ruminant animal of the great Western plains. Although the progress of settlement has much diminished its numbers and reduced the limits of its range both easterly and westerly, the prongbuck still holds its own over an area extending for about 30 degrees from Saskatchewan on the north to the Mexican state of Zacatecas on the south, and from the Dakotas and Kansas westward through the Rocky Mountains and in the Cascades into Oregon. It occurs in Arizona and at a few points in California, but is absent from large areas in Colorado, Utah, New Mexico and Arizona. Prongbucks live in bands on the open plains or in the hilly countries; bucks, does and fawns associating during the greater part of the year, but at the close of the gestation period, which varies from March to September, according to latitude, the pregnant does separate to drop their two fawns in solitude, and the old bucks wander into the wooded hills. Their natural food consists almost entirely of grass, though grain, apples, etc., will be eaten in captivity. They are wonderfully alert animals, with keen senses, and so timid that they retreat on the slightest alarm, but withal so curious that they soon pause to gaze at the cause of their alarm. Their speed is marvelous, and their bounds of tremendous extent, but their power of endurance is not great and they never leap over an obstacle of any height. They may be domesticated with comparative ease and sometimes breed in captivity; and it is said that a fence of only three or four feet high is quite sufficient to confine them. Owing to the excellence of their flesh, though it is rather dry, and their splendid game qualities, they are much sought by hunters. The methods most in vogue are coursing with grey or deer hounds, running with relays of horses, and stalking, the latter especially requiring much skill, though they may be lured toward the concealed hunter by an appeal, by means of a fluttering colored cloth or handkerchief, to their inordinate curiosity. The Indians hunted them by stalking, sometimes dressed in the skin of one of their kind; by driving them into brush enclosures, over which they would not leap; and in other ways. Consult Canfield (in 'Proceedings of the Zoological Society,' London 1866); Caton, 'Antelope and Deer of America' (Boston 1881); Lyddeker, Richard, 'Royal Natural History' (Vol. I, London 1895); Roosevelt, Theodore, 'American Big Game Hunting' (New York 1901) and 'The Deer Family' (New York 1902); Seton, E. T., 'Life Histories of Northern Animals' (ib. 1909).

PRONOUN, a part of speech which takes the place of the noun, to avoid too frequent repetition of the noun or to designate an object whose name is not known or, if known, is not desirable or available for use. Pronouns have the same properties as nouns, viz.: gender, person, number and case. It differs from the noun in this, that whereas the noun stands always for some definite object or concept or class of concepts, for example, Chicago, man, house, the pronoun may stand now for a given concept or class of concepts; but again for a totally different one; thus the pronoun has no fixed denotation: "it" may stand for "Chicago," or "horse," or "universe." A usual classification of pronouns divides them into those personal (I, thou, he, she, it); demonstrative (this, that), interrogative (who? which? what?), possessive (my, thy, his, her, hers, its, our, ours, your, yours, their, theirs), relative (who, what, which, that), and indefinite (any, aught, some, each, every, other, etc.): but the demonstratives and the indefinites do not, as a rule, fall under the definition of pronoun. Worthy of note is the general going out of use (at least in polite society when equals address equals) in all modern languages, of the personal pronoun (and its possessive) of the second person singular, thou, thy, thine and the substitution for it of the second person plural or (in German) the third person plural or of a form signifying "your worship" or the like. Consult Amyot, C. J. B., 'De la Nature des Pronouns' (Paris 1856); Goebel, K., 'Die Grammatischen Kategorien' (in *Neue Jahrb. für das Klassische Altertum Geschichte, und Deutsche Literatur*, Series III, Vol. V, Leipzig 1910); La Grasserie, D. de, 'De la Veritable Nature du Pronoun' (in 'Etudes de Grammaire Compare,' Louvain 1888); Maetzner, E., 'An English Grammar' (3 vols., London 1874); Owen, E. T., 'A Revision of the Pronouns' (in Wisconsin Academy of Sciences, Arts and Letters, Translations, Vol. XIII, p. 1, Madison 1901).

PRONUNCIAMENTO, in Spanish-speaking countries, especially in Spanish-American republics a proclamation against the existing government, intended to serve as a signal of revolt. The word *contrepronunciamento*, that is, counterproclamation, also occurs.

PRONUNCIATION, the act of uttering words or articulate sounds of the voice. The alphabetic characters are designed to represent with more or less precision the voice-sounds of a language, and if all those sounds have each its proper sign, a written word will be a sure index of its pronunciation. The alphabet of the Spanish language is nearly perfect in this respect. In Spanish the vowels have each one quality of sound: in whatever situation, they have each but one value and *a, e, i, o* and *u* are pronounced respectively as *a* in father, *ei* in rein, *ee* in see, *o* in lone and *oo* in moon. The consonants, too, have only one sound, except that before the vowels *a, o* and *u* and before consonants, *c* has the sound of *k* and *g* the hard sound of *g* in get; also, to represent special sounds, *l* is doubled (*lleno,* pron. lyaino) or a diacritical mark is used (*año,* pron. ahnyo). Not so in English. In English each of the vowel and consonant signs designates various sounds. Thus the vowel sign *a* denotes at least six different vowel sounds; *e* at least four; *i* at least three; *o* (including *oo*) seven and *u* in four; often they are silent, representing no sound. Many of the consonants, too, though not to the same extent as the vowels, represent each, whether singly or compounded, two or more different sounds; examples: cede, call, child, machine, chemic. Other consonants which stand for more than one sound are *s* (sat, has, sure), *t* (tan, thin, thine, nation), *n* (sin, sing), etc.

The different sounds represented by the vowel sign *a* are: (1) the short vowel sound which it oftenest represents: it is heard in man, cab; this sound is almost peculiar to English; it differs slightly from the short *a* of French and considerably from the short *a* of German; Germans who are beginning to learn English have difficulty at first in producing this English vowel and instead of man say men, het instead of hat. (2) The long sound of *a* as in hate, late; its sound is that represented in other languages by the second vowel *e;* in German and other languages the sound of the word bane would be represented by ben or behn or bên, etc. (3) The sound of *a* (however represented — by *a,* or *ei,* or *ea,* etc.) — before *r* in the same syllable, as in share, bear. A vulgar mispronunciation of such words is shar, bar; in Irish pronunciation the *a* in share, bear, pear, etc., has precisely the same sound as in shape, lane, bane. (4) The sound of *a* in father, calm, far: this is usually styled the Italian sound of *a.* (5) The sound of *a* in ask, branch, pass, differing from the pronunciation of the same letter in at, tan, pan: it is the short sound of the *a* in father. In England and New England the distinction is made between the sound of *a* in branch, ask, etc., and the *a* in barn, ran; elsewhere in the United States it is not observed. (6) The sound of *a* in all, warm, talk, is peculiar to English; it is much broader than *a* in German words all, fall. (7) The sound of *a* in what, wander, is peculiar to English; it is represented by *o* in not, gone, etc. The sounds of *e* are (1) its short sound as in net, sent; (2) the long sound as in obese. mete, green; this sound is represented in most other languages by the third vowel *i;* (3) the sound which it has in vein, rein; in other languages this is the primary sound of this vowel; (4) the sound, peculiar to English, which it has before the letter *r* as in per, confer. Three sounds are represented by *i;* namely: (1) the short sound as in pin, bin; (2) the corresponding long sound as in marine: this is the regular sound of *i* in other languages; in English *i* is so sounded only in a few words; (3) the long sound heard in pine, ride: this is a diphthong and equal to *ei* or *ai.* The vowel *o* represents the following sounds: (1) Its primary sound in English and other languages, as in ode, lone; (2) a short sound peculiar to English, as in not, nod: this is not the *o* of ode shortened; the shortened *o* of ode is unknown in English; (3) the obscure short sound (same as that of *u* in but) heard in other, son, done; (4) the sound heard in prove, move: this is the long vowel *u* of German, Spanish, etc., and the *ou* of French; (5) the same sound shortened, as in wool, book, took; (6) a sound closely resembling that of *a* in all: it occurs when *o* is followed by *r* in the same syllable, as in order, corner; in Irish pronunciation this *o* has the same sound as *a* in all. The sounds represented by *u* are: (1) that heard in rule, rumor, Lucifer: here it is equal to oo in moon, and it represents the sound of *u* in German, Spanish, Italian, etc., but not in French; (2) the corresponding short sound heard in put, bull; (3) the peculiar sound given it before *r* in the same syllable, as in urge, urn; (4) the diphthongal sound that it has in union, pure: here it is equal to *yu* or *eu.* In the United States long *u* after *l* has always the sound of *oo* in ooze; but dictionaries which represent the pronunciation of such words as lurid, luce, in England, give to the *u* the same value it has in cure, that is, the diphthongal sound (l'yurid, l'yuce), though in the same dictionaries the *u* in luna, lunary, ludicrous, etc., is represented the same as in rule. In the United States the *u* in such words as duty, tulip, is commonly mispronounced as dooty, toolip, instead of d'yuty, tyulip; the Irish mispronunciation of such words is jooty, tshoolip.

In the pronunciation of various consonants English is peculiar or differs from other languages in sundry respects; for example, *ch* in English words is equal to *tsh* (chat) or to *sh* (chivalry) or to *k* (chemism). The *d* and *t* of English are pronounced with the tip of the tongue touching the gums well above the teeth; in other languages the contact is at the roots of the teeth. The *th* in thin is almost peculiar to English, but the same sound exists in Spanish; the sound of *th* in thy, that, is peculiar to English. In Irish pronunciation the sound of *th* in thank, thousand, is produced by firm contact of the end of the tongue with the teeth and forcible emission of the breath. In the Irish pronunciation of thy, that, there is also contact of the tongue with the teeth and gums. For the value of the letters and their combinations in other languages see the articles on these languages and consult the works referred to under these heads. Consult also Bloomfield, Leonard, 'Introduction to the Study of Language' (New York 1914); Passy, Paul, 'Petite phonétique comparée des principales langues européennes' (2d ed., Leipzig 1912); Soames, Laura, 'Introduction to English, French and German Phonetics' (3d ed., London 1913); Viëtor, T. W., 'Elements der Phonetik des

Deutschen, Englischen und Französischen' (6th ed., Leipzig 1914). See ACCENTS.

PRONY, prō-nē, **Gaspard Clair François Marie Riche**, BARON DE, French engineer: b. Chamelet, Rhone, 22 July 1755; d. Asnières, Seine, 29 July 1839. He received his technical education at the Ecole des Ponts et Chaussées. As assistant to the civil engineer Perronet he was employed in building the bridge De la Concorde at Paris and the restoration of the harbor of Dunkirk. Made head of the board of survey, in 1791 he superintended the construction of new trigonometrical tables, extended to 25 decimal places, necessitated by the establishment of the metric system. This great work in 17 volumes is preserved in manuscript at the Observatory at Paris. In 1794 he was appointed director-general of bridges and roads and at the same time was made professor of mathematics at the Polytechnic School, in 1795 he became a member of the Institute and in 1798 director of the Ecole des Ponts et Chaussées. Under Napoleon he executed improvements in the harbor of Genoa, Ancona and Venice and in the navigation of the Po. In 1810 he became a member of the commission charged with the drainage and improvement of the Pontine Marshes. In 1818 he was made one of the 50 foreign members of the Royal Society and in 1835 a peer of France. He wrote several works of a technical character connected with the engineering operations of which he had charge, the most important of which is 'Déscription Hydrographique et Historique des Marais Pontins' (2 vols., Paris 1822–23). He also published 'Nouvelle Architecture Hydraulique' (2 vols., Paris 1790–96); 'Viede Pingré' (Paris 1796); 'Nécanique Philosophique' (Paris 1800); 'Leçons de Mécanique Analytique' (2 vols., Paris 1810–15).

PROOF. See EVIDENCE.

PROOF IN ART, the name given to an impression of an engraving «pulled» or struck off, from the plate, with or without the signature of the artist. After the various «proofs» and «states,» there comes, finally, the «finished» or «publication state,» preceded by the last proof passed by the artist as «ready for printing.» Each of the impressions issued to the public is classed under one of the following headings: (1) Artist's proofs; (2) proofs before letters; (3) lettered proofs (or proofs after letters), and (4) prints. These headings do not necessarily correspond with «states» of a plate. They are simply description of the amount of lettering printed on the impressions to which they refer. The «publication line» should be on every impression and is the only lettering which appears on artist's proofs. Proofs before letters have printed on them the names of the artist and engraver of the work, in addition to the «publication line,» but they are without the title. They are stamped on the right.

Lettered proofs have printed on them the names of the artist and engraver of the work and the title of the subject. They are also stamped on the right. Prints have all the above-mentioned printing, but the style in which the title is printed is altered in some manner from that appearing on the proofs. They are not stamped at all. To-day artists who «pull» their own proofs usually sign in pencil.

A «wax proof» is a tentative proof by the engraver for the purpose of learning what retouching may be necessary. It is obtained by filling in the lines with lampblack and applying it to a sheet of paper coated with white wax and exerting upon it a gentle pressure with a burnisher.

«Proof with gray letter» is applied to proofs in which the lettering is grilled with «hatchings» (small lines).

«Proof with white letter» is a proof in which the characters of the legend or inscription are only indicated by outlines.

«The word 'state' and 'proof,' writes Dr. Frank Weitenkampf, 'call for explanation.' Their use is not always well defined. In a general way it may be said that the 'proof' is usually applied to an impression taken from the plate in the earlier clearly unfinished stages, while 'state' is used to indicate stages of relative completeness. As the engraver, or etcher, works on his plate, he takes an impression occasionally to get the effect of what he has done. Such impressions are known as 'trial-proofs' or 'working-proofs.' There are many ways of making changes. Work on copperplates may be obliterated by scraper and burnisher or the plate may be beaten up from the back on an anvil by a hammer. A portion of a wood block may be cut out and a plug of wood inserted in its place to be re-engraved. A piece may even be added to an engraved block or plate and the engraving then enlarged. Occasionally an etcher will try his point on the margin of the plate or even execute some slight sketch. Chodowiecki did this; Buhot did it to a very elaborate extent. Such marginal sketches are called 'remarques.' And from this habit originated the systematic production of 'remarque proofs' against which Whistler directed his fine sarcasm. But he also declaimed vigorously against the presence of any margin at all. A margin on the plate is not a necessity, but a proper amount of margin is undoubtedly a protection for a print. In modern times the whole matter of 'proofs' and 'states' was brought into a regular system, impressive to the buyer and profitable to the producer. There may be, for example, successively trial proofs, finished proof, proof with remarque, artist's proofs, before all letters (or inscription), 'state' with names of artist only, with inscription, in open letters, with letters filled or solid, with publishers' address. And the 'states' again may be on India or Japan paper and on plain paper.

«The importance of a good impression is paramount and the good impression is the result of the printer's skill and the 'state' of the plate. For this reason, also, early 'states' are sought by collectors, but even more, perhaps, because they are rare. For rarity plays a very important part in the collector's list of reasons. In reality, mere priority of 'state' does not mean much in itself. The very fact that the artist thought it necessary to create a later 'state' by making corrections or additions, is significant. Such an afterthought may raise a plate from comparative insignificance to telling force or it may spoil it altogether. Turner's 'Calm' (No. 44 of the *Liber*) is usually considered much finer in the third 'state' than in the first. The Techener reissue of Jacquemart's 'Gemmes et Joyaux' is better than the first 'state,' says Wedmore. In the second 'state' of Whistler's 'Kitchen' a large amount of added dry-point work appears, especially on the walls leading to the window, increasing the richness and harmony to a remarkable extent. On the other hand, the luminous quality and reflected light in the first 'state' of Turner's 'Crypt of Kirkstall Abbey' have become dull and flat in the second. Some of Meryon's plates have distressing additions in the later 'states,' strange birds and beasts and human beings, sometimes of a troubled mind. Nor could any amount of working change the fumbling effect of the body in Whistler's 'Becquet' (the 'cello player'), in which the interest is absolutely concentrated on the well-wrought head. There may be various reasons for preferring an early 'state.' Experience, developed taste and acquired knowledge of the individual case will determine your choice.»

ESTHER SINGLETON.

PROOF, Ontological, or ONTOLOGICAL PROOF. See ONTOLOGY.

PROOF-READING, the process of reading the printed proof of matter to be printed, and marking errors, corrections, etc., on the margin. Proof-readers require to be expert in typography, as well as possessed of considerable education and general knowledge. An established set of signs is used. The specimen of a proof shown on this page exhibits most of these signs.

The immediate object of proof-reading or correcting is to mark every error and oversight of the compositor, with a view to make the printed sheet a perfect copy of the author's manuscript. This is done on the presumption that the manuscript is correct, which is seldom the case; and, therefore, the duty of a good reader extends to seeing that there are no inconsistencies in orthography, punctuation, abbreviations, etc., and in many cases to the verification of quotations, dates and proper names. Where extensive alterations, omissions or additions are likely to be made by writer or editor, it is more convenient to take the proofs on long slips called galley proofs, before division into pages. The making of new paragraphs, or the suppression of those in type and needless addition or omission of words that involve resetting many lines, should be avoided as causing trouble and expense.

The duty of securing consistency in spelling and punctuation is especially important in the case of works on which several writers are employed, such as newspapers and periodicals. The proof-reader has also to observe the numbering of the pages; arrangement of chapters, paragraphs and notes, running titles, etc. It is part of his business to observe the mechanical defects of the work — defective types, turned letters, inequalities of spacing between words, sentences and lines, crooked lines, and to secure symmetry in verses, tables, mathematical operations and such like. In almost all cases two proofs are taken, and in difficult works, such as those in foreign languages, tables, etc., even more. Lastly follows the revision, in which

(1) A wrong letter. After every mark of correction a line / should be drawn, to prevent its being confounded with any other in the same line. (2) A word or letter to be transposed. Where letters only are to be transposed, it is better to strike them out, and write them in their proper sequence in the margin, like a correction. (3) A space to be inserted. This mark is also used when the spacing is insufficient. (4) A space or quadrat sticking up. (5) Alteration of type. One line is drawn under the word for *italics*, two for SMALL CAPITALS, three for CAPITALS. (6) Correction or insertion of points. (7) A word struck out, and afterward approved of (Latin *stet*, "let it stand"). (8) A turned letter. (9) An omission. (10) A letter of a wrong font. (11) A word or letter to be deleted. (12) Alteration of type. (13) A new paragraph. (14) Insertion of a clause. (15) A space to be removed or diminished. (16) A wrong word. (17) Straighten into line (18) Insert a hyphen. (19) No paragraph. (20) The manner in which the apostrophe, inverted commas, the star, and other references, and superior letters and figures are indicated.

little more is done than seeing that the compositor has made all the corrections marked on the last proof. It is usual for the writer or author to reserve the correction of the second proof for himself. The work of a proof reader is more difficult than the uninitiated would believe. It requires extensive and varied knowledge, accurate acquaintance with the art of typography and, above all, a peculiar sharpness of eye, which, without losing the sense and connection of the whole takes in at the same time each separate word and letter. The proof-reader usually is assisted by a second person, called the copy-holder, who reads aloud from the original copy, spelling out names, words in foreign languages and other words offering special difficulties. Proof-reading now is usually done by persons devoting themselves exclusively to this work. In earlier times it was the custom of publishers to employ scholars and writers and authors were in the habit of sending the proofs of their works to friends for the purpose of reading them. In the case of scientific books this custom is still frequently followed. (See PRINTING). Consult Appleton, D., and Company, ‹Of the Making of a Book› (New York 1904); Booth, W. S., ‹Notes for the Guidance of Authors› (New York 1900); Crapelet, G. A., ‹Études Pratiques et Littéraires sur la Typographie› (Paris 1837); De Vinne, T. PROPAGANDA, a shortened name for the *congregatio de propaganda fide* (congregation for propagating the faith), founded by Gregory XV in 1622. It consists of a number of cardinals with the cardinal prefect at their head, has a general secretary and a vast number of inferior agents or employees. A special section is devoted to the Oriental rites. It is the central missonary association of the whole Roman Catholic Church, and superintends and guides missionary operations in all parts of the world. Under its direct control are now all countries in Europe and America where the ecclesiastical hierarchy is not established. Connected with it is the *collegium seu seminarium de propaganda fide,* usually called the Collegium Urbanum after its founder, Urban VIII, who instituted it in 1627 for the education of missionaries, students of all nationalities subject to the Propaganda being here received and trained and maintained free of expense, from the age of 14 years. Converts to the Roman Catholic Church who have come to Rome are instructed and supported by its funds. Bishops and other clergy who have been missionaries are also welcomed and supported there. The Roman Propaganda had, until within recent years, a printing-press, celebrated for the works which issued from it. The efforts of the propaganda are directed particularly to countries outside of Europe. In close connection with it stand a number of seminaries or colleges for missionaries in various countries, including the United States. (See MISSIONS). Consult Benigni, U., ‹Propaganda› (‹Catholic Encyclopedia,› Vol. XII, New York 1911); Freri, J., ‹Missionary Work of the Church› (New York 1908); Martinis, R. de, ‹Ius Pontificum de Propaganda Fide› (7 vols., Rome 1889–98); Mejer, O., ‹Die Propaganda, ihre Provinzen und ihr Recht› (2 vols., Göttingen 1852–53); Pieper, A., ‹Gründung und Erste Einrichtung der Propaganda Kongregation› (Munich 1901).

PROPELLER. See SCREW-PROPELLER.

PROPERTIUS, prō-pėr'shĭ-ŭs, **Sextus,** Latin poet; b. Assisium, Umbria, about 50 B.C.; d. Rome, between 15 and 2 B.C. He is ranked by many as the greatest elegiac poet of Rome. Comparatively little is known regarding his life. He was deprived of his estate in the course of the agragrian confiscation and reduced to comparative indigence. Nevertheless he acquired a good education and was urged to take up the profession of advocate, but seems to have preferred devoting his energies to light literature and affairs of the heart, in which his love for the woman in his poems called «Cynthia» (her real name was Hostia), finally gained the ascendant and is reflected in much of his best writing. Propertius numbered among his friends Virgil and Ovid and engaged the patronage of Mæcenas. With Horace his relations do not appear to have been friendly. He was of a delicate constitution, pale and thin in person and of an emotional temperament in which melancholy seems to have had a large share, particularly in his late years. It is said of him that he was very careful about his personal appearance, almost foppish in his attention to dress and gait. The poems of Propertius consist of a collection of elegies usually divided into four books, though some commentators claim that they ought to be divided into five. All existant manuscripts, however, contain many gaps and have been in some instances more or less disfigured by corruptions. They are in their outward form modeled somewhat after the manner of the Alexandrine poets Callimachus and Philetas. He excels in the presentation of quiet description and emotion, «a fine and almost voluptuous feeling for beauty of every kind, and pleading and almost melancholy tenderness.» English translations have appeared by Palmer, Paley and Postgate. The best texts are those by Hertzberg (1843–45); Keil (1850); and Haupt (1885). There are now no manuscripts in existence of his works that date earlier than the 12th century. The best and most complete manuscript is the so-called *Codex Neapolitanus,* now at Wolfenbüttel (12th century). Others are *Codex Vossianus* at Leyden (14th century); *Codex Laurentianus* at Florence (15th century); *Codex Daventriensis* at Deventer (early 15th century); *Codex Holkhamicus* at Holkham (1421); *Codex Urbinas* in the Vatican (15th century). The first edition was published in Venice (1472). Other editions of importance are by Passerat (Paris 1608); Lachmann (Leipzig 1816; Berlin 1829); Hertzberg (Halle 1843–45); Paley (London 1872); Bährens (Leipzig 1880); Palmer (Dublin 1880); Postgate (London 1894); Rothstein (Berlin 1898); Haupt-Vahlen (Leipzig 1904); Butler (London 1905); Phillimore (London 1911); Hosins (London 1912). English translations have been made by Kelly (London 1854); Moore (Oxford 1870); Cranstown (London 1875); Phillimore (Oxford 1906), and

Butler (London 1912). There are also translations into German, French, Italian and other modern languages. Consult Davis, J., 'Catullus, Tibullus and Propertius' (Philadelphia 1876); Gruppe, O. F., 'Die Römische Elegie' (2 vols., Leipzig 1838); Havet, L., 'Notes Critiques sur Properce' (in *École Pratique des Hautes Études. Paris Bibliothèque.* Paris 1916); Housman, A. L., 'The Manuscript of Propertius' (in *Classical Philology,* Vol. VI, p. 292, Chicago 1911).

PROPERTY, Laws of. Anything, whether tangible or intangible, which can be reduced to possession or made the subject of ownership, comes within the legal definition of property. The sea, the waters of rivers and the atmosphere enveloping the earth are for the common use of all men and can become the exclusive possession of no individual; wherefore they are not designable as property. But a thing may be property and subject to ownership without being the physical possession of the owner. With respect to intangible objects physical possession is impossible. One may own land without being in occupation thereof either personally or by representation; but a copyright is not a thing that one can put in a wallet and carry around on his walks. Here are two objects of ownership, one intangible and the other the most concrete of earthly things, in the case of which the fact of proprietorship may be, and in the latter instance must necessarily be, merely a matter of record. Some things are loosely spoken of as property which are not really objects of ownership in a legal sense. A man has a right to his good name, but he does not «own,» though colloquially speaking he may be «robbed» of it. The capability of being transferred is the quintessence of property. One cannot transfer his personal reputation to another, but good will, patent rights and many other intangibles are property because they may be bartered and sold like goods and chattels. But ownership implies not only the transferability of the thing owned, but also the possibility of transferring the same. If a man were alone in the world he could call nothing «mine,» says Kant. The relation of ownership is not a relation between the man and the thing but between him and other men, whom he excludes from, and to whom he gives, possession. Property is an «exclusive» right and where there are no people to exclude, the right cannot exist.

Primitive Law.— In early society one should not expect precise conceptions of proprietory and other legal rights to be prevalent. Nothing is further from the truth than the theory of the «Law of Nature» that the institution of property is the result of a social contract, whereby each individual surrendered a part of his liberty — meaning the privilege of doing whatsoever he pleased — in consideration of being secured in the remainder of his rights, including the possession of his belongings. In the «state of nature» the legal conception of ownership is absent and possession is merely a fact, not a right. Primitive man took unto himself everything within his ability to take and kept all he was capable of defending. Mankind was ruled by the might of the strong. Even in a relatively advanced stage of civilization the possessor was expected to protect his own by force. When an early Englishman had slain another while resisting dispossession by an intruder, the question to be determined in any ensuing lawsuit would not be whether violence in the defense of possession was justified, but whether the defender should pay a penalty, and if so, how much, for killing the trespasser. Under nearly all early laws larceny is punishable with death and the injured person is permitted to inflict the penalty on a manifest thief. These rules of self-protection are very different from legal prescriptions or constitutional guaranties — and there is in the latter not a trace of their derivation from a primordial social contract. On the contrary, the primitive conceptions of property conform in a crude way with those of 19th century utilitarianism. Everything that an individual could acquire and successfully defend (in the savage state by brute strength, in the condition of individualistic materialism by power of law) was regarded as absolutely his own and disposable at his volition.

Between these two poles of extreme individualism there lie social ideals of many degrees, varying longitudinally in point of time and latitudinally according to the stage of civilization attained by those who hold them. The periods of historic time and social progression do not synchronize, so that the greatest diversity of property laws may coexist in different parts of the world. The salient sociological fact, however, is that the institution of property (when it has been raised above the cave man's level of anarchic self-sufficiency) has everywhere passed through a communistic stage. When this step in advance has been made a man may individually own his weapons and implements, a woman her distaff, spinning wheel and personal ornaments; everything else, however, is usually owned in common — the land by the *gens,* clan or commune, the chattels by the family, the paterfamilias functioning as trustee, so to speak. But collective ownership is not found to be incompatible with individual possession. Quite the opposite, in the social stage referred to the division of the common property for singular use and enjoyment is a subject of supreme concern. A partition of the arable land is made between the families of the commune or tribe, annually or less frequently, for the purpose of cultivation; woodlands and pastures are preserved as commons, while the ground occupied by the family domicile is usually granted for possession in perpetuity, with a reservation of ultimate ownership by the community. Collectivism in this primitive form has persisted to the present day in the Russian "mir." When the system breaks down communal ownership is not superseded at once by individual ownership, but by the quasi-corporate ownership of property by the family group. The homestead and farmed land became the inalienable and indivisible family *allod* of early Teutonic law and, while chattels were let and hired and could be pledged and forfeited, the alienation of patrimonial property was an affair of families, not of individuals, which was accomplished by a clumsy adaptation of the Roman *hereditas universalis*. Clear traces of the precedent communal system of proprietorship are found in the laws of republican Rome. The paterfamilias with all his despotic powers could not divest his descendants of their heritage and, when there were no descendants, property reverted to the *gens*, whose right of succession could be defeated only by a will made with the consent, and in the presence, of the entire *comitia*, armed and drawn up in battle formation. In the village communities of India the primitive Aryan collectivism has developed to a most complicated system of ownership, not only with respect to houses and land, but to all property. Everything a member of the community acquires, from an elephant down to a soldering iron, theoretically becomes a part of the common stock, though there are minute regulations securing to individuals the possession and use, and the disposition or bequest of the same. The conception of absolute individual ownership is of modern origin, relatively speaking, among European nations, but it seems to have prevailed in the ancient monarchies of Chaldea, Assyria and Babylonia. The Mosaic law ordered the redistribution of property by tribes and families in the jubilee years.

Roman Law.— Early Roman law made a distinction between *res mancipiæ* and other things. With the former were classed *immobilia*, corresponding in a general way with what he calls real property, though the term was more comprehensive, extending not only over lands tenements and hereditaments, furniture, fixtures and everything that could be considered as part of an estate, including some slaves (glebemen) and other chattels. *Res mancipiæ* were considered a more dignified kind of property than mere merchandise, and could be transferred only by *mancipium*, a ceremonial form of contract, at the execution of which many witnesses representative of interests in the subject-matter of the bargain were required to be present. The absence of one of these, the mispronunciation of a ceremonial word or the omission of a gesture made the contract a nullity. Ceremonial impediments and the trammels of collectivism are incompatible with the rapid exchange of commodities. Rome is now generally believed to have been in its origin an Etruscan trading post, established in the midst of an agricultural Latin community. The power of the merchant or tradesman to dispose of his merchandise in his sole right has to be recognized if commerce is to be successfully conducted. Possession must be assumed to give, and a transfer without formalities suffice to pass, title. The rules applicable to articles of commerce brought to port by Greek and Punic traders, or manufactured in Rome by plebian artificers, were presently applied also to the products of patrician Roman farmers, and, ultimately, to *res mancipiæ* without distinction. Possession, or dominium, was defined by the Roman lawyers with great precision, the *jus possessionis* being quite the most important part of the Roman law of property; nor are their reasonings mere speculative niceties. Possession, as the saying still goes, is nine points of the law, and, as Bentham remarks, "in defense of his possessions a man may lawfully strike, wound or kill, if need be." To constitute possession or dominium two elements are required, the ability to take and the will to hold. The desire to have a bird in the bush does not give possession to one who is unable to catch it; the power to seize a stray cow does not make one a possessor who has not the least intention of exercising his power. These corporeal and mental constituents of the act of possession are designated *corpus* and *animus domini*.

One may have possession of a thing, *dominium*, without being in actual contact. A soldier is in possession of his rifle lying within reach; the purchaser of goods in storage is in possession when he holds the key to the warehouse where they are stored; an heir is in possession of the entire estate, though he may have entered only on a part of it or merely viewed it from a distance. The essence of possession is the power to exclude others. A man is in possession of things left at his domicile, though they have not been touched by him nor by anyone in his behalf; but not of a treasure buried on his grounds unless he may have dug for it and actually found it. The distinction is reasonable, though rather fine. One is in more complete control of one's house and its contents than of one's fields and what is hidden therein, and one may be forestalled by another in lifting a treasure. It should be remembered that these definitions have reference to *dominium* as a juristic fact and not to the rightfulness of the possession. The will to control, *animus domini*, is manifested in perfection by those only who rightly or wrongly recognize no superior or parallel right in any other person to possess the thing held. The intention of a servant, who resists the taking of property entrusted to him by his master, is merely to protect it from violence, without any assertion of right over the same on his own behalf. So also, where the intention to hold or dispose of an object is limited by the distinct recognition of the outstanding rights of another — as in the case of a tenancy or bailment — the Roman law regards the holder as lacking the *animus domini*, i.e., the intention to act as owner to the complete exclusion of everybody else. The difference between the Roman and Teutonic and English laws in this respect is not so great in fact as it seems, however. The interdicts provided "real" remedies for the protection of possessory rights, analogous to actions of replevin or suits in ejectment, of which only "exclusive" possessors could avail themselves; bailees and lessees having no rights *in rem* had to take recourse to personal actions to redress their injuries. Even to this rule the Roman law made important exceptions. A non-contractual tenant, *tenens precario*, a ground-renter for a long term of unimproved agricultural land, *emphyteusis*, the holder of a pledge, and a *sequester* (receiver or trustee) could resist dispossession by actions *in rem*. Loss of the power to exclude or of the will to control, of course, makes an end of possession or *dominium*. A temporary interruption of use or occupancy, however, is not a relinquishment of the possessory right. One who regularly pastures his cattle on a certain meadow during the summer does not abandon his use because he does not graze there in the winter also; nor may one who leaves his possessions in charge of a steward and goes abroad be presumed to surrender his power of control. Neither does failure to exercise the will to possess and to exclude others terminate a *dominium*, when the failure is due to a legal disability — the possessor being a minor or a lunatic, for instance.

Ownership, *proprietas*, is a further development and amplification of the right of possession. Indeed *dominium* or exclusive possession implied ownership. But one may own a thing, though one have no actual control over the same — while property may be denuded of every attribute that gave it value and ownership therein still persist. In this condition the Roman law designates it *nuda proprietas*. The right of ownership includes the right to possess, and an owner out of possession obtains restitution in virtue of the *jus vindicandi*. Ownership has been defined as "complete dominion over a thing." The owner of property has the right of disposal; he may sell it or give it away, and he may destroy it. But the owner's rights are limited by other rights. No man may use his own in a manner injurious to others, and all property is held subject to the right of the State to tax or take for public purposes, or to restrict the uses to which it may be put by the owner. The "complete" dominion of the owner, moreover, is diminished by servitudes and co-ownership, and the right to possess is suspended by letting or hiring, deposits, pledge, mortgage, etc. Ownership is extinguished by conveyance, gift or bequest, by long-continued adverse possession and by the death of the owner. Ownership may be derivative or original. It is derivative when acquired by purchase, gift or inheritance. Original ownership is established by *occupatio*, *accessio*, *specificatio*, or *usucapio*. *Occupatio* (literally, laying hold of) applies to ownerless things, *res nullius*, in which class the Roman law places wild animals, treasure buried by one in a stranger's land and derelicts — the latter including all the property, whether public or private, of enemies, which was conceived to have no legal owner and to be subject therefore to capture. *Accessio* signifies an addition to property through no action of the owner as by the planting of a tree or the building of a house on one's land by another person. *Accessio* includes *alluvio*, the gradual deposit of soil by the sea or a running stream, and *avulsio* the sudden accretion of soil torn from another's property by a freshet or landslide. *Specificatio* refers to property that comes into being when one works material belonging to another into something new and different (*nova species*). A sculptor owns the statue he has carved, irrespective of the ownership of the marble. Even more obviously, a work of literature is the property of the author, not of the owner of the paper on which the manuscript is written. One who works up material for hire, or whose work is not creative in the same sense as an artist's, does not become a proprietor by *specificatio*. A tailor does not own the coat made from cloth furnished by his customer. Neither does the *speciefactor* become the owner when the material he has worked up can be restored to its original condition. Good faith, of course, is a pre-condition to the establishment of ownership by specification. *Usucapio*, the taking of a thing to one's own and exclusive use, is indistinguishable from what is known to English law as adverse possession, except that the periods of prescription in Roman law are shorter — one year for movables and two years for immovables. According to Roman law the right to possess can exist in such completeness as to constitute a *dominium* in only one person at a time. Partial or conditional possession of a thing does not make it property of the possessor in the juristic sense of the word. Ordinary leases create merely a contractual relation, not a proprietory right; and things lost by, or stolen from, a bailee are recoverable in a procceeding *in rem* only by the owner. Property in land includes not only the surface but the mineral wealth contained therein to any depth beneath.

Mediæval and Modern Law.— Teutonic custom distinguished less sharply than Roman law between ownership and inferior possessory rights. Delivery regularly passed title to movables. In some instances a bailee had the right of action, for a recovery of property to the exclusion of the owner. Possession was regarded as equivalent to ownership, except with respect to things lost or stolen, though a lender or pledgor had the reversion or equity of redemption, of course. The distinctions between rights in movable and immovable property, which had almost become obliterated in the Roman system, was reasserted and broadened in the *leges barbaroum*. Rights in land could only be acquired by inheritance or by "investiture," and the transfer thereof was restricted, not only by the interests of the ruling classes, but by the rules of family community. The distinction became still more marked by the establishment all over Europe of the system of feudal tenures. This system gave paramount ownership, *dominium eminens* to the sovereign, in the first instance, and secondarily to the baronial and manorial lords — and made the possession and use of land dependent upon the performance of military and other public, or quasi-public duties or, in the case of peasant leases, upon the rendering of customary services to the lord. Tenures (even peasant holdings in Germany) became hereditary, but the right of alienation was late in obtaining recognition. The eminent domain of the sovereign or lord gradually lost the character of a property right and became a governmental power, while the use and possession, *dominium utile*, slowly developed into ownership. The hereditary peasant leases have been converted into full proprietorship by modern legislation. The reservation of forests to, and the control of hunting and fishing by, the feudal lords were the foundations for the exercise of similar powers by the modern State. Wild animals, when objects of sport, could be hunted and taken only by those authorized or licensed to do so and the sovereign prince claimed as his own many things regarded by the Roman law as *res nullius* and subject to private capture and appropriation — for example, abandoned land, treasure trove, wrecks, flotsam and enemy property. The right to minerals under ground was separated from the ownership of the superficies, and mining privileges could be exercised only under license from the overlord, which was usually given to the first finder in consideration of a share of the profits. Nearly all these rights and the royalties — literally the king's fees — derived from them have passed into modern law as rights and revenues of the State. In modern European legislation the distinction of movables from immovables is nominally preserved, but has long since been obscured by the practical uniformity of the rules governing the right to hold, dispose of or inherit property, irrespective of its mobility or immobility. All property to which there is no one entitled to legal possession belongs, or escheats, to the State. The Code Napoleon awards *trésor* (treasure trove) to the finder and so does the Civil Code of Germany. The Roman rules of «accession» and «specification» have been generally accepted, though stress is laid in some modern codes upon the relative value of the nova species produced and the material out of which it has been fashioned. Such modern law terms as *domaine, Eigenthum* and *property* define rights identical with those defined by *dominium* and *proprietas*, their Roman equivalents, except that modern law regards some forms of qualified possession as proprietory in character. The most advanced view of modern European jurists is that which regards possession as not a right, but a «social function,» the recognition and protection whereof by the State is conditioned upon the exercise of the privilege (or function) of ownership to the greatest possible advantage of the community as a whole. The Swiss Code declares the misuse of property to be unlawful.

English and American Law is characterized by the cleavage between the rules governing «real» and «personal» property. This cleavage is due in the first instance to the exceptional character impressed upon estates in land by the feudal system — land being «held» not owned. The terms «real» and «personal» however, did not originally define two kinds of property, but indicated a distinction between various early forms of judicial procedure. A «real» action was one whereby possession of the thing itself, which was the subject matter of the controversy, could be recovered. In a personal action the suitor laid claim to, and could obtain no more than, an indemnity (damages) for the withholding of, or injury done to, a thing or his rights therein. The indestructibility of land, and the powers and dignity attached to the tenure thereof, favored recourse to «real» actions to recover possession by those dispossessed, or prevented by trespassers from the use and enjoyment, of such property. By the most obvious association of ideas the subject matter of «real» actions became «real» property. The distinction between real and personal property does not coincide, however, with the distinction between movables and immovables, or between an estate in land and the ownership of goods and chattels. Not all interests in land could become the subjects of «real» actions. Leaseholding was deemed degrading to a «freeman,» the payment of rent in manual labor, in money or in kind, being considered an act of servility. The right of a tenant was not vindicable by a «real» action and, when dispossessed, even though the dispossessor be his landlord, the tenant's only recourse was a «personal» action for damages. The measure of damage being rent paid, if he paid nothing after dispossession, he could recover nothing. Easements, rents and profits, however, are real property, because they were rights to which the early common law extended the protection of «real» remedies. The right of property in chattels is absolute in the highest degree, a man may do as he will with his own. A man's right to his land, however, is not so untrammeled. No man has the right to excavate his own land so as to withdraw lateral support from his neighbor's land and the buildings thereon; no man may vitiate the air over his neighbor's land by noxious gases or malodorous vapors, or impair the value and usefulness of other property by maintaining nuisances on his own; no man may divert or otherwise unreasonably interfere with watercourses running through his own and other land. Further limitations are placed on proprietory rights in land by building codes, and by zoning commissions and other public authorities. Intangible objects, such as patents, good will, etc., are property just the same as are tangible objects. Ownership is a right *in rem*, meaning a right which the owner holds against the whole world, as distinguished from a right *in personam*, which is actionable only against one or more ascertained or ascertainable persons. When a right *in rem* is infringed a right *in personam* comes into existence, which is enforcible against the infringer. This right, however, is not correctly defined as possessory. English and American legal terminology, whereby *choses in action* are called «property» is, therefore, rather confusing. In all essentials the American and English law of personal property is in harmony with the modern European and ancient Roman laws. Feudal tenures were never recognized in the United States and have been formally abolished in England by statute. The distinction between real and personal property survives mainly in the differences in the rights of succession and inheritance, and in the formal methods required for transferring title to land, while ownership of goods is conferred by their mere delivery. Peculiar to American law are the Constitutional guarantees, which forbid the taking of private property for public uses without compensation of the owner, or the deprival of any man of his possessions except as punishment for crime and by due process of law.

PROPITIATION, the act or means of appeasing or atoning. It is a Biblical and theological term applying especially to Christ and his death. Saint John (1, ii, 2) says, «He (that is, Christ) is the propitiation for our sins.» The end of all the sacrifices prescribed in the Old Testament was to obtain propitiation, to propitiate an offended Creator. See ATONEMENT.

PROPHECY. I. Definition.— The word prophet is derived from the Greek word προφήτης, which doubtless meant originally an interpreter, then more specifically an interpreter of deity. Hence a prophet may be defined as a person who is considered to speak by the direct inspiration of a deity or spirit, while prophecy is the message of a prophet. The prevailing idea that the fundamental meaning of prophecy is prediction is thus erroneous, although prediction is often associated with the work of a prophet. Prophecy was thus an endeavor to ascertain the will of the deity by personal or subjective means, in contrast with omens and some forms of oracles which used external means.

II. Prophecy among other Nations aside from the Hebrews.— Prophecy was common in the early history of the world, although ordinarily much less frequently than oracles and omens. It prevailed particularly in Greece. Specially celebrated was the Pythia, the priestess of the Pythian Apollo at Delphi, who spoke in an ecstatic state supposed to be caused by vapors from a chasm in the temple. There were also various sibyls in Greece, their number varying in the traditional accounts from four to ten. These sibyls were highly esteemed by the Romans and some of their written productions were regarded with great veneration. In the Semitic group of peoples, aside from the Hebrews, there is no explicit evidence of the presence of prophets among the Babylonians and Assyrians, nor among the Canaanites, although their existence among the latter people is often inferred from their similarity to the Phœnicians. They are found among the Arabs, being there called by the name kahin, which is the same as the Hebrew word for priest, and the Arab prophets sometimes acted also as priests. They are also found in the service of the Phœnician Baal, as appears from the Old Testament accounts. No important written records of the utterances of any of these prophets outside of the Hebrew people have been preserved, the Sibylline Books, reputed to be of Greek authorship, being almost entirely late Jewish compositions, thus really pseudonymous, with some Christian fragments. Prophecy among other nations aside from the Hebrews was ordinarily of the clairvoyant type, being given in answer to specific questions of individuals, and hence of no general or permanent value.

III. Hebrew Prophecy. 1. *General Conception.*— The usual Hebrew word for prophet is נָבִיא. While the meaning of the word is disputed, it seems probable that its etymological significance is «speaker»; hence it has the fundamental idea of one who speaks for God, in accordance with the discussion above. The Hebrew prophet always spoke in the name of Yahweh. As among other nations, there are indications that in early times prophets and priests were connected; even some of the later prophets, as Jeremiah and Ezekiel were from priestly families.

2. *Historical Development.*— Considered historically, the Hebrew prophets may conveniently be divided into three classes, which are not, however, entirely distinct from each other, an individual sometimes exercising functions belonging to more than one class, and all of them having certain characteristics in common. These classes may be called seers, oral prophets, and writing prophets. The seer was consulted by individuals concerning personal matters, Samuel, according to one representation, belonging to this class, 1 Sam. ix, 7–8. This class seems to have been an early development, but it probably continued active until a late period. The oral prophets were concerned with the affairs of the nation and of the king as the representative of the nation. Their work, however, was specific, their usual task being to give advice concerning a particular situation, especially when consulted by the king. These may be called largely, but not entirely, professional. Many no doubt also acted as seers. The writing prophets were distinguished superficially by the fact that, while their messages were ordinarily proclaimed orally, later these messages were committed to writing, either by the prophet himself or by his disciples. But this really resulted from a deeper distinction. Their messages were actually characterized by great and permanent significance; they not only gave advice in reference to a particular situation, as Isaiah to Ahaz and Hezekiah, but they based this on fundamental and comprehensive teaching concerning God, his relations to men and his principles of action. The presentation of new truth is thus specially characteristic of the writing prophets, and some of the greatest messages of the Old Testament come from

them. These prophets were clearly not professional. What are usually called the prophetic books of the Old Testament contain the messages of this class, as well as other portions, such as the prophetic narratives of the Pentateuch known as J and E.

3. *Characteristics of the Prophets.*— The prophets often formed guilds, living together in communities. These guilds are frequently called «sons of the prophets,» compare also the designation «a band of prophets,» 1 Sam. x, 5, 10. Such guilds are mentioned several times during the life of Samuel, 1 Sam. x, 5, 10; xix, 18–19, etc., in the time of Elijah and Elisha, 1 Kings xx, 35; 2 Kings ii, 3, 5, 7, 15, etc., and in the time of Amos, Amos vii, 14. Presumably this was a continuing feature. Samuel and Elisha were particularly connected with these guilds. The writing prophets were independent of them and sometimes hostile.

Gifts or fees to the prophets were customary. A fee for professional services was expected when a seer was consulted, 1 Sam. ix, 7–8; 1 Kings xiv, 3. A gift of first-fruits was made to Elisha, 2 Kings iv, 42. The prophets seem ordinarily to have made their living by prophesying, as is indicated by Micah iii, 5; Ezekiel xiii, 19; Amos vii, 12, etc. But no such gifts seem to have been made to the writing prophets, and Amos repudiates the idea, Amos vii, 14.

The prophets were often marked by a distinctive dress, viz., a hairy mantle, 1 Kings xix, 13; 2 Kings i, 8; Zechariah xiii, 4. Naturally this would be especially characteristic of the prophetic guilds, the writing prophets apparently not following the practice. A distinctive sacred mark in the forehead is mentioned only once, 1 Kings xx, 41.

In the early times religious estacy or frenzy was a prominent characteristic of the prophets, 1 Sam. x, 9–13; xix, 18–24, as was the case also with prophets of the Phœnician Baal, 1 Kings xviii, 28; similar is the condition of Elijah when he runs before the chariot of Ahab, 1 Kings xviii, 46. In 2 Kings ix, 11 one of the prophets is called mad. This frenzied condition was excited especially by music, consult 1 Sam. x, 5; 2 Kings iii, 15. This condition is not mentioned in the later time and doubtless gradually ceased. Dreams and visions were also part of the experience of the prophets. But these, especially dreams, became less frequent in the later times.

The prophets, especially the oral prophets, often gave a message that suited those consulting them, in particular messages of prosperity for the king and the nation. Such prophets may be described as professional, they regarded their work as a profession with no high conception of its religious significance. Some of these prophets were no doubt insincere, other perhaps merely professional and conventional, repeating the messages of earlier prophets with no distinctive addition of their own. In the Old Testament these are not described as false prophets, but, at times, as prophesying falsely or prophesying lies. The writing prophets come into sharp opposition with prophets of this kind. The favorable message of such prophets is mentioned in Isaiah xxx, 10; Micah iii, 5; 1 Kings xxii, 13; Jeremiah xxiii, 17; xxviii, 1–4, etc. Several of the oral prophets, however, exerted a very important influence in reference to national affairs. Thus Samuel anointed Saul as king, and later announced his rejection and anointed David; David followed the instructions of Gad, 1 Sam. xxii, 5; Nathan gave David directions concerning the temple, 2 Sam. vii, 1ff, and rebuked him for his sin, 2 Sam. xii, 7; while the importance of the work of Elijah and Elisha is well known.

The conviction of the prophets that Yahweh was speaking through them seemed universal. This appeared to be quite as strong in the case of the lower professional prophets as with those of a higher kind. How fully this conviction was justified in each case, therefore, must be determined by careful study, especially by the contents of the individual message.

The dominant purpose of the actually sincere prophets may be stated thus: so to present the truth of God as to produce practical religious results. This appears from a study of the various elements in their messages, and of course applies more fully to those of the higher kind. The national interest has a fundamental religious basis; the social teachings, prominent as they are, are essentially religious; and the ethical teachings, which are conspicuous, have a religious centre. The teaching is pre-eminently practical rather than speculative, the message of the prophet was fundamentally a message to his own time.

In connection with what has already been said, the matter of prediction and fulfilment may be noted. The message in prediction, as elsewhere, was for the time of the prophet; the aim of prediction, therefore, was not to present a program for the future, but to teach the comprehensive truth concerning God and His principles of action for the sake of the present effect. Hence the prediction was not a statement of that which the prophet thought must necessarily take place, but rather a presentation of the prophet's expectation or ideal, with a view to the encouragement or warning of his hearers. Fulfilment of details, therefore, is not to be expected and does not ordinarily appear; there is a more general fulfilment in the realization of the principles that are stated.

In the latter part of the Old Testament, chronologically considered, prophesy began to pass into apocalyptic, as in the book of Daniel and in small portions of other books, which finally replaced prophecy in the Jewish thought of the two centuries before Christ and the first century after Christ. See Apocalyptic Literature.

IV. *Prophecy in the New Testament.* In the New Testament the prophet is in general an interpreter of God's message, who speaks to the edification of the church, 1 Cor. xiv, 3, 24, 25, prediction being only rarely mentioned, as in Acts xi, 28; xxi, 10—11. Prophets formed a special class in the church, ranking next after apostles, 1 Cor. xii, 28; Eph. iv, 11, and much superior to the possessors of the gift of tongues, 1 Cor. xiv, 5, 39.

PROPONTIS. See Marmora, Sea of.

PROPORTION, an equality of ratios; a series in which the first of any even number of terms bears the same mathematical relation to the second term as each other odd-numbered term does to the even-numbered term which immediately follows; thus 4, 12; 5, 15; 6, 18 (or 4:12=5:15=6:18, or 4:12::5:15::6:18, these forms being read "4 is to 12 as 5 is to 15 as 6 is to 18," etc.) is a *geometrical* proportion. The definition given above using the words "same mathematical relation" shows that there may be other than geometrical proportions, in which the relation is the fundamental one of multiplication (or division). The fundamental relation of addition (or subtraction) also gives rise to a proportion, the so-called *arithmetical* proportion; thus 4, 6; 7, 9; 11, 14, or, generalizing, a, $a+d$; b, $b+d$; c, $c+d$, are in arithmetical proportion as each odd-numbered term is related to its corresponding even-numbered term by the difference 3. The distinction between geometrical and arithmetical is here the same as in progressions (q.v.), and the proportion is merely a special case of progression. It is perfectly obvious that the concept of the proportion may be applied elsewhere, the relation for example being not that of multiplication (or division) nor that of subtraction (or addition), but that of evolution (or involution); htus 4, 16; 5, 25; 11, 121, is a series in which the analogy between terms 1 and 2, holds in the case of terms 3 and 4, as well as terms 5 and 6, the relation being that of the root to the square. But this general concept of the proportion or analogous relation finds small place in mathematics, even the most modern theory being little fresher than Euclid's Fifth Book, which was derived in part from Pythagoras, and which is, save for the difficulty in the treatment of incommensurables, far superior, though reckoned more difficult, than the numerical treatment which came into vogue in the Middle Ages; Euclid's method is concerned with lines, instead of numbers. To all intents and purposes the modern method like Euclid's is concerned merely with geometrical proportions. In a geometrical proportion the odd-numbered terms are called the antecedents, the even the consequents; the first and fourth terms the extremes, the second and third, the means. A mean proportion has the second and third terms identical as $a: b = b: c$, which may more conveniently be written $\frac{a}{b} = \frac{b}{c}$. The chief properties of a geometrical proportion, say $\frac{a}{b} = \frac{c}{d}$, are the following: (1) the product of the means equals the product of the extremes, $bc = ad$ (clear of fractions); (2) the terms are in proportion by composition, $\frac{a+b}{b} = \frac{c+d}{d}$ (add 1 to each member of the original equation); (3) the terms are in proportion by division, $\frac{a-b}{b} = \frac{c-d}{d}$ (subtract 1 from each member); (4) the terms are in proportion by composition and division, $\frac{a+b}{a-b} = \frac{c+d}{c-d}$ (divide the equation in (2) by the equation in (3)).

PROPORTIONAL REPRESENTATION, as its name suggests, is the result obtained when the members of legislative bodies are so chosen that each party or faction in the voting population is represented by a number of delegates proportionate to its numerical voting strength.

Proportional representation gained respectability as a reform in England and the United States largely as the result of the able exposition of its principles made by Mr. Thomas Hare in 1859 and John Stuart Mill in 1862. Since its underlying principle, as will be later pointed out, is destructive of the two-party system which forms the framework of the present English and American political structures, it is natural that it should have received scant recognition or approval from party leaders. It has been put into practice in the United States only in those rare instances in which the principle of non-partisanship has found expression, — instances thus far confined in the main to cities in which the new forms of commission or city manager organization have been adopted. The socialist party indorses its application in State and National governments, and one or two non-political organizations are conducting campaigns of education in its behalf.

Method of Operation.— The nature and working of proportional representation may best be made clear by an examination of the two leading methods which have been devised to give it effect.

(a) *The single transferable vote.*— This system is applicable to an election in which several representatives are to be chosen from a large constituency. Suppose six vacancies are to be filled by an electorate of 60,000 voters. Under the usual bi-party system each party would nominate six candidates and the party which cast the majority, or even the plurality in case more than two parties had tickets in the field, would elect all six representatives. It might be, therefore, that 31,000 voters would elect all the representatives and the other 29,000 would go unrepresented. By the use of the single transferable vote each voter would vote not for six candidates but for one. Any candidate, therefore, who received 10,000, or one-sixth of the total vote cast, would be elected. In this way any group in the community which had this much voting strength could secure the election of one representative. With no other provisions for expressing a preference between candidates this system would, of course, tend to give the same representation to all groups of voters alike provided they could each cast a vote of 10,000. A voter might, therefore, find himself wasting his vote by casting it either for a man who had already received more than enough votes to elect him or for a man who did not receive enough to elect him. To avoid this difficulty the single vote is made transferable by allowing the voter to indicate his second, third, fourth, fifth and sixth choices or as many of them as he cares to indicate. If the man for whom he has expressed his first choice does not need his vote, or cannot be elected even with the aid of it, then his second choice vote is added to the total first-choice votes of the man for whom it is expressed, and so on. In this way, by counting as many of the later choices as are necessary to secure the election of six men each group in the electorate is able to elect approximately its proportionate share of the whole number of representatives. In other words, 40,000 of the 60,000 could by expressing their first four choices elect four men.

This system was roughly the one advocated by Hare and bears his name. It has been modified in many ways especially in the matter of the counting of the votes and the procedure in the elimination of the weak candidates. A good many detailed problems arise in connection with its application which cannot be mentioned here.

(b) *The List System.*— This system gives the voter a chance to express a preference not only for an individual candidate but also for a party or group. The names of candidates are put on the ballot in lists or blocks so that those of similar views are grouped together. The voter, as in the first system described, has but one vote to cast and he casts it for one candidate on one of the lists. This vote counts one in determining how many candidates the adherents of that list are to elect and it also counts one toward the election of a single candidate on that list. The proportion of the total vote which is cast for a single list determines the number of representatives which are chosen from that list; and when that number has been determined the highest candidates on the list are chosen. Thus a man may vote for a man who is defeated yet at the same time further the election of another candidate from the same list or party.

Minority Representation.— The chief difference in principle between proportional representation and minority representation is that the latter system seeks to secure the representation only of the leading minority party or parties. It may be presented in terms of the Illinois system of minority representation adopted in 1870 for the election of the lower house of the State legislature. This is a system of cumulative voting. From each district three representatives are to be chosen and each voter is given three votes to cast. He may cast them in any way he chooses, — one for each of the three candidates, two for one and one for another, one and one-half each for two, or all three for one candidate. The result is that any party in any district which can cast one-third of the total vote may, by concentrating or "plumping" all their votes on one man, elect him. In practice it has commonly worked out that the majority party has elected two candidates and the minority has elected one. The smaller minority parties go unrepresented. Under extraordinary circumstances the minority party by supporting solidly two candidates has been able to elect them both against the majority party which has unwisely scattered its vote among three candidates. To avoid this the party managers have usually tried to limit the number of candidates of their parties to the number they can reasonably expect to elect. In this way the freedom of choice of the voter is somewhat abridged.

Arguments for Proportional Representation.— The arguments in favor of proportional representation may be summarized as follows: First, it would prevent the non-representation of any respectable minority in the body politic but allow each group to enjoy that share in political power to which its numbers entitle it. The domination of majorities would be abolished. Second, attention would be centered upon the selection of men who represent a definite body of opinion rather than upon men who, as now, represent a definite geographical unit or district. Third, by the wide range of choice open in the election the necessity for complicated nominating machinery with all the evils attendant upon it would be obviated. Finally, it would tend to break up the bi-party system and the elaborate organizations and methods of control which that system produces, and replace it by a natural, informal and genuine alignment of the people along the lines marked out by the actual divisions in the public opinion of the community. This is peculiarly desirable in municipal government where the influence of State and National parties dominates municipal politics to the exclusion of local issues. For this reason proportional representation has developed most rapidly and successfully in cities.

Arguments Against.— The following arguments are advanced by the opponents of proportional representation: First, the system makes the formulation and development of a legislative policy very difficult. The legislature is composed of a large number of groups with no cohesive influence uniting them and the policies they work out are usually compromises which really do not represent the real views of any group. Furthermore, responsibility is lost in such a case. Under the two-party system each party goes before the people on a certain platform and the successful one may properly be held responsible for the carrying out of that policy. With a large number of parties the policy which is ultimately agreed upon is one upon which the electorate may never have expressed itself and no one group can be held accountable for it. Second, it is very hard to say just what is being represented in an election held under this system. The groups which may temporarily gather in support of a candidate may be based upon racial, religious, social, or political grounds, and the legislative body which results may be a mosaic of widely divergent and incompatible interests with no common ground upon which to meet. Third, it is urged that the average voter would not be able to vote intelligently the somewhat complicated ballot necessary to a proportional representation scheme; that it enormously increases the difficulties of counting the election and materially augments its cost.

Extension in the United States.—Although proportional representation in its various forms has been used rather widely in Europe for many years it has but recently made its appearance in this country. The first instance of its use was in the city of Ashtabula, Ohio, in 1915 where under a new city charter it was used in the selection of the municipal commission. In 1917 it was incorporated into the charter of Boulder, Colorado. It is being seriously considered as a desirable adjunct to the commission and city manager types of municipal government.

Doc. 359, 63d Cong. 2d Sess.); Holcombe, 'State Government in the United States' (1916); *Proportional Representation Review* (published quarterly); *Equity* (published quarterly); Library of Congress, a List of Books and References to Proportional Representation (1904).

ROBERT EUGENE CUSHMAN,
Associate in Political Science, University of Illinois.

PROPOSITION, (1) *in mathematics,* a statement in terms of something proposed to be proved or done. (2) *In grammar,* a sentence, or part of one, consisting of a subject, a predicate, and copula. (3) *In logic,* a sentence, or part of a sentence, affirming or denying a connection between the terms; limited to express assertions rather than extended to questions and commands. Logical propositions are divided: First, as to substance, into categorical and hypothetical; secondly, according to quality, into affirmative and negative; and thirdly, according to quantity, into universal and particular. (4) *In poetry,* the first part of a poem, in which the author states the subject or matter of it. (5) *In rhetoric,* that which is proposed, offered, or affirmed, as the subject of a discourse or discussion.

PROPRÆTOR. See PROCONSUL.

PROPRIETARIES, in American history, a common name applied in colonial days to those indivduals to whom colonies had been granted by the Crown. Most of the 13 English colonies were originally proprietary but New York, New Jersey and the Carolinas became royal provinces and only Pennsylvania, Delaware and Maryland remained such until the time of the Revolution. In proprietary governments, the proprietor appointed the governor, and in general enjoyed all those prerogatives of government which in monarchies were attached to the Crown. The laws of Pennsylvania and Delaware were subject to the supervision and control of the Crown; those of Maryland were not. Consult Edgerton, H. E., 'A Short History of British Colonial Policy' (London 1897); Id., 'The Origin and Growth of the English Colonies and Their System of Government' (Oxford 1903); Doyle, J. A., 'The English in America' (5 vols., London 1882–1907); Hart, A. B., ed., 'The American Nation: A History' (Vol. V, New York 1904); McCrady, E., 'The History of South Carolina under the Proprietary Government' (New York 1897); Mereness, N. D., 'Maryland as a Proprietary Colony' (New York 1901); Osgood, H. L., 'The Proprietary Province as a Form of Colonial Government' (in *American Historical Review,* Vol. II, p. 644; Vol. III, pp. 31 and 244, New York 1897–98); Shepherd, W. R., 'History of Proprietary Government in Pennsylvania' (in *Columbia University, Studies in History, Economics and Public Law,* Vol. VI, New York 1896); Whitehead, W. PROPRIETARY GOVERNMENT. See COLONIAL GOVERNMENT, PROPRIETARY.

PROPYL (C_3H_7), the third radical of the series $C_n H_{2\,n1}$. It does not exist in the free state, but enters into the composition of a large series of important compounds.

PROPYLÆA, prŏp-ĭ-lē'ą, *in Greek architecture,* the entrance to a temple. The term was employed particularly in speaking of the superb vestibules or porticoes conducting to the Acropolis (q.v.) or citadel of Athens, which formed one of the principal ornaments of the city. This magnificent work, of the Doric order, was constructed by Pericles (437–433 B.C.) after the designs of Mnesicles, one of the most celebrated architects of his age. Pausanias says it was covered with white Peutelic marble, remarkable for the size of the blocks and the beauty of the workmanship. It was built on the foundation of an earlier gateway and was never fully completed. The imposing structure consisted of three parts: a central gateway with wings on the north and south. The building has suffered much from the ravages of foreign invaders, but even its ruins show clearly the wonderful beauty which must have been possessed by the original structure. Consult Boetticher, A., 'Die Akropolis von Athen' (Berlin 1888); Bohn, R., 'Die Propylæen der Akropolis zu Athen' (Berlin 1882); Doerpfeld, W., 'Die Propyläen der Akropolis von Athen' (in *Kais, Deutsches Archäologisches Institut, Athenische Abteilung, Mitteilungen,* Vol. X, pp. 38 and 131, Athen, 1885); id., 'Zu den Bauwerken Athens' (in ib. C., 'Principles of Athenian Architecture' (London 1888); Rohden, H. von, 'Proyläen' (in Baumeister, A., ed., 'Denkmäler der Klassischen Altertums,' Vol. III, p. 1414, Munich 1888); Stuart, J., and Revett, N., 'Antiquities of Athens' (Vol. II, London 1784); Weller, C. H., 'The Pre-Periclean Propylon of the Acropolis at Athens' (in *American Journal of Archæology,* Vol. VIII, p. 35, Norwood 1904); id., 'Athens and its Monuments' (New York 1913).

PROROGATION OF PARLIAMENT, in Great Britain, the continuance of Parliament from one session to another, as adjournment is a continuance of the session from one day to another or for a longer period. Prorogation determines the session, but adjournment does not. After a prorogation any bill which has previously passed both houses or either house, without receiving the royal sanction or the concurrence of the other house, must be taken up *de novo*. Parliament is prorogated by the king in person or by his commissioners. The death of the crown or the calling out of the militia or reserves during a period of prorogation, immediately put an end to the latter. See GREAT BRITAIN — PARLIAMENT.

PROSAURIA, a subclass and also an order Palæozoic reptiles. See HERPETOLOGY.

PROSCENIUM, prō-sē'nĭ-ŭm, in Greek and Roman theatres, the place where the actors appeared. It was in front of the rear wall or *skene*. The front part of it, where the actors stood, was called in Greek *logeion* or *ocribas* and in Latin *pulpitum* and was elevated above the rest of the stage. The orchestra was in front of it. The place where the actors dressed and undressed, was called *postscenium*. Projecting wings on each side of the proscenium were called *parascenia*. In the modern theatre it designates that part of the stage located between the curtain and the orchestra and usually including the proscenium arch. The boxes, immediately adjoining the stage, therefore, are usually called proscenium boxes.

PROSCRIPTION, *in Roman history*, a mode of getting rid of enemies, first resorted to by Sulla in 82 B.C. and imitated afterward in the years that closed the republic. It literally signifies «a writing before» and commonly meant an advertisement or announcement of articles to be sold. But Sulla applied it to a proclamation containing names of citizens and promising a reward to any person who should kill those named in the lists and a threat of death to those who should aid or shield them. The persons named were said to be proscribed. Their property was confiscated and their children were declared incapacitated for public office. The most notorious proscription after that of Sulla was that posted by the second triumvirate — Antony, Octavianus Cæsar and Lepidus (43 B.C.), in which was included the name of Cicero.

PROSE LITERATURE. See LITERARY FORMS.

PROSECUTOR, *in law*, is one who prosecutes another for a crime in the name of the government, whether public or private. A public prosecutor is an officer appointed by the government to prosecute all offenses. In the United States the chief law officers that are public prosecutors are the attorney-generals of each State and there are subordinate officers known as State, district or county attorneys. Federal offenses are prosecuted by the attorney-general of the United States and the United States district attorneys. A private prosecutor is one who prefers accusations against a person whom he suspects to be guilty and if he acts from proper motives he will not be responsible to the party in damages, although he was mistaken in his suspicions, but if from a motive of revenge he caused a criminal prosecution without reasonable foundation, he would be liable in an action for malicious prosecution. A prosecuting attorney bringing an action in the name of the people is presumed to have authority. His powers are limited to the preparation and trial of cases.

PROSELYTE (Greek, an arrival or newcomer), he who leaves one religion for another. In New Testament times there were proselytes of two degrees, the proselytes of the gate who renounced idolatry and worshipped the only true God according to the (so-called) seven laws of the children of Noah, without subjecting themselves to circumcision and the other commands of the Mosaic law, and were only admitted to the court of the temple, and stood at the door of the inner temple, whence their name; having the right of dwelling in the land of Israel, but only in suburbs and villages; and the proselytes of righteousness who had been fully converted from paganism to Judaism, had been circumcised, and bound themselves to observe the Mosaic law. Before their circumcision they were examined respecting the grounds of their conversion; after their circumcision they received baptism, being immersed with their whole body in a cistern full of water, on a festival, in the presence of three judges. This baptism, known under the name of proselyte baptism, was repeated in the case of those children of a proselyte who had a heathen mother. Boys under 12 and girls under 13 could not become proselytes without the consent of their parents, or, in case of their refusal, the aid of the magistrates. By the baptism every one was considered as born anew, so that his parents were no longer regarded as such, and slaves thus baptized were set free. Consult Bertholet, A., ‹Die Stelluing der Israeliten und der Juden zu den Fremden› (Freiburg 1896); Brandt, W., ‹Die Jüdischen Baptismen› (Giessen 1910); Graetz, H. H., ‹History of the Jews› (6 vols., Philadelphia 1891–98); Schürer, E., ‹Geschichte des Jüdischen Volkes› (4 vols., Leipzig 1901–11).

PROSERPINA, prō-sėr'pĭ-nạ. See PERSEPHONE.

PROSODY (Greek, *prosōdia*), the part of grammar that treats of quantity, accent, metre and the laws of versification. See RHYME; RHYTHM; VERSE.

PROSPECT PARK, N. J., borough in Passaic County, on the Passaic River, forming a residential suburb of the city of Paterson, which it adjoins. Pop. 2,719.

PROSPER (Fr. prŏs-pār) **OF AQUITAINE,** also called **PROSPER TIRO,** Christian poet and religious controversialist: b. Aquitaine, about 400; d. soon after 463, probably at Rome. He was a layman, probably a teacher of rhetoric and had settled in some city of Provence (perhaps Marseilles) when Saint Augustine's work on ‹Correction and Grace› reached Southern Gaul. In that country there were many Semi-Pelagians who taught that Saint Augustine's doctrine of grace militated against the notion of Free Will. Prosper with a companion went to Rome after the death of Saint Augustine in 431 and induced Pope Celestine to write a letter against the Gallican Semi-Pelagians. Prosper also wrote a Latin dogmatic poem of over 1,000 hexameters, ‹On the Ungrateful,› as he styled the Semi-Pelagians who seemed ungrateful for the gift of divine grace; many essays on ‹Grace and Free Will› and a most valuable chronicle, *Epitoma Chronicom*, which brings the history of the French church down to 455; and he compiled a *Liber Sententiarum* from Saint Augustine's works. There are many editions of his works. The best collection of them is to be found in Migne, J. P., ed., ‹Patrologiæ Cursus

Completus' (Vol. LI, Paris 1846). The best recent edition of his chronicle is included in Momrusen, T., ed., 'Monument Germaniæ Historica Chronica Minora' (Vol. IX, Berlin 1892). Consult Potthast, A., 'Bibliotheca Historica' (2 vols., Berlin 1896); Valentine, L., 'Saint Prosper d'Aquitaine' (Toulouse 1900); Wörter, F., 'Prosper von Aquitanien über Grade und Freiheit' (Frieburg 1867).

PROSPERO, one of the principal characters in Shakepeare's romantic drama, 'The Tempest' (q.v.). He is the rightful duke of Milan, but is dispossessed of his dukedom by his brother Antonio and the king of Naples, and with his daughter Miranda is put adrift at sea in a leaky boat. Having reached a desolate island he establishes a refuge for himself and daughter, with Caliban, a half-human monster, the only inhabitant he found on the island, as servant. He takes up the practice of magic which he had studied at Milan, raises a tempest which wrecks upon his island coast Antonio, the king of Naples and their suites, and saves them from drowning only to subject them to various punishments until he finally reveals himself, and gives them his forgiveness. All prepare to return home, Miranda meantime betrothed to the King's son Ferdinand. Prospero then breaks his wand and renounces magic. Consult Carpenter, W. B., 'Shakespeare's Tempest' (in 'Religious Spirit in the Poets,' p. 103, New York 1901); Furness, H. H., ed., 'A New Variorum Edition of Shakespeare' (Vol. IX, Philadelphia 1892); Moulton, R. G., 'Shakespere's Tempest' (in *New Shakespere Society, Transactions,* 1887, Ser. I, p. 37, London 1887); Rolfe, W. T., ed., 'The Tempest' (New York 1904); Stephens, G., '«The Tempest»: An Outline Sketch of the Play by William Shakespeare' (Stockholm 1836).

PROSSER, Charles Allen, American educator: b. New Albany, Ind., 20 Sept. 1871. He was educated at the universities of De Pauw, Louisville and Columbia. He was superintendent of schools for the Children's Aid Society in 1909–10 and deputy commissioner of education for Massachusetts in 1910–12. In 1912 he became secretary of the National Society for the Promotion of Industrial Education; and he was director of the Minneapolis Survey in 1915, in which year he became director of the William Hood Dunwoody Institute at Minneapolis. Author of 'New Harmony Movement' (1903); 'The Organization and Administration of Vocational Education' (1913); etc. He was general editor of the 'Vocational Education Series' of the American Book Company in 1913.

PROSSNITZ, prŏs'nĭts (Czech *prostějov*), Austria, a town of Moravia, 11 miles southwest of the town of Olmütz, on the Rumza. There are two railway lines. It is the centre of a fertile and prosperous region. It has extensive manufactures of woolen and linen cloth, cashmere and cotton goods, in all of which it carries on an important trade; numerous distilleries of brandy and rosolio, extensive breeding of geese and one of the largest corn-markets in Moravia. The city hall is an interesting ancient building. There are German and Czechish schools. Most of its inhabitants are Roman Catholic Czechs, but there is a large Hebrew congregation. Pop. 31,462.

PROSTATE GLAND, the pale, firm body composed of both muscle and gland, in shape resembling a chestnut, which surrounds the neck of the bladder and the beginning of the urethra in the male. It consists of two lateral lobes and one middle lobe. The excretory ducts from the glandular substance of the organ open into the prostatic portion of the urethra. It is well supplied with blood-vessels and nerves and is enclosed in a thin but firm fibrous capsule. The secretion of the prostate is a milky, viscous fluid of acid reaction, discharged under sexual excitement with the semen and forming for the latter a fluid vehicle. Enlargement of one or more lobes of the prostate is very common in men over 55. The cause is not known. It is said that such enlargement has never been found in eunuchs, or where the testicles have been lost. The enlargement encroaches on the rectum and urethra, interfering with their functions, the bladder becoming distended; its walls may be thin and inefficient and a cystitis may be set up. In this disorder the stream of urine becomes slower; there is a frequent desire to urinate, even at night, but only a few ounces of urine are passed each time. Exhaustion, sepsis from retained urine and sometimes local hemorrhage cause enlarged prostate to be a serious condition. Treatment includes mild and easily digested food, regulation of the bowels, freedom from exposure to cold and damp and the careful use of the catheter. Sometimes enucleation of the enlarged gland (prostatectomy) is of value; so are Bottini's operation, burning a channel through the obstructing mass, and vasectomy, the cutting of the vas deferens. Removal of the testicle to reduce the size of the prostate is sometimes resorted to. Acute prostatitis, an acute inflammation, is most often due to gonorrhœa or to strong injections for its relief, but may arise from the irritation of calculi or the use of instruments, etc. The symptoms are painful and frequent micturition, swelling, high fever, retention of urine and tenderness in the region of the lower bowel and the neck of the bladder. The inflammation may progress so far that suppuration (prostatic abscess) occurs. The treatment requires rest in bed, hot anodyne fomentations, leeches, purgation and opening of the abscess. Chronic prostatitis may be the sequel of the acute form, or it may be primary. There is less swelling, pain and tenderness than in the acute. It is a condition which needs the supervision of the physician or surgeon. Tubercular disease of the prostate may either be primary or be secondary to similar disease of the testes. There are nodular lumps, which may break down and produce an abscess. The disease may invade the bladder and the whole urinary tract. The prostate is subject, though rarely, to malignant tumors, carcinoma and sarcoma. Prostatic calculi about the size of millet-seed are quite common in old men. They rarely give rise to noticeable symptoms unless inflammation occurs. Sometimes they are voided or they may form the nucleus of a prostatic calculus.

PROSTITUTION. See HYGIENE, SOCIAL.

PROSTYLE, *in architecture*, a portico in which the columns stand in advance of the building to which they belong. The term *amphi-prostyle* is used when there is such a portico attached to a building both in front and behind.

PROTAGORAS, prō-tăg'ō-ras, Greek sophist: b. Abdera, Thrace, about 480; d. about 410 B.C. He studied the old Ionian philosophy paying especial attention to Heraclitus, and he was the first to assume the title of Sophist, and to teach for pay, a practice which, Plato informs us, proved very remunerative. He taught principally at Athens. When, about 443, a number of Athenians left the city to join in founding the new colony of Thurii, Protagoras was appointed by Pericles to accompany them and subsequently drew up a constitution for the Thurians. Before returning to Athens he lived for some time in Sicily, where he acquired great fame. He returned to Athens before 430. In 411 he was brought before the Aeropagus for beginning one of his works ('Concerning the Gods') with the words, "Respecting the gods, I am unable to know whether they exist or do not exist," was banished for atheism, and perished at sea. He was the author of a large number of works, all of which are lost. The two most important of them were the ones already mentioned, and another entitled 'Truth.' One of the dialogues of Plato (q.v.) bears the title 'Protagoras,' and yields some information regarding his mode of teaching. His famous apophthegm, ἀνθρωποςμέτρον (man is the measure of all things) has become the eternal possession of philosophy and can never lose its significance. Man from his subjective impressions can, he said, decide what things are, and what things are not. Hence he taught that Science was impossible and Opinion everything. This was what in modern philosophy corresponds to Sensualism. For these views he was controverted by Socrates and the Socratic school. He is also credited with being the first grammarian to have systemized grammar and to have been the originator of a classification of the parts of speech, tenses and moods.

PROTANDRY. See POLLINATION.

PROTECTION is a term in political economy, employed to describe the policy of indirectly promoting the growth of national industries, either to secure the defensibility of the country in time of war, or to promote its general welfare, or both. It differs from Socialism in seeking this by indirect means, and with the minimum of interference with individual freedom, recognizing that the true function of government is to steer the ship of state in industrial matters, and not to propel it. It differs on the other side, from free trade, which excludes government from any kind of activity in the industrial sphere, and especially objects to any legislation which will have the effect of diverting capital and labor into channels in which they would not otherwise flow.

More than one way to this end has been used, such as the absolute prohibition of specified imports, premiums upon exports, bounties upon home production, and the retention of raw material. But the usual way has been to impose, upon the competing product from abroad, a duty sufficient to discourage its use and to make it unprofitable to the dealer. Such duties are either *ad valorem* or specific. The former are levied upon the value of the imported commodity, and are either directly or inversely proportional to that value. Thus the duties imposed by the British Corn Laws rose as the price of wheat fell, and the converse. Specific duties are those which tax the commodity by number, weight or bulk, irrespective of differences in value. For protective purposes they are preferable.

From the rise of national feeling in Europe, at the close of the Middle Ages, to the Congress of Vienna in 1815, all governments pursued the policy of protection to home industry. Among economic theorists a protest against this was begun by the French *Economistes* (Gournay, 1754; Quesnay, 1758; Turgot, 1766). It found its finest exposition and defense in their Scotch disciple, Adam Smith (1776), who contended that the interplay of self-interest is quite sufficient to secure the best industrial development, and that when every man is left to "do as he will with his own," he will do what is best for society. The antipathy of Napoleon I to this theory, and the questionable means he employed to counteract it in his Continental System, seemed likely to give it a chance of being applied in the states represented at the Congress of Vienna. But a few years of actual experience satisfied the rulers and cabinets of the Continent that the path to national prosperity did not lie in that direction. They returned to protection, which England and France, indeed, never had abandoned, and which Germany made effective for the whole country through the Zollverein (1817–33).

It was in the United Kingdom, in 1846, after eight years of popular agitation by the Anti-Corn-Law League, that a European government first took steps to abandon Protection, and that after 510 years of it had lifted England out of the dire poverty of a merely agricultural country, into the first rank among manufacturing nations. And even she continued to protect her silk and glove industries against French competition, until the Cobden Treaty of 1860 agreed to the abolition of these duties.

Twenty years later there began a reaction against free trade, which is now supported by the Conservative party. It grew out of the failure of that policy to obtain the support of other countries, and the rapid growth of France, Germany and America in commerce and manufactures under protection, while England became more dependent upon the rest of the world for food, and was obliged to keep up a great navy that her ports might be kept open in case of war with any one or several European powers. The outbreak of war in 1914 emphasized this necessity. The destruction of many merchant vessels by German submarines, and the diversion of others to transport use, reduced her means of bringing food from abroad, so that importations are limited by royal order to things thought necessary. Even strenuous free traders now recede from the principle adopted in 1846, and propose that home production shall be fostered and importations restricted by imposing duties on these. In this they revert to the principle laid down by Nassau W. Senior in 1835, that the economist has no right to dictate the policy of the statesman, since economic reasonings are only a part of the considerations which should influence him.

In America the need of a national government, which could extend protection to the prostrate industries of the States, was one of the most powerful motives to the formation and adoption of the Constitution of 1787, which authorized Congress to impose duties on imports «to pay the debts and provide for the common defence and general welfare of the United States.» The harsh experiences of the war for independence had shown the country the need of manufactures for the defense of the nation. It was on this ground that Washington repeatedly pressed for adequate legislation; and in this he was supported by his secretary of the treasury, Alexander Hamilton.

The great President, in his address to Congress in 1790, said, «A free people ought not only to be armed but disciplined, to which end a uniform and well digested plan is requisite; and their safety and interest require that they should promote such manufactures as tend to render them independent of others for essentials.»

Duties were steadily adapted to this end, until the political revolution of 1801 brought Jefferson into office. From that time no advance in the direction of more adequate protection were made, although only the duty on salt was repealed, with the result that the country had a second salt-famine during the war of 1812-15. Its sufferings in this, and other industrial wants, effectually converted Jefferson from free trade but is was not until 1824 that the country returned to an effective protective policy.

The South, however, found that its adhesion to slavery precluded it from entering upon manufactures, and now began to antagonize protection as an encroachment on the rights of the States, although her cotton-growing industry had been brought into existence and advanced to prosperity by a protective duty continued for many years. Her threats of nullification led to the adoption of the tariff of 1833, which provided for the gradual reduction of all duties to a 20 per cent level by 1840. The general suspension of manufacturing through this reduction and the derangement of the currency brought about the severe depression of 1837–42, and caused another political revolution in the election of a Protectionist Whig to the presidency in 1840.

During the four years of the tariff of 1842 there was a great and general restoration of prosperity; but the influence of the example set by England, and the prospect of open markets in that country for western and southern products, brought about another change. The tariff of 1846 embodied no economic principle, but effected a large reduction of duties below the protective level. In 1857 these duties were farther reduced by one-fourth, and another severe depression of industry helped to the election of Mr. Lincoln in 1860. Before he came into office the Morill tariff had been passed by Congress and signed by President Buchanan.

This was done in view of the certainty that a civil war at home was impending, and that it might involve the country in hostilities with England and France. It was therefore felt necessary to put the country in the way of equipping itself for any emergency. The relation of home industry to national defense thus indicated, was amply shown in the distresses and disabilities of the Southern Confederacy, which solemnly committed itself to free trade in its Constitution, and was dependent upon its friends in Europe for military and other supplies. For over 30 years our country persisted in this policy of protection, with some unhappy experiments in the reduction of duties,— notably those on wool and woolens in 1883. The presence of a surplus of revenue in the national treasury was made the pretense for demanding «Tariff reform,» meaning an advance toward free trade. In spite of partial victories, nothing was effected until after Mr. Cleveland's second election in 1892. The tariff of 1893 fell far short of what he and his friends wished, but it went as far beyond what the country would endure, and brought about a reaction and a return to Protection.

This continued until a division of the Republican party on other grounds, in 1912 brought back the Democrats to power under a President devoted to free trade. The tariff of 1913 is a distinct step in that direction. It has not been so harmful as some earlier tariffs, because the vast development of wealth and industrial power under the long continuance of Protection has given the country some power of resistance to legislation adverse to our industrial interests. Also the depression which followed upon its adoption was neutralized in many fields of industry by the outbreak of war in Europe, as this created an immense demand for the products of our two greatest industries — agriculture and metal wares. European competition was checked also by the diversion of millions of men from industry to military service, and by the seclusion of Germany and Austria-Hungary from foreign commerce. At the same time we were shown the folly of depending upon foreign producers for our supply of indispensible articles, such as dye-stuffs. Some of these were placed under a moderate protective duty by the votes of the party which had enacted the tariff of 1913, and measures were adopted to prevent our markets being flooded with European goods at sacrifice prices after the close of the war, as was done in 1783 and 1816.

The Reasons for Protection are numerous and mutually supporting. (1) The necessity of varied industries for the national defense has been indicated already. It was again shown in the Boer War, in which a brave people were handicapped by their being a merely agricultural population, in conflict with a great manufacturing country. It was amply illustrated in all nations involved in the great World War. (2) The variety of industry, which Protection establishes, is not less necessary to defend the country from the perils of famine. A country which produces food only, is liable to famine and its consequent pestilences, whenever the rains are too scanty or too plentiful for the harvesting of the crops. Such a country has all its eggs in one basket, and should that fall, it has nothing to fall back upon. Ireland and India became famine countries through the destruction of their manufactures by English legislation and by English competition. They will remain such until they secure the independence which will enable them to enact the protection of their home industries they both desire. All the regions visited by famine in modern times — Persia, central Russia, northern China, northern Sweden, Asia Minor, and even some districts of our own country,— are merely agricultural communities. (3) Protection secures the general welfare of the producers of the country, by bringing each class into the neighborhood with the others, which supply its wants and demand its goods. It thus saves the cost of carrying products over land and sea to find a market and bring back, at a like cost of carriage, whatever is taken in exchange. The railroads of the country save about $5 a ton on having their worn rails converted into new, through not being obliged to send them to rolling-mills in Europe. The farmer gets more for his crop when he has the artisan close at hand to consume it, and obtains in greater abundance what the artisan produces, even if he has to pay a higher money-price for it. All this advantage is lost when a country keeps its farms on one continent and its workshops on another, and spends both strength and money in transportation which could be avoided. (4) The naturalization of varied industries by protection gives the people of the country greater liberty to choose the kind of work they prefer, and a finer opportunity to develop their natural capacities in improving old methods or inventing new ones. This has been especially true of America, whose people were taunted for their backwardness in invention before this became a manufacturing country. An English manufacturer declared we could not make so much as a mouse-trap for ourselves. American inventions have lightened the burden of toil for half mankind. They have made many staple articles, such as steel, cutlery, cotton and silks, cheaper to the whole world. The American character has been distinctly improved by emergence out of the stage, at which farming and shipping furnished almost the only employments, and has grown in manifoldness and energy. (5) The variety of industry, at which Protection aims, is highly useful in drawing the people of the country in closer relations, and thus contributing to the unity of will and understanding, which underlie national unity. It was by the trade between the English colonies that the fierce prejudices of our earliest time were overcome. It was through the development of foreign commerce at the expense of home trade that the Union was imperiled. As Mr. Carey showed Mr. Lincoln, our railroad lines ran only to the seashore, to facilitate exports and imports. They now run north and south as well. By the Zollverein and its fostering of home trade, Germany was helped to national unity. The English sneered at the notion that the Germans could «spin and weave themselves into national unity,» but the result came. (6) By preventing adverse balances of trade, Protection guards the national supply of solid money from being drained out of the country. Money is «not a commodity like any other,» as to whose incoming and outgoing we can afford to be indifferent. It is the means of organizing labor for the conquest of nature and the production of wealth. And it is not indefinitely replaceable, as are many other commodities. To exchange it for hardwares and textiles is to exchange power itself for the products of power. Laveleye compares such an exchange with that between two parties of hunters, who should trade game for guns and ammunition, while at a distance from the basis of supply. Nor is it true, as some economists tell us, that the loss of gold and silver have no other effect than to lower prices in the country which exports them, and thus lead to a return of coin by purchasers from aboard. Prices are lowest in the countries which have the most money, because labor is organized there to the best advantage, and is thus made more productive. «Start a shilling in Thibet, and it will turn up in London.» It goes to where it will buy more commodities, though less labor. Therefore is it true that the gold of the world tends constantly to the great centres of money and of manufacture, moving on the same lines with the commerce in food and raw materials. By refusing this unequal commerce, we have ceased to be a gold-exporting country, and have thus obtained that stock of money which enables us to organize labor on a great scale, and acquire industrial power.

The Objections to Protection are many in form, but they resolve themselves into a few. (1) It is charged that «protection is hostile to commerce. If we do not buy, we cannot sell. Thus we are deprived of the possibility of disposing of our surplus products.» But with the single exception of England since 1846–60, all the great commercial nations have practised protection; and under that policy our own exports have reached a figure not equaled by any other country in the world, our rate of progress in this respect being rivaled only by protectionist Germany. In truth, nations buy of each other just what they must, and sell all they can, and means of payment are always found. (2) It is objected that "the interest of the consumer is that of society at large, while the interest of the producer is that of a class only. Free trade promotes the former, while protection seeks the latter. For the consumer is interested simply in getting what he uses as cheap as possible, and with this a protection duty must interfere." But "better than a low price for any article is a fair price," Mr. Lowell says. The times of especial cheapness are what we call "hard times," and even the free trader fails to recognize his own ideal in those times. Like other people he begins to talk of an "improvement in prices," meaning a rise. In considering the effect of protective duties upon prices it is necessary to look at both sides of the account. Nearly every one in the community has something to sell, and it is of small use to him to be able to buy at a low rate, if he must sell at a still lower. Ireland is a land of cheapness, but not to the advantage of its people, who cannot find a market for their labor. Nova Scotia is another country of low prices, and its people flock in thousands to Massachusetts, to seek employment at such wages as they never can earn at home and to live in comfort there. The free trader fixes attention on one side of the account, to the neglect of the other. Nor is the consumer, in the long run, obliged to pay higher prices because of protection. Mr. Greeley used to challenge the free traders to mention a single article whose manufacture had been protected for 14 years, without falling in price below the point at which it has stood. All kinds of commodities in this country are cheaper to the consumer than they were before the enactment of the Morrill Tariff. The national consumption of all has increased far more rapidly than the increase of the population. (3) It is alleged that "Protection is but a method of forcing a hot-house growth of industries, which would have come to us naturally, when our density of population warranted the transition from farming to manufactures. The latter arise when there is a real need and demand for them, without any interference on the part of government." This statement is not supported by any historic instances of this natural growth. Every nation, which now possesses such industries, made its beginnings under Protection. Every great industry that is fighting for the markets of the world was built up by protective duties. On the other hand, everyone admits that the want of manufactures is the root of the misery of Ireland and of India. The governmental commission to investigate the cause of Indian famines reported, in 1885, that nothing but the diversion of a large part of the labor of the people to manufactures would put an end to them. The need of both countries is beyond question, for in both the density of population has passed the point at which people can live by the soil. But neither of them possesses the power of transforming mere need into effective *demand*, by native legislation. How long are they to wait for that "natural growth?" (4) Adam Smith's argument from the beneficial effects of what he called "natural liberty" supposes that "individual self-interest is enough to secure all the industrial growth that any country needs or should want. If everyone be left free to do as he will with his own, he will do what society needs to have done." Those who repeat this argument are never willing to apply it to other forms of the state's activity, which affect industry. They do not propose to have the merchants of each seaport keep its harbor in condition by their individual or even their united action. They dare not assert that individual self-interest has not inflicted deep and lasting injury of our country in the devastation of its forests, the destruction of its game, and especially the extirpation of insect-destroying birds. They sustain the government in making the coinage of money and the carrying of letters public monopolies, and punishing all who invade either. They have ceased to look to private self-interest for the maintenance of a school system adequate to our national need. They make all these exceptions to their own theory, and the protectionist adds one more. Adam Smith's principle, however, has great truth. It is the rule, and all these other things are the exception. The protectionist differs from the free trader in that he has no panacea or cure-all to offer to the public. He has only a specific for a single social defect, and he alleges in its favor that it interferes as little as possible with personal liberty. (5) It is objected that "protection favors the manufacturers at the expense of their laborers and of the farmers of the country." As for the laborers, protection does not set aside the law which Carey, Bastiat and Atkinson have shown to govern the distribution of profits. The laborer's share of the joint-product of capital and labor constantly increases, while that of the capitalist constantly diminishes. Protection makes that joint-product greater with every expansion of industry, and thus secures to the workman a higher standard of living and a greater opportunity to save. Between 1860 and 1880, the wages of labor, measured in the power to purchase the staple commodities, more than doubled in this country. While free labor in America was once little if anything above the slave's level, as to the enjoyment of the necessaries and comforts of life, it is now on the highest level that it ever has attained in history. The superior condition of American labor was shown by an investigation carried out by our own government in 1911, and still more strikingly by one conducted by the British Board of Trade through the English consuls in 1912. The London *Times* sums up the result, "The workman in America enjoys an enormous advantage over his fellow in England. . . . He earns two and a quarter times as much money, and works shorter hours for it, so that his hourly rate of earning is as 240 to 100. Against that enormous difference in wages there is something to be set in the way of expenditures, . . . but the cost of living is only as 152 to 100. The advantage in regard to the cost of food is less than it looks. A workman living on the American scale pays only 25 per cent more for his food than he would in England." The Board of Trade itself says, "The margin is clearly large, making possible the command of the necessaries and minor luxuries of life greater than that enjoyed by the corresponding class in this country." The farmer is directly cared for in the tariff, being secured by the great market for his produce which our manufacturing districts furnish him. From that market the protective tariff shuts out his Canadian competitor, in spite of the demand of our free traders, seconded by some short-sighted manufacturers, that we shall return to the reciprocity which existed from 1854 till 1867. The farmer is also benefited indirectly by having his market for produce brought into his neighborhood, thus making his exchanges more equal. As an English newspaper put this years ago, «when the western farmer in America had free trade, he gave a pound of butter for a pound of nails. But under protection he gets 14 pounds of nails for his pound of butter.» (6) It is alleged that «protection favors the formation of trusts, and thus destroys that domestic competition, which the protectionist himself relies upon to secure reasonable prices.» Yet a large number of our trusts, beginning with the Standard Oil Company, are almost independent of the tariff. Of the rest, very few have been able to secure such a control of production as to have the power to dictate prices; and of these several avoid attempting it. Their especial product is as cheap as before the trust was formed, their new gains coming from the saving of expenses. Others still are international trusts, of the sort that would be sure to abound if we abandoned protection. Nor are the countries which practise free trade characterized by unlimited competition among producers. Wherever the trades-union has obtained the control of the rate of wages and of the hours of labor, capitalists have been led to combine for mutual protection. They naturally think that they cannot afford to buy labor in a close market and sell their product in an open one. Unified control has come to be the rule in the great English industries, and they have improved upon our example by including the workingmen in their arrangements for adjusting prices and wages.

The general movement of American industry to better conditions under the protective policy is shown by some statistics of our national position at the beginning of our longest period of protection and the last national census, 1910.

	1860	1910
Population	31,443,321	91,972,266
Wealth	$14,183,000,000	$167,579,806,316
Share per capita	$454	$1,822
Exports	$333,576,057	$1,487,764,991
Imports	$353,616,119	$823,172,165
Wages	$378,878,966	$3,427,032,000
Wage earners	1,311,246	6,615,046
Average earnings	$289	$518
Savings banks deposits	$149,277,504	$4,070,486,247

Thus while population in that half-century increased 180 per cent, our wealth increased 1,815 per cent, and the individual share in it 301 per cent. The increase in our exports was 331 per cent, and that of our imports only 130 per cent, or less than the growth of population. While the number of wage earners increased 404 per cent, the wages paid increased nearly 800 per cent; and the savings banks deposits nearly 2,702 per cent.

PROTECTIVE COLORATION. See COLORATION, PROTECTIVE.

PROTECTOR, in the history of England, a person appointed to act as regent generally during the minority of the king. Those on whom it was conferred were the Earl of Pembroke, in 1216, during the minority of Henry III; Humphrey, Duke of Gloucester (1422–47), during the minority of Henry VI; Richard, Duke of York, February 1454 to February 1455, and November 1455 to February 1456; Richard, Duke of Gloucester, in 1483, before the death of the young princes, his nephews, and his own accession to the throne; and the Duke of Somerset (January 1547 to October 1548), during the minority of Edward VI. On the 12th of December, 1653, the title of lord-protector was bestowed upon Cromwell (q.v.), as head of the Commonwealth of England, Scotland and Ireland, by the provisions of the Instrument of Government. At his death, in 1658, he was succeeded by his son, Richard Cromwell (q.v.), who, however, abdicated in 1659.

PROTECTORATE, a term applied to the relationship existing between a strong nation and a weaker one wherein the former undertakes to protect the latter from hostile invasion or other form of aggression and in consequence exercises more or less control over its domestic and entire control over its foreign affairs. The protectorate, unlike the colony, does not lose its individual sovereignty; its people do not become citizens of the protecting state; if the protecting state goes to war with another power the protected state may remain neutral. The relation has, however, often been a mere cloak for absolute dependency on the part of the weaker nation, which for reasons of state it has seemed expedient to disguise. The term protectorate is also applied to the state thus protected. The relation between a protectorate and its protector is usually established by treaty, although sometimes it is the result of mere understanding only. There are two classes of protectorates which differ essentially from the existing circumstances: (1) Where both nations are civilized; (2) where the protector is civilized and the protectorate is not. Most of the protectorates of the present day belong to the second class and are to be found in Asia and Africa and the islands of the Pacific Ocean. Notable examples of existing protectorates are Tunis, Annam, Tonking, Madagascar and Somali Coast under French protection; and North Borneo, Bechuanaland, Somaliland, British Central Africa, British East Africa protectorate, Uganda protectorate, the Sudan and Nyassaland under British protection. Italy also maintains a protectorate in Africa. The United States has from early times exercised similar control over weak nations in various parts of the world. One of these was Liberia on the west coast of Africa and founded by the American Colonization Society in 1820. It has been understood all along that no other nation would be permitted to annex it or interfere in its affairs. Likewise Hawaii for a short time occupied the position of a protectorate until its annexation to the United States in 1898. From 1882 to 1897 the United States was one of the three powers to exercise a protectorate over the Samoan Islands. Likewise from 1836 to 1845 it exercised a protectorate over the republic of Texas. From 1846 to 1903 the United States as a result of treaty with Colombia exercised a quasi-protection over the Isthmus of Panama for the purpose of ensuring the neutrality of the Panama Railroad. Partly as a result of American aid Panama seceded from Colombia in the latter year and virtually placed itself under the protection of the United States. The most perfect example of an American protectorate at the present time is that of the republic of Cuba, which secured its independence of Spain in 1898 chiefly through the intervention of the United States and which upon demand of the American government inserted in its Constitution a promise not to enter into foreign relations with any other country without the consent of the United States and accepted other conditions which materially impair its independence.

PROTEIDÆ, a family of large Urodele or long-tailed amphibians characterized by three pairs of persistent gills besides lungs, the presence of both fore and hind legs, the absence of eyelids and maxillary bones and the presence of teeth on the premaxillaries, the vomers and the mandible. The vertebræ are amphicoelars. The family contains three genera, each containing one species. These are Necturus, common in the eastern Mississippi Basin, the blind Proteus (q.v.), and the likewise blind *Typhlomolge*, found in artesian waters from Texas. The *Proteidæ* are often known as mud-puppies. (See AMPHIBIA; URODEL). For the development of this group see EMBRYOLOGY.

PROTEINS, a large group of organic compounds, of which the white of egg or ovalbumin, may be taken as a typical example. They make up the principal bulk of the solid matter of all animal cells and tissues, and are found in various parts of the structure of plants, especially in seeds. The proteins found in nature are 40 or 50 in number, mostly amorphous and indiffusible, and possess a complex chemical structure, whose nature is not clearly understood. They appear as non-crystallizable compounds of carbon, hydrogen, nitrogen, oxygen, generally, but not always, sulphur, and sometimes phosphorus; and occurring in a solid viscous condition, or in solution. Iodine is a usual constituent of the proteins found in marine animals. The different members of the group present differences in physical, and to a certain extent in chemical, properties; they all possess, however, certain common chemical reactions, and are united by a close genetic relationship. Thus, carbon is present in amount varying only from 50 to 55 per cent; hydrogen, from 6.9 to 7.2 per cent; oxygen, from 19 to 24 per cent; nitrogen, from 18 to 19 per cent; and sulphur, from 0.3 to 2.4 per cent — keratin of human hair, being a notable exception, having a sulphur content of 5 per cent. Proteins occuring in the vegetable kingdom are built up from simpler compounds; but the animal system is believed to be incapable of performing a synthesis of this kind, and the proteins that occur in the animal body are believed to be derived wholly by a modification of those that are taken into the system in the form of food. The proteins in the food are largely converted, by the action of such digestive ferments as pepsin and pancreatin, into soluble substances known as «peptones,» and these, after absorption through the intestinal walls, are (in large measure) transformed into the proteins that normally occur in the muscles and other tissues of the animal. Some of the protein portion of the food is, however, apparently transformed, in the course of digestion and assimilation, into glycogen and fat. In the changes which are inseparably associated with the life of the animal, the proteins that are stored in the body (and especially those in the muscular and nervous system) undergo a process of oxidation, or slow combustion, by which they are transformed into other compounds that are much less highly organized; the ultimate products of this oxidation being mainly water, carbon dioxide and urea.

The proteins, as a class, are so similar to one another in their ultimate composition, that Gerhardt believed them to consist mainly of one fundamental albumen-like substance, mingled, or perhaps chemically combined, with varying amounts of inorganic matter. This view is not in favor among the chemists of to-day.

Efforts to determine the molecular weights of the proteins have been many, and not at all satisfying. The results obtained, while quite indefinite, seem to prove that the molecular weights of the proteins are very large as compared with those which have been determined for other substances. For example, the molecular weight of egg-albumen, as obtained by the freezing-point method, is given as 14,270; that of hemoglobin, as determined by the iron content method, as 14,000.

Chemically, proteins exhibit a wide variance, some being distinctly acid and others decided bases which form strong salts with strong acids. The most of them, however, are neither markedly acid nor basic, but react toward acids as bases and as acids toward bases. Recent investigation of the proteins has been chiefly along the line of hydrolysis, accomplished by heating them with concentrated hydrochloric acid or strong sulphuric acid. A large number of amino-acids have thus been obtained from the simple proteins, but with the very unsatisfactory disappearance of about 30 per cent of the protein substance treated.

Though the proteins are mostly amorphous, a few are known that are capable of crystallization, notably some which have been obtained from the seeds of hemp and the pumpkin, from Brazil nuts and from castor-oil beans. Some other proteins which are not found in nature in a crystallized form can be obtained in that phase by special treatment. Thus, if egg-albumen is precipitated from its solution by ammonium sulphate and acetic acid, and allowed to stand, it gradually crystallizes. All the proteins are insoluble in absolute alcohol, but many of them are soluble in water, or in dilute saline solutions. Dissolved proteins all rotate the plane of polarization of polarized light to the left, the extent of the rotation varying with the nature of the dissolved protein. Dissolved proteins are not diffusible, as a rule, and mineral matters with which they may be mixed can, therefore, be removed by placing the solution in a vessel which is separated into two parts by a vertical porous membrane, pure water being placed in one compartment, while the solution to be dialyzed is placed in the other. The mineral salts will diffuse through the porous membrane, while the protein remains in the compartment in which it was originally placed. By renewing the water in the second compartment from time to time, the dialysis may be caused to proceed until practically the last trace of mineral matter has been removed from the protein. The peptones, however, are themselves diffusible, and the proteoses (or «albuminoses») are so to a lesser extent.

Many of the proteins that are soluble are precipitated from their solutions in a permanently insoluble condition by the action of heat, the substance which is thus thrown down being known as «coagulated protein.» The temperature at which heat-coagulation takes place varies with the nature of the protein, and (to some slight extent) with the degree of acidity or alkalinity of the solvent from which they are thrown down. The fibrinogen of the blood, for example, coagulates at about 133° F.; while serum-albumin and egg-albumen coagulate at 162° F., and crystallin at 199° F. When a protein is precipitated from solution by heat, the liquid from which it was thrown down almost invariably has its alkalinity increased, or its acidity diminished. Dry proteins may be brought into the «coagulated» condition by raising their temperature to 230° F. Raised to higher temperatures they carbonize, and evolve gases.

Coagulated proteins are exceedingly insoluble, and in fact cannot be brought into solution at all except by the action of some agent which changes their chemical nature profoundly. Pepsin (in an acid medium) or pancreatin (in an alkaline medium) convert them into soluble peptones, when the experiment is performed at a temperature not very close to that of the human body. A protein which is precipitated from its solution by alcohol is not at first thrown into the «coagulated» condition, but passes into it gradually upon prolonged contact with the alcohol. When a solution of proteins is saturated with ammonium sulphate, all of its proteins are precipitated except the peptones; but the precipitate is not in the coagulated form, for it is capable of dissolving again, either in pure water or in a dilute saline solution. This reagent is used, in the laboratory, for estimating the amount of protein in a given solution; the precipitate that it gives being removed by filtration; washed with a saturated solution of ammonium sulphate; heated to 230° to produce coagulation; and finally weighted, after the ammonium sulphate has been removed by thorough washing with pure water, and the precipitate has been dried. Many of the salts of the heavy metals (basic acetate of lead, for example), precipitate proteins from solution by forming, with them, an insoluble proteo-metallic compound. From this compound the metal may be subsequently removed by the action of sulphuretted hydrogen gas; the protein then being set free in its original, soluble state.

Of the chemical reactions manifested by the proteins as a class, the following may be especially mentioned: (1) *The xanthoproteic reaction.* When strong nitric acid is added to a solution containing a protein the protein is often (but not invariably) precipitated; and both the precipitate and the solvent turn yellow from the formation of xanthoproteic acid, the precipitate dissolving upon prolonged boiling, if the nitric acid is present in excess. The yellow color changes to an orange upon the addition of an excess of sodium hydroxide. (2) *Millon's reaction.* «Millon's reagent,» which is one of the best tests for detecting the presence of a protein, is prepared by dissolving mercury, by the aid of gentle heat, in an equal weight of nitric acid of specific gravity 1.4. When the metal has entirely dissolved, the solution is diluted with twice its bulk of water, and the abundant precipitate which comes down is allowed to subside. The clear liquid remaining is the reagent desired. Millon's reagent throws the proteins down in the form of a white precipitate; and both the precipitate and the solution become colored, ranging from pink in the cold to brick red upon boiling, though time is sometimes required before the coloration is complete. Solid proteins give this same reaction, when boiled with the test solution. Tyrosine and silk respond to it also. (3) *Sulphur reaction.* Warmed with a solution containing sodium hydroxide and a lead salt, a black precipitate or brownish color is produced in a solution of a protein containing sulphur, due to the formation of sulphide of lead.

The classification of the proteins has been essayed by several groups of students both in Europe and America, and the work, extremely difficult in itself, has been complicated by the use of terms to which different meanings have been attached by various writers. The American Society of Biological Chemists and the American Physiological Society have agreed on the following classification, which is regarded as standard by American students.

SIMPLE PROTEINS.

Albumins.— Those which are soluble in pure water, and coagulate when heated.

Globulins.— Those which are insoluble in pure water, but dissolve in neutral solutions of salts derived from the action of strong acids upon strong bases.

Glutelins.— Those which are insoluble in all neutral solvents, but which dissolve in very dilute acids or very weak alkalies.

Prolamins (Alcohol-soluble proteins).— Those which are insoluble in water, neutral solvents and absolute alcohol, but dissolve in alcohol of 70 to 80 per cent strength.

Albuminoids.— Those which exhibit a high degree of resistance to solubility with all neutral solvents, while having apparently the same chemical structure as the soluble proteins.

Histones.— Those soluble in water and insoluble in ammonia (unless ammonia salts are present), which yield precipitates with solutions of other proteins, and, when heated, a coagulum readily soluble in very dilute acids.

Protamines.— Polypeptids simpler than the proteins of the groups above specified: soluble in water; not coagulated by heat; having the quality of precipitating water-solutions of other proteins; and exhibiting strong basic characteristics, forming stable salts with the strong mineral acids.

CONJUGATED PROTEINS.

Nucleoproteins.— Compounds of one or more protein molecules with nucleic acid.

Glycoproteins.— Compounds of the protein molecule with one or more substances containing a carbohydrate group other than a nucleic acid.

Phosphoproteins.— Compounds of the protein molecule with phosphorus-containing substance other than a nucleic acid or the lecithins.

Hemoglobins.— Compounds of the protein molecule with hematin, or similar substance.

Lecithoproteins.— Compounds of the protein molecule with the lecithins.

DERIVED PROTEINS.

Primary Protein Derivatives.— Those formed from the protein molecule apparently through hydrolytic changes, with but slight alteration in the protein molecule: embracing (1) Proteins — insoluble products of the action of water, very dilute acids or enzymes; (2) Metaproteins — products of such action of acids and alkalis as alters the molecule, forming substances soluble in very weak acids and alkalis, but not soluble in neutral solvents (including the so-called acid-albuminates and alkali-albuminates); (3) Coagulated Proteins — insoluble products resulting from the application of heat to their solutions, or to the action of the alcohols on proteins.

Secondary Protein Derivatives.— Products of a more extended cleavage of the protein molecule: embracing (1) the Proteoses — those which are soluble in water; not coagulated by heat; and which are precipitated by saturating their solutions with ammonium sulphate or zinc sulphate; (2) the Peptones — those soluble in water; not coagulated by heat; but not precipitated by saturating their solutions with ammonium sulphate; (3) Peptids — those compounds of definite structure in which two or more amino-acids are combined through the union of the carboxyl group of one with the amino group of the other and the loss of a molecule of water.

Albumins.— Serum-albumins have been separated from the lymph and blood-serum of vertebrate animals, from milk and from certain seeds. Lact-albumin is found in milk though in the small proportion of less than one-half of 1 per cent. The principal vegetable albumins are leucosin — found in wheat, rye and barley; and legumelin — of peas, beans and lentils.

Globulins are found in blood-serum and in certain body tissues and organs and in eggs, milk, seeds, etc. A typical globulin is fibrinogen, found in the blood of vertebrate animals. Upon being separated from the living animal the fibrinogen is almost immediately changed into fibrin or blood-clot by the action of an attendant enzyme. Musculin and myogen are globulins found in the tissue of what are known as a striped muscle. It is the coagulation of musculin after death which produces the stiffening of a corpse, known as *rigor mortis*.

Glutelins and **Prolamins** are found in the grains, a familiar example being the gluten of wheat, which is a mixture of glutenin, a glutelin; and gliadin, a prolamin. Zein, of Indian corn, is another example of the same group.

Albuminoids.— In this group are found the protein substances which in large measure give stability to the structure of the animal body. Collagen is a typical example. It is the foundation of cartilage and connective tissue and enters largely into the bony skeleton. When boiled in water, collagen yields gelatin. When treated with tannic acid, as in the making of leather, it becomes tough and highly resistant to decay. To this group belong also keratin, the principal substance of hair, horns, hoofs and feathers; and elastin, the largest constituent of the ligaments of the animal body.

Histones.— The most familiar example of this division of the proteins is globin, the protein constituent of the red coloring matter of the blood, hemoglobin.

Nucleoproteins are comparatively numerous, forming the chief constituents of the nuclei of all nucleated cells and hence found in every part of the body and its organs. They are found also in yeast and in certain plants.

Glycoproteins.—A common example of this group is mucin, a constituent of the saliva. As previously noted, egg-albumen is probably to be classed in this group; and here belong also the mucoids of egg-albumen and blood-serum.

Phosphoproteins.— The most familiar example is the casein of milk, regarded as a calcium salt in combination with calcium phosphate. When casein is coagulated with rennet, the product is paracasein, differing from casein chiefly in that its calcium salt is insoluble. Vitellin, found in the yelks of hen eggs, is another example of the phosphoproteins.

Hemoglobins.— The red corpuscles of the blood have a very large content of hemoglobin. When human blood is dried, the proper proportion of hemoglobin in the red corpuscles is found to be about 94 per cent. Either acids or alkalis reduce hemoglobin to the histone globin and the iron compound hematin, which is not a protein, but a derivative of pyrrole, one of the decomposition products of the proteins.

Albuminates belong to the group Metaproteins. They result from the so-called "acid albumin," obtained by treating an albumin or a globulin with dilute acetic or hydrochloric acid. Acid albumin is soluble in dilute acids or alkalis, but insoluble in a neutral mentsruum. When the original protein is treated with a small quantity of dilute alkali, it combines with the alkali to form "alkali albumin"; and this, like acid albumin, is soluble in weakly acid or alkaline media, but insoluble in a neutral one. Alkali albumin is likewise not coagulable by heat. The combinations here described may be taken as typical of the albuminates in a general way; but as the albuminates are doubtless very numerous and as they have not yet been fully investigated, it must not be inferred that they will all possess the characteristics of ordinary acid and alkali albuminates.

Proteoses and Albumoses.— Proteins derived from the albumins or globulins or albuminates by the action of digestive ferments, such as pepsin and trypsin. They are intermediate between the original proteins and the peptones into which these original proteins are ultimately transformed by the digestive ferments. They are precipitated from solution by nitric acid, the precipitate dissolving upon application of heat. They are also somewhat diffusible, but not to the same extent as the peptones.

Peptones.— Proteins which are formed by the prolonged action of digestive ferments upon other proteins. (Compare the *proteoses* in the preceding paragraph). While they are not precipitated by heat, nor by nitric acid, they are precipitated by tannin and by certain other reagents. It seems quite clear that peptones are polypeptids. The peptones are diffusible and they play an exceedingly important part in digestion and assimilation. Peptones that are artifically prepared are commonly bitter, perhaps from the development of alkaloids or glucosides. Pure peptone has a meaty flavor.

Peptids.— The majority of peptids dissolve readily in water but not in alcohol. A few which are almost insoluble in water dissolve in acids or in alkalis. Most of them have a bitter taste. When heated with concentrated hydrochloric acid for several hours they are completely resolved into amino-acids.

Through this system of investigation it is hoped ultimately to discover the process of the upbuilding of the whole class of proteins from their primal elements.

PROTERANTHUS. See Gillenia.

PROTEROGLYPHA, a division of the Colubridæ family of snakes, in which the grooved poison teeth or fangs are attached to the forward part of the upper jaw — those in which the fangs are at the rearward part of the jaw being known as Opisthoglypha (q.v.). The group includes nearly all the more deadly of poisonous snakes.

PROTEROZOIC (Greek *proteros*, early, and *zoa*, life), a geologic time division generally given the rank of an era. According to the United States Geological Survey it includes all time before the Paleozoic, and is divided into the Archean and Algonkian periods. Other geologists divide the time before the Paleozoic into two eras, the Archeozoic (Archean) and Proterozoic (Algonkian). This article follows geological survey usage. Proterozoic time is also frequently referred to as the Pre-Cambrian. The type sections are in the region of the Great Lakes, in northern United States and Canada. The rocks of the era readily fall into two systems, the Archean (q.v.) and Algonkian (q.v.), separated by a profound unconformity. The former are dominantly igneous, consisting of a great series of basic lava flows and minor amounts of interbedded sediment, cut by large granite intrusions. This period of volcanism was followed by long erosion, and Algonkian rocks, dominantly sedimentary, were laid down on eroded Archean surfaces. Little is known of the geography of either period, except that in Algonkian time considerable limestone was deposited, pointing to probable submergence under an ocean. It is believed that glaciers occupied parts of Canada in the early Algonkian, and in the latter part of the period volcanism was again extensive.

There are no direct evidences of life in the Archean nor in the early Algonkian though limestones may point to the existence of minute lime-secreting animals. A few imperfect fossils, probably brachiopods and crustaceans, have been found in very late Algonkian rocks. Two similar rock systems, under various names, are recognized in Europe and probably in other continents. The intense metamorphism that Proterozoic rocks have undergone in many regions makes it impossible to separate the two systems over much of the world, at least until much more detailed work is done.

PROTESILAUS, prō-tĕs-ĭ-lā'ŭs, Greek hero, son of Iphiclus, king of Phylace, Thessaly. He led a band of Thessalian warriors against Troy and was the first of the Greeks to land on the Trojan coast, whereupon he was killed by Hector. Another tradition makes Achates slay him. He is famed in ancient story for the affection which existed between him and his wife, Laodamia, who, when she learned of his death, prayed that he might return to her for three hours. The prayer was granted and Hermes conducted Protesilaus to the upper world. At the end of the three hours Laodamia died with her husband and returned with him to the lower regions. However, there are also some other versions of his life and death. His tomb was near Eleus in the Thracian Chersonesus, a temple was erected to him there, and at Phylace a sanctuary was built in which funeral games were played in his honor. The story is told by Wordsworth in one of his most beautiful poems, 'Laodamia,' written in 1814. It was also the subject of a tragedy by Euripides of which only some fragments remain. In more recent times the Polish poet, S. Wyspianski, wrote a tragedy in verse (Krakow 1901) which has been translated into French by A. de Lada and L. Maury as 'Protésilas et Laodamie' (Paris 1913). Two ancient Roman sarcophagi, showing the history of the hero's life and death, have been preserved, one in the Vatican and the other in the church of Santa Chiara at Naples. Consult Preller, L., 'Griechische Mythologie' (2 vols., Berlin 1872–75); Roscher, W. H., ed., 'Ausführlichen Lexikon der griechischen und römischen Mythologie' (Vol. III, pt. 2, p. 3155, Leipzig 1902–09).

PROTEST, a solemn declaration of opinion, commonly against some act, particularly a formal and solemn declaration in writing of dissent from the proceedings of a legislative body, or a like declaration of dissent by a minority of any body against the proceedings of the majority. In the commercial usage of the term, a protest is a formal declaration, made by a notary public, under hand and seal, at the request of the payee or holder of a bill of exchange for non-acceptance, or non-payment of the same, protesting against the drawer and others concerned for the exchange, charges, damages and interest. This protest is written on a copy of the bill of exchange, and notice is given to the drawer and endorsers of the same, by which they become liable to pay the amount of the bill, with charges, damages and interest. To be of legal effect the action of the notary must be taken on the day the payment was due. (See BILL — BILL OF EXCHANGE). A protest is also a writing, attested before a notary public, a justice of the peace or a consul in foreign parts, drawn by a master of a vessel, stating the severity of a voyage by which the ship has suffered, and protesting that the damage was not owing to the neglect or misconduct of the master.

PROTESTANT EPISCOPAL CHURCH, The, the American branch of the Anglican Communion. The Church in America, though quite independent, is in full communion with the Church of England and inherits her ecclesiastical position. As the Preface to the Prayer Book states: «This Church is far from intending to depart from the Church of England in any essential point of doctrine, discipline or worship; or further than local circumstances require.» To define her principles and position is to define Anglicanism, to interpret that movement in history known as the English Reformation.

In the beginning of the 16th century the Church of England was in full communion with the national churches of western Europe, acquiescing with them in the headship of the Church of Rome. In doctrine and discipline she had become identified with the prevailing type of Latin Christianity. By the end of the 17 century she had withdrawn from the Roman obedience and had gradually come to assume the position she maintains to-day. This period of transition constituted the Anglican Reformation. The status of the Church of England was unique. Positively, the change involved a reassertion of the principles of primitive Christianity and an assimilation of the newly-awakened tendencies of modern thought. Negatively, it involved the repudiation on the one hand of mediæval Roman Catholicism, on the other of Continental Protestantism. Anglicans believed that the change involved no breach in the continuity of the English Church. They maintained that in rejecting much that was Roman and mediæval they had forfeited nothing essentially catholic.

The American Church inheriting this position claims to be a branch of the primitive Catholic and Apostolic Church. At the same time she is frankly opportunist in adapting herself to the needs and conditions of modern life. In the sense of being not-Roman, she is Protestant. As maintaining that her continuity with the ancient Church is guaranteed by her possession of the Apostolic succession of bishops, she is Episcopal. She is Episcopal also in the sense of being not-Papal. This, perhaps, gives the rationale of her common legal title. Members of the Church are spoken of indifferently as Anglicans, Episcopalians or Churchmen.

The fundamental principles of Anglicanism as well as Anglican terms of inter-communion are indicated in what is known as the Chicago-Lambeth Quadrilateral. In 1886 a Commission on Christian Unity reported to a General Convention held at Chicago. The substance of their report was embodied in a Declaration of the House of Bishops. Two years later this Declaration was, with slight modifications, adopted by the bishops of the whole Anglican Communion, meeting in conference at the archbishop of Canterbury's palace in Lambeth. The wording of this Anglican Eirenicon, defining the essentials of the Christian faith, is as follows:

«1. The Holy Scriptures of the Old and New Testaments, as containing all things necessary to salvation, and as being the rule and ultimate standard of faith;

«2. The Apostles' Creed, as the Baptismal Symbol, and the Nicene Creed, as the sufficient statement of the Christian Faith;

«3. The two Sacraments, ordained by Christ Himself — Baptism and the Supper of the Lord — ministered with unfailing use of Christ's words of institution and of the elements ordained by Him;

«4. The Historic Episcopate locally adapted in the methods of its administration to the varying needs of the nations and peoples called of God into the Unity of His Church.»

This declaration may be taken as an official indication of the bases of the Anglican position.

It is the belief and hope of Anglicans that the position gives them good vantage-ground for promoting the cause of Christian unity. They have much in common with all bodies of Christians. While their attitude toward Roman Catholics is one of resolute protest, their quarrel is only with a mediæval Romanism by which they believe that the primitive Catholicism of the great Latin Communion has been obscured. Their position more nearly approximates that of Eastern Orthodox Catholicism — Greek Christianity — and that of the Old Catholics. Their relations with both these communions are those of friendly interest and intelligent sympathy, although there is no inter-communion nor immediate prospect of it. The many differences due to widely differing antecedents oppose difficulties to the adoption of a common platform. This, however, does not prevent many manifestations of present friendship and hope of closer relations in future. Recent years have seen a marked rapprochement between the Anglicans and the Russian Orthodox Communion.

On the other hand, the Anglican Church is in close sympathy with the life and aims of various bodies of Protestants. Her breach with the Christian past is not so great as theirs but she rejoices to feel that the fundamentals of her faith are the same as theirs, and that she is at one with them in striving to adopt and apply Christianity to the needs of modern times. Since the appointment of a Commission on Christian Unity in 1856 there have been conferences with the Presbyterian General Assembly, the General Synods of Evangelical Lutherans of the North and South and the Provincial Council of the Moravians. These have contributed somewhat to a better mutual understanding. Some idea of the nature of the Anglican claim and hope is necessary at the outset for an appreciation of the details of Anglican history.

The Church of England in the American Colonies.— The Church of England came to America with the first English explorers and colonists. The first English service, so far as is known, was held in 1579 on the coast of California by the Rev. Francis (or Martin) Fletcher, ship's chaplain to Sir Francis Drake. In 1607 an English clergyman was regularly established among the Virginia colonists at Jamestown. This missionary was the Rev. Robert Hunt, a man of simple piety and great zeal, who held daily services in the open air, and on 21 June 1607 for the first time in America administered the Holy Communion. Virginia was a Church of England colony. Various missions were established as the colony grew. The clergy were most of them faithful missionary priests. Some, unfortunately, were men who had bad records at home, and whose lives tended to discredit the Church which they served. In the same year that Jamestown was settled, Prayer-Book services were held also on Saint George's Island, Maine. Within a short time there were English clergymen settled in Maryland, and before the end of the century missionaries working in New Hampshire, South Carolina, Delaware, New York, New Jersey and Pennsylvania. In 1692 grants of land were made for Trinity Church, New York. Five years later the Rev. William Vesey was established as rector of what has become the most important parish in the country.

In New England the Church of England fared badly. The Puritans of Massachusetts Bay had on leaving England professed unalterable attachment to their mother-church. They had, however, adopted a Calvinistic theology differing in various ways from the teaching of the Prayer Book. Shortly after reaching New England, they adopted also the ecclesiastical polity of the Pilgrims of Plymouth. In England, Puritans as well as Anglicans had done their best to suppress «Independents.» Calvinistic Congregationalism became the «standing order» in Massachusetts and Connecticut. The use of the English Prayer Book was made a penal offense and Churchmen, so far as possible were driven from the colonies. Among the more notable victims of Puritan intolerance were John Checkley, William Blackstone, the Browns of Salem and Samuel Maverick. Some took refuge in Rhode Island, others in colonies farther south.

The 18th century saw increased effort on the part of the Church of England to minister to the needs of colonists in America. Since 1634 colonial churches had been under the supervision of the bishop of London. In 1696 Bishop Compton of London appointed as his «commissary» for Maryland, Dr. Thomas Bray. Dr. Bray's interest in American missions led to the formation of the Society for Promoting Christian Knowledge (S. P. C. K.) and of the Society for the Propagation of the Gospel in Foreign Parts (S. P. G.). This latter society was especially active in providing missionaries for America, and in furnishing them with means of support. The most notable of these missionaries were the Rev. George Keith and the Rev. John Talbot. They traversed the colonies from New Hampshire to North Carolina and sent to the S. P. G. full reports of the needs of America.

English clergy met with much opposition in New England. There was a special outcry against them owing to secession from the Congregational ranks. In 1722 the president of Yale College, Dr. Timothy Cutler, and four tutors resigned their position to embrace Episcopacy. One of these, Dr. Samuel Johnson of Stratford, became the most notable Churchman in Connecticut. One of the wisest and most far-seeing friends of America in England was Dr. George Berkeley, dean of Derry, afterward bishop of Cloyne. He wished to found a training school for American missionaries. «Saint Paul's College» was to have been situated in — it being a conveniently central point — the Bermuda Islands. Dean Berkeley came to America and spent three years in Rhode Island. He was forced to abandon his project by failure to receive funds which had been promised by the English Parliament.

John and Charles Wesley for a time worked in Georgia in the early days of the colony. This was before any Methodist societies had separated from the English Church. Later Methodist preachers, especially George Whitefield, were vehement in denouncing the Anglican clergy and did much to disturb the S. P. G. missions. However, the work prospered despite drawbacks — greatest of which was the lack of bishops — and by 1775 there were about 300 parishes, ministered to by 250 clergymen. It is estimated that between 1607 and 1775 about 2,000 «Clerks in Holy Orders» of the English Church had, for longer or shorter periods, labored in America.

Organization as an Independent Church. — The outbreak of the War of the Revolution put an end to intercourse between colonial Churchmen and the authorities of the Church of England. Many of the clergy were Tories. These left the colonies for England and Nova Scotia. During the war services were maintained in a few places, prayer for Congress being substituted for prayers for the king. The one man whose influence did most to hold together scattered bands of Churchmen was Dr. William White of Christ Church and Saint Peter's, Philadelphia. He was in close touch with the fathers of the Commonwealth and was for many years chaplain of Congress. Immediately after the recognition of American independence steps were taken to organize an independent American Church and to establish new relations with the Church of England, which should recognize «the Change in our Situation from a Daughter- to a Sister-Church.»

First to act — for themselves alone — were the clergy of Connecticut. They were convinced that the first step of all must be to obtain bishops. In 1783 a meeting was held at Woodbury, at which a petition was addressed to English bishops to consecrate for America and a candidate was chosen for the episcopal office. The bishop-elect was Dr. Samuel Seabury, a native of Connecticut, an S. P. G. missionary in the colony of New York and a chaplain in the British army. He sailed to England and asked for consecration. This he was unable to obtain. The English bishops, as officers of a state-church, were unwilling to act without formal authorization by Parliament. This was not forthcoming. After waiting a year Seabury, in compliance with instructions from Connecticut, transferred his application to the Episcopal Church of Scotland. The Scottish bishops willingly granted his request and he was consecrated in Aberdeen 14 Nov. 1784. He signed a «concordate» with his consecrators, in which inter-alia it was agreed that he should use his influence to introduce in America a Communion Office like the Scottish. This differs from the English one, being in some ways «more agreeable to the genuine Standards of Antiquity.» Five years later Bishop Seabury was enabled to keep this promise. His enduring monument is the complete form in the American Prayer Book of the Prayer of Consecration in the Eucharistic Office. Bishop Seabury lived until 1796. He was a noble man and a staunch Churchman. He was indefatigable in administering his diocese, but, partly owing to his «war record,» did not exercise great influence outside of Connecticut. It was not until a century after his death that his fellow-Churchmen fully appreciated the extent of their indebtedness to this first of all bishops in America.

In 1785 delegates from seven colonies south of Connecticut, laymen as well as clergymen, met in convention in Philadelphia. Their most important acts were to arrange for triennial General Conventions, and to make a new application to the archbishops of England to consecrate bishops for America. There was some delay. The English bishops objected to proposed changes in the Prayer Book. Their objections were met by action of a convention held in Wilmington, Del., in 1786. Finally, on 4 Feb. 1787, English bishops in Lambeth Chapel consecrated Dr. William White to be bishop of Pennsylvania and Dr. Samuel Provoost to be bishop of New York. Four years later, Dr. James Madison, president of William and Mary College, was consecrated, in England, bishop of Virginia. The four American bishops in 1792 joined in the consecration of Thomas John Claggett, as bishop of Maryland, through whom the joint succession from the bishops of England and Scotland has passed to every member of the American episcopate.

The bishops of the Church are its chief officers, but the «Constitution and Canons,» adopted in 1789, provide that presbyters and laymen shall share their responsibility of administration. Each diocese has a standing committee, consisting of presbyters and laymen (in three dioceses, of clergy only) elected by the diocesan convention. This committee acts as a cabinet to the bishop. In case of vacancy in the episcopate, or sometimes during a bishop's absence or incapacity, the standing committee for canonical purposes becomes the «Ecclesiastical Authority» for the diocese.

Similarly, the House of Bishops is associated with a House of Deputies in General Convention. The lower House is composed of four clerical and four lay delegates (communicants) from each diocese and one clerical and one lay delegate from each missionary jurisdiction. Either House may originate legislation, but concurrent action is necessary to make it valid. The House of Bishops has a veto on the action of the lower House. All bishops are equal in rank. The senior by consecration acts as primate or «Presiding Bishop.» All general disciplinary regulations are comprised in the Constitution and Canons of the General Convention. In addition to these, each diocese has its own constitution and canons.

A general convention was held in 1789. Bishop Provoost and some delegates objected to the recognition of Bishop Seabury, but the objection was overcome by the influence of Bishop White. As Bishop Provoost was absent, Bishop Seabury and Bishop White constituted the first House of Bishops. Their chief work was the revision of the Prayer Book. All proposed changes emanated from the bishops and, with one exception, were ratified by the House of Deputies. The two bishops formed an effective combination. To quote an apt comment of Bishop John Williams: «For the results of that memorable Convention, in which so much was gained — may we not say so little lost? — we are indebted under the over-ruling wisdom of the Holy Spirit to the steadfast gentleness of Bishop White and the gentle steadfastness of Bishop Seabury.»

The Prayer Book adopted in 1789 (to which a few additional offices were later added) continued in use for over a century. In 1892 a second revision was completed when the Prayer Book was given its present form. This Prayer Book, which contains all the public offices of the Church, is the best evidence of the doctrinal and ecclesiastical position of the Protestant Episcopal Church. Canons give regulations for practical administration, discipline and clerical education. They give a fair idea of the Church's methods of working. The Prayer Book alone can suggest the faith and spirit which constitute her life.

History during the 19th Century.— For 50 years the Episcopal Church was a small body. It could do little more than assert its right to exist in the face of hostile prejudice. It was suspected for its English antecedents and disliked for its assertion — distinct though timid — of ancient ecclesiastical principles in the midst of prevalent Protestantism. It was perforce apologetically apostolic. It was inevitable, however, that it should gain a firm footing in American life, when its representatives were such clergy as its first bishops and such laity as Washington, Jefferson, Hamilton, Franklin and two-thirds of the signers of the Declaration of Independence. For 50 years the most conspicuous figure in the Church was that of Bishop

White. His episcopate (1787–1836) was the most important the Church has seen. His wise and gentle guidance of his own people, his fairness and charity toward all others, did much to protect the Church in the critical period of its history.

There were other strong men in the House of Bishops. John Henry Hobart of New York (1775–1830) had the most forcible personality. He was, as his epitaph states, «the able and intrepid Champion of the Church of God.» He was enthusiastically loyal to the principles of his Church and saw no wisdom or charity in hesitating to avow them. «Evangelical Truth and Apostolic Order» was his motto. No Churchman of this time did so much to make explicit the principles of Anglican Catholicism.

Alexander Viets Griswold (1766–1843) of the Eastern Diocese (all New England except Connecticut) was influential in a different way. He possessed New England virtues, a serious piety, patient hardihood and frugality and a great capacity for hard work. His faithful ministrations in all parts of his immense diocese did much to dispel Puritan supersition concerning Episcopacy and the episcopal order.

Philander Chase of New Hampshire (1775–1852), first bishop of Ohio and later of Illinois, labored indefatigably as a missionary in many States. He was founder of Kenyon College and Bexley Hall, Gambier, Ohio, and Jubilee College, Peoria, Ill. For both of these he obtained funds in England. He was of an eccentric character, but a man of determination. His one aim was to spread the knowledge of his own two treasures, the Bible and the Prayer Book. These men were typical American Churchmen of the first half of the 19th century. their work indicates very fairly the kind of work done by their fellow-Churchmen in all parts of the country.

Parties.— The work of the Church has been largely missionary; its clergy, men of affairs rather than theologians. It has produced no peculiar school of thought, but has reflected the theological developments of England and Germany. There have been, generally speaking, three types of Churchmen, known respectively as High Church, Low Church and Broad Church. Each of these has emphasized some one side of Church teaching and has not escaped the dangers of one-sided partisanship.

The Low Church represented the 18th century revival in the Church of England which took the form of Evangelicalism within the Church and Methodism without. The truths which it emphasized were the absolute dependence of the spiritual life on the person of Christ, the need of conversion, the reality of grace and purely instrumental character of «ordinances.» The Atonement was the central fact in Evangelical theology. (Men of this school were also noted for promoting the cause of foreign missions). The Evangelicals were dominant until the middle of the 19th century. They were strenuous in opposing High Church teaching as being thinly disguised «Popery.»

High Church principles were brought to the fore by the Tractarian (Oxford) Movement which began in 1833. These were the assertion of the character of the Church as a divine society, the special sphere of the working of the Holy Spirit; of the character of sacraments as veritable means of grace; of the central place in Christian worship of the Holy Eucharist. Among the more obvious results in this movement were increased reverence and beauty in church services, increased parochial activity, especially among the poor; the revival of frequent Eucharists and (to some extent) of auricular confession. The later stages of the movement produced a party of Ritualists. They differed from the early Tractarians. Their ritual was largely in imitation of the Latin rite, whereas their predecessors copied a Laudian model; their ideals were mediæval rather than patristic. The early Tractarians sought to revive the teachings and spirit of the first four centuries, the ritualists to reproduce the picturesque externals of the 14th. Both sections of the party emphasized the «sacramental principle» in Christianity and made the Incarnation rather than the Atonement the central fact in their theology.

Parallel with the Oxford Movement was the development of what is variously described as the Liberal Theology or Latitudinarianism. The Broad Church platform is based on the fundamental truth of the Fatherhood of God. It is well described in words of its most distinguished American representative, Phillips Brooks: «The broader theology, which had its masters in England in such men as Dr. Arnold and the Rev. Frederick D. Maurice, has likewise had its clear and powerful effect upon the Episcopal Church. A lofty belief in man's spiritual possibilities, a large hope for man's eternal destinies, a desire for the careful and critical study of the Bible, and an earnest insistance on the comprehensive character of the Church of Christ — These are the characteristics of much of the most zealous pulpit teaching and parish life in these later days.» Broad Churchmen desire to vindicate the rational character of Christianity, to develop its philosophic side, to bring formal statements of the faith into accord with modern knowledge and modern thought. They find themselves much in sympathy with the early theology of Alexandria and more or less opposed to the type of mind represented by Augustine.

There has been conflict between representatives of these several schools, not concerning positive principles but concerning their respective negations. Too often zeal for a half-truth has denied or disparaged another half-truth. In retrospect it seems easy to see that the special principles of the three schools are equally part of the Church's teaching. The difference between them is largely one of emphasis. They divide the Creed between them. The Church Catechism contains a question, «What dost thou chiefly learn by these articles of thy belief?» The answer is: «First, I learn to believe in God the Father, who hath made me and all of the world; secondly, in God the Son, who hath redeemed me and all mankind; thirdly, in God the Holy Ghost, who sanctifieth me and all the people of God.» This suggests a generalization which may characterize High, Low and Broad Church. Each has emphasized one section of the Creed, and, at times, failed to do justice to the others. The Broad Church are concerned for the Fatherhood of God, the moral and philosophical basis of Christian truth. The Low Church are chiefly concerned to present Christ as Redeemer and the Centre of all their thought. The High Church have had to emphasize a neglected portion of the Creed, belief in the Holy Ghost, the Sanctifier, in Church and Sacraments as ordained means of union with Christ. The best men of the various schools have never been mere partisans. Party-lines are now less clearly defined. The tendency is to combine truths, to cultivate an all-round Churchmanship, which has more than one dimension.

Controversy.— For over 30 years, Churchmen were more or less disturbed by discussions aroused by the Tractarian Movement. American Low Churchmen were strongly opposed to the «Oxford Divinity.» The first important incident in the agitation was the «Carey ordination» in 1842. Arthur Carey, a graduate of the General Theological Seminary, who had accepted Tractarian principles, was, in consequence, subjected to a severe examination by the chaplains of the bishop of New York. They declined to recommend him for orders. The bishop, Dr. B. T. Onderdonk, himself examined the candidate, was satisfied with his answers and proceeded to his ordination. This occasioned an outcry against the bishop and was the signal for a series of disputes and campaigns of pamphlet warfare, in various parts of the country. In many instances, Low Church bishops objected to the liking of High Church clergy for «awkward chancel-arrangements» suggestive of High Eucharistic doctrine. Bishop McIlvaine of Ohio refused to consecrate a church until the altar was removed from the east wall. Bishop Eastburn of Massachusetts refused to visit a Boston church for confirmations because the clergy kneeled facing the altar, which was surmounted by a cross and candlesticks. These were typical examples. There were discussions over vested choirs, preaching in surplice, stained-glass windows, flowers on the altar and similar details. There was also an effort made by Low Church partisans to discredit High Church doctrine by impugning the moral character of its leading champions. Partisan motives mingled with the laudable feeling that a bishop like the wife of Cæsar «must be above suspicion.»

A revival of controversy followed the Civil War. At two successive General Conventions, 1868 and 1871, the main discussion concerned a «Canon of Ritual.» Various proposals were made to forbid the use of ceremonies recently revived and behind this was opposition to Tractarian teaching on the sacraments. In the Convention of 1871, Dr. James De Koven of Racine College took a firm stand as champion of «the Real Presence» and challenged anyone to bring him to trial for erroneous doctrine. The challenge was not accepted. In 1875, however, because of his principles, the Church at large refused to confirm Dr. De Koven's election to the see of Illinois, as it had previously refused to confirm the election of Dean George F. Seymour. The Convention of 1874 passed a canon forbidding «ceremonies or practices not ordained or authorized in the Book of Common Prayer and setting forth or symbolizing erroneous or doubtful doctrines.» The accompanying discussion indicates that the framers had especially in mind «the doctrine commonly known as Transubstantiation.» In 1878 Dr. G. F. Seymour was elected bishop of Springfield. This time his election to the episcopate was confirmed by the Church. The event of his consecration marks the end of the effort to deny that High Church doctrine is in harmony with Anglican formularies. It marks also the end of a crusade against ritual as such, although the Church has consistently disapproved any attempt to supersede Anglican by Roman doctrine.

At the time of this later discussion occurred the secession of the «Reformed Episcopalians.» The occasion of this was a controversy over Baptismal Regeneration. A number of Churchmen who held Zwinglian views of sacraments objected to the wording of the baptismal office. They found a leader in the assistant bishop of Kentucky, Dr. G. D. Cummins. He issued a call for a conference of all who wished to reform the Church. The convention adopted an expurgated Prayer Book and organized as a new sect. Bishop Cummins was deposed by the House of Bishops. He continued, however, to act as bishop and consecrated as a colleague the Rev. C. E. Cheney, a deposed clergyman of the diocese of Illinois. Their following was never large and has now dwindled to insignificant proportions.

The Church of the Confederacy.— It is pleasant to turn to a striking episode in the Church's history where an unavoidable division was quickly and quietly healed. By the outbreak of the Civil War, Southern Churchmen were isolated from their Northern brethren. Their position was analogous to that of colonial Churchmen at the Revolution. There was this great difference that there were 11 organized dioceses, each with a bishop. These 11 dioceses eventually united to form the Protestant Episcopal Church of the Confederate States. For five years the Church of the Confederacy pursued its independent course. Bishop Polk of Louisiana, who had had a West Point education, assumed command of a Confederate army and was killed in battle. At the end of the war the Church was confronted with the difficult question of the relation of these severed parts. Some Northerners were anxious to take action which would have been very offensive to Southern susceptibilities. There were two specially difficult points, the precedent established by Bishop Polk and the case of Bishop Wilmer of Alabama, who had been consecrated during the war, without the consent of the Northern dioceses. Fortunately the wisdom of a few leaders, Hopkins of Vermont, Horatio Potter of New York and others, guided all to a satisfactory conclusion. The Convention of 1862 had ignored the absence of Southern delegates. In 1865 the Southern bishops were urged to attend and «trust to the love and honor of their brethren.» Two bishops and delegates from three dioceses responded. In the Convention of 1868, the South was fully represented. By exercise of tact and patience on both sides, Churchmen had succeeded in ignoring «the late unpleasantness.»

Christian Unity.— As has been already noted, the Episcopal Church believes that she has a special mission to promote Church Unity. For 50 years there has been a standing Commission to consider this subject. The occasion of its appointment was the presentation at the Convention of 1853 of a «Memorial» signed by Dr. W. A. Muhlenberg and other well-known clergymen. This «Memorial» made a plea for greater liturgical freedom and a less stringency in conferring Holy Orders. It aimed at taking «an important step toward the effecting of a Church unity in the Protestant Christendom of our land.» The first report of the Commission made valuable suggestions, but led to no immediate results. Important members of the Commission were Bishops George Burgess of Maine and Alonzo Potter of Pennsylvania. The discussion which ensued paved the way for subsequent Prayer Book revision and conferences with representatives of other Christian bodies. Part of the aim of the «Memorial» was realized in 1898 by the passage of the «Huntington Amendment.» This relaxes the obligation always to use the Prayer Book in public worship and recognizes the duty of bishops to provide special forms of service for special congregations and special occasions. Both «Memorial» and «Amendment» aim at making the Church freer for evangelistic work.

There is another side to this work for unity. Dr. Muhlenberg had in mind «the Protestant Christendom of our land.» There is a larger Christendom than this which the Church may not forget. Something has been done to establish friendly relations with Eastern Orthodox and Old Catholics. Bishop Horatio Southgate in 1843 was accredited, as representing the Church, to the patriarch of Constantinople; Dr. J. F. Young of New York (later bishop of Florida) in 1864, and Bishop Grafton of Fond du Lac, in 1903, have paid official visits to the Church in Russia. Bishop Whittingham of Maryland in 1872 attended the Old Catholic Conference in Cologne. Russian and Old Catholic bishops have on several occasions accepted the official courtesies of the American Church. Polish Old Catholics in America have made definite proposals of union. Another century may see some result from these small beginnings.

Missions.— The Episcopal Church has always been breaking ground in new fields. Her first duty was to extend her work in the Western States. Among the typical examples of the home missionaries were the Rt. Rev. Jackson Kemper, missionary bishop of the Northwest, and Dr. James Lloyd Breck. Dr. Breck with two friends founded Nashotah House in Wisconsin as a training school for missionaries. Later he removed to Minnesota, organized work among Indians at Crow Wing and laid foundations for Church institutions in Faribault. Bishop H. B. Whipple developed and completed his work. Still later Breck organized the «Associate Mission for the Pacific Coast.» His last work was the founding of schools in Benicia, Cal. The first bishops in the Pacific States were William Ingraham Kip of California and Thomas Fielding Scott of Oregon and Washington. Most of the Western States contain one or more organized dioceses. There are still 16 missionary jurisdictions in the United States and four others in American possessions. Bishops have been recently sent to Alaska, Sandwich Islands, the Philippines and Porto Rico.

There are six foreign missionary jurisdictions, Western Africa (Cape Palmas); Shanghai and Hankow in China; Tokio and Kioto in Japan, and Cuba. Bishops have also been consecrated for independent churches in Haiti, Mexico and Brazil. The direction of missionary work is entrusted to a Board of Missions with headquarters in New York. Contributions for missions of all kinds probably amount to a million dollars a year.

Institutions.— There are a number of Episcopalian theological schools. The General Theological Seminary in New York is a training school for the whole Church. It was founded in 1817, was removed for a time to New Haven, returned in 1820 to New York and was shortly after established in Chelsea Square. It owes its present buildings to generous gifts of Dean Eugene Augustus Hoffman. Of other seminaries, the more important are the Episcopal Theological School, Cambridge, Mass., Berkeley Divinity School, Middletown, Conn., the Divinity School of Philadelphia, Seabury Divinity School in Faribault and Nashotah House.

Trinity College, Hartford, Conn., Kenyon College, Gambier, Ohio, Hobart College, Geneva, N. Y., the University of the South, Sewanee, Tenn., and Saint Stephen's College, Annandale, N. Y., are all Episcopalian institutions. Columbia University, New York, always has a Churchman for president and uses Church prayers in its chapel. Lehigh University, South Bethlehem, Pa., is by direction of its founder under Church auspices. There are many diocesan schools for boys and girls and special schools for Negroes and Indians. Of the larger Church schools for boys may be mentioned Saint Paul's School, Concord, N. H., Groton School, Groton, Mass., and Racine College, in Wisconsin. Churchmen have always been active in promoting charitable work. Saint Luke's Hospital, New York, is a conspicuous example of their zeal. There are numerous organizations for the furthering of Church work and a number of religious orders for men and women.

The number of Churchmen is not large, but the rate of increase has been comparatively rapid. In 1800 there were 11 dioceses served by seven bishops and 208 other clergy; in 1916 there were 102 dioceses and missionary jurisdictions served by 122 bishops and about 5,800 other clergy. The number of communicants was about 1,060,000, a number which implies about 4,000,000 adherents.

The materials for the history of the Protestant Episcopal Church are to be found in Journals of the General Convention, the memoirs of distinguished Churchmen and collections of pamphlets in the libraries of Church institutions. Perry's 'History of the American Episcopal Church,' a collection of monographs, is the most complete formal history. There are smaller works by the Rt. Rev. Leighton Coleman, D.D., bishop of Delaware, the Rev. C. H. Tiffany, D.D., and the Rev. S. D. McConnell, D.D.

FREDERICK JOSEPH KINSMAN,
Bishop of Delaware.

PROTESTANTISM. The Diet of Worms (1521) placed Martin Luther, the friar of Wittenberg who had presumed to criticise the Pope and to condemn certain ecclesiastical practices of his day, under the ban of the empire. He had already been placed under the ban of the Church by Pope Leo X, and thus stood condemned by Church and State alike. But he had powerful supporters in Saxony and elsewhere and their influence was sufficient to protect him from personal harm and to promote his cause until, at the Diet of Speyer (1526), it was voted that each state of the empire should decide for itself whether the Edict of Worms should be enforced. This was the first step toward the legal toleration of the Lutheran faith. At the second Diet of Speyer (1529) this limited degree of toleration was withdrawn. Nineteen of the states of the empire protested against the reactionary measures of this Diet, and their formal protest caused them to be known as «Protestants.» This is the historical origin of the name which is now commonly applied to all who in the 16th century broke away from papal Rome, and to their ecclesiastical successors down to modern times. The organized Christian world of the West has ever since been divided into two great groups, namely, Roman Catholics and Protestants. The countries where Greek Catholicism held sway took no part in the Reformation movement, and until recent times have remained for the most part uninfluenced by Protestantism.

The Protestant movement looks to Martin Luther (1483–1546) as its founder and chief leader, and to the University of Wittenberg as its original home. Luther's most notable early associate was Philip Melanchthon (1497–1560), a theologian and humanist, the author of the first Lutheran work on dogmatic theology, and the framer of the Augsburg Confession (1530). A well-known contemporary, Huldreich Zwingli (1484–1531),— also a very able and influential preacher against ecclesiastical abuses,— led an anti-papal movement of almost equal importance in German Switzerland, and there laid the foundations of the Reformed faith. The chief scene of his activities was the town of Zürich. The movement which Zwingli inaugurated was, however, overshadowed and absorbed by the more constructive work of John Calvin (1509–64), a Frenchman by birth, who made of Geneva a Protestant stronghold,— «Little Rome,» as his opponents called it. From Geneva the principles of the Calvinistic Reformation went forth to many other European lands. They were carried into Scotland by John Knox (1505–72), and that country became an important factor in promoting the growth of the Reformed faith in the Anglo-Saxon world. The Protestant forces of Europe, called into life by these leaders and others hardly less important, fall into two main groups, commonly called by European historians the Lutheran and Reformed churches. The Lutherans were not only originally Teutonic, but for the most part have remained so. The Reformed, known in America more commonly as Calvinists, proved to be much more international in character. Among the Lutherans are included chiefly Germans, Danes and Scandinavians; among the Reformed, or Calvinists, are included Swiss, French, Dutch, English, Scotch, Irish and various minor nationalities found in America. Historians have sometimes attempted to account for the wider extension of the Calvinistic type of Protestantism by pointing out that it sanctioned the employment of force in maintaining the faith, which Luther never did except reluctantly, that it emphasized popular education, offered greater freedom from traditionalism (for instance in the interpretation of the Lord's Supper), and that it tended to separate Church and State. The Lutherans for the most part were organized throughout Germany into a series of state churches,— a natural outgrowth of the German political principle, *cujus regio ejus religio*. The Protestant princes exercised control over the churches within their respective jurisdictions, and although this power was usually delegated to an officer known as the superintendent (the Lutheran analogue to a bishop), yet in each case the prince himself was to a large degree the governor of the church.

Except in England, where ecclesiastical conditions were different, state control of religion among the followers of Calvin, even if it once existed, rarely lasted very long, for Calvinism always encouraged the growth of a republican type of government. One of the best examples of this growth is found in the French town of La Rochelle where a political as well as an ecclesiastical system was developed which for a time threatened the existence of royal absolutism in France. Although in not a few cases the Calvinistic régime produced intolerance, yet Calvinism itself was based upon a principle which sooner or later was bound to result in freedom. It would, therefore, be an error to assume that, because in Geneva or in Massachusetts Bay there existed a theocracy, there must of necessity be theocratic government wherever the principles of Calvin are taught.

Lutherans and Calvinists may further be distinguished from each other by their attitude toward the Bible. Generally speaking Lutherans believed that the Church might properly retain whatever doctrines or ceremonies were not obviously prohibited in Scripture. Calvinists on the other hand believed that only such doctrines and ceremonies should be retained as were expressly commanded there. The general principle of biblical authority was, to be sure, maintained in both churches, as over against the principle of ecclesiastical authority held by the Papacy, but the difference to which reference has just been made proved to have an important bearing upon the development of the two branches of Protestantism. It is obvious that the appeal to Scripture, constantly made by Protestants, contains within itself a corrective for such errors as might from time to time come into existence through its use. Thus the verbal authority of Scripture, upon which in the latter part of the 16th century not a few Protestants both Lutheran and Calvinist relied, gave place in time to a much less mechanical conception. The more the Bible was studied and the better it was understood, the less it showed itself to be a legal code and the more it came to be regarded as a history and source of spiritual and religious power. Modern critical study of the Bible, including what is commonly called the Higher Criticism, is a legitimate outgrowth of the Protestant principle of Scriptural authority.

The connection between Protestantism, as a religious movement, and politics is real and historically of the highest importance. In French Switzerland is to be found a model of the self-governing churches which belonged to the Calvinistic wing of the Reformation. That model was Geneva, where religion was the controlling influence, and where the ecclesiastical organization was hardly less significant than the civil. In the history of the Netherlands, as well as of Scotland and England, one may find constant illustration of the interplay of the same two forces. James I's famous declaration, "No bishop, no king," was not only true for the Stuart monarchy at the time, but also affords a key to the history of the relations between politics and religion throughout the 17th century. It was the spirit of self-government, exhibited among Presbyterians and Independents which inspired the Puritan Revolution, that dramatic interruption of the Stuart line, and from the same spirit arose the long and tragic struggle for freedom in the Netherlands.

Lutheranism on the other hand proved hospitable to a union between Church and State; but in the Germanic lands in modern times it has produced a merely nominal religious conformity. During the last 100 years some of the most undesirable effects of the state-church system have become visible in Germany,— secularism, formalism and the inevitable detachment of morality from the controlling sanctions of a vital religious faith. Within the United States Lutheranism has suffered from sectarian movements not unlike those which have divided and subdivided other Protestant churches. In spite of the traditional boast that Lutherans know no sects, there are more different Lutheran organizations in the United States to-day than there are of any other Protestant denomination. Western and northern Germany and German Switzerland became almost wholly Protestant in the 16th century. The Reformed faith also made important gains in France, showing an especially vigorous growth so long as the Edict of Nantes continued in force (1598-1685). With the revocation of that edict a Roman Catholic reaction set in and the gains which Protestantism had made were mostly wiped out. Denmark and Sweden early received the Lutheran Reformation and have remained Lutheran down to modern times. The Calvinistic faith was the controlling one in French Switzerland, the Netherlands, the British Islands and New England. Protestant liberalism in the form of Socinianism early found a home in Poland and Transylvania. The European lands least affected by the Reformation were Italy, Austria, Spain and the countries where the Eastern Church held sway.

Protestants of all types were agreed in their opposition to Roman Catholicism, however energetically they might differ among themselves. This opposition took form at first in the rejection of the Papacy (q.v.). It next showed itself in the rejection of the Roman hierarchy and the sacramental system. The popular demand for a reformation of notorious abuses, such as simony, nepotism, pluralities, laxity of discipline, clerical ignorance, etc.,— a demand which had long been heard on all sides, and which had been ably advocated by Erasmus and other humanists,— materially strengthened the forces which made for ecclesiastical revolution, and prepared men's minds for the adoption of more radical measures than were at first contemplated by the leaders of reform. Not all Protestants, however, rejected the theory of church government by bishops, and the history of Protestantism shows a sharp distinction between the churches which have retained the episcopate and those which have rejected it. The best-known examples of the churches maintaining an episcopal type of government are the Church of England, the Protestant Episcopal Church, and the Methodist Episcopal Church of the United States.

The Anglican Church, so far as it may be regarded as detached from the Catholic Church of the West, owes its origin to a movement in the reign of King Henry VIII whereby the papal jurisdiction in England was abolished. For a time the English Church endeavored to maintain its doctrine and canon law in other respects unchanged. But Puritanism, which is only thorough-going Protestantism, soon grew up within the Church of England, and the long struggle of the 17th century, which in 1689 resulted in the toleration of Non-Conformity, left the English people religiously divided and created an ecclesiastical situation which, with some modifications, has ever since continued. Thenceforward there were in the kingdom (1) the Established Church, Episcopal but not Roman Catholic; (2) the Non-Conformist bodies, which for some time labored under various political disabilities which have since been removed; and (3) the Roman Catholics, who down to the period of Parliamentary reform and Catholic emancipation (about 1830) were also under serious political disabilities. It was partly in indirect consequence of the Oxford movement, and because of the going over of a considerable number of Anglicans to the Roman obedience, that Roman Catholicism in England received a considerable increase of strength and now includes in its membership an important fraction of the population. The Established Church at present comprises only about one-half of the English people.

Denominationalism found its special field of action and reached its highest development within the territory of what is now the United States. The earliest discoveries and conquests in North America were indeed made by Roman Catholic nations, especially by the Spaniards. At a somewhat later date the French, also Roman Catholics, explored and attempted to colonize the valley of the Saint Lawrence and region of the Great Lakes. The settlements however which proved most enduring and which gave permanent character to the political institutions of the new world were those of English origin. The two groups of English colonists, Anglican in Virginia, Puritan and Separatist in New England, proved not to be sufficiently unlike to render difficult a political union, which came about at the American Revolution. The existence of several varieties of Protestant churches, as well as the abstract political theories held by the framers of the Federal Constitution, made possible the adoption of the American system of a free church in a free state. The Constitution, including its first amendment, prohibits the establishment of religion, and all interference with the free exercise thereof. As a consequence denominationalism in the United States has had a free opportunity for development, with the obvious disadvantage of a rapid increase in the number of sects, but with the compensating advantage of an unmatched opportunity for judicious comparison of their value and for the survival of the fittest.

Among the leading Protestant denominational types represented in the United States are the Congregational and Baptist (which are very similar in polity), the Presbyterian, the Episcopalian, the Methodist and the Lutheran. Of most of these there are several distinct or subordinate varieties. Outside the leading groups lie many ecclesiastical organizations, some of them with a large constituency, each of which exhibits some special feature of doctrine or polity upon which its denominational existence is based. During recent years a movement toward affiliation and union has gained increasing strength among many Protestant bodies, and this movement is likely to be accentuated by centralizing influences growing out of the Great War.

The distinctive characteristics of Protestantism continue to be those which the great reformers more or less perfectly perceived, but which they did not always follow to their consistent and logical conclusion. The two great Reformation principles were justification by faith alone through divine grace, and the sole authority of Scripture in matters of faith. Involved in these was another principle, perhaps more comprehensive than either of them, namely, the inalienable right of private judgment in religion. The history of Protestantism exhibits the gradual working out into full recognition and acceptance of these fundamental principles. But the process is still incomplete. It is obvious that many nominal Protestants have not as yet fully accepted these principles, yet modern Protestantism has recently begun to recognize more fully their true significance. Catholicism on the other hand, whether Greek, Roman or Anglican, is frankly based upon the principle of a divinely authoritative church, organized and governed according to apostolic precept, exhibiting a legitimate succession of bishops outside of which there is no authorized ministry, maintaining unimpaired an original deposit of faith, and thus furnishing a living organ for the exercise of divine authority throughout all the generations. For the existence of such a divinely authoritative church it is immaterial whether the authority be exercised by a Pope or by a council of bishops; the principle remains the same.

The Protestant conception of the Christian ministry is very different from that outlined above. In spite of exceptions and inconsistencies the logic of Protestantism requires that the Christian minister shall be essentially the pastor and teacher of his people, chosen by them to lead in public worship and to administer the sacraments, and that his position shall be representative, not sacerdotal. Strictly speaking there can be no such thing as a Protestant hierarchy. Nevertheless it must be freely recognized that in many Protestant churches a conception of the ministry still obtains very different from this — a conception which really involves the persistence of Catholic theories within the boundaries of nominal Protestantism.

The distinction between the two types of religion here contrasted has been stated thus: Catholicism furnishes to the individual believer an institutional guarantee of salvation; Protestantism insists upon personal assurance of salvation. Looking at the question from a slightly different angle, Schleiermacher said that Catholicism makes the relation of the believer to Christ depend upon his relation to the Church, while Protestantism makes the relation of the believer to the Church depend upon his relation to Christ. It is obvious that between these two conceptions of religion there is a fundamental difference.

Present-day Protestantism comprehends practically all of those who have dissociated themselves from the Catholic Church in any of its forms. It will, therefore, include many persons who are not actively identified with any Church, but who would refuse to be classified as Catholic. In the Protestant Churches there are wide divergencies of opinion upon theological matters and the constant tendency of Protestantism is away from dogmatic theology and toward the employment of simple religious formulas and the promotion of practical religious and philanthropic activities. Dogmatism still lingers here and there in Protestant communities which are intellectually less progressive, but it no longer plays an important part in the more enlightened section of Great Britain and America. Protestant creeds and confessions of faith tend constantly to grow more simple and general in their language, and look toward a definition of Christian duty in practical life rather than toward the formulation of a speculative theological system.

Protestant worship is characterized by simplicity and directness, especially in comparison with the stately ritual of the Mediæval Church. Catholicism makes the altar central, and emphasizes the sacrificial aspect of Christian worship; Protestantism substitutes the pulpit, and thus shows its predominant characteristic to be that of a teaching church. The idea of mystery in worship gives place to intelligibility. In the early days of Protestantism this simplicity became at times barrenness, for example among the Puritans. But in modern times there has come a reaction against this tendency, and the forms of public worship have grown more elaborate, resulting often in the adoption of a liturgy not unlike the services of morning and evening prayer in the Church of England.

A great variety of philanthropic activities have been created by Protestants during the past 100 years. Missionary enterprises, both domestic and foreign, educational institutions of every grade, hospitals and other remedial agencies for mind and body, organizations for social betterment, young men's and women's Christian associations, and many related undertakings, here have their origin. Similar institutions also exist among the Roman Catholics, and in not a few instances Catholics and Protestants now fraternally co-operate, to the obvious advantage of both. Many educational institutions within the United States, which owe their origin to a distinctively religious motive, have lately become unsectarian and to the ordinary observer practically secular. This secularizing tendency, traceable in the history of Protestant education, finds little counterpart among the schools and colleges which are under the control of the Roman Catholic Church.

Reliable religious statistics for some countries are hard to obtain, but the following table exhibits with a fair degree of accuracy the numerical strength of the various ecclesiastical groups throughout the world at the beginning of the 20th century:

Roman Catholics, about 250,000,000.
Greek Catholics, about 125,000,000.
Protestants (including Anglicans), about 175,000,000.

The approximate membership of the principal churches within the United States at the present time may be estimated as follows:

Roman Catholics, about	16,000,000
Methodists, about	7,800,000
Baptists, about	6,500,000
Lutherans, about	2,500,000
Presbyterians (including Reformed), about	3,300,000
Disciples, about	1,400,000
Episcopalians, about	1,100,000
Congregationalists, about	800,000
United Brethren, about	350,000

The Protestant groups here listed include in several instances churches which have separate organizations but which are sufficiently alike in doctrine and polity to be included under the same general designation. Some of the smaller churches are omitted entirely, except in the summaries given below. The membership of the Roman Catholic Church and of the Protestant Churches within the United States may be thus summarized:

Roman Catholics, about	16,000,000
Protestants, about	24,000,000

The actual constituency of both is of course much larger than the figures given above, which include only those who are in full membership.

Ever since the period of the Reformation, and until comparatively recent times, church historians have endeavored to show either that Protestantism was an unjustifiable departure from the principles and usages of the Church for more than a thousand years (the Catholic position), or that Protestantism finds its justification in primitive Christianity, that the Mediæval Church had grown increasingly corrupt with the lapse of time, and that the reformers' effort to do away with its corruptions and to return to the simplicity of the New Testament was not only legitimate but was also their obvious Christian duty. The latter is the Protestant position. These two tendencies find their best early illustration on the Protestant side in the 'Magdeburg Centuries,' and on the Roman Catholic side in the 'Annals' of Baronius. It was only in the 19th century that the period of critical ecclesiastical historiography began. At the present day writers of all schools exhibit an increasing desire for the impartial treatment of church history, and many of them employ a critical method which is making their subject a true science.

Bibliography.— Among the more important books on Protestantism may be mentioned: Lindsay, T. M., 'History of the Reformation,' (2 vols., 1906–07); 'Cambridge Modern History, Vol. II, The Reformation' (1904); Beard, C., 'The Reformation of the 16th Century in its Relation to Modern Thought' (Hibbert Lectures for 1883); Macmillan, K. D., 'Protestantism in Germany' (1917); McGiffert, A. C., 'Protestant Thought before Kant' (1911); Moore, E. C., 'Christian Thought since Kant' (1912); Tulloch, J., 'Movements of Religious Thought in Britain during the 19th Century' (1885).

JOHN WINTHROP PLATNER,
Professor of Ecclesiastical History, Andover Theological Seminary.

PROTEUS, prō'tūs, or prō'tē-ūs, in Greek mythology, according to Homer (whose account is the one chiefly identified with the name "the old man of the sea"), a subject of Poseidon (the sea god), gifted with the power of prophecy, who pastured the seal herds of Amphitrite upon the shore of the island of Pharos near the mouth of the Nile. According to Virgil his abode is located on the island of Carpathos, between Crete and Rhodes. ('Georgics' IV, 386). He is represented as of great age and able to change himself instantly into any form he might wish. To compel him to prophesy it was necessary to steal craftily upon him and hold him so that he might not escape whatever form he took. Menelaus, as told in the Odyssey (IV, 351), succeeded in doing this even though Proteus became in turn fire and water. Allusions to Proteus refer to his power of assuming many forms, as in the adjective, protean. Herodotus (II, 112, 118) relates that Proteus as king of Egypt entertained Paris and Helen, but giving Paris a phantom in her stead kept Helen with him and afterward restored her to her husband, Menelaus. Consult Preller, L., 'Griechische Mythologie' (2 vols., Berlin 1872–75); Weissaecker, P., 'Proteus' (in Roscher, W. H., ed., 'Ausführliches Leikon der Griechischen und Römischen Mythologie,' Vol. III, pt. 2, p. 3172, Leipzig 1902–09); Welcker, F. G., 'Griechische Götterlehre' (3 vols., Göttingen 1857–63).

PROTEUS, a remarkable genus of urodele amphibians allied to the axolotls, sirens, etc., and often called "mud-puppies." The gills in these are retained throughout the entire lifetime of the animals, in addition to the lungs with which they are also latterly provided. These animals are found only in the waters of certain subterranean caves in central and southern Europe. The animal itself is about 12 inches long. Its body is elongated, slender and somewhat cylindrical, and averages about one inch or three-quarters of an inch in diameter. It is of a pale flesh tint — the absence of color being the necessary result of its non-exposure to light. The tail is broad and compressed. The limbs are weak, the front legs possessing three and the hinder limbs only two toes. Three pairs of bright red or scarlet branchiæ or gills project from the branchial clefts on each side of the neck. Two series of small teeth exist in the upper and in the lower jaw. The eyes are rudimentary and completely covered by the skin. The proteus is eminently aquatic in its habits, and in dry seasons, or when the water of the caves becomes dried up, is said to bury itself in the mud. See PROTEIDÆ.

PROTEUS ANIMALCULE. See AMŒBA.

PROTEVANGELIUM, prō-tē-văn-jĕl'ĭ-ŭm (Greek "the first gospel"), term applied to the passage in the Old Testament, Genesis iii, 15, in which theologians see the first announcement of the coming of a Messiah. It is also applied to an apocryphal gospel, ascribed by some to Saint James the Less.

PROTHERO, prŏth'ėr-ō, **George Walter**, English historical writer: b. Wiltshire, 14 Oct. 1848. He was educated at Eton, Cambridge and the University of Bonn, was university lecturer in history and tutor of Kings College 1876–94, and professor of history at the University of Edinburgh 1894–99. He is a member of the Royal Historical Society, the president of which he was 1901–05. He is also a member of a number of other historical societies in England and other countries, an Honorary Fellow of King's College, Cambridge, holds honorary degrees from Cambridge, Edinburgh and Harvard and is editor of the *Quarterly Review*. In 1910 he was Lowell lecturer at Boston and Schouler lecturer at Johns Hopkins, Baltimore. Together with A. W. Ward and S. Leathes he has edited 'Cambridge Modern History' (14 vols., Cambridge 1901–12) to the fourth volume of which he contributed four chapters on English history, from 1625–49. He has also edited the 'Cambridge Historical Series,' some early volumes of the 'Pitt Press Series,' L. V. Runk's 'Universal History' (New York 1885), and J. R. Seeley's 'The Growth of British Policy' (2 vols., Cambridge 1895). He is the author of 'The Life of Simon de Montfort' (London 1877); 'A Memoir of Henry Bradshaw' (London 1889); 'Select Statutes and Other Constitutional Documents Illustrative of the Reigns of Elizabeth and James I' (Oxford 1894); 'British History Reader' (2 vols., London 1898); 'School History of Great Britain and Ireland to 1910' (London 1912); 'German Opinions and German Policy before the War' (London 1916); 'A Lasting Peace' (London 1917); and with A. J. Philip, 'Catalogue of War Publications to June 1916' (London 1917).

PROTHERO, Rowland Edmund, English author, brother of G. W. Prothero (q.v.): b. Clifton-on-Teme, 6 Sept. 1852. He was educated at Marlborough and Oxford and was editor of *The Quarterly Review* 1894–99. From 1875–91 he was a Fellow of All Souls College, Oxford. Since 1914 he is M.P. for Oxford and since 1916 president of Board of Agriculture. He is the author of 'Pioneers and Progress of English Farming' (London 1887); 'Life and Correspondence of Dean Stanley' (2 vols., New York 1893); 'The Psalms in Human Life' (London 1903); 'The Pleasant Land of France' (London 1908); 'English Farming Past and Present' (London 1912); and has edited 'Letters and Verses of Stanley' (London 1895); 'Private Letters of Edward Gibbon' (2 vols., London 1896); 'Handbook for Travellers in the Isle of Wight' (London 1898); 'Letters and Journals of Lord Byron' (6 vols., London 1901–04); 'Letters of Richard Ford' (New York 1905).

PROTHONOTARY, also **PROTONOTARY**, in Pennsylvania, and a few other States, the name given the judge of the Orphans' Court. (See COURT). Formerly the term was applied to chief clerks or registrars in most English courts of law. It is still applied, usually in the form «Prothonotary Apostolic» to certain functionaries connected with the papal court who receive the last wills of cardinals, make informations and proceedings necessary for the canonization of saints, etc.

PROTISTA, a group-name introduced by Ernst Haeckel to designate the simple forms of life appearing spontaneously in infusions of animal and vegetable matter, and known as the organisms of fermentation and putrefaction. They have all been proved to arise from pre-existing germs. The group includes both the protozoans and the unicellular plants.

PROTOAMŒBA. See MONER.

PROTOCOL, *in diplomacy*, the minutes of the discussions of a conference, or the tentative draft of an instrument or transaction; a statement of the principles to be afterward embodied in a treaty or the original copy of such treaty, dispatch or other document; a document serving as the preliminary to diplomatic negotiations; a diplomatic document or minute of proceedings, signed by the representatives of friendly powers in order to secure certain political ends peacefully; a convention not requiring the formalities of ratification. By a *protocol* concluded and signed 12 Aug. 1898, by William R. Day, Secretary of State of the United States, and Jules Cambon, Ambassador Extraordinary and Plenipotentiary of the republic of France, at Washington, respectively representing for that purpose the government of the United States and the government of Spain, the United States and Spain agreed upon the terms on which negotiations for the establishment of peace between the two countries should be undertaken. Following the signing of this peace protocol, President McKinley issued a proclamation suspending hostilities.

PROTOCOL, The Industrial, a juridical covenant formed in 1910 between the several associations of New York manufacturers, respectively, of dresses and waists; of children's dresses; of ladies' underwear; of embroideries, and of house dresses and kimonos, and the 60,000 operatives employed by these industries. The agreement was brought about by the endless conflict between the manufacturers and the workers, resulting in a series of strikes and lockouts in which both sides were losers. The condition arose from the very large number of small individual manufacturers, who, in the necessities of keen competition, pursued widely diverse shop methods, some to the benefit but more to the detriment of the employees. Friends of the workers joined with them in an endeavor to stabilize working conditions and wage incomes, and the protocol resulted. The instrument established certain foundational rights and principles on behalf of the workers, and provided that these should be forced upon the less scrupulous individual manufacturers by the large associations who joined in the signing of the protocol. The manufacturers were assured that there should be no strike; that work should continue, no matter what the dispute, and that the differences should be referred to a board of arbitration, of which Justice Brandeis was the first chairman, succeeded upon his elevation to the Supreme Court by Justice Mack. A board of standards of nine members was created, with three representatives of the manufacturers, three of the employees and three persons representing the public. Its office was to enforce the provisional standards set forth in the protocol and adjust from time to time the conditions of pay to the market values of the work produced. The instrument provided for «fair and reasonable» betterments from time to time, both in working conditions and wages. This was the seed of disruption, the workers claiming that these betterments did not materialize as rapidly as they should, and an open break occurred in 1915. The mayor's

"Council of Conciliation," headed by Dr. Felix Adler as chairman, was successful in readjusting the difficulty, and the protocol was revived. It was again terminated in 1916, this time by the manufacturers, who claimed that the dictation of the union officials was ruinous to their business. The workers contended that the conduct of the business on the part of the manufacturers was so incompetent that they were shut out from the betterments which they had a right to expect. Since 1916 there has been much disturbance, and several strikes have occurred in spite of the provision of the protocol that work shall continue. The workers have gained substantial increases in wages and the 44-hour week. The protocol still remains as a psuedo-covenant, though hardly with its former prestige, both workers and manufacturers having lost faith in it.

The idea is regarded favorably by social workers and has been adopted in Chicago, Philadelphia and Boston.

PROTOGENES, prō-tōj'ĕ-nēz, Greek painter, contemporary with Apelles: b. Caunus on the coast of Caria. He lived about 350 B.C. and spent most of his life in Rhodes. He was one of the first of Greek realists in painting. Several masterpieces of his are mentioned, in one of which a Rhodesian local hero, Ialysus, was represented hunting with a panting hound which showed foam on his mouth. Pliny, who is our chief source of information ('Hist. Nat.,' XXXV, 36), relates that for a long time the painter failed in the execution of the foam; but at last, in a fit of anger, threw against the picture the sponge which he used in painting, and thus accidentally produced a natural representation of it. This picture saved the city of Rhodes when it was besieged by Demetrius Poliorcetes (305–304 B.C.) who refrained from making his attack on the weakest part of the city where the picture was placed. In the time of Cicero it was in that city, but Vespasian carried it to Rome, and placed it in the temple of Peace, in which it was burned under Commodus. Protogenes is said to have lived in comparative obscurity at Rhodes till the 50th year of his age, when his merits were made known to his fellow-citizens through a visit of Apelles (q.v.). Apelles offered Protogenes an enormous sum for each of his works, which the painter himself had been in the habit of selling for very insignificant sums. The Rhodians now wished to buy back the pictures from Apelles, in order that they might keep them among themselves, but Apelles refused to part with them except for an advance. Protogenes subsequently went to Athens, where he executed the 'Nausicaa,' one of his finest pictures in the Propylæa. Amongst other famous pictures ascribed to Protogenes should be mentioned 'Satyr playing on a Flageolet'; 'Cydippe'; 'Tlepolemus'; 'Alexander and Pan'; portraits of Philiscus, Antigonus and Aristotle's mother. He is also reported to have executed a number of statues in bronze, especially of athletes, soldiers and hunters. Consult Bostock, J., and Riley, H. T., 'The Natural History of Pliny' (Vol. VI, London 1857); Brunn, H., 'Geschichte der Griechischen Künster' (2 vols., Stuttgart 1857–59); Hauler, E., 'Fronto über Protogenes und Nealkes' (in *Kais.-Deutsches Archäologisches Institut, Mitteilungen, Römische Abteilung,* Vol. XIX, p. 317, Rome 1904); Hwiid, A. C., 'Protogenes' (Copenhagen 1788); Maas, E., 'Apelles und Protogenes' (in *Oesterreichisches Archäologisches Institut in Wien, Jahreschefte,* Vol. XI, p. 29, Vienna 1908); Six, J., 'Protogenes' (in *Kais.-Deutsches Archäologisches Institut, Jahrbuch,* Vol. XVIII, p. 34, Berlin 1903); Winckelmann, J. J., 'History of Ancient Art Among the Greeks' (trans. by G. H. Lodge, new ed., 4 vols. in 2, Boston 1880).

PROTOPLASM. The most fundamental characteristic of animals and plants is life. While no one can, as yet, demonstrate just what the physical basis of life is, still there is general agreement that the substance known under the rather indefinite name of *protoplasm* is that physical basis. The term was first used in 1840 by Purkinje, who applied it to the whole substance of young embryos, so that it included cell walls as well as cell contents. Von Mohl, in 1844, restricted the term to the living contents of the cell. At present, it is still further restricted, being applied to the living contents of the cell, exclusive of the nucleus, so that the living contents are said to consist of nucleus and protoplasm. In this latter sense, some use the term cytoplasm, instead of protoplasm. Protoplasm is, typically, a viscid substance, usually colorless, and it will not mix with water. In some forms and under some conditions, it has more tenacity and in the resting, but still living condition, found in seeds, it may become as hard as bone. Between the soft, viscid condition and the bony condition found in seeds like the date and vegetable ivory, there is every conceivable gradation. Chemically, protoplasm consists principally of carbon, hydrogen, nitrogen, sulphur and oxygen, but may contain also smaller quantities of chlorine, phosphorus, potassium, sodium, magnesium, calcium and iron. Living protoplasm is alkaline, turning the red litmus blue. In regard to the structure, there is great diversity of opinion, but most investigators believe that it is something like foam or honeycomb. There is a round substance containing globular bodies of various sizes, so that protoplasm looks like an emulsion, and its general appearance may be simulated by mixing olive oil and common salt. In active living cells, the protoplasm is always in motion and in some cases the motion is so rapid that it can be seen even under a low power of the microscope. In the long cells of the stonewort, *Chara,* the protoplasm moves round and round in a definite path. In the stamen hairs of the Spider Lily (*Tradescantia*), the movement is easily observed. Stinging hairs of various plants will generally show some movement and any very thin leaves of water plants are good subjects. The outer layer of the protoplasm is somewhat different from the rest and has been called the plasmamembrane (the *Hautschicht* of the Germans). It is sometimes visible and sometimes not, but it is claimed that it is always present. The protoplasm of adjacent cells is connected by extremely fine threads, called proto-plasmic connections, which bind the living parts of the plant into a more or less connected whole. These threads pass through almost inconceivably small pores in the cell walls. If the threads are unusually small, they can be demonstrated by using reagents which cause swelling, and then applying dyes to the swollen structures. When plants die and the living contents of the cells dry up and seem to disappear entirely, as in the case of seasoned wood, the threads still remain in the pores and can be demonstrated. There is abundant room for all kinds of investigations upon protoplasm. Consult Butschli, O., 'Untersuchungen über mikroscopische Schäume und das Protoplasma'; Wilson, E. B., 'The Cell in Development and Inheritance.'

CHARLES J. CHAMBERLAIN.

just 75 pounds. Another fragmentary specimen was still larger, and indicated a turtle 14 feet in length. The habitus being robust, this formidable boatman of the Cretaceous seas represents the culmination in size of not only the Protostegids, but the entire order. If the paleontologic record may be trusted, not until the comparatively recent Pliocene of the Siwalik Hills of Northern India do land species approach in size but scarcely rival the Cretaceous *Protostega* and *Archelon*. That, which renders the Protostegids conspicuously interesting is, however, not so much their size as their structure. It is this group which has gone far towards yielding a convincing solution to one of the most instructive but difficult of all problems presented by reptilians, the origin of Dermochelys, the "leatherback" of present day tropic seas.

FIG. 1.— *Dermochelys coriacea*. Extreme weight about 1,500 pounds or half that of the *Archelon* shown in the plates. Carapace seven keeled, and made up entirely of an osteodermal mosaic invested in a leathery hide.

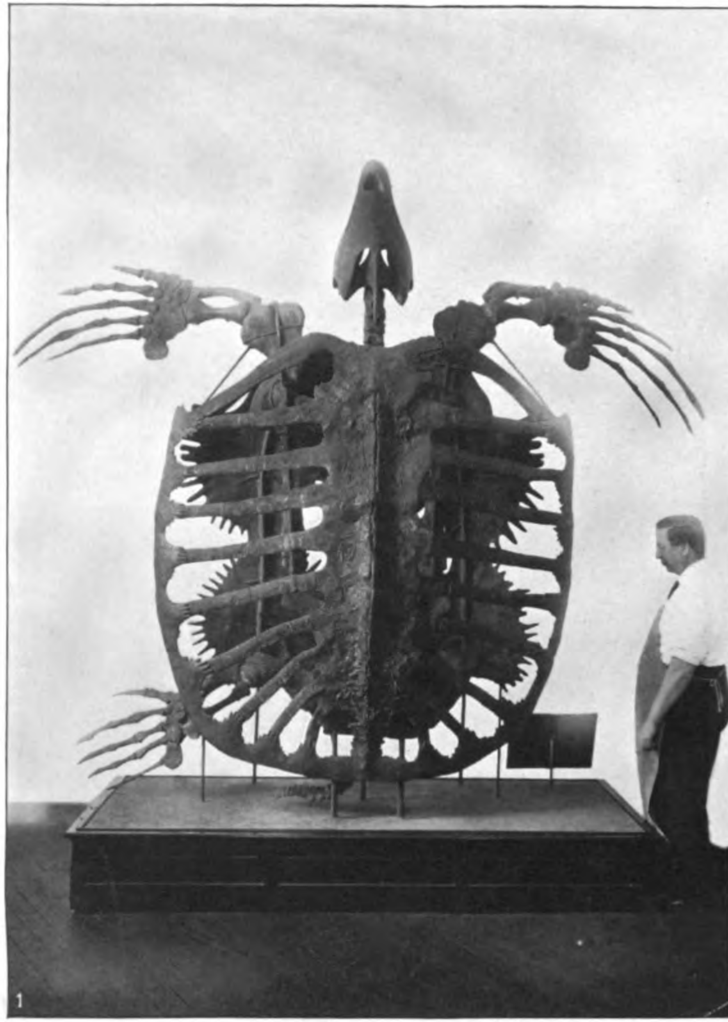
PROTOSTEGIDÆ, a family of mostly gigantic marine Testudinata, or "turtles," now wholly extinct, from the mid-Cretaceous Niobrara Chalk beds of western Kansas, and the overlying Fort Pierre formation of South Dakota. These turtles lived in the great but shallow supra-continental or "epeiric" Niobrara and Pierre seas. They were shell fish eaters, well able to navigate the open ocean and among the most formidable of marine reptiles. The group is of extreme osteologic interest.

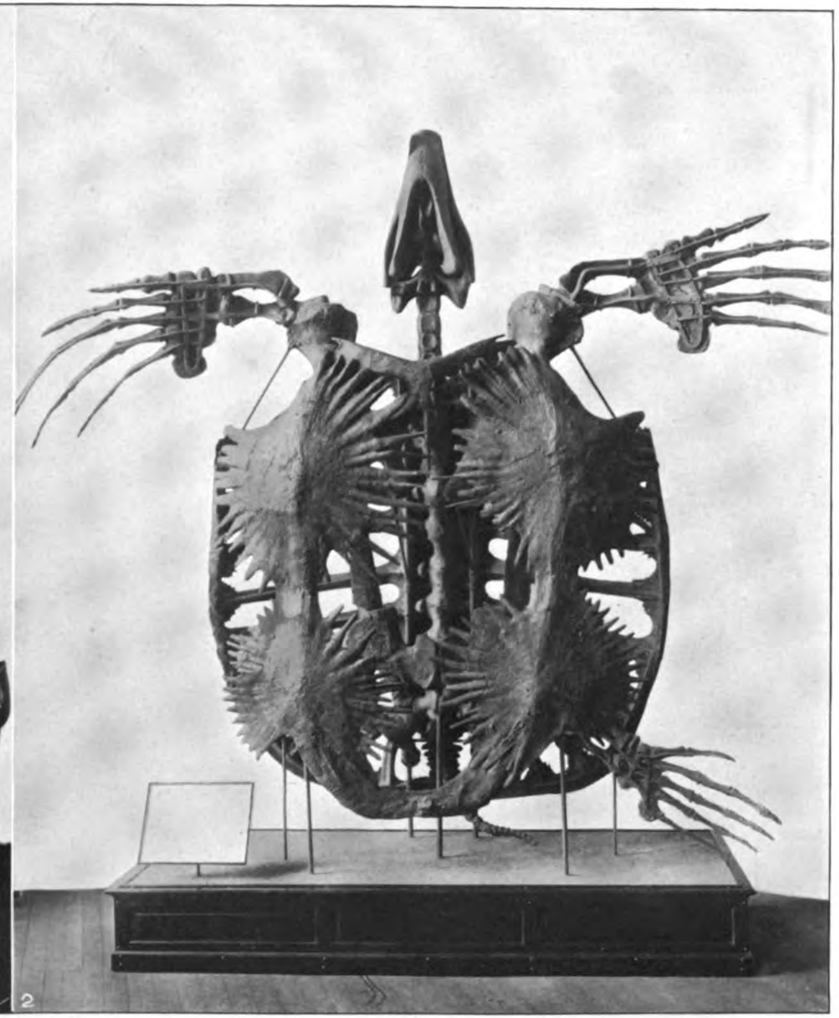
The first specimens were discovered along the Smoky Hill River by Cope in 1871, and called by him *Protostega gigas*, being recognized as a new family type. The great Yale specimens of a second genus *Archelon* were secured by Wieland in 1895 to the east of the Black Hills along the Cheyenne River in the uppermost Pierre shales near the overlap of Bad Lands (Tertiary). Ten years later the veteran fossil hunter Charles H. Sternberg, to whom American paleontologists owe many unique "finds," again collected Protostegas along the Smoky Hill River which aided greatly in completing the details of the skull and limb organization. One of these, made the subject of a restoration in the Carnegie Museum at Pittsburgh, is truly remarkable, the flippers having nearly all their elements in place.

The Yale *Archelon* from the Cheyenne River is only less complete, but much larger and an even finer fossil. It represents a huge turtle nearly 12 feet long with front flippers of an indicated 15-foot span. (See Plates). As a unit of size, it may be mentioned that the humerus as fossilized, and mounted, weighs

It should be recalled that *Dermochelys* differs from all other turtles in the absence of a dorsal bony carapace of neurals, pleurals and marginals interlocked. This protecting roof is instead replaced by what may be termed a *pseudo-carapace* of innumerable interlocking polygonal plates, all osteodermal in character and marked by seven ridges or dorsal keels. (See Fig. 1). Under this shield the ribs are slightly expanded proximally but neither unite with each other or with neurals, which wholly fail; though oddly enough there is a large thin detached nuchal.

The osteodermal mosaic of plates also continues around on the nether or plastral side presenting five more of the keels. But here the plastron is found in the underlying normal, that is subdermal position, except for the further anomaly of a missing entoplastron. That this element should lack, while an unsupported nuchal persists is singular. The plastral bones, however, are slender and thin, enclosing a vast fontanel, and having every appearance of extensive reduction. Now, the sum of Dermochelan characters, despite certain cranial resemblances to other sea turtles and more remotely to Chelydra, might lead to the view that of all the Testudinata, *Dermochelys* is nearest to a primitive form with the ancient keels still present. But if evidence of osteodermal keels is found in fossil forms, and if additional skeletal resemblances are there recognizable, then *Dermochelys* is far more closely related to modern forms than at first appears to be the fact,— is in a word not the least, but the most specialized of turtles.





1 Archelon ischyros Wieland. Dorsal view of the Cheyenne River specimen mounted at Yale. The right hind paddle was early in life bitten off by some predaceous enemy, as a fish, shark or mosasaur, of the Pierre sea

2 Archelon ischyros Wieland. Plastral view of the Yale Cheyenne River specimen. See Plate 1. Length 11 feet

The latter alternative appears nearest the truth. *Protostega Copei* of the Niobrara has a shell as heavy as that of marine species in general, but there is some plastral reduction with digitation of the separate elements. In the contemporaneous *Protostega gigas* rib and plastral reduction are seen to have gone still further; while in *Archelon* of the considerably later Pierre, carapacial reduction has proceeded very far. The ribs (see Plate) only show a small thin proximal expansion, while the neurals are nearly eliminated and ridden by a median keel of elements as truly osteodermal as those of the Dermochelan carapace. There are moreover highly digitate marginals, with pretty clear evidence of a supramarginals row. Bearing in mind that the marginals of all Testudinates are dermal, this accounts for the chief of the Dermochelan keels. With (1) segmentation of larger into lesser interlocking dermal or epithecal elements; (2) gradual thickening of these into a heavier shell; (3) a correspondent elimination of rib expansion and neurals; and (4) marked plastral reduction, the chief features of *Dermochelys* would be evolved in the late Cretaceous and Tertiary; though the actual line of descent might be a discrete one far back in geologic time.

neurocostal shield plus dermal marginals (see Fig. 3); (3) The Protostegids (and *Toxochelys*) have the most complex bithecal carapace known, retaining the subdermal elements with not only the marginals but supramarginals and a median keel of expanded epineurals; (4) *Dermochelys* in contrast with *Trionyx* has an osteodermal (mosaic) carapace, plus only the subdermal nuchal; (5) The Testudinate plastron is far less variant than the carapace. It remains complex in recent form only in *Dermochelys*, with both subdermal and dermal elements.

Taking both carapace and plastron, *Dermochelys* and the Protostegids are thus closely apposed, and other forms variant. But as indicated by large nutrition canals of the epineural keel, *Archelon* had a heavy leathery hide instead of an outer hornshield. It is, therefore, possible and probable that there were also dermal elements in the plastron. In this case the Protostegids were completely bithecal and fall still closer to the «leatherback» than is inferred from the resemblances cited.

The deeply interesting paleontologic problem here briefly outlined, is in a measure solved. But many details and doubts yet remain which only discovery of further evidence can resolve.

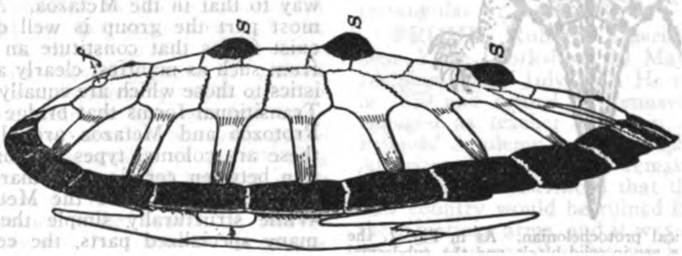


FIG. 2.— *Toxochelys Bauri* Wieland. (From the Niobrara Cretaceous of Kansas). Side view of carapace of diplogene type. The dermal elements (epineurals *S*, *S*, and marginals) are in solid black, and the subdermal elements (neurals and pleurals) in light outline. The hide being leathery, several rows of dermal elements must have intervened between the epineurals and marginals, thus fulfilling the old Prochelonian condition. See Fig. 3.

It is then virtually proved that in the primitive carapace there are two overlapping bony layers — the neurals and pleurals (costals) underneath, with a neural, pleural, supramarginal and marginal keel above. In the great majority of turtles the underlying neuropleural layer early interlocked with the marginal dermal keel, and all traces of the other dermal keels were gradually lost, or the hornshields were formed instead. But the *Protostegas* with the related form *Toxochelys* (see Fig. 2) indicates that an epithecum of median and lateral rows of dermal elements could also reach prominence, finally replacing the endothecum as in *Dermochelys*. The latter could not always have had so prominent an osteodermal mosaic as now, and it is difficult to believe that weak and thin neurals like those of *Archelon* were not once present in sequence with the nuchal. It is also significant that the nuchal, the pelvis and the epiplastron of *Archelon* strongly resemble these several elements in *Dermochelys*.

In recapitulation it is seen that: (1) The *Trionyx* carapace is now completely endothecal or subdermal; (2) in the majority of Cryptodiran and Pleurodiran Testudinates the carapace is diplogene,— that is, equals the subdermal

The general biologic problem has been outlined for just 50 years and naturalists who have successively given their attention to it are E. D. Cope, L. Dollo, G. Baur, O. P. Hay and G. R. Wieland; while especially J. Versluys and his students have considered the osteological evidence.

As a corollary the features of Dinosaurian armor are also brought into unity. In the Dinosauria as in the Testudinata there are the two armor forming strata. But while in the Testudines, *Miolania* affords the sole example of cranial armature, this occurs frequently in Dinosaurs and becomes extraordinary in the Ceratopsids, in which both the nether and upper layers take part in armor formation. Conversely in *Polacanthus* the deep layer forms a lumbar hip carapace. In the Stegosaurs the simple dermal armor takes the most singular expression seen in reptilians existent or extinct. Wieland, who was the first to point out this significant parallelism says:

«At first sight all development of dermal armor may appear to be mainly a senile feature due even to inertia — the general life movement of the individual and the race. But it is also evident that the development of dermal ossicles in series resulting finally in a protective sub, and osteodermal armature or carapace is a profound change co-ordinated with striking endoskeletal alteration. The Dinosauria developed their varied armor types late and when already highly specialized, apparently with only varying or far less success than the Testudinates. In them an early development of simpler patterns appears to have resulted in an exceedingly long lease of life.»

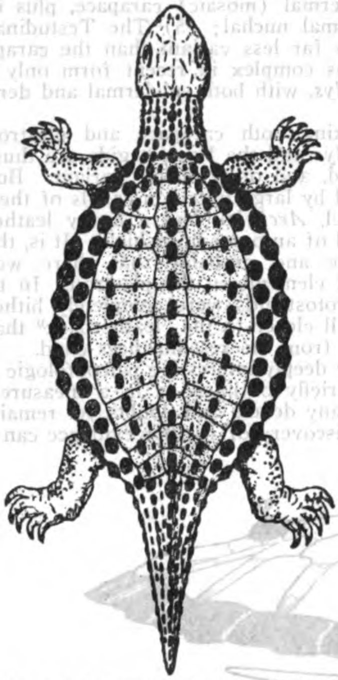

FIG. 3.— Hypothetical protochelonian. As in Fig. 2, the dermal elements are in solid black, and the subdermal or neuropleural shield in light outline.

PROTOTHERIA, a division or subclass of mammals embracing the *Monotremata* (q.v.) and with more or less certainty some fossil forms classified as *Protodonta* and *Allotheria* or *Multituberculata*. In the living forms their most marked peculiarities are that though classed as mammals they are without teats, that they are oviparous or ovoviviparous, and that they have but a single opening for the digestive tract and the urogenital system; a feature which also obtains in the marsupials, beavers and some other rodents. The sutures of the skull are obliterated, and while in the young there are peculiar teeth with many tubercles upon the crown, these are lost in the adult, the jaws being furnished with horny plates. Similarities in the teeth lead the fossil forms to be associated here. The only living examples are the duck-billed platypus (*Ornithorhyncus*) and spiny ant-eaters (*Echidna*). The marsupials are sometimes known as *Metatheria*, and all other mammals as *Eutheria*; but the latter term is more scientifically made to include all mammals except the monotremes. Consult Beddard, F. E., 'Mammalia' (Cambridge 1902).

PROTOZOA. Fundamentally contrasted with all other types of animal life, which are together designated the Metazoa, in that the body consists of a single cell or a colony of simple cells, the group is still usually termed a phylum though it is evidently of a higher grade than the subdivisions of the Metazoa to which that rank is always assigned and the designation sub-kingdom seems better justified. The organisms included are all minute; the largest being barely visible to the naked eye and the smallest lying at or beyond the limits of optical vision. With great simplicity of structure they combine functional complexity equal in a general way to that in the Metazoa. Although for the most part the group is well defined yet there exist forms that constitute an unbroken series from such as manifest clearly animal characteristics to those which are equally certainly plants. Transitional forms that bridge the gap between Protozoa and Metazoa are also well known; these are colonial types in which a differentiation between certain cells marks the first step in the production of the Metazoan organism. While structurally simple the Protozoa have many specialized parts, the cell-organs or organellae, for the discharge of particular functions. Thus for locomotion one finds projections of the external layer, either in the form of soft, mobile protoplasmic lobes that undergo constant changes in form, the pseudopodia, or in fixed processes of contractile substance known as flagella and cilia that carry out vibrating movements which propel the body and aid in taking food. The simplest types consist, like the Amœba, of a mere drop of naked protoplasm enclosing a nucleus. In most forms, however, a cell-membrane covers the mass and imposes evident limits on its activity, though it is on the whole an advance in specialization.

Many forms possess protective coverings like shells, scales and spines that are permanent, or cysts which are of a temporary character and related to special conditions such as reproduction, drought and seasonal changes. Membraneless forms ingest food at any point but those species with a membrane have at least a mouth opening and sometimes a second orifice for the extrusion of solid waste. The membrane may form at the mouth an inturned funnel-shaped esophagus. Many parasitic species have an unbroken membrane and take nourishment by osmosis. Contractile vacuoles fed by delicate radiating canals serve to eliminate waste and excess of water from the protoplasm, thus serving both as respiratory and as excretory organs. The existence of anuclear forms, the Monera of Hæckel, is now strongly doubted. On the other hand the normal mononuclear condition is varied by a binuclear type in some groups. One also finds a multinuclear condition which may indicate a colonial organism or a phase in reproduction just antecedent to spore formation. Division is the ordinary method of reproduction and may be simple or multiple either in the free or the encysted state. Similar spores (*isogametes*) or dissimilar spores (*micro-* and *macro-gametes*) are produced by most Protozoa, and may develop asexually, but in many cases fuse by pairs as a preliminary phase in the life cycle that suggests the start of Metazoan development.

Many parasitic species exhibit the alternation of two different generations, or a change of hosts as a characteristic factor in their life history. Parasitic Protozoa may infect an organ or an individual cell, or even be found in a nucleus; and the various phases in the life cycle may illustrate these different locations as the malarial plasmodium is successively a cell parasite in the red corpuscle, an organ parasite in the blood, and a tissue parasite in the wall of the mosquito's midgut. No less distinctly than in Metazoa are the effects of parasitism seen among Protozoa as in the degeneration of structures characteristic of free life, in the formation of hold-fast organs, in the increase of reproductive activity, in the occurrence of metagenesis, and in the adjustment of the parasitic life cycle to the habits of the host. Protozoan parasites are the cause of serious and even fatal diseases when by tissue destruction they produce ulcers or by tissue proliferation they give rise to tumors. Metabolic products resulting from the activity of the invading Protozoa may exert a powerful toxemic influence on the host as is well recognized in malaria for instance. The source of human Protozoal diseases may be found in the ingestion of encysted spores with impure food or drink, or it may be traced to the active inoculation of such spores through the medium of some blood sucking insect, like the mosquito, bedbug or louse. The control of Protozoal diseases depends clearly upon knowledge of the life cycle of the organism and of its means of transmission. The brilliant successes of recent years in controlling malaria, yellow fever and other Protozoal diseases depended absolutely on attacking the parasite at some weak point in its life cycle and by preventing its dissemination putting an end to the disease. In this great work American investigators have played an important rôle. The most important Protozoal diseases of man are amœbic dysentery due to several species of Entamœba; sleeping sickness of tropical Africa caused by Trypanosoma, a flagellate blood parasite; malaria, a scourge of tropical and subtropical regions since history began, produced by Plasmodium. In yellow-fever the organism is yet undiscovered but apparently belongs in the Protozoa; and in typhus it is a minute spirillar structure sometimes placed here and sometimes included under the Protophyta. To other less important human diseases must be added many formidable pests to which domestic animals are subject and a host of others that attack all sorts of animals. These facts serve to show the great and growing importance of Protozoa in an economic way. Among the Protozoa are distinguished the following major sub-divisions, termed classes or less often phyla: (1) Sarcodina, naked forms moving by pseudopodia; (2) Mastigophora, usually with a membrane and with flagella for locomotion; (3) Sporozoa, exclusively parasitic, without locomotor processes of any sort. Spores without polar capsule; (4) Cnidosporidia, exclusively parasitic, sometimes amœboid. Spores with one or more polar capsules; (5) Infusoria, with firm membrane, moved by cilia. Among groups *incertae sedis* are the Spirochætidæ, often included near the Mastigophora, and the Chlamydozoa, possibly related to the Sarcodina; the first contains the organism of syphilis, the second those of some obscure diseases, but the exact place of both is at the present date very doubtful. Consult Calkins, G. N., 'Protozoa' (New York 1901); Lankester, E. R., 'A Treatise on Zoology' (London 1903); Hartog, M. M., 'Protozoa' (in 'Cambridge Natural History,' Vol. I, New York 1909); Minchin, E. A., 'Introduction to the Study of the Protozoa' (New York 1912).

HENRY B. WARD,
Professor of Zoology, University of Illinois.

PROTRACTOR, an instrument for laying down and measuring angles on paper, and by which the use of the line of chords is superseded. It is of various forms — semicircular, rectangular or circular.

PROUD, Robert, American historian: b. near Yarm, Yorkshire, 10 May 1728; d. Philadelphia, Pa., 7 July 1813. He came to America in 1759 and settled in Pennsylvania where he engaged as teacher of Latin and Greek in a Friends' Academy in Philadelphia. During the American Revolution he remained loyal to the crown, firmly convinced that the future of the new country would be ruined by the success of the American arms, and it was during the progress of the war that his work of greatest importance 'The History of Pennsylvania' (2 vols., 1797–98) was written. The work is of much value as containing original material and important information, but the narrative is not well sustained. The documents, letters, etc., which he used in writing his history formed a large and valuable collection and became known as the 'Proud Papers.' As such they were sold at public auction at Philadelphia in 1903. Consult Henkels, S. V., 'Catalogue of the Proud Papers' (Catalogue No. 893, Philadelphia 1903); 'Letters of Robert Proud' (in *Pennsylvania Magazine of History and Biography,* Vol. XXXIV, p. 62, Philadelphia 1910); Thomson, C. W., 'Notice of the Life and Character of Robert Proud' (in *Historical Society of Pennsylvania, Memoirs,* Vol. I, p. 391, Philadelphia 1826). Consult Thomson, 'Life and Character of Robert Proud' (in 'Memoirs of the Historical Society of Pennsylvania,' Vol. I, 1826; 1864).

PROUD FLESH. See GRANULATION TISSUE.

PROUDFIT, David Law ("PELEG ARKWRIGHT"), American author: b. Newburgh, N. Y., 27 Oct. 1842; d. New York, 23 Feb. 1897. He enlisted in the Union army as a private in 1862, was commissioned lieutenant-colonel of colored troops and served through the war. He afterward entered business, became interested in pneumatic tube experiments and later was president of the Meteor Dispatch Company. He was a frequent contributor to newspapers and magazines. His poems enjoyed a great vogue amongst recitationists. His publications include 'Love Among the Gamins' (New York 1877); 'Mask and Domino' (Philadelphia 1888); 'From the Chapparal to Wall Street; or a Man from the West' (New York 1891).

PROUDHON, proo'dôn, **Pierre Joseph,** French philosophical anarchist: b. Besançon, France, 15 July 1809; d. Passy, Paris, 16 Jan. 1865. He studied at the University of Besançon, but left without completing his course there because compelled to find some means of self-support. He then learned printing and in 1837 became partner in developing a new typographical process. He had continued his education by improving every opportunity for study; and in 1838 published a philological treatise, 'Essai de Grammaire Générale,' for which the Academy of Besançon conferred on him a pension which yielded an income of 1,500 francs for three years. Political economy now became his chief study, and in 1840 appeared his famous work 'Qu'est-ce que la Propriété?' ('What is Property?'), to which question the first page of the treatise contains the answer, "La Propriéte c'est le Vol" ("Property is theft"). This first treatise was followed in 1841 and 1842 by two pamphlets in the same strain, the second of which, 'Avertissement aux Proprié taires,' led to his prosecution and trial for his revolutionary opinions, resulting in an acquittal. In 1843 Proudhon undertook the management of a system of transports on the Rhone and Saone. But he still continued to write. In that year appeared his treatise 'De la Création de l'Ordre dans l'Humanité,' a proposed system of political organization; and in 1846 'Système des Contradictions Economiques' on 'Philosophie de la misère.' In 1847 he moved to Paris and soon became one of the best-known radicals. After the revolution of February 1848 he began the publication of a journal at Paris called *Le Représentant du Peuple,* which, however, was speedily suppressed. But he had by this time acquired so much popularity that he was elected the representative of the Seine in the Assembly. Here, however, he had little success, and again turned to writing and journalism. He published several pamphlets, and started three journals in succession, *Le Peuple, La Voix du Peuple* and *Le Peuple de* 1850. He was frequently fined for his statement of his radical theories, but the fines were paid for him by subscription. In 1849 he attempted to found a bank under the name of the "Banque du Peuple" with the object of abolishing interest and finally putting an end to capital. This project failed, and he fled to Geneva to escape imprisonment for violation of the press laws, but returning in June 1849 was imprisoned for three years. On his release in 1852 he went to Belgium, where he continued to write and in 1860 under an amnesty returned to Paris, where he lived in retirement till his death. His publications in addition to those already mentioned include 'De la concurrence entre les chemins de fer et les voies navigables' (1845); 'Solution du problème Sociale' (1848); 'Résumé de la Question Sociale; Banque d'Echange' (1849); 'Idées Révolutionnaires' (1849); 'Organisation de crédit, etc.' (1849); 'Confessions d'un révolutionnaire' (1849); 'Actes de la révolution' (1849); 'Banque du peuple' (1849); 'Intérêt et principal' (1849); 'Gratuité du crédit' (1850), the last two a resumé of discussions he had with Bastiat (q.v.) on the subject of interest; 'Le droit au travail et le droit de propriété' (1850); 'De la célébration du dimanche' (1850); 'Idée général de la révolution aux 19e Siècle' (1851); 'La révolution sociale demontrée par le coup d'état' (1852); 'Philosophie du progrès' (1853); 'Manuel du spéculateur à la Bourse' (1856); 'De la justice dans la révolution et dans l'eglise' (3 vols., 1858); 'La guerre e la paix' (2 vols., 1860); 'Théorie de l'Impôt' (1861); 'Les majorats littèraires' (1862); 'La fédération et l'unité en Italie' (1862); 'Du principe fèdérative, etc.' (1863). The following works of his have been published posthumously: 'De la capacité politique des classes ouvrières' (1865); 'Théorie de la propriété' (1865); 'Du principe de l'art' (1865); 'Le Bible Annotée' (2 vols., 1866–67); 'France et Rhin' (1867); 'Contradictions politiques' (Paris 1870); 'Du principe de l'art, etc.' (1875); 'La pornocratie, etc.' (1875); 'Césarisme et christianisme' (2 vols., 1883); 'Jésus et les Origines du Christianisme' (1896); 'Napoléon I' (1898); 'Napoléon III' (1900). A collection of his works, 'Œuvres Complètes,' has been published (37 vols., Paris and Brussels 1866–83), and an abridged edition, 'Abrégé des œuvres de Proudhon' (Paris 1897). His correspondence has been edited by J. A. Langlois (14 vols., Paris 1875). Only a few of his many writings have been translated: 'What is Property?' (translater by B. R. Tucker, Princeton, Mass., 1876); 'System of Economical Contradictions; or the Philosophy of Misery' (translated by B. R. Tucker, Vol. I, Boston 1888).

He was the first to formulate the doctrines of philosophical anarchism; he maintained that property was unjustifiable, that labor only should give just claim to share in the product of labor, and that consequently rent and interest should not exist. He thus far agreed with the socialist doctrine of value, but he was neither a socialist nor a communist; because the state depended upon and protected property he claimed that the State must be destroyed; and that the proper basis of society was a voluntary contract between individuals.

PROUSTITE, or **RUBY SILVER,** Ag_3AsS_3, the most beautiful silver mineral and one of the most important ores of silver. It occurs in acute rhombohedral, or, less commonly, in prismatic crystals, also massive. Its lustre is brilliant adamantine, typical color cochineal-red, but changing to nearly black on exposure to light, losing simultaneously much of its transparency. Chemically, it is silver sulpharsenite, the silver percentage being 65.4. In the rich silver mines of Chile it is one of the chief ores and magnificent crystalized specimens worth thousands of dollars have been taken out. The royal Saxon mines are also celebrated for their ruby silver, and it occurs as an ore in many European, Mexican, Colorado and Nevada silver mines.

PROUT, prowt, **Ebenezer,** English composer and writer on musical theory: b. Oundle, Northamptonshire, 1 March 1835; d. Hackney, London, 5 Dec. 1909. He was educated at University College, London. From 1860 till 1884 he was a professor of the pianoforte at the Crystal Palace School, and in 1876-82 professor of harmony and composition at the National Training School for Music. He occupied a similar chair in the Royal Academy of Music and the Guildhall School of Music, and from 1894-1909 the chair of music in Dublin University. From 1876 to 1890 he was conductor of the Hackney Choral Association which under his guidance became soon one of the most prominent concert-giving institutions of London. His compositions include cantatas, concertos, quartets, symphonies, overtures, etc., among the first named being 'Hereward' (1878); 'Alfred' (1881); 'Red Cross Knight' (1886); and 'Damon and Phintias' (1888). He also edited several of Handel's oratorios and made many pianoforte arrangements of oratorios. Among his theoretical works are the following: 'Instrumentation' (1876); 'Harmony' (1889); 'Counterpoint' (1890); 'Double Counterpoint and Canon' (1891); 'Fugal Analysis' (1892); 'Fugue' (1892); 'Musical Form' (1893); 'Applied Forms' (1895); 'The Orchestra' (2 vols., 1898-99). He was the first editor of the *Monthly Musical Record* (1871-74), a frequent contributor to musical journals, and musical critic of the *Academy* (1874-79) and of the *Athenæum* (1879-89). Dublin University gave him the honorary degree of Mus.D in 1895. Consult Anon., 'Ebenezer Prout' (in *Musical Times,* Vol. XL, No. 674, p. 225, London 1899).

PROUT, Father. See MAHONY, FRANCIS, SYLVESTER.

PROUT, Samuel, English painter: b. Plymouth, 17 Sept. 1783; d. Camberwell, 10 Feb. 1852. He early manifested a turn for drawing, but the only lessons he received were from a drawing-master in his native town. In 1801 he made the acquaintance of Britton, the architectural antiquary, who employed him in visiting the rural districts to make sketches, which were to be engraved in the 'Beauties of England,' but which finally were rejected. Later sketches, however, were used in that work. In 1818 he visited Normandy, returning with many striking water-color drawings, whose merits placed him at the head of this department of art. He was especially happy in depicting monuments of mediæval architecture throughout France, Germany and Italy, and also directed his attention to lithography, publishing several collections of lithographed sketches. He was a great water-color painter, in the English sense of the term. and relied altogether upon wash tones, whose depth was determined by the degree to which the white paper on which they were laid was permitted to appear. The principal features of his buildings he marked with strong lines and deep shadows, but his main characteristics are breadth, freedom of handling, and power of coloring. He was one of the most active members of the Water-color Society and a regular exhibitor. His industry was great and his pictures were eagerly sought for, though he received only moderate prices during his lifetime. However, in 1868 his 'Nuremberg' (21 x 28 in.) was sold for $5,010. He is the author of 'Hints on Light and Shadow,' the 'Young Student's Drawing Book,' and a series of lesson books published by Ackermann. A number of his water colors are in the South Kensington Museum, London. Consult Ruskin, J., 'Notes on Samuel Prout and William Hunt' (London 1880); Winslow, H., 'The Drawings of Samuel Pront' (in *American Institute of Architects, Journal,* Vol. IV, p. 485, Harrisburg 1916).

PROUTY, Charles Azro, American lawyer: b. Newport, Vt., 9 Oct. 1853. He was graduated at Dartmouth College in 1875 and in 1882 was admitted to the bar in Vermont. He was engaged in law practice at Newport, Vt., in 1882-96; served in the Vermont House of Representatives in 1888; and was a reporter of decisions of the Supreme Court of Vermont in 1888-96. In 1896-14 he was a member of the United States Interstate Commerce Commission, serving as chairman in 1912-13; and since 1914 he has been director of valuation for the Interstate Commerce Commission. He was appointed director of public service and accounting on the staff of the Railroad Administration, Washington, D. C., in February 1918.

PROVANCHER, prō-vän-chēr, **Leon,** Canadian naturalist: b. Bècancour, Quebec, 10 March 1820; d. Cap Rouge, Quebec, 1892. To devote himself exclusively to the pursuit of botany and kindred studies, he retired from the Catholic priesthood which he had entered in 1844. He established 'Le Naturalist Canadien' in 1868, and published 'Traité Élémentaire de Botanique' (1858); 'Flore Canadienne' (1862); 'Le Verger Canadien' (1865); 'De Quebec à Jerusalem' (1882); 'Petite Histoire du Canada' (1887); 'Une Excursion aux Climats Tropicaux' (1890).

PROVENÇAL (prō-vän-sal) **LANGUAGE.** The term is used in two distinct significations, according to one of which it embraces only the speech of Provence; while according to the other, it includes the dialect not only of Provence but of all the neighboring districts of southern France where the langue d'oc is spoken. The term is even intended to include, in a literary sense, the sister dialects of Catalonia and the eastern coast of Spain in general and northern Italy. The term Provençal was applied to the literary language of all the sister dialects of southern France because of the early prominence of Provence in the literature of the early provençal period. Between 8,000,000 and 10,000,000 people speak Provençal using the term in its broader signification and including the Gascon dialects, which local jealousies have been inclined to look upon as a speech apart from Provençal, on account of its French peculiarities and its inability to identify itself with the dialectic and literary movement of southern France.

Provençal is distinguished from French noticeably by its tendency to strongly accentuate one syllable of a word at the expense of the others instead of more or less equally distributing the accent over all the syllables. This accent almost always rests on the ultimate or penultimate syllable; and in this respect Provençal resembles Spanish and Portuguese more than it does French. French has changed the Latin accented *a* of free syllables to *e*, and the Latin unaccented *a* to mute or slurred *e*, while the Provençal has retained the Latin form changing, however, in modern Provençal the final unaccented *a* into *o*; as far example, Provençal *amat,* French *aimé;* Provençal *bona,* French *bonne.* Another feature of Provençal which tends to connect it with the dialects of southern and eastern Spain is the tendency to convert the palatalized *l* into the palatal vocalic *y,* a tendency noticeable in Cuba and most of the central and South American countries. The lack of nazalization in vowels distinguishes Provençal from French and Portuguese and helps to relate it more to Spanish and Italian. As a result of this nazalization Latin final consonants have a tendency to disappear in Provençal even when they are retained in French and Portuguese or converted into vocal endings in Spanish and Italian; as for example Latin *bonum*; French *bon*; Portuguese, *bom*; Spanish *bueno;* Italian *buono;* Provençal, *bo.* But Provençal is like French in that the *s* used as the sign of the plural, is silent, where as in Spanish it is pronounced; but unlike it and the other Romance languages, in its retension of the Latin diphthong *au.* Examples: Latin *aurum,* French *or;* Provençal *aur;* Latin *pauperem;* French *pauvre*; Provençal *paubre.* In this latter example although the French preserves the Latin *au,* in the spelling, in effect, it has not since the au pronounced as though it were written *o.* A general tendency of the Provençal dialects is to change the Latin termination following *an,* in open syllables into open *o.* Examples:

Latin	French	Spanish	Provençal.
granum	grain	grano	gro
manum	main	mano	mo
panem	pain	pan	po.

Another peculiar feature of Provençal is the change of the Latin *a* (following the tonic accent) into *o.* Example:

Latin	French	Spanish	Provençal
terra	terre	tierra	terro
amata	amie	amado.	amado

It must be constantly kept in mind, in any study of Provençal that not only was the ancient literary language much like the modern, but that in it as in the present speech there were many variations due to dialects and local conditions, hence the tracing of the phonology, morphology and texts of Provençal is largely a matter of noting these many local variations, and undertaking not profitable for the general reader, because so few of these variations are common to all the Provençal dialects and at the same time distinctly different from the other Latin tongues. This constant dialectic variation in High Limousin, Law Limousin, Marchese, Auverguese, Gascon, Bearnese, Roygerat, Languedocian and Provençal proper has made the task of creating a modern Provençal literature very difficult. The leaders of the modern movement have, to a certain extent, disregarded the tendencies of the natural growth of languages and they have attempted to create a so-called pure Provençal by the exclusion of words of foreign origin and also of those formed from Provençal through French influence. The literary men of the modern Provençal school write in a literary tongue that is the speech of none of their readers. The lack of a Provençal school system and the constant and ever increasing encroachment of French upon the Provençal and other dialects and the indifference of the greater part of the masses to the literary future of their tongue, all tend to make a losing one of the battel the Félibres have been fighting, since the middle of the 19 century, for the revival of Provençal as the literary and folk tongue of southern France. The extension and improvement of the French school system and the consequent increase of literacy throughout the land, are slowly but surely creating a national sentiment and a feeling of unity such as may be said to have never before existed in the country. The European War has made France realize, as probably no other one factor could have done, that her people are one and indivisible and that there is no room for a supreme non-national tongue in the south or in any other part of France. Hence the Provençal tongues seem destined to disappear ultimately, not only from France but also from Spain and Italy. For the history of the Provençal movement in modern times see FÉLIBRES, and consult articles on PROVENCAL LITERATURE; CATALONIA; TROUBADOURS; Appel, Karl, 'Chrestomathie'; and the publication *Annales du Midi* (Toulouse); *Revue des langues romanes* (Montpellier); *Romania* (Paris); *Romanische Forschungen* (Erlangen); *Zeischrift für rümanische Philologie* (Halle).

John Hubert Cornyn,
Editorial Staff of The Americana.

PROVENÇAL LITERATURE made its appearance in southern France toward the close of the 11th century; although previous to this date there undoubtedly existed ballad and other verse in the vernacular of the masses, which seems to have been handed down from one reciter or singer to another and not to have been committed to writing. At this time Latin formed the sole literary medium of the poets and other writers who lived the life of the court and courtly society. But while Latin maintained its entrenched position as the vehicle of the literary expression of the court and the nobility, the masses were shaping the Romanic tongue of southern France to their own ends. Just when this new tongue began to take form as a speech apart from Latin and the native language spoken in the country on the advent of the Romans is not known, but a considerable fragment of a poem of the first half of the 11th century which has been preserved shows that at this time the provençal had already assumed a strong individuality of form and a grammatical structure very different from those of the Latin tongue. This poem consists of 257 decasyllabic verses forming the beginning of a composition based on Boethius' 'De consolatione philosophiæ.' It is evident that the author was acquainted with Latin, which probably influenced his handling of the vernacular; and the form of the poem suggests that it was composed to be sung or recited probably by some professional entertainer. This poem is of considereable interest, since it shows that the importance of the vernacular had already become great enough to induce a court writer to revamp, in the popular speech, the work of a noted Latin author, and also because it indicates that, while Christianity had already got the upper hand of Roman paganism, yet the pagan writings, reshaped and commentated, were still serving to entertain the Christianized public.

The poems of William IX, Count of Poitiers, consisting of love songs and occasional compositions of various kinds, which belong to the end of the 11th and first quarter of the 12th centuries, are the earliest extant representatives of the Provençal literature which was soon to become so popular in southern France and the east of Spain. The form of these poems shows they were intended to be sung, probably at the court, to the courtly friends and guests of the sovereign, since the subjects are in no sense popular. They bear evidence that the Provençal tongue had already by the end of the 11th century become the language of the people of southern France, peasant and prince alike. Their lack of resemblance to Latin poetry would seem to prove the contention that they were imitations of the compositions of the joglars (*jongleurs*) or professional entertainers, who were welcome guests at the castles of princes and barons. William of Poitiers seems to have set the style in vernacular poetry for the Provençal writers who followed him. Those love poems in which profound respect is shown by the poet to his lady love, or to some lady of higher rank, perhaps the head of the household or court to which the singer was attached. These poetic effusions were always couched in the most respectful terms and in the highest refinement of language at the command of the poet. Growing up under these conditions and flourishing among the court followers and the families of the barons and knights, Provençal poetry remained, as it was when it first came into notice, the possession of the privileged class. It was, therefore, undoubtedly more refined and Latinized than the speech of the masses. This explains the fact that, after a comparatively long period of vogue and noted popularity, it dropped almost completely out of sight for several centuries. Provençal poetry received its first encouragement and inspiration at the court of William of Poitiers, at a time when it had already acquired sufficient strength, character and individuality to fit it to be the medium of the expression of the life and aspirations of the court and its followers. The example set by the royal poet of writing in the vulgar tongue, to the exclusion of Latin, was followed by many writers, not a few of whom were of noble birth. The writing of poetry was soon looked upon as a courtly accomplishment; and it naturally became fashionable. It would seem as if every one at court wrote or tried to write songs, generally of love. Very often the author also composed the music to which his songs were sung either by himself, his friends or professional singers and reciters. Songs of over 400 Provençal poets have been preserved while the poems of many more writers known by name or reputation have been lost. The very respectable body of Provençal poetry that has survived is a good indication of the great amount written during the period of its vogue. Being the expression of the sentiment and an idealization of the life of the court, the work of the Provençal poets could never have been popular in the sense that a modern poet is popular; and it is doubtful if it ever penetrated to the masses. Confined to the narrow court circle and idealizing to the extreme a life that was none too ideal, Provençal poetry rapidly became artificial and more and more characteristically the voice and the peculiar property of the aristocracy. This result was undoubtedly due to the illiteracy and low condition of the masses who were very far from the ideal condition pictured by the poets of the age. As

Provençal poetry became more and more artificial it lost considerable of its virility and much of its earlier and charming appearance of naturalness. Its tendency was to assume a stereotyped form from which succeeding poets found it very difficult to break away. It was so inseparably identified with the court life and the ideals of the Provençal aristocracy that, when the latter fell from its high estate on the subjugation of the Provençal domains in the 14th century, the ornate literary branch that had been grafted on its ancient family tree fell by the wayside and perished with the local feudalism it had been used to glorify. But its own peculiar glory did not die with it; for it had already impressed its peculiar mode of thought, its idealism, its literary artificiality on the feudalism of Europe; and left its impress strongly and indelibly upon the literature, prose and poetry alike, of France, Germany, Italy and Spain. The Provençal literary movement during this first or aristocratic period embraced not only the French Provençal country but also Catalonia and the outer east coast countries of Spain in which Catalan was and still is the native tongue, Gascony and northern Italy. In all these regions it showed the same characteristics; and in none of them was it ever the expression of the life of the masses; nor did it ever deal with the legend story or the history of the earlier life of the people. In this respect the early literature of northern France was superior in rugged strength, in human interest and real dramatic qualities.

Aristocratic Period.— Although the poetry of this period was largely lyrical, it naturally, during its more than 250 years of existence, reached out into other fields. Religious, epic, narrative, didactic and dramatic poets there were in the Provençal countries; but even in these the lyrical influence is strongly in evidence, for the habit of public singing and recitation had fixed upon the poetry of the age certain easily recognizable marks which it continued to bear so long as it remained under the influence of feudalism and the artificial rules it had set up for the government of literature, not formally, of course, but unconsciously, yet none the less inexorably. Lyrical poetry being the fountain head of Provençal literature is, naturally, its most characteristic expression. It was symbolical of the life of the court and of the chivalric spirit of the age to such an extent that the French word «courtoise» was often used in the sense of «lyrical»; that is to say, that form of poetical expression which belonged particularly to the court, which had under the influence of chivalry developed complicated and highly artificial court manners generally referred to as courtesy. Gentle courtesy was the court manners of the gentle born. Of this the lyrical Provençal poetry was the expression in a very particular sense, not only in France but also throughout the other countries in which the Provençal tongue was dominant. It was this lyrical poetry, too, which appealed to the poets of Europe and set the style for poetry for years and later on for romances in prose. Love and the faithfulness, purity and devotion of the knight to the lady of his choice was the principal theme of Provençal lyrical poetry. This was carried to such an extreme that it became almost a cult; and as such it has left its impress upon the Latin and Saxon countries to-day in such a manner as distinctly to differentiate them from the other peoples of the world in their treatment of woman who was for the Provençal poet the centre and soul of all things courtly and chivalric. How much of this feminine sentiment was due, as French critics contend, to the powerful influenece of clever women during the most active period of Provençal literature it is, at this late date, hard to determine. It is certain, however, that Eleanor of Poitiers, at whose court the best of the Provençal poets were welcomed, inspired these singers to sound her praise and that of courtly women in general. This undoubtedly had a very strong influence on the general trend of lyrical poetry at this time. Eleanor, who was the wife of Louis VII of France and later on of Henry II of England, was a woman of excellent literary taste and sound judgment. As the consort successively of two of the most powerful sovereigns of her day; and possessed of the tongue of Provençe and the sympathies of her people, she exercised a powerful influence upon the life of her day in France; and the glamor of her name, her gifts and her courtesy spread to other countries, especially to Catalonia and northern Italy, from whence came noted vernacular poets to her court. Eleanor of Poitiers was to the most brilliant Provençal period what Queen Elizabeth of England was to her own time. Thus it was quite natural that, in an age of chivalry, a powerful, clever, ambitious and popular woman like Eleanor should set the ideal of the perfect woman before the eyes of the court poets in such a way that they never afterward lost the vision so long as the system upon which Provençal poetry depended continued vigorous and dominant.

One of the most noted of the Provençal lyrical poets was Bernart de Ventadour, one of the singers at the court of Eleanor of Poitiers. Some 50 or more of his songs which have survived are distinguished by their sincerity and passion; and their elegance of form and expression justify the judgment of his age which ranked him as one of the most inspired poets of his own day. Another poet who lived about the same time and who seems to have had great popularity and to have exercised strong influence on Provencal lyrical poetry was Cercamon, a Gascon who wrote «pastorals» in the popular tongue in an original style and with considerable originality of thought and forms of expression. At the court of Richard Cœur de Lion, himself a great lover of music and song, there were noted Provençal poets, Arnaut Daniel, Peire Vidal, Folquet of Marseilles and Gaucelm Faidit, some or all of whom undoubtedly entertained the Crusaders on their long and venturesome journey. Bernart de Ventadour, already mentioned, appears to have been also at the courts of Ermengarde of Narbonne and Raimon V, Count of Toulouse. The other Provençal poets seem also to have gone from one Provençal court to another and even some of them were invited to the courts of France and Castile. Among the patrons of the Provençal period, in addition to those already mentioned, were in France, Raimon VI, Count of Toulouse; Alphonse II, Count of Provence; Raimon Berenger IV, also Count of Provence;

Barral Marseilles; William VIII of Montpellier; Robert of Auvergne; William du Baus, Prince of Orange; Savario de Mauléon; Henry I and Henry II, counts of Rodez; Nunyo Sanchez, Count of Roussillon and Bernard IV, Count of Astarac. In Spain the courts of Alphonse II, Pedro II, Jamie I, Pedro III, kings of Aragon; Alfonso IX of Leon and Alfonso X of Castile extended the strongest sympathy and aid to the Provençal poets; and some of these sovereigns, like Jamie I, entered actively into the lists for literary honors. Hence all the great names in the first period of Provençal literature are inseparably connected with one or several of these courts, or literary centres.

Arnaut Daniel, considered by his contemporaries as the most gifted poet at the court of Richard Cœur de Lion, was greatly admired by both Petrarch and Dante. He was the originator of the «sestina» and, incidentally, a lover of complicated and intricate versification, both of which he succeeded in making popular. Arnault of Mareuil, noted for his delicacy of style, symplicity and felicity of expression, had many of the qualities of a good poet, and his surviving work commends itself to the modern reader. Bertran de Born, a noted poet who lived at the court of Henry Curtmantle, son of Henry II of England, was a famous soldier, as well, who is said to have been known to all the courts of Europe of his day where Provençal poetry was known. He gained additional notoriety by the prominent part he took in the quarrel between Henry and his unruly sons. Peire Vidal of Toulouse, who was well and favorably known at all the Provençal courts, was looked upon as one of the greatest singers of his day, and in addition to being one of the favorite troubadours of Richard Cœur de Lion, was on especially good terms with Raimon V of Toulouse and Barral of Marseilles, where his striking poetical gifts and his knowledge of the ways of the court and his natural tact made him a general favorite and incidentally enabled him to become one of the richest of troubadours. Girault de Borneil, who has been termed the master poet of the troubadours, was distinguished for simplicity of style and other attractive poetical gifts. He was a great master of the *trobar clus* (close verse) which he made popular. Gaucelm Faidit, one of the favorite troubadours of Richard Cœur de Lion, has left, among other short poems of merit, a touching lament on the death of the great Crusader whose exploits caught the fancy of the Europe of his day and held it for several generations. Among the numerous troubadours of good family was the famous Folguet of Marseilles who later became bishop of Toulouse, and in that capacity savagely persecuted the Albigenses, all forgetful of the passionate love songs he had sung in his youth, and the gentle ways of the court for which he had distinguished himself. Although many troubadours arose among people of lower rank yet, especially after the profession became famous and kings like Jamie I of Aragon had lent it dignity by composing troubadour songs themselves, many men of noble birth entered the ranks of the poets; and of these not a few became professional troubadours. Among these were Raimon de Miraval who became one of the most popular troubadours of the court of Pedro II of Aragon, and, later, of that of Raimon VI, Count of Toulouse; Guillem Azemar and Raimbaut de Vacqueiras, a favorite at the court of Guillaume du Baus, Prince of Orange, in the latter half of the 12th and the beginning of the 13th centuries. But the patrons of the troubadours were no respectors of rank when it became a question of the recognition of the gifts of poetry and song. Bernart of Ventadour won the love of the lady of Ventadour through his wondrous lyrical gifts, and when he had to flee from the court, he found like favor in the eyes of the more famous Eleanor of Guienne. Yet he was the son of a house servant. Several troubadours were sons of trades-people, bourgeois, scriveners, clerks and persons in a position to give them at least the rudiments of education. Others began their poetical work as students as a means of paying expenses and continued at it because it appealed to them; while another very considerable class of troubadours consisted of needy younger sons of noble families who found the wandering life of the troubadour a very pleasant means of making a living. On account of the high connection of this class of singers their existence at all the courts was agreeable, since it brought them constantly into public prominence without the restrictions of rank imposed upon gifted poets of more humble birth.

Marcabrun shows in his surviving poems that the age in which he lived was as appreciative of biting satire as the France of to-day. Pons de Capdoil, Raimbaut de Vacqueiras and Peirol, all Crusaders, were writers of excellent love songs which helped to swell the fame of the Provençal troubadours and their art. After the first century of brilliant success the quality of Provençal literature began to depreciate. The earnestness and enthusiasm of the earlier poets had been replaced by the artificiality and more or less stereotypes of succeeding generations who continued to follow the fashion set by the predecessors. The opening of the Albigensian Crusade in 1209 was the beginning of a movement which finally destroyed the power of the independent principalities of southern France, broke up the Provençal society and caused to disappear the centres in which the troubadours found welcome and support, and finally destroyed the Provençal tongue as an official speech and the vehicle of poetical expression. The French power, language and culture overran the Provençal countries and the troubadours and other Provençal poets disappeared almost suddenly about 1350.

Middle Period.— After the overthrow of the southern French principalities and the disappearance of the court troubadours Provençal literature, as the medium of expression of the aristocracy disappeared; but it did not altogether die out. As the courtly bonds which had bound it together into one homogeneous whole, that made the troubadour at home in southern France, eastern and southeastern Spain and northern Italy, were cut, and the patronage of the nobles and princes was withdrawn, the heritage of Provençal literature fell to the masses, who wrote more or less in the language of the country. As each district made use of its own dialect, the old uniformity disappeared; and thus provençal literature lost its former prestige and all but very local interest, the work excepted, of a few singers and reciters who still made the rounds of the country appearing at the castles of the local nobility, town fairs and other places where crowds of people met together. Owing to the lack of encouragement and patronage, and its dialectic character, this literature was vastly inferior in quality, if not in quantity, to that of the period of the troubadours. The overthrow of the Provençal principalities also made it necessarily different in plan, form, composition and objective. After the disappearance of the brilliant Provençal courts with their charming and cultured ladies, their heroic and chivalrous knights, their cultured centres, their poet-princes and their literary contests, the reason for being of the troubadours and their semi-artificial language and literature largely ceased to exist. The troubadours themselves migrated to the Provençal countries of Spain and Italy where they found a short respite from the fate that was rapidly overtaking their whole literature. But although the unity of the Provençal effort was thus broken an effort was made by the Academy of Toulouse (founded 1324), to encourage the literary use of the tongue of the troubadours. Prizes and literary contests were offered and literary titles were given to the successful contestants. Even after the discovery of America this society was still as active as it dare be, and throughout the centuries since then it seems to have maintained some sort of existence, though certainly not a very active one. Gradually, however, the French influence, even in this native society, gained the upper hand and succeeded in finally shutting out the Provençal from participation in its contests or sharing its honors (1670). The latter, left to itself, developed along the line of least resistance. Scarcely had the stream of courtly poetry ceased to flow, arrested and finally dried up at the fountain-head by the inflow of French culture, when the Provençal districts became active in directions that had begun to make themselves noticeable before the overthrow of the troubadours. While, as already stated, the distinguishing feature of the literature of the period of the troubadours was the prominence of lyrical poetry to the practical overshadowing of every other department of literary endeavor, yet Provençal showed, especially toward the latter half of this period, considerable activity in other departments of literature. Numerous epics belong to this period. Some of them were quite lengthy, though they have survived in only a fragmentary form. Various tales and romances presenting the life of the period, allegories, didactic poems, lives of the saints and other similar religious compositions of a moral nature occupied the attention of a class of writers of an inferior order, who apparently could not aspire to be troubadours. Between these and the troubadours was a body of romancers, some of whom at least found favor at the court. These composed lengthy poetical tales in the manner of the stories of Arthur and other heroes of lengthy romance. There is every reason to believe that these romances were popular in their day and probably outlived their authors, though perhaps not everywhere strictly in their original form. The 'Biographies of the Troubadours,' which gives the lives of over 100 of the more popular of these poets, reads more like romance than a sober statement of facts. But it is of interest because of its subject and the added fact that it is in prose while most of the literature of the age was in verse form. 'Flamença,' a very long and artificial love story, instinct with the life of the period in which it was written (during the first quarter of the 13th century), shows the Provençal mind working along the line of romantic tales of intrigue later on developed by the Italian writers. Much in the same form is the long historical romance, the 'Chanso d'Antioche,' whose inspiration was the first Crusade, with its glamor of tradition and its stirring adventures. The period that followed the disappearance of Provençal as a court literature continued to imitate the literature of the preceding period; but the work produced, which was didactic, religious or educational, was of a very poor quality and served from the literary standpoint only to keep alive the habit of and facility in writing. For over 100 years little of interest appeared in Provençal literature, except a number of mystery plays dealing with religious subjects. There was a tendency for each writer to make use of his own dialect to the neglect of the literary Provençal. This 100 years, devoid as they were of literary fruit of even mediocre value, were a preparation for a movement that promised to be in a sense more national than the literature of the troubadours. The leader of this new movement, Pey de Garros (b. about 1500; d. 1581), a Gascon, and a great lover of his native country and dialect, did his utmost through his long life to encourage the use of his maternal speech in literature. To this end he translated the Psalms into Gascon (1565) and wrote many poems. To this movement to restore the tongue of the south there adhered, among other writers of talent, Louis Bellaut de la Bellaudière (1532–88) and Claud Brueys (1570–1660); in Languedoc also Pierre Goudelin (1579–1649); David Sage (middle of 17th century); the avocat, Bonnet de Béziers (active 1616–57), and François de Cortete (1571–1655). This movement was carried on, not only without support from those in authority but with the avowed opposition of the French court. There was talent enough in the south at this period, had the writers worked together, to have made itself felt strongly all over the Provençal countries. But there was no unity of effort or aims and a surprising amount of most promising literary talent was dissipated and in a sense neutralized in more or less petty regional aspirations, jealousies and misunderstandings. 'Le Don-Don internal' (1588), a collection of humorous poems made by Bellaud, illustrates well the spirit of the times throughout the Provençal country. It was very popular and ran through several editions. Brueys, whose 'Jardin deys musos provensalos' was published in 1628, presents a very varied program of poetic effort which includes comedies, songs, ballets, carnival pieces and occasional poems, and was immensely popular in his day. But for real merit he was surpassed by other contemporary Provençal poets. Among the writers of comedy of this period were Gaspard Zerbin, Jean de Cabanes (1653–1712), Seguin de Tarascon (middle of 17th century), Nicolas Saboly (1614–75) and Bonnet de

Béziers. Saboly, who also entered other poetic fields, and whose works have passed through several editions, is still read in France; and the Félibrige movement has tended to bring him into vogue once more. 'Las Foulies dau Sage de Mounpelié' (1650) of David Sage; and 'L'Embarras de la foire de Beaucaire' of Jean Michel of Nimes, popular and much overestimated by their contemporaries, contain too many obscurities for modern taste. In almost every respect they are inferior to the work of Goudelin and Bonnet. The latter was the cleverest of a number of writers who made their headquarters in Languedoc and wrote in the dialectic of that district. He was master of lyrical tragic and comic poetry. Among his works are 'Jugement de Pâris' (1616), a tragic-comedy, and 'Histoire de Pépésuc, an allegory. 'Lou Ramelet Moundi' (1617) of Pierre Goudelin of Toulouse was one of the books of the age that became popular wherever Provençal was spoken. He was a very prolific writer who gave all his time and energies to literature, almost every branch of which he attempted, generally with success. Odes, masques, songs, sonnets and occasional poems he wrote in a masterly style which attracted to him attention throughout France and made him the most favorite poet of Languedoc. Numerous editions of his works have appeared and translations of his most characteristic poems have been made into most of the languages of Europe. In his day he had a very large following and many imitators. Of these Jean Guiraud-Dastros was one of the best. His 'Trinfe de la langue gascoune' (1642), which is still read, and which has gone through many editions, contains very natural and entertaining descriptions of the life and customs of the country. François de Cortete (1571–1655), of Prades, shares with Goudelin the reputation of being the best Provençal writer of the 17th century. His works, which have been looked upon as models for style and linguistic correctness, have never ceased to be read since his day. Among them are 'Ramounet' and 'Miramoundo,' two comedies.

During the 18th century the standard of Provençal literature declined in originality of subject, form and purity of language. Most of the writers were little more than imitators of the popular poets of the preceding generations. Yet here one meets with a writer who departs enough from this monotonous routine to attract attention. Among these are the Abbé Favre (1727–83), author of 'Siège de Caderousse and 'Lou Sermoun de moussu sistre,' and Claude Peyrot, prior of Pradinas (1709–95), who wrote 'Los Quatre sosous.' Both of these authors are witty and jovially good-natured to a degree scarcely to be expected of ecclesiastics. To these should be added the name of Cassanea de Mondonville, whose play 'Daphnis et Alcimadure' became immensely popular not only in the Provençal countries but throughout France; and finally had the honor of being played, by invitation, before the king, Louis XIV. In Provence and Gascony there were poets of much natural talent who, under more favorable circumstance, or even a little encouragement from the French court, might easily have made Provençal literature approach the popularity of the days of its prosperity. But the lack of a spirit of unity here, as in the preceding centuries, caused most of these to fall by the wayside. Their eyes were ever so near to the ground that they failed of the vision that is ever necessary to make great poets.

Yet there ever continued to exist in the Provençal countries a spirit of racial pride in their customs, history, language and literature which was kept alive by writers and speakers, generally of mediocre talent. The study of the *language d'oc* was kept by enthusiasts in an unscientific and desultory way, and various grammars, vocabularies and dictionaries of the language were written, though the interest in this kind of work, even by scholars, was so small that often laborious works of this kind remained in manuscript for lack of encouragement to print them. Fabre d'Olivet (1767–1825), scientific investigator, musician, poet, philologist and enthusiast, was forerunner of the Félibrige. He aimed at writing pure Provençal to the exclusion of dialect, and to unite the literary aspirations and efforts of all the Provençal countries. He was a poet and writer of very considerable vision and much talent; and yet he labored from 1787 until the opening of the 19th century to stir up the local enthusiasm and aspirations of his fellow-countrymen before he finally succeeded in catching the public fancy. But finally he succeeded in driving home the lesson that Provençal, if it deserved to produce a literature worthy the name, must throw aside its various dialectic efforts and set up before itself, as its chief aim, purity of language. He strove to establish a rational orthography *and* to have it generally adopted through the Provençal districts. He made collections of Languedoc poets with explanatory notes and wrote fine poems of his own in the native tongue; and in this way for almost a third of a century he continued to influence the public mind and to educate it in the appreciation of its treasures of early Provençal literature. His work in this direction influenced all the Provençal writers contemporary with him and created for him a large literary following, among whom was Jacques Jasmin (1798–1864), the greatest and most influential of the Félibrige movement. For a study of the modern Provençal movement, see FÉLIBRIGE. Also see CATALAN; CATALONIA; CATALAN LITERATURE; TROUBADOURS.

JOHN HUBERT CORNYN.

PROVENCE, prō-vāṅs, a province of ancient southeastern France, bounded by Piedmont, the Mediterranean, Languedoc, Venaissin and Dauphiné, and including what is now the departments of Bouches-du-Rhône, Var, Basses Alpes, and, in part, Vaucluse and Alpes Maritimes. Lesser ranges of the Alps, called the Alpines and in the south the Maures, break up the country. The principal rivers are the Var, Durance and Rhone; the last river has a great marshy delta. Climate and soil vary greatly, from the damp, changeable, rather sterile and stony north to the south with its ideally mild air, its culture of bees and silkworms and its produce of olive-oil, wine, mulberries, oranges, citrons and all southern fruits. There is good sheep-grazing, but other livestock is less successful. The inhabitants of the Provence preserve to a large degree southern characteristics quite foreign to the northern Frenchmen, and keep a language and literature of their own, nearly as much akin to the Spanish and Italian as to the French. See PROVENÇAL LANGUAGE AND LITERATURE.

History.— There are traces in Provence, as in the polished stones found in the Grotte de la Masque and elsewhere, the tunnuli, and dolmens of Draguignan, Pontève and la Blaque, and the lake dwellings of the mouth of the Var, of a civilization as early as the middle of the Stone Age. The Iberians held sway here until the 5th century B.C., when they were finally displaced by the Ligures. Greek and Phœnician colonies, notably Massilia, the modern Marseilles (q.v.), had been founded here at least as early as this. The Greek city of Marseilles by its repeated appeals to Rome for help against the Ligures, first in 155 B.C., effected the introduction of Roman influence, and in 124 B.C. Marcus Fulvius, pro-consul, and Gaius Sextius Calvinus, consul, destroyed the capital of the Saluvii and founded (123 B.C.) on its site the city of Aquæ Sextiæ (modern Aix-en-Provence). Victories over other tribes in the next few years gave all the country between the Cevennes and the Alps to Rome. A Roman province, Provincia Romana, or Gallia Transalpina (or Narbonensis, from its capital Narbo, modern Narbonne), arose, was threatened 15 years later by the invasion of the Cimbri and Teutones, and was racked by the civil war between Cæsar and Pompey, in which Massilia (Marseilles) siding with the Senate was captured and crushed by Cæsar in 49 B.C. The amphitheatre of Fréjus, the theatres of Arles, Fréjus and Orange, the triumphal arches of Orange, Cavaillon, and Carpentras, the temple of Augustus and Livia at Vienne, and the splendid Roman roads through southern France, are remains of the glory of Provence in the first four Christian centuries, when Arles was a great commercial centre and one of the residential cities of Constantine and when Autun and Marseilles were great university towns, Marseilles being the seat of a Greek college and a medical school.

The Visigoths entered Provence in the beginning of the 5th century and about 470 Eurich captured Arles and made it his capital. The Ostrogoths held Provence from 510 to 536, receiving it as the price of their assistance against the Franks, but losing it after a quarter of a century to the growing Frankish Empire. In the 8th century Charles Martel rescued it from the Saracens. In the 9th century Provence was twice a kingdom (see BURGUNDY), and from 934 to 1113 was ruled by the counts of Arles (or of Provence), descendants of Boson whose male line failing in 1113 the country went as a result of the marriage of Provençal heiresses to Berengar of Barcelona. His claim was contested by the Count of Toulouse, who in 1125 by treaty secured Valence, Die, Orange and Venaissin; what had been retained by Berengar went to Aragon in 1162, the Count of Barcelona having come to that crown in 1137. In Venaissin; what had been retained by Berengar IV, the last of the male line, married Charles of Anjou and Provence was a possession of the house of Anjou (q.v.) until 1481, when it was willed to Louis XI of France and lost its separate significance politically, though it was not united with France until 1487 under Charles VIII.

PROVENCE II, a French transport, sunk by a German submarine in the Mediterranean on 26 Feb. 1916. Over 900 lives were lost.

PROVERB, a short, pithy saying, presenting in striking form a well-known truth. They originate principally in the primitive stages of society, are colloquial rather than literary and constitute a form of folklore common to all races. While certain proverbs have undoubtedly strayed from one country to another the very nature of these pungent characterizations, founded on the common facts, experiences and observations of humanity, ensure their existing in similar form in different countries. New proverbs cease to appear as printed literature takes the place of folklore, the common catch phrase or valued quotation bearing no relation to these bits of wisdom with the stamp of ages of popular acceptance and use. Bacon calls them the "edged tools of speech"; Lord Russell's definition "the wisdom of many and the wit of one" is concise and accurate; as is South's "the experience and wisdom of several ages gathered and summed up in one expression."

PROVERBIAL PHILOSOPHY, a once popular didactic work by Martin Farquhar Tupper (q.v.), published in four series 1838–67. It is a series of poems in blank verse, dealing with almost every emotion and condition of life. The book contains many wise sayings, but is for the most part merely padded commonplace. In spite of remarkably extensive sales, both in England and America, it was mercilessly criticized by all serious reviewers. It is claimed that more than 1,000,000 copies were sold in the United States and more than 5,000 per year for many years in England. The most recent American edition was brought out in Rochester, N. Y. (1904). It has also been translated into Danish, French, German and Italian. Consult Anon., 'Tea Table Literature' (in *Fraser's Magazine,* Vol. XLVI, October, London 1852); Tupper, M. F., 'My Life as an Author' (London 1886).

PROVERBS, Book of, a portion of the Old Testament. **Date and Authorship.**— The book of Proverbs is the subject of much discussion in reference to date and authorship. The old view that King Solomon was the author of nearly or quite the whole of the book has been generally abandoned. Two classes of views are widely held at the present day. One is that all of the book or all but the last two chapters was written and compiled before the Babylonian exile. The amount attributed to Solomon varies, but is in any case an appreciable quantity, forming the kernel of the whole. The other view is that most or all of the writing and compilation are to be dated long after the exile, little or no part having been written by Solomon. The completion of the work of compiling is assigned to various dates from about 350 to 180 B.C., the whole composition of the book being supposed to cover not more than a century. There is a growing tendency toward the second view, which is held by most of the very recent writers on the book.

Arguments for Late Date.— The chief argument in favor of the late date of the book is from language, that is, the occurrence of a considerable number of words found elsewhere only in late Hebrew and of words borrowed from the Aramaic. But the number of words which can with certainty be assigned to these two classes is much smaller than is often claimed. Historical indications also urged for the same conclusion are that the book makes no mention of polygamy and idolatry, which were common before the exile, and that it assumes the existence of a distinct class of sages, known as wise men, who are hardly mentioned in the historical and prophetical books before the exile, nor are any results of their activity apparent. These are arguments from silence and therefore, of course, to be used with caution. The resemblance to the apocryphal book of Ecclesiasticus, which is also urged, has little bearing on the question, in view of the well-known habit of the author of Ecclesiasticus of borrowing from other books.

Arguments for Early Date.— In favor of the early date, the chief argument is the thought of the book. The oft-repeated teaching of the book concerning the problem of God's government of the world is this: the good will prosper, the wicked will be punished, in this life. This is generally acknowledged to be the pre-exilic doctrine, while the dominant view of the exile and after the exile is quite different. It is not difficult, however, to suppose that the pre-exilic doctrine had persisted after the exile, in certain quarters, in face of the teaching then current that the wicked prosper and the righteous suffer. Further, the frequent allusions to a king suggest the early date. Many passages speak of him as the promoter of justice and none refer to him as a foreigner. After the exile the sovereignty of Palestine was in the hands of foreigners, with little justice in their administration. The syntax of the book, also, is of the classical, earlier type. The titles in chapter i, 1; x, 1 and xxv, 1, which attribute portions of the book to Solomon represent a tradition, but have not necessarily much authority. In general, the background favors the late date; there is nothing seriously inconsistent with this view. There is no sufficient reason, however, for denying the presence of pre-exilic, and even of Solomonic material.

Divisions of the Book.— As ordinarily viewed, although with some variation, there are eight different portions into which the book is divided, each of which is a separate compilation. These divisions, in the chronological order usually, but not invariably, assigned to them, are as follows: chapter x, 1, to chapter xxii, 16, containing the title in chapter x, 1, «The proverbs of Solomon.» Chapter xxii, 17, to chapter xxiv, 22, called in chapter xxii, 17, «the words of the wise.» Chapter xxiv, 23–34, a similar collection, of which it is said in chapter xxiv, 23, «These also are sayings of the wise.» Chapters xxv–xxix, headed by the statement in chapter xxv, 1, «These also are proverbs of Solomon, which the men of Hezekiah king of Judah copied out,» which division, however, some regard as older than chapter x, 1; xxii, 16. Chapters i–ix, a connected discourse in praise of wisdom, in the form of advice to a son or scholar. Chapter xxx, with the title in chapter xxx, 1, «The words of Agur the son of Jakeh.» Chapter xxxi, 1–9, described in chapter xxxi, 1, as the words probably should be translated, as «the words of Lemuel king of Massa.» Chapter xxxi, 10–31, an anonymous alphabetic poem or acrostic in praise of the ideal housewife. The first division was probably compiled somewhat after the time of Solomon, the fourth is traditionally assigned to the time of Hezekiah, while the last three divisions probably belong soon after the exile. There are no indications of precise date for the other divisions, but on the view adopted all of them are to be regarded as pre-exilic.

Solomonic Authorship.— That the first and fourth divisions are not entirely the work of Solomon is clearly shown by the fact that there are many repetitions of proverbs partly the same and by the further fact that some are not written from his standpoint, especially the utterances concerning the king. While it is not unlikely that Solomon uttered some of these proverbs, it is difficult to be certain of his authorship in any specific case. It is improbable that Solomon wrote any proverbs in the form now existent: 1 Kings iv, 32, does not mention Solomon as *writing* proverbs, but as *speaking* them.

Literary Characteristics.— The Hebrew word for proverb (mashal) probably meant originally a *comparison* and then was broadened to apply to any sententious saying, because often containing a comparison. The proverbs of this book do not bear in general the stamp of long popular use, but rather of the reflection of individuals. The whole book is written in what is called, from the Hebrew standpoint, poetry; for the most part gnomic, although the lyric form is also found, especially in chapters i–ix. Like Hebrew poetry generally, parallelism of the members of a verse is the most prominent characteristic. Antithesis is found especially in chapters x–xv. Each verse expresses usually an independent thought, except in chapters i–ix and chapters xxx–xxxi, where connected discourse is found. Brevity and sententiousness of statement are implied in the very nature of a proverb, while simile, metaphor and paradox are common. An extended personification of wisdom is found in the eighth chapter.

Purpose.— Although Proverbs has several authors and compilers, and much of it is disconnected in form, yet a marked degree of unity pervades the whole. The book confirms the statement of purpose in chapter i, 1–6, that is intended to teach wisdom to men, especially to the young and inexperienced, but also to those who already have some knowledge of wisdom. Wisdom, however, is a comprehensive term, it includes all that is desirable in character, folly all that is undesirable. Its foundation is religious, it consists fundamentally in a right relation to God, «the fear of Jehovah is the beginning of wisdom» (chapter ix, 10). But all that pertains to humanity is included in the scope of wisdom, so that the book touches all phases of human life. Observation of the customs and habits of men, and conclusions therefrom, have a prominent place.

Relation to Philosophy.— Wisdom is thus practical rather than speculative. To speak of the book as philosophical, as some have done, is, therefore, misleading. The book, it is true, identifies virtue with knowledge. But this is done, not from a philosophical standpoint, but from a religious and practical one. For the practical purpose of the writers, men are divided into two classes, those who know the right and do it, and those who are ignorant of it and do not do it. The other class, always so common, consisting of those who know the truth and do it not, is simply ignored. The speculative element is wanting in the book. The teachings concerning wisdom often suggest philosophical speculations concerning the greatest good, but they are always religious, not philosophical. Some of the proverbs may reflect a general acquaintance with Greek philosophy, but not definitely with the doctrines of any specific school.

Ethical Teaching.—The ethical teaching of the book is on a high plane. Ceremonial is occasionally alluded to, but the sages agree with the prophets that the external act has no value without an inner reality. When revenge is forbidden, chapter xx, 22, and chapter xxiv, 29, and kind treatment of enemies is enjoined, chapter xxv, 21, the standard approaches closely to that of the New Testament.

George Ricker Berry,
Professor of Old Testament Interpretation and Semitic Langauges, Colgate University.

PROVIDENCE, R. I., the county-seat of the county of the same name and the capital and largest city of the State, is situated at the head of Providence River, a tidal arm of Narragansett Bay. It is 30 miles north from the open ocean, about 20 west from Fall River, 40 southwest of Boston and 188 northeast of New York. It is the Atlantic terminal of the Grand Trunk Railway system and is also served by the New York, New Haven and Hartford Railroad, and by several coast lines of steamships and by one transoceanic line. It covers an area of 18.29 square miles. The early settlement was on the river at the mouth of two small streams, and for nearly 200 years it grew in an easterly direction, many of its finest residences being erected on the high hill overlooking the Providence River, this hill or ridge about 200 feet high dividing the valley of the two streams from that of the Blackstone or Seekonk, a river of some size. Later on the settlements began to extend in a westerly direction over low and rolling ground, and to-day the West Side, as it is called, is the most densely populated section of the city; though within the past few years a movement has again set in toward the east, a large area having been built up in that part of the city adjacent to and running west from the Seekonk. Situated near the sea the city has a rather humid climate with a considerable range of temperature, but the weather is neither as hot in summer nor as cold in winter as in places farther inland. The suburban seashore resorts are famous, and in the inland surrounding scenery is no less attractive to thousands of annual summer visitors. The prevailing winds in summer are from the southwest and in winter from the northeast or northwest. The city is more healthful than many large manufacturing cities and has been noticeably free from epidemics of serious diseases. The death rate is 14.71 per 1,000 and the birth rate 23.43 per 1,000. The centre of the city is given over to the business district. There are 253.21 miles of streets, curbed, graded and paved. There are 47 city parks with a combined area of 650 acres, the chief of which is Roger Williams Park. The chief monuments are those of Roger Williams, Thomas A. Doyle, for many year mayor of the city, the Soldiers and Sailors' monument and that of Gen. Ambrose E. Burnside. Providence possesses a civic centre which rivals anything of the kind in America. The principal buildings are the city hall, State house, State Normal School, public library, Roman Catholic cathedral, Rhode Island School of Design, buildings of Brown University, Providence College, Roman Catholic, and the State armory. Among its charitable institutions are the Rhode Island Hospital, Rhode Island Homœopathic Hospital Butler Hospital for the Insane, Saint Joseph's Hospital, Dexter Asylum and the State Institute for the Deaf. There are 160,000 volumes in the public library, while there are also the Law Library, that of the Providence Athenæum, the Rhode Island Historical Society and the Rhode Island Medical Society.

Commerce and Manufactures.— In 1681 Providence was the most compact settlement of the colony of which it was a recognized centre; but its commercial growth for the ensuing hundred years was not as rapid as that of Newport, which on account of its geographical position was better adapted for the maritime trade of the East Indies, China and the western coast of Africa. Providence, however, eventually became considerable of a seaport town, and for many years the wealth of the city was mainly derived from its commerce of the seas. With the growth in size of the freighters of the coastwise and trans-Atlantic trade and a proportionate lack of increased facilities for accommodating these larger vessels, Providence began about 1840 to lose its prestige in the shipping world, until finally its foreign maritime trade entirely disappeared. It can hardly look for its return, until the city, State or private owners of water front privileges provide suitable accommodations for the handling of that trade, which by reason of the natural advantages of a magnificent habor, easily entered, it should enjoy. It has a city quay 3,000 feet long, and State Pier No. 1, equipped to handle trans-Atlantic freight and passengers. Chief among the advantages of Providence as a centre of industry, commerce and trade are those pertaining to its geographical position, it being the natural outlet of southern New England, and the sources of supply and distribution which are the natural outcome thereof. For this reason it is designated as the southern gateway of New England. Though its reputation as a shipping port has gone, to-day Providence is one of the great industrial centres of the United States, noted for the variety of its manufactured products, the greatness of its industries, the skilled workmanship of its artisans and for the invention of those numberless ingenious accessories of modern life which have become necessities in this age of luxury. Pre-eminent among the varied industries of the city is the manufacture of jewelry with its allied interests, such as chasers, electroplaters, gilders, engravers, colorers, enamelers, die-sinkers, etc., approximating a total of over 1,000 establishments, engaged in a manufacturing industry whose products are distributed alike among the civilized and uncivilized nations of the earth. Providence is the first city in the country in the manufacture of many things, including jewelry and silverware, these producing $35,000,000 worth of goods annually and employing 12,000 people. Providence has the largest mechanical tool factory, file factory, engine factory, screw factory and silverware factory in the world, and almost a dozen other establishments deserving of similar distinction. According to the recent census it had 1,080 large manufactories, employing 46,349 operatives with an annual production worth $120,380,000. Besides there were from 1,500 to 2,000 smaller industrial establishments. In addition to the metal-working establishments there are textile mills, with an annual output valued at $523,000,000, dye-works, packing houses, rubber and elastic works and other establishments. The city ranks tenth among the seaports of the United States in bulk of tonnage and value of cargoes. The general coastwise trade is very extensive. It is the leading oil port of New England. There are 18 banks with combined capital, surplus and undivided profits of $27,607,322. The assets of national and State banks and trust companies amount to $203,063,356; savings banks, $57,659,673, making a total of $260,723,029. Individual deposits amount to $218,554,406, to which must be added $3,964,552 deposited in loan associations. The assessed valuation in June 1917 was $388,715,600, including real estate $231,838,840; tangible personal property, $64,651,900; intangible property, $92,194,860. The city's annual budget exceeds $7,000,000. Its gross debt amounts to $24,276,830.28; net debt, $15,014,-646.56, including water bonds of $2,069,856.44. The net debt per capita is $58.87. The tax-rate is $18.50 per $1,000 on real estate and tangible personal property and $4 per $100 on intangible personal property. About $600,000 is expended annually on the fire department and about the same amount on the police department. There are 418.18 miles of low-pressure water-pipes laid in the city streets and 12.46 miles of high-pressure fire service pipes in the central district. There is also an excellent sewerage system.

The educational facilities include five high schools, 17 grammar, 17 primary, five for individual work, 10 ungraded for backward children, five open air, 12 evening, 28 training schools, 38 kindergartens, with 1,010 teachers and 212 evening teachers. The cost of maintenance is about $1,600,000 annually. The attendance in public schools is 34,814, and in 13 parochial schools 6,156 and 599 in 12 private schools. The evening school enrolment is 6,538.

History.— Providence was founded by that great apostle of religious liberty for the New World, Roger Williams, who arrived from England in Massachusetts Bay Colony in February 1631. He was well received by the Puritans as a "godly minister" but because of his boldness in announcing his views regarding the power of magistrates in religious matters he was forced to seek refuge with the Pilgrims at Plymouth. Subsequently he went to Salem, where his convictions regarding religious freedom incurred the displeasure of the General Court, and in January 1636 he was ordered to return to England; he refused and fled into the wilderness. Accompanied by five other men from Salem he had no fixed abode for weeks, but in June 1636 he began a settlement at a point north of the present site of Saint John's Church in Providence. Williams obtained a grant to lands covering what is now part of Rhode Island west of Narragansett Bay, from the Indians, the earliest deed on record being a memorandum dated 24 March 1637. In 1640 articles of agreement were adopted by the settlers as the basis of the town government, all affairs being regulated by a monthly town meeting. A royal charter was obtained in 1644 uniting various settlements about the bay, as "Providence Plantations in the Narragansett Bay in New England." Providence being on the mainland and more exposed to the attacks of Indians, grew less rapidly than Newport on the island of Rhode Island, and in 1676 was nearly deserted. Less favorably situated for shipping than Newport, Providence grew but slowly; in 1730 the population of Providence, which included four settlements, was 3,916. In 1750 the population of Newport was twice that of Providence, and 1774 the population of the town of Providence proper was but 4,321, though by this time the population of Providence County was greater than that of Newport County. The first notice of a schoolhouse in the town records appears in 1752. A charter for a college was granted in 1764, and Providence County raising the most money, the first building was erected at Providence in 1770. This was the beginning of Brown University. Providence was one of the first towns in America to have a public library, a set of books having been bought by subscription before 1754 by a company formed for that purpose. During the whole of the 18th century Providence was a quiet community, where people lived simply with few amusements. The first theatrical performance was given by an English company in 1762. The first fire engine was purchased about 1755. The first advertisement of a regular stage line to Boston appears 1767; the stage made weekly trips. The first public market-house was erected in 1773. In the disputes with England that preceded the outbreak of the Revolution Providence took a considerable part. The first overt act of resistance to England was the destruction of the armed schooner *Gaspee* in 1772. During the Revolution Newport was occupied by the British from 1776 to 1779, and the commerce of Providence was almost cut off by the British fleet, though a number of privateers hailing from Providence preyed on English commerce. After the Revolution commerce slowly moved again, trade being with Europe, China and Central and South American ports. In 1801 a fire destroyed property valued at $300,000, and in 1815 a great gale wrecked many vessels and did damage to the amount of $1,000,-000. From this time on the growth of Providence was steady if not rapid, the population about doubling every 20 years. Government by town meeting proving inadequate to meet the public needs, a city charter was adopted in 1831. The history of Providence during the 19th century is largely that of the industrial progress of the nation. The government is vested in a mayor and bicameral council. The latter elects several of the administrative officers. Connected with the suburban but separate municipalities of Cranston, Pawtucket, Warwick and East Providence, there is in a comparatively small area an aggregate civic population of over half a million, to which the city of Providence contributes 263,218.

I., and its Activities' (Chicago 1912); Powell, L. P., 'Historic Towns of New England' (New York 1898); Stokes, H. K., 'Finances and Administration of Providence, 1636–1901' (Baltimore 1903).

CLARENCE A. COTTON,
Secretary Chamber of Commerce.

PROVIDENCE, *in theology,* the supervision exercised by God over his creatures and the universe; the doctrine being that divine power is possessed and exercised in every smallest detail of life. The doctrine differs from omnipotence, which does not insist that the power possessed by the Deity is exercised; and from naturalism, which holds that the universe is governed by natural laws with which God does not interfere. Religion and mythology agree, from their earliest records, in placing the affairs of men under the guidance of divine power.

PROVIDENCE, Sisters of, a religious order of the Roman Catholic Church, founded in France, according to some accounts in 1806, to others in 1820 (Sœurs de la Charité de la Providence), by Pastor Dujarie in the parish of Ruillé, diocese of Le Mans (department of Sarthe). It gradually extended beyond this parish, and was authorized in 1826. The final approval of the rules and constitution was given by the Holy See in 1887. A colony from Ruillé opened the first institute of the order in the United States on 22 Oct. 1840 at Saint Mary's, near Terre Haute, Vigo County, Ind. Establishments are conducted by the order in the archdioceses of Baltimore, Boston and Chicago and in the dioceses of Fort Wayne, Rockford, Indianapolis and Peoria. In 1918 the order had charge of 74 parochial schools, 32 academies for higher education, one industrial school, one college and two orphan asylums, with a total of 25,841 pupils. The mother-house is located at Saint Mary-of-the-Woods, Vigo County, Ind., formerly the centre for 1,332 sisters. Another mother-house is located at Brightside, Holyoke, Mass., with 345 sisters, 20 novices and 10 postulants, conducting orphan asylums, homes for aged men and women, hospitals and working girls' homes in the diocese of Springfield, Mass.

PROVIDENCE PLANTATIONS. See Rhode Island, *History*.

PROVINCE is a territory, section or district of a nation or government. Among the Romans a province was a district of conquered country, governed by a proconsul or proprætor. The first Roman province was Sicily, 241 B.C. From the time of Augustus they were divided into the senatorial provinces and the imperial provinces. The latter comprised those which were most exposed to hostile inroads, and the administration of which was left entirely to the emperor under the pretense of sparing the Senate and people the trouble of managing them, but in reality to keep the army in his own hands. Under the empire the provinces were much better governed than they had been under the republic. One reason of this was that the emperors were more disposed to pay regard to the complaints of the provinces than the republican courts had been, for the latter were largely composed of men who had themselves profited, or who hoped to profit, by the same kind of maladministration with which the governors were charged, and were, therefore, always willing if possible to connive at such offenses. In addition to this the provincial governors under the empire received fixed salaries, which lessened the temptation to resort to illegal exactions to indemnify themselves for the expenses that they necessarily incurred in soliciting the office that was an indispensable condition of their governorship.

In modern times the term has been applied to colonies or to dependent countries at a distance, or to the different divisions of a kingdom itself. The name has sometimes been retained by independent states. Thus, the republic of Holland, after it had thrown off the Spanish yoke, was called the United Provinces; and the Argentine Republic used to be called the United Provinces of La Plata. In the canon law the term is applied to the jurisdiction of an archbishop. In the Roman Catholic Church it is also given to the territorial divisions of an ecclesiastical order such as the Franciscans, as well as to those of the Propaganda. For exhaustive accounts of the Roman provinces and their administration consult Arnold, W. T., 'Roman Provincial Administration' (1879); Mommsen, 'Roman Provinces under the Empire' (1884), and Taylor, T. M., 'Constitutional and Political History of Rome' (1899).

PROVINCE HOUSE, a brick mansion in Washington street, opposite the head of Milk street, Boston, Mass. It was built in 1679 for Peter Sargeant, a rich merchant, who used it as a dwelling. In 1716 it was purchased by the provincial legislature. From then on it was the residence of the colonial governors. After the Revolution it housed some of the officers of the Commonwealth. In 1811 it was given by the State to the newly incorporated Massachusetts General Hospital as part of its endowment. The trustees of this institution leased it in 1817 to a tenant who converted it to the uses of business. It finally became a tavern, a negro minstrel hall, and in October 1864 was destroyed by fire, only the walls remaining standing. Nathaniel Hawthorne used it as the setting for his 'Legends of the Province House' (1838–39) which were later reprinted in 'Twice-told Tales.' Consult Drake, S. A., 'Old Landmarks and Historic Personages of Boston' (Boston 1876); Hawthorne, N., 'Twice-told Tales' (edited with notes by J. H. Scott, in *Riverside Literature Series*, Boston 1907).

PROVINCETOWN, Mass., town, Barnstable County, at the extremity of Cape Cod, and on the New York, New Haven and Hartford Railroad. The earliest visitor to this place of which there is any record was Bartholomew Gosnold, 15 May 1602; it was visited by Capt. John Smith on his voyage to Virginia in 1614, and on 11 November (O. S.) the *Mayflower* anchored in the harbor and remained one month before going to Plymouth, and here the compact for their own government, said to be the first form of constitutional government in history, was prepared and signed; here Perigrine White, the first English child born in New England, first saw light, and here Dorothy Bradford, wife of the governor, was drowned. In commemoration of this visit, the United States government, in conjunction with the Commonwealth of Massachusetts and the Pilgrim Memorial Association of Provincetown, erected an imposing granite monument, 254 feet high, on Town Hill in the centre of the town, at a cost of $100,000, which was dedicated by President Taft on 5 Aug. 1910. The town remained a precinct for many years, and was incorporated as a town in 1727. The principal industry of the people is fishing, and in June 1915 a fleet of 75 vessels of all kinds were engaged in this industry. There are six large cold storage plants for fish freezing with a capacity of 80,000 barrels, a board of trade, one national bank, one savings bank, four Protestant and one Catholic churches, a public library, four private art schools, a high school and an art association. In recent years it has become popular as a summer resort. Pop. 4,370.

PROVINCIAL LETTERS ('Lettres provinciales'), by Pascal, or Provincial Letters, as they are usually called, though they are more accurately letters purported to be written to a friend in the provinces, mark an important stage in the great quarrel between the Jesuits and the Jansenists. These two parties were struggling in the 17th century for the religious, moral and intellectual control of France. As the Jesuits painted religion alluring and the Jansenists made it out almost oppressive in its austere majesty, the two sects were diametrically at variance. Arnauld, the great Jansenist theologian and friend of Pascal, was a leader in the controversy. In 1655 he was involved in a religious dispute, and his views were in January 1656 condemned by the Sorbonne or theological faculty. Arnauld, realizing that his own involved controversial writings could not appeal to the ordinary man, sought the help of Pascal, who brought out the first 'Provinciale' on 23 Jan. 1656. They lasted until March 1657. Pascal wrote 18 letters, began a 19th and had planned a 20th. They are supposed to tell a friend in the provinces what is happening in Paris between the Jesuits and the Jansenists. Pascal attacks both the dogma and the morals of the Jesuits. He argues the logically consistent Augustinian determinism, carried even beyond the doctrines of Saint Augustine, which was at the bottom of the teachings of Jansenists. He aimed to show the inconsistency of the Pelagians or semi-Pelagians, as he called the Jesuits, in trying to reconcile doctrines of God's foreknowledge and of salvation imparted by grace with man's liberty to accept or reject what is offered to his choice. But Pascal's most effective assaults were made against the morals of the Jesuits as Molinists or followers of the casuist Molina. The Jansenists were rigid, unbending moralists, unwilling to compromise in the slightest degree in word or in deed, even for the sake of a greater good. The Jesuits desirous of making converts had not invented but developed doctrines of casuistry, or the study of cases of conscience, by which in certain contingencies allowance could be made for deviation from the path of rectitude. Pascal made the most of his opportunities to attack the Jesuits' excuses for «equivocation» and «mental restrictions,» and charged them with teaching hypocrisy, unchastity and other sins.

The Letters form one of the most important examples of pamphlet literature in history. They deal, of course, with conditions and events now largely forgotten, but they were of extraordinary importance in their day and contributed greatly to the permanent discrediting with so many people of the Jesuit order. They are undoubtedly often unfair in their sarcasm and dialectical victories, perhaps sometimes even in statements of facts, but their vividness and lucidity make them a monument in French literature and one of the chief examples of early classical French prose.

Bibliography.— Important editions of the 'Lettres provinciales' are by Feugère (2 vols., 1887–95), and in the edition of Pascal's works, edited by Brunschvicg, Boutroux and Gazier and published in the series of 'Grands Ecrivains de la France.'

Charles H. C. Wright,
Professor of French Language and Literature, Harvard University.

PROVING GROUND, a space provided for testing ordnance and making ballistic experiments. The United States army's proving ground is at Sandy Hook, N. J. The navy has its proving ground on the Potomac River at Indian Head, Md.

PROVO (prō'vō) **CITY,** Utah, county-seat of Utah County, on the Provo River, and on the San Pedro, Los Angeles and Salt Lake, the Rio Grande Western and the Salt Lake and Utah Electric railroads, about 45 miles south of Salt Lake City. It was settled in 1849, and in 1851 was chartered as a city. It is in a region in which the principal occupations are agriculture, stock-raising and cultivation of fruit. The chief manufactures are flour, lumber, tin and iron roofing, woolen goods and canned fruit. There is a large trade in farm products, livestock, fruit, lumber and in the importing of groceries and textiles. The place is visited by many tourists on account of the Provo Cañon, Utah Lake and Bridal Veil Falls in the vicinity. It has the State insane asylum and a Mormon tabernacle. It is the seat of the Brigham Young University (Mormon). Pop. 10,000.

PROVOOST, prō-vō', **Samuel,** American Protestant Episcopal bishop: b. New York, 26 Feb. 1742; d. there, 6 Sept. 1815. He was graduated at King's College (now Columbia) in 1758, at its first commencement; went to England in 1761 to prepare for ordination, studied at Saint Peter's College, Cambridge University, and was ordained deacon and priest in 1766. Returning to America he became assistant rector of Trinity Church, New York. He resigned in 1771. In 1784 he was elected rector of Trinity Church. In the same year he was appointed a regent of the University of New York and was given the degree of D.D. by the University of Pennsylvania. Throughout the Revolution he took a firm stand in favor of the liberty of the colonies, and was chaplain to Congress in 1785 as well as to the United States Senate in 1789. In 1787 he was appointed a trustee of Columbia College. After presiding at the general convention held in Wilmington in 1786 (the absent Seabury being the only bishop in America), he set sail for England in company with William White to receive episcopal consecration, having been elected as bishop of New York. A special act of Parliament having been passed empowering the archbishops of Canterbury and York «to consecrate to the office of a bishop persons being subjects or citizens of countries out of His Majesty's dominions,» Provoost and White were consecrated by these prelates and the bishops of Bath and Wells and Peterborough in the chapel of Lambeth Palace, 4 Feb. 1787. Bishop Provoost resigned the rectorship of Trinity Church in 1800 and his see in 1801, but the House of Bishops declined to receive his resignation, giving consent, however, to the consecration of Dr. Benjamin Moore as assistant bishop. He is buried in Trinity churchyard. Consult Berrian, W., 'An Historical Sketch of Trinity Church' (New York 1847); Dix, M., ed., 'A History of the Parish of Trinity Church, New York' (4 vols., New York 1898–1906); Francis, J. W., 'Old New York' (New York 1858); Gallagher, M., 'Chapter of Unwritten History' (New York 1888); Hartley, I. S., 'Rt. Rev. S. Provoost' (in *Magazine of American History,* Vol. XXVI, p. 115, New York 1891); Perry, W. S., 'Bishop Seabury and Bishop Provoost' (1862); 'Provoost, A. F., 'Memorial of Bishop Hobart' (New York 1831); Wilson, J. G., ed., 'Centennial History of the P. E. Church in the Diocese of New York, 1785–1885' (New York 1886); id., 'Samuel Provoost, First Bishop of New York' (in *New York Genealogical and Biographical Record,* Vol. XVIII, p. 1, New York 1887).

PROVOST, one who is set over others; one who is appointed to superintend or preside over something; the principal, head or chief of certain establishments or bodies; applied to (1) a jailer; the keeper of a prison; (2) the head of the faculty or principal of several colleges in the English universities of Oxford and Cambridge; the principal of the University of Dublin. In the case of a few colleges in the United States (e.g., University of Pennsylvania) the term is used in the same sense; (3) in Scottish cities the mayor is called provost, and in Aberdeen, Dundee, Edinburgh and Glasgow «lord provost»; (4) in ecclesiastics it is sometimes used in the same sense as prior, or to designate the head of a chapter, corresponding to the more frequent term «dean»; in the German Lutheran State Church is applied to the pastor of the principal church in a district; (5) in France the judge of certain royal and feudal courts.

PROVOST-MARSHAL, in military affairs, an officer who takes cognizance of offenses against discipline, orders the arrest and the punishment of deserters and other offenders according to the sentence of a court-martial, and maintains order generally. In the British army the provost-marshal has the rank of captain, and superintends the preservation of order, and is really the head of the military police of a camp or military district. In the United States army there is a provost-marshal-general who supervises the work of the several divisions, and to this was added in 1917–18 the charge of the operation of the Selective Service (Conscription) Laws, and the multitudinous duties incident thereto. See COURT-MARTIAL; MILITARY LAW.

PROXY, person who is empowered, or the instrument by which a person is empowered, to act or vote for another, most frequently used in the case of public assemblies, conventions, boards of directors, meetings of shareholders, etc. In Great Britain every member of the House of Lords was formerly permitted, on obtaining a nominal license from the Crown, to appoint another lord of Parliament his proxy to vote for him in his absence. Only a spiritual lord could be proxy for a spiritual lord, and a temporal for a temporal lord, and no peer could hold more than two proxies at the same time. Proxies were never used in judicial business or in committees of the House, nor could a proxy sign a protest. The practice of admitting proxies was discontinued in 1867.

PRUDDEN, prūd'ĕn, **Theophil Mitchell,** American physician and author: b. Middlebury, Conn., 7 July 1849. He was graduated from the Sheffield Scientific School, Yale, in 1872; from the Yale Medical School in 1875 and received the degree of LL.D from Yale in 1897. Besides contributing to the scientific literature of pathology and of bacteria and their influence in disease, he has written on these and other scientific topics for the general public. He is emeritus professor of pathology in the College of Physicians and Surgeons, Columbia University, New York. Among his writings are 'Handbook of Pathological Anatomy and Histology' (10th ed., 1914), with F. Delafield; 'Story of the Bacteria' (1899); 'Dust and its Dangers'; 'Water and Ice Supplies' (1891); 'On the Great American Plateau' (1907).

PRUDENTIUS, proo-dĕn'shĭ-ŭs, **Aurelius Publius Clemens,** Christian hymn writer: b. Spain, probably at Saragossa, 348; d. about 410. He practised the profession of an advocate and afterward became a functionary of the government. From a life of pleasure and worldliness he was reclaimed by his conversion to Christianity, retired to a cloister in his 57th year and there spent the remainder of his life. It was during these latter years that he wrote the religious poems which have made his reputation as the greatest Christian poet of the 4th and 5th centuries in the Latin Church. This was the golden age of Latin patristic letters and his contemporaries included Ambrose, Jerome and Augustine. It is quite evident that he was a profound student of classic latinity, for he shows a complete mastery of the epic and lyric metres of Roman literature, and at the same time these poetical works are purely Christian, full of devotional feeling and theological lore. His 'Liber Cathemerinon' consists of 12 religious poems for daily use; while 'Psychomachia' is an allegorical description of the struggle between good and evil in the human soul. 'Peri Stephanon' is a metrical martyrology. Other works by him are 'Apotheosis'; 'Hamartigenia'; 'Contra Symmachum'; and 'Dittochæon,' the first three being polemic, the last chiefly of archæologic interest. There are many manuscripts of Prudentius' works; the best of these is considered to be that in the Bibliothèque Nationale, Paris (Latin Department, 8084), dating from the early 6th century. There are also a great number of editions of his writings. Amongst these should be mentioned Giselin (Antwerp 1564); Arevalo (Rome 1788), the latter reprinted in Migne, J. P., ed., 'Patrologia Latina' (Vols. LIX–LX, Paris 1847); Obbarins (Tübingen 1845); Dressel (Leipzig 1886). A still more recent critical edition has been undertaken by J. Bergman and is still uncompleted. There are a number of English translations of some of his works amongst which should be mentioned Anon., 'Psychomachia; the War of the Soul: or the Battle of the Virtues and Vices' (London 1743); Anon., 'The Cathemerinon and other Poems in English Verse' (London 1845); Pinder, N., ed., 'Selections from the Less Known Latin Poets' (Cambridge 1866); Morrison, G., translator, 'Hymns, etc.' (London and Cambridge 1887–91); Thackeray, F. St. J., 'Translations from Prudentius' (London 1890); Pope, R. M., and Davis, R. F., translators, 'Cathemerinon' (New York, n.d.). O., 'Notes on the Manuscripts of Prudentino' (in *Journal of Theology,* Vol. XXIX, p. 166, London 1904).

PRUDHOMMES, Conseils de, kŏn-sā-ē dė prū-dŏm, courts of conciliation in France for deciding small disputes between workmen and employers. The first councils called by this name in Paris were formed in 1296 in the reign of Philippe le Bel, when 24 *prud'hommes* were appointed to assist the provost of the merchants in settling disputes between merchants and manufacturers at the fairs and markets. After the Revolution of 1848, at which period 75 towns had conseils de prud'hommes, the whole legislation on this subject was revised. All the patrons and workers of industrial establishments within the circle of jurisdiction of the council of prud'hommes were made eligible as electors. In June 1853 a law was passed which, with some modifications, is still in force. The patrons and the workmen are formed into separate electoral colleges, each to elect an equal number of prud'hommes. Qualifications for election are a minimum age of 30 years, ability to read and write and citizenship. The office used to be honorary, but compensation, varying locally, is now permitted by law. The general conseil, besides the president, vice-president and secretary, is composed of an equal number of patrons and workers, with a minimum membership of six. They are elected for six years, one-half of the membership being renewed every three years. The jurisdiction of the conseils is summary and without appeal for sums under 200 francs; above that sum an appeal lies to the tribunals of commerce. The presidents and vice-presidents of the conseils de prud'hommes are elected by the conseils for one year, one being a patron and the other a workman. The number of conseils de prud'hommes is now about 225. Consult Block, R., and Chaumel, H., 'Traité Théorique et Pratique des Conseils de Prud'hommes' (Paris 1912); Block, M., 'Dictionnaire de l'Administration Française' (Vol. II, Paris 1905); Cluzel, G., 'Traité Pratique des Conseils de Prud'hommes' (Paris 1908); Thomas, E., 'Les Conseils de Prud'hommes, leur Histoire, leur Organisation' (Paris 1888).

PRUDHON, Pierre Paul, pē-ār prū-dôn, French painter: b. Cluny, Saône-et-Loire, 4 April 1758; d. Paris, 16 Feb. 1823. He received his first instruction in his art at Dijon under Devosge. In 1780 he went to Paris. Two years later he won a competition for a Roman scholarship offered by the estates of Burgundy. He arrived in Rome early in 1785 and devoted himself assiduously to study, forming his style on that of the 16th century masters, especially Leonardo da Vinci and Correggio. He returned to Paris in 1789 and painted portraits, gaining with difficulty his living under the Terror. He gradually made himself known, although his misfortunes had been early aggravated by a marriage undertaken under circumstances of great imprudence; and in 1800 he became famous by his timely picture 'Truth Descending from Heaven.' In 1808 appeared in the Salon his 'Psyche Carried off by Zyphyrus' and 'Crime Pursued by Justice and Divine Vengeance,' the latter now in the Louvre. From this time his position was assured. In 1808 he received the Legion of Honor and in 1816 was made a member of the Institute. In these years he also found compensation for his unhappy marriage in the love and care of one of his pupils, Mlle. Constance Mayer. Besides paintings and mural decorations he also made many designs for elaborate furniture for the emperor and his family amongst which may be mentioned the cradle for the Prince of Rome, the son of Napoleon I and Marie Louise. He also etched many of his works and almost innumerable engravings of many of them were made by etchers of his own times and of later periods. His importance in the history of French art history lies in the fact that he indicated a revolt from the cold classicalism of David, introduced freer and bolder pictorial effects than had so far obtained in French art and utilized the emotional and sentimental resources which lie in the skilful distribution of light and shade in a picture. Other works of his are 'Cupid Chastised' (National Gallery, Dublin); 'The Assumption'; 'The Crucifixion'; 'Interview of Napoleon I and Francis II after Austerlitz' (Louvre, Paris); 'Union of Love and Friendship'; 'Venus and Adonis'; 'An Unhappy Family'; 'Venus in the Bath.' The last four works are in private collections, as are also many others, as well as most of his portraits and sketches. Seventeen of the latter, however, are to be found in the Louvre. Works of his may also be seen in museums at Angers, Cherbourg, Dijon, Montpellier, Orleans, Quimper, etc. A sketch of a ceiling in Dijon is owned by the Historical Society, New York. Consult Blanc, C., 'Histoire des Peintres' (Vol. III, 'Ecole Française,' Paris 1865); Burty, P., 'Un Carnet de P. P. Prud'hon' (in *L'Art,* Vol. VII, p. 11, Paris 1876); Clément, C., 'Prud'hon, sa Vie, ses Œuvres et sa Correspondance' (Paris 1872); Delacroix, E., 'Peintres et Sculpteurs Modernes' (in *Revue des Deux Mondes,* n.s. Prud'hon, Peintre' (Paris 1824).

PRUE AND I, a work by George William Curtis (q.v.), first published in 1856. It is a series of sketches or meditations showing the enjoyment to be derived from even the most commonplace existence. The papers are supposed to be written by an old bookkeeper, who strolls down the street at dinner-time and without envy watches the diners-out. But whatever the genial old bookkeeper is thinking or relating, his heart is full of Prue, and from beginning to end it is always «Prue and I.» Consult Cary, E., 'George William Curtis' (Boston 1894).

PRUNE, dried plums of certain varieties and the varieties used for drying. They are extensively cultivated in the Danubian principalities, France, Italy, and in recent years in California, Oregon and Washington, from which States the American market is now chiefly supplied. The product is of great commercial importance and nutritious qualities. Any variety of plum having the requisite percentage of sugar, plenty of solids and which, when cured, will keep for a long time without deterioration, is suitable for making prunes.

Prune growing was introduced into California in 1856, from scions imported from France, and in 1863 prunes were for the first time publicly exhibited as a California product. The first large orchard was planted in 1870, yet in 1915 nearly 100,000 acres of bearing and 30,000 of young trees were recorded. Attempts have been made to cultivate the prune in eastern parts of the United States, but without success, owing to the absence of requisite conditions for curing. Cultivation has been successfully extended to Australia and South America, and these countries will ultimately prove formidable competitors in the trade. In California where the wet and dry seasons are well defined, and from May until October rains are infrequent, never exceeding a fraction of an inch in volume, exist the best natural conditions for perfect curing of the prune. The fruit is not picked until perfectly ripe, then it is gathered from the ground whence it has fallen naturally from the trees when ripe. It is then passed through a sizer which separates the various sizes in order to secure uniformity in drying, as small fruit will dry in a shorter time than will a larger size. Next it is dipped into a weak solution of boiling lye to take off the bloom and facilitate curing. Sometimes the outer skin is punctured by needles to allow the surplus moisture in the fruit to escape readily. In large establishments endless-chain machines are employed in dipping, but where it is done by hand a wire dipper is used. The fruit is washed in fresh water after the process to clean off the lye. After spreading upon wire-netting trays, the fruit is taken to the field and exposed to the sun's heat until properly cured. The summer days in California are invariably hot and the raw fruit, after exposure to the sun's rays for 6 to 10 days, depending upon size, is thoroughly dried. (In eastern Europe it is customary to cook the fruit partly before exposing it to the sun). In countries where periods of dry weather are liable to be interrupted, evaporators are used in extracting the moisture of the fruit, the trays being introduced into a chamber in which the temperature is raised to 140° to 180°, and where they remain from 12 to 48 hours. To understand the exact amount of time necessary perfectly to cure the fruit is essential, as if this matter is ill-judged an inferior quality of product results. When sufficiently cured, the fruit is taken from the trays to bins, where it is allowed to «sweat» for two or three weeks, after which it is ready to be graded and packed for market. Grades are indicated by the number of prunes to the pound, according to the size; 30 to 40 to the pound represents the highest grade, 120 or 130, the smallest. Before final packing the prunes are «processed» by dipping into a hot solution of water with glycerine or fruit syrup, which not only adds to the beauty and polish of the fruit, but extirpates insect germs that may be present. Producers seldom introduce a substance in the process mixture for increasing weight. In shipping, sacks are employed when a buyer intends to pack for his own trade, but the larger quantity is packed into boxes of stated dimensions at the place of shipment. French methods are also practised in packing high grades in fancy boxes with attractive linings. In quantity the States of California, Oregon and Washington produce a larger amount than all foreign countries put together, the annual output of the three States aggregating about 210,000,000 pounds in 1912. Large quantities of the better sort of American fruit are exported to Europe, where they rank equally with the finest brands of France.

Orchards of large size are found in various parts of California. They require the same careful cultivation as plums and frequent pruning, besides occasional irrigation. The nomenclature of the prune-making plum is large and abounds in synonyms. The following varieties are most favored in America: Petite or Prune d'Agen, the most important in California; Italian (Fellenberg) in Oregon, with Tragedy perhaps second and Hungarian third. Other varieties grown commercially are Pacific, Willamette, Clairac, Mammoth, Columbia, Tennant, Silver and Sugar. Consult Bailey, 'Standard Cyclopedia of Horticulture,' titles 'Prune'; 'Plum'; 'California'; and 'Evaporation of Fruits' (New York 1914–17).

PRUNELLA, a kind of smooth woolen or mixed stuff of which clergymen's gowns were once made and which is still used for the uppers of ladies' boots and shoes.

PRUNING, the removal of parts of plants in order to economize and divert energy in desired directions. Fundamentally the various objects for which plants are pruned are (1) training, in which the limbs are started and disposed as desired; (2) pruning proper; (3) trimming or the shaping to some artificial form. The first is of prime importance in the early years of orchard fruits, but is of smaller and smaller application as the subjects dealt with are shorter-lived or less tree-like. The second is important, as a rule, during the whole life of the plant, in many cases, especially of trees, commencing when the plants are set. The third is usually of small importance, at least in America, being employed mainly with such ornamental subjects as hedges, topiary specimens and dwarf trees.

Popular opinion concerning the practice has changed within recent years. Formerly it was against pruning upon the ground that the plants suffered and that the practice was unnatural. But nature is an inexorable pruner, as the straight limbless trunks of forest trees and the dead twigs and branches of trees left to themselves sufficiently show. The horticulturist improves upon nature in doing his work intelligently, not only with respect to what shall be removed, and when, but how it can be best done, so as to enhance the healing of the wound. The practice is essential to successful orchard fruit culture and to a greater or less extent with other plants. With woody plants that have been grown in nurseries it is necessary to cut back the tops to approximate a balance between the top and roots which latter have been necessarily reduced in digging. The usual practice in this matter is to remove at least one-half of each branch that is to remain and to cut off all the others. Many orchardists trim off all the limbs and some leave nothing but a switch or even a stub, claiming that they can then form the head of the tree where they desire and that the tree more quickly recuperates than if a larger proportion of top is left. Certain it is that in practice the trees untrimmed at transplanting time generally suffer severely.

Among the principal objects sought in the pruning of fruit-trees the following may be mentioned: To divert plant-food from wood production into fruit formation and development of improved specimens; to keep, not to force, the tree in bearing condition, which is secured by regular annual attention and not by intermittent neglect and butchery; to prevent the excessive production of wood which is usually at the expense of fruit production and ordinarily is a sequence of excessive pruning; to keep the tree within manageable limits so as to facilitate cultivation, spraying and harvesting; and to admit light and air to the tops so that the fruit may be well colored.

Before any pruning is done, however, it is essential to know the exact manner in which the trees or shrubs bear their fruits, for unless this is understood the operator may be working against his own interests and injuring the tree at the same time. For instance, apples and pears bear their fruits upon gnarly twigs called spurs, the plum and cherry usually upon spurs, but sometimes also on the axial growths; the peach bears usually upon the axial growth of the previous season, but also to some extent upon spurs which live only two or three years as a rule; the quince bears upon terminal shoots of the present season; the grape upon shoots of the current season; the raspberry and blackberry usually upon shoots of the previous season, the shoots dying after production; and the currant and gooseberry upon wood one or more years old. Further advantage may be taken of the method of fruit production in preventing the necessity of thinning, the fruit-buds being removed by the cutting out of the fruit-bearing wood.

In the pruning of ornamental subjects the same principles apply. Except for removing straggling, unsightly or unnecessary growths, the pruning has mainly to do with flower production. Flowering shrubs and trees may be divided into two groups; those which produce their flowers from buds which were matured during the previous season; and those whose buds are developed during the current year. The one rule that will apply to these subjects is: Prune after flowering. If members of the first group are pruned during the winter they will generally suffer severe loss of flower buds; members of the other group, however, should be pruned, preferably, in early spring about the time that growth starts. Properly done and at the right time the production of bloom should be greatly enhanced with each group.

There is considerable difference of opinion as to when subjects should be pruned, but if wounds are properly made, that is, close to the main stem without leaving any stub, and if the large ones are protected from decay during the healing process, they may be pruned at any time, preferably, perhaps, just before the season of most active growth when the object is wood, and after this period if the object is fruit. Trees grown as cordons, espaliers, etc., require the greatest skill, but these practices are largely matters of training and are of rare application in the United States.

There is an immense literature on the subject, consisting chiefly of short articles on special phases, to be found in horticultural journals of this and foreign countries and in the publications of governmental departments of agriculture and of agricultural colleges and schools. For general treatment of the subject consult Bailey, L. H., 'The Pruning Manual' (New York 1916); Hood, G. W., 'Laboratory Manual of Horticulture' (Boston 1915); Kains, M. G., 'The Principles and Practice of Pruning' (New York 1917); Newsham, T. C., 'The Propagation and Pruning of Hardy Trees, etc.' (New York 1913); Udale, T., 'The Handy Book of Pruning, Grafting and Budding' (Evesham 1915).

PRUNUS, a genus of shrubs and small fruit trees of the rose family, about 75 of which are widely distributed, especially in the north temperate zone, and include many leading fruits of the world and many species of ornamental value. They have alternate leaves; solitary or clustered, pink or white flowers which appear usually in spring; and drupaceous fruits containing one hard-stoned seed. The number of varieties and hybrids is legion; they include weeping, double-flowered, variegated-leaved and diversely colored subjects, besides the host of varieties cultivated for their fruits. Their range of hardiness varies with the species, some being hardy in the cold North and Plains States, others tender even at the latitude of New York. The most important members of the genus or sometimes referred to it are treated under their own titles, as ALMOND; APRICOT; CHERRY; NECTARINE; PEACH; PLUM; PRUNE; SLOE.

PRURITUS, itching, a symptom of various skin diseases. It may occur independently of any structural alteration of the skin, as a purely psychogenic affection and is then frequently a symbol of unconscious masturbation. It may involve the skin of the entire body or be limited to a particular region, such as the anus, scrotum or vulva. The sensation is described as prickling, burning or crawling. It is very annoying when slight and may be so severe as to destroy all sense of comfort. Excitement and overheating, even the warmth of the bed at night, cause at times troublesome exacerbations. The etiology of this affection is frequently obscure. Impaired general health and a neurotic tendency are predisposing causes. Pruritus senilis is a distressing form occurring in advanced age and is due to degeneration of the skin. Pruritus hiemalis (winter itch) is peculiar to cold weather. Other causes are the change from light to heavy under-clothing; ingestion of certain drugs, as opium; sometimes hepatic and renal disease; and the circulation in the blood of abnormal biliary constituents, as in jaundice, and of other abnormal material in diabetes. Localized pruritus frequently depends upon a venous congestion of the part; thus pruritus ani is invariably aggravated by constipation and obstruction of the portal circulation; and in pruritus vulvæ, uterine engorgement and pregnancy are exciting causes. Worms not infrequently produce itching of the anus and of the nose, the latter being a reflex condition. The almost constant scratching caused by a persistent localized pruritus is likely to produce eczema.

In treatment the general health is to be improved by hygienic measures; sometimes an entire change of diet, scene, etc., is necessary. Internal medication should be left to the physician. A psychoanalysis is necessary to cure certain cases. Local remedies are palliative, only relieving the discomfort until the cause of the itching is removed. Among the palliatives are carbolic acid, borax, soda, starch, chloroform in powder, liniments, solutions and ointments.

PRUSSIA (German, Preussen; Latin, Borussia), a kingdom of Germany, and its largest, most populous and most important state, comprising nearly two-thirds of its area. The boundaries of Prussia are on the east, Russia; on the south, Austria, Saxony, Bavaria, Hesse-Darmstadt and the Thuringian states; on the north, the Baltic, Denmark, Mecklenburg and the North Sea; on the west, Belgium and the Netherlands, Alsace-Lorraine and Luxemburg. The circumference of Prussia measures 4,762 miles and except for some small enclaves, including the Hohenzollern principality, which is surrounded by Württemberg territory, Prussia is a compact mass of land, taking up nearly the whole of northern and eastern Germany. In shape it is, roughly, an elongated oval. Its greatest length, from Memel to the borders of Alsace-Lorraine, is about 800 miles, and its greatest width something over 400. The frontiers of Prussia, however, are political rather than natural. The area is 134,622 square miles. The heart of it is the province of Brandenburg, from which small core the kingdom of to-day has grown by conquest or otherwise. Prussian territory encloses, wholly or nearly so, the small German states of the two Mecklenburgs, Anhalt, Brunswick, Oldenburg, as well as the old Hansa republics of Hamburg, Bremen and Lübeck. Prussia holds some five-eighths of the population of Germany. The density of population by the square mile, in 1910, the last census year, was 292.80.

Topography.— Three-fifths of Prussia form part of the great northern European lowlands. This plain is much wider in the east, only the southern border of Prussia being there mountainous, than it is in the west. Roughly, an imaginary line run from about Bonn to Wittenberg would separate the lowlands from the highlands of Prussia. The Sudetian range divides Prussia from Bohemia and Austria, and its highest peak, the Schneckoppe, lies on Prussian soil. The Harz range runs nearly parallel with the Sudetes and might be considered a continuation of them. South of the Harz the Prussian boundary cuts the Thgringian Forest, and this again is prolonged by the Weser range of hills and the Teutaburg Forest. In the southwest the lower Rhine region includes the Hunsrück and Eifel, the Taunus, Westerwald, Siebengebirge, Spessart and Sauerland, nearly all of it on Prussian territory. Again the Rhön mountains, the Vogelsberg and other small ranges interpose themselves between the Rhenish and Thuringtian system. North of the Sauerland, in the region of the Ruhr River, are situated the most important coal-bearing lands of Prussia, while the extensive, but on the whole not so valuable, coalfields are in eastern and northern Silesia. Prussia has an ocean front («Waterkant») of some 1,100 miles on the North Sea and the Baltic, being nearly the whole seashore that Germany can boast of. Tidal variations are not very great on the North Sea, and still less so on the Baltic, but fierce and frequently recurring northwest storms have caused great devastation along the rather flat seaboard of Prussia, so that during historical times alone thousands of square miles of coast have been swallowed up in the ocean. The Frisian chain of small islands (including Heligoland) are the remnants of a former coast line, and dikes and other costly means of preservation have to be kept in constant repair against the renewed inroads of the sea. Much of the coast land being marshy soil, it serves for pasturage only. The Baltic is much more shallow than the German Ocean and is not distinguished by well-defined ebb and flood, and its coasts are mostly sandy and infertile dunes. The only island along the Prussian line of the

Baltic that deserves mention is Rügen, a fertile tract of great scenic beauty. However, the Baltic coast has several deep indentations, such as those near Lübeck, Danzig, Kiel and the Pomeranian bight. The so-called Haffs are semi-inland bodies of water but slightly brackish and formed by the waters of the rivers emptying themselves into hollows nearly cut off from the sea proper by dunes and small tongues of projecting mainland. Although Prussia is in its main part rather flat, so that no serious obstacles interfere with the railroad and canal systems, that does not mean that the land is quite level. Indeed, hills and rocks rising to a height of 600 feet and more are of frequent occurrence on the long line between the mouth of the Ems River and the Russian border, these elevations dating from the Ice Age and being formed by accumulations of boulders and moraines.

Hydrography.— Prussia contains a large number of lakes, especially in her northeastern section, but none of them of great importance. There are also large swamps along the lower course of the Oder, Havel, Warthe and Netze rivers, and drainage work has been going on. All the river system of Prussia belongs to the basins of the Baltic and North Sea, the Danube, which empties into the Black Sea, being the only large river of Germany that does not figure in Prussia's national economy. All the other principal rivers of Germany, such as the Elbe, Rhine, Weser and Oder, with most of their tributaries, and the Vistula (Weichsel) and Niemen (Memel), coming from Polish or Russian soil, in their most navigable and important portions, form part of the Prussian river system. The Rhine flows through Prussian territory about 200 miles, the Weser and Oder almost completely and the Elbe for about two-thirds of its course. There are also a large number of shorter coast rivers, such as the Pregel, Leba, Wipper, Rega, Peene, Ucker, Trave, all belonging to the Baltic, and the Eider, Ems, Werra, Fulda, Saale, Havel and Aller of the North Sea range. Prussia has also a considerable number of artificial water courses. Of these the Baltic-North Sea Canal (officially styled the Kaiser Wilhelm Canal), the construction of which entailed an expenditure of about $36,000,000, is in most respects of highest importance. Vistula and Oder are connected by the Bromberg Canal; Oder and Spree by the Müllrose Canal; Havel and Elbe by the Plau Canal; Elbe and Trave by the Stecknitz Canal; Eider and Baltic by the Eider Canal. Of late years these canals have been increased in size and depth, and since the beginning of the great World War just past Prussia has planned, and is now as a matter of fact executing, a great and ambitious plan intending to connect all the principal Prussian rivers with the Danube and with each other, so as to form a great Danube shipping canal that is to make the Danube available for large boats from Regensburg to the Black Sea. It can, therefore, be said that in its hydropathic aspects, as far as variety, diversity of direction and number of means are concerned, Prussia is singularly fortunate and well supplied.

Climate and Soil.— The climate of Prussia is wholesome and temperate. It is the distance from the Atlantic rather than mere latitude that is the determining factor in its climatic variations. Thus the mean temperature of Königsberg (far to the northeast of Prussia) is 43° F.; that of Berlin but five degrees more, namely, 48° F.; at Aachen (Aix-la-Chapelle), on the western border, 49° F. and at Köln (Cologne) and Trier (Treves) 50° F. As one proceeds to more southerly latitudes, in Prussia, the higher altitudes even up differences. However, the greatest differences are between east and west, due to the prevailing northern and eastern winds from Prussia and the Scandinavian north in the eastern portions of Prussia. Extremes of temperature, therefore, are also greater in the eastern parts, wholly in the colder seasons. The average rainfall in Prussia is about 21 inches, being highest in some of the western provinces (31–34 inches) and lowest in the northeast portions (16 inches). The soil of Prussia, though in some of the western mountain regions (Rhön, Eifel, etc.) and in certain districts of the northeast very bleak and sterile and but of mediocre fertility in the northern central portion (Brandenburg), is on the whole fairly productive, and pre-eminently so in the bottom lands of the Rhine, Weser, Oder, Elbe, Unstrut, Warthe, Netze rivers. Even where in its natural state the soil is poor and meagre, much has been done by wise agriculture, assiduously fostered by the government, to improve its yield from year to year.

Geology and Mineral Resources.— Of the two widely differing geological formations of Prussia, the entire flat part of it, being the larger, is covered with clay and sand of the Quarternary Age, having been spread over the surface since the Ice Age till the present day by alluvial and glacial action. And these deposits rest upon all formations from the Primary down to and through the various phases of the Tertiary. Cropping out here and there the harder rocks often emerge above the Diluvian and Alluvian. This is the case in Rügen with its chalk cliffs, in the limestone plateau near Rüdersdorf, etc. The Rhenish and the Thuringian systems are part of the Triassic system of the upper Rhine. The Silesian ranges — Riesengebirge, Sudeten, etc.,— are mainly of gneiss and granite, while Harz and lower Rhine belong to the Devonian and Silurian formations. Prussia excels as a mining country, especially in coal, iron, lead, zinc, copper, potassium, leading by far the rest of Germany in mining products. About 89 per cent of Germany's coal supply comes from Prussia, mainly from the Ruhr Basin, Rhine province, Westphalia and Silesia, while soft coal and lignite comes from Saxony; peat also is obtained in big quantities from the northwestern lowlands near the coast. The last available statistics, those of 1912, show that Prussia mined 165,302,784 metric tons of hard coal and of lignite and soft coal 65,803,959 metric tons. Iron comes chiefly from the provinces of Silesia, Westphalia, Hesse-Nassau and Hanover, the yield being in pig iron in 1911 some 10,477,263 metric tons. The eastern portion of Silesia has practically a world monopoly in zinc, the figures for 1913 being 702,893 metric tons. Copper was mined in the same year in Prussia to the amount of 996,235 metric tons in ore, and of lead some 158,857 metric tons. In manganese production, too, Prussia is supreme. Of table salt Prussia is very prolific, and in potassium it is the chief source of production. Petroleum is obtained in limited output in the province of Hanover. The far northern coast of the Baltic yields an abundance of amber. A large proportion of mines and salines in Prussia are under government control and ownership. In 1913 there were employed in the mining industry in Prussia some 769,584 persons.

Agriculture.— Prussia is the chief agricultural state of Germany. Of the total area of Prussia 52.3 per cent consists of cultivated fields, orchards, vineyards and vegetable gardens; 17.5 of meadows and pastures; 22.7 of forests and woods, and 7.5 only of untilled or unproductive land. The number of agricultural holdings in 1911 was 3,256,044, the farm lands totaling 20,781,147 hectares (one hectare = 2.471 acres). Of these by far the larger proportion was in small farms of less than 20 hectares, owned by 3,103,151 parties and making up 41.2 per cent of the whole cultivated soil. Of large estates of 100 hectares and over the percentage is more considerable in Prussia than in the remainder of the empire, because of «East Elbian» political and economic conditions. In fact, in those provinces of Prussia where the landed gentry still keeps its traditional grip on the country and where thousands of them own estates each over 1,000 hectares agriculture is most backward and the soil yields, in proportion, the least per hectare. This is due to the system of tillage in vogue, the land being annually worked by so-called «wanderhände» (or season laborers) who come from the neighboring districts of Poland or Galicia, and who return thither after the crops are in. In a general way, however, although it cannot be denied that urban industry in Prussia, as elsewhere in Germany, has made large strides, somewhat at the expense of the former rural population, it must be conceded that the peasants, farmers and estate-holders, large and small, are in a fairly prosperous condition, attributable chiefly to intensive cultivation of the soil and to the fostering legislation of the government, as well as to the extensive use of agricultural machinery, much of it made available by the co-operative plan, to most progressive methods of tillage and to increasing diligence. The co-operative system in vogue, notably among the smaller farmers, enables them not alone to buy on shares or hire even the most improved types of farming machinery run by electricity, alcohol, petroleum, etc., for all the processes of farming, such as ploughing, drilling, harvesting, binding, threshing, grinding, etc., but also to dispose of their produce to best advantage, much of it without any middlemen, by directly dealing between producer and final consumer. Alcohol, used as a source of mechanical energy, is more extensively employed in Prussia than anywhere else in the world, and distilleries for the wholesale manufacture of methyl alcohol are very common, a cheap grade of potatoes being mostly used in the process. The soil of Prussia varies greatly in quality. Of the cultivable land there some 29 per cent is loam and clay, 32 per cent middling, namely, loam and sand mixed, 31 per cent is predominantly sandy and 6 per cent bogs and marshes. Besides the basin of the Rhine and its tributaries, that of the middle Elbe, Saale, Unstrut, etc., the extensive plain around Magdeburg, the so-called *Böhrde,* and some other large areas are most fertile. The chief cereal produced in Prussia is rye, which is consumed for bread and other food by the people in general in preference to wheat. About 75 per cent of the entire rye crop of Germany is raised in Prussia; 72 per cent of the potatoes, the crop next in importance; much of the latter is used in manufacturing alcohol; of the wheat Prussia yields 63 per cent, and of the oats 67 per cent. The vineyards of Prussia in 1913 aggregated 17,216 hectares and yielded 218,264 hectolitres of wine. The orchards and private gardens produced all the fruits of the temperate zone in abundance and excellent quality, notably cherries, plums, pears, apples, quinces, apricots and berries. In the whole of Prussia in 1913 there was grown of rye, on 4,935,425 hectares, some 9,345,155 metric tons; of potatoes, on 2,329,404 hectares, some 39,215,298 metric tons; of wheat, on 1,166,054 hectares, some 2,942,647 metric tons; and of oats, on 2,943,255 hectares, some 6,559,911 metric tons. Prussia excels also in livestock. The breeding of strong and generally serviceable horses has been made a special feature by the Prussian government. A score of royal studs in Teakehnrn, East Prussia, and elsewhere endeavor to keep up the grade suitable for army use, agricultural and general purposes, and the export of horses has been a regular feature. In 1913 the number of horses in Prussia was 3,387,301; of cattle, 12,344,507; of swine, 16,574,-202; of sheep, 4,081,724. The total area of Prussia under forest is 22.7 per cent, and of this the fiscus owns about one-half, coniferous trees being in a vast preponderance. The government derives some $22,000,000 of its revenues from the profits on the sale of wood, etc., of its Crown forests. As to viticulture, practically all the palatable and economically valuable wine grown in Prussia comes from the Rhine and its chief tributaries, the Moselle, Nahe, etc. A number of the vineyards are owned by the state. All the wine-growers have suffered great losses for the past 30 years from the ravages of the phylloxera, but have got the trouble now under control. The better vintages of both Rhine and Moselle wines fetch high prices and are esteemed for their rare flavor. While fishing, both on inland waters (carp, pike, pickerel, trout, salmon, etc.) and the sea, is likewise an important source of income for Prussia, the fisheries on the Baltic and its «haffs» (herrings, sardines, anchovies, a species of cod, etc.) being of special value in pisciculture and deep-sea fishing Prussia is undoubtedly still far behind when compared with a number of other countries.

Manufactures.— From an industrially insignificant country Prussia during the last 40 years, with the remainder of Germany, has become a manufacturing centre of great importance. Among the industries that have grown up with almost spasmodic swiftness in Prussia within that period are the beet-sugar manufacture, in which Germany is leading the world and which flourishes mainly in the central provinces of Prussia; cotton spinning and weaving, which are of great importance in the Rhine province; the linen manufacture of Westphalia and Silesia; the woolen industry of the district around Aachen, as well as the silk and velvet production of Krefeld, Elberfeld, etc. In money value, however, the making of machinery of every description overtops all; Berlin, Magdeburg, Buckau and several large towns in Westphalia and along the Rhine, leading. The iron and steel industry centres in the coal region of the Ruhr Basin and is carried on on a very large scale, as in Essen, Remscheid, Suhl, Solingen, Düsseldorf, Elberfeld, Dortmund, etc. The most considerable shipyards in Prussia are located in Kiel, Danzig, Emden, Stettin and Elbing. Cologne, Görlitz, Königsberg and Düsseldorf are also noted for the making of smaller machines and mechanical devices, such as sewing machines, cash registers, typewriters, telephones, etc. Glass, paper, porcelain and pottery are turned out in the provinces of Saxony, Silesia and the Rhine, while the chemical and dye industry is mainly carried on in Berlin and in a number of towns by the Main and Rhine, as Höchst, Elberfeld, etc. Of those engaged in manufacturing and industrial establishments in 1911, 6,906,526 were employed in Prussia.

Transportation.— Prussia is well provided with all means of communication and transportation. The first railroad was built in 1838 and since 1866, after Prussia's annexation of Hanover, Hesse-Nassau and Schleswig-Holstein, the railroad system was rapidly extended, until, with one or two exceptions, of the larger countries Prussia possesses the closest network of rails. The same is true of her canal sytem. The shape of Prussia being twice as long as broad, these two systems, too, had to be laid out accordingly. Communication between the eastern and western provinces of Prussia is even more rapid and cheap than between the southern and northern ones. Steel lighters of large tonnage and small draft are now doing on the canals and rivers the transportation of the larger part of the bulky goods, manufactured goods and foodstuffs, carrying the latter westward and the former eastward. An enormous and steadily rising tonnage of such vessels, peculiarly adapted to their task, is devoted to this traffic. It is to the excellence of her water routes and railroad lines that Prussia owes much of its rise to economic prosperity. Dating from the eighties the Prussian railroads were gradually purchased by the state, following out a plan of Bismarck's, and by special agreements (called «Konventionen») with neighboring smaller states, such as Hesse, Saxony, Bavaria, and by embodying the railroads of a number of other adjoining states of less size, the serviceableness and income of the government-owned roads were guaranteed. The proportion of railway mileage in Prussia has now caught up with that of Great Britain, though in point of volume of traffic it is considerably behind, owing to the canal competition and to the fact that military-strategic reasons, rather than purely economic ones, have been deciding factors in laying out the railroads of Prussia. Significantly the most important trunk line of Prussia is that which runs from the western frontier at Herbesthal through Cologne, Berlin, Königsberg in the direction of Paris-Petrograd. For 1912 the Prussian railroad systems comprised 37,698 kilometers in length, all but 2,559 of which is state-owned and all but 520 kilometers being broad-gauge. It is admitted that in Prussia government ownership of railroads has proved an unqualified success from the financial and commercial point. Before the outbreak of the war the Prussian government derived just about one-fourth of its entire revenues from the profits of operating its railroads, while by controlling freight schedules at all times it was also enabled to lend a helping hand to industry as a whole. As to its merchant marine, next to that of Hamburg and Bremen, it was the most important of the several German states. Though the ports of the Baltic freeze over in winter, the one of Stettin, being nearest Berlin and, therefore, of greatest moment, is kept free by icebreakers. Emden, a Prussian port on the North Sea, already of economic importance, was intended to become the rival of the two Hansa ports near by. The figures as to the size of the Prussian merchant fleet will have to be modified after the war. In 1913 the number of vessels was 2,329 of 318,646 tons net.

Banking and Finance.— The banking system is the same in Prussia as in the remainder of Germany. The Reichsbank (Imperial Bank) is at the same time the fiscal agent of Prussia, and its resources, privileges and emoluments have been repeatedly widened and expanded since 1871. Prussia, of course, is financially in a dominating position for the whole of Germany, since Berlin has become by far the most important financial centre of Germany, having outstripped Frankfort long ago. In Berlin there are 11 great corporate banks (aside from some powerful private banks) and the volume of business transacted by them is nearly as large as that of the Reichsbank with its 325 branches. The Deutsche Bank is the largest institution, followed by the Dresdner Bank, the Diskonto-Gesellschaft, etc. The Deutsche Bank has done enormous service in the spread of German commerce abroad, financing many transoceanic enterprises. Its capital and assets have increased 50-fold since 1871. Of vast importance, too, is the Preussische Seehandlung (Prussian Marine Association), which was founded by Frederick the Great and which was the main financial support of the government for over a century. The Preussische Seehandlung was the forerunner of the crédit mobiliers in France and other countries. While its capital stock is less than $10,000,000, its assets amounted, when the World War broke out, to $130,000,000. The Prussian (and German) banking system possesses great elasticity, a fact which is largely responsible for the avoidance of recurring great financial panics, at least since the one of 1873. As to finance, it has expanded and contracted by leaps and bounds similarly to that of other countries. In a general way it may be said that since 1891 Prussian finance has made enormous strides. As in all other civilized countries, however, the state itself has veered a good deal in its finances, depending largely in this on the diminishing or increasing revenues or the expenditures and vast economic state enterprises that have been undertaken from time to time, such as the purchase of the Prussian railroads, for instance. A certain degree of stability, though, is a consequence of the fact that a large section of the regular resources are coming in steadily and in predetermined bulk, such as the profits of the various state properties (railroads, fiscal lands, mines, forests, etc.). Taxation is, on the whole, on a satisfactory basis, a progressive income tax and other imposts being quite fairly apportioned. It must be kept in mind that Prussian finances are quite separate from those of the empire. From 1901 the Prussian budget has shown a rapidly rising scale. In that year it was (in marks) 2,885,017,665, for revenues, and 2,688,595,268 for expenses, while in 1915 it had risen to 4,848,881,000, for revenues, and the same (estimated) for expenses. The public debt of Prussia has likewise bounded upward for many years; in 1914 it amounted to 10,355,-537,145 marks. By far the larger part of its load of debt has been incurred, up to the war, for productive enterprises, such as the acquisition of the railroads, domains, mines, etc.

Government.— In a certain limited sense Prussia was a country constitutionally governed. Its Constitution, the outcome of the short Revolution of 1848, dates from 1850 and was promulgated by the then king, Frederick William IV, but was in some (not vital) respects since amended or modified with royal sanction. The Constitution is a written instrument and could only be changed by concurrent resolutions, twice passed by the Prussian Parliament, the Diet, on these alterations being approved by the monarch himself. Executive power was vested in the king alone, the latter attaining his majority at 18. The Crown was hereditary and descended to the first-born male heirs in a straight line of succession through all the branches of the Hohenzollern dynasty. The king himself was irresponsible and exercised his powers through a cabinet, the members of which were not responsible for their actions to the Parliament, but to the king alone; he, too, both appointed and dismissed the ministers of the Crown. Members of the Cabinet had a seat in the Diet and participated in the debates. None of the ministers exercises more power than his colleagues, although the one directing the foreign policy was styed «Minister-President,» and presides at their meetings. The power of legislation and of raising taxes and disbursing public moneys is vested in the Diet. This parliamentary body (Landtag or Diet) is composed of two houses, the Abgeordnetenhaus (Chambers of Deputies) and the Herrenhaus (House of Peers). The electoral system, however, on which the membership of this Prussian Parliament was based was unfair, illiberal, antiquated and was stigmatized by Bismarck himself at a public session as «the worst in the world.» Despite repeated promises held out by the ex-Kaiser, as king of Prussia, to bring this election system more in accord with those in use in more enlightened countries, up to the end of the war no change had been made, due chiefly to the power of the «Junker» class of Prussia, who feared with reason to be deprived of their traditional predominant influence within the state if representative government were adopted in earnest. As it still stands at this writing the lower, i.e., the popular, more active and powerful, house is made up of 443 members, elected for a term of five years by indirect vote. For that purpose the country is divided into electoral districts, very uneven both as to size and population, in each of which usually one member is chosen by the three-class system. Under this plan the voters (all male Prussians of 25 and over who are not otherwise disqualified by reason of crime, extreme poverty, etc.) are cut up into three classes according to the amount of taxes paid by each. The moneyed class has so much the advantage under this preposterous system that generally one vote by a person of great wealth balances that of hundreds, even thousands, of humbler subjects. Together the three classes choose by open ballot an even number of electors, and these in turn make the final choice of a candidate, likewise by open ballot. Each chamber of the Diet again is the arbiter as to whether the choice was made properly, and may reject the candidate on evidence. Budgets and revenue bills must be passed by this lower house and cannot be amended by the higher. The Herrenhaus (House of Peers) again is made up of princes of the blood royal, of members of the higher nobility, of special titled members chosen by the estate-holders of Prussia, of representatives of universities and certain cities, and, lastly, of an indeterminate number of persons appointed by the king at pleasure. In 1915 the number of members of the Herrenhaus was 307, and about two-thirds of these represented, directly or indirectly, landholding (Junker) interests. While the general judicial system is the same throughout Germany, the judges themselves are appointed for life by the monarch; their position, although inferior in emoluments and standing to that in more Western countries, is on the whole fairly independent of outside influences. Judges must all have gone through a prescribed course of study and training to be fitted for office, and the standard is rigid and rather exacting. There are administrative courts («Verwaltungsgerichte») of various grades, special courts, jury courts («Schwurgerichte»), petty courts («Schöffengerichte»), etc. The highest courts are the 15 «Oberlandesgerichte»; next in grade the «Landesgerichte,» and «Schöffengerichte» being lowest. It is the «Reichsgericht» in Leipzig which decides, on appeal, cases handed up from the state courts, as an Imperial Supreme Court. As for local government in Prussia it is to-day largely the creation of Professor Gneist, the so-called «Kreisordnung» («Kreis,» provincial district), which dates from 1872. It gives decidedly a larger measure of local autonomy and has worked out on the whole very satisfactorily. For the purpose of administration Prussia is divided into 12 provinces, and these again into subdivisions, or «Regierungsbezirke» (government districts), 35 in all. Below these are the smallest units, the «Gemeinde» (community) and «Amtsbezirk» (administrative district). The administrative officers at the head of these various units are all appointees of the Crown and supposed to work in its interest and to preserve public loyalty toward the rulers and institutions of the country.

The Racial Population.— The table on following page shows the area and population of Prussia in each of its provinces from 1871 to 1910.

Increase in population has, as seen from the table, been very rapid since 1871, but at a steadily diminishing rate. This growth has been most rapid in Berlin, Westphalia, Rhineland, Brandenburg and Saxony, and least so in

PROVINCE	Square miles	Population, 1871	Population, 1900	Population, 1910
Brandenburg	15,383.1	2,036,888	3,108,554	4,092,616
East Prussia	14,286.5	1,822,934	1,996,626	2,064,175
Hanover	14,868.5	1,961,437	2,590,939	2,942,436
Hesse-Nassau	6,062.5	1,400,370	1,897,981	2,221,021
Hohenzollern	441.0	65,558	66,780	71,011
Pomerania	11,633.7	1,431,633	1,634,832	1,716,921
Posen	11,193.6	1,583,843	1,887,275	2,099,831
Rhineland	10,424.8	3,579,347	5,759,798	7,121,140
Saxony	9,755.7	2,103,174	2,832,616	3,089,275
Schleswig-Holstein	7,343.2	1,045,419	1,387,968	1,621,004
Silesia	15,573.4	3,707,167	4,668,857	5,225,962
Westphalia	7,806.8	1,775,175	3,187,777	4,125,096
West Prussia	9,866.7	1,314,611	1,563,658	1,703,474
Berlin (city)	24.5	826,341	1,888,848	2,071,257
	134,663.9	24,689,252	34,472,509	40,165,219

the rural districts; in fact, in many purely agricultural regions there has been a positive decline in population. During the Great War there has been an abnormal growth of population in a number of industrial and mining towns along the western border, a growth which, in the case of a few cities such as Essen, Düsseldorf, Dortmund, etc., has amounted to 200, even 300 and 400 per cent, owing to new enormous munition plants and other ephemeral economic causes. The annual rate of suicide in Prussia is exceptionally high.

Ethnologically considered, Prussia is by no means a country inhabited by a homogeneous population. Historically the core of Prussia, that is, the province of Brandenburg, is largely Slavic in origin, the Teutonic settlers and conquerors over the Slavic tribes (Wends, Sorbs) mingling with the latter; the eastern and northern provinces of Prussia are also, in varying degree, a mixture of Slav and Teuton. The very name of Prussia (Preussen) is derived from a small pagan nationality in the northern regions of the present kingdom, the Preussen or Borussi, who became (with also their language) entirely extinct. This large admixture of Slavic blood in the original provinces of what is to-day Prussia, viz., in the so-called Transelbia, the provinces of Brandenburg (Slavic: Brennabor), Pomerania, Posen, East and West Prussia and Silesia, has, of course, considerably altered the resultant population, both physically and in point of character, when comparing it with the more purely Teutonic stock in the west and south of Germany. So far as the latest official census figures of Prussia are concerned, those of 1910, they claim some 33,500,000 of the roundly 40,000,000 as Germans (the criterion being the language spoken at home); 3,500,000 as Poles, (in Posen, Silesia, East and West Prussia), 115,000 Lithuanians (in East Prussia), 142,000 Danes (in Schleswig), 75,000 Wends (in Brandenburg, Silesia), 30,000 Czechs (in Silesia) and 78,000 Walloons (near the Belgian border). In the rural districts of Posen and in portions of eastern Silesia and West Prussia the Poles form the vast majority of inhabitants. The above figures are merely approximative and do not include such fragments of foreign (Slav) race as the Kassubians of Pomerania and West Prussia, for instance, nor the 400,000 Jews or the foreign-born residents in Prussia, some 350,000 strong.

History.— The history of Prussia properly ought to begin, of course, with the assumption of the title of royal ruler over Prussia. The latter was a duchy (it is identical with the present province of East Prussia) to the far northeast of Brandenburg and had been wrested from its aboriginal owners, the heathen Borussi or Preussen, by the conquering and missionary zeal of the Teutonic Knights, a militant order of semi-monkish warriors, who, after their labors in Palestine were no longer needed, were entrusted by the Church of Rome with the task of christianizing that northern land. The Borussi appear to have been near relations of the Lithuanians, of whom a remnant have survived in the province. The Elector of Brandenburg, Frederick the III, having become heir to the lands of the defunct order of the Teutonic Knights, on the strength of an understanding with the then emperor of Germany, on 18 Jan. 1701, with elaborate ceremonies crowned himself in Königsberg, capital of the territory, «King in Prussia.» The emperor after much urging, acquiesced in this, but the proceeding created a peculiar status for the new king, who henceforth spoke of himself as Frederick I, as the «King in Prussia,» but remained nevertheless also Elector of Brandenburg and as such the subject lige of the emperor in Vienna. However, the whole method pursued by Frederick I was symbolical of what was to come. Frederick I was a Hohenzollern, descendant of that Frederick, an insignificant burgrave of Nuremberg, who, in 1411, by the grace of the Emperor Sigismond was called to wasted and utterly desolate Brandenburg as its margrave. From the accession of this energetic ruler in small Brandenburg dates, with several severe setbacks, the gradual rise to power of what became subsequently known in an enlarged sense as Prussia. The father of the first «King in Prussia,» the wise and pushing «Great Elector,» Frederick William (1640–88), laid the foundation to the greatness of his house by fortunate wars with Sweden and Poland, and his acquisitions of new territory in western Germany, as also by lucky treaties of hereditary accession. He defeated the Swedes at the pitched battle of Fehrbellin, helped the emperor with his troops in the War of the Spanish Succession, and left his somewhat scattered domains fairly prosperous and in good order. During the whole of the preceding century his predecessors had not played an important part, either in the Reformation era or in the Thirty Years' War, although they had seized the Church property within their lands and become adherents of the new religion themselves and had fallen heir to the dukes of Pomerania and thus prospectively enlarged their patrimony.

Frederick I, although a vain man and one who lived in a style of sumptuous luxury far beyond the scant resources of his state, nevertheless knew how to play his cards well as the leading Protestant prince in Germany, his particular rival, Augustus the Strong of Saxony, having been shortsighted enough to forego that rôle by forswearing his Lutheran faith in order to win the elective royal crown of Poland, a barren and costly honor. Nor was that all.

Frederick I purchased or otherwise acquired from spendthrift Augustus some important Saxon territory; he gained from William III of Orange the territories of Lingen, Mörs and Neufchâtel; he founded the University of Halle (1694) and at Berlin an Academy of Sciences and an Academy of Arts. Thus he left his states, overburdened by taxation and in an exhausted condition, though somewhat larger in size (1713). Fortunately for little Prussia his son, Frederick William I, was a man of quite a different calibre, a penurious, clear-headed, thoroughly practical man, with «no nonsense about him.» And while the new king's education had been sorely neglected, so that he scorned all mere learning and ridiculed the very institutions his father had created, he had an innate genius for administration and for obtaining tangible power. His savings filled the empty treasury of Prussia; his army was not large, but well-drilled and equipped; by his wise economic policy he made Prussia the model of Europe in this respect; after lengthy bargaining with the Emperor Charles VI he was allowed the succession to the western duchies of Jülich (Juliers) and Berg, close to the Belgian and Dutch borders. As for his share in the tremendous wars during his reign in the North — Poland, Russia, Sweden under Charles XIV and Denmark being engaged — and in the West, they proved in a measure advantageous to him, as he secured the larger part of Swedish Pomerania. Much of the king's time was taken up with the negotiations carried on with the emperor relative to the Pragmatic Sanction and the succession of that monarch's daughter, Maria Theresa, to the throne. On both sides there was much duplicity, and finally Frederick William turned to the hereditary foe of the Hapsburgs, France, and that was the state of affairs when he died from an attack of the gout consequent on imprudent diet, on 31 May 1740, and a man of a very different fibre, his son Frederick II, subsequently surnamed the Great, stepped into his shoes. This son had been grossly maltreated by his ignorant father (whom he hated), so that at one time the young man had planned flight to his uncle, the king of England, and had been sentenced to death by his autocratic father for this piece of youthful folly. The old despot even forced his son to witness the execution of his friend and fellow-plotter, a young army officer named von Katt, but finally forgave him and restored him to favor. Young Frederick had passed the years immediately preceding his accession far away from his father's boorish and niggard court, on a small estate of his own, Rheinsberg, among some choice spirits, both French and German, and had there cherished ambitious dreams and polished his mind in all the refinements of art and learning of the period. Now, with 28, a good-looking, slender, blue-eyed young man, he mounted the throne, his head and heart full of things he meant to do to render his name famous. When Frederick II began his reign, Prussia had but 48,000 square miles and was thinly peopled. His father had left him the best disciplined army in Europe, numbering 80,000, and 9,000,000 thalers in the treasury, a sum equivalent to five times the amount to-day. Now Frederick could realize those day-dreams of his. At once he began a war of conquest against Austria for the possession of Silesia. After the first and second Silesian War had brought him this province, Frederick II, after a peace, began to consolidate and fructify his gains by wise economic measures. But in 1756 the so-called Seven Years' War broke out, Maria Theresa not having been able to reconcile herself to her loss. This tremendous and desperate struggle was waged with varying fortunes, until at last, by the Peace of Hubertusburg, Prussia was left in possession of Silesia. During the Seven Years' War, Frederick II had at times made headway against the combined power of France, Austria and Russia, and England, too, taking part, for or against Prussia. It was only by his undaunted energy and superior generalship that Frederick II was able to defend himself against these powerful coalitions. But when peace came, in 1763, Prussia was in a pitiful condition. In 1772 took place the first partition of Poland, in which Frederick II joined and by which Prussia profited. When at last, in 1786, Frederick died, he left his nephew and heir, Frederick William II (1786–97) a territory of 77,000 square miles with 6,000,000 subjects and an army of 200,000. During the 11 years' reign of Frederick William II the chief event was Prussia's alliance with Austria in order to put down the French revolution, a purpose in which they signally failed, and next to that the further acquisition of 40,000 square miles by the second and third partitions of Poland. Frederick William III (1797–1840) succeeded, by his weak and vacillating policy, in isolating Prussia and arousing the wrath of Napoleon. In 1806 Prussia was completely defeated at Jena, and her domain was reduced to less than half its former area. In 1813, however, Prussia acting in concert with Austria and Russia, Napoleon was at last overcome by sheer force of numbers and definitely disposed of. At the Congress of Vienna the former possessions of Prussia were restored and new ones added, especially the larger half of Saxony and the remaining portions of Pomerania, as well as valuable territories in the Rhine district. The promise of a liberal constitution given to the Prussian people was not kept. The only statesmanlike act of Frederick William III was the establishment of the *Zollverein* (or free-trade zone) which knitted northern Germany closer together. Frederick William IV (1840–61), a well-meaning monarch of great natural gifts, but of shifting character and erratic mind, went far toward destroying Prussia's prestige and military power, submitting abjectly to the political yoke of Austria. The part played by him during the revolution of 1848–49 was not free from duplicity. However, under pressure he granted a sort of constitution to his people. The last four years of his life he was insane, and on his death was succeeded by William I (1861–88). It was in his reign, in 1866, that the latent jealousy between Prussia and Austria finally burst into flame in one of the shortest and yet most decisive wars, a war lasting but six weeks. At Sadowa the ancient power and glory of Austria were overthrown and the path for aggrandizement thus made clear for Prussia. Most of the German states, outside of Prussia, had sided against her in 1866, and of these she annexed several at the Peace of Prague, including Hanover, Hesse-Cassel, Nassau and Schleswig-Holstein, thus raising Prussia to absolutely the dominant state within Germany and leaving her one of the leading military powers of the world. The Norddeutsche Bund (North German Confederation) was formed by Prussia, under the successful statesmanship of Bismarck, and the latter's farsightedness envisaged even then the war with France. This came about in July 1870 under circumstances which are not quite clear even to-day. Certain it is that Bismarck and the gifted Prussian chief of staff, von Moltke, together precipitated it by some clever juggling with a despatch from their king referring to the French Ambassador, Benedetti, and King William rousing the French emperor, Napoleon III and the French parliament to outbursts of fury and wounded pride and bringing on a declaration of war from France. The War of 1870–71, in which unexpectedly to the duped Napoleon III, by special previous agreements with Prussia, not only the states belonging to the North German Confederation, but also the Southern ones — Bavaria, Baden and Württemberg — joined, was disastrous for France from start to finish, and at the Peace of Frankfort, humbled France was forced to yield up Alsace and a portion of Lorraine, and an extortionate war indemnity of five billions of francs. While, however, the war still lasted, on 18 Jan. 1871, in the historical Salle de Glace at Versailles, the German princes offered the formal primacy of Germany and the imperial crown to King William of Prussia, who accepted and thus became the first German emperor. On 21 March 1871, the new Reischstag (or Imperial Parliament) met for its initial session at Berlin. From then on, therefore, the history of Prussia is properly but a part of that of the Empire as a whole.

WOLF VON SCHIERBRAND,
Professor of German Language and Literature; Chief Correspondent of Associated Press, Berlin.

PRUSSIA, East, or **OSTPREUSSEN,** ōst-prois'sĕn, the northeasternmost province of Prussia, Germany. It is bounded in the south, east and north by Russia, and in the west by the Baltic Sea and West-Prussia. Area 14,320 square miles; pop. (1910) 2,064,175. Capital, Königsberg. See PRUSSIA.

PRUSSIA, West, or **WESTPREUSSEN,** vĕst-prois'sĕn, a northeastern province of Prussia, Germany. It is bounded in the south by Russian Poland and the Prussian province of Posen, in the east by East-Prussia, in the north by the Baltic Sea, and in the west by Pomerania. Area, 9,859 square miles; pop. 1,703,474. Capital, Danzig. See Prussia.

PRUSSIAN BLUE. See DYES.

PRUSSIAN BROWN, a color obtained by adding a solution of the yellow prussiate of potash to a solution of sulphate of copper, which throws down a precipitate of deep brown. This, when washed and dried, is equal to madder, and possesses greater permanency.

PRUSSIC ACID. See HYDROCYANIC ACID.

PRUTENIC, obsolete word meaning Prussian in astronomy, a term applied to certain planetary tables published by Erasmus Reinhold in 1551 founded on the principles of Copernicus. They were dedicated to a Prussian duke of that time and thus acquired their name.

PRUTH, prooth (Ger. proot), a river of Europe, which rises on the eastern side of the Carpathian Mountains, in the southeast of Galicia near the Hungarian frontier; flows circuitously east, then south-southeast, forming the boundary between Rumania and Bessarabia, and after a course of more than 500 miles enters the Danube on the left, about 12 miles below Galatz. For about 200 miles, from Jassy downward, it is navigable. On the bank of Pruth, near Husi, in 1711, the army of Peter the Great was surrounded by the Turks, and the Czar was not allowed his freedom until he ceded Azov to Turkey.

PRUTZ, proots, **Hans Georg,** German historian: b. Jena, Germany, 20 May 1843. He is the son of Robert Edward Prutz (q.v.), was educated in Jena and in Berlin and became privat-docent at the latter place in 1873. He was engaged in a government expedition into Syria in 1874, and in 1877 accepted the chair of history at the University of Königsberg, from which he resigned in 1902 and has since them resided in Munich. He has published 'Heinrich der Löwe' (Leipzig 1865); 'Kaiser Friedrich I' (3 vols., Danzig 1871–74); 'Geschichte des Kreises Neustadt in Westpreussen' (Danzig 1872); 'Radewins Fortsetzung der Gesta Friderici Imperator's des Otto von Freising, etc.' (Danzig 1873); 'Aus Phönicien' (Leipzig 1876); 'Quellenbeiträge zur Geschichte der

Kreuzzüge' (Danzig 1876); 'Besitzungen des Deutschen Ordens in Heiligen Lande' (Leipzig 1877); 'Geheimlehre und Gehedinstatuten des Tempelherrenordens' (Danzig 1879); 'Kulturgeschichte der Kreuzzüge' (Berlin 1883); 'Malteser Urkunden und Register' (Munich 1883); 'Staatengeschichte des Abendlandes im Mittelalter' (in Onckern, W., ed., 'Allegemeine Geschichte in Einzeldarstellungen,' Division II, part 6, 2 vols., Berlin 1885–87); 'Entwickelung und Untergang des Tempelherrenordens' (Berlin 1888); 'Die Königliche Albertus-Universität zu Königsberg in Preussen in 19 Jahrhundert' (Königsberg 1894); 'Aus des Grossen Kurfürsten Letzten Jahren' (Berlin 1897); 'Preussische Geschichte' (4 vols., Stuttgart 1900–02); 'Bismarck's Boldung; Ihre Quellen und ihre Ansserungen' (Berlin 1904); 'Die Geistlichen Rotterorden' (Berlin 1908); 'Jacques Cœur von Bourges' (in *Historische Studien*, part 93, Berlin 1911); 'Studien zur Geschichte der Jungfrau von Orleans' (in *Königl. Bayerische Akademie der Wissenschaffen, Sitzungsberichte, Philos.-Philologische und Historische Klasse,* Abbandlung II, Munich 1913); 'Die Briefe Jeanne d'Arcs' (in Ibid., Abbandlung I, Munich 1914); 'Die Friedensidee un Mittelalter' (in Ibid., Abbandlung I, Munich 1915). He has also translated 'Herbods Leben des Bishofs Otto von Bamberg' (in Wattenbach, W., ed., 'Geschichtschreiber der Deutschen Vorzeit, 12 Jahrhundert,' Vol. VII, Leipzig 1884–96); and has edited 'Rechunugen über Heinrich von Derby's Preussenfahrten, 1390–91–92' (Königsberg 1893); and with others 'Allgemeine Weltgeschichte' of which latter work he wrote 'Geschichte des Mittelalters' (Vols. V and VI, Berlin 1891). To the 'History of All Nations' (Philadelphia 1902) he contributed Vols. VIII–X: 'The Age of Charlemagne' (translated by H. W. Hayley); 'The Age of Feudalism and Theocracy'; and 'The Age of Renaissance' (the last two translated bv F. E. Zinkeisen).

PRUTZ, Robert Eduard, German poet and historian: b. Stettin, Prussia, 30 May 1816; d. there, 21 June 1872. He was educated at Berlin, Breslau and Halle, and edited, with Arnold Ruge, a radical periodical *Hallesche Jahrbücher* designed to promote more liberal views in science, politics and religion. His liberal views made him unpopular with the authorities who refused him permission to teach. However, in 1849 he became professor of literature at the university at Halle, but in 1859 resigned to devote himself exclusively to science and literature. His poetry is of the patriotic order, as are also his dramas; his novels display keen powers of satire, and his researches as a historian gave him high rank in that field of literature. As a public speaker, too, he ranked very high and during the latter part of his life, in spite of poor health, he was in great demand as a public lecturer. He was one of the founders and editor in 1851–66 of the *Deutsches Museum.* He also edited 'Literarhistorisches Taschenbuch' (6 vols., Leipzig 1843–44 and Hanover 1845–48); 'Deutsche Dichter der Gegenwart' (Prague 1859); 'Holbergs Ausgewählte Komödien' (translated from the Danish, 4 vols., Hildburghausen 1868). Amongst his plays, none of which are of great importance should be mentioned 'Moritz von Sachsen'; 'Erich, der Bauern König'; 'Die Politische Wochenstube.' They have been collected as 'Dramatische werke' (4 vols., Leipzig 1847–49). His novels, too, are of secondary importance, the best known, perhaps, being 'Das Engelchen' (3 vols., Leipzig 1851). As a poet he ranks much higher, especially in some of his lyrical poems. They include 'Der Rhein' (Leipzig 1840); 'Gedichte' (Leipzig 1841); 'Ein Märchen' (Leipzig 1841); 'Gedichte Neue Sammlung' (Zurich 1842); 'Aus der Hesmat' (Leipzig 1858); 'Aus Goldenen Fagen' (Prague 1861); 'Herbstrosen' (Munich 1864); 'Mai 1866' and 'Juli 1866' (Leipzig 1866); 'Buch der Liebe' (Leipzig 1869). The most important of his writings, however, consist of his historical and critical works 'Der Göttingen Dichterbund' (Leipzig 1841); 'Geschichte des Deutschen Journalismus' (unfinished, Hanover 1845); 'Dramaturgische Blätter' (Hamburg 1846); 'Kleine Schroften zur Politik und Litteratur' (2 vols., Merseburg 1847); 'Vorlesungen über die Geschichte des Deutschen Theatres' (Berlin 1847); 'Vorlesungen über die Deutsche Litteratur der Gegenwart' (Leipzig 1847); 'Zehn Jahre 1840–1850 Geschichte der Neuesten Zeit' (unfinished, 2 vols., Leipzig 1850–57); 'Neue Schriften, etc.' (2 vols., Halle 1854); 'Goethe' (in 'Unterhaltende Belehrung,' Vol. XXVII, Leipzig 1856); 'Ludwig Holberg Sein Leben und Seine Schriften' (Stuttgart 1857); 'Deutsche Litteratur der Gegenwart' (2 vols., Leipzig 1859); 'Menschen und Bücher' (Leipzig 1862). Consult Anon., 'R. E. Prutz' (in 'Moderne Klassiker,' Vol. XLIV, Cassel 1852); Buettner, G., 'Robert Prutz' (in *Teutonia Arbeiten zur Germanischen Philologie,* part 25, Leipzig 1913); Gottschall, R. von, 'Robert Prutz' (in *Unsere Zeit,* Leipzig 1872); Mähly, J., 'R. E. Prutz' (in 'Allgemeine Deutsche Biographie,' Vol. XXVI, Leipzig 1888).

PRYCE, Richard, English novelist and playwright: b. Boulogne, France, 14 May 1864. Among his fictions, many of which have been reissued in this country, are 'An Evil Spirit' (1887); 'The Ugly Story of Miss Wetherby' (1889); 'A Just Impediment' (1890); 'The Quiet Mrs. Fleming' (1890); 'Deck-Chair Stories' (1891); 'Miss Maxwell's Affections' (1891); 'Time and the Woman' (1892); 'Winifred Mount' (1894); 'The Burden of a Woman' (1895); 'Elementary Jane' (1897); 'Jezebel' (1900); 'The Successor' (1904); 'Towing-Path Bess' (1907); 'Christopher' (1911); 'David Penstephen' (1915); 'Statue in the Wood' (1918). He has also written the following plays: 'Little Mrs. Cummin' (1909); 'The Visit' (from stories by M. E. Mann, 1909); 'Helen with the High Hand' (from the novel by Arnold Bennett, 1914); together with F. Fenn, 'Op-o'-me Thumb' (1904); 'The love Child' (1910); together with W. P. Drury, 'A Privy Council' (1906), and together with A. Morrison, 'The Dumb-Cake' (1907). Consult Carney, F. T., 'Richard Pryce. An Appreciation' (in *Bookman,* Vol. XXXVII, p. 520, New York 1913).

PRYNNE, prĭn, **Hester,** the principal character in Nathaniel Hawthorne's romance, 'The Scarlet Letter' (q.v.), published in 1850. For her sin with the young minister, Arthur Dimmesdale, she was condemned to stand holding her child upon the platform of the pillory in the sight of the populace and wear a scarlet letter A embroidered upon her bodice. This badge of her shame was worn thereafter, while she did expiation by deeds of mercy among her townspeople. Consult Howells, W. D., 'Heroines of Fiction' (Vol. I, p. 161, New York 1901).

PRYNNE, William, English author and politician: b. Swainswick, near Bath, Somerset, 1600; d. London, 24 Oct. 1669. He was graduated at Oriel College, Oxford, in 1621 and admitted to the bar in 1628. He early became a militant Puritan, wrote pamphlets against Arminianism and the frivolities of the age and in 1633 published a huge volume, entitled 'Histrio-Mastix, the Players' Scourge,' further devoted to assaults on theatres, court masques, cards and music. Passages alleged to reflect on the king and queen brought down on him savage punishment. He was prosecuted by the Star Chamber and underwent sentence which included the payment of a £5,000 fine, expulsion from Lincoln's Inn and loss of his degree, having his work burned by the hangman, the loss of his ears, exposure in the pillory and imprisonment in the Tower. Unbroken in spirit he issued tracts from prison, one of which he facetiously entitled 'News from Ipswich,' against Archbishop Laud and other prelates, calling them, among other names, «Luciferian lord bishops, execrable traitors, devouring wolves.» The Star Chamber, in consequence, ordered what remained of his ears again cut off, fined him another £5,000 and had the letters S. L. (seditious libeler) branded on both his cheeks. He remained in prison — still vigorously writing, though, because of a stricter guard, not for the public — till 1640. He was then released by the House of Commons, was awarded damages and made a triumphal entry into London. Later he was member of Parliament for Newport in Cornwall and took part in the prosecution of Laud, but was expelled by Cromwell in 1648 for opposition to the extreme measures leading to the execution of the king. He now published such virulent articles against Cromwell that he was twice imprisoned. In 1660, after Cromwell's death, he again sat in Parliament and upon the Restoration was made keeper of the records in the Tower. Pamphleteering again brought him into trouble with the House of Commons, but he recanted, and busied himself with the collection of Parliamentary records. He produced more than 200 volumes, of which the most valuable are 'Collection of Records' and 'A Brief Register, Kalendar and Survey of Parliamentary Writs' (4 parts, London 1659–64). A fairly exhaustive list of his writings and their many editions will be found in 'British Museum Catalogue of Printed Books' (p. 159–183, London 1895). The most authoritative list of them is attached to S. R. Gardiner's work published by the Camden Society and mentioned below. Consult Bliss, P., ed., 'A à Wood's «Athenæ Oxonienses»' (new ed., Vol. III, p. 844, London 1817); Firth, C. H., 'William Prynne' (in 'Dictionary of National Biography,' Vol. XLVI, London 1896); Gardiner, S. R., ed., 'Documents Relating to Proceedings against William Prynne' (in *Camden Society Publications*, n. s. Vol. XVIII, Westminster 1877); id., 'History of England 1603–42' (Vols. VII–IX, London 1884); id., 'History of the Great Civil War' (3 vols., London 1888–91); Peach, R. E. M., 'The Annals of the Parish of Swainswick' (London 1890).

PRYOR, Nathaniel, American soldier, trader and explorer: b. (probably) Amherst County, Va., about 1785; d. Los Angeles, Cal., 1850. He was a great grandson of Nicketti, daughter of Powhatan and sister of Pocahontas. Left an orphan in infancy, he was taken to Kentucky by the family of his maternal uncle, Charles Floyd. In 1803, he enlisted as a private soldier in the army for the purpose of accompanying Lewis and Clark on the expedition across the continent to the mouth of the Columbia. Returning in 1806 with the rank of a sergeant, he was commissioned an ensign and assigned to the command of the detachment sent to escort Shahaka, the Mandan chief to his home on the Upper Missouri in 1807, but failed because of the hostility of the Arikara Indians. He was promoted to a lieutenancy in 1808 and resigned from the service in 1810, engaging in trading and lead mining. During the War of 1812, he re-entered the military service and was discharged at its conclusion with the rank of captain. He then became a trader among the Osage Indians, in Oklahoma, operating a trading post near the mouth of the Verdigris River part of the time. In 1821 he joined Fowler and Glenn on their trading expedition to the Rocky Mountains. In 1824 he joined the Pattie's on their trading expedition to the Rocky Mountains and followed all of their wanderings until they arrived in southern California, where the entire party was imprisoned. After his liberation he settled at Los Angeles where he remained until his death. Pryor Creek and the town of Pryor, county-seat of Mayes County, Okla., were named for him. Consult Nuttall's *Journal*; Long, Stephen N., 'An Expedition from Pittsburgh to the Rocky Mountains, Performed in the Years 1819 and 1820'; Coues, Elliott, 'The Journal of Jacob Fowler'; Flint, Timothy, 'Pattie's Narrative,' and James, Thomas, 'Three Years among the Indians and Mexicans.'

PRYOR, prī'ôr, Roger Atkinson, American lawyer: b. Dinwiddie County, Va., 19 July 1828; d. 1919. He was graduated at Hampden-Sidney College in 1845 and at the University of Virginia in 1848 and was admitted to the bar in 1849. For a number of years he was editor of newspapers in Petersburg and Richmond, Va., and in 1855 was appointed special minister to Greece by President Pierce; sat in Congress 1859–61 and in the Confederate Congress in 1862. He entered the Confederate army with the rank of colonel in 1861; was brevetted brigadier-general in 1862, but resigned his commission and re-entered the army as a private. From 1864–65 he was a prisoner at Fort Lafayette, N. Y. After the war he settled in New York City where he was admitted to the bar in 1866. From 1890–94 he was a judge of the Court of Common Pleas and from 1894 to 1899 was justice of the State Supreme Court. He then resumed the practice of law. He published 'Essays and Addresses' (New York 1912). Consult Hardy,

S. E. M., 'Roger A. Pryor' (in *Green Bag*, Vol. X, p. 161, Boston 1898).

PRYTANEUM, the building in the capital of a Greek state possessing similar features to the town-hall of modern communities, but having in addition a religious significance and devoted to purposes peculiar to the Greek state. It was dedicated to Vesta and contained the perpetual fire of the state hearth. At Athens (q.v.) the state here entertained as public guests its foreign ambassadors, its envoys returned from a public mission, its distinguished generals, victors in the Panhellenic games and citizens who had done important service to the state. In the latter case the privilege lasted for the life-time of the recipient. The exact location of the Athenian Prytaneum has never been determined. In the same manner each city and village had its prytaneum, forming the religious and political centre of the community. Consult Michel, C., 'Prytaneum' (in Saglio, E., and others, ed., 'Dictionnaire des Antiquités Grecques et Romaines,' Vol. IV, pt. 1, p. 742, Paris 1907); Poland, F., 'Geschichte des Griechischen Vereihswesens' (Leipzig 1909).

PRZEMYSL, pzhĕm'isl, Austria, one of the oldest towns in Galicia, on the river San, 51 miles west of Lemberg. It is strongly fortified, being a place of strategic importance. It has an active trade and thriving industries. Przemysl was founded in the 8th century by the Polish prince Przemyslaw, and called after his name. The ruins of the ancient residential castle are on a neighboring hill. During the European War Przemysl was invested by the Russians in September 1914. For about two weeks in October the investment was broken, and troops, arms and provisions were hurriedly transported to the fortress. By 12 Nov. 1914 the town was completely cut off again and besieged by General Selivanoff. On 22 March 1915 the town surrendered with nine generals, 2,500 officers and officials and 117,000 men. In the great Galician drive of von Makensen in the summer of 1915, when the Austro-German forces stood at the gates of Przemysl, the whole Russian garrison disappeared from the town during the night of 2–3 June 1915.

PSALMANAZAR, săl-mą-nā'zėr, **George** («The Formosan»), French literary imposter: b. probably in Languedoc, France, about 1679; d. London, England, 3 May 1763. He was educated by the Jesuits, led a vagrant life in Brabant, Flanders and Germany, posing as a Japanese convert. Later he enlisted in the Dutch service, and finally attracted the attention of Innes, chaplain of a Scottish regiment at Sluys, Holland, who apparently converted him to Protestantism and took him to England, where he was presented to Bishop Compton and others as a native of Formosa. Whether Innes was duped by Psalmanazar or was an accomplice is uncertain, but the supposed Formosan was treated with great honors, encouraged to write 'An Historical and Geographical Description of Formosa' (1704), translated parts of the English Catechism into the pretended Formosan language, and later was sent to Oxford. A few years later he published 'A Dialogue between a Japanese and a Formosan' (1707). He repented of his imposture, however, confessed his duplicity, and devoted himself to study. He became a fine Oriental scholar and led a much respected life in London. He wrote 'Essays on Scriptural Subjects' (1753); several volumes of the 'Universal History'; and completed Palmer's 'History of Printing' (1732). Consult autobiographical 'Memoirs of . . . commonly known by the name of George Psalmanazar' (1764).

PSALMODY, săl'mō-dĭ or sä'mō-dĭ, a singing of the Psalms (q.v.) of Scripture in metrical versions to simple tunes. Psalms and hymns were sung in the religious assemblies of the early Christians; and the psalms of Scripture form the bulk of the daily religious service or «Divine office» of the Catholic Church, the custom having been borrowed from the synagogue and the temple of Jerusalem. After the Reformation in the 16th century psalmody was greatly encouraged in the Protestant churches of Germany, France and the Low Countries, and most of the psalm melodies now sung in churches were composed or adapted by German musicians of the 16th century. Metrical versions of the Psalms were made in German, French and English. The Scotch reformers paid great attention to psalmody: in John Knox's psalter the Sternhold and Hopkins metrical English version of the psalms was arranged with four-part harmony. The metrical version now used in Scotland is the one made by Francis Rous during the Commonwealth and approved by the General Assembly of the Scottish Church. Consult Armknecht, F., 'Die Heilige Psalmodie' (Göttingen 1855); Bonner, D. F., 'The Psalmody Question' (New York 1908); Cooper, J. S., ed., 'True Psalmody' (Philadelphia 1859); Kent, C. F., ed., 'The Songs, Hymns and Prayers of the Old Testament' (New York 1914); Parker, W. H., 'The Psalmody of the Church, Its Authors, Singers and Uses' (New York 1892); Soullier, E., 'Les Origines de la Psalmodie' (Paris 1901).

PSALMS, Book of. Title.— The Old Testament gives no title to the book as a whole. The ordinary Hebrew designation for the book is *Sepher Tehillim*, meaning *Book of Praises*. The common title in the Setptuagint is *Psalmoi*, *Psalms*, a designation taken from one of the minor collections of the book. This Septuagint title has been followed in most of the versions, including the English.

Authorship, Date and Compilation.— The titles of the individual psalms contain many statements which have usually been considered to be ascriptions of authorship to various persons. These statements consist of proper names preceded by the Hebrew preposition *le*, which may denote authorship, but may also mean *belonging to* in more general significations. Most prominent of these statements is the title in which the Hebrew preposition precedes the name *David*, the combination being usually rendered *of David*. This is found with 74 psalms, the actual authorship of David being impossible in a large majority of these, as shown by the circumstances, language and thought. If this title was intended to indicate authorship, therefore, it was in most cases erroneous. The 12 psalms with the title *of Asaph*, also, could not have been written by Asaph, who was a contemporary of David, the psalms being of much later origin. The title *of the sons of Korah*, in 11 psalms, can hardly have been intended to indicate authorship by a group. The sons of Korah, according to 2 Chron. xx, 19 and elsewhere, were a guild of temple singers after the exile. In the light of these facts it is now often and preferably held that these titles were not intended, in most cases, to indicate authorship, but to show that the individual psalm had belonged to a minor collection of psalms designated by the name in question, *sons of Korah* designating a collection used especially by the guild of the sons of Korah, and *Asaph* indicating a collection used by the Asaphite guild, which was also prominent after the exile. Several other minor collections are also indicated by the titles, the Hebrew names of these collections being Shir, Miktam, Maskil, etc. Most of the psalms were in more than one of these minor collections, some in one only, a few in none. The evidence indicates that when a compiler used a psalm from an earlier collection he put the name of the collection, or a term derived from the name, as a title at the head of the psalm; when used again a second title was added, etc. It is probable that at least 10 of these minor collections which preceded the present psalter can be traced, the earliest having been made soon after the exile, and the latest in the early Greek period or somewhat later. The Elohistic Psalter, one of these minor collections, needs special consideration for some of its peculiarities. This embraces Psalms xlii–lxxxiii, and is characterized by a great preponderance of the use of the divine name Elohim, in the present text not to the entire exclusion of the term Yahweh, but perhaps originally so. This was probably partly a matter of original composition, but was certainly in some measure due to editorial change. Such editorial change appears clearly from the fact that Psalm liii is an Elohistic recension of Psalm xiv, and Psalm lxx, of Psalm xl, 13–17, and also from a few other details. The reason for the use of the divine name Elohim, both originally and editorially, is very uncertain. It doubtless represents the usage of some circle or region. The documents of the Hexateuch, it is well known, present similar phenomena, but as those were written much earlier there may be no direct connection. It seems hardly probable that the usage is due to the superstitious avoidance of the divine name Yahweh, which was common later. Psalms cxx–cxxxiv constitute a collection usually called «Songs of Ascents,» and supposed to be pilgrim songs sung by those who were going up to the great feasts at Jerusalem. The title should probably be rendered «Exalted Songs,» describing the collection as distinguished by special elevation of thought and feeling, which is in harmony with their character. They have also unusual regularity of form. There are also indications of other small collections not as definitely marked as those which have been described. Thus Psalm cxxxv, 21 has the appearance of being a doxology originally closing a small collection. There are indications, also, that the closing doxology of book four was originally the doxology closing a small collection. Psalms xciii, xcv–c are marked by many similarities to one another, and probably formed originally a small theocratic collection. The complete Book of Psalms as it now exists, or practically so, was probably compiled about 200 B.C., allusions in the book of Ecclesiasticus, written about 180 B.C., making it probable that it was practically complete at that time. It is now generally held that only a small part of the psalms are of pre-exilic composition. The division into five books doubtless did not take place during the compilation, but later after the compilation was complete, following the analogy of the divisions of the law.

Other proper names appear in the titles of the psalms with the Hebrew preposition *le*. These are Solomon in 72 and 127; Moses, 90; Ethan, 89; and Heman, 88. It is probable that no one of these marks a collection, and hence that the titles were designed to indicate authorship. But none of them were written by the respective authors indicated. It is probable, therefore, that these psalms should be regarded as pseudonyms, later compositions considered to be in the spirit of these men.

Davidic Psalms.— The number of psalms to be ascribed to David is a much-disputed question. The opinion was held earlier that nearly all the psalms were written by David. It is still believed by some that as many as 40 psalms were written by him. On the other hand, his authorship of any psalms is often denied at the present time. The character of David and the general level of the thought of his time are not favorable to the opinion that he was the author of many psalms. Nevertheless, compositions similar to the psalms are earlier than David, and he is by tradition closely connected with the psalms, while his general musical ability is several times noted. The Davidic authorship seems probable for Psalms iii, vii, xiii, xviii and xxiv, 7–10. These are simple in thought and style and have a pronounced warlike element.

Thirteen psalms contain in their titles references to specific events in the life of David which are said to have called them forth. The notice might be correct in the case of Psalm 18, but in every other case the notice is definitely out of harmony with the contents of the psalm, 10 of the psalms being quite certainly not of Davidic authorship. These notices are probably later traditions of no historical value, or else illustrative additions made by a later compiler.

Maccabean Psalms.— Some have thought that many psalms were written during the Maccabean period beginning in 168 B.C. The religious devotion and patriotism of the early Maccabean period might naturally have prompted such expression, and some are in a measure appropriate to that time. In the Maccabean period, however, Hebrew, it seems evident, had been replaced as a spoken language by Aramaic (consult Buttenweiser, ‹Are There any Maccabean Psalms,› *Journal of Biblical Literature*, XXXVI, 1917, pp. 225–248). Hence Hebrew, if used, would have been employed in an artificial and inexact manner such as does not appear in the psalms. The Maccabean origin of any psalms is therefore improbable.

Musical and Liturgical Titles.— Besides the elements in the titles already discussed, musical and liturgical instructions are also found. Examples of the liturgical statements are: «For the Sabbath day» in the title of Psalm xcii; «A song at the dedication of the house» in the title of Psalm xxx, etc. The liturgical titles are much later than the psalms themselves, and are added only in a few cases, in no systematic way; they evidently represent the usage of the Jews at the time of their addition. The Septuagint has several additional liturgical assignments.

Musical directions form part of the title in thirty psalms. It is probable that they were first added in the Elohistic Psalter, 20 of them being found there. These titles are of three kinds: references to musical instruments; references probably to voices although possibly to the effects of musical instruments; and references to the melodies in accordance with which the psalms are to be sung, a melody being usually designated by one or more of the opening words of a well-known song with which it is associated.

Community Psalms.— In Psalm cxxiv it is explicitly said that the speaker is Israel. In a considerable number of psalms which are expressed in the first person the obvious view is that the speaker is the community or the nation, or at any rate some considerable portion of the people. The question has been much discussed in recent years whether this is not the correct understanding of many or most of the psalms written in the first person singular, instead of the individual interpretation. The question is one to be settled in each case by the evidence at hand, with no definite presumption in favor of either view. The indications of an individual interpretation are strongly marked individual traits. The indications of a community interpretation are the absence of such strongly marked individual traits, and also the presence of elements of experience which are difficult to reconcile with an individual interpretation, or more strongly suggest some community experience. The result is that many of these psalms seem to be individual, and many to belong to the community. Doubtless in some cases an original individual psalm has been revised to make it more appropriate for community use, but this is a process difficult to trace.

The Poetical Character of the Psalms.— There is much difference of opinion concerning the essential nature of Hebrew rhythm. Many regard accent as its essential feature; but the better view seems to be that, in the very nature of the case, duration of time, rather than accent, is always the fundamental element in rhythm. The Hebrew foot, therefore, has the same essential nature as the classical foot, but is more elastic. The Hebrew foot may be defined as follows: A group of syllables, more or less in number, which, together with any silences that may be included, occupies in utterance a time relatively fixed, that is, the same as other feet in the same composition (consult Lanier, 'The Science of English Verse,' p. 40). The number of feet in a line in the Psalms varies from two to six, there being a measure of uniformity in an individual psalm. The normal stanza consists of two lines, being ordinarily a verse. A division into strophes, a regular combination of several stanzas, is found occasionally, but is no regular feature of Hebrew poetry, although many consider it to be such. This division into strophes, when found, is sometimes marked by a refrain. Parallelism of the lines of a stanza is frequent but not universal, parallelism being also found in Hebrew prose. Assonance, particularly the repetition of the same word in lines near together, especially in the two lines of a stanza, is frequent. Most of the Psalms are lyric, a few didactic while a few have a dramatic element. Psalms ix, x, xxv, xxxiv, xxxvii, cxi, cxii, cxix, cxlv have the alphabetic or acrostic structure, in which the separate lines, or stanzas (verses), or two successive stanzas, begin in Hebrew with the successive letters of the alphabet. Ps. cxix, however, is distinguished by being divided into sections of eight verses, each verse in a section beginning with the same letter.

The Thought of the Psalms.—As the psalms are for the most part lyric they are primarily an expression of feeling. Hence a presentation of thought would naturally be in a less connected form than in other parts of the Old Testament. Nevertheless, the book contains the principal phases of thought found elsewhere in the Old Testament. The imprecations found in abundance in several of the psalms constitute their principal defect to the thought of the present day. Yet that feature is easily intelligible when approached historically and constitutes no real difficulty when understood in relation to the time. Several of the psalms show an attitude that is favorable toward the ritual worship, yet with no presentation of its details. For the most part, however, the general attitude of the psalms is in accord with that of the prophets. The lyrical element in the psalms, their character as an expression of deep religious feeling, gives them an appeal to the feelings of men through the ages. While much is in form local and national, there is often an underlying universality of spirit which gives them permanent value as one of the supreme products of the thought and feeling of humanity in fellowship with God.

George Ricker Berry,
Professor of Old Testament Interpretation and Semitic Languages, Colgate University.

PSALTER, sâl'tėr, the Book of Psalms (q.v.); also a book containing the Psalms separately printed; also specifically, the version of the Psalms in the English Book of Common Prayer. It is also the name of an ancient string instrument of music, the Hebrew *Kinnor*; called by the Germans Rotta (*Cithara Teutonica*). Sometimes the rosary of 150 beads used by some order of nuns is called the Psalter, as the Psalter contains 150 Psalms. Consult Bovet, F., 'Histoire du Psautier des Eglises Reformies' (Neuchâtel 1872); Jordan, W. G., 'Religion in Song, or Studies in the Psalter' (London

1915); Mackmeeken, J. W., 'History of the Scottish Metrical Psalters' (Glasgow 1872); Strauss, O., 'Der Psalter als Gesang — und Gebet-Buch' (Berlin 1859); Whitham, A. R., 'Christian Use of the Psalter' (London 1908).

PSAMMETICHUS, sa̧-mĕt'ĭ-kŭs (Greek ψαμμήτιχος, Egypt Psammetk), the name of three rulers of the 26th dynasty. PSAMMETICHUS I, first monarch (664–610 B.C.) succeeded his father, Necho, who had been chief of 20 local princelings and vassal of Asurbanipal, King of Assyria. He is first heard of as feudal lord of Saïs, the chief centre of the western delta. He formed an alliance with Gyges, king of Lydia, against the suzerain power of Assyria; and by the aid of Carians and Ionian Greeks supplied by Gyges, defeated the Assyrian vassal-kings and was crowned «lord of the two Egypts.» Herodotus says he blockaded Azotus (Ashdod) for 20 years; and he may indeed frequently have besieged it. He made Phœnicia a vassal state, and devoted much attention to art and architecture. The demotic (or enchorial) writing which, because of greater facility, superseded the hieratic, was invented during his reign, though it cannot be ascribed to his initiative. PSAMMETICHUS II (594–589 B.C.), was grandson of the above. His reign is of note chiefly because of the inscriptions made at Abu Simbel (q.v.), by his Greek, Carian and Phœnician mercenaries. PSAMMETICHUS III (526–525 B.C.) was last king of the dynasty. His reign was brought to a close by the Persian conquest, and Egypt became a province of Persia.

PSARA, psä'rä, or **IPSARA** (Gr. *Psyra*), an island belonging to Greece, in the Ægean Sea, seven miles northwest of Khios; about five and a half miles in length, and as many in breadth. It consists almost entirely of rock, thinly covered with a vegetable mold. At one time it had considerable commerce, and a population of 30,000. However, in 1824 it was invaded by Turkey, and after having been devastated most of its inhabitants were killed. As a result of the Balkan Wars (q.v.) of 1912–13 and of the Treaty of London it was, in 1914, annexed, with the consent of the Great Powers, by Greece. Pop. about 4,500.

PSEUDEPIGRAPHA. See APOCALYPTIC LITERATURE.

PSEUDO-ISIDORIAN DECRETALS. See DECRETALS.

PSEUDOLEUCÆMIA, sū"dō-lū-sē'mĭ-a̧, or **HODGKIN'S DISEASE**, a disorder of the lymphatic glands and sometimes an affection of the spleen, characterized by anæmia and progressive hyperplasia. It is also attended by secondary lymphatic growth variously distributed in the body. Leucocytosis — excess of white corpuscles in the blood — which accompanies many blood diseases, is not present in pseudoleucæmia. See BLOOD.

PSEUDOMORPH, the name applied to a mineral which has replaced another, or which appears in crystal forms which are foreign to its original formation. Massive varieties of minerals are more subject to such changes, but the action is frequently more difficult to trace. There are three kinds: Pseudomorphs, epimorphs, and paramorphs. See also MINERALOGY.

PSEUDONYM (Fr. *pseudonyme*, from Gk. *pseudonymos*). A name adopted by an author who desires to remain unknown, or assumed for the purpose of attracting more attention at first than might follow from the use of the author's own name. (See ANONYMOUS). Pseudonymous authorship raises certain legal points as to the rights of the author under the Copyright Law (q.v.). In the United States it has been held, though not always, that a copyright acquired under a pseudonym protects fully the actual author if he is the user of the pseudonym. In practically every civilized country there have been published a number of works listing and revealing the pseudonyms used by their respective authors. For pseudonyms used by the authors of France, Germany, Great Britain, the Middle Ages and the United States. Consult Barbier, A. A., 'Dictionnaire des Onorages Anonymes et Pseudonymes' (3d ed., 4 vols., Paris 1872–79; supplement, edited by P. G. Brunet, Paris 1889); Celani, H., 'Additions et Corrections au Dictionnaire des Anonymes de Barbier' (in *Revue des Bibliothèques*, Vol. XI, p. 333, Paris 1901); Courtney, W. P., 'The Secret of our National Literature' (London 1908); Cushing, W., 'Initials and Pseudonyms' (2 vols., New York 1885–88); Franklin, A. L. A., 'Dictionnaire des Noms, Surnoms, et Pseudonymes Latins de l'Histoire Litteraire du Moyen Age, 1100–1530' (Paris 1875); Halkett, S., and J. Laing, 'A Dictionary of the Anonymous and Pseudonymous Literature of Great Britain' (4 vols., Edinburgh 1882–88); Haynes, J. E., 'Pseudonyms of Authors' (New York 1882); Holzmann, M., and J. Bohatta, 'Deutsches Pseudonymen Lexikon' (Vienna 1906); La Fare, A., ed., 'Petit Dictionnaire des Pseudonymes' (in 'Tort-Paris,' p. 802, Paris 1918); Manes, A., 'Das Recht des Pseudonyms' (Göttingen 1899); Marchmont, F., 'A Concise Handbook of Literature Issued under Pseudonyms and Initials' (London 1896); Querard, J. M., ed., 'Les Supercheries Litteraires Devoilées' (3d ed., 3 vols., Paris 1869–70); Thomas, R., 'Handbook for Fictitious Names' (London 1868); Id., 'Aggravating Ladies: Being a List of Works Published under the Pseudonym of «A Lady»' (London 1880); Weller, E., 'Lexicon Pseudonymorum; Wörterbuch der Pseudonymen aller Zeiten und Völker' (Regensburg 1886).

PSEUDOSCOPE, *in optics*, an instrument, invented by Wheatstone, for producing an apparent reversion of the relief of an object to which it is directed, by the transposition of the distances of the points which compose it. A false impression is thus conveyed to the eye, a globe becoming apparently concave and a hollow body assuming a convex form. See OPTICS.

PSEUDOSUCHIA, an order of *Crocodilia*. See HERPETOLOGY.

PSILOMELANE, a hard, dull, black mineral, essentially a hydrous manganese manganate, but part of the manganese often replaced by barium or potassium. It occurs abundantly massive or in botryoidal and stalactitic forms in Germany, England, Arkansas and many other localities. It is one of the commonest ores of manganese.

PSITTACI, sĭt'a̤-sī, the parrot tribe, a family of scansorial birds, comprising over 300 species, of which the genus *Psittacus* is the type. See PARROT.

PSKOV, pskŏf, or **PLESKOV**, Russia, (1) town, capital of the government, on the right bank of the Velikaya, which here receives the Pleskova, 165 miles south-southwest of Petrograd, with which, as also with a number of other cities, it is connected by railroads. There is also a steamship line between Pskov and Dorpat. It is walled, flanked with towers, all in a very delapidated state, as are also many of the houses. It consists of the Kremlin, the Central city, the Great city and a considerable suburb. All the private houses and the far greater part of the public edifices are of wood. The finest buildings are in the Kremlin. The principal manufacture is Russian leather; and there is a considerable trade in hemp, flax, tallow, hides, etc. Pskov is the see of an archbishop and possesses a theological seminary, a well-managed hospital, an ancient cathedral and other old churches and monasteries, most of the latter being in ruins. It is said to have been the birthplace of the Princess Olga toward the end of the 10th century. During the Middle Ages it possessed great importance as a trading centre and for a long time maintained its freedom as a city republic, which it lost in 1509 when it came under the rule of Moscow. It went through a number of sieges and gradually deteriorated, though with the coming of railroads, it regained some of its former mercantile prosperity. Pop. 38,300.

(2) A government of Russia, bounded north by Petrograd, northeast by Novgorod, east by Tver, southeast by Smolensk, south by Vitebsk, west by Livonia; area, 16,678 square miles. The surface toward the southeast is traversed by the Valdaī Hills, but sinks gradually down near the centre, having only a gentle slope toward the north and west. The soil is throughout of poor quality and can only be made to yield tolerable crops by fertilization. Wheat is seldom grown, and the principal crops are flax, oats and barley, which are raised in considerable quantities, so as to leave a surplus for export. Forests are extensive; but the wood is not of the best quality. The only other manufacture of importance is leather. There are more than 800 lakes in the government, covering about 390 square miles. The largest of these is Lake Pskov (300 square miles). Over 1,200 square miles are covered by marshes. Pskov is divided into eight districts. The majority of its population are Great Russians. Pop. 1,447,000.

PSORIASIS, sō-rī'a̤-sĭs, chronic skin disease, allied to alphus and lepra, non-contagious but often hereditary. It is characterized by an inflammatory condition, with slightly elevated patches, dry and various in number, size and shape, to which grayish scales adhere. These exfoliate, to be repeatedly renewed. The extensor sides of the extremities, the elbows, knees, trunk and scalp, became first affected, and the flexor sides of the limbs are afterward attacked. Only the mucous membranes of the body are exempt from this disease, the cause of which is little understood, and which requires for treatment competent medical skill. It is mainly a disease of adult life. The treatment is both external and internal, the former being the more efficacious. Arsenic is a favorite in internal treatment, but its use is open to serious disadvantages. "Asiatic pills" is another arsenical preparation used in treating psoriasis. Salvarsan and neosalvarsan have proved ineffective. Hot baths at night, with a liberal use of soap, assist greatly in removing the scales. Sapo viridis is also used for this purpose. Consult Hutchins, M. B., 'Psoriasis' (in 'Reference Handbook of the Medical Sciences,' Vol. VII, New York 1916).

PSOVIE, or **BORZOI**. See GREYHOUND.

PSYCHE, sī'kē (Greek ψυχή, meaning breath, soul, life), in Greek mythology, a beautiful maiden regarded as an allegorical personification of the human soul. In a version of her story given by Apuleius in 'The Golden Ass' she is the daughter of a king and far outshines in loveliness her two elder sisters. Men take her for Venus herself and pay her the homage due to the goddess. In anger Venus directs Cupid to inspire Psyche with love for some unworthy wretch, but Cupid himself falls in love with Psyche. Meantime her father consults the oracle of Apollo regarding his daughter's marriage, and is commanded to convey her to the summit of a mountain and there leave her, for she is the destined bride of a monster dragon feared by gods and men. Sorrowfully he obeys, but when Psyche is left alone she is wafted by Zephyr to the palace of Cupid who visits her every night and departs unknown before morning. She is warned by her lover never to seek to know who he is, and no break would have occurred to her happiness had she not allowed her jealous sisters whom she admitted to her confidence to half persuade her that she held a hideous monster in her arms. One night while Cupid slept she came with a lamp to see him and in her astonishment and joy at beholding the most beautiful of the gods she lets fall a drop of heated oil upon his shoulder. Cupid awakes, reproaches Psyche for her suspicions, and leaves her. After trying in vain to drown herself, Psyche wanders from place to place seeking her beloved till she comes to the temple of Venus. Having Psyche at last in her power Venus treats her as a slave and imposes menial tasks, under which the maid would sink but for secret help obtained from Cupid. At length Venus orders Psyche to descend to the realm of shadows and bring away Proserpine's box of cosmetics. She succeeds in the adventure, but on opening the box is assailed by a deadly vapor issuing therefrom and perishes. Cupid now reappears, touches her with an arrow and restores her to life. Venus is reconciled, and Jupiter places Psyche among the immortals. Her marriage to Cupid is celebrated with great festivities, while her envious sisters cast themselve from a precipice. The story, as the name implies, doubtless was an adaptation of, and possibly was founded upon, the theory of the pre-existence of the soul, its suffering in this life, and then final redemption. Various phases of the story are to be found in early Greek and Roman art, dating even from the 2d century B.C., Psyche being represented as a delicate maiden with butterfly wings. Consult a translation of Apuleius' story in Walter Pater's 'Marius the Epicurean' (London 1885; new ed., New York

1902); and poetical versions of the tale in Morris' 'Cupid and Psyche' in 'The Earthly Paradise'; and Bridges, 'Eros and Psyche'; Conze, 'De Psyches imaginibus quibusdam' (Berlin 1855); Rohde, E., 'Psyche' (1894).

PSYCHIATRY, that branch of medicine which deals with diseases of the mind. Historically while mental diseases have always been recognized, they have often been thought to be of divine or diabolical origin and their consideration has been hopelessly entangled with religion and with metaphysical speculation. Even after mental diseases came to be recognized as the legitimate occupation of medicine their study was for a long time confined to the more serious varieties, collected under the caption «insanity,» which were found only in the asylums, and correspondingly the study of these patients and their illnesses became a distinct specialty of the asylum physicians (alienists). The practice of mental medicine in this restricted field tended for a long time to be little more than the custodial, albeit kindly care, of the seriously ill of mind. The great mass of practitioners of medicine had little or no interest in the subject. During the asylum period in the history of psychiatry very little was accomplished in the way of the scientific development of this branch of medicine. Its very isolation operated to prevent its growth and when finally progress did gain access to the asylum it was more occupied with humanitarian than with more strictly scientific problems. Then, too, the sciences upon the basis of which a firm foundation for psychiatry could be laid were not far enough advanced to warrant much progress. The science of psychology was honeycombed with metaphysical speculations and has only come to a systematic effort at an experimental elaboration of its data during the past generation. As a result of these conditions the early history of psychiatry is a history of more or less crude speculations, classifications and descriptions. Little was suspected of underlying causes and metaphysical discussions of the relation of mind and body effectually prevented all practical considerations of human behavior.

Present-day psychiatry has been made possible by the advances which have been made in the sciences upon which it rests, particularly by the advances in psychology, or more particularly that department of psychology which deals with abnormal mental reactions, namely psychopathology. A better understanding of the nature of mind and its position in the general evolutional scheme has made it evident that mental disease is the psychological manifestation of difficulties and defects of adjustment due either to causes operating within (endogenous) or from without (exogenous). Psychiatry thus becomes concerned with discovering these causes and makes a therapeutic approach to the problem presented by the symptoms of mental diseases by attempting to secure a better adjustment by removing the causes, avoiding their operation, or effecting some compromise solution. Inasmuch as defects of adjustment of some sort are present in practically every one, psychiatry has come to deal with all problems of mental health and not only the severe types of maladaptation found in the hospitals for the insane. Its therapeutic armamentarium includes not only all of the mechanical (surgery) and chemical (drug) methods of general medicine, but psychological methods (psychotherapy) as well as efforts at social rehabilitation and readjustment. It therefore includes the whole field of mental medicine, reaching into the field of social adaptation as a very important point of its domain and including, on the preventive side, the problems of mental hygiene.

To particularize the more important fields in which psychiatry has become important in recent years. In the first place there is of course the field of the so-called insanities or the frank psychoses such as we see in the hospitals for the insane. This field has been greatly broadened of late by appealing to patients to seek the assistance of the hospital before becoming seriously ill and availing themselves of the hospital's help after recovery to re-establish themselves socially. Then there is the immense field of the defective including the problems of the idiot and imbecile; the backward child in the school; and the innumerable problems of social maladaptation which have their roots in defectiveness such as many of the problems of prostitution, criminality and poverty. The whole field of criminology belongs essentially in the domain of psychopathology and thus comes within the practice of mental medicine-psychiatry. The most important field of modern psychiatry is perhaps the neuroses and psychoneuroses, which include those conditions known as hysteria, neurasthenia, obsessions, doubts, fears, impulses, etc. The persons who manifest this group of symptoms are not infrequently well endowed mentally, but their efficiency is greatly impaired by their illness. They can now be greatly helped by appropriate psychotherapeutic treatment. A study of these conditions has shown so clearly the conditions from which they grow that a further advance in preventive medicine along these lines will project the findings of psychiatry upon the problems of education and in fact the whole great group of problems involved in successful living. The principles which are found applicable to all these various abnormal conditions are as truly applicable to transient mental disturbances in quite normal people such for example as various types of nervousness, unhappiness or difficulties of adjustment dependent upon some character trait. The differences between the normal and the abnormal mind is only one of degree so that the field of psychiatry has now broadened to include what but a short time ago would have been considered the normal but where minor maladjustments prevent the fullest efficiency.

PSYCHIATRY AND WAR. In harmony with the general fact that it is man's mind that receives last consideration in questions of health it has taken until the present war for any real appreciation of the incidence of mental disease in the military forces to get recognition. The Russians in the Russo-Japanese War had a regular organized service for caring for the mentally ill, removing them from the front and taking them back to the hospitals at Moscow and Saint Petersburg, but it has remained for the present war to develop a real comprehensive appreciation of the nature of the problems involved. The first of these problems, namely the examination of recruits for the purpose of eliminating the mentally defective or otherwise affected individuals who would probably not be able to stand the stresses of actual conflict, has been developed more elaborately in this country than in the European countries, probably for the obvious reason in America the man power has not been so severely taxed, for when it is experience teaches that all methods of examination which result in the elimination of recruits are looked upon with progressingly less favor.

The general plan in dealing with mental illness in the American army is broadly as follows: first, a weeding out of defective and otherwise mentally abnormal individuals in the various camps, the establishment in connection with the various hospitals, particularly the large base hospitals, of psychiatric wards in charge of a competent psychiatrist and assistants, with a detail of nurses who have had experience in institutions for the care of the mentally ill. The mental cases thus in the large base hospitals receive their proper classification and therefore treatment as do other varieties of illnesses and injuries. Coupled with this fundamental organization there is an effort to segregate the mental case as soon as possible back of the firing line and to place him under treatment at the earliest possible moment. Psychiatric departments therefore naturally took their place alongside of other departments in the great hospitals for the American troops on the other side. In these divisions of the hospital the mentally ill received prompt treatment, the object being to deal with minor mental ailments promptly before they have become aggravated or chronic with the immediate object of getting the soldier back into service and avoiding the necessity of invaliding him home.

The present war has developed no new forms of mental disease. The particular delusions or hallucinatory experiences of the mentally ill naturally vary and take their material from the immediate surroundings. Aside from this the pictures of mental illness are the same as we are accustomed to see in civil life. The one overwhelming feature, however, which distinguishes the mental cases in this war is the prevalence of the neuroses, grouped together under the somewhat misleading and general term «shell shock.» These neuroses seem to offer nothing particularly different from those that are seen in civil life, but are very numerous and a source of serious concern because of that fact. It is because many of these neuroses can be dealt with effectively, if gotten at early, that the scheme was to deal with them in hospitals on the other side. All of the chronic cases such as we see every day in our State hospitals and patients suffering from neuroses in whom the neurosis has become a pretty well-fixed affair will ultimately be invalided home and distributed on landing to specially constructed psychiatric wards, for the most part along the Atlantic Coast. From here they will be further distributed, some to State hospitals, some to the Government Hospital for the Insane — Saint Elizabeth's Hospital, in Washington, D. C., others to their friends and relatives.

The United States government will normally be responsible for these soldiers whose mental illness is directly traceable to the performance of their duties as soldiers. Naturally there will be a number of cases whose mental illness will be traceable to conditions which arose before they went into the service and were only discovered by the army. For these the United States will not be responsible. For the others, however, they will be, and the treatment of their mental condition will be a part of the large problem of the rehabilitation of the soldier when he returns shattered in mind and body from the war.

The immediate dealing with mental disease as generally recognized merges imperceptibly in several directions into the handling of various psychological situations which are recognized as being more or less abnormal. For example, in the rehabilitation of the injured and crippled soldier the psychological problems involved are most important and strike at the very foundations of the capacity for social adjustment. The crippled hero is not easily going to be inducted back to the hum-drum drudgery of the shops, nor is the employer easily going to be induced to hire a man who is severely crippled when he can just as easily get one who is not. The method of approach to these problems is psychological and in the case of the attitude of the soldier at least approaches, if it does not overstep, the limits of the normal.

In the same way numerous problems of defective psychological adjustment are arising in other directions. The highly trained, exquisitely sensitive flying men not only require a most careful and frequent sizing up of their physical resources, but it is beginning to be appreciated that they need the same kind of attention to their psychological resources and that perhaps a number of the accidents which happened in this branch of the service could have been avoided if this sizing up had been effectively done.

The psychological examination of recruits in large numbers introduced methods of sifting out defectives, but in addition to that it introduced methods which serve as measuring rods of efficiency. So that the hundreds of thousands of men who went into the service were measured in a way in which the population has never before been measured, with a result that methods are growing up which will serve more and more effectively to fit the individual to his job and also to pick out all manner of defects in the usual way of accomplishing this end.

The army is proving to be a great piece of efficiency machinery which demands certain pretty-well defined results and the line officers and the scientific men are working side by side, not for the sole purpose of weeding out the unfit or treating those who have become ill but with the added purpose of saving those that are misfits by making readjustments in their relations to the army machine either by transfers to other branches of the service, certain reeducational adaptations, or what not, which will render it possible for them to stay in the army and render good service in accordance with their capacities. Undoubtedly this great experience will be projected into the civil population after the war with the result that the problems of psychiatry, of mental illness, or social adjustability, will all be viewed in a much broader aspect and be much more wisely dealt with.

In addition to the above definite efforts are being made along other lines which at first perhaps seem to have no relation to mental illness but which really are closely related thereto, specifically the efforts in the direction of social hygiene, namely, the prevention of the high incidence of venereal disease which is so usual in military organizations. When it is appreciated that syphilis is responsible for upwards of 10 per cent of the cases of mental disease confined in our public institutions it will be also appreciated how efforts at limiting the incidence of this disease go directly to the root of the problem of the prevention of mental disease. A co-ordinate activity addressed in the same direction is the effort at providing adequate recreation and suitable occupation during the leisure hours for soldiers in camp. These are all efforts in the direction of mental hygiene and as such are addressed to the preservation of mental health and the prevention of mental illness and, therefore, come within the scope of psychiatry in its widest meaning. The prevention of any material percentage of venereal disease in the military organization by such methods as are addressed directly or indirectly to their prevention or cure will ultimately have an enormous effect upon the general health throughout the country when the soldiers return to civil life and to their various pursuits. Ordinarily they bring back into civil life an enormous amount of potential suffering and disaster in the shape of venereal infection, an unknown portion of which must necessarily result in mental illness of themselves and others. Venereal prophylaxis and methods of mental hygiene will serve to curtail this danger very materially.

PSYCHICAL RESEARCH. In its technical sense psychical research refers to objects and methods of investigation employed by The Society of Psychical Research, which was founded in England in 1882. The function of this society is set forth in the following announcement: "It has been widely felt that the present is an opportune time for making an organized and systematic attempt to investigate that large group of debatable phenomena designated by such terms as mesmeric, psychical and spiritualistic. From the recorded testimony of many competent witnesses, past and present, including observations recently made by scientific men of eminence in various countries, there appears to be, amidst much illusion and deception, an important body of remarkable phenomena, which are *prima facie* inexplicable on any generally recognized hypothesis, and which, if incontestably established, would be of the highest possible value. The task of examining such residual phenomena has often been undertaken by individual effort, but never hitherto by a scientific society organized on a sufficiently broad basis." The society's membership has included the names of Henry Sidgwick (the first president), A. J. Balfour, W. F. Barrett, Balfour Stewart, Edmund Gurney, Frederic W. H. Myers, Oliver Lodge, William Crookes, Lord Rayleigh and Alfred Russell Wallace. In 1884 an American Society for Psychical Research was established and later (1890) incorporated with the British society. In 1906 the societies again separated. Similar organizations have been formed in Germany and other countries. The records of the English society fill many volumes of Proceedings and Journals. Besides these official reports, individual members have published numerous works on psychical research. The investigations of the society have been directed by six principal committees to whom the following tasks were severally assigned in 1882: (1) An examination of the nature and extent of any influence which may be exerted by one mind upon another, apart from any generally recognized mode of perception. (2) The study of hypnosis, trance, clairvoyance and other allied phenomena. (3) A critical revision of Reichenbach's researches with certain organizations called "sensitive." (4) An investigation into apparitions and haunted houses. (5) An inquiry into the various physical phenomena commonly called spiritualistic; with an attempt to discover their causes and general laws. (6) The collection and collation of existing materials bearing on the history of these subjects. In brief, the work of the committees has covered the subjects of telepathy, hypnosis, trance, automatisms, "magnetic sensations," apparitions and "spiritualistic manifestations." Three principal methods have been employed by the committees and by individual members of the society: (1) the examination of accumulated evidence and of current cases; (2) experimental investigation, and (3) statistical treatment. The first of these methods has been used widely in the study of apparitions and alleged spiritualistic phenomena — ghost stories have been collected and noted mediums examined; the second, in hypnosis, in tests of Reichenbach's claims and in the collection of evidence for telepathy; and the third, in interpreting extensive data regarding apparitions and hallucinations.

The results obtained by the several committees are quite unequal. Investigations into the «magnetic sense,» into clairvoyance, haunted houses and the grosser physical manifestations of «spirits» — that is, raps, table-tipping, slate-writing, levitation and «materializations» — have turned out, on the whole, negatively. Many instances of fraud, of defective observation and of involuntary deception have been brought to light. Hypnosis and allied states have been investigated, not so much for their own sake as for the study of telepathy and of subconscious states. The work of the society may be said to centre in the question of telepathy and the existence of mind independently of the body. In order to secure evidence touching both these matters the Society for Psychical Research instituted, in the years 1889–92, an extensive census on hallucinations. Answers to the number of 17,000 were returned to the following question: Have you ever, when believing yourself to be completely awake, had a vivid impression of seeing or being touched by a living being or inanimate object, or of hearing a voice; which impression, so far as you could discover, was not due to any external physical cause? About one-tenth (1,684) of the answers were affirmative, and of this number 80 were «death-coincidences; that is, cases of recognized apparitions occurring within 12 hours of the death of the person represented, the death being unknown to the percipient at the time.» The committee in charge of the census draws the conclusion that «between deaths and apparitions of the dying person a connection exists which is not due to chance alone.» In the last few years the society has devoted much attention to the study of trance states as produced in certain persons called «sensitives.» This study is said to furnish evidence of telepathy. It is considered by some members of the society to be the most fruitful subject for further investigation.

The achievements of psychical research are difficult to estimate. The movement has undoubtedly contributed to knowledge of the facts investigated and the conditions under which these facts arise. It has also performed a service to mankind in its critical examination both into the validity of human testimony and into certain unreliable factors in the motives to the establishment of belief. The evidence offered for a telepathic agency and for the independent existence of mind apart from cerebral functions is considered in some quarters as amounting to proof; in others, as lending probability only to these hypotheses; and, by many educated persons, as entirely lacking in cogency. It is of importance to notice, in this connection, that belief in the factual basis of telepathy — that is, in the influence of one mind upon another where no physical medium has yet been discovered — does not necessarily imply a theory regarding the nature of and the conditions underlying such influence. Various hypotheses intended to explain the facts in question have been offered, but no one of them has as yet found general acceptance.

Psychical research, in so far as it examines conscious experience, sustains a somewhat intimate relation to psychology; although it is more closely allied to abnormal than to general psychology. It should be pointed out, however, that its aims and in some respects its methods also bring it into closer relation to certain practical aspects of life and to philosophy than to psychology.

PSYCHIDÆ, a family of moths (q.v.).

PSYCHOANALYSIS is primarily a system or method of medical practice which aims to interpret and treat various visceral, nervous and mental disorders through their most fundamental causes in the nature and life of the individual. These causes are discovered and a readjustment of the factors they represent is effected through the means which the name suggests, an analysis of the psyche or mind. This name was chosen by Sigmund Freud of Vienna to express the nature of his work when he elaborated this method in his experience with hysteria and other psychoneuroses. It was through his experience working with Breuer in hypnotizing such patients that he came to a realization of the existence and continued activity of certain factors or groups of factors belonging to the mental life, which survived in the unconscious when consciousness no longer remembered their existence. He found that the bringing of these hidden factors into conscious memory or into free activity through hypnosis and the obtaining thus of an emotional reaction to them, even after a long period of years in which they were consciously forgotten, gave relief from various physical and mental symptoms. As he proceeded with his work he came to realize that hypnosis was by no means a completely satisfactory method of procedure. Many patients could not submit to hypnosis; the results were not always sufficiently permanent as it was more or less difficult for consciousness to retain the effect of the abreaction of affect or emotion which had been obtained during the hypnotic state. He felt that there should be more co-operation between the patient and the physician, which could be better realized and more effectively handled if the patient retained consciousness and brought his own reason also to bear upon the problems and the facts involved. This would be a slower but a more effective method and one which would have an application to a larger class of people. The method consists briefly in a series of interviews extending over varying periods of time owing to the mass of mental material to be examined and to the emotional obstructions which have to be patiently understood and overcome as this long buried and highly emotional material is brought to light. The working principles of psychoanalysis lie in the acceptance of an unconscious side to the mental or psychic life, which forms the greater part of any individual life. This unconscious material should naturally be the reserve material conserved from the past lying ready for continual passage over into the superficial conscious life to furnish material for thought and action. It should be the storehouse of all past experience and of the sum of feeling and tendency which constitute individual character. The way into consciousness should be sufficiently open so that such material may be selectively chosen according to practical and creative needs and yet so well guarded that superfluous material shall not thrust itself distractingly into the field of thought and action. Therefore a certain amount of repression is necessary to hold the psychic material in useful control.

The ideas and the feelings which belong to past experience and which form the mental content of each individual, however, have not always established themselves in the past in proper proportion and relation to the facts of life and toward each other. There is a good deal of exaggeration, disproportion and distortion in any life and an excess of these things, from the point of view of psychoanalysis, constitutes a neurosis. Here repression has become excessive because emphasis was laid upon certain factors probably in infancy, which would thrust into undue attention certain things which society and the individual's own social, ethical and æsthetic sense would tend to banish. Yet these factors had not been properly attended to before repression occurred. Their exaggerated emotional importance had not been relieved by a reaction to them, «abreaction» Freud has called it, at the time when they were established. Therefore it is the work of psychoanalysis to search the unconscious for the existence of such hidden factors and bring them out through an understanding and interpretation of them and a recognition of their actual place in the economy of the child's and the adult's growth and development. The discovery of these, their correct appraisal and then the readjustment of them to the claims of reality and the demands of the social environment in which the individual has to live must be made by the patient with the guidance and interpretative aid of the psychoanalyst. The searching of the unconscious takes place chiefly through the interpretation of the dreams of the night, when according to the theory of psychoanalysis the unconscious emotional nature, which manifests itself as wish, speaks most freely, conscious control being largely withdrawn. Enough of the latter is present, at least at the moment of waking and remembering the dream, to cause the latter to take a distorted form, so that the wish, the pure expression of the unconscious impulses, is much disguised. For this reason psychoanalysis in the use of the dream is dependent further upon the free associations which are called forth by relating and thinking over the dream. These too are imperfect and fragmentary but, because they belong in the endless chain of mental associations, disclose more and more of the mental background out of which the dream arose. It is the endeavor of psychoanalysis to watch these, follow them patiently as they draw themselves together and gather insight and interpretation from them. Daydreams are of the same nature as the dreams of the night, only a little more under control of conscious intellectual thought. From the same source are certain sudden acts, facial expressions, attitudes, mistakes in speaking, sudden forgettings, spontaneous displays of feeling. They all arise from the unconscious depth of the mental life to appear on the conscious surface. These are also watched and utilized in psychoanalysis for the discovery and understanding of the hidden mental life.

The cure in psychoanalysis is no mystery but occurs through the simple understanding of the hidden forces and desires within one, with the strange and unsocial or obsolete ideas which have surrounded these from earlier stages of individual development and which analogous to earlier or even more primitive periods of racial history. When the real nature of this inner life is realized and its emotional dynamic force understood for the first time, it follows naturally that the life is reconstructed along new lines of usefulness and health. Yet because of the depth and the complexity of this inner psychic life such understanding and readjustment are not arrived at quickly or easily. For this reason psychoanalysis necessarily has to pursue a pathway of serious duty, profound psychology and extensive knowledge of human life in its present extent as represented in all peoples and all varieties of individual and in the past history of men and the gradual development of the race as well. It must learn to know the history of human striving with these same emotions which belong to all ages, and to know the special manifestations of these which belong to any one age of history or evolution. For traces of all these are found in the psychic recapitulation of each individual and any one of these may help to understand any particular mental fixation which may lie as a basic cause of a neurosis.

Psychoanalysis finds its particular field in the psychoneuroses or borderland cases, so-called «nervous» disorders of a mental rather than a purely physical anatomical type. Such cases are particularly fitted for the intellectual co-operation which the method entails and they are also in particular need of a method which combines reason and a frank recognition of the feeling life. Strictly medical procedures fail to reach them and other forms of so-called mental healing do not enter as psychoanalysis does into the detailed investigation of individual difficulties and bring them one by one into the clear light of reason. A sweeping and revolutionizing «faith» is supplanted here by personal and patient examination and interpretation. Actual psychoses, pronounced mental derangements, are not always amenable to psychoanalytic treatment yet much has already been done here when the more lucid intervals or the still remaining reason of a patient could be utilized for co-operation. Psychoanalysis has proved itself invaluable in the understanding of such mental disorder and appreciation of the emotional conflict involved with an interpretation of the hitherto meaningless ideas and behavior of such patients. The field opens here for mental prophylaxis through psychoanalysis. A promising field is opening up for the application of the principles of psychoanalysis to various physical diseases since on the side both of psychology and of physiology new information is continually being discovered and reported in regard to the close interrelation between mental factors and physical manifestations. In its prophylactic function psychoanalysis bids fair to become an important pedagogical agent. It has shown through its medical work the importance for the health and success of later life of the right attitudes in childhood and of a clearer knowledge on the part of the child of the mental life which he conceals within him. Its province certainly lies in the future in better instruction for children in regard to their own mental and physical lives and better understanding and adjustment of the problems which arise in the course of their development and adjustment to the world in which they are to live. Though psychoanalysis began as a form of medical practice and its chief service lies in this sphere, still from its nature it is bound to find its way into other territories. In the first place it has done much to reveal the close connection existing between the province of medicine, that is, health and disease, and every other interest of life. Then in its strictly medical application it has been shown how dependent it is upon all forms of human effort and interest for a complete understanding of the human problems and human strivings that make up the mental life of the patient. All this has tended to push it on into fields of wider interest. The principles of the unconscious mental life, preservation of the mentality of the past and present, the unconscious as the dynamic source of endeavor, as the fountain from which human creativeness must draw, give it also a peculiar interpretative value in all forms of artistic creation, a special power of evaluating these and a similar interest in the study of all forms of history, art, religion, language, material advance, in short of all human activity. It has a practical application in the discovery of latent powers, the inhibitions and hindrances with which these are encrusted and, therefore, the spread of its principles of investigation and understanding should form the true basis of a practical psychology of efficiency.

The history of psychoanalysis as a movement dates from Freud's development of it in the last decade of the 19th century (1893) as he modified his own and Breuer's earlier treatment of hysteria. He worked privately with a sincere conviction of the reasonableness of his method and its peculiar applicability to the psychoneuroses. His expectations were modest. Its radical character brought him opposition but he was content to work alone waiting for time to prove the correctness of his theories and the usefulness of the method. Soon, however, he realized a growing interest about him. Other physicians gathered around him and interest began to be manifested in the wider application of psychoanalysis, outside the field of medicine. Two of the early followers of Freud were Bleuler and Jung who carried the teachings of psychoanalysis to Zürich and did much to disseminate them throughout the world. Although they have since altered to some extent the application of psychoanalysis to medical practice, they stand essentially for the original promulgation of these.

Psychoanalysis spread through other adherents into Germany, Russia, Holland, France, Italy and other countries of Europe though not to an equal extent in all. England has been but slowly receptive, though experience in the World War has given it marked impetus there. The United States has proved itself especially hospitable to psychoanalysis. It was first introduced there chiefly by Drs. A. A. Brill and E. Jones and in 1909 by Freud himself when he delivered a series of lectures at Clark University and psychoanalysis entered under the official sanction of G. Stanley Hall. Since then it has flourished chiefly in medical circles. These have been small but gradually a general acceptance of it is making its way into the medical body. It is represented officially by the American Psychoanalytic Association. One American periodical is devoted to the subject, the *Psychoanalytic Review,* and a wide literature has sprung up and is being constantly increased. This consists of translations of Freud's works, some of which pertain strictly to medical problems, some of which are a thoughtful application of psychoanalysis to other spheres of interest. Translations of other foreign writers on the subject are appearing from time to time. Original articles appear in increasing numbers in various medical and scientific journals together with medical reports of actual psychoanalytic work. Various books on psychoanalysis, some popular in presentation, others more strictly technical, have appeared from time to time. It has been inevitable that a subject which so closely appeals to deeply laid human interests should fall victim to a great deal of misunderstanding and bitter reproach on the one hand and become the prey of a flippant superficial interest in whatever is new and emotionally appealing on the other. Its true import and its actual service to the health and well being of the individual and society are matters for the test of time and for further development in meeting these individual and social needs. The application of the principles and methods of psychoanalysis to nervous and mental disorder resulting from the war gave a new impetus toward its acceptance and interest in its real significance in the United States as well as abroad. Consult Jelliffe, S. E., 'Technique of Psychoanalysis,' and Jones, 'Papers on Psychoanalysis'; Lay, W., 'Man's Unconscious Conflict.'

SMITH ELY JELLIFFE, M.D.

PSYCHOLOGICAL APPARATUS. The object of the psychological laboratory is, in brief, to standardize the conditions of introspection (see PSYCHOLOGY); to make it possible that psychological observations shall be taken in the most favorable circumstances, so that they may be repeated (by the same or by other observers), isolated and varied. It is only under these experimental conditions that the results of introspection can lay claim to universal validity. The single, hap-hazard observation, made under all the distractions of ordinary life, is worth as little in psychology as it would be in physics or physiology. Hence it was nothing less than a revolution in psychology when W. Wundt founded in 1879, at Leipzig, the first psychological laboratory that the world had known. Wundt's example was quickly followed in America by G. S. Hall, who founded a laboratory in 1881 at the Johns Hopkins University. At the present time all the more important seats of learning in Germany and the United States are equipped with psychological laboratories, while there are a large number distributed through the other civilized countries of the world.

To give an idea of the problems with which the experimental psychologist is busied, we may mention some of Wundt's early apparatus and the questions which he hoped to solve by their aid. In 1861 Wundt devised the ***complication pendulum*** (Fig. 1) in order to determine the behavior of attention under the influence of two simultaneous stimuli. Suppose that I am subjected, at one and the same time, to a sight and a sound. Do I hear and see together? Do I see before I hear or hear before I see? The question was of great practical importance, since it was involved in the «eye and ear» method then in vogue for a certain type of astronomical observations. Its general psychological importance is obvious. The instrument now «consists of a large, heavy, wooden pendulum. The bulb carries a pointer, which as the pendulum swings passes over a circular scale. Near the point of rotation *m* there is fixed to the stem a horizontal metal bar *ss*. A movable vertical standard *h* has attached to it a metal spring, also in the horizontal line. The spring is fixed in such a way that the bar *ss* in passing by produces a short single click, the end of the bar and the point of the spring just touching each other, while the shock is so slight that the course of the heavy pendulum is not noticeably affected. By watching the course of the pointer attached to the bulb of the pendulum, while the upper part of the instrument remains concealed, we can determine at what point of its passage to or fro the click of the spring takes place. For example, if the pointer appears to be at *e′* at the moment of the sound, the bar *ss* will be in the position *ab*, and this will mean that the passage is put too early. If the pointer seemed to be at *e″*, the bar would be in the position *cd*, and this would mean that the passage was put too late. If we know the duration and amplitude of the pendular vibration and measure the angular difference between *e′* or *e″* and the actual point at which the bar *ss* comes in contact with the spring, we can easily calculate the interval between the giving of the sound and its apperception.» The instrument has been gradually refined and its scope extended until it now has the form shown in Fig. 2.

Another of Wundt's early experiments was made to determine the range of consciousness for auditory impressions. I hear a number of similar sounds; say, of metronome strokes. How large a group can I keep in mind at once? I must not count; for that would mean a separate attention and a verbal association to every sound. Suppose that a group of 20 strokes, marked off by bell-tones, is followed by a group of 21 marked off in the same way. Do the two groups appear the same or can I tell that they are of different lengths? This question was answered by Wundt by aid of the instruments shown in Fig. 3. The metronome *M* gave the series of sounds, and the limits of the series were indicated by the bell *G*. Fig. 4 shows a later and better instrument for the determination of the range of consciousness to visual impressions.

A third experiment concerns our judgment of time intervals. A wheel, driven by clockwork, carries a pointer which clicks against contact strips arranged along the circumference. The instrument is shown in Fig. 5. It is possible to give two clicks and to let the observer arrest the clock after an interval which seems to him to be equal to the interval that separates the clicks; or to sound three clicks — two continuous intervals — and to let the observer judge of the equality or inequality of the times enclosed by them; or, finally, to sound four clicks — two intervals with a pause between — and to see how the observer's judgment of equality or inequality of the times varies with variation of this intervening pause. A newer and more elaborate instrument is shown in Fig. 6.

A fourth experiment, known as the «simple reaction experiment,» is important for the psychological analysis of attention and action. A simple stimulus (a flash of light or the sound of a ball falling on a wooden plate) is given to the observer, and he replies to it by making some simple movement, which has been determined beforehand. Instruments are so arranged that the giving of the stimulus starts an electric clock, and the responsive movement stops it: so that the time elapsing between stimulus and answer to stimulus can be exactly measured. It is clear that the «reaction» experiment reproduces for us, in an elementary form, the consciousness of voluntary action. We see or hear something and act upon it. Since the experiment can be repeated as often as necessary it is possible, by means of it, to subject the action consciousness to minute and refined introspective examination. We find, further, that the time of reaction varies according as the attention is directed predominantly to the stimulus or to the reaction movement, according as the stimulus attended to is to be apprehended in its qualitative or intensive character, according as the observer is fresh or fatigued, etc. The apparatus employed are shown in Fig. 7. The falling of the ball upon the plate in *F* starts the electric clock *H*, whose unit is 1/1000 second. Pressure of the finger upon the key *U* stops the clock; this pressure constitutes the movement of reaction. *C* is a hammer, whose time of fall is constant; it serves to check the accuracy of the clock (chronoscope). The other instruments figured are subsidiary. Fig. 8 shows an elaborate apparatus for giving visual stimuli in reaction work.

The reaction experiment may be adapted to more complex consciousness. Thus the observer may be told that he will hear either a noise or a tone; he is not to move until he is sure of the stimulus given [illegible] discrimination re-action). Or he may be told th[illegible] either a noise or a tone, and that [illegible] to noise with the right and to tone wi[illegible] hand (choice reaction). Or again, the st[illegible] may be a spoken word, to which the obs[illegible] reacts by speaking a second word which he [illegible] associated to the stimulus. Instruments ha[illegible] been devised which meet the requirements of these and of many other variations of the experimental procedure.

The four experiments thus far discussed are typical of the problems with which experimental psychology set out. In a well-equipped modern laboratory the apparatus fall into three main groups: demonstration instruments, with which

experiments may be performed upon the lecturer's desk; class instruments, which are put into the hands of undergraduate students for training and drill-work; and research instruments, the materials of investigation by graduate students and by the instructing staff. As an illustration of the demonstration group we may cite Wundt's apparatus for negative after-images of vision (Fig. 9). A large circle of colored glass, placed directly behind a ground glass plate and illuminated by a powerful lamp, is fixated by the members of the class for some 30 seconds. At the end of this time a screen is dropped between colored glass and lamp. The ground glass surface then appears, as a light gray; and upon this gray background the after-image of the colored stimulus develops. As an illustration of the second group we may mention an apparatus for the determination of the *minimum visible* of distance (Fig. 10). Two black points appear upon a white cardboard surface. The one point is fixed; it is painted upon the back surface of a sheet of glass which covers the cardboard. The other, painted upon the cardboard background, can be moved to or from the fixed point by means of a micrometer screw (reading to 1/200 mm.) placed at the side of the frame. The problem is to determine the last separation of the points which (under given conditions of experimentation) can still be perceived by the observer. Finally, as an illustration of a recent research instrument, we may refer to the drop-tachistoscope for range of visual attention shown in Fig. 11 (see Fig. 4).

The range of psychological instruments is very wide. In the sphere of sensation we have apparatus for work on color mixture, contrast, adaptation, after-images, color blindness and the spatial distribution of the retinal sensitivity; for work on tonal fusion, beats, combination tones; for work on the sensations of pressure, warmth and cold, on the sensations of taste and smell and on the organic (muscular, articular, etc.) sensations. In the sphere of affection we have instruments which register exactly the bodily changes that accompany change in the affective disposition (pleasantness and unpleasantness): pulse recorders or sphygmographs, breathing recorders or pneumographs, volume recorders or plethysmographs and strength recorders, ergographs and dynamographs. In the sphere of attention we have instruments for measuring the duration and the range or span of the attentive state. In the sphere of perception we have, for example, all sorts of instruments for the analysis and synthesis of visual space perception: among them the familiar stereoscope and its converse, the pseudoscope; instruments for the measurement of the various types of optical illusion, and so on. Memory and association have a whole laboratory of apparatus of their own; one of these, which exposes at regular intervals a series of words or syllables to be memorized, is shown in Fig. 12.

It should be clear, even from this hasty and imperfect survey, that the arrangement and furnishing of a modern psychological laboratory is a very complicated matter. There must be a large lecture-room, fitted with all conveniences for desk demonstrations and class experiments. There must be a dark room for work in psychological optics, and an absolutely quiet room for work in psychological acoustics. There should be a special room, specially ventilated, for work on olfactory sensation and perception. There must be a series of fairly large and well-lighted rooms for the group work of undergraduate students. There must be a series of closet-rooms for the research students. There must be research laboratories for the instructing staff. There must be a workshop, or rather there should be two workshops — one in the general laboratory, in which the students themselves may assemble complicated pieces, and make the necessary modifications in existing instruments, and another sacred to the mechanician, who is an indispensable part of the staff of an adequate laboratory. Every new investigation — and experimental psychology presents far more novel problems than can be solved, at the present rate of work, in a human generation — demands its own new set of instruments. It must be confessed that, as things are, psychology is for the most part rather shabbily housed. The science of mind appeared on the scene later than the science of life and of inorganic nature; and, when it came, funds and buildings were very largely pre-empted. There are, however, some signs that it is coming to its rights in this regard; and the next 10 years should see a very considerable improvement in the material conditions under which experimental psychologists are called upon to work in colleges and universities.

PSYCHOLOGICAL DETERMINISM. See Determinism.

PSYCHOLOGICAL SCHOOL OF ECONOMICS. See Economics.

PSYCHOLOGY has been defined, from time immemorial, as the science of mind. This definition, which agrees well with the etymological meaning of the word «psychology,» may be accepted by the modern psychologist, provided that its two terms («science» and «mind») are themselves correctly defined. This is an important point: for it is clear that the terms of a definition must be mutually compatible. If we speak of a «science of mind,» we must define the word «science» in such a way as to make it cover the field of mental phenomena, and we must define the word «mind» in such a way as to make it amenable to scientific treatment. To speak of a «science of mind» when one meant by «mind» something outside and beyond the reach of scientific method would be absurd.

The general characteristic of science is just its method. All science proceeds by observation; but the term science is not usually applied to any body of knowledge until it has reached the stage of experiment,— the stage, that is, at which its observations can be taken under standard conditions, can be repeated, isolated and varied at will. Further, the term science is usually reserved for classified and coherent knowledge; for experimental observations that can be grouped together, as illustrative of some natural law or uniformity. One of the tests of a science, from this point of view, is its capacity to predict, on the basis of natural law, what will happen, under given conditions, in the individual case. Yet again, the term science, in its strictest sense, is reserved for explanatory knowledge: the observations must not only be accurate, must not only fall into groups, under general laws, and thus render it possible to predict the outcome of new observations, but must also be linked with and referred to their own causes or conditions in the world at large. Experiment, uniformity and explanation,—these are the three tests which psychology must satisfy, if it is to rank as a science among the sciences.

Within the scope of these general requirements, the sciences are differentiated by differences of their subject matter. Now the subject matter of psychology is mind: not mind as popularly understood, perhaps, but mind which is accessible to experiment, mind whose uniformities we can discover, mind whose processes we can explain. Descartes, when he set to work to reconstitute philosophy, took his stand upon the proposition «I think.» It is a long 250 years since Descartes gave his 'Discourse' to the world; and what, to him, was metaphysical speculation has now become an unquestioned belief of common sense. We all tend to look at mind as Descartes looked at it; we all tend to say «I think,» and so to separate the «I,» as active thinker, from the «thought» which is the result of the I's activity. Psychology cannot recognize this distinction. The datum for a psychology, if it is to be a scientific psychology, is rather «Thought goes on:» «there are processes of thought in the world.» And so the subject matter of psychology is thought just as thought exists, thought looked at for its own sake and interest. Or rather, since mind is a wider term than thought, and covers the facts of feeling and of will as well as the facts of intellect, the subject matter of psychology is mental process: the whole tangle of thoughts, memories, fancies, feelings, emotions, resolves, desires, aspirations, that make up our mind as we look at it from moment to moment. The problem of psychology is to bring order into this chaos, to reduce the infinite variety of our immediate experience to a coherent and manageable system.

If it be asked how precisely this material differs from the material upon which other sciences are working, what is the criterion that differentiates the subject matter of psychology from the subject matter of physics, the reply is simple. Mental process, the material of psychology, is confined to the exeprience of a single individual; psychological experience is unshared experience. The universe of nature is common to all of us; the universe of mind is open but to one,— to each man his own. The laws of physics and of physiology take no account of the individual: sound is a certain motion of the air waves, digestion is a certain sequence of chemical changes; and the phenomena of sound and of digestion are treated abstractly, so that we can conceive of a deaf man as understanding acoustics, or of an anæsthetic patient as familiar with physiological chemistry. Psychology, on the other hand, deals with the sound as we hear it, with the hunger and thirst that we feel; and these experiences, however accurately we may express them in words, are, as experiences, incommunicable.

Two results follow from this peculiarity of psychological subject matter. The first is that the method of psychology differs from the methods of the physical sciences. All science demands observation, we have said; all exact science demands experiment. So far, then, all scientific method is one and the same. But the observations and experiments of physics and chemistry, physiology and zoology, are made upon material that is common scientific property; the observations and experiments of psychology are made upon private property, and, more than that, upon property which is inalienable. If we class the former all together as inspection, we may oppose the latter to them as introspection. In the physical sciences we look out upon a world that is shared by everyone alike; in psychology we look within, upon our personal world. From this difference in method it follows, in the second place, that the need of an experimental verification of results is more pressing in psychology than in any other department of science. If we cannot, in some way, transcend the intrinsic defect of introspection, its personal and individual character, we are likely to have as many psychologies as there are psychologists to introspect. In actual fact, the history of psychology records not a few cases of introspective deadlock,— of observation pitted against contrary observation. It was not until the introduction of the experimental method in psychology that this danger ceased to be serious.

«But,» it may be asked, «is modern psychology really free from this danger? Are all psychologists always agreed? Are there not still schools of psychology?» To answer these questions we must distinguish a little. In principle, modern psychology *is* free from the danger of introspective deadlock. Divergent observations are still made, in plenty; but psychology herself furnishes the means of reconciling the divergence. Let us take an illustration from physics. Two competent observers may be analyzing a compound body by the spectroscopic method: the one may find the lines of a certain rare element, the other may be wholly unable to see these lines. Both analyses are published. We read them, and notice that they disagree. Do we at once lose confidence in the method? Not at all: we simply hold our judgment in suspense until further observations, by the same method, are forthcoming. We say that there must, in the one case or the other, have been some unsuspected source of error which vitiated the result; and we appeal to the method itself to indicate this source of error. More observations are made, with stricter regard to the conditions of the analysis; and presently we reach a final conclusion. It is precisely the same in psychology. Experimental introspection may yield conflicting results, as does experimental inspection. But we have merely to go on experimenting, and the true result will ultimately emerge. In principle, then, psychology has nothing to fear from this particular danger. On the other hand, it must be frankly admitted that there are many and various schools of psychology. Only, the points of disagreement are points that lie outside of psychology itself. Let us, again, take an illustration from the sciences of nature. Listen to a group of mathematicians discussing the character of the infinitesimal: to a group of physicists discussing the definition of energy: to a group of physiologists discussing the mechanics of life. To hear them, one would think that the status of their respective sciences was precarious in the extreme. Yet we all make use of the calculus; we build locomotives and power-plants and rely upon the balance and the thermometer; nay, we trust our actual lives to the surgeon and the physician. Moreover, the practical work of all these sciences goes on, and goes on with increasingly fruitful result, despite the theoretical difficulties that lie behind it. So it is in psychology. Psychologists are apt to dispute the greater and more fundamental issues that lie before and after their science: these issues will always be disputed, so far as we can see, while human nature remains human nature, and men are individualized by training and temperament to envisage the universe from different points of view. In a general sketch, like the present, such differences must be baldly and plainly stated. The reader must, therefore, be warned not to lay too much stress upon them. The extreme opinions of opposing schools shade into one another by imperceptible gradations. And however extreme they may be, they have little if any bearing upon the practical work, the teaching and investigation, of mental science.

The Problem of Psychology.— We said above that the problem of a scientific psychology is to bring order into the chaos of the immediate experience. We may now note that, chaotic as this experience is, it neverthless is something more than chaos; it groups itself, roughly and indefinitely, no doubt, but still quite noticeably. If we reserve the wider term «mind» for the sum total of mental processes running their course between birth and death, we may say, first of all, that mind splits up into «consciousnesses.» A consciousness is a mental present; a mind that has a temporal «now» stamped upon it; a bit of mind that is occupied with a single, however complicated, topic. Thus, to put the matter crudely, we begin the day with a getting-up consciousness; this is followed by a breakfast consciousness; this by a newspaper or a correspondence consciousness; this by a daily-work consciousness; this by a luncheon consciousness; and so on. The divisions are real, even if they are not very accurate or precise. We notice, further, that these consciousnesses themselves fall into groups. Sometimes we are stirred and moved by the topic of consciousness: we are ill-humored, angry, anxious, pleased, relieved, aggrieved, hopeful, satisfied and what not. Sometimes we are passive, indifferently taking things as a matter of course. Sometimes we are hard at work, resolute to solve a problem or to overcome a difficulty or to extricate ourselves from an embarrassing position, bending all our energies upon a given end. Sometimes, again, we are unable to concentrate ourselves; we are talkative, reminiscential, fanciful, dreamy, whimsical. A very little introspection of this sort will suggest the distinction of the great mental categories of memory, attention, imagination, emotion, etc. Once more, we notice that the consciousnesses which fall under these categories are complex. Take the emotion of anger. It is not a simple, unanalyzable experience, but is made up of part-processes. There is the idea of the scene or act that has called up the anger; the idea of retaliation; the feeling of injury or of wounded self-esteem; all sorts of memories of one's own or of others' conduct on similar past occasions; and all sorts of «bodily» feelings,— a choking or strangling, perhaps, or a feeling of strength and power, coming with a brace of the body and a clenching of the fist. These part-processes are readily distinguishable; and they take us a step further in the analysis of consciousness, and show us the concrete processes that are termed, technically, perception and idea, feeling and desire, etc. Lastly, we may notice, after a little scrutiny, that these processes in their turn are, literally, concrete: not simple, but made up of simpler elements. My idea of retaliation, for instance, is an idea of something that would take time for its fulfilment, of something that would run its course in stages or phases. And it is more than probable that each one of the stages would, under accurate observation, turn out to be a concretion and not an elementary process.

Now this work of analysis, which we have so far pursued without the aid of any technical method, constitutes the first part of the real problem of psychology. The psychologist is called upon, first of all, to determine the number and nature of the mental elements. Mind, like all other organizations,— like the natural world itself,— is built up from certain irreducible elements; and if we are properly to understand it, we must catalogue and describe its elementary processes. Psychologists are nowadays fairly well agreed that the mental elements are of two kinds or classes: sensations (blue, gold, sour, tone C, the sensations of pressure on the skin, of muscular contraction, of smell, etc.), the ultimate constituents of the intellectual life, and affections (pleasant, unpleasant), the ultimate constituents of the life of feeling and emotion. There is no simple process underlying the volitional life; all acts of will, all resolutions and choices, are made up of sensations and affections in conjunction. On the other hand, mind is not adequately described as a resultant or derivative of the two elements. It is true that every consciousness, in the last resort, is compounded of so many sensations and a certain affection. But we find that the elementary processes of a consciousness may differ, not only in degree or intensity (as strong and weak, loud and faint), but also in clearness or distinctness. So we may speak of a «state» of consciousness, very much as we speak of the state of the roads, or of the weather or of a man's affairs. We speak always in terms of the same material: in terms of the road-bed, of rain and shine, of capital and interest. In the case of consciousness, we speak always in terms of the ultimate elements, sensations and affections. Only, as the road may be firm or muddy, the weather clear or threatening, the financial outlook good or bad, so may the processes in consciousness be clear or obscure, distinct or indistinct, powerful and insistent or ineffective, overshadowed by rival processes. It is worth noting that modern psychology thus finds a use for the phrase «state of consciousness» which is altogether different from its use in the older psychology. When consciousness was identified with the «I,» the phenomena that we now call processes of consciousness were naturally identified with the «states» or «manifestations» of the active principle; and even to-day, in popular writing, the phrase «states of consciousness» is oftentimes employed with the meaning of «conscious processes.» Such confusion of language can only minister to confusion of thought. The processes, the materials of consciousness, are one thing; the state or condition in which the materials are presented is another.

The most important states of consciousness, in the normal life, are those of attention and inattention. In attention, the processes that make up a consciousness run their course at two different levels. The processes attended-to are more clear and distinct, sometimes are stronger and last longer than their fellows; the processes attended-from are depressed, checked, obscured. In inattention, all the processes run at the same low level.

Analysis, then, the first part of the problem of psychology, leaves us with the two elementary processes, sensation and affection, and with the elementary states of attention and inattention. The psychologist is next required to bring the results of his analysis together, to make a synthesis, to formulate laws of the connection of the elements. The synthesis is tested, at every step, by appeal to introspection, that is, to the actual facts of mental experience. If the analysis has been faulty, the reconstruction will be faulty, will not square with the facts; the method thus becomes its own test of truth. Proceeding in this way, psychology is able to rise to laws or uniformities; it states the laws of color mixture, the laws of affective sequence and composition, the limits of the grasp and duration of attention. Proceeding still further along the same road, it states the laws of the association of ideas, or of the expression of the emotions. In time, it becomes quantitative, and gives numerical formulæ for the intensity of a color contrast or the trustworthiness of memory. In doing all this, it is simply following the example of the sciences of nature, organizing and systematizing its material.

If, now, psychology went no farther, it would still have claims to rank as a science. But it would be a merely descriptive, not an explanatory, science. As a matter of fact, it goes on to explan its phenomena, to give the conditions under which they occur or appear. And at this point we come upon one of those theoretical differences of which we spoke above. What are the conditions of a mental process? Some psychologists affirm that, as the mind is always found together with a living body, so it is always conditioned upon physiological processes; a mental formation of concretion is to be explained by reference to the bodily condition that underlies it. Others, again, make appeal to unconscious or subliminal mental processes, which are the condition of our conscious experience, of the supraliminal mind. And yet others would explain mind by mind, deriving mental process from mental process by a principle of mental causality. We cannot decide between these suggestions; limits of space forbid us even to give an adequate account of them. It may be said, however, that the second is the least satisfactory of the three, while controversy is keenly concerned about the other two. The experimental psychologists tend, perhaps, rather toward the first than the last.

The Method of Psychology.— The special method of psychology is experimental introspection. Two questions arise with regard to it: Is introspective observation ever really valid? And is the experimental method adequate to the whole mind, or only to its simpler processes?

It has been objected that introspection can never yield valid results, for the simple reason that it interferes with the course of consciousness. If consciousness is made up of mental processes, then introspection itself is a process or a group of processes. Hence, whenever I set out to observe a given complex, I introduce into consciousness (by the mere fact of observation) another complex, which must clash with the object of my observation. But this is a poor method which interferes with the very thing which it purports to examine and describe! The objection is usually met by the rule that one must wait to observe a mental process until after it has completed its passage; that introspective examination must always be a *post mortem* examination. On this rule, every introspection would involve memory, and be subject to the errors to which memory is subject; though the memory is in play so soon after the event to be remembered that these errors may be considered minimal. In reality, both the objection and its answer seem to beg the question of what introspection is. What the psychologist does, when he introspects, is to experience attentively, to live attentively, the process under investigation, and to make a report about his experience in words. No new process is introduced into consciousness. Whether the words that describe the experience are uttered as the process runs its course, or are pronounced after it is over, will depend upon the circumstances of observation and upon the psychologist's ability and training: no single rule can be laid down in the matter. As thus understood, there can be no question but that introspection is a valid form of scientific observation. And even apart from this theoretical justification, introspection is justified by its results.

The second question, that of the scope of experiment in psychology, has been much discussed, and with very different results. If we face it in the light of history, it seems to answer itself. Psychologists were told, at first, that they could not push the borders of experiment beyond sensation. But they invaded the spheres of affection and attention. They were then told that expermient was adequate only to the simplest states and processes of mind. But they experimented upon perception and idea, upon association and memory and imagination. They were told again that experiment could never attain to the purely intellectual, or indeed to any of the higher aspects of the human mind. But they made experiments upon judgment and reasoning, and upon the æsthetic consciousness. It is true that these latter experiments are few and scattered, and that whole consciousnesses still await experimental investigation. But there seems to be no doubt that, in principle, the entire realm of mind is susceptible to experiment. With a method thus justified, it can only be a matter of time for psychology to establish herself as securely as physics or physiology.

The Various Departments of Psychology. — Many attempts have been made to classify the different departments of psychology in accordance with some logical plan. As no such classification has received general acceptance, we may ourselves abandon the attempt to be logical, and simply pass in brief review the most important branches of psychology that exist at the present time.

We may distinguish, at the outset, an analytical from a genetic psychology. Defining roughly, we may say that analytical psychology takes the human mind as it is, and aims to distribute its elements and laws, while genetic psychology seeks to trace the growth of mind from its first beginnings, and to explain the present in the light of mental history. It is needless to say that the two psychologies overlap at many points. Analysis can seldom be completed, except by help of genetic considerations; and the study of psychogenesis implies, on its side, an analytical knowledge of the developed mind. Genetic psychology is also termed comparative psychology, and has various subdivisions: animal psychology, child psychology, the psychology of adolescence, etc.

We may distinguish, secondly, between qualitative and quantitative standpoints within psychology. Suppose, for example, that I am interested to determine the least difference between two weights that can be perceived by the lifting hand. The numerical result that I obtain is a quantitative result in analytical psychology. If, however, I attempt to trace out the various conscious factors that contribute to my judgment of difference or no-difference,— factors of expectation, of habit, of fatigue, of attention, that may affect the judgment; factors of attentive comparison, of association, of first impression, of effort or ease, that may directly prompt the judgment,— then I am performing a qualitative experiment. The two sorts of result should always go side by side, and should (in a perfect psychology) run exactly parallel,— a numerical statement accompanying the introduction of every qualitative term. Both are indispensable to complete knowledge. Genetic psychology is, at present, almost entirely qualitative, and will probably remain so for a considerable period. It is but the other day that statistical methods were introduced into the study of organic evolution.

We may distinguish, once more, between psychology as a science of mental function and psychology as a science of mental structure. The difference is very much like that which obtains between anatomy and physiology. Structural psychology seeks to discover what consciousness is composed of, when the organism is functioning in a certain way. I remember, or I recognize, or I imagine. What, then, are the constituent processes of the memory consciousness? What is my mind made up of, when I am recognizing? What actually takes place mentally, when I imagine? Many interesting facts have been brought to light by structural psychology. Thus it has been shown that, when we recognize an object, we ordinarily do so, not by way of a comparison of the perceived thing with its memory image, but simply by way of a diffused "feeling of familiarity," consisting essentially of those organic (internal) sensations which enter into the bodily attitude of relief or freedom from tension. Functional psychology seeks, in its turn, to classify and derive the functions of consciousness, the uses to which mind is put in the service of the organism. Thus it may reduce the root-functions of mind to those of cognition and interest, and trace the differentiation of the former into discrimination, integration, comparison, etc., and that of the latter into the manifold modes of conative (will) and emotive consciousness.

All these psychologies are, in one sense of the term, individual psychologies; they discuss the composition or genesis of a single, typical mind. There is, however, a specific, individual or differential psychology, whose problem it is to trace the correlation between the processes or functions characteristic of a certain type of mind, and to compare this with other minds of different types. Thus it is a fact of individual psychology, in this sense, that some minds depend mainly upon visual, other again upon auditory, and still others upon kinæsthetic (motor) images in the processes of memory, imagination and thought. Over against individual psychology, in this meaning of the word, stands national or racial psychology, which attempts to discover the forms of thought and feeling characteristic of the common mind of a people.

This common mind is, indeed, a fertile field for psychological cultivation. The mind of a people is, from one point of view, nothing more than the aggregate of the minds of the individuals composing the people. There are no new processes in the common mind: common mental processes are impossibilities. From another point of view, however, the common mind offers a distinct problem to psychology. The mental productions of men in society differ from the mental productions of the individual. No single man would ever have invented language in order to talk with himself; language is a product of the common mind. One mind may take on a habit; it requires at least two to make a law or a custom. These products of the common mind — mythology, and religious observances, language, law and custom — are treated by social psychology, which approaches them by analytic, comparative and genetic methods, and seeks to explain them in part from the nature of the individual mind, in part from the circumstances in which man, as a social being, has at various epochs of his history been placed.

Lastly, we may contrast normal with abnormal psychology. This deals with such transitory abnormalities as sleep and hypnosis, or with the chronic derangements of insanity. In every case, the key to the abnormal mind is to be found in the status of attention. In dreams, we have a limited and irregular distribution of attention; in hypnosis, an exaggerated passive attention, with its accompanying suggestibility. And we have misdirection, inertia and decay of attention variously exhibited in the various forms of mental disorder.

Here our list of the principal departments of psychology may come to an end.* All through, introspection is the special psychological method, and the dictum of introspection is the final appeal. Animals and infants and the insane cannot, of course, be called upon to introspect. Nor, for that matter, can a «common» mind. But we observe the conduct of children and animals, and interpret it in the light of our own adult introspections; we search for parallels to the abnormal in our own normal consciousnesses; and we base our study of social psychology upon the laws of the individual mind.

Mind and Body.— The question of the relation of mind to body is an old one in the history of philosophy; but it is a question that still awaits its answer. Psychology cannot avoid it; and we may, therefore, give here a brief indication of current views.

The two rival theories now most in vogue among systematic psychologists are those of psychophysical parallelism and of interaction. The former declares that mental and bodily processes run side by side, without mutual influence or interference. Every mental process is paralleled by a nervous process. But the nervous processes are links in the unbroken chain of physical causation; and this is complete in itself. Mind is wholly unable to work changes in matter. The latter theory affirms, on the contrary, that mental process influences and is in turn influenced by bodily process: our grief makes us cry, our idea that it is late makes us run to catch a train, as truly as our fit of indigestion makes us gloomy, or a cold in the head makes us stupid.

Common sense is, naturally enough, on the side of interaction. Nevertheless, the theory presents grave difficulties. We must either admit that mind is a special mode of energy, capable of give-and-take with the various forms of energy familiar to us in the natural world; or we must assume that the mind can, without expenditure of energy, deflect the course of physical molecules. Parallelism, while it sins against common sense by making mind causally inefficient, epiphenomenal, has at least the advantage that it leaves the order of the natural universe intact. It has, indeed, further advantages. It has proved to be an admirable working hypothesis for scientific psychology; and it is a purely empirical and non-committal statement of the relationship of mind and body,— a statement that may be reconciled with diverse forms of philosophical belief. It leads, perhaps, most directly to the philosophical doctrine of panpsychism, according to which consciousness is the reality and the concomitant brain-process a phenomenal symbol of this reality. This doctrine serves to reconcile the conflict between parallelism and interactionism, seeing that it guarantees the efficiency of mind while it insists upon the parallel relation of mind and body. It may be noted that Gustav Theodor Fechner (1801–87), the father and founder of experimental psychology, combined an acceptance of psychophysical parallelism, as a working hypothesis for the laboratory, with a belief in panpsychism as the only tenable metaphysics.

The Relation of Psychology to Other Sciences and to Philosophy.— Psychology comes into manifold relation with the natural sciences. As a quantitative science, it requires the aid of mathematics; as an experimental science, it requires the aid of physics. In all its forms, it presupposes a knowledge of the physiology of sense-organs and nervous system: if it seek its explanations in physiology, this knowledge must be accurate and detailed. Insanity can be understood only in the light of pathological histology; comparative psychology rests upon comparative anatomy and comparative physiology.

Nor is the relation less close with the «mental sciences.» Social psychology comes into contact with anthropology and ethnology; with political history and sociology; with philology; with the history of art, religion, law,— the history of civilization at large. It is, indeed, hardly too much to claim for psychology the central position in the classification of the sciences: a position that connects it equally with the sciences of nature, on the one hand, and the sciences of the productions of the human mind on the other.

The relation of psychology to philosophy is less easily defined. Until very recently, psychology was not a science at all, but a branch of philosophy. Now that her independence is established, psychology naturally tends to emphasize the breach between herself and the philosophical disciplines. Philosophy, on the other hand, unwilling to recognize the independence of a revolted subject, insists that psychology runs into danger as soon as ever she rejects metaphysical guidance. There is truth in both attitudes. One may be a good psychologist, at the present day, without having opened a philosophical book. Contrariwise, one cannot approach the fundamental questions that lie before and after psychology without plunging, at once, into problems of epistemology and of metaphysics. As with life and matter, so with mind; there is practical work to be done in physics and biology and psychology that may be done, and well done, without philosophical reference. But the practical work springs out of, and leads toward, theoretical issues of the widest kind.

It may be added that the central position of psychology is further warranted by its relation to the special departments of philosophy. Functional psychology is the necessary basis of logic; social psychology is the only straight path to a sound ethics; a psychological analysis of the sentiment of beauty is the prerequisite of æsthetics; the psychology of the religious consciousness is the propædeutic to a philosophy of religion. Sage Professor of Psychology, Cornell University.

PSYCHOLOGY, Animal. See ANIMAL PSYCHOLOGY.

PSYCHOLOGY, Ethnic, a division of psychology under which some modern writers include their efforts at the analysis of the mental differentiations of communities, peoples, races or tribes. The term is not in favor with a great number of writers, who include this field under social psychology, ethnology, etc. Consult Le Bon, G., 'The Psychology of Peoples' (London 1898).

PSYCHOLOGY, Social. See SOCIAL PSYCHOLOGY.

PSYCHOLOGY OF THE ABNORMAL. By the psychology of the abnormal is meant the psychology of individuals who are classed as abnormal, or those individuals who evidence in their conduct or speech or in the character of their ideas or emotions responses that stamp them as being unusual or as differing from the usual, the average, along the lines that make them less efficient in dealing with the various problems of life which they meet and have in some way to adjust to. Considered in this way the psychology of the abnormal is not a different psychology from the psychology of the normal; it is only the application of psychological principles of explanation to the understanding of the various kinds of failure of adjustment which may arise in the career of individuals.

An individual, from this point of view, may be considered as one considers a bit of material that is being tested as to its strength, its breaking point. A bar of iron, for example, may be tested by having a force applied to determine the number of pounds that must be added in order to break it. The breaking point is the function of two factors, the strength of the bar and the force applied. Some bars, the smaller ones, for instance, will break with the application of much less force than others, the larger ones, and theoretically any bar, no matter how strong, can be broken by a force if the force is only great enough. Then again, the exact place where it, the bar, breaks and the way in which it breaks, whether by a clean cut fracture at right angles to the application of the force or in a jagged irregular line depends upon the nature of the material and its uniformity or lack of uniformity of texture at the point of application. So some individuals will fail at comparatively simple problems of adjustment, while others will only fail when the problems are very difficult. And further the way in which an individual fails will depend upon his personality make-up, the kind and character of material with which he meets the difficulties.

The individuals who can only meet the simplest problems of adjustment are the defectives: at the lowest level the idiots and imbeciles, higher up the backward children and still higher the types of so-called psychopathic individuals who present an outward appearance of normality but whose lives disclose a continuous series of avoiding, side-stepping responsibilities and an incapacity for that continuity of effort necessary for success. Stronger individuals only break down under the most difficult of problems, usually only after struggling more or less ineffectually for a long time and then often only as a result of some physical illness which temporarily has reduced their strength and so comparatively increased that of the stressing forces.

Still bearing in mind the analogy to the testing of the strength of material, those individuals who only break as a result of great stress are the better organized and their failure is due rather to the degree of stress than to a faulty make-up — the failure is largely *exogenous* in origin. Those who fail to adjust to relatively simple problems show that the trouble is within, that it is more dependent upon a faulty make-up than upon the character and degree of stress. In these the failure is largely *endogenous* in origin.

Abnormal psychological reactions are thus failures of adjustment; failures of the personality make-up of the individual to adequately meet the stresses and strains. His incapacity to meet these stresses and strains may be due to their very great strength or to his relative weakness and his weakness may be constitutional, that is, natural to him, the result of inherited influences; or acquired as the result, for example, of illness, infectious diseases, injury, more especially to the brain, or methods of life that he cannot escape, such as solitary confinement in prison.

The individual symptoms of the failure are in their general characteristics dependent upon the personality make-up. That is, the disorder of the psyche must manifest itself in terms of the material disordered. Certain details of the symptoms, however, may take their coloring from the surroundings in which the difficulty occurs. This is manifest in the false beliefs — *delusions* —which occur so frequently as symptoms. An individual may compensate himself for his failure by a belief that some baneful influence is exercised over him by others. Now-a-days he not infrequently believes the influence to be brought to bear by means of wireless electricity. Manifestly, before the days of wireless transmission no such belief would have been possible.

The psychological symptoms of individuals who are mentally ill indicate the nature of their difficulties and the means which they are bringing to bear to meet them. They indicate, in other words, the existing status of the problem of adjustment with which they are confronted, the degree and character of the failure.

The most familiar symptom of mental illness is *delirium* which commonly accompanies poisoning, as by alcohol (drunkenness, delirium tremens) or some physical illness particularly when accompanied by infection and high fever. In delirium the principal mental symptom is that of confusion. The patient sees all sorts of things which pass before his vision in kaleidoscopic procession and hears voices, sometimes emanating from the people of his visions, sometimes just coming out of space. These false perceptions — *hallucinations* — are the characteristic phenomena of delirium and to the onlooker seem quite meaningless and incoherent. When the patient gets well, however, it is possible to trace their references and to appreciate that they represent the outcroppings of worries, anxieties and impulses which had before been held in check. Delirium results when illness removes the power of efficient reaction and releases all those tendencies which otherwise had been under control. There is little capacity for adjustment. With recovery from the physical illness the delirium tends to subside. Similarly when we see a picture like this, a *deliriod* type of reaction but not the result of physical illness we feel that the powers of adjustment are pretty well broken, that the constructive forces of the personality are in abeyance.

Delusions are false beliefs which represent a somewhat more definite situation as between the stresses and the personality. Delusions always represent definite attempts at adjustment, but because they are not successful, only compromises. The weak man believes himself strong, the poor man rich, while quite commonly the recognition of weakness within as a cause of failure is avoided by the delusion that malicious influences from without are the cause of the trouble. This is the mechanism of *projection* and is at the basis of delusions of persecution which are so characteristic of that mental disease known as *paranoia* and all sorts of *paranoid* types of reaction in other mental illnesses and also of those unhappy individuals who are always filled with suspicions of those about them.

Hallucinations and delusions may be the passing phenomena of some acute upset or, on the contrary, they may become fixed, stereotyped and definitely organized into a system which is relatively unshakable and remains unchanged over long periods of time. Such a system represents a type of reaction to a defect of personality make-up which is the best that the individual can do and so comes to be a final solution. The delusion is like the scar tissue that fills up a wound. It remains permanently as a disfigurement but it nevertheless represents what has been accomplished by the repair processes.

In still milder forms of mental illness, the *neuroses* and the *psycho-neuroses*, conditions that are on the borderline between the normal and the abnormal and are consistent with a considerable capacity for adaptation and apparent normality, the forms which the symptoms take are somewhat different. They take on the character of what are called *obsessions* or *compulsions*. The patient is the victim of certain ideas, feelings or necessities for action which he recognizes as abnormal or foolish but which he cannot control. Thus in the realm of abnormal ideas he may be forced to think certain disagreeable thoughts, he may be obsessed to think of certain numbers or certain phrases will recur to mind persistently or he may be forced to think how the people he meets would look if they were dead. The obsessive emotions come similarly without apparent reason. He may feel a nameless fear or anxiety or be depressed without apparent cause or he may have definite fears of certain things or situations — the *phobias* — such as claustrophobia, fear of closed spaces, misophobia, fear of contamination, etc. Compulsive acts are equally common. The patient may be forced to touch every tree he passes or forced to step over every crack or start upstairs always with the same foot. In this group are the so-called *manias* such as kleptomania, the necessity for stealing, although there may be no desire for the stolen object, pyromania the necessity for setting fires, etc. All of these tendencies represent instinctive trends which force themselves to expression but which, because they demand for their satisfaction inacceptable forms of conduct seek these devious ways of expression by attaching themselves to what usually appear to be unimportant activities.

All these abnormal forms of expression, delusions, hallucinations, obsessions, compulsions are then efforts at expression of certain instinctive tendencies which are not acceptable to the individual. They represent indulgences that at some past period were normal to the individual, that is, they are relatively infantile. The individual who flies into a rage and curses and kicks the inanimate objects of his environment, breaks furniture and tears up books, is acting like a small child that has been thwarted in some of its desires. All the other abnormal reactions could be explained in a similar way so that we might say that the abnormal as a class are not yet fully grown in some aspect of their personality, they retain infantile traits of character. This is obvious in the idiots and imbeciles but less obvious as we have to deal with better developed personalities. This explanation, however, becomes again obvious in those very dilapidated types of chronic mental illness that degenerate into helplessness, who wet and soil themselves as do infants and have to be fed and otherwise cared for just like children. Mental disease, therefore, shows reactions that reproduce types of response that were at one time normal either in the history of the individual — infancy and childhood — or in the history of the race-primitive man and from this point of view their study has been termed paleopsychology.

There are two ways of reacting to these inherent difficulties— conflicts — of instinctive expression either by turning back within onesself and reanimating infantile ways of reacting — the method of *introversion* — or by running away from the difficulty, so to speak, into reality and by developing a great activity and interest in everything about and so attempting to escape a reckoning with onesself — the method of *extroversion*. The first is, in general, the more serious type and in it we find the malign types of the psychosis such as dementia precox: the second is less serious and here we find the more benign types such as the manic-depressive psychosis. A chronic delusional psychosis such as paranoia represents a more or less permanent compromise which is not as disintegrating as the first nor as recoverable as the second.

All these methods of reacting are found equally among the relatively normal; the only differences are differences of more or less. In mental disease we find the mechanisms of normal mental life writ large because disproportionately emphasized in some direction. The symptoms of mental disease can thus be understood as the outward evidences of attempts at adjustment, made difficult by some psychological conflict and the language of the symptom, so to speak, can be translated when it is understood as expressing reactions of escape, defense or compromise in the face of the problem presented. The study of these exaggerated forms of reaction found in the mentally ill has gone a long way to help explain the psychology of the normal because the failures represent an experiment of nature, so to speak, which throws certain of the aspects of the personality into relief. A complicated mechanism comes to be understood when it gets out of order and finally by taking it apart.

PSYCHOPHYSICS. By some this science is regarded as synonymous with physiological psychology; by others, as dealing particularly with the phenomena which bring out the relation of sensations to physical stimuli. In this character it deals with the study of Fechner's and Weber's laws as a separate department of psychological science. Psychophysics deals particularly with the measurements of intensity of sensations, and endeavors to establish general laws regarding the phenomena. See DURATION; LIMINA; REACTION TIME; WEBER'S LAW.

PSYCHOZOIC, a term used by a few geologists to indicate the time since man came into the world. Some prefer to give it the rank of an era, but it is usually called the Recent Epoch of the Quaternary period, and the name Psychozoic is but little used.

PSYCHROMETER, an instrument for measuring the tension of aqueous vapor in the atmosphere. It is also known as the wet-bulb hygrometer. See HYGROMETER.

PTAH, ptä, or **PHTHA,** Egyptian god of the most ancient type, described in inscriptions as «creator of the earth, father of the gods and all the beings of this earth, father of beginnings.» He was compared by the Greeks to Hephæstus, being, like him, patron of metalworkers and sculptors. Representing the beginning of all things he was shown as an undeveloped child or dwarf (Ptah-Patack), or as a mummy. He had a magnificent temple at Memphis. See EGYPTIAN RELIGION AND SOCIOLOGY.

PTARMIGAN, tär'mĭ-gạn, a grouse of the genus *Lagopus,* which differs from the ordinary grouse in having the legs feathered to the claws, giving somewhat the appearance of a hare's foot (whence the generic name). The truncated tail has 14 or 16 feathers, most of the species become white in winter, and the nasal groove is densely clothed with feathers. There are six or eight species described, inhabiting the northern and snow-covered regions of both hemispheres, being one of the few genera characteristic of the arctic fauna; they are as much at home in snow as are the web-footed birds in water, and their plumed feet enables them to run over its surface without sinking in. They live in families during most of the year, and are monogamous; the females incubate, but the males assist in rearing and feeding the young. The males have a loud harsh or sometimes clear cry, and the females cackle like a hen. They flv swiftly without a whirring noise, and run well. They feed upon berries, buds, mosses and lichens and insects. Their pursuit affords an exciting sport; they are very shy, but when started are easily shot on account of their regular flight. The summer plumage is varied with brown, black and gray, most of the wing remaining white; in the males the mottling is finer and the colors brighter. There are three well-ascertained species in America, besides several subspecies and races. The white ptarmigan or willow grouse (*L. lagopus*) is about 16 inches long and 24½ inches in alar extent; the bill is black, very stout and convex, and broad at the tip; the general plumage in summer is rufous or orange chestnut on the head and neck; feathers of back black, closely barred with yellowish brown and chestnut; most of wings and lower parts white; tail brownish black; in winter white, with black tail; no black stripe through the eye. It occurs commonly in the northern parts of America, and in rare instances in the northern United States (Maine and Minnesota). It is found in open rocky grounds and among dwarf willows and birches. In winter they scratch in the snow down to the mosses and lichens on which they feed, collecting often in considerable flocks. In winter the flesh is dry, but is tender and with an agreeable aromatic flavor in summer. They breed in

Labrador about the beginning of June, placing the nest under the creeping branches of low firs; the eggs are from six to 14, of a fawn color or rufous ground with irregular spots of reddish brown; only one brood is raised in a season. The rock ptarmigan (*L. rupestris*) is 14½ inches long; the bill is slender, rather compressed at the tip; in summer the feathers of the back are black banded with yellowish brown and tipped with white; in winter white, with the tail black (the four middle feathers white), and the male with a black bar from the bill through the eyes. It occurs in arctic America, from Alaska to Labrador and the Gulf of Saint Lawrence. The white-tailed ptarmigan (*L. leucurus*) is found on the alpine summits of the Rocky and Cascade Mountains from New Mexico to the Artic regions. This species is entirely white in winter; and in summer the tail, wings and lower parts of the breast are white, the remainder of the plumage being a fine mixture of gray, brown and black. A fourth species (*L. welchi*) is attributed to Newfoundland. Of the Old World species the red grouse (*L. scoticus*) is peculiar to the British Islands and a famous game bird. Unlike the other members of the genus it does not become white in winter. A typical ptarmigan (*L. alpinus*) is found in northern Europe, especially in Norway. Our own willow grouse, or a closely related species, also occurs. Consul Baird, Brewer and Ridgway, ‹North American Land Birds› (Boston 1874). See GROUSE.

PTERANODON. See PTERODACTYLS.

PTERASPIS, a fossil fish. See OSTRACODERMI.

PTERICHTHYS, tĕ-rĭk'thĭs, a genus of extinct fishes belonging to the subclass *Ostracophori* and considered to be remotely related to the modern lampreys. *Bothriolepis* is a related genus from the upper Devonian formations of America, as well as the Old World. None of the species exceed a few inches in length. The affinities of these strange forms are little understood. See OSTRACODERMI.

PTERIDOSPERMÆ, tĕr'ĭd-ō-spėr'mē, or **PTERIDOSPERMEÆ,** in paleobotany, a *class,* co-ordinate with *Gymnospermæ* and *Angiospermæ,* of fossil Paleozoic fern-like plants, including all such which on the evidence available appear to have been reproduced by means of seeds. Potonie called this class *Cycadofilices.* And some paleobotanists even regard the group as a *phylum,* or primary division, and not as a *class;* and to this phylum they then apply the name «Pteridospermaphyta»; but the idea of the group's being a *class* is gaining favor. A single plant of the group is a «Pteridosperm.» The cases in which the evidence available appears to be decisive are but few; and to these have been applied the names which follow: (1) *Lyginodendron oldhamium;* (2) *Neuropteris boterophylla;* (3) *Pecopteris Pluckeneti;* (4) *Aneimites fertilis;* and (5) *Aneimites tenuifolius.*

In the first named pteridosperm, Lyginodendron oldhamium, the structure both of the vegetative and reproductive organs is known; and the evidence from comparison and association is sufficiently strong. So identification is certain and easy. And in the other cases there is direct proof of continuity between seed and plant; but only the external characters are known. In a great number of forms amounting to a majority of the Paleozoic plants of fern-like habit, the evidence — such as it is — is in favor of their having possessed *seeds.* They are pre-eminently plants resembling ferns in habit and in many anatomical characters but bearing *seeds* of the *Cycadean* type. Seeds and microsporangia,— or pollen sacs of the anthers,— are low on the fronds, and only slightly modified as compared with the vegetative leaves in Pteridospermæ. Pteridospermæ, of which only a few examples have so far been considered by paleobotanists, evidently constituted a group of vast extent in Paleozoic times. In a large majority of the fern-like fossils of that period the evidence is in favor of *reproduction by seeds* rather than by the *cryptogamic methods* of *true ferns.* The whole class of Pteridospermæ though clearly allied to the typical Gymnospermæ may be kept distinct for the present on account of the relatively primitive characters shown in the anatomy and morphology of the former. During recent years a number of Carboniferous and Permian plants have been very thoroughly investigated in the light of modern anatomical knowledge, and as a result it has become clear that in those times a large series of plants existed intermediate between the modern Gymnospermæ,— especially the Cycads,— and the true ferns.

The first definite evidence of the mode of reproduction of Lyginodendron oldhamium was due to the studies of F. W. Oliver, who in 1903 identified the seed Lagenostoma Lomaxii by means of the glands on its capsule, which agree exactly with those on the associated leaves and stems of the plant. No similar glands are known on any other Palæozoic plant. Lagenostoma Lomaxii is a small, barrel-shaped seed, 5.5 by 4.25 mm. when mature, enclosed in a husk or capsule, which completely envelops it when young but ultimately opens. The male organs of Lyginodendron oldhamium were discovered by Kiddon, a year or two after the seeds were identified. They are of the type known as Crossatheca, formerly regarded as a Maratteaceous fructification. This is the *first* case in which the pollen-bearing organs of a Pteridosperm have been identified. It will be noticed that while the seeds of Lyginodendron oldhamium were of an advanced Cycadean type, the microsporangiate organs were more like those of a fern, the reproductive organs thus showing the same combination of characters which appears in the vegetative structure. It must here be mentioned that the family Calamopityeal, allied anatomically to Lyginodendreæ, is of the Devonian and Lower Carboniferous age.

H., ‹Studies in Fossil Botany› (2d ed., London 1908–09); Seward, A. C., ‹Links with the Past in the Plant-World› (Cambridge 1911); Stopes, M. C., ‹Ancient Plants› (1910).

PTERIODOPHYTES. See FERNS AND FERN ALLIES; PALEOBOTANY.

PTERODACTYLS, tĕr'ō-dăk'tĭlz, an order of extinct flying reptiles technically known as Pterosauria. They lived exclusively during the

Mesozoic period, from the beginning of the Jurassic to near the close of the Cretaceous. Their fossil remains have been found in Europe and North America, but are best known from the chalk deposits of western Kansas, where many hundred specimens have been collected. Of known reptiles they are nearest allied to the dinosaurs (q.v.); they are only distantly related to birds. They are especially characterized by their very hollow bones and the extraordinary elongation of the fourth (according to some authors, the fifth) finger, which supported a thin bat-like membrane that extended to the sides of the body and the legs. Not only were the bones very hollow, more so than in any living birds, but they were composed of very dense osseous tissue and were pneumatic, that is, had openings, usually near the ends, for the ingress and egress of air, as in birds. The nature and extent of the wing membrane, or patagium, are known from impressions in the rocks, but the covering of the body elsewhere is still in doubt. That the body is not clothed with feathers is certain, but it may have had, like that of most reptiles, horny scales.

The neck was more or less elongated and very flexible; the legs were relatively feeble and of but little use in locomotion upon land; the breastbone, which is poorly developed in other reptiles and wholly absent in early reptiles, was of great size, covering the whole under side of the thorax. Unlike birds, however, it had no real keel but only a stout projection in front for the attachment of muscles. The pelvic or hip bones were well developed for the support of the hind legs, which were of material use in flight. The fifth finger was absent; the first three fingers were short and useful only for clinging to rocks and branches.

In all the early kinds, those from the Jurassic, the skull, of moderate length, was provided with long and sharp teeth. The tail was long and flexible and had at its extremity a diamond-shaped expansion for use in controlling flight. The bones of the skeleton were less hollow and the wing was proportionally less elongated. The first bone of the wing-finger, that is, its metacarpal, was relatively short, never longer than the forearm, and the first three fingers were articulated directly with the wrist. There were five separate toes and the feet were of some use upon land. None was of large size, not exceeding five or six feet in expanse. The best known form is *Rhamphorhynchus* (Fig. 1), and the group or suborder is known as the *Pterodermata.*

FIG. 1.— The Rudder-tailed Pterosaur, Rhamphorynchus phyllurus Marsh. From the lithographic shales of Solenhofen (Jurassic). One-seventh the natural size.

The later and much more specialized group, beginning near the close of the Jurassic, known as the *Pterodactyloidea,* had the skull more elongated, the wing-finger longer, with its metacarpal longer than the forearm, the first three fingers of the hand loosely attached in the flesh, the tail vestigial, the pelvis larger and firmer and the feet with only four toes. The earliest of these, of which *Pterodactylus* is the best known example, were small, some with a body not larger than that of a sparrow, and they had teeth in the jaws. The later ones, however, those from the Upper Cretaceous, of which so many are found in America, reached a size of more than 20 feet from tip to tip of wings. The skull was very long and slender, in some with an enormously developed crest upon the back of the head, and the jaws were without teeth. The neck was longer and more flexible, in many with additional articulations, giving greater strength; the bones of the shoulder were united into a firmly ossified ring, which, unlike all other known animals, articulated directly with the spinal column; the wrist was firmer; the wing-finger still more elongated; the small bone of the legs had disappeared, as in birds; and the first bone of the ankle, the astragalus, had become indistinguishably united with the leg bone, as in birds. The most noted member of this group is *Pteranodon.*

In their maximum and final development the pterodactyls attained the highest volant powers of all creatures, whether of the past or present, being quite incapable of locomotion except in the air. *Pteranodon,* with a wing expanse of 22 or more feet, had a body smaller than that of a turkey. *Nyctosaurus,* an allied genus from Kansas, with a body only six inches long and five or six inches across the shoulders, measured eight feet from tip to tip of expanded fingers, and probably did not weigh more than five pounds when alive. They doubtless spent most of their time in the air, resting suspended from cliffs by their small clawed fingers, much like the way of bats, except that their fingers, instead of their toes, are used for suspension. The presence of bony plates in the sclerotic membranes of the eyes indicates either nocturnal or soaring habits. (Cf. Fig. 2).

In flight, unlike birds and bats, their «wings» served more as gliding surfaces, and could have been used only for upward and downward motion. Flight was controlled by the legs, which were extended backward and connected by membrane, serving the purpose of the feathered tail in birds. The rudder-tailed *Rhamphorhynchus* (Fig. 1) was a veritable monoplane.

Their food habits are only imperfectly known. Because so many of their remains are found in ocean deposits, it is believed that they fed largely upon fishes, and this assumption is strengthened by the discovery, in several instances, of the remains of their stomach contents containing comminuted fish-bones. But it is probable that they also lived in part upon other flying creatures, insects and small birds, which must have been swallowed whole. Their brain was better developed than in other reptiles, and because of this and of the highly-developed, pneumatic skeleton, it has been thought by some that they were warm blooded; they have even been placed in a separate class of back-boned animals. They were, however, true reptiles, even though warm-blooded, which may have been possible.

Remains of young pterodactyls have never been found. Like most reptiles they were probably oviparous, since otherwise, among the many hundreds of known specimens, embryonic young would probably have been found. The bones of the pelvis, unlike those of birds, were closely connected, and only eggs of small size could have passed through it, not much larger than hens' eggs, even in the largest kinds. Such small young would have been practically helpless, which, together with the greater intelligence of the adult animals, as indicated by their large brains, renders it probable that the young were cared for by the parents until able to care for themselves. These facts suggest limited breeding grounds, and extensive seasonal migration. (Note Fig. 3).

FIG. 2.— Outline of the skull of *Pteranodon longiceps* (from the Kansas chalk), showing the great steering crest. The crest is fully two-fifths the length of the skull, which measures nearly four feet from tip of sharp bill to end of crest.

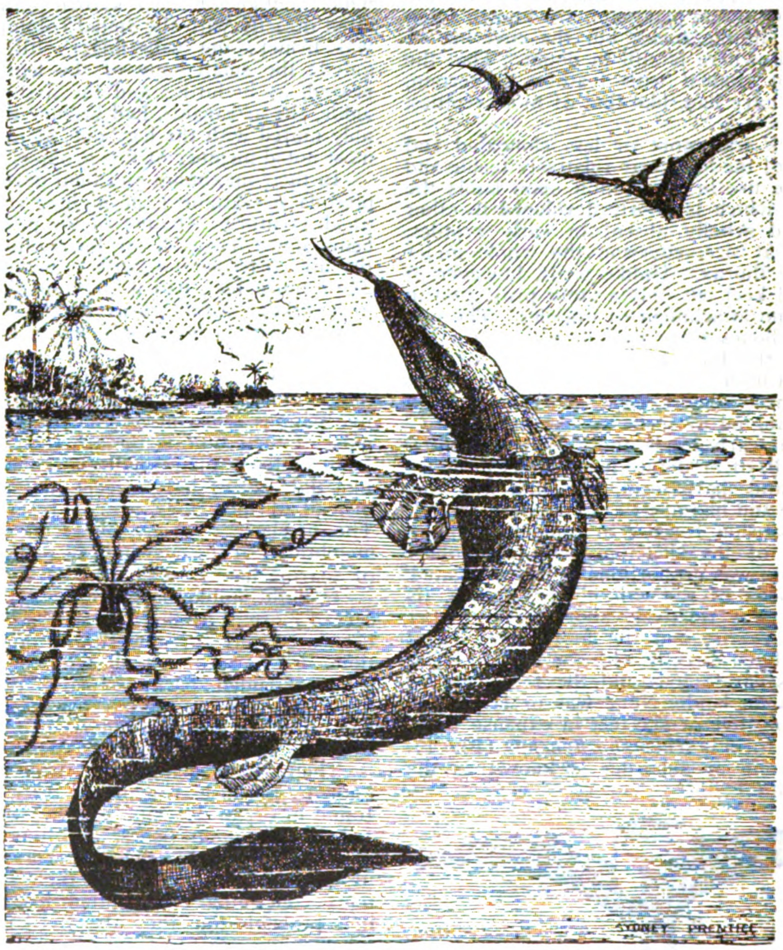

FIG. 3.— *Crested Pterodactyls* as they appeared in life, hovering over the palm-lined shores of the Kansas inland sea of the chalk period. (The details are scientifically accurate. A mosasaur and crinoid or "stone-lily" in the foreview).

About a dozen genera are defined, of which *Rhamphorhynchus, Dimorphodon, Pterodactylus, Pteranodon* and *Nyctosaurus* are best known. In North America, with the exception of some fragmentary remains from the uppermost Jurassic, *Pteranodon* and *Nyctosaurus* are the only, though abundantly represented genera.

Bibliography.— Cuvier first named this group. Consult the «Ossemens Fossile,» (1809 and 1824). Also consult Buckland's Bridgewater Treatises, 1837. Later works are H. G. Seeley's 'Ornithosauria and Dragons of the Air' (1870 and 1901). The discovery and description of the American forms is found in the scientific writings of O. C. Marsh, S. W. Williston and G. F. Eaton. Consult especially Eaton, 'Osteology of Pteranodon,' Memoirs of the Connecticut Academy of Arts and Sciences for July 1910, where many illustrations of the Pteranodon crests are given.

S. W. WILLISTON.

PTEROPOD OOZE. See PTEROPODA.

PTEROPODA, a group of mollusks, formerly regarded as a distinct class, but now known to be only a suborder of the episthobranch gastropods, especially modified for a pelagic life. Like the other opisthobranchs, they are simple in structure, the heart being posterior in position and the nervous system without a trust. They are hermaphroditic. The name pteropod refers to the ring-like development of lateral processes (parapodia) of the foot, which serve as fins by means of which the animals swim. The head and usually the tentacles and eyes are lacking. Some of the species are naked, while others secrete delicate shells, which are in some cases spiral (*Limacinidæ*), or straight slender cones (*Carolinidæ*), or more or less pyramidal (*Hyaleidæ*). All of the species are small, many being almost microscopic in size. In certain parts of the ocean these animals are so abundant that their dead shells, accumulating on the bottom, have given the name «pteropod ooze» to the deposits. In the northern seas one species (*Clione papilionacea*) occurs in enormous numbers, forming a large element in the «brit» on which the right whales feed. Fossil pteropods are well known from all rocks from the Lower Cambrian to the present. Consult authorities cited under MOLLUSCA. See OOZE.

PTEROSAURIA, a subclass of Mesozoic reptiles, prominently characterized by the power of flight; the pterodactyls. Anatomically, they have fixed quadrate bones, and the anterior limbs formed into wings, with enormously elongated ulnar finger carrying a patagium. The group consists of an order (*Pterosauri*), divided into two suborders: *Pterodactyli* and *Pteranodontes*. See PTERODACTYLS.

PTERYGIUM, a fan-shaped patch of mucous membrane on the ocular conjunctiva, its base being usually at the inner angle of the eye (the canthus), its apex at the margin of the cornea or overlapping it. It may appear on the temporal side of the eye; sometimes two of the patches occur in the same eye and cover the whole cornea as with a thick veil, preventing vision. Pterygium occurs in middle and advanced life, and may be either stationary or progressive. In the progressive form the patch is fleshy and the vessels are pronounced; in the non-progressive form it is pale and flat. The ordinary (regular) pterygium is due to irritation of the conjunctiva by dust and minute bodies. It may become inflamed and lead to ulceration of the conjunctiva and cornea and to impaired vision. Irregular pterygium is usually the result of burns or ulcerations. Paronychia is sometimes spoken of as pterygium digiti; pinguicula, a fan-shaped yellowish patch on either side of the cornea in old age, due to irritation from dust, etc., and leading to colloid inflammation, is sometimes called pterygium landaceum or pterygium pingue. Pterygium unguis is a condition in which the epidermis coats the nail with a thin transparent layer. For treatment of peterygium, removal by excision, strangulation, cauterization or curettement may be employed. See EYE and consult works referred to under that article; also 'Reference Handbook of the Medical Sciences' (New York 1916).

PTERYLOGRAPHY, the description of the arrangement and habit of growth of feathers (*pterylosis*) on the body of a bird. A bird's plumage does not grow evenly from the whole surface of the skin, but in certain tracts (pterylæ), the form, extent and disposition of which differs in the various orders, families and genera; so that the pterylosis is a character of importance in classification. The fact that the nearest approach to a uniform clothing of feathers occurs now in the ratite birds, penguins and the like, which are lowest in organization and of most ancient origin among birds, indicates that pterylosis is a comparatively modern acquisition, and its more striking manifestations occur among birds otherwise referable to a high rank in classification. The principal feather-tracts are similarly disposed in all the groups and consist of a tract embracing the head; a tract along the spine; a line along each side of the neck, down each side of the breast and along the side of the abdomen curving inward to meet at the vent; a line lengthwise across the shoulders; two patches upon each leg; and the regions of growth of the wing and tail feathers. The disposition of the powder-down tracts is also a part of pterylography. This matter was first expounded by the German naturalist, Nitzsch, author of 'Pterylographie' (Halle 1847), whose work was translated and extended in a volume of the Ray Society of London for 1867. Consult Newton, 'Dictionary of Birds' (1893–96).

PTERYLOSIS. See PTERYLOGRAPHY.

PTOLEMAIC SYSTEM, *in astronomy*, the system by which Claudius Ptolemy tried to explain celestial motions. For 14 centuries this was the universally accepted and authoritative system of astronomy, only being completely overthrown upon the development of the Copernican system by Kepler toward the middle of the 17th century. The very long time during which the system of Ptolemy was received may perhaps be more clearly realized from the statement that though it was first proposed so early as the 2d century, A.D., in the early days of our American universities it was still taught in connection with that of Copernicus. This was doubtless because, so far as was evident from the rough, naked eye, observations of the sun, moon and planets, it seemed to account for all of their complicated apparent motions in a wholly satisfactory manner. According to this system the earth is the fixed centre of the universe; a vast sphere, the «primum mobile,» carries all the clestial bodies, and rotates once a day; the sun and moon travel in eccentric circles round the earth, and this accounts for the annual motion of the sun, and the monthly motion of the moon; each planet moves in a circular path, termed its epicycle about a point, and this point travels in an eccentric circle round the sun; all motions in each order of circle being described uniformly, this explained the looped paths, the progressions, stations and retrogradations of the planets. But every new astronomical observation required a new contrivance on this system, and at length the necessary cyclic and epicyclic combinations became excessively cumbrous. The discovery of the elliptical form of the orbits, in the 17th century, and especially the development by Newton of the principles of mechanics, which wholly govern all the motions of the planets, quickly made it evident that the reality of the Ptolemaic system was a manifest impossibility.

PTOLEMY, tŏl'ĕ-mĭ (PTOLEMAIOS), the name of a line of Græco-Egyptian kings, who ruled from the death of Alexander the Great till the Roman occupation of Egypt 323–30 B.C. The name Ptolemy, though the common, was not the exclusive name of the kings of this dynasty, and they are better distinguished by the surname Lagidæ, from Ptolemæus Lagus, the founder of the dynasty, also surnamed Soter. Consult Budge, 'A History of Egypt' (New York 1902); Mahaffy, 'The Empire of the Ptolemies' (London 1895); id., 'A History of Egypt under the Ptolemaic Dynasty' (New York 1899); Meyer, 'Das Heerwesen der Ptolemäer und Romer in Ægypten' (Leipzig 1900); Starck, 'Die Dynastic der Ptolemäer' (Berlin 1897).

PTOLEMY I (called SOTER, «the Saviour»): b. Macedonia; d. 283 B.C. According to Lucian he was born about 367 B.C., but on the supposition of his being a son of Philip it must have been some years later. In 330 B.C. he was admitted into the body-guard, and from this time appears in important transactions. During the Indian campaigns he was regularly employed in the most important commands, and distinguished himself alike for valor and capacity as a general. He continued on terms of intimate friendship with Alexander, and accompanied him in his last campaign 324 B.C. On the death of Alexander he attached himself to the party of Perdiccas, and secured for himself the government of Egypt. He then proceeded to strengthen himself in his government, and concluded a secret league with Antipater against Perdiccas. In the arrangements made after the death of Perdiccas Ptolemy retained Egypt; and subsequently strengthened himself by marrying Eurydice, daughter of Antipater. On the death of Antipater (319 B.C.) Ptolemy united with Cassander and Antigonus against Eumenes, and on the defeat of Eumenes by Antigonus joined Cassander and Lysimachus against Antigonus, who invaded Syria, 315 B.C., overran Phœnicia, and laid siege to Tyre, which he took in 314 B.C. Cyprus revolted in 313, and Ptolemy proceeded thither in person, and reduced the whole island. In 312 B.C. he invaded Palestine. In 311 a general peace was effected, but it was not of long duration and was broken by Ptolemy in 310 B.C. In 308 he invaded Greece, but made little progress, and Antigonus now resolved to wrest Cyprus from Ptolemy (307 B.C.). The Egyptians were totally defeated at Salamis, and Cyprus fell into the hands of the victor, who assumed the title of king. In 305 B.C. Ptolemy assisted the Rhodians against Demetrius, and from the Rhodians on this occasion acquired his surname of Soter. In 302 a league was formed against Antigonus, but alarmed by a false report that Antigonous had won the battle of Ipsus he retired to Egypt. The defeat and death of Antigonus in this battle raised Seleucus to a position of great power, and a dispute ensued between him and Ptolemy 295 B.C. Ptolemy recovered Cyprus, which became a permanent dependency of Egypt. Ptolemy had two sons by Eurydice, but determined to bestow the crown on Ptolemy Philadelphus, a younger son by his favorite wife Bernice. He announced his own retirement, and caused him to be proclaimed as his successor 285 B.C. Ptolemy is regarded as the most prudent of the successors of Alexander. His internal administration of Egypt was enlightened and successful. He raised Alexandria to the highest rank in commercial prosperity, and founded in that city a colony of Jews, to whom the special place taken by Alexandria in subsequent times in philosophy and literature, as well as in politics, was in great measure due. He was also an eminent patron of literature, science and art, and founded the library and museum of Alexandria. He himself wrote a narrative of the wars of Alexander, used as authority by Arrian. For bibliography see PTOLEMY.

PTOLEMY II (PHILADELPHUS): b. Cos, 309 B.C.; d. 247. He was raised to the throne during the lifetime of his father Ptolemy I. He concluded a treaty with Rome after the defeat of Pyrrhus, and continued faithful to his allies during the Carthaginian War. There was a chronic but uneventful war carried on during his reign with Syria. Toward the close of his reign it was terminated by the marriage of Ptolemy's daughter Bernice to Antiochus III. Either by the treaty or in the course of the war Ptolemy acquired Cœle-Syria and Phœnicia. He was also, in general, on hostile terms with Macedonia. But the chief care of Ptolemy was directed to the internal administration of his kingdom and the encouragement of commerce. He founded Arsinoë (on the site of Suez) to protect the navigation of the Red Sea and Berenice on the Red Sea Coast, and from the latter place formed a road to Coptos on the Nile, by which the commerce of India and Arabia continued for ages to pass to Alexandria. The chief glory of Philadelphus was his munificence as a patron of science and literature. He raised the institutions founded by his father to the highest degree of splendor and spared no pains to fill the library of Alexandria with all the treasures of ancient literature. Among architectural works of merit erected during his reign were the lighthouse on the island of Pharos, the Alexandrian Museum, and the royal burying-place. He founded numerous cities and colonies not only in Egypt, but in Syria and Cilicia. He is supposed to have been the patron of Manetho in his Greek rendering of Egyptian history, and there is a tradition that it was at his instance that the Seventy made their translation of the Old Testament. During his reign the dominion of Egypt extended into Ethiopia, Arabia and Libya and embraced the provinces of Phœnicia and Cœle-Syria, besides extensive tracts in Asia Minor and the islands of the Mediterranean.

PTOLEMY III (surnamed EUERGETES). son of Ptolemy II; d. 222 B.C. He succeeded

T., 'On the Origin of the Maps Attached to Ptolemy's Geography' (in *Journal of Hellenic Studies,* Vol. XXXVII, pt. I, p. 62, London 1917); Winsor, J., 'A Bibliography of Ptolemy's Geography' (in *Harvard University Library, Bibliographical Contributions,* No. 18, Cambridge 1884).

PTOMAINES, a series of organic nitrogenous bodies, closely resembling the vegetable alkaloids in many of their chemical properties. They are present in many animal products, and are formed either by the chemical breaking down of complex nitrogenous molecules or by bacterial agencies capable of inducing similar decompositions. Most of the ptomaines are ammonia compounds. By the older chemists all of this group of so-called animal alkaloids were termed ptomaines, but later studies have given a series of groups of these bodies. Thus ptomaines, leucomaines and toxins are at present recognized; the former being the results of abnormal catabolic changes, due to chemical or bacterial agencies; the leucomaines being usually normal catabolic compounds of this group. The toxins are ptomaines, products usually of bacterial decomposition or ferment activity of some type or other, and which are poisonous. Many of the ptomaines are inert; others, the toxins are poisonous, some highly so. Ptomaine-poisoning resulting from eating altered sausage meat, mussels, tinned meats, etc., is due to some form of toxin. Chemically the ptomaines contain carbon, hydrogen and nitrogen. They belong mostly to the amines or substituted ammonia compounds, monomethyl amine, $N \begin{smallmatrix} \diagup H \\ - H \\ \diagdown CH_3 \end{smallmatrix}$ being one of the simplest of these bodies. It is present in many decomposing foods, and even as mercurialine in a living plant. Dimethylamine, $(CH_3)_2NH$ and trimethylamine, $(CH_3)_3N$, are similar ptomaines of this simpler group. Amines of higher alcohols are also common forms, ethylamine, butylamine and others being examples. Putrescine and cadaverine are more complex ptomaines which have been isolated from putrescent meat. They are both diamines. Neuridin, $C_5H_{14}N_2$, was one of the first of this class isolated by Brieger, the practical founder of the study. Choline, neurine, betaine and muscarine are four oxygenated ptomaines of closely related chemical structure that are peculiarly convertible one into another by simple chemical processes. Choline is non-poisonous, but neurine and muscarine are highly toxic. They are found in decomposing meat. Muscarine, from the poisonous fly-mushroom, is thought to be identical or very closely similar to the choline, neurine, muscarine compound. Mytilotoxin is the specific poison of the mussel. Typhotoxin and tetanotoxin are ptomaines supposed to be the active poisons produced by the typhoid fever and lockjaw bacteria. Tyrotoxicon is a toxic ptomaine found in cheese and in ice cream. At least 200 ptomaines have been described. (See TOXINS and ANTITOXINS). For a full consideration of the many lines of thought on this subject, consult Vaughan, V. C., 'Ptomaines and Leucomaines and Cellular Toxins' (with Dr. Novy); 'Protein Split Products' (with Vaughan, V. C., Jr., and Vaughan, J. W., 1913).

PTOSIS, tō'sĭs, a falling or drooping of the upper eyelid owing to paralysis of the muscle that lifts it. It is somtimes congenital and it may be produced by various disorders of the brain.

PTYALISM. See SALIVATION.

PU-LU, poo'loo. See FERNS AND FERN ALLIES; FIBRE.

PUBERTY, the period in both male and female marked by functional development of the generative system. This period, when capacity for reproduction begins, is indicated in both sexes by certain characteristic signs. In the male puberty is generally reached, in temperate climates, between the ages of 15 and 18, and although it is commonly believed to be reached somewhat earlier in warm regions, climatic conditions appear to affect the male less than the female. Before the attainment of this period the physical powers have been appropriated to the nutrition of the body. This is in accordance with a well-known law of physiology, whereby the processes of nutrition and reproduction are mutually antithetic; the reproductive energies are opposed to the nutritive, and act as an important drain upon the physical and nutritive powers. Therefore the generative instincts are limited or restrained until nutrition and growth have been duly advanced.

In the male the occurrence of puberty is marked by a varied and general change in the physical constitution. The body attains, within a comparatively short period, a large relative increase in size. The form acquires greater fulness and stamina. The larynx particularly enlarges; the voice deepens; there is a growth of hair upon the face, the pubes, etc.; and the entire sexual system receives an unwonted stimulus, the testes secreting the seminal fluid characteristic of full sexual vigor. The male thus reaches sexual maturity. In ordinary cases his virile powers decrease after the age of 50 or 60, when the energies seem to be withdrawn from the reproductive function in the interest of nutrition.

In the female the state of puberty usually begins, in temperate climates, between the 14th and 16th years. At this period the female form acquires a characteristic fulness and roundness. The breasts enlarge, depositions of fat taking place in the mammæ and on the pubes, and over the body generally. The internal organs of generation also enlarge, and their functional perfection in woman is marked by the most unequivocal of the signs of puberty, the appearance of menstruation (q.v.). The production of ova, ready for fertilization, is the most essential and significant sign of the full attainment at once of puberty and of the true female generative functions. (See OVARY). Puberty in both man and woman may be retarded or advanced by individual and inherited peculiarities of constitution and by modifying circumstances and habits of life.

PUBLIC FINANCE. 1. Definition and Scope of Public Finance.— Governmental organization is necessary in any society which has passed beyond the lowest stage of social development, and in modern industrial states the functions and needs of the government are large and important. Public finance treats of the raising and application of the resources of the state. It analyzes the needs of the state and the means by which these needs may best be met, that is, it treats of public expenditure and public revenues. It also describes the methods by which these are determined upon and raised, which leads to a discussion of financial legislation and budgetary practice. And finally the subject of public credit, by which the orderly income of the state may be anticipated, is included by most writers as falling within the scope of public finances. This gives a fourfold division of the subject.

2. Public Expenditures.— It is practically impossible to lay down any principles governing public expenditures, since before we can do this a prior question has to be answered, namely, what are the proper functions of the state. The answers to this stretch all the way from the extreme individualism of Herbert Spencer, which would limit the duties of the state to the protection of life and property and the enforcement of contracts to the collectivism of modern Socialists, who would enlarge the activities of the state to such an extent that they would absorb all private enterprise. We may, however, treat the question of public expenditure as a practical problem in each specific case, to be determined on its merits without reference to any a priori theory.

Upon one point there is no difference of opinion: the tendency of public expenditures has shown a steady and universal tendency to increase. This has been true under centralized administration, as in France, or under decentralized governments, as in the German states; in large countries like Brazil or in small ones like Belgium; in democratic countries like Switzerland or despotic ones like Russia; in old countries like Greece or new ones like the United States. Part of the seeming increase, to be sure, may be accounted for by the growth of the population, the growth of money payments in lieu of payments in services or kind, the general advance in wealth and the decline in the value of money. But after making all these allowances there still remains a real increase to be accounted for, especially since the beginning of the 19th century.

The direction of the growth of public expenditures will become clearer if we distinguish three classes, namely, those for protection or defense, those involved in carrying on public works and those for the social welfare of the citizens. The first includes not only military expenditures, but also those for police, the courts and the preservation of domestic tranquillity. Some years ago Herbert Spencer laid down the dictum that as society advanced it would expend less for militarism and more for amelioration, but the former part of this statement at least seems not to have been borne out by the facts. Responsible for this is the growing cost of modern armament. War is incredibly expensive, the total money cost of the World War being estimated at about $186,000,000,000. Peace to-day costs the great modern powers more than the most expensive war of antiquity, and the greater the progress in invention the greater is the expense involved in replacing obsolete equipment with new. Even in a country as free from war as the United States has been in the last 50 years, over two-thirds of the Federal expenditures to-day are directly or indirectly attributable to war and preparation for war. Police and court and similar expenses probably show a tendency to decrease, and it is possible that the future may also see a decline in the expenditures for war, but no such tendency can now be predicted.

There is a decided tendency for the second group of functions to increase. The number and variety of services undertaken by the state is daily increasing, and there is constant pressure from the citizens of all modern states that the government shall expand its functions still further. The post office, national railways, telegraph and telephone systems, municipal water, light and street car systems, are a few of the more important lines along which the state has entered the industrial field, while most governments own lands, forests and mines which they administer. As to whether these enterprises shall cause a corresponding increase in net expenditures or whether they will pay for themselves is a matter of public policy and administration. If managed on business principles the growth of this group will have no effect in increasing the burden upon the taxpayer.

Expenditures for social amelioration and for the development of the well-being of the mass of citizens fall in the third group. These include such items as education, recreation, the care of the dependent and defective classes, and the control and regulation of private industry for the purpose of eliminating unfair and undesirable practices. That these have grown rapidly in the past needs hardly to be stated, and there is every reason to believe that they will increase even more rapidly in the future. From one standpoint they may be regarded as an investment which the modern state makes in its citizens, from which it reaps large returns in the form of greater efficiency, knowledge, contentment, decrease of suffering and improvement in the general standards of living.

The economic effects of public expenditures are far-reaching; if wisely directed they may greatly benefit a people while an unwise outlay may work positive harm. But there is probably no more widespread economic fallacy than that public expenditure, no matter to what purpose directed, is a desirable thing in itself, since it "puts money in circulation." Adam Smith, however, as early as 1775, contended that whether it was beneficial or not depended upon the purpose for which it was spent, and this is the correct view, though sadly overlooked in our pork-barrel and similar wasteful government expenditures in the United States. As to what is regarded as beneficial will again depend upon the particular point of view; war is considered so by some writers. In general it may be said in conclusion that no general rule can be laid down to govern public expenditures.

Much will depend upon the stage of political and social development of a people. But that state may be considered to make the wisest expenditures which returns to its citizens relatively the greatest amount of benefit therefor, irrespective of whether these expenditures be large or small.

3. **Public Revenues.**— The revenues of the state have been variously classified by different writers, but it is possible to subsume all important sources under two heads, namely, (1) contractual or commercial revenues and (2) taxes or compulsory revenues. According to this classification, fees, special assessments and fines should be included in the second group, while such minor or unusual sources of revenue as gifts or indemnities would be included in the first. For all practical purposes such a broad classification serves as well as the more detailed ones of some writers.

Contractual revenues are derived in general from two main sources, public domains and public industries. Of these the former has been the more important in the United States. There are in general three policies which governments have adopted respecting the public domain. One is for the government to cultivate its own domain. This was the general practice in the mediæval period when the revenues of the ruler were not sharply distinguished from those of the public treasury, and is still followed in many European countries which are influenced by feudal custom. Owing to the intensive nature of agriculture, which calls for close personal attention, this method has not yielded large revenues. In the case of forests, however, this policy may be heartily approved. A second possibility is for the government to retain the title but lease its domain for cultivation. Such a policy would involve serious political dangers in the United States, owing to the pressure to make unduly favorable leases for partisan or personal reasons, and may be dismissed as unworkable. In some of the European countries, however, and notably in India, such a policy seems to work well and is highly endorsed by writers on public finance, especially in the case of mineral deposits. A third method, and this is the one which has been followed in the United States, is for the government to dispose of its public domain by sale or gift. If it is settled by an industrious and intelligent agricultural population the government will probably be able to secure larger revenues from taxation of the increased wealth and land values than from the receipts from direct farming by the state or from rentals from tenants. Solely from the standpoint of public finance, therefore, the policy of the United States government may be approved.

Public industries vary greatly from country to country, as they have varied in number and extent from time to time. At one extreme stands Prussia, owning and operating its railroads, telegraphs and telephones, and in large part managing its mines and forests, to say nothing of its porcelain factories and other government plants. At the other stands probably the United States, which until the war confined itself practically to the administration of the post office. Municipalities differ among themselves no less in regard to their public industries, though here the movement for government enterprises is much stronger than in the case of the central governments. The industries selected for government management have usually been socially desirable but unremunerative, as education; of general interest to all the people, as the post office or waterworks; monopolistic in their nature, as telegraphs or street railways; and fairly simple in administration. The revenues from public industries will, of course, differ greatly from country to country according to the policy of administration.

Taxation remains the principal source of revenues for all modern governments, and one that is growing rather than lessening in importance. A tax may be defined, in John Fiske's alliterative description, as a "portion of private property taken for public purposes." It must always be for a public purpose and it involves the power of legal coercion on the part of the sovereign. Because of this characteristic it is highly essential that a tax system be just and equitable. Probably no passage in the literature of finance is more celebrated than that in which Adam Smith stated his well-known canons of taxation, which may be summarized as follows:

"1. The subjects of every state ought to contribute toward the support of the government, as nearly as possible in proportion to their respective abilities; that is, in proportion to the revenue which they respectively enjoy under the protection of the state.

"2. The tax which each individual ought to pay ought to be certain and not arbitrary.

"3. Every tax ought to be levied at the time, or in the manner in which it is most likely to be convenient for the contributor to pay it.

"4. Every tax ought to be so contrived as both to take out and to keep out of the pockets of the people as little as possible over and above what it brings into the public treasury of the state."

In addition to these requirements of justice, certainty, convenience and economy, a satisfactory tax system should also be productive of adequate revenues, and elastic or responsive to the needs of the government.

Some writers, as for instance the Physiocrats of the 18th century and the single taxers of to-day, argue that a simple system of taxation is preferable to a multiple system, and both of these schools have urged the substitution of a single tax on land or on land values for all existing taxes. It may be urged, however, that it is possible to realize the various ideals just enumerated, especially of adequacy and elasticity, only by a multiple or plural system of taxation. Moreover, only by the employment of various kinds of taxes is it possible for a government to achieve other ends by means of the taxing machinery, as protection, regulation of the liquor traffic, etc. All modern governments use a plural system of taxation, in some cases leaving but a few sources of revenue untapped.

The canon of taxation upon which most emphasis has always been laid by writers on public finance is that of justice. The first question that suggests itself in this connection concerns the relative duty of citizens to pay taxes for the support of the state. How shall the tax burden be apportioned among the taxpayers? Two main answers have been given to this problem: the benefit and the ability theories of taxation. According to the benefit theory taxes should be apportioned among the citizens according to the value of the services of the government to them — a sort of pay-as-you-use plan. It is evident that an attempt to carry out such a theory practically would result in imposing excessive taxes upon those least able to bear them; the defectives in our state institutions would bear the heaviest burdens. It may be observed, however, that every taxpayer should receive very real benefits from the government which he helps to support, and indeed unless taxation yielded such benefits there would be no justification for it. This, however, is a very different thing from saying that the tax burden should be apportioned in accordance with the benefits which one receives from the government. The more generally accepted theory is the so-called ability theory, according to which each citizen is expected to pay for the support of the state in proportion to his ability as compared with the ability of others. It is the application of Christian ethics to public finance. This is stated in the first canon enumerated above by Adam Smith. "In the observation or neglect of this maxim," he went on to observe, "consists what is called the equality or inequality of taxation." His successors have carried on a lively debate as to what constitutes equality, and, particularly, whether a proportional or progressive rate of taxation corresponds most nearly with the demands of justice. To a consideration of this disputed topic we may, therefore, next turn.

By a proportional tax is meant one that is levied at a constant rate irrespective of the amount of property or income from which it is paid. For instance, a proportional income tax of 2 per cent would exact always the same proportion of the income no matter how large this might be: $20 if the income is $1,000, $200 if the income is $10,000 and $20,000 if the income is $1,000,000. On the other hand in the case of a progressive tax the rate increases as the amount of property or income to be taxed grows greater. Thus in the illustration given above the rate might be 2 per cent on incomes of $1,000 (tax would be $20), 5 per cent on incomes of $10,000 (tax would be $500 instead of $200), and 10 per cent on incomes of $1,000,000 (tax would be $100,000 instead of $20,000). Under progressive taxation a relatively bigger slice of the large incomes in taken than in the case of the smaller incomes. The point at issue in determining the question as to whether proportional or progressive taxation best accords with the principle of justice or equity in the distribution of taxation is whether a man's ability to pay is measured by the amount of property or income he enjoys, or whether his ability increases at a rate more rapid than the growth of his property or income.

The modern tendency is to affirm the latter proposition and to make more general use of the progressive principal. In support of this view a few of the leading arguments may be briefly summarized.

Probably the most popular argument in favor of progression is that it tends to break up large fortunes and to equalize the distribution of wealth. This is doubtless the motive which has led to the approval of inheritance taxes in this country, but in few cases has the application of the progressive principle been drastic enough really to bring about a redistribution of wealth. A second argument is the so-called equality of sacrifice idea: if the rich man is to make a sacrifice proportionate with that of the poor man he will have to give up a relatively larger per cent of his income, because as fortunes grow larger the utility of each dollar grows less. According to this view the burden of the tax is measured by what is left after payment rather than by the payment itself. Another reason has been suggested by Prof. E. R. A. Seligman, namely, that a man's ability to acquire wealth increases progressively — "money makes money" — and hence it is only fair to apply the progressive principle of taxation to rich men. Finally Prof. H. C. Adams urges that there will be a social gain if the very rich older men be discouraged from further accumulation, and by withdrawing from active industry both give the younger men a chance and also devote their talents to philanthropy, social betterment, etc. Against the progressive principle is usually urged the familiar argument that it would discourage industry and saving, and hence mean an economic loss.

In the discussion thus far it has been assumed that when the legislator imposed a tax he knew what its effects would be. Such, however, is not the case. Taxes are generally shifted by the person who makes the first payment to the public treasury by being incorporated in the price of the article taxed. The final resting place of the tax is called its incidence. Two rather simple theories of shifting and incidence have been held, the one, the diffusion theory, holding that wherever a tax is originally imposed it gradually diffuses itself throughout society; hence no tax is so good as an old tax. Another theory, which may be called the concentration theory, argues that the whole burden of taxation, no matter where originally placed, tends ultimately to be shifted upon some particular class or form of wealth; this was the idea underlying the *impot unique* of the Physiocrats. The actual shifting of taxes is, however, much more complicated than either of these theories admits. See article on TAXATION.

The actual tax system of any country is the result of a complex of historical, constitutional and political causes, and that of the United States is no exception. The Federal government has relied for the most part upon indirect taxes — customs and excise duties — though since the amendment of the Constitution in 1913 it has been able also to make use of an income tax, which has already grown heavier as the needs of the Federal government increased. Three-quarters of the State revenues are derived from the general property tax, though the unsatisfactory and inequitable administration of this tax has lead a number of the more progressive States to supplement or supplant this by corporation and inheritance taxes. The great expansion of municipal functions has forced the cities to overhaul their tax systems and to impose heavier burdens upon municipal utilities in addition to real estate.

4. Public Credit.—To say that a state makes use of public credit is equivalent to saying that a government borrows money. Public credit is a branch of general credit and like that depends upon trust or confidence. But the fact that a sovereign state is the debtor in the case of public borrowing differentiates a government bond from other securities. In the first place a state cannot be compelled to pay its debts; but in spite of this fact government bonds are eagerly sought after. This is because the modern state is compelled to maintain its credit untarnished as it is almost certain to need to borrow again. On the other hand, the state has eternal life and hence can make perpetual debts; it has sovereign power to raise by means of taxation the funds for payment of interest and repayment of principal.

In 1820 it was estimated that the civilized governments of the world were resting under a burden of indebtedness amounting to $7,750,000,000. By 1910 this had grown to $40,000,000,000, and since the beginning of the European War in August 1914 these debts have practically quintupled. The growth of great public debts has been almost wholly a phenomenon of the 19th century, and has attended the development of a money market and improved credit facilities, better means of communication and transportation and of modern constitutionalism. The cause of the national debts has been almost exclusively war and preparation for war; State and local debts are usually due to improvements and investments, though sometimes improvidence has occasioned them. In general there are three objects for which a government may properly borrow money. These are to cover a casual deficit, to meet a fiscal emergency and to provide funds for industrial investment.

Temporary but unforeseen deficits may properly be met by the issue of short-term obligations in anticipation of the next tax levy. It may be impossible or undesirable to disturb existing tax rates, and, unless there is a surplus on hand, it is preferable to borrow than to permit a floating indebtedness to be created. Such loans, however, are for short periods and for relatively small amounts.

Much more important is the second group, that designed to care for serious emergencies such as war. In such a case the government cannot wait for the slow increase in revenues from increased taxation; it must have the money at once. The only alternative method of guarding against such a contingency is the so-called "war-chest policy" of Prussia, according to which that kingdom amassed a quantity of precious metals amounting to $60,000,000 and securities for use in case of war. How inadequate such a resource is becomes evident when it is noted that this sum was spent in the first three or four months of the Great War. Only by the use of public credit, perhaps to the breaking point, is it possible for modern nations to meet the cost of war.

The third occasion for public borrowing arises when a government wishes to undertake a scheme of public investment, such as the building or purchase of a railway, a waterworks system, an electric-light plant, etc. If the business is a commercial one it will itself provide the means of repayment, and it is, therefore, unnecessary as well as undesirable to saddle it upon the taxpayers. Moreover, from an engineering point of view, it is desirable to have the whole amount of capital necessary for the enterprise on hand at the start, so that no delays may occur. Debts for this purpose should not, if the business is well conducted, impose any additional burden upon the taxpayers.

There is no magic in government borrowing; it means simply a postponement of the unpleasant necessity of paying one's debts to the next generation. One of the first and most obvious effects of public borrowing is an increase in the tax rate, for the interest must be paid even if the principal is not. If the sums borrowed by the government have been large this lessens the amount of capital available for private industry and consequently raises the rate of interest. Various social and political effects may also be noted, such as the creation of a district bond-owning class, as in France, or the lessened control of our legislatures over the disposal of public funds when existing debts absorb large amounts of revenue.

The technique of public borrowing will be discussed in another place. (See article DEBTS, PUBLIC). It is sufficient to point out at this time that in selling bonds the Minister of Finance must in general appeal to the same motives as the ordinary seller of commercial paper, except that in times of emergency like war the patriotism of the people may lead them to accept somewhat worse terms than they ordinarily would. In fact loans are classified by numerous writers into the three classes of forced loans (such as the issue of irredeemable paper money), patriotic, and voluntary loans, but the last two can really be considered together, as they are both contractual rather than forced.

It frequently happens that when the emergency which forced the government to borrow possibly at very high rates is past, the rate of interest falls. Then, if the government has the right of repayment of the principal, it can avail itself of this opportunity to sell new bonds at a lower rate of interest and to pay off the holders of the old bonds with the proceeds. This is called conversion or refunding. By this process, without any extinction of the principal, the burden of the interest charge on a given amount of debt was steadily reduced for the nations of Europe during the 19th century.

But while conversion may reduce the interest charge it leaves the principal untouched, and states, like individuals, are faced at last with the unpleasant problem of debt payment. As yet it must be said that this problem has not been squarely faced by modern governments. Except for the United States and to a lesser degree Great Britain, almost none of the civilized nations has attempted to pay off its national debt. And yet a sound financial policy requires that this be done as rapidly as is consistent with the economic development of a country.

5. Financial Legislation and Budgetary Practice.— Modern governments carry on their financial operations under well-defined constitutional checks and budgetary practices. Certain general rules of financial procedure are laid down within which legislatures may vote taxes and legalize appropriations or incur debt. The study of these rules forms a fourth and last part of the subject of public finance.

The rise of constitutional arrangements in respect to financial matters undoubtedly originated in England, and it is said that the English system has served as a model for the other European countries. While this is only partly true the English budgetary practice will serve as a convenient point of departure for our study of the United States.

By the word budget is meant a comprehensive report and balance sheet of the past and estimated receipts and expenditures of the government for the next fiscal year. Such a statement forms the basis of legislative action on revenue and appropriation in practically every civilized country except the United States. In England, for instance, the budget for the fiscal year is prepared by the Chancellor of the Exchequer as a member of the Cabinet upon the basis of reports made to him by the heads of departments. This contains a statement of the revenues and expenditures for the past year, together with an estimate of the revenues and the proposed expenditures for the coming year. The government then defends the proposed budget against criticism, modifying it where necessary, but resigning from power and responsibility if the opposition overturns their plans.

Contrast with this highly centralized and responsible method the decentralized and irresponsible practice of the Fedcral government of the United States. A report is made to Congress to be sure by the Secretary of the Treasury, based upon data submitted by the various department heads, but until recently there was no certainty that the report was trustworthy, and even now Congress is but little influenced by the estimates of the executive department. According to our theory of separation of governmental functions there is no connection between the executive and legislative departments and Congress prefers political independence to financial orderliness. The result is that tax laws and appropriations are determined by political rather than fiscal considerations.

Another striking point of difference between the English and American systems lies in the fact that in the English budget both revenue and expenditures are determined by the same body, while in the United States the taxing and spending powers are allotted to two different sets of committees. Under the English system there is thus possible a well-balanced budget in which the Ministry of Finance, responsible for adjusting outgo to income, is able to avoid either surplus or deficit. At the same time the device of a variable rate for the income tax makes possible an exceedingly accurate equilibrium.

In the House of Representatives in the United States there are some eight different committees which bring in 14 different appropriation bills, of which six are prepared by the Committee on Appropriations. As each of these committees is under the temptation to swell its bill asking for appropriations in order to magnify its own importance, there is constant pressure to extravagance. And when it is remembered that still a different committee, that on Ways and Means, has charge of revenue bills, it is not difficult to see that a well-balanced and harmonious budget is all but impossible under such a system. Not only is there no careful correlation between revenue and appropriations as a whole, but the relation between different categories of appropriations is haphazard and unscientific as they are under the control of different sets of men.

The remedy for these evils is of course the adoption of a budget system for our Federal government. President Taft in 1912 requested Congress to provide for a budgetary form of statement of the annual report of the Secretary of the Treasury, and to follow such procedure in their financial legislation, but without avail. Probably nothing will be done in this direction until the force of public opinion compels Congress to adopt business methods and forms.

The State legislatures shadow forth, rather dimly, the same financial procedure that is found in Congress. It is practically impossible to speak of a scientific budget in any of the States. More progress has been made, on the other hand, in our municipal government, where under the highly centralized administration of the commission or city manager plans of government a budget becomes possible. In the majority of our cities, however, but little more progress toward this fiscal ideal can be recorded than in the case of our State legislatures. They are still in a chaotic state of transition.

Ernest L. Bogart,
Professor of Economics, University of Illinois.

PUBLIC HEALTH, or the health of the people, i.e., of groups or communities of human beings, is to-day a great and growing subject which may be regarded either as a science — and is then nearly or quite synonymous with public hygiene — or as a state or condition of the physical well-being of human groups or societies. As a science, it has of late years, and especially since the great pathological discoveries of the last quarter of the 19th century, taken on new forms and extraordinary importance. As a state or condition, it has also recently attracted much attention in the improvements shown in almost all civilized countries. As a science, it is beginning to be recognized in schools and universities by the establishment of new courses, special teachers and even special training schools — notably at Harvard University and the Massachusetts Institute of Technology, at Yale and at the Johns Hopkins University — an early step in this direction having been taken at the University of Pennsylvania. As a condition, worthy of and demanding world-wide attention, it has led to the establishment of a Federal Bureau in the Treasury Department of the United States government (formerly the United States Marine Hospital Service, later the United States Marine Hospital and Public Health Service and now the United States Public Health Service, having at its head a surgeon-general with several assistant surgeons-general, with a large and important hygienic laboratory (in Washington) and a strong staff of medical men, sanitary chemists, sanitary biologists and sanitary engineers. Private and voluntary associations in great numbers, such as the International Health Board of the Rockefeller Foundation, the American Public Health Association, the American Association for the Study and Prevention of Tuberculosis, the American Society for the Prevention of Infant Mortality, and many others far too numerous to mention, have also been formed and are generally actively at work to promote and improve the public health. The latest step of great magnitude and promise in this direction is the diversion of some of the vast machinery and effort of the American Red Cross remaining after the World War into channels of public health education and sanitary and hygienic betterment. It is plain that the problems of individual or personal health or hygiene are sufficiently complex and uncertain, both of determination and amelioration, but if, instead of dealing with the individual, we deal with groups or masses of individuals in the form of communities, such as families, villages, towns, cities, States and nations, all the difficulties (and these are by no means few) connected with individual hygiene become enormously multiplied and complicated. It is easy to see that when the problems of the individual under varying conditions dealing with a variable environment are multiplied and complicated by the introduction of those of other individuals, with the inevitable effects which these produce upon the common environment, the public health problems with which we have to deal are by no means either simple or easy of solution. We need in the first place a precise knowledge of the quantity of life (that is, the *population*) with which we have to deal, and if over against this we set the total amount of dying within a particular period and then determine the death-ratio (or *death rate*), we shall have at least a crude and general measure of the sanitary condition of the community. But if we determine simply the general death rate, we shall not have gone far enough, for it is now well understood that the death rate is profoundly influenced by factors other than disease, such for example as the *birth rate*, a high birth rate naturally leading under present conditions to a high death rate. It becomes necessary then in any scientific examination of public health problems to go behind the general death rate and to study other conditions. One of the most important of these is the so-called *specific death rate*, that is to say, the death rate in any given population from particular diseases such as tuberculosis, typhoid fever, pneumonia and the like; for it not infrequently happens that in the presence of a fair general death rate the mortality from typhoid fever (for example) may be excessive. In determining *population* the census is of the first importance (see CENSUS) and a well-directed census should furnish not merely the total number of the living but the «age periods» of the population, inasmuch as the mortality at different ages varies widely, and no safe conclusions concerning the sanitary conditions of a population can be drawn without careful reference to the constituents of that population at the different age-periods. Space will not permit here a detailed treatment of the sources of error to which students of sanitation, morbidity, death rates and the public health are exposed in various other directions, but which reference to any of the leading works upon vital statistics will readily disclose.

Epidemics.— From the practical point of view there is no more interesting subject connected with the public health than the rise, progress and decline of epidemics, the study of which now forms a special science known as epidemiology. From time immemorial civilized communities have been ravaged by plagues, pestilences and epidemics, which have at times enormously increased the death rate, as in the famous black death (see BLACK DEATH; PESTILENCE; PLAGUE), and have thus made serious inroads upon the public health. With the disappearance (until the Great War) of such diseases as typhus (ship fever, jail fever) and of scurvy, both of which formerly destroyed thousands even among civilized peoples, attention has of recent years been fixed more particularly upon the bubonic plague, which after a long absence from Europe has reappeared in great intensity in China and India, and has even threatened the shores of England and the United States. Asiatic cholera, which made a dramatic although brief appearance in the great commercial city of Hamburg, Germany, in 1892 has since been kept at bay in civilized countries. Typhoid fever, however, still remains a curse of some even highly civilized communities, largely owing to the fact that it is readily conveyed by food and drink, such as oysters, milk and water, while its specific germs appear to be more than usually hardy or resistant. But with the discovery of an effective serum or vaccine capable of conferring immunity against typhoid fever, the dread of this disease is largely done way. Tuberculosis popularly called «the great white plague,» and which has always been credited with a very large proportion of the total mortality in all communities, still destroys perhaps larger numbers of people than any other one disease. Probably there was never a time (except perhaps in the middle of the 19th century in Great Britain) when a more general scientific, professional or popular interest has been felt in public health problems, and especially in the particular disease last mentioned, than to-day. As a result of the immense progress which has been made in our knowledge of the methods of dissemination of infectious and contagious diseases; and doubtless also in part because of the general improvements which the 19th century has witnessed in housing, heating and ventilation, and the better protection of the health of individuals as well as communities, a distinct decline in the death rate is apparent and a correspondingly greater longevity. It is impossible to determine how much influence should be credited to general improvements, the result of a higher degree of civilization, but after making all deductions it probably still remains true that life is safer and longer to-day than ever before, largely because of a better knowledge of the causes of disease and a better practice of the arts of hygiene and sanitation among the people. The discoveries which have been made in respect to the principal infectious and contagious diseases affecting the human race within the last 50 years have been so extensive and so extraordinary that the names of these diseases have become almost household words, and the methods of dealing with them have become familiar, not only to physicians, but to sanitary experts, trained nurses and the intelligent public in general; and inasmuch as knowledge of this sort lies at the basis of effective promotion of the public health, we may briefly describe the more marked features of some of these diseases and especially the methods of their dissemination and control.

Before we do this, however, we may point out the remarkable fact that certain diseases which only two or three centuries ago ravaged the human race have been to-day almost completely exterminated from the higher civilizations. The most important of these is probably the *bubonic plague*, which in one form or another appeared in Europe down to the 19th century under the various names of the black death, the plague and pestilence. This disease is characterized (among other features) by swelling of the lymphatic glands, which turn black and suppurate, being then known as buboes, but it was not until the last decade of the 19th century that these buboes were found to be loaded with microbes (bacilli) capable of producing the disease in certain of the lower animals. Very late in the 19th century this plague, which had previously been for many years almost unknown in Europe and had never, so far as known, visited America, suddenly spread both westward and eastward from China, and menaced the coasts of Europe and America. It has, however, for the most part been successfully held in check, and is no longer greatly dreaded. Its method of dissemination is believed to be by means of rats and fleas, rats being very susceptible to the disease, and fleas which have bitten rats being abundantly capable of transferring the bacilli to human beings.

Another disease formerly very prevalent in highly civilized communities, which has within the last century or two practically disappeared, is *typhus fever* (spotted fever, jail fever, ship fever, etc.). This disease, which for a long time was not separated from typhoid fever in classifications, and which resembles it closely, but differs from it in the fact that it frequently causes extensive eruptions and is also lacking in the characteristic ulceration of the bowels which is the distinctive feature of typhoid fever, was formerly greatly dreaded, but, doubtless owing to the improved sanitation (greater cleanliness) of crowded places such as jails and ships, has practically disappeared from among the most highly civilized peoples. How far better food and air have aided in the good work it is impossible to say. The main factor, however, is greater cleanliness, for it is now known that this disease is transmitted by lice, and that freedom from lice means, as a rule, freedom from typhus fever.

Smallpox, a disease formerly so prevalent that, according to one authority, "scarce one in a thousand escaped it," and so much dreaded that the pesthouse in the early American towns and cities, a constant as well as a repulsive feature, was regarded almost with terror by many of the inhabitants, has of late years been nearly exterminated in the most highly civilized countries, and wherever sufficient pains have been taken to hold it in check by means of vaccination and revaccination. In the German army, for example, this disease is now extremely rare, apparently for the reason that vaccination and revaccination are most carefully attended to. The only serious danger from smallpox to-day is that communities which because of its scarcity are unfamiliar with the horrible character of the disease and its ravages may come to rely upon improved sanitation or other supposed safeguards and neglect vaccination which, according to all experience, is the only trustworthy defense against this extremely infectious and contagious disease. This danger is aggravated somewhat by the mistaken zeal of the so-called anti-vaccinationists, who, fixing their attention upon the occasional injuries consequent upon vaccination rather than upon the enormous saving of life which has resulted from its use, maintain a propaganda against it, and seek to have vaccination entirely done away. However earnest and honest these persons may be, there can be no doubt in the minds of those who will take the trouble to review all of the evidence, that their contentions are largely unfounded.

Typhoid fever, a diarrhœal disease, ever since its clear recognition, about 1840, as a malady distinct from typhus fever, has gradually come to be recognized as one of the most insidious diseases of civilized societies. Its ravages among the uncivilized are doubtless excessive, and even among highly civilized societies it is far more frequent than it ought to be, apparently because the bacilli which characterize and cause the disease are capable of maintaining their life outside the human body in the environment of man for a somewhat longer period and under somewhat more trying circumstances than are the germs of many other diseases. These bacilli are, for example, fairly resistant to cold and to dryness, and, although they are not known to produce spores, they are apparently able to persist for a long time (in greatly diminished numbers) in sewage, water, ice and upon fruits, vegetables and other articles of food. In milk under certain circumstances they may even multiply, and a very large number of epidemics of typhoid fever has been traced to infected milk. The same thing is true of drinking-water, and, since 1894, when an extensive epidemic of this disease, due to infected oysters, occurred among the students and others in Wesleyan University, in Middletown, Conn., many investigations have been made, both in Europe and in America, tending to show that raw oysters are not infrequently grown near the mouths of sewers and that such oysters may readily convey the germs of this disease. Furthermore, since it has become known that the bacilli of typhoid fever occur not only in the bowel discharges, but also in the urine, and even in the sputum of persons sick of this disease, it has become easy to understand the fact that it is often really, as well as apparently, contagious, although of course in far less degree than the eruptive diseases, such as smallpox, measles and scarlet fever. The control of typhoid fever is now largely within our power, for it has been shown by experience, in armies and navies, that it can be mostly avoided by "vaccination" with a serum made from the dead bacilli of the disease itself.

Malaria and malarial fever had long been associated in the popular mind with swamps, but until 1880 no germ characteristic of these diseases (which are really one and the same) had been discovered. In that year Laveran, a French investigator in Algiers, discovered in the red blood-cells of persons sick of the disease certain animal parasites, protozoan in character, which appear to be not only the constant accompaniment, but the sufficient cause of the disease. Quite recently Ross in England, Celli in Italy and various other observers have proved beyond doubt that these germs are conveyed from one human being to another by means of certain female mosquitoes, belonging to the genus *Anopheles*, without the bite of one of which containing the microbes the disease does not appear to be transferable. The life history of these parasites has been worked out thoroughly, and to-day it is universally believed that malaria is caused by the parasites mentioned above, which spend only a portion of their normal life in their human host, and the remaining portion in the bodies of mosquitoes of the genus *Anopheles*. The importance of this discovery can scarcely be overestimated, for although formerly, as already stated, malarial fever was associated with swamps, no one could tell precisely how; while to-day it is easy to see that if swamps contain infected malarial mosquitoes they may be dangerous sources of disease for human beings. On the other hand, it had long been observed that it was not swamps *per se* which produced malaria, inasmuch as thousands of swamps had never been brought under suspicion. This circumstance is now interpreted as due to the fact that whatever mosquitoes may have been present in the swamps in question must have been of some other genus incapable of transmitting the disease; or else, if of the right genus, then these *Anopheles* had never become infected by biting human beings suffering with malaria. The practical importance of these discoveries in regard to malaria cannot easily be exaggerated, for malarial fever has long been the dreaded pest of the engineer, and such enterprises as the digging of the Panama Canal had been enormously hampered and even prevented by the prevalence of malarial and other fevers. Nowadays it suffices to make sure that all sleeping huts or houses are covered with nettings which shall keep out mosquitoes, and that if possible the breeding places of these pests shall be either drained and altogether done away or else petrolized, that is, treated with oil of some sort which shall interfere with the breeding of mosquitoes.

Tuberculosis has long been recognized as one of the worst diseases afflicting the human race. It is characterized by certain cheesy masses called tubercles, which may be formed either in the lungs or upon the membranes of the brain, in the lymphatic glands or even within the tissues of the face, the disease in this last case being known as *lupus* (a wolf), and causing serious disfigurement. In 1882 Dr. Robert Koch discovered within these cheesy masses small microbic rods or bacilli to which he gave the name by which they are now universally known, of the *Bacillus tuberculosis*. These bacilli frequently occur in the sputum of tuberculous patients, and if this sputum is cast out upon the streets or in public places, it may become dried and disseminated in various ways, for example in dust. The bacilli are believed to be disseminated also by the coughing of fine moist particles from the lungs of tuberculous patients into the air; by milk derived from the tuberculous udders of tuberculous cows; by kissing — as when, for example, a tuberculous mother kisses her young child; by the hands,— as when a tuberculous patient, coughing upon his hand, afterward, without having washed it, touches the hand of another, or articles of food which are eaten raw; and in a great variety of other ways. Here also much is being done by boards of health and other sanitary organizations which seek to control the spitting nuisance; by physicians who educate tuberculous patients to use destructible spit-cups, handkerchiefs and the like; by sanatoria, that is, establishments intended especially for the benefit and cure of cases of *incipient* tuberculosis, and by a campaign of education consisting largely in the distribution of literature bearing upon the disease. Among the most noted sanatoria for tuberculosis in the world are those at Davos Platz, in the Italian Alps, and at Saranac Lake, in the Adirondacks. More recently State sanatoria have begun to be established, the first in America being that of the State of Massachusetts, at Rutland, Mass. It was formerly thought necessary for incipent tuberculous cases to be removed to Colorado or other high, dry localities, but to-day it is commonly felt that, however, desirable a removal of this kind may sometimes be, it is not always wise, and that the essentials of a good sanatorium (which are largely rest, fresh air and good feeding) may often be found near a large city, the first institution of this kind to be established (namely, the Sharon Sanatorium at Sharon, Mass., only 16 miles from Boston, upon a slight elevation and a dry, sandy soil) having proved eminently successful.

Diphtheria, or malignant sore throat, has of late years come, unhappily, to be quite common, and is rightly much dreaded. The causative germ of the disease was discovered and described by Loeffler, a pupil of Koch, in 1884, since which time it has been very widely studied, and has been found to do its damage by producing in the bodies of its victims, or even when growing in beef tea, a highly poisonous substance known as its toxin. Until 1892 no remedy for it was known, but in that year von Behring of Germany announced the discovery of that remarkable antidote for the disease, now universally known as diphtheria *antitoxin*. Behring was led to his magnificent discovery by reflecting upon the fact that some animals can be immunized to diphtheria toxin and that the blood of such immune animals is capable of neutralizing the poisonous character of the toxin produced by the germs of diphtheria. The manufacture of diphtheria antitoxin is now a large industry, sometimes carried on under private and sometimes under State or municipal control. There can be no question that its use has largely diminished the mortality from this disease.

There are many other diseases such as yellow fever, leprosy, scarlet fever, measles and pneumonia, a knowledge of which has of late years become more precise and practical, but these cannot be referred to within the limits of this article.

Some Methods for Health Improvement. — Engineering enterprises, such as drainage and sewerage, water supply, the filtration of water, the purification of sewage, the cleaning of streets, and garbage collection and disposal, have had much to do in the past, and will doubtless have much to do in the future, with improvement of the public health; and there is every reason to hope that the general death rate may continue to diminish, as it has diminished, in the past, largely by virtue of these enterprises. In addition, however, much remains to be done; the more crowded sections of cities — the so-called slums — require the most careful supervision to prevent overcrowding, bad ventilation and accumulation of noxious or even toxic wastes. The milk supplies of cities are as yet very largely in a primitive state so far as the production of milk is concerned, and it will become necessary in the near future either to improve radically the conditions of its production or else to abandon almost altogether the use of uncooked milk. Vegetables, fruits and berries, which are eaten in the raw state. such as celery, lettuce, radishes, watercress, cherries and strawberries are peculiarly exposed to infection either by handling or because they are occasionally treated with manure-water during the process of growth, and such water is not infrequently polluted and infected. The dangers from oysters have already been referred to. How far uncooked or underdone meats are dangerous is uncertain, although it is well known that uncooked ham and other lean meat of hogs has frequently caused trichinosis, an infection due to minute parasitic worms.

Illuminating gas, particularly water gas, which contains a large percentage of carbonic oxide (CO), has an important bearing on the public health, not when properly burned or by its products of combustion, but because of leaks in the mains or the service pipes, or about the fixtures by which it is distributed. Many deaths occur annually from this source, and the use of water gas should be accompanied by special precautions.

As for the effect of *public gymnasia, playgrounds* and other open places in cities or other crowded communities little need be said, inasmuch as it is impossible to determine their precise value. There can be no question, however, as to the general wisdom or advantage of such things in modern cities. Isolation hospitals for infectious diseases are gradually being established in our larger cities, and are filling a long-felt want. Best of all, the recent improvements in transportation are making it possible for large numbers of persons to live near, rather than within, cities and suburban life is becoming as characteristic a feature of modern life as is city life itself. Unfortunately this remedy for the evils of city life applies only to the fairly well-to-do, for the very poor will probably always find it easier, cheaper, and more exciting to live closely crowded in the congested centres of population, where work is most abundant and where the incidental diversions of a varied and noisy city life may be had free of cost.

The public health problem is very largely, but not exclusively, a problem of the life of crowded communities. Yet something needs to be said concerning the *sanitation of farms* which, while they ought to be the most healthful places in the world, are by no means always such. Damp or even wet cellars, bad ventilation, overheating and poor feeding; defective sanitary arrangements, shaded houses and unwholesome surroundings, or close association with domestic animals, such as dogs, cats and poultry or swine, too often make farm life unsanitary, and boards of health having in charge the sanitation of States or Territories should give attention to these problems as well as to those of more crowded communities. *Railway sanitation, steamship sanitation*, and the more technical aspects of the work of boards of health, such as *disinfection, scavenging, quarantine, isolation, vaccination* and the like, are nowadays subjects of great public consequence and are fully treated in special works or memoirs, reference to some of which will be found at the end of this article.

There are few more interesting matters relating to the public health than the control of the adulteration of foods and drinks. In spite of the increase of general intelligence, flaming advertisements of quack medicines too often disfigure the pages of the newspaper press and testify to the enormous use of patent medicines, drugs, etc., by the public at large. In many States special laboratories are maintained for the investigation of foods and drinks, and stringent laws exist for the regulation of their adulteration and sale. One of the most striking facts which these have disclosed is that many of the so-called compounds, tonics, sarsaparillas and other patent foods or medicines are rich in alcohol, some of them containing as much alcohol as many kinds of wine or beer. Some which profess to contain certain ingredients are totally lacking in them, and others which profess to cure the alcohol habit or the morphine habit actually contain alcohol or morphine respectively, occasionally in large quantities. The revelations which proceed from these State laboratories are sometimes startling, and any one interested in the public health should inform himself upon this subject, as he may readily do by turning, for example, to the 'Annual Reports of the State Board of Health of Massachusetts.'

State and Municipal Laboratories are thus an important and modern adjunct to the public health work of boards of health. In the best of these means are provided for the rapid and certain diagnosis of doubtful cases of diphtheria, typhoid fever, malaria, hydrophobia, glanders, anthrax and some other infectious diseases. In them also analyses of milk, water, ice, sewage, vinegar and other liquids, of illuminating gas and of air, and of substances subject to infection or adulteration may be made; foods and drinks may be examined; materials for pavements or buildings may be tested and a great variety of useful operations conducted, all tending to a better knowledge of local sanitary conditions. It is doubtful if any arm of the public health service is to-day more important than this. Largely in consequence of all these and many other efforts now making for the improvement of the public health, human life is probably to-day safer and healthier than it has ever been before, and the outlook for further progress is very bright. See HYGIENE; HYGIENE, MILITARY; SANITARY SCIENCE AND PUBLIC HEALTH; SANITARY ENGINEERING.

PUBLIC HYGIENE. See SOCIAL HYGIENE.

PUBLIC LANDS. The expression "public lands" or "public domain" of the United States, is used to include such lands of the United States as are subject to sale or other disposal under general laws and are not reserved or appropriated for any special public purpose. This article will treat of the entire area which at any time has been included in the public lands of the United States.

The table below shows for the several States and the Territory of Alaska the total area in acres and the areas unappropriated and unreserved on 30 June 1915 subdivided into those which have been surveyed, those which have not been surveyed and the total area.

Unappropriated public lands are subject to disposition under general laws, the principal of which are the Homestead Law (q.v.), the Desert Land Law (q.v.), the Timber and Stone Law (q.v.), the Reclamation Laws (q.v.) and the Mineral Laws (q.v.).

The public lands of the United States were acquired by treaty, purchase and occupation. By the Articles of Confederation agreed to in Congress 15 Nov. 1777 and ratified by the several States in the four subsequent years the government of the United States of America was organized and pursuant to that action took possession and control of the unappropriated Crown lands of Great Britain as the successor of that government. By the definitive treaty of peace concluded 3 Sept. 1783 Great Britain formally relinquished all its "propriety" (proprietary) and territorial rights, leaving the ownership of the United States and of the several States undisputed.

NOTE.— Definite reports regarding the areas disposed of in Alaska have not been published but the amount is probably less than 200,000 acres.

During the existence of the government under the Articles of Confederation, Congress on 6 Sept. 1780 passed a resolution recommending the surrender and disposal by the several States of their waste and unappropriated lands to aid in paying the public debt incurred by the War of the Revolution. These lands lay to the west of the present boundaries of the then existing States.

In 1781 New York ceded without reservation 202,187 acres now in the county of Erie, Pa. In 1784 Virginia ceded 169,559,680 acres north of the Ohio and east of the Mississippi rivers and known in subsequent legislation as the «Northwest Territory,» reserving therefrom 150,000 acres for the benefit of George Rogers Clark and the officers and soldiers who aided him in his successful expedition into that country against the British and also so much of 3,800,000 acres in Ohio as should be needed to satisfy certain donations to her Revolutionary soldiers. There were other minor stipulations.

In 1785 Massachusetts ceded, without reservation, 34,560,000 acres, which now forms a part of southern Michigan and Wisconsin and northern Illinois.

In 1786 Connecticut ceded 26,600,000 acres, which now forms the northern parts of Ohio, Indiana and Illinois; reserving, however, 3,800,000 acres, a strip in northern Ohio 120 miles long, which was afterward known as the «Western Reserve» and of which Connecticut donated 500,000 acres, subsequently known as «Fire Lands,» to certain of her citizens who had suffered loss by fire and raids during the Revolutionary War.

The remainder of the lands reserved by Connecticut were sold to a company for $1,200,000.

In 1787 South Carolina ceded, without reservation, 3,130,000 acres, a strip 15 miles wide which now forms the northern parts of Georgia, Alabama and Mississippi; while in 1790 North Carolina ceded 29,184,000 acres, which now forms the State of Tennessee, reserving the right to satisfy therefrom certain donations made to her soldiers and other claims under its land laws, which absorbed the bulk of the lands embraced in her cession.

In 1802 Georgia ceded 56,689,920 acres, now forming parts of Alabama and Mississippi, in consideration of the payment to her of $1,200,000 and the satisfaction of certain outstanding obligations known as the «Yazoo Claims,» the settlement of which finally cost the United States $5,000,000.

By treaty of 30 April 1803 France ceded 757,961,920 acres, now known as the «Louisiana Purchase,» the government paying therefor $27,267,621, which includes the original price of $15,000,000, interest, settlement of claims, etc. These lands now constitute a part of Mississippi, Alabama, Texas, Colorado, Wyoming, Montana and the States lying between them and the Mississippi River.

By treaty of 22 Feb. 1819 Spain ceded 37,931,520 acres, now constituting the State of Florida, at a total cost of $6,289,768.

By treaty of 2 Feb. 1848 Mexico ceded 334,443,520 acres, now constituting the States of California, Nevada, Utah and parts of New Mexico, Arizona, Colorado and Wyoming, at a cost of $19,250,000.

On 25 Nov. 1850 Texas ceded 61,892,480 acres, now constituting a part of New Mexico, Oklahoma and Colorado, for $16,000,000.

By treaty of 30 Dec. 1853 Mexico ceded 29,142,400 acres, known as the «Gadsden Purchase,» now part of New Mexico and Arizona, for $10,000,000.

By treaty of 30 March 1867 Russia ceded all of Alaska, embracing 378,165,760 acres, for $7,200,000.

On 7 July 1898 the Territory of Hawaii was acquired, containing 4,127,360 acres. By treaty of 10 Dec. 1898 Spain ceded Porto Rico, containing 2,198,400 acres; Guam, 134,400 acres, and the Philippine Islands, containing 73,573,120 acres, for $20,000,000.

By treaty of 2 Dec. 1899 with Germany and Great Britain, Tutuila and other small Samoan islands, containing in all 49,280 acres, were annexed.

By treaty of 7 Nov. 1900 Spain ceded Sibutu and other small islands in the vicinity of the Philippines, containing in all 43,520 acres, for $100,000.

The Oregon Country, containing 183,480,960 acres and embracing Oregon, Washington, Idaho and part of Montana, was claimed by the United States through discovery and exploration and that claim was afterward recognized by England and Spain.

A controversy with Great Britain regarding the northern boundary west of the Rocky Mountains was not settled until the treaty of 15 June 1846, which, however, left undetermined the extreme western end of the boundary line at its junction with the Pacific Ocean.

The treaty of 8 May 1871 provided, among other matters, that the decision of this point should be left to the emperor of Germany, who decided in favor of the contentions of the United States, 21 Oct. 1872.

The total area of the acquisitions by State cessions was about 500,000 square miles or 320,000,000 acres at a cost of $22,200,000. The area acquired from foreign governments, including the Oregon Country, was about 2,400,000 square miles or about 1,500,000,000 acres, at a cost of $65,957,389.98. In addition to these costs, which include interest and settlement of private claims, the United States has paid more than $200,000,000 for extinguishing the rights of the Indians to these lands.

In forming new States from the territory obtained through these cessions from States and foreign governments, Congress has required each new State to adopt an irrevocable ordinance that the State shall not tax the public lands nor pass laws to interfere with the primary disposal thereof by the United States.

The public lands of the United States were, in the beginning, regarded as an asset for the payment of the debt incurred in carrying on the War of the Revolution. Many plans for disposing of the lands were proposed and considered. The earliest efforts were to sell the land in large blocks and prior to the organization of our present government Congress made three such sales. The first was the sale to the Ohio Company. This was originally intended to cover 2,000,000 acres at $1 per acre, the land lying in the present State of Ohio on the Scioto and Ohio rivers. The area was reduced to 822,900 acres and the sale was confirmed 27 July 1787. The amount actually received was two-thirds of a dollar per acre and payment was made in certificates of the public debt.

The second sale was to John Cleves Symmes, finally confirmed by the Act of 5 May 1792. The lands lie in the present State of Ohio on the Ohio River, between the Great and Little Miami rivers, near the site of Cincinnati. The tract was supposed to contain 1,000,000 acres, but its actual area was 248,540 acres. This was sold at the same rate of two-thirds of a dollar, paid in certificates of the public debt and military land warrants.

The third sale was to the State of Pennsylvania, a tract now in Erie County, containing 202,187 acres, ceded to the United States in 1781 by New York. This was sold at the same rate and paid likewise in certificates and military land warrants.

By the Act of 2 March 1799 those who had made contracts with Symmes for lands not lying within his purchase, as finally determined, were allowed to buy the lands contracted for at $2 per acre, payable in certificates of the public debt. About 88,880 acres were sold under this law.

Practically the first act of general character for the sale of lands was passed 18 May 1796 and related to a tract in the present State of Ohio. This provided for a system of rectangular surveys substantially as now in use. Townships were laid off six miles square containing 36 sections, each being one mile square and having an area of 640 acres. Alternate townships were to be subdivided into sections, while only the exterior boundaries of the others were laid out on the ground.

The subdivided townships were to be sold in tracts not less than one section or 640 acres each. The other townships were to be sold in tracts not less than a quarter township, excluding the four middle sections which were reserved for future disposal, thus having a block of eight sections in each quarter township, so that these lands, were to be disposed of in tracts of 640 acres and 5,120 acres, respectively.

The sales were to be made to the highest bidder at a public sale, but no sale was to be made for less than $2 per acre. One-half was to be paid within 30 days and of this one-tenth was required at the time of sale, with one year's credit for the remaining half. The land was forfeited in case of failure to pay the balance. A discount of 10 per cent was allowed on one-half the amount if the whole sum were paid within 30 days.

By the Act of 3 March 1797, passed the next year, the lands sold after that date could be paid for in evidences of the public debt.

The Act of 1796 remained in force for four years without producing very satisfactory results, only 121,540 acres having been disposed of.

The total area sold prior to the Act of 10 May 1800 was 1,484,047 acres for $1,201,725.68, an average price of less than 81 cents per acre. This includes some small tracts sold before the organization of our present government at the minimum prices of $1 and two-thirds of a dollar.

The Act of 1796 established the office of surveyor-general with substantially the same duties as that officer now exercises. The sales were made under the supervision of the Secretary of the Treasury. The smaller tracts were sold under the direction of the governor or secretary of the Western Territory and the surveyor-general at Cincinnati or Pittsburgh according to districts defined by the act. The quarter-township tracts were sold by the Secretary of the Treasury at Philadelphia, then the seat of government.

The Act of 10 May 1800 made further provision for the sale of lands in the present State of Ohio, modifying in several important particulars the Act of 1796.

Four land districts were designated each under the administration of a register and a "Receiver of Public Monies" with substantially the same functions as at present. Their offices were established at Cincinnati, Chillicothe, Marietta and Steubenville. Provision was also made for a receiver at Pittsburgh. Thus by 1800 there had been established substantially our present system of the surveys of the public lands under the supervision of a surveyor-general for a specified district and a system of sale by a register for each land district, not necessarily the same as the surveyor-general's district, and the receipt and accounting for funds by a receiver of public moneys for each district. New land offices were opened and new offices of surveyor-general were established from time to time as they became necessary.

Under the Act of 1800 the lands were offered at public sale in sections and half-sections for not less than $2 per acre, payable in cash or in evidences of the public debt. One-fourth of the price was to be paid within 40 days, one-fifth of that or one-twentieth of the whole, was required at the time of sale. The other three-quarters were payable in two, three and four years, respectively, with interest at 6 per cent per annum. A discount of 8 per cent per annum was allowed for advance payments. Provision was made for forfeiture and resale in case of default. The lands remaining unsold after having been offered for sale could be purchased at private sale for $2 an acre.

The surveyor-general was authorized to lease the lands reserved for future disposition, in sections and half-sections, for terms not exceeding seven years. The act also provides that any person who has erected or has begun to erect a grist-mill or saw-mill upon the lands to be sold was "entitled to the preemption" or preference right to purchase the section on which it was located at $2 per acre.

Before 1789 deeds for the lands sold were executed by the Board of Treasury, corresponding to our present Treasury Department, or by the loan commissioners, agents of this board. After that date all patents for the lands sold were executed by the President, countersigned by the Secretary of State and recorded in his office. It is to be noted that in a few cases Congress had made grants of lands in such terms that patent was not required, title passing directly by virtue of the act.

By Act of 25 April 1812 the General Land Office was established in the Department of the Treasury. To this office were transferred all the duties relating to the survey, sale and patenting of the public lands previously performed by the Secretary of War and the Secretary and Register of the Treasury. All patents for lands were to be issued in the name of the United States under the seal of the new office, signed by the President and countersigned by the Commissioner of the General Land Office.

To relieve the President of the great burden of personally signing the large number of patents issued, Congress by Act of 4 July 1836 authorized the President to appoint, by and with the advice and consent of the Senate, a secretary whose duty it would be to sign land patents in his name. This statute continued in effect until 19 July 1878 when the President was authorized to designate an executive clerk to perform this duty, instead of submitting a nomination for confirmation by the Senate.

The General Land Office became part of the Department of the Interior when the latter was organized 3 March 1849.

After the Act of 1800 the sales of public lands continued without material change in system but with gradual improvements in detail. As each new area was opened to sale, the existing system was extended to it providing for sale at public auction with the right of purchase at private sale after the period of public offering, usually three weeks, part payment in cash and the balance in four years.

Prior to the Act of 26 March 1804 the lands were offered for sale in not less than half-sections (320 acres). By that act the survey and sale of lands in quarter-sections (160 acres) was authorized. Before that time payment of surveying expenses and patent fees had been required, but was discontinued by that act.

Payments for land in evidences of the public debt were authorized by all the general land laws until the passage of the Act of 3 March 1803, which provided that in the purchase of the lands in Mississippi Territory, being the lands lying south of the State of Tennessee, such payments could not be made. The Act of 18 April 1806 discontinued such payments as to all public lands thereafter sold.

The Act of 24 April 1820 made a radical change, however, requiring immediate payment in full for all sales made from and after 1 July 1820. The credit system had been demoralizing. Congress had been constantly importuned to extend the time for payment and acts for this purpose were passed at nearly every session. The privileges of these acts were limited to persons who had purchased not more than 640 acres. After 1820 such acts were passed nearly every year until the passage of the Act of 23 May 1828, which provided for the issue of certificates to represent the money paid for land which had reverted to the United States because of failure to complete the payments. These certificates were receivable in payment on the purchase of other lands within the same State or Territory.

This act was followed by the Act of 31 March 1830 and the Act of 9 July 1832 providing for further relief in such cases, closing the long series of enactments for the relief of credit purchasers.

The total amount of land sold under the credit system was about 19,400,000 acres for about $47,700,000. This was scaled down by the operation of legislation, by reversions and by relinquishments to about 13,600,000 acres and the receipts were about $27,900,000, an average of a little more than $2 per acre.

The Act of 24 April 1820 made other important changes than requiring cash payments. It provided that from and after 1 July 1820 all public lands should be offered for sale in half-quarter sections, or 80-acre tracts. This had not been previously permitted except in six designated sections of each township, authorized by the Act of 22 Feb. 1817. When disposed of at private sale the purchaser had the option of buying as much as a section (640 acres). The Act of 1820 also fixed the minimum price, whether at public or private sale, as $1.25 per acre. The act also provided that public sales should be kept open for two weeks.

By the Act of 5 April 1832 the sale of quarter-quarter sections, or 40-acre tracts, was authorized.

In pursuance of the early policy for the sale of the public lands in large blocks every effort was made to prevent settlement on the lands prior to purchase.

On 15 June 1785 Congress, under the Articles of Confederation, passed a resolution forbidding settlement on the public domain. Other warnings were given in various ways. The Act of 3 March 1807 prohibited such settlement under penalty of forfeiting any right or claim that the settler may have, and the President was authorized to use the civil and military forces to remove such persons from the lands. An exception was made in favor of settlers prior to the passage of the act who, upon application to the local land office, could obtain permission to occupy the lands as tenants at will, but must remove from them when a sale was made.

On 25 March 1816 a similar privilege of temporary occupation on application was given to all who had settled upon public lands prior to 1 Feb. 1816. The right to make such application was to continue for one year from the date of the act. On 3 March 1817 Congress extended this time to 3 March 1818, and on 20 April for another year.

Meanwhile the difficulty of preventing settlement prior to sale, and the gradual abandonment of the idea of obtaining a large revenue from the sale of the lands, due no doubt to the increasing prosperity of the nation, induced the policy of encouraging settlement and home-making upon the public lands. Pre-emption entries based upon settlement were accordingly authorized from time to time for certain specified areas.

The first right of pre-emption or preference right was given by the act of 2 March 1799 in favor of those who had made contracts with Symmes or his associates for lands which were not included in the area patented to them. This right was not based upon settlement, and the Act of 10 May 1800 was the first to give such a right based upon occupation of the land, namely, to those who had erected or had begun to erect a gristmill or a sawmill in the Ohio country before the passage of the act.

From time to time acts were passed providing for pre-emption rights within certain areas and subject to varying conditions. By 1830 a large part of the public land was comprehended within the operation of these acts.

On 29 May 1830 the first pre-emption act of general application was passed, allowing entry by those who had settled on the land before that date, and remaining in force for one year.

On 5 April 1832 "all actual settlers, being housekeepers upon the public lands," were allowed the right to enter, within six months after the passage of the act, a tract not exceeding 80 acres, to include their improvements. By various subsequent enactments these provisions were continued in force until the passage of the general Pre-emption Act of 4 Sept. 1841.

This act provides that "every person being the head of a family, or widow, or single man, over the age of 21 years, and being a citizen of the United States, or having filed his declaration to become a citizen," who since 1 June 1840 has made, or shall thereafter make, settlement in person on surveyed public land and shall live upon and improve the same, may enter not exceeding 160 acres at the minimum price of $1.25 per acre. No person was entitled to make more than one such entry, nor could any one make such entry who was the owner of 320 acres of land.

In 1853 and 1854 the right of pre-emption on unsurveyed lands was extended to a number of the States, and afterward, by the Act of 2 June 1862, to all unsurveyed public land.

The passage of the Pre-emption Act and the change in sentiment regarding the public lands rendered less important the early system of disposing of the lands at public sale.

Soon after the passage of the Pre-emption Act the Commissioner of the General Land Office was, by the Act of 3 Aug. 1846, authorized to offer for sale isolated or disconnected tracts which had not previously been offered without the formality and expense of a proclamation by the President, which had previously been required.

In the course of time the practice of disposing of lands at public sale gradually died out, and now such sales take place only for isolated tracts and in certain other exceptional cases.

From 14 Aug. 1854 to 2 June 1862 there was in force a law providing for a modification in the price of lands taken under the pre-emption acts known as the Graduation Act. Its purpose was to reduce the price of public lands to actual settlers and cultivators. The price of all lands which shall have been in the market for 10 years or upward was fixed at $1 per acre; when this period had reached 15 years the price was reduced to 75 cents per acre, and so on, by graduation of 25 cents for each five years till the period had reached 30 years, after which the price was 12½ cents.

The Pre-emption Law remained in force until 3 March 1891, when it was repealed.

The existing system was inaugurated by the enactment of the Homestead Law 20 May 1862. A detailed statement of its history and present status is found in the article HOMESTEAD LAWS.

The Desert Land Law, now in force, was enacted 3 March 1877, and is treated more in detail under the title DESERT LAND LAWS.

The treatment of the arid and semi-arid areas in the West required special attention and some experimenting which is discussed under the title of RECLAMATION LAWS, the principal of these being that known as the "Carey Act," enacted 18 Aug. 1894, and the Reclamation Act of 17 June 1902.

A considerable area has been granted under the head of "Private land claims, donations," etc., recognizing claims based upon the laws of the governments formerly in control of the acquired territory and also upon claims based on settlement upon public lands not authorized by specific law. Considerable areas were granted to encourage wagon road, canal and river improvements to State and corporations.

Congress has also granted very large areas to encourage the building of railroads in the Western States, usually granting the odd-numbered sections within a certain distance from the line of road, this distance varying from 6 to 20 miles on either side.

There have also been granted to the States large areas covered by swamp lands on the theory that the State would reclaim them, but comparatively little has been done in this direction.

Congress in disposing of the public lands has been very liberal in grants for educational purposes, providing in each State large areas for the public schools and special grants for State universities. In the acts admitting the several States to the Union until recently two full sections of land in each township were set apart for public schools, being two square miles or 1,280 acres in each township of 36 square miles or one-eighteenth of the area. In recent years the school grant has been doubled, four square miles in each 36, or one-ninth, being set apart for public school purposes. Congress has made other grants to a number of the States for public buildings, internal improvements, etc.

Military and naval land warrants were issued in recognition of service in war, and about 61,000,000 acres of land have been so taken.

Scrip represents a form of authority to take public lands given in adjustment of rights claimed to lands which could not be satisfied by granting the particular lands claimed.

Reservations of various kinds have been made; the largest areas are covered by the National Forests (q.v.). The National Monuments are established to retain for public use lands which have special historic or scenic value.

The history of our public lands and the policy applied to their disposition divides itself into three distinct periods.

The first period is characterized by the desire to dispose of the land in large tracts and to secure as great and rapid a return as possible.

In the second period the desire for return becomes less important and the encouragement of settlement is the main feature.

In the third period the obtaining of funds from the sales of the lands is entirely subordinated and the main desire is to secure the establishment of homes on comparatively small tracts and a utilization of lands available for grazing or mineral or other resources under regulations for the general public benefit.

The table in the beginning of this article shows that the area which has been disposed of and the area reserved for public purposes make a total of about 1,245,636,095 acres. This does not include lands in the original 13 States or Texas, because the United States had no lands in these States available for general disposition. Figures are not available to show the details which make up this total area disposed of by the United States. The principal items are the following, being the areas disposed of to 30 June 1915, as published by the General Land Office, except where followed by the figures (1904), which are the results published in 1905 by the Public Lands Commission appointed by President Roosevelt. The figures of this commission here given have not changed very much to date as they refer to methods of disposition not now in force.

Private land claims, donations, etc.	(1904) 33,400,000
Railroad, wagon road, canal and river improvement grants	122,215,763
Swamp land grants	63,832,583
Common school grants to States, including Alaska	98,400,000
Other grants to States and Alaska	34,900,000
Military and naval land warrants	(1904) 61,000,000
Scrip issued for various purposes	(1904) 9,300,000
Homestead entries	154,327,812
Timber and stone entries	13,289,906
Timber culture entries	10,866,529
Desert land entries	7,210,562
Cash entries, including entries under the Pre-emption and other acts	(1904) 270,000,000
National forests	184,240,596
National monuments	1,201,568
Indian reservations (excluding Alaska)	33,334,261

MORRIS BIEN,
United States Reclamation Service, Washington, D. C.

PUBLIC LAW. In general public law as contradistinguished from private law, which determines the status and relationships of persons and property, may be defined as that branch of the law which deals with the organization of the state and the relations which subsist between it and the individuals who compose it, as well as its relations to other states. The distinction between public and private law was emphasized by the Roman jurists who taught that *publicum jus est quod ad statum rei Romanæ spectat, privatum quod singulorum utilitatem.* It is equally recognized in the legal systems of continental Europe to-day and finds a place in their classification of the law. In England and the United States, however, while the distinction is recognized by the jurists, its importance has never been emphasized to the same degree.

What are the characteristics of public law and how does it differ from private law? Lord Bacon, who dwelt upon the distinction, said public law was the «sinews of property,» while private law was the «sinews of government.» In private law the state is the arbiter rather than a party; in public law it is both arbiter and a party. Private law determines the rules of conduct to be observed by individuals in their mutual relations; it defines their rights of person and of property; it deals with such matters as the ownership, use and disposition of property, contract, agency, partnership and business generally, the relations between husband and wife, parent and child, guardian and ward and the domestic relations generally, etc. Public law, as stated above, deals with the organization, powers and rights of the state, including its relation to individuals subject to its jurisdiction and to other states. It may be conveniently subdivided into five branches: (1) constitutional law; (2) administrative law; (3) criminal law; (4) criminal procedure, and (5) international law. Constitutional law contains the body of rules, written and unwritten, which determine in broad outline at least the organization of the state. It usually deals with the organization, mode of selection and the powers of the chief organs of government, legislative, executive and judicial. It defines the suffrage, the relations, if any, between church and state, the relations between the state and its local subdivisions, etc. Administrative law is that part of public law which governs the relations of the executive and administrative authorities of the government to one another and to individuals; it defines the organization and determines the competence of the administrative authorities, and sets forth the remedies of the individual in case his rights are violated by the administrative authorities. On the continent of Europe administrative law (*Droit administratif* in France; *Verwaltungsrecht* in Germany) is treated as a distinct branch of the law and is applied by a separate and distinct group of tribunals known as administrative courts composed in part of judges who are professionally trained or who are active administrative experts. In England and the United States, however, administrative law is not classified and treated as a separate branch of the law nor applied by a distinct set of tribunals; but this does not mean that administrative law has no existence in those countries. It only means that no distinction is made between administrative controversies and controversies between private individuals; both alike being determined by the ordinary judicial tribunals and the remedies of the individual being the same whether the issue is between private individuals or between an individual and the government.

The criminal law is usually classified as a branch of public law because it deals with offenses against the state as the guardian of public order and the protector of individual rights. By the law of every country a crime is regarded not as injury to the particular individual who may be the immediate victim but as an offense against the whole society and the state provides the machinery for its punishment. The law, therefore, which prescribes the punishment and organizes the machinery for the enforcement of the criminal law may very properly be regarded as a part of the public law. For the same reason the law which prescribes the rules of procedure by which the courts try offenses against the state is regarded as a branch of the public law.

Finally, international law, or the body of rules, whether conventional or customary, which regulates the conduct of independent states in their relations with one another is treated as a part of public law. See INTERNATIONAL LAW.

The place of public law in the general classification of law and its relation to the other branches of the law may be seen from the following outline:

I. PRIVATE LAW	Persons. Domestic relations. Property. Contracts. Partnership. Agency, etc.
II. PUBLIC LAW	Constitutional law. Administrative law. Criminal law. Criminal procedure. International law.

JAMES W. GARNER,
Professor of Political Science, University of Illinois.

PUBLIC LIBRARY AND POPULAR EDUCATION. The Growth of the Democratic Idea in Public Libraries.—Historically, the library has always been an adjunct to education. The temple libraries of the Egyptians and Assyrians, the public libraries of the Romans, the monastery and cathedral libraries and the libraries of the mediæval universities kept the educational purposes of the library consciously in the foreground.

Cassiodorus and Saint Benedict in the 6th century emphasized the spiritual benefit to be received from copying and studying the Holy Scriptures. Alcuin (ca. 735–804) was a librarian and a user of libraries as well as a great teacher. The early universities at Trèves, Constantinople, Bagdad, Cairo, Cordova, to say nothing of later universities, were noted for their libraries no less than their teaching faculties.

Cathedral, monastery and other libraries for the clergy, founded in the early centuries of the Christian era, have persisted to our own time. In September 1537 an «injunction» provided that Bibles should be put at public expense into every parish church in England for the free use of the parishioners. In 1651 Humphrey Chetham bequeathed several collections of books to different parishes to serve as parish libraries. Other similar benefactions led Dr. Thomas Bray, the founder of the Society for the Propagation of the Gospel, to secure the passage by Parliament of «An act for the better preservation of parochial libraries in that part of Great Britain called England.» The idea was not confined to England. Johannes Megapolensis, the first pastor at Albany, had a library of 25 volumes furnished by Patroon Van Rensselaer for pastoral use. The Rev. Thomas Bray in 1697 proposed the purchase of «Lending libraries in all the deaneries of England and parochial libraries for Maryland, Virginia and other of the foreign plantations.» A number of these parochial libraries were sent to Annapolis, Albany, Boston, New York, Philadelphia, Williamsburg and elsewhere. The provincial library at Annapolis, which was sent there in 1697, numbered nearly 1,100 volumes, and was «probably the first free circulating library in the United States.»

Bray at first intended the parochial libraries to be for the use of the clergy. He soon changed their purpose to «lending libraries» open to all, the local collections to be supplemented by the larger provincial libraries. He says: «I hope, though the design seems more immediately directed to the service of the clergy, yet gentlemen, physicians and lawyers will perceive they are not neglected in it. . . . And indeed those persons of quality whose eldest sons being commonly brought up to no employment have a great deal of time lying upon their hands, seem to me to be as nearly concerned as any to favor it. For many of these young gentlemen, when removed from the universities . . . residing all their lifetime in countries where they can meet with no books to employ themselves in reading and whereby they may be able to improve the talent they have there gained; they do therefore too commonly become not so conspicuous for their excellent knowledge and morals as will ever be expected from men of rank and station in their country.» Bray here emphasizes the value of the library as a continuation school for the laity as well as its vocational value to the clergy. Nevertheless, broad as his ideas were, they were essentially aristocratic as well became a period almost devoid of any appreciation of the need of universal education and in which literary culture was a class distinction, not a recognized public need. This is doubtless the chief reason why Bray's libraries failed, for the most part, to accomplish what he expected of them, and why most of them became not only inactive but actually extinct.

A more significant movement in the educational purpose of the library was the foundation by Benjamin Franklin in 1731 of the library of the Junto. Both club and library were deliberately planned for the self-improvement of the members. The library, which afterward developed into the Library Company of Philadelphia, was the first of the subscription libraries which under the name of Mechanics', Athenæum or Society libraries, Young Men's Institutes, etc., soon spread throughout the United States and England. Though this was a proprietary library, it was a collection for tradesmen and mechanics as well as for the gentry. Within a few weeks after the first books arrived the directors agreed that the librarian «may permit any civil gentleman to peruse the books of the Library in the Library room.» Franklin's democratic purpose is shown by the reference, in his 'Autobiography' (Chap. V) to this library: «This was the mother of all North American subscription libraries, now so numerous. These libraries have improved the general conversation of the Americans, made the common tradesmen and farmers as intelligent as most gentlemen from other countries, and perhaps have contributed in some degree to the stand so generally made throughout the colonies in defense of their privileges.» Libraries of this type were really more nearly free than their names imply. They were open to practically everyone, their fees were usually small and entirely free use of their reading-rooms was a fairly general practice. Together with the small local «lyceum» libraries which became very common in the fifth to the seventh decade of the 19th century, they did much to promote the reading of American literature and to shape American popular opinion.

Two notable library conferences (in 1853 in New York and 1876 in Philadelphia) greatly stimulated the development of the American public library. Many libraries supported by public tax for public use were already in existence. New York State in 1835 had established a system of «district libraries» in each school district of the State for the free use of the people of the district. Similar legislation was passed in many other States but in few cases was the use of the library at all commensurate with the hopes of the founders. The chief reason was that the library existed, in most cases, as an unadministered collection of books, growing or diminishing by chance and with little or no reference to the tastes or needs of its patrons. The idea that the education of the people through reading should be fostered by State revenues and not left by chance to proprietary or endowed institutions was of slow evolution. Many libraries had long been «public» in the sense of allowing all to use them who wished to do so but there had been little attempt to adapt the character of the library to the need of its community. Thus the Free Library of Hamburg, founded in 1539, issued in 1869 but 4,000 volumes, though its collection numbered nearly 200,000 volumes, chiefly because it was never a really popular library. This is typical of nearly all of the so-called public libraries in Europe and America up to the last quarter of the 19th century.

The new type of public library was described in 1876 by Dr. William F. Poole as follows: "The public library which we are to consider is established by state laws, is supported by local taxation and voluntary gifts, is managed as a public trust, and every citizen of the city or town which maintains it has an equal share in its privileges of reference and circulation. It is not a library simply for scholars and professional men . . . but for the whole community — the mechanic, the laboring man, the serving-girl, the youth and all who desire to read, whatever their rank, intelligence or condition in life. It is the adjunct and supplement of the common-school system. Both are established and maintained on the same principles — that general education is essential to the highest welfare of any people: and considered simply as a question of political economy, it is better and cheaper in the long run to educate a community than to support prisons and reformatories."

Massachusetts in 1847 had authorized Boston to tax itself for a free public library; New Hampshire in 1849 passed a general law enabling towns to establish and maintain libraries by public taxation. William Ewart secured in 1850 the passage of a bill permitting "the establishment of public libraries and museums in all municipal towns, in England." Massachusetts in 1851 passed a general law permitting towns throughout the State to establish and maintain public libraries by public tax. The whole underlying purpose of such libraries is democratic. Everyone has equal opportunity to use the books he needs for culture, recreation or for aid in his daily vocation. As the public school has more generally recognized the duty of fitting the individual student to take an individual part in society instead of merely putting him through a uniform course of general training, the educational value of the library has been more generally recognized. The school library has been developed to meet the need of those still in school. The public library meets the needs both of those still in school and those who have left school. By far the greater part of the people of any country leave school with only a slight amount of formal training. Compulsory education seldom extends beyond the 14th or at most the 16th year. Private libraries, especially in the United States, are not generally increasing in number or value. Individual education on civic problems in whose determination every voter has a part can in most cases be obtained in any adequate degree only through an active, well-selected public library. President Hibben of Princeton University says: "At this time [1916], when the whole world seems rushing on to an unknown future, you [librarians] are holding fast the great articles of the past. You are guarding the sources of knowledge. The library is to-day the only absolutely democratic institution that man possesses." Andrew Carnegie gives as the greatest recent accomplishment of the public library: "The spread of the truth that the public library, free to all the people, gives nothing for nothing; that the reader must himself climb the ladder and in climbing gain knowledge how to live his life well."

Democracy in any country cannot safely content itself with developing a high average of intelligence, essential as this is. Exceptional citizens must be enabled to develop their exceptional abilities, for the service of the whole community. Every public library must aim to collect some material which, though directly used by only a minority of its public, through them serves the whole community. Not only do the larger libraries aid the research student by their own collections, but virtually the whole country can be served through inter-library loans of material valuable only to the exceptional few.

Substantial agreement on the fundamental moral and social ideas whose sum forms the national ideal is essential for the welfare of any self-determining nation. This is the whole purpose of popular education at public expense. One more step is necessary. Present-day society is so rapidly developing new ideals and modifying old ones that constant self-instruction in prevalent current opinion is necessary for good citizenship and, consequently, for national stability. No school course can give this to the adult. The public library, whose duty is to contain books and periodicals on all phases of controverted subjects, is the only institution which can even measurably give this instruction at times and in forms suited to individual needs.

The recent war has shown clearly the importance of *morale* in military affairs and every well-considered scheme for the social readjustments which are following the war has included the development of peace-time *morale*. The library cultivates civic *morale* through its recreational reading as well as through its professedly educational books. Even the business library has this for one of its aims. The good library of this type usually includes recreational books as a welfare project.

Official Connection of Library and Public Education.— Many legal decisions in the United States, England, Canada, Scandinavia and elsewhere have officially recognized the library as an educational institution. It is on this basis that the library chiefly bases its claims to tax exemption and to direct tax support. In virtually every civilized country the control of libraries is vested in the official department which directs public education.

In the United States the connection between the public library and popular education is usually made by the State Library Commission or by making the library activities of the State a duty of the State Education Department (as in New York and Utah).

Since popular education in the United States most nearly follows a democratic ideal, it is natural that the connection of public education and public library is closer than in any other country. Canada (especially in the province of Ontario) and most European countries include both school and library under their ministries of education. In Norway and Denmark there is a general tendency to consider both school and library essential in popular education. England is beginning to show a similar disposition — an example followed in varying degrees by many of her colonies. In Italy, the connection, though theoretically recognized, is not practically realized to any great extent. France and Germany, with their rigid courses of elementary and secondary training, discourage rather than encourage individual research for those below the university and make little attempt to establish or use public libraries for direct educational purposes. Several provinces of India (notably Baroda and the Punjab) have established library systems for the purpose of popular education.

Specific Educational Activities of the Public Library.— The main lines of direct educational activity in vogue in American libraries are noted below. They are characteristic of the work of nearly all of the better public libraries of the country, though the emphasis on different activities will vary in different places. These are also in the main the same as those of other countries in which the public library is recognized as a part of the public educational system.

(a) Work with Schools.— The school library, definitely planned as an auxiliary to the school course, is rapidly assuming a place of its own. Its limited purpose will always more or less limit its independent development. The public library can and usually does supplement the school library in various ways. Instruction in the use of books and libraries is often given in the public library. Books which the school library cannot afford or which it needs only occasionally are purchased by the public library and books and space are reserved in reading-rooms for the use of individual pupils as well as entire classes. Reference lists are compiled for the use of teachers and pupils and the attention of teachers is called to recent material of use in school work. School collections of pamphlets, clippings, maps, pictures and lantern slides are supplemented by loans from the local public library collection. Material is made accessible at the public library at hours when the school library cannot conveniently be kept open. Much of the technical routine of cataloging, classification, book purchase, etc., is frequently done through the public library. In some cases, especially in small places, school and public library unite to employ a competent librarian who serves both. In others, branches of the public library, for gene -l public use, are maintained in public school buildings. This interrelation of the two types of libraries tends to make habitual the use of the library after the pupil has left school. In a rather large number of cases, the public library selects the school librarian and administers the school library subject to the general consent of the school authorities.

(b) Work with Children.— The children's room of the public library also supplements the work of the school. The story-hour and the collection of children's literature enable the child to read voluntarily along the lines of his individual tastes. A wider range of subjects and a greater freedom of treatment than the school can give are usually open to the children's librarian. This is especially important in connection with elementary schools and the tendency of teacher, school librarian and children's librarian to work together in this direction is increasing.

(c) Work with Clubs and Societies.— This work may be either with children or adults. In the former case it is usually conducted by the children's department of the public library either independently or in connection with some distinct organization such as the Boy Scouts, Girl Scouts, etc. Carefully selected collections of books suited to the age and taste of the club members are provided, and in many cases meeting-rooms are provided by the library. Boys' and girls' reading, debating or social clubs are also often organized and conducted by the library. The voluntary character of these clubs and the usual insistence on self-government not only act favorably on the older boys and girls who have left school but react very favorably on those still in school.

The adult clubs whose activities are related to the library vary in character from trade unions and other industrial societies (to whom industrial as well as recreational books are supplied) to classes of aliens learning English and to social clubs with literary or sociological purposes. Suitable books and other printed material are furnished and the library often serves as a clearing-house for the club activities. As a public institution, impartial in its aim to furnish any legitimate information on any question affecting public welfare, the library is pre-eminently suited to be an agent in the demonstration of practicable democracy. Its educational service is especially direct in supplementing the conscious attempt at self-culture which is the ·sual feature of these clubs.

(d) Lectures and Exhibitions.— Closely allied in purpose with the work of the public library with clubs are the lectures and exhibitions held under its auspices in the auditoriums which are a part of most modern public library buildings. These are often conducted by outside organizations to which the library gives a meeting-place or exhibit-room. In such cases the library usually attempts to develop and conserve the educational results by preparing lists of books, periodicals or prints relating to the subject of the lecture or exhibit or by making prominently accessible the selected resources of the library on the subject. In other cases the library prepares the exhibit or plans and conducts the lecture-course and supplements it by its printed material. Exhibits of local industries, arts and crafts and current and local history have shown rather definite educational results. At present the public library is often the only substitute for the public museum. When the work of the public library and the public museum become more closely related, greater results may be expected.

(e) Civic Education.— The library's contribution to civic education has already been noticed. By supplementing the school course, by providing standard and current material on civic matters, by aiding clubs devoted to the study of social questions and by lecture and exhibit the library is an educational force. It furnishes the impartial publicity which promotes discussion of public affairs and which leads to more intelligent decisions concerning them.

The European War revealed the effectiveness of the library as an agent in educational propaganda. The promoters of the liberty loan campaigns, the allied war service campaigns, the land army and similar movements found it an admirable agent for the effective, economical distribution of their printed material as well as for the display of their posters and other advertising material. It furnished material for speakers and writers for the various campaigns. Its effectiveness in this direction has led it to be used by other agencies for public service. Its use as a clearing-house for public information of all kinds seems destined to increase. Its public usefulness in this direction must obviously depend on the judgment shown by the librarian in deciding what organizations and movements are granted this library privilege and by the extent to which they are permitted or encouraged to use it.

In the broader field of international relations the public library can play a very important part through its selection of material dealing with the life, thought and natural resources of foreign countries and by using them to supplement the agencies for civic education already mentioned. It is already proving of great service to schools with inadequate library facilities on whom the present program of Americanization has been imposed with little opportunity for preparation to carry it out.

In the special field of Americanizing the alien the library has been of very direct service. It has supplemented the efforts of the school and other social organizations. It has often anticipated their methods. To many foreigners the library has been the only public institution standing for equal opportunity for voluntary effort. Its auditorium has often been the only respectable meeting place open without taint of specific social or religious propaganda to the alien social group. It has kept alive the human relations of the alien by giving him books and periodicals in his own language, dealing with the United States as well as with his native land. It has organized classes for the study of English and of American institutions and has freely furnished its books to other instructional agencies. Its service is to individuals, not to nationalities or to classes in the mass. Through the cultivation of individual thinking, — the motive principle of democratic education,— it discourages mob thinking and mob action and maintains the traditional American attitude toward civic rights and duties.

(f) **Æsthetic Education.**— The growing consciousness of the American public to the importance of the cultural in American life is directly aided by the public library. The importance of the library in cultivating literary taste is generally recognized. Much of the support of its work is based on its success in getting the public to use the best books, from a literary and ethical standpoint, which the individual members of that public can read with profit. Its undoubted influence in the formation of public taste in this direction sometimes obscures its equally direct service in æsthetic education.

Nearly every large public library and many small ones maintain collections of prints and act as distributing centres for lantern slides, motion pictures and other illustrative material either from their own collection or lent by larger or more special libraries or departments of education. (See VISUAL INSTRUCTION). Under present housing conditions the public library is often the only practicable public place for the collection of prints and the larger and more costly illustrated books and monographs on art. Some libraries and education departments lend framed pictures for school and home use. The library art collection promotes local arts and crafts as well as art appreciation in general.

Nearly all public libraries include some books on the history and criticism of music. Collections of musical scores and single compositions, instrumental and vocal, are common. A few libraries maintain collections of music rolls for mechanical piano-players. The high cost and perishable character of talking machine records has so far prevented the establishment of many such collections for public use, but some libraries, notably in California, have formed such collections. Many school libraries have collections of these records selected for their direct educational value. The success of many recent "community sings" has been partly dependent on the music collection of the local library.

In the matter of permanent art exhibits the library is properly subordinate to the public museum. In the absence of the latter and to supplement it, the library exhibits as noted above can have distinct educational value.

Bibliography.— Much material on this subject is scattered through educational and library periodicals. Specific references may be found in Cannons, H. G. T., 'Bibliography of Library Economy' (London 1910); 'Library Work, Cumulated' (Minneapolis 1912); Hortzschansky, A., 'Bibliographie des bibliotheks- und buchwesens' (Leipzig, annual); and in the monthly summaries of library literature of the *Library Journal*. The annual volumes of the National Education Association also include many articles on the subject. The reports of the United States Commissioner of Education include valuable summaries and special articles.

Among the more specific books and pamphlets are the following: Adams, H. B., 'Public Libraries and Popular Education' (Albany 1900); Alexander, C. B., 'The Library in the Economy of the State' (New York 1916); Ayres, L. P., and McKinnie, Adele, 'Public Library and the Public Schools' (Cleveland 1916); Bostwick, A. E., 'Relationship of the Library and the Public School' (New York 1914); Dana, J. C., 'Libraries' (New York 1916); Emery, J. W., 'The Library, the School and the Child' (Toronto 1917); Hardy, E. A., 'The Public Library, Its Place in Our Educational System' (Toronto 1912); Powell, Sophia H. H., 'The Children's Library a Dynamic Force in Education' (New York 1917).

PUBLIC SCHOOL ORGANIZATION. This article on school organization deals first with the kind, distribution and relation of schools in the community, second with the organization of the supervisory and teaching force in the system and in the individual school. The ordinary units of school organization are rural districts, townships, villages and cities. By far the most of the rural schools have but one teacher who instructs all the children who attend, dividing them into as many grades as seem desirable. A few rural schools have two teachers and in occasional instances a larger number is employed. The township system usually includes a number of rural schools of one or more departments and a larger centrally located school where academic studies and perhaps industrial and homemaking courses are pursued. The proportions of the total number of pupils in the township registered in the outlying schools and in the central school respectively vary greatly. In some instances few if any outlying schools are maintained and pupils are brought to the central school by carryalls or auto buses. In other cases only the pupils of high school age or those of the upper grades and the high school, are brought to the central school, while the smaller children attend rural schools near their homes.

In order to explain most easily the school organization of communities of varying sizes, the development of a typical school system from village to city will be described. A small village usually maintains either a "graded" school, that is, a school with teachers and pupils sufficient to maintain a full eight-grade organization, or a combined grade school and high school. In this way the term "high school" is sometimes used rather deceptively to denote a school in reality consisting of both high school and grades. As the village grows there are likely to be added outlying grade schools, at first small with the lower grades only, and later with complete grade organization. At about this time the high school is likely to be separated from the grades and placed in a building adapted to its special needs. As the village develops into a large city grade schools multiply and the number of high schools increases. Special high schools for industrial, commercial, homemaking, vocational instruction are added, or these lines of work form recognized departments of the regular high school. Grade schools will be placed as the density of the population demands and high schools will be so located as to serve definite sections of the city. Unless the city develop beyond the half million mark there will probably not be more than one or at most two special high schools such as those just named, and these will be centrally located.

The development of the junior high school, a form of city school organization which at the time of writing is found in but comparatively few American villages and cities, seems likely to bring about within a period of years a general reorganization of school systems. It is sufficient to say here that the junior high school contemplates the division of the 12 years of public school education into three periods, probably with one or the other of the following groupings: 6-3-3, or 6-2-4. There will be an elementary course of six years, a junior high school course of three or two years and a senior high school course of three or four years. This change would necessitate the placing of six-year grade schools as needed, junior high schools as required as centres to which pupils from a number of elementary schools would come, and high schools in turn as centres to which the graduates of a number of junior high schools would come.

The chief administrative officer of a small school is the principal who has charge, under the direction of the local school trustee or trustees and usually of the county or State school authorities, of the organization and instruction throughout the school. In small schools the principal gives much of his time to classroom instruction, but as the schools grow larger less time is given to instruction and more to supervision. Many principals in village high schools and nearly all principals of large village or city grade schools give all or essentially all of their time to supervisory duties. Although there is naturally much variation in this respect, it is seldom that a principal teaches more than a few hours weekly if he has the supervision of 15 to 20 teachers.

In larger communities the chief school administrative officer is the superintendent. In different parts of the country the term has very different significance as to size of the community and the number of teachers supervised. Usually in a community having a superintendent there are more school buildings than one and the superintendent is not a part of the organization in any one building, but maintains an office frequently outside of the school buildings and has the same supervisory relation to all of them. In its simplest form a typical school system organized under a superintendent consists of the superintendent, two or more grade principals with separate teaching staffs, and ordinarily a high school principal and teaching force. This organization is subject to many possible variations. As has been said elsewhere in this article, development is along the line of additional groups of grade school, high school and technical school teachers, each group having its principal. In large city systems assistant superintendents, supervisors of instruction in the various subjects and officials charged with the care of buildings, records, finances, etc., are added.

Within the individual school there may or may not be further organization. This is largely dependent upon the size of the school. When the number of teachers in the grade school becomes too large for the principal to supervise effectively he is usually assisted by one or more of the following department principals: primary, grades one to three, intermediate, grades four to six, grammar, grades seven and eight, or by an assistant principal with general duties. The high school principal in a school large enough to have about three or more teachers of each subject, i.e., of English, mathematics, etc., is assisted by heads or chairmen of departments, through whose hands goes more or less of the administrative work regarding the organization of classes and supervision of instruction in the respective subjects. In large city high schools assistant principals are frequently provided.

RANDOLPH T. CONGDON,
Principal, State Normal School, Potsdam, N. Y.

PUBLIC SCHOOLS. The idea of a free public school maintained entirely at municipal or State expense and altogether under State and secular control is a modern development, which was not realized until the 19th century. The growth of democracy in the last 100 years has been one of the chief causes of the rapid advance of the free and secularized public school system. Only in the United States, however, has the public school system had a development such as a democratic society logically demands.

A system to be truly democratic must have the following characteristics: (1) It must be free to all; (2) it must extend over all stages of education; (3) it must have what is called the «educational ladder»; that is, pupils must be able to pass upward freely from one grade to the next higher; and (4) it must be patronized by all classes of the community.

It may fairly be claimed that the American public school system has now reached a stage where all these ends have been attained. In Germany, France and until recently, at least, in England, public education has not been, and is not even now, generally free, since, though most of the expenses have been met from public or institutional (usually religious) sources, each pupil unless a pauper has had to pay school fees. No educational ladder exists in those countries, for secondary education begins at eight or 10 years of age and always in schools parallel to the elementary schools. The pupil who completes the public school at the age of 14 must go back from four to six years if he wants to have a secondary education. In the United States, however, the pupil enters the high school without loss of time, since the high school begins where the elementary school ends. It naturally follows that in European countries only the children of the «lower classes» attend the elementary schools, and that it is only in exceptional cases that they ever find their way into schools of secondary and higher education. From the beginning, in those countries, the secondary schools, and later the universities, are patronized by the higher social classes, reinforced to some extent by the children of thrifty and ambitious members of the lower ones. In sharp contrast to this state of affairs, it is the proud boast of the American school system at its best that the public school is open to the poorest and is good enough for the highest; that in form, at least, the system is so organized that the road is open for every child in the republic to carry his mental development to the highest possible point; for not only are elementary and secondary schools free and properly articulated, but in most of the States a free education is offered also in universities. It is furthermore a matter of daily observation that all classes of our population freely patronize the public schools. The only considerable exception is the private religious, or parochial, school, where the motive for segregation is religious, not social. Nearly 90 per cent of all children of elementary grade attend the public school.

Colonial Beginnings of Public School Evolution.—The beginnings of the free common school reach back to the earliest colonial times. In New England, at least, the predominant motive for promoting public education was religious rather than political. The elementary school of that period quickly merged into the academy or secondary school, where the promising lads were prepared for college. However, the idea that the early education should be free, and in considerable degree compulsory upon all, found early expression. The General Court of Massachusetts in 1642 enjoined upon town authorities the duty of seeing that all children acquired at least the rudiments of an education. The order even went so far as to require the removal of children from those parents who persisted in bringing up their offspring in ignorance. The selectmen of every town were further required «to have a vigilant eye over their brethren and neighbors, to see that none of them shall suffer so much barbarism in any of their families, as not to endeavor to teach, by themselves or others, their children and apprentices, so much learning as may enable them perfectly to read the English tongue and (obtain) a knowledge of the capital laws; upon penalty of 20 shillings for each neglect therein.» In 1635 Boston made public provision for the support of a school. The Act of 1642 was greatly strengthened by the Massachusetts School Law of 1647, which required all towns having 50 householders to «appoint one within their town to teach all such children as shall report to him, to write and read; whose wages shall be paid, either by the parents or masters of such children, or by the inhabitants in general,» and which further required that where any town has increased to 100 families or householders, «they shall set up a grammar school, the master thereof being able to instruct youths so far as they may be fitted for the university.» This law laid the foundations for the present free elementary and the free secondary, or high school, for though it did not insist that all school revenues should be raised by public taxation, it provided that they *might* be so raised, and it made the community responsible for the establishment and maintenance of schools for all its children. In 1638 New Haven set up a school under Ezekiel Cheever, who was paid «out of the common stock of the town.» Rhode Island established a public school at Newport in 1640, and Providence one 20 years later. In 1633 the first Dutch schoolmaster arrived at Manhattan, when the first school tax, amounting to £4, was levied and collected. By 1650 the 800 inhabitants of New Amsterdam paid their schoolmasters regularly from the public treasury.

More or less rudimentary beginnings of public education are found in the older colonies, as in New Jersey, Pennsylvania, Virginia and the Carolinas. In the South, however, the free school idea was not so hospitably received as in New England and in New York. An oft-quoted expression by Governor Berkeley of Virginia may be cited. When the English Commissioners of Foreign Plantations asked what course was taken in Virginia for instructing the people in the Christian religion, Governor Berkeley replied, «The same that is taken in England out of towns, every man, according to his ability instructing his children.» He also added, «I thank God there are no free schools nor printing presses, and I hope we shall not have them these hundred years; for learning has brought disobedience and heresy, and sects into the world, and printing has divulged them and libels against the best of governments:

God keep us from both!" So far as Virginia and the remainder of the South were concerned, good Governor Berkeley had his wish, for it was not until after the Civil War that that section of the United States was supplied with anything like a system of free public schools.

The Revolutionary Period.— In all European countries at this period, the financial responsibility for the education of children was held to belong to the parents, so that neither state nor community, religious or charitable organization, ever desired to make education free, except for children of paupers or others unable to meet the expense. The idea that free schools are only for paupers or the very poor permeated most of the American colonies during the Revolutionary period of American education. Even where the schools were not strictly private, the "rate-bill" for all who could pay was a common device for helping to meet the expenses of the school. This idea prevailed in Pennsylvania, Rhode Island, New York, New Jersey and the South. Some States raised taxes to school the paupers, but they made those pay who could do so. Only in Massachusetts and in the more democratic settlements west of the Alleghany Mountains did the pauper idea of free schools fail to obtain a firm hold upon the people. The fees were collected in various forms. In cities the assessment was usually in money; in country districts both East and West the rate frequently included a period of board for the teacher, who was thus obliged to "board round" among the families of his district. By 1848 all fees were abolished in Rhode Island. They lasted until 1864 in Vermont, 1867 in New York, 1868 in Connecticut and until 1871 in New Jersey.

Development of State Control.— From the earliest times in America the responsibility for the support of schools was focused upon the settlement, village or town, never upon the colony, or later upon the State as a political entity. This condition of things lasted well into the first quarter of the 19th century. Since that time, however, there has been a steady advance toward State support, supervision and control of public elementary education. In no State of the American Union has the right to control the public schools been abruptly assumed by State authority; on the contrary, State control has sprung almost spontaneously from natural conditions, chief among which have been the rapid growth of population and the equally rapid growth of State school funds. The process has been somewhat as follows: As soon as a given State, say Illinois, had at its disposal a considerable amount of money for annual distribution among the school districts, it was natural that the legislature should lay down the conditions with which the district must comply in order to enjoy such aid. Among the first things prescribed would naturally be (1) a minimum number of days during which the school must be held in session; (2) a course of study that must be taught; (3) the certification of teachers, usually be county authority, but in subjects prescribed by the State. Again, individual communities, however loath to relinquish the management of their own school affairs in their own way, have been obliged to bow to the will of the State, in so far as it saw fit to assert its authority since the power to levy and collect taxes is derived directly from the State. At present all State constitutions contain provisions relating to popular education.

The idea that has everywhere prevailed is that the State should in every way possible stimulate local interest and local effort for the support and improvement of schools, laying its hand of authority only upon those general essentials of the school system which are indispensable to efficiency. This is why the American public school system has manifested such astonishing elasticity. Every community can have as good or as poor schools (down to a certain point) as it desires. The salaries may be high or low, the equipment ample or inadequate, the schools backward or progressive as the community wills. Again, this elasticity is felt also within the teaching body, quite aside from the general tone of the community. It is not uncommon to find public sentiment quickened and elevated by a corps of teachers led by an active and progressive superintendent. The absence of restrictive State control as to subject matter, methods of teaching and school organization opens the door to individual initiative, and to consequent progress. The interaction of the two influences, that of the State on the one hand, with its general prescriptions and supervision, and that of the local community, on the other, with its power of adjustment to circumstances, makes the American school system the most perfect adaptation to democratic needs that is to be found in the world. Any civilized European system maintains standards with respect to given particulars that the American public school as a whole can by no means measure up to; but it may be confidently asserted that no European system, however excellent, could, if put into operation in an American State, produce results so wholesome and excellent as those that come from the present system.

The Growth of Public School Funds.— Individual States began at a very early period to establish permanent funds for the support of common schools. In 1795 the lands known as the "Western Reserve," held by Connecticut, were sold for $1,000,000, and the money turned into the school fund. New York also made provision for common schools by setting aside a portion of the public lands for this purpose. New Hampshire began a school fund by exacting one-half of 1 per cent upon the capital of banks within the State. Other States made similar but less effective efforts, a favorite means being the granting of lottery privileges for the raising of funds. Much more fruitful sources of permanent school funds in the several States have been Congressional land grants that have been made from time to time out of the unsettled government land lying to the west of the original colonies. Each of the States subsequently carved from this vast territory received a grant varying from one to three sections from each township for school purposes. In addition to the direct appropriation of land, it has been the policy of the government to turn into the State treasuries, also, a percentage of the net proceeds from the sale of public lands within their borders. In some States, the school lands were sold at an early date at low prices; in others the lands are held to the present day. By act of Congress 1836 a surplus in the United States treasury was distributed among the States. The amount actually given was something less than $30,000,000. In 16 of the 26 States then existing, this money was appropriated in whole or in part to the permanent schools' funds. The present total annual income from permanent school funds and the rent of school lands is something over $17,500,000, but this amount is very unevenly distributed among the States. When we consider that the total annual expenditure for public schools now closely approximates $640,000,000, it can be seen that the income from permanent funds forms but a small fraction of what is actully expended; yet it would be an error to assume that the influence of these public funds has been limited to their comparative magnitude.

Systems of Administration.— Developing as the public school has done from the individual settlement as the starting point, it can easily be understood why the district system of administration has been so potent in the past, and why in some States the people still cling so persistently to this form of management. The "school district," our oldest and most primary form of school organization, is the smallest civil division of our political system. It was early recognized by law and given legal functions and responsibilities. The district manages its school affairs in a simple way, a board of directors or trustees, usually three in number, being elected to employ the teacher, determine the amount of money to be expended and in general to conduct the school affairs of the district. This is the most elementary and at the same time the most democratic of methods for school administration. It is particularly well fitted to sparsely settled sections of country, but not so well adapted to denser populations, since it prevents the efficiency that arises from consolidation.

The township system forms the next natural stage in the development of school administration, since it is based on a convenient political unit, not too large for effective local direction. In this system, one set of officers conducts the educational affairs of the whole township, erecting buildings where they will best accommodate the people, employing teachers, grading the schools, in many cases providing for the transportation of children to and from school, and usually crowning the whole with a township high school, to which pupils may be promoted upon the completion of their elementary course. The State of Indiana has been a pioneer in introducing the township system. A number of other States have adopted it wholly or in part.

Most if not all the Southern States have a county system of school administration, because there the county rather than the township is the unit of government. While in the Northern States the county has never been the unit for civil or for educational organization, it is and has long been the unit for supervision of schools. With but few exceptions each county has a superintendent whose chief duties are: (1) the certification of teachers; (2) the personal supervision of the schools through visitation; (3) the conducting of teachers' institutes.

The foregoing organization exists chiefly for the administration of rural and village schools. Nothing has been more marked than the development of cities. It is obvious that administration through the primitive district system would soon become altogether inadequate for the needs of a city. Legislatures have accordingly made special laws to meet the needs of cities of various classes. The largest cities in a State, like New York City, Buffalo and Rochester, in New York, usually have special charters enabling them to conduct their schools as they deem best. Cities as a rule have boards of education for the administration of the system. These boards differ greatly in size and in the manner of their appointment. In most cities the members are elected by the people for stated periods, sometimes at large, sometimes by wards or subdistricts. In some of the larger cities the members are appointed by the mayor and city council acting jointly.

Housing and Equipment.—Nothing is more noteworthy than the development of public school architecture in the United States. In full accord with its democratic genesis, the housing and equipment reflects completely the educational status of the community. The rural school may be a mere unsightly box with the most primitive apparatus; or it may be an artistic building, adequate in size, well heated, lighted and ventilated, supplied with separate wardrobes for boys and girls, and equipped with needed books and apparatus. State and county superintendents have done much to inform their respective rural communities of what is desirable and practicable in country schoolhouses, furnishing freely plans and specifications, and even providing the builders with complete models for their guidance. In the State of Missouri over 600 rural schoolhouses were erected in a short time in accordance with a model furnished by the State superintendent of public instruction. The cost of a building of this type was $600.

The elementary school covering a period of eight years, the most common type of graded-school building in towns and small cities, is the eight-room schoolhouse — one room for each grade. The heating, ventilation and lighting of such a building has become an important problem. This problem is rendered much more complex in cities where the plan must be enlarged to accommodate from 1,000 to 4,000 pupils. A typical classroom in such a building should be approximately 24 by 32 feet in dimensions, and from 13 to 14 feet in height; it should be lighted entirely from one of its longer sides, the windows reaching to the ceilings; about 2,000 cubic feet of pure warm air per hour should be provided for each pupil; and each room should be provided with a convenient wardrobe. By the use of steam indirect heating, supplemented by "plenum" and "exhaust" fans run by steam or electric power, it has been found practicable to meet the foregoing conditions of heating and ventilating. Practically all of the modern city school buildings secure these most desirable ends. The buildings are usually an architectural ornament to the neighborhood in which they stand. It has gradually come about, therefore, that the public school is one of the best-housed institutions of modern society. In the poorer districts of large cities, the school buildings are the palaces of the people; they are, moreover, the places where the children of the slums find warmth, light, pure air, beauty, and sympathetic humane treatment from their teachers. It is here that their hearts are warmed, their minds developed and supplied with useful and inspiring knowledge; it is here that they are enabled to rise to higher planes of living, and to prepare themselves for a worthier citizenship than their humble origin would seem to warrant. In well-to-do districts of the city, the same beneficent physical surroundings contribute more than any other instrumentality of society to develop the best that there is in democracy.

The Sex of the Teaching Force.— For the first time in history, society has, since the beginning of the 19th century, undertaken to educate all its children, boys and girls alike. Before that time only certain classes of boys were educated, invariably by men teachers. With the new duty there appeared a new means, namely, the employment of women as teachers. So long as women remained uneducated, it occurred to no one, least of all the women themselves, that they could teach. So long as they could find productive labor in the home, as they could until steam-power and machinery drove industries to the factory, women felt no especial need of a new calling. But when remunerative labor for women failed in the home, when the schools began to educate them along with their brothers, and when the new social undertaking of universal education began to clamor for more and cheaper teachers, then it was that the world awoke to the fact that it had in its midst a new and hitherto unused force — its young unmarried women. Women began to be employed as teachers in large numbers in the United States before 1850, especially in the New England States, where the first normal schools were established. The period of the Civil War saw a rapid increase, owing to the natural withdrawal of the young men in order to enlist as soldiers. Since the close of the war the percentage of women in the schoolroom has steadily and rapidly increased, throughout the Union, until in the cities, at least, men are rarely found as teachers in the grades. They are still employed to some extent in rural schools, especially in the newer States. The following table shows the increase in the number of women teachers in 13 typical States since 1875:

STATES	1875	1880	1886	1902	1916
Vermont	85	83	88	82	92
Pennsylvania	50	52	83	87	78
New Jersey	71	76	79	87	95
Iowa	63	67	76	86	89
Indiana	42	48	49	55	68
Illinois	57	61	67	75	81
Rhode Island	80	78	87	91	92
Missouri	39	43	40	66	75
Connecticut	76	76	82	91	93
Massachusetts	88	87	89	91	89
New Hampshire	86	83	88	91	92
Ohio	46	52	56	62	75
Maine	69	67	65	86	88

The women now number 80.2 per cent of all the teachers in public elementary schools of the whole Union, while in city elementary schools they rarely number less than 90 per cent of all teachers. In New York State high schools about two-thirds of the teachers are women. The same phenomenon is seen in foreign countries, but the increase in the number of women teachers there has in general been less rapid. In Great Britain and Ireland the increase has been from 54.3 per cent in 1870 to 75.3 per cent in 1900. If one may judge by the attendance at the normal schools, the number of men and women in French elementary schools is about equal. In Germany, as a whole, less than 20 per cent of all elementary teachers are women. In Italy, however, 93 per cent of the students of normal schools are young women, though the women form only about 58 per cent of the whole elementary teaching force. In the 11 State normal schools of Massachusetts there are 308 men and 2,811, or 90 per cent, women students.

The large, almost exclusive, employment of women as elementary teachers is the newest thing in our civilization. It is difficult as yet to interpret its full significance. There is no doubt that society has been well served at very small expense. The economic motive constantly appealing to communities that do not like high taxes is that they can get better teaching from women for a small sum than they can from men. A first-class woman teacher, they say, is always to be preferred to a second-rate man at the same salary. The assumption is that vigorous, active, well-prepared men can do better financially out of than in the school, and that only second-rate men will accept women's salaries. Ultimately, if the feminization of the school should prove not to be for the best welfare of society, it is pretty evident that the additional cost will not prevent the employment of a suitable number of men. The public school system may be said to be now in its «brick and mortar» stage, for it is expending vast sums to house and equip the school. When this has been done, the resources of the community may easily be turned to the improvement of the teaching force. Ex-President Eliot of Harvard University argues that the people ought not to spend less upon the minds of their children than they do upon their food. Were this standard attained, it is probable that school support would be quadrupled. So far as present experience teaches, it seems evident that for the first four or five years of school life women are the natural and the more efficient teachers. When it comes to the early years of puberty, society still holds theoretically that the influence of men is essential to the proper unfolding of the minds and characters of both boys and girls. It is this conviction which, for the most part, enables the non-sectarian private school to maintain its existence in the more wealthy communities. It is probable, notwithstanding the aforementioned theory that men are indispensable as teachers of youth, that the availability of women and the difficulty of holding the right type of men in such positions will confirm the present custom of almost exclusively employing women for grade teaching.

The Development of the Public School Curriculum.— Down to 1837, when Massachusetts created her board of education and placed Horace Mann at its head, the curriculum of schools not fitting boys for college was limited to the bare acquisition of the school arts, spelling, reading, writing, ciphering, relieved by a trifle of geography and history. The discipline was always rigid and sometimes harsh; the school term was short and the years of schooling few; the path of learning was not strewn with roses; but the intellectual, like the moral, discipline did honor to the straitest notions of our Puritan forefathers. In his seventh annual report, Mr. Mann, who had visited schools abroad, especially in Germany, where the new philosophy of Pestalozzi was earnestly applied, attacked with great vigor the old curriculum, the old Puritanic ideas and the old unsympathetic methods of teaching. He demanded new subjects more suitable to children, more humane and sympathetic treatment of pupils and new ideals of the ends to be attained by education. These criticisms and demands led to a spirited battle between Mr. Mann and his admirers and the «Thirty-one Boston Schoolmasters,» who defended the old-time rigorism in study and discipline. The result was a drawn battle. The reformers succeeded in getting their ideals and watchwords accepted, but the conservatives preserved the old curriculum practically unchanged. It was, however, a great advance to have the new ideals of character-forming accepted as a supreme end of education. Even if this school were to be confined to the acquisition of the school arts, it was a vast improvement to have the new methods everywhere put into practice, for now the concrete was made to precede the abstract, facts came before principles and inductive reasoning enlivened and enlightened the old-time memory drills and mechanical application of rules. The school term was gradually lengthened and with this there came a perceptible thought-enrichment of the studies by means of which the children were drilled in the use of the tools of knowledge.

This condition of things lasted until after the period of the Civil War, when the rapid development of the public high school, the still more remarkable expansion of the university curriculum and the rise of all sorts of social organizations for the moral and economic welfare of the community, forced upon the public school an amount of new subject matter that is little short of astounding. As already explained, the old curriculum was mostly confined to the studies through which the child was drilled in the use of the school arts. The children learned to read, but they never read anything; they learned to spell and write and parse, but they produced nothing more than an occasional school essay. But now behold how this old course of study has been «enriched!»—(1) by copious amounts of literature suitable to every grade, not only in the elementary but in the high school as well; (2) by systematic «language lessons» throughout the full course; (3) by the occasional introduction of elementary algebra and concrete geometry in the seventh and eighth grades; (4) by four years of history and as many of geography; (5) by nature work in all the grades; (6) by a course in manual training or «occupations» throughout the whole elementary period; (7) by extensive acquisition in fine arts, such as drawing, painting, molding and music, and finally (8) by an obligatory course in physiology and hygiene, accompanied by what is called scientific temperance instruction.

The foregoing may be called reform by addition. Heretofore the method of relief from a congested curriculum has been by subtraction. When the «reform» forces of a community have been in the ascendency, the new subjects have been added; when, on account of complaints of taxpayers, parents and children, the wave of reform has receded, the new subjects, then called «fads,» are dropped and the curriculum assumes something of its old-time proportions. Obviously some method better than that of addition and subtraction is needed for overcoming this obtrusive dualism in the course of study. That of organization has been suggested by Prof. John Dewey, whereby the school arts shall be made to emerge from the acquisition of extensive bodies of life-giving knowledge. To effect this reform, however, teachers must be better trained, school facilities must be increased and, most important of all, teachers must have smaller classes. The ideal public school of the future will not require one teacher to teach more than 20 children. Now the number often rises to 60.

For statistics of the public school, see EDUCATION, ELEMENTARY.

Emeritus Professor of Science and Art of Education, Cornell University.

PUBLIC UTILITIES. Defintion.— Public utility is a term which is not easy to define with precision. When used in a popular sense it applies to those services rendered to the public which are so intimately related to the welfare of the entire community that those who render them are subjected to varying degrees of public control, assume special obligations and duties to the public and enjoy special privileges. A public utility is commonly referred to as a «business affected with a public interest,» and one of its most obvious distinguishing characteristics lies in the fact that those in control must serve equally all who demand its services instead of remaining free, as the ordinary business man is free, to refuse its services to those for whose patronage it does not care. Because of the many legal problems relating to public utilities it might be expected that a satisfactory definition of the term would be found in the literature of the law. We find, however, that lawyers and judges instead of developing an abstract definition have resorted to the familiar practice of marking out the meaning of the term by the process of judicial inclusion and exclusion, i.e., by determining in each concrete case whether or not the business in question is a public utility. By this method it has been established in some or all of our States that the following are public utilities: common carriers of all kinds by land or water, water supply, gas, electricity, telegraphs, telephones, bridges, warehouses, grist-mills, saw-mills, sewers, cemeteries, hospitals, grain elevators, stockyards, cotton gins, docks, hotels, ice plants, markets and news service.

Distinguishing Characteristics.—An examination of the nature of the businesses just mentioned will reveal the fact that there is no single characteristic common to all except the general fact that each of them has the somewhat vague property of being "affected with a public interest." There is no universal distinguishing feature of a public utility. It is possible, however, to point out certain characteristics, one or more of which will be found to mark every public utility. (1) Public utilities frequently enjoy *special legal privileges* denied to other kinds of business enterprises. The right of eminent domain is commonly delegated by the State to corporations for the purpose of constructing railways, pipe lines, irrigation ditches or of erecting poles and wires. Subsidies in money have sometimes been given to various public utilities on the theory that enterprises so vitally necessary to the public welfare might properly be supported or aided from the public funds. This has usually occurred in cases in which it seemed unlikely that sufficient private capital could be relied upon to initiate the enterprise and was a common practice during the early and highly speculative period of railroad development. Grist-mills, saw-mills and drainage and irrigation projects have also received aid from the public treasury from time to time. A third legal privilege is the right to use the public highways in special ways. Concessions of this kind must be secured by public service companies whose businesses require the laying of tracks, the embedding of pipes or wire conduits or the erection of poles and wires. (2) *Legal monopoly* is an attribute sometimes distinguishing public utilities. There are many early examples of exclusive franchise grants made either as special inducements to the investment of capital or as a means of forestalling competition in fields where it would be impracticable or inconvenient. Legal monopolies are now generally regarded as contrary to public policy except in the case of those public utilities which are at the same time either natural or virtual monopolies. (3) Many public utilities are *natural monopolies*. The several factors which may make a business a natural monopoly are outlined by Mr. Bruce Wyman, perhaps the leading authority in this field. First, there may be a limitation upon the source of supply of the commodity or service. This may be the case with the water used for supplying the wants of a city or for irrigation. It is not infrequently true of natural gas and water power. The only available supplies of commodities or services of vital interest to the entire community cannot be regarded merely in the light of private property. They become of necessity public utilities. Second, a natural monopoly may result from a scarcity of advantageous sites upon which to carry on forms of business in which the community as a whole has a paramount interest. This is true of docks, wharves, freight sheds, warehouses of certain kinds, stockyards and grain elevators. Those who occupy the ground first enjoy the advantages of monopoly simply because there is no room physically for a competitor. A third basis for a natural monopoly may be the limitation of time incident to the service rendered. The service is not only necessary but it is immediately necessary. The person who desires it cannot wait. He is not in a position to haggle over price or quality nor to hunt for a possible competitor. This sort of monopoly may be temporary but it is none the less effective. It is this position of vantage which is enjoyed by the hotel keeper, the hackman, the commercial messenger and the telegraph company. In the fourth place the difficulty of distribution of services constitutes in some cases effective limits upon competition and creates a natural monopoly. Fuel in the form of wood or coal may usually be brought to the consumer with an ease which encourages competition. Fuel in form of gas can be brought only through pipes and competition is for all practical purposes precluded. Those who furnish electric light or power, steam heat, water and the like enjoy what is in effect a natural monopoly based upon this difficulty of distribution. (4) Another characteristic of certain public utilities is their enjoyment of what may be called a virtual monopoly, a monopoly which arises not from any of the causes which produce natural monopolies but rather from certain economic restrictions. In the first place, there are many public utilities which represent a capital investment of many millions of dollars. The financial obstacles in the way of competition are sufficient to preclude it. This is apt to be the case with the various transportation facilities, railroads, bridges, terminals, tunnels, pipe lines, ferries and the like. Every business instinct warns the capitalist not to undertake to duplicate the costly equipment already engaged in these enterprises, for the hope of dividing with a competitor a volume of business frequently no greater than can be readily handled by one system. In the second place, virtual monopolies are created by the desirability or even necessity of service on a scale too large to duplicate. The value of the service rendered by a telegraph, telephone or express company depends in large part upon the number of persons, towns or places that are brought into touch with each other through one system. By reason of this fact they are practically sure to be free from competition when once well established. It was because of the virtual monopoly due to the size and complexity of its service that the Associated Press was held to be a public utility.

Obligations Resting upon Public Utilities. — Because the interests of the entire community are directly concerned in the manner in which a public utility is operated and because the public service company is almost invariably the recipient of some of the legal privileges already mentioned, it is necessary and natural that obligations and duties should be imposed on those who engage in public utility enterprises which do not rest upon the ordinary business man conducting an ordinary business. These obligations and duties may be set forth under the following heads: (1) The public utility must serve all who apply. The man who runs a dry-goods store or a carpenter shop may decline the patronage of persons with whom he does not care to deal. His reasons may be entirely arbitrary, but he is nevertheless within his rights. Not so with the public utility corporation. The nature of its business makes necessary a very different rule. The law imposes upon it the obligation of serving any member of the public without discrimination. The railroad company or the hotel cannot arbitrarily pick and choose their patrons. Refusal to serve any one who is entitled to demand its service not only subjects the public utility management to an action for damages but also will lead to the issuance by the courts of a writ of mandamus compelling it to perform the duty of rendering equal service to all. This rule is, however, subject to certain reasonable qualifications. A public utility, for example, may be under a duty to serve only the members of a certain class. Thus common carriers and hotels are obliged to serve only travelers and not those who wish to use their facilities for other purposes. Also there is a duty to serve only those who comply with such reasonable regulations as may be made by the public utility management in the interests of the convenience, health and safety of the public. (2) The public service company must not only serve all who apply but it must give them equal service without discrimination. This does not mean actual identity of service nor does it preclude the establishment of proper systems of priorities, as in the case of emergencies of various kinds or in the transportation of perishable freight. But every member of the public must have the same chance to enjoy these special services. The requirement of equal service does not prevent the segregation of the races by the establishment of so-called "Jim Crow" facilities on common carriers and the like. In such cases, however, the accommodations afforded, though not the same, must in the eye of the law be equal. (3) The public utility must make the same charges to all for the same service. Discriminations and rebates are forbidden. This problem will be considered more fully at a later point. (4) The duty of furnishing adequate service and suitable facilities rests upon those who engage in public utility enterprises. The private business man is free to give poor service or sell inferior goods. Those whose businesses are affected with a public interest must meet the reasonable standards of efficiency or quality set forth usually by corporate charter, franchise or statute. Water, gas and electricity must be supplied continuously and in stipulated quantities and railway coaches must be heated and kept clean. (5) Finally, public utility corporations are subjected to special rules of liability for loss or injury to their patrons in certain cases. In this regard innkeepers and common carriers are in a peculiar position. They are held to have insured the safety of the goods or belongings of their patrons. They are liable for the loss of such property while in their possession, even without fault upon their part. This is a rule of unusual strictness and it does not apply to other kinds of public utilities nor does any such absolute liability attach to common carriers or hotel-keepers for injuries to the persons of their patrons. In fact apart from these special cases the duty which rests upon public service corporations to exercise due care in behalf of the safety of others is in no way peculiar. If the service rendered involves special danger of course special diligence is necessary to constitute reasonable care, but the law requires only the care which a reasonable man under like circumstances would exert. Public service companies, however, are not permitted to enter into contracts by which they exempt themselves from all liability for loss or injury due to their negligence. Such contracts are regarded as contrary to public policy since they would tend to lower the standards of service rendered to the public. It is, however, within limits permissible to make contracts limiting the amount of damages recoverable for losses or to require patrons to place a valuation which shall be regarded as final upon goods transported by a common carrier.

Rights of Public Utilities.— The special obligations resting upon public service corporations are compensated not only by the special legal privileges already referred to but also by certain well-defined legal rights. (1) First, there is the right to reasonable compensation for the service rendered. There is no duty to furnish free service. This right may be enforced by placing a lien upon the property or belongings of the patron. It is also permissible for the public service company to ensure payment by requiring it in advance. (2) In the second place, there is the right to make reasonable rules and regulations regarding the conduct of its business. The non-compliance with these rules by any person is sufficient justification for denying him the service to which he would otherwise be entitled. Such rules are those requiring decent and orderly deportment in inns or public conveyances. Or the rules may bear upon the liability of the management of the public utility for losses suffered by patrons, such as the familiar rule restricting the legal responsibility of hotels to the loss of property placed in checkrooms provided for that purpose.

The Need for Regulation of Public Utilities.— From the foregoing discussion it is obvious that the welfare of the public is vitally concerned with the manner in which the business of a public utility is carried on. Public convenience and economic necessity may demand that public service companies enjoy monopolistic privileges; but it is certainly imperative that any such monopoly be subjected to strict regulation in the public interest. Wherever a business is endowed with privileges and rights not commonly enjoyed, such a business must be held rigidly accountable for the way in which those advantages are used. As public utilities have increased in number and variety, as modern society with the increasing complexity and insistence of its demands has become more vitally dependent upon the services they render and as it has grown ever more apparent that, left to their own devices, public service corporations will usually serve their own interests at the expense of those of the public, the necessity of subjecting them to adequate and scientific regulation has come to be universally recognized. Public utility regulations may be conveniently grouped under three heads: first, regulation of rates or charges; second, regulations to secure equality of service; third, special requirements in the interest of public convenience. Each of these forms of regulations may be briefly discussed.

Regulation of Rates.— Practically every public utility is subjected to regulation in the matter of rates. When a business is affected with a public interest either by reason of its monopolistic character or its enjoyment of peculiar legal privileges, the public must be protected from exploitation through the charging of exorbitant rates. Otherwise public utilities would speedily become agencies of oppression instead of public service.

The question who is to determine what rates shall be charged for public utility services has been answered differently at different times. At the outset the view was taken that the legislature should decide what the rate should be and that public service corporations who felt that the rate so fixed was unreasonably low had no remedy except to persuade the legislature to change its mind. This was the view adopted by the Supreme Court of the United States in the famous case of Munn v. Illinois (94 U. S. 113), decided in 1876, sustaining the right of the legislature of Illinois to fix the charges made by grain elevators. This doctrine has been modified, however, in such a way as to subject the reasonableness of rates fixed either by direct action of the legislature or by commissions acting under its authority to scrutiny by the courts. The courts will not themselves determine what the rate should be as a rule of future policy but confine themselves to the task of approving or invalidating the rates established by legislative authority when the reasonableness of such rates is questioned by litigation.

Needless to say a public utility corporation cannot be deprived of the right to charge a reasonable rate for its services. To deprive it of this right would be to discriminate arbitrarily against it and thereby deny to it the equal protection of the laws. It would also amount to a deprivation of property without due process of law. But to decide in a given case what is a «reasonable» rate is not so simple. The solution of the problem is not much furthered by quoting the rule which our courts have frequently announced that a reasonable rate is one which ensures a «fair return upon a fair valuation of the property devoted to the public use.» This statement, of course, means nothing until some definiteness attaches to the meaning of the terms «fair return» and «fair valuation.» The inability of economists, legislators and judges to agree upon what these terms mean has brought the whole problem of the regulation of public utility rates into a confusion from which it has but very recently begun to emerge.

It is not perhaps so difficult to say what is meant by «fair return,» although it is naturally impossible to lay down as a general rule that it is this or that percentage of profit on a given investment. The courts have reached with practical unanimity the conclusion that a fair return from a public service enterprise is that measure of profit which would be realized from any other business where the risks and capital investment are the same. What this is in any given case depends of course upon the peculiar circumstances of that case.

There has been much diversity of opinion as to what is a «fair valuation of the property devoted to the public service.» Several different standards for measuring that valuation have received recognition. (1) First, it has been urged that the total original cost of the plant and improvements should be deemed the true valuation. There are many objections to this test. Except in the case of newer enterprises the original cost cannot usually be determined with any accuracy. Furthermore, in such a figure may be included various items representing unwise or unnecessary expenditure which ought not to be made the basis of earnings at the present time. (2) The present capitalization of the business is also suggested as a measure of public utility valuation. This, however, overlooks entirely the not infrequent fact of over-capitalization, an abuse which public control has only begun to mitigate. There is too little relation between the capitalization and the actual investment in public service companies. (3) Another proposal is to take as the proper valuation the cost of reproducing the plant less the existing depreciation of the equipment. Opinions differ as to whether this should be the cost of reproducing the original plant, perhaps with a somewhat antiquated equipment, or the cost of reproducing a new and modern plant. (4) Perhaps the weight of authority inclines to the view that «fair valuation» means the present value of the plant as a going concern. This includes two elements, the physical valuation of the equipment and an additional increment representing the fact that the system is actually operating and producing earnings. It seems clear that any attempt to arrive at a fair valuation of a public utility investment must begin with an accurate appraisal of the value of the physical property. This fact has received a somewhat belated recognition and there is now a widespread tendency throughout the several States in the United States to provide for the making of such a valuation on a scientific basis. In estimating the value of the business as a going concern it must be borne in mind that the value of the public utilitity franchise should be excluded. This franchise value is directly based upon the capacity of the corporation to earn profits and it would accordingly be absurd to include it in the valuation upon the basis of which those profits are to be computed. The Supreme Court of the United States has declined to adopt any one of the above methods of determining the fair valuation of the property devoted to public service but has declared that all of them are to be given consideration. In Smyth v. Ames (169 U. S. 466, 1898), the court said: «In order to ascertain that value, the original cost of construction, the amount expended in permanent improvements, the amount and market value of its bonds and stock, the present as compared with the original cost of construction, the probable earning capacity of the property under particular rates prescribed by statute, the sum required to meet operating expenses, are all to be given such weight as may be just and right in each case. We do not say that there may not be other matters to be regarded in estimating the value of the property.»

Regulations to Secure Equality of Service.— Inequality of service rendered by public service corporations may take three forms: First, the arbitrary refusal to some of service rendered to others; second, the rendering of service of unequal quality for the same charge, and third, the charging of higher rates for the same service rendered under substantially similar conditions. The illegality of the first two forms of discrimination has long been established, but discrimination in rates has been made illegal *per se* only in relatively recent years. Under the early common law one who was not charged a rate unreasonable in itself had no cause of complaint because some one else was charged less. This rule was later modified so as to make discrimination in rates *prima facie* evidence of the unreasonableness of the higher rate charged. Finally, such discrimination came to be recognized as contrary to public policy and has been made illegal by statute practically everywhere.

The task of defining what is meant by discrimination, however, has not been easy and the different solutions of the problem arrived at by different legislative bodies have produced a highly variegated system of regulations upon the subject. Furthermore, it is not feasible to forbid discrimination of all kinds since absolute uniformity of rates is undesirable, and it has been necessary, therefore, to leave some leeway in the laws and regulations so that this legitimate discrimination may exist. The result has been to cast upon the courts a heavy burden in deciding in a multitude of concrete cases whether or not the particular discrimination complained of is forbidden by the statute. The Federal Interstate Commerce Act, for example, enumerates a considerable list of discriminations which are illegal when practised by common carriers upon those "in substantially similar circumstances and conditions," a phrase evidently designed to give a large measure of elasticity to the enforcement of the law.

The forms of discrimination in rates which are now commonly forbidden by law are the following: (1) Discriminations for the purpose of destroying competition, such as the offering of lower rates to a competitor's patrons to induce them to abandon him; (2) concessions made to large customers when the difference lies not in the amount of service rendered at any one time but merely in the total amount during a given period of time; (3) concessions made to exclusive patrons as against those who divide their patronage; (4) discriminations in favor of special kinds of business when the service rendered is the same, as when a railroad charges less for the shipment of goods to be used for one purpose than for another in order to develop particular industries in certain communities.

On the other hand, the law very generally recognizes the legitimacy of certain forms of discrimination. Among these may be mentioned the following: (1) Rates may differ where the services rendered entail different costs. Extra charge may be made, for example, for transportation on a train of unusual speed. (2) Lower rates may be charged for services rendered in units which entail less cost and inconvenience. A carload of goods may be shipped at a cheaper rate than a single package, or a large party may be given reduced passenger rates. (3) Rates may be lowered for patrons who themselves furnish a portion of the public utility facilities, such as cars, wharves, etc. All such discriminations are, however, closely scrutinized and strictly limited.

Special Regulations in the Interest of Public Convenience.— This point has already been touched upon in discussing the duty resting upon public service companies to furnish adequate service and suitable facilities and need not be further elaborated here. Legislatures have passed numerous and highly various laws of this kind. An illustration in point is the requirement sometimes found compelling the establishment of certain relations in the interest of public convenience between connecting railroads.

Machinery of Public Utility Regulation — Commissions.— Experience has demonstrated beyond doubt that public utilities can be effectively regulated neither by State legislatures nor by courts. As public utilities increased in number and in the complexity of their relations to the public welfare it became apparent that some machinery of control was necessary which would remove the problems of their regulation from partisan politics, protect the public in the matter of rates and service, protect the public utility itself from ill-advised attacks of legislative majorities and secure a scientific, efficient and impartial supervision which should be based upon an examination of facts. It is now universally recognized that these needs are best met by the creation of public utility commissions, modeled roughly after the Interstate Commerce Commission, and such organizations exist in all but one or two States of the Union for the regulation of at least the more important types of public utilities such as common carriers.

These commissions are usually, though not invariably, appointed by the State governor and are supposed to be non-partisan in personnel. The membership varies in number from three to seven, and the term of office varies from 2 to 10 years. The salaries paid range from $1,500 to $15,000. It is almost universally provided that no one who has any direct or indirect pecuniary interest in the public utilities over which the commission has jurisdiction may be a member of it.

The powers of public utility commissions may be grouped under four heads. In the first place, the commissions exercise power over public utility franchises. This power may include the determination of the necessity of granting new franchises, the control over franchise terms and the enforcement of the obligations resting on the public service company. In the second place, control is exercised in some States over the issuance of stocks and bonds of public utility companies for the purpose of preventing over-capitalization. In the third place, the commissions have authority over rates and service. Their powers in this respect differ widely in the several States. They have commonly, however, the right to make detailed investigations and conduct hearings for the purpose of securing data upon which to determine what rates may be charged or what service required. The orders issued upon these points are not final but may be reviewed by the courts. They are, however, regarded as *prima facie* reasonable and will be nullified only when clearly unreasonable. Finally, public utility commissions are empowered to require public service companies to adopt a uniform system of accounting and periodically to file detailed reports.

The regulation of public utilities by commission has not escaped criticism. Reference is made to the delays resulting from the system of appealing to the courts so large a proportion of the orders of the commission. It is pointed out that rates have not, as a rule, been materially reduced under this form of control. It has also sometimes happened that State public utility commissions have evinced an unfriendly attitude toward the public ownership of municipal utilities and have used their powers to block the progress of that movement. But on the whole it is generally conceded that commissions afford the only solution for the public utility problem. It has succeeded in large measure in taking the problem out of politics, has brought about very general improvements in service, and by creating an administrative agency of more or less expert ability has provided a means for dealing in a scientific manner with the perplexing problems relating to public utilities which remain as yet unsolved.

PUBLIC WORKS, School of. See POLYTECHNIQUE, THE.

PUBLICANI, pŭb-lĭ-kā'nī, Roman farmers of the public revenues. In ancient Rome the privilege of collecting revenues from foreign districts dependent upon Rome was sold at auction by the censors for a period of five years. The security required by the state from these tax-gatherers was usually the price at which they had purchased the branch of the revenue to be collected and frequently was far in excess of the wealth of any single bidder, which resulted in the formation of companies for the purpose, called *socii*. Their business with the state was conducted under the name of one member designated the *manceps*. The farmers of the revenue were of the wealthiest classes. None but Roman citizens could be a member of the publicani and magistrates and governors of provinces were not eligible. The revenues were derived principally from tolls, tithes, mining duties and *scriptura* (tax levied for the use of the public pasture lands). The collections were made by an inferior class who were often freedmen or slaves in the employ of the company and were cordially detested by populace. The high price paid for the privilege and the greed of the publicani resulted in great injustice which together with the character of the collectors explains the bitterness with which they are mentioned in the New Testament. From about 150 B.C. they were usually of the equestrian order. Consult Greenidge, A. H. J., 'Roman Public Life' (London 1901); Livy (xxiii, 49; xxiv, 18); and the article «Publicani» (in Smith, William, 'Dictionary of Greek and Roman Antiquities,' Vol. II, 3d ed., London 1891).

PUBLICITY OF POLITICAL EXPENSES. See CORRUPT PRACTICES ACTS.

PUBLICK OCCURRENCES, the first newspaper published in America, though it can hardly be called a newspaper, as no second number appeared, the colonial authorities suppressing it four days after its first appearance. It was issued at Boston 25 Sept. 1690 by Benjamin Harris and printed by Richard Pierce. As far as is known, there is only one copy extant now which is in the archives of the Public Record Office in London. A reproduction of it is contained in Green, S. A., 'Ten Fac-simile Reproductions Relating to old Boston and Neighborhood' (Boston 1900). See NEWSPAPERS, AMERICAN.

PUBLICOLA, Publius Valerius. See VALERIUS, PUBLIUS.

PUBLISHERS' ASSOCIATION. See NEWSPAPERS, AMERICAN.

PUBLISHING, American. The book trade or publishing industry in the New World had its origin in a more remote period than is generally supposed. It began within 100 years of the invention of printing, and from the date of the first American book, 1535, to the year 1799, over 7,000 different books had been published, nine-tenths of them, however, being pamphlets. The 19th century saw almost the full development of book publishing, the establishment of colleges and schools and the founding of many libraries, creating an ever-increasing demand for the best in literature.

Early American Books.— The first book printed on the American continent is said to have been 'La Escalera Spiritual de San Juan Climaco,' published in Mexico in 1535. It was a translation from the Latin into Castilian. Other books were printed on the first press set up in Mexico and six or seven books are known to have been published in Peru before 1600. In the United States the earliest publication was a pamphlet called 'The Freeman's Oath,' printed in Boston in 1639. This was followed in the year 1640 by the 'Bay Psalm Book,' printed by Stephen Daye at Cambridge, Mass. After its publication in the colony it was reprinted in England, where it went through 17 editions, the last one bearing the date of 1754. It was also a highly popular work in Scotland, 22 editions having been printed there, the last dated 1759. The first original American book published in this country was Mrs. Anne Bradstreet's 'Poems,' and this volume, issued in Cambridge, Mass., in 1640 was republished in London in 1650. Cambridge remained the only publishing town for a long time, and for 21 consecutive years issued about one volume a year. In 1653 Samuel Green published John Eliot's famous 'Catechism' in the Indian language, followed in 1659 by the Psalms in Indian, in 1661 by the Indian New Testament and in 1663 by the whole Bible in the Indian tongue. This was the first Bible printed in America.

Early Publishers.— In New York City the original book publisher was William Bradford, who became official printer in 1693, for «40 pounds a year and half the benefit of his printing, besides what served the public.» In 1694 he issued the 'Laws of the Colony,' the first bound book published in New York. In 1738 Christopher Sauer established a publishing house at Germantown, Pa., and issued the first German Bible printed in America in 1743. The firm of Little, Brown and Company was established in 1784 in Boston while in the following year, in Philadelphia, Lea Brothers and Company and Henry Baird and Company began business. It was also in 1785 that S. E. Bridgeman and Company began publishing books at Northampton, Mass. The existing house of J. B. Lippincott and Company was established in Philadelphia in 1798. The firm of Harper and Brother began business in New York in 1817. From this date the publishing business had a rapid growth, among the firms established being the following in New York: Baker, Voorhis and Company, 1820; D. Appleton and Company, 1825; D. Van Nostrand, 1830; Ivison and Company, 1831; John Wiley and Sons, 1832; John F. Trow, 1835; A. S. Barnes and Company, 1838. In other cities the early firms included the following: Cincinnati, Ohio, U. P. James, 1831; Springfield, Mass., G. and C. Merriam Company, 1831; Louisville, Ky., John P. Morton, 1825; Richmond, Va., J. W. Randolph Company, 1831; Mobile, Ala., G. H. Randall, 1831; Montgomery, Ala., Joel White and Company, 1833; Lancaster, Pa., John Baer's Sons, 1817.

The Early Book Trade.—As an adjunct to publishing, the selling of books originated in Boston as early as 1652, when Hezekiah Usher opened the first shop. Many colonial booksellers printed and published their wares. Benjamin Franklin (q.v.) was among the early book printers. In 1732, Richard Fry, an English man and bookseller of Boston, advertised: "Whereas it has been the common method of the most curious merchants of Boston to procure their books from London, this is to acquaint these gentlemen that I, the said Fry, will sell all sorts of accompt books, done after the most acute manner, for 20 per cent cheaper than they can have them from London. . . . For the pleasing entertainment of the polite parts of mankind, I have printed the most beautiful poems of Stephen Duck, the famous Wiltshire poet. It is a full demonstration to me that the people of New England have a fine taste for good sense and polite learning, having already sold 1,200 of these poems." The first convention of booksellers for the regulation of trade seems to have been held in Boston, 1724; it was for the special purpose of increasing the prices of certain works. Toward the close of the century bookselling began to take rank among the most considerable commercial pursuits, though it then only foreshadowed its present comparative importance. Works of standard character, involving large expenditures, were undertaken by publishers, who, in such cases, usually subscribed together as a guarantee for the printer's outlay. The trade was conducted upon established principles, and innovators were held in poor esteem. All these usages were, however, disturbed by competition, and after the publication of the Waverly novels, of which rival editions were issued, the individual members of the trade acted more independently of each other, and their customs afterward partook of a less narrow spirit. The American Company of Booksellers was founded in 1801. Books were formerly sold in sheets, to be bound as purchasers might desire, a practice which no longer obtains. The universal diffusion of education in America, and the inquiring mental character of its people, not only increased the circulation of books but reduced their price, and the old-fashioned veneration which literary works had once inspired experienced no little modification. Externals were of small consequence to the great body of readers, and works were purchased not so much for preservation as for immediate reading.

Statistics.— From 1825 to 1840 the number of American publications show an aggregate of 1,115. Of these 623 were original and 492 were reprints from foreign works. The population of the United States in that year was about 17,000,000. In 1853, 733 new works were published in the United States, of which 278 were reprints of English works, 35 were translations of foreign authors and the remainder were original American works. The population of the United States had reached about 25,000,000, an increase of 50 per cent compared with 1840. The original American works published in 1853, compared with the 15 years ending in 1840, show an increase of about 800 per cent in less than 20 years. In other words, the original American publications of the book trade seem to have advanced about 15 times as fast as the population. In 1880, with a population of 50,000,000, the new books published during that year amounted to about 2,000 — nearly three times more than in 1853, whereas the population had only doubled. The total number of new books published according to the records of the *Publishers' Weekly*, for the years given below, is as follows:

1881	2,991	1896	5,703
1882	3,472	1897	4,928
1883	3,481	1898	4,886
1884	4,088	1899	5,321
1885	4,030	1900	6,636
1886	4,776	1901	8,141
1887	4,437	1902	7,833
1888	4,631	1903	7,865
1889	4,014	1909	10,901
1890	4,559	1910	13,470
1891	4,665	1911	11,123
1892	4,862	1912	10,903
1893	5,134	1913	12,230
1894	5,134	1914	12,010
1895	5,469	1915	9,734

It will be observed that there is a heavy falling off for 1915, due to abnormal conditions brought about by the war. While the number in other classes was unusually small, books of history numbered 758, as compared to 581 in 1914, the increase being due to the many publications on the war.

As an illustration of normal conditions in the book trade the figures for 1914 are of more value. Of the total number of titles published during this period, 10,175 were new books and 1,835 were new editions. Imported books, editions printed abroad, but bound in this country, numbered 2,852. Of the various classes fiction leads. The output for 1904 may be compared to that of 1914 by the chief classes, showing the change in public demand within the past 10 years:

	1904	1914
Fiction, American	1,262	689
Fiction, foreign	559	364
Law	614	507
Education	628	268
Theology	717	1,032
Philosophy	58	408
Sociology and Economics	336	1,038

Considering only the books of American authorship for 1914, it will be seen that there is some change in the relative proportion of classes. Books on sociology and economics take the lead, fiction coming second almost 200 titles behind.

BOOKS BY AMERICAN AUTHORS PUBLISHED IN 1914.

CLASS	No. of titles
Sociology and economics	876
Fiction	689
Religion and theology	677
Poetry and drama	558
Applied science	552
Science	509
Law	483
Medicine and hygiene	414
Juvenile books	405
History	400

Popular Books.— In 1903 there were 1,700 book publishers in the United States. While Boston and Philadelphia remain true to their earlier reputations as leading book centres, New York has become the largest book mart and the leading factor in the manufacture of books. Chicago too has assumed an important place in the book trade, while some hundreds of books are published annually in Cincinnati, San Francisco, Cleveland and other smaller cities. The majority of American books are published by 100 firms in New York, Boston, Chicago and Philadelphia. During 1902 and 1903 the historical novels enjoyed widespread popularity, and nine books of this class circulated to the extent of 1,400,000 copies. This enormous output, however, did not lessen the sale of older and more standard books. These were largely reprints. A popular work 75 years after its first publication is often found to have been reprinted 20 times by as many different publishers. Of the world's great standards, hundreds, and in some cases thousands, of editions have appeared. There is, nevertheless, a distinction to be made between the manufacturer of books who takes old works and reprints them, and the publisher who issues entirely fresh and original matter. Among early successful books Mrs. Stowe's 'Uncle Tom's Cabin' had a phenomenal sale, 500,000 copies being sold in less than five years in the United States, and by April 1852 more than 1,000,000 had been reprinted in Great Britain. Of Longfellow's poems, without taking into account unauthorized English reprints, the American sales in 1839–57 amounted to 325,550; from the latter date till 1901, 220,000.

School Books.— No small factor in bookmaking during the 19th century was the phenomenal production of school and college textbooks. In 1902 the reports showed a list of 433 educational works, while in 1904 this was increased to 628, though there has since been a marked decline in the production of this class. Of books for use in the public schools editions of 500,000 copies, intended for one year's consumption, are not an unusual event. Messrs. D. Appleton and Company for many years sold over 1,000,000 copies of Webster's 'Speller' every year; and W. B. Smith and Company of Cincinnati, Ohio, sold over 1,000,000 copies of the Eclectic Series during each year. The electrotype plates of schoolbooks, Bibles, prayer-books and hymnbooks, are very rarely changed and enormous quantities are sold every year.

Miscellaneous Books.— In the United States many encyclopedias, dictionaries, the complete works of standard authors in definitive editions, anthologies of literature, etc., are sold by subscription; and the initial expense of such books being enormous, before a single copy of the book is made, the sales must be enormous also. Then there are many «books which are not books» — such as city directories, which are usually published by a company devoted exclusively to the publication of this one book; State directories, list of dealers in each business and commercial agency reports (each of these agencies makes four revised editions of its books each year, each book measuring about 11 by 13 inches, and containing about 2,500 pages of matter in close print). There are also innumerable genealogies, indexes, catalogs, together with many other productions which are truly books, but which cannot be called literature.

Commercial Value.— In the publishing of books the following are the items of outlay which need to be taken into account: Copyright, paper, typesetting, author's corrections, electrotyping, press work, binding, advertising. Publishing means a great deal more than merely printing and binding a book. It means putting it where it is likely to sell. The machinery of distribution, which means the method of getting books finally into the hands of readers through the various middlemen, is vastly important. The manufacture of a book now demands the assistance of various branches of mechanical skill. Besides the paper-maker, the type-founder and the printer, to whom it gives a large proportion of employment, it engages, exclusively, the bookbinder. Its material form has, till the present era of cheap publications, always borne a commercial value extravagantly disproportionate to its matter.

Copyright.—A common arrangement between the American author and publisher is a payment of 10 per cent royalty on the retail price of all sales; sometimes a cash sum is paid, and the publisher secures the copyright, which is granted for 28 years, subject to renewal by the author, his widow or children for other 14 years. A condition is that a copy of a title-page must be registered with the librarian of Congress, and two copies of the book lodged there not later than the day of publication. The entry fees are 50 cents for an American author, $1 for a foreigner and 50 cents additional for a certificate of record. A copy of any new edition must also be sent to the librarian. (See COPYRIGHT). By the provisions of the International Copyright Act (1886), a foreign author's rights are protected in Great Britain, Belgium, France, Germany, Haiti, Italy, Spain, Switzerland and Tunis. Colonial authors can also secure copyright without publication in the United Kingdom, and a work copyright in the United Kingdom is copyright in Canada. American cheap reprints of British books are admitted to Canada subject to a customs duty of 12½ per cent, to be paid over to the British author, but the returns from this source have been very small.

Bookbinding.— Since 1885, in the book-making industry, many improvements have been made in wire-stitching machines. One of these machines will stitch anything from two sheets to a book two inches thick, and with several of them either round or flat wire may be used. There has also been introduced a noteworthy combination folding and wire-stitching machine, which, by a continuous and automatic operation, takes the sheets from the feeders, and folds, gathers, collates, covers and wire-stitches them. Paper-cutting machines have been improved by the introduction of automatic clamps, indicators and gauges. The invention of a steam rounding and backing machine has increased the capacity of from 500 to 1,000 books per day to a capacity of from 5,000 to 6,000 in the same time. The latest case-making machine feeds itself from a roll of cloth which it automatically cuts into pieces of proper size for use. The cloth is first covered with glue by contact with a cylinder revolving in a pot of glue. It is then cut by the machine and nicked in corner sections; boards are supplied from a holder and a back lining from a roll, both receptacles forming part of the machine. This process completed, the nearly finished product drops a little, the cloth is folded over the boards and back lining, and the binding, after passing through a case smoother, is delivered in a finished state. Among other inventions are a casting-in machine, for putting the body of a book into its cover, and a gathering machine. This latter invention promises important developments in economy. See BOOKBINDING.

Book Plates.—About the year 1804 the art of stereotyping was invented in England, and in a few years was introduced into this country. With the type-printed book under the old conditions a publisher did not dare print a large number of copies of any book unless he believed it would have a quick sale. Books were bulky and took up too much space. Consequently, the types for a first edition were distributed when they left the press; then had to be reset with renewed chances of error in the second edition. Resetting for two or more editions added largely to the cost of the book and limited its supply. The process of stereotyping first used, known as the plaster process, served book printers for about 50 years. The practice of the art was brought to New York by David Bruce in 1813, but the first book stereotyped in America was the 'Westminster Catechism,' made by J. Watts and Company of New York in June of the same year. For the printing of books, all methods of stereotyping have been superseded by electrotyping, which was experimentally tried in New York as early as 1841, and was in general use before 1855.

Book Imports.— The summary of the chief imports of books and other printed matter for 1909 and 1914 shows the following:

VALUE OF BOOKS, ETC., BOTH FREE AND DUTIABLE, IMPORTED IN 1909 AND 1914.

IMPORTED FROM	1909	1914
United Kingdom	$2,819,302	$3,540,824
France	394,620	566,572
Germany	1,671,679	1,416,658
British North America	167,262	120,007

Book Exports.— The books and other printed matter of domestic manufacture exported from the United States during 1909 and 1914 represent the following:

COUNTRIES TO WHICH EXPORTED	1909	*1914
United Kingdom	$1,334,499	$1,554,698
Belgium	37,116	32,609
France	229,129	86,476
Germany	141,562	235,920
Italy	29,576	32,992
Netherlands	16,093	24,780
Other Europe	59,566	106,216
British North America	2,658,380	4,905,329
Central American States and British Honduras	88,454	169,795
Mexico	245,453	321,914
Cuba	325,599	239,359
Other West Indies and Bermuda	49,101	37,917
Argentina	97,606	130,661
Brazil	230,353	227,866
Chili	68,856	109,509
Other South America	134,921	236,222
Chinese Empire	50,480	143,743
British East Indies	22,813	35,110
Japan	67,371	115,962
British Australasia	260,079	376,721
Philippine Islands	156,199	317,995
British Africa	22,823	38,734
All other Africa	5,302	6,455
Other countries	20,114	152,877
Totals	$6,351,445	$9,639,860

* Year ends 30 June, just before war began, thus covering period of normal conditions.

During the two decades from 1894 to 1914 the only striking change recorded in the book-publishing trade was the enormous and phenomenal circulation of popular novels. During this period the advance in good taste and in artistic beauty of product was a marked characteristic of the industry. Fashions in bindings changed annually, but a widening range of materials and patterns, more daring use of designs and inks, and the invention and general use of automatic binding machinery supplemented improvements in printing, permitting lower prices for books and promoting phenomenal sales. It is a significant coincidence that the decade which witnessed extraordinary advance in all details of mechanical productions in this industry should be characterized also by the most noteworthy advance in the good taste and appreciation of the general public.

CHARLES H. COCHRANE.

PUCCINI, pū-chē'nē, **Giacomo**, Italian operatic composer: b. Lucca, Italy, 22 June or 23 Dec. 1858. He came of a family of distinguished musicians, his great-great-grandfather Giacomo, his great-grandfather Antonia, grandfather Domenico and father Michele all being famous. He was educated at the Conservatory at Milan, studying under Bazzini and Ponchielli. His first opera, 'Le Villi' (1884), was produced at the Teatro del Verme and was favorably received. His 'Edgar' (1889) was produced at La Scala, but his first great success was with 'Manon Lescaut' (1893) at Turin. Three years later his 'La Bohème,' also produced at Turin, achieved an extraordinary success and won world-wide fame for its author. 'Tosca' (1900) was followed by 'Madame Butterfly' (1904), with which the composer again scored a triumph. His 'Girl of the Golden West' ('La Fanciulla del West') enjoyed signal success at the Metropolitan Opera House, New York. The European War interrupted the production of his new compositions, but 'La Rondine' and 'I Due Zoccoletti' were both completed in the first year of the war. His work is highly original and he ranks among the foremost modern Italian composers.

PUCK, in mediæval mythology, a celebrated fairy of mischievous tendencies whose character and attributes are depicted in Shakespear's 'Midsummer Night's Dream.' This fairy is known by a variety of names, as Robin Goodfellow and Friar Rush in England, and in Germany as Knecht Ruprecht; but it is by his designation of Puck that he is most generally known in England, Germany and the more northern nations. He was the chief of the domestic tribe of fairies, or «brownies,» as they are called in Scotland and innumerable stories are told of his nocturnal exploits.

PUD. See Pood.

PUDDING-BERRIES, the berries of the Canadian dogwood (*Cornus canadensis*), common throughout North America. See Dogwood.

PUDDINGSTONE. See Conglomerate.

PUEBLA, pwäb'lä, a state of Mexico. The state of La Puebla in the central plateau of the Anahuac has Vera Cruz to the north and east, Oaxaca to the south, Guerrero to the southwest and Morelos, Mexico, Tlaxcala and Hidalgo to the west. The area is 12,204 square miles. Pop. 1,101,600. (See Mexico). Consult Palacios, E. J., 'Puebla su Territorio y sus Habitantes' (2 vols., Mexico 1917).

PUEBLA, Mexico (originally called La Puebla de los Angeles, more recently Puebla de Zaragoza), capital of the state of the same name, 116 miles east of the City of Mexico by the Mexican Railway, but only about 60 miles in a straight line; altitude over 7,000 feet above the sea. The climate is most agreeable, the maximum temperature being 84° in summer and 75° in winter. The peaks Popocatepetl and Ixtaccihuatl are only about 25 miles distant and those of Orizaba and Malinche are in plain view. Three steam railways,— the Mexican, the Mexican Southern and the Inter-Oceanic and electric street railways supply transportation. Straw hats, leather goods and numerous other articles are manufactured in considerable quantities, and in the immediate vicinity are several large cotton mills. Near by are the famous onyx quarries which have for many years supplied great quantities of beautiful onyx to Mexico and the United States. A manufactory in the city makes of the product of these quarries and endless variety of useful or ornamental objects, from store and saloon fixtures, table tops and wash basins to imitations of every fruit known in the country. The banking facilities of the city are supplied by the Oriental Bank, with $8,000,000 capital, and a number of other financial institutions. The city is noted for its many churches, clean streets, substantial business edifices and grand cathedral, which was almost 100 years (1552–1649) in building, is 323 feet long, 101 feet wide and 80 feet from floor to roof.

The educational institutions besides the primary and high schools are the State College, School of Medicine, Normal School for Men, Normal School for Women, Normal School of Arts, Academy of Fine Arts and hospicio for the education of children. There are three public libraries, museum of archæology, an art gallery, an observatory, a market hall, sulphur baths, a general hospital, founded in 1658, and a maternity hospital, state hospital for both sexes, hospital for the insane, children's hospital, military hospital, Interoceanic Railway Hospital and Spanish Beneficiary Hospital. The palace of the state government, which faces the principal part or zocolo, is one of the notable buildings of the city. The extensive and very beautiful Alameda is a most attractive spot and contains a monument erected in 1898 in honor of Mexico's liberators, and the monument to Gen. Nicolas Bravo. There are also the French-Mexican monument erected by the French colony in 1902, and the equestrienne statue of General Zaragoza, which surmounts a fine monument erected at the foot of the hill of Guadalupe. In the Government Palace is a most interesting collection of historic paintings and a librarv of 28,000 volumes. The zocolo or central park of the city is artistically laid out in vine and foliage covered walks, with fountains and statues here and there, and numerous small plazas supply needed breathing spots. There are three theatres, one of which, the «Teatro Principal,» was built in 1790 and claims to be the oldest theatre on the American continent. Since 1532, in which year the royal sanction was given to form a settlement here, Puebla has occupied second place among all the cities of the land, commercially, spiritually and in population, until very recently, when Guadalajara forged ahead in population and material development generally.

The city of Puebla was founded in 1532 by the Franciscans, and is considered the military key to the capital of the republic. During the war between Mexico and the United States it was captured by Gen. Winfield Scott, who made his headquarters there from June to August 1847. It was captured by the French in 1863 and recovered by the Republican forces under Gen. (later President) Porfirio Diaz, in 1867. Tradition asserts that when Cortez came he found a city of 300,000 inhabitants, 400 temples and a legion of priests, six miles distant from Puebla, where now is the famous Pyramid of Cholula; and that the Aztecs came there in great numbers to worship and offer up human sacrifices. Pop. about 96,121. Consult Carrión, A., 'Historia de la Ciudad de la Puebla de los Angeles (Puebla de Zaragoza)' (2 vols., Puebla 1897).

PUEBLO, Colo., city, county-seat of Pueblo County, and second city in the State, on the Atchison, Topeka and Santa Fé, the Colorado and Southern (Burlington Route), the Denver and Rio Grande, the Missouri Pacific and the Chicago, Rock Island and Pacific railroads, also on the Colorado-Kansas Railroad, about 120 miles south by east of Denver. Within its corporate limits are several former villages: North Pueblo, Central Pueblo, South Pueblo and Bessemer. It is in a valley on the eastern foothills of the Greenhorn Range of the Rocky Mountains. The old fort at Pueblo was built about 1840, and here came the agents of the American Fur Company (John Jacob Astor's Company) to trade with the white trappers and Indians for their furs. In 1846 there were 100 white people located here engaged in raising crops, and a real trading post was established in 1850. In 1854 the Ute Indians massacred the residents of the post. In 1859 the present city was laid out, and in 1873 it was chartered as a city. The region of country east is largely devoted to agriculture and stock-raising. In the vicinity of the city are extensive coal and oil fields and deposits of limestone and ores. The silver and copper ores are brought to the smelters of Pueblo; and lead, gold and zinc are here prepared for the metals of commerce. The iron and steel industries have become quite extensive. The Colorado Fuel and Iron Company (steel plant) have 6,500 employees; the railroad car-shops and yards, 3,200 employees; the smelters, 2,200; the foundries and other manufactories, 6,000. There are invested in manufacturing industries a capital of about $18,000,000, and the products are about $65,000,000.

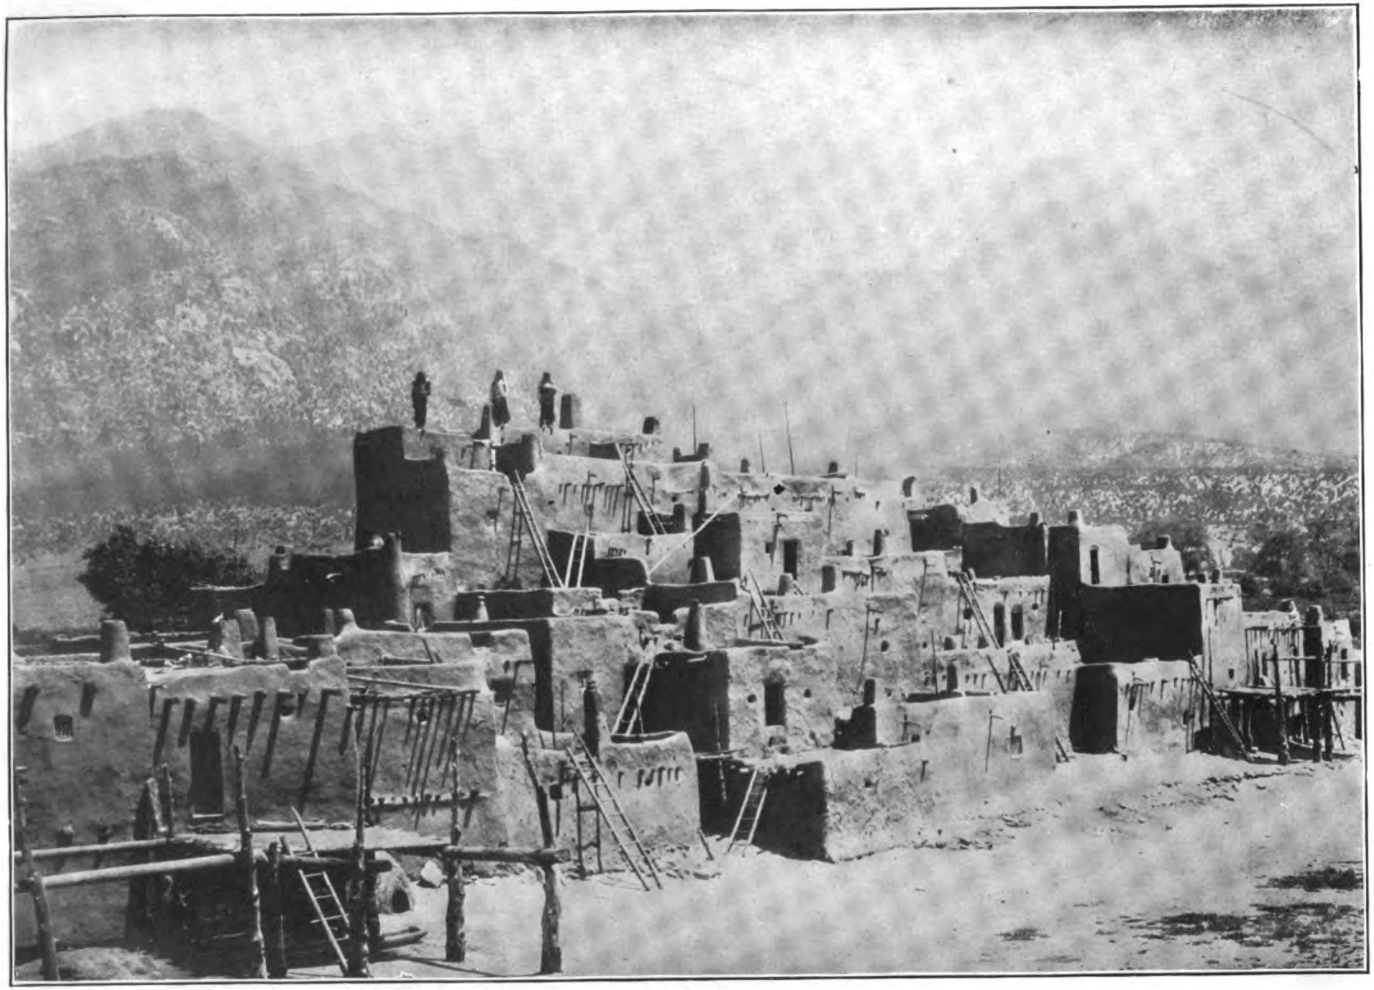
The principal public institutions are the State Insane Asylum, Saint Mary's Hospital and Sanatorium (1,000 patients annually), Minnequa Hospital (cost $300,000), and private sanatoriums. There are two systems of public schools, one on each side of the river; two high schools, public and parish schools (16,000 school children), Loretto Academy, the McClellan public library with 14,000 volumes, law libraries, school libraries, and the State Mineral Palace and Park. A complete collection of the minerals of Colorado are in the Mineral Palace. The five banks have a combined capital of $800,000 and deposits of over $15,000,000. The government is administered under a special charter, adopted 19 Sept. 1911, amended 4 Nov. 1913 and again on 2 Nov. 1915. The charter provides for three commissioners, who select appointees from lists furnished by a civil service commission, which holds examinations twice a year. The civil service commission consists of three members, who are elected by the people. The police judge and city comptroller are appointed by the civil service commissioners and are not civil service officers. Their term of office is four years. The city clerk, city attorney and city engineer are appointed by the council, which is made up of the three city commissioners. They are not protected by civil service and are appointed for four years. The city commissioners are elected for four years and the civil service commissioners for six years. Elections are biennial; one city commissioner is chosen at one election and two at the succeeding election. The city owns two systems of waterworks, which are operated by trustees elected by the residents of those water districts. The large majority of the population are native-born Americans; about 2,000 are Italians; 1,000 are Austrians, and 1,500 are colored. Pop. 73,000.

P. A. Gray,
Secretary of Pueblo Commerce Club.

PUEBLO INDIANS (Spanish, «town,» «village»; hence Pueblos, «villagers»), a group of sedentary agricultural tribes comprising the Tanoan, Keresan or Queres, and Zuñian linguistic stocks in New Mexico, and the Hopi or Moqui of the Shoshonean stock in northeastern Arizona. There are also some Mexicanized remnants of the Tanoan stock on the Rio Grande below El Paso, in Texas, and Chihuahua. For details see under the above stock names.

Physical Characters.— Disregarding those who have been more or less affected by Spanish contact, the Pueblo Indians are generally small in stature, particularly the women, some of whom are quite diminutive. After marriage the latter frequently become stout, but obesity is rare. The men are a rich brown in color, not so dark nor so reddish as their Navaho neighbors. The women are lighter, many of them being of a fine olive tint, which, with regular features and often with eyes almost oriental in type, make them decidedly comely. Albinism is common among the Hopi and Zuñi, those of the latter tribe averaging one in 200. The hair is thick, black and glossy. That of the men is cut «terrace fashion,» that is, banged across the forehead, cut horizontally at the sides on a line with the chin, and allowed to grow to full length behind, but knotted and tied into a short queue. This is probably the more primitive style of hair-dressing, but it now varies more or less with the tribe. The front hair of the women is cut level with the chin, parted laterally, and allowed to fall over the face, necessitating continual brushing aside with the hand to permit them to see. The unmarried Hopi girls retain the primitive method of wearing the hair in large whorls over the ears.

Dress.— The costume of the men, now largely superseded by the clothing of civilization, consisted of a shirt, a poncho-like coat formed of a squarish piece with a hole in the middle for the head, and sewed down the sides, with partly open sleeves; a pair of loose trousers reaching below the knees, open half-way up the outer sides and fastened with a belt; footless stockings, leggings, garters, moccasins or sandals, breechcloth, headband, hairband, and blanket. Dressed skin or native cotton formed the chief materials from which their costumes were made, but these gave place largely to woolen articles after the introduction of sheep by the Spaniards. The woolen blanket of later times was probably preceded by a robe made of strips of rabbit or wildcat skin coarsely woven or plaited together. Yucca strips, feathers, and even human hair also formed raw materials for clothing. The typical dress of the women consisted of a skirt of skin or cotton (now of wool) reaching from the neck to below the knees, and girded with a belt, the right arm and shoulder being bare; a manta hanging loosely from the neck and down behind or thrown over the head; stockings, deerskin leggings, consisting usually of an entire skin wrapped many times around the calf, and sandals or moccasins, to which latter the leggings were attached. Among some of the Rio Grande Pueblos the women wear soft deerskin boots instead of the cumbersome leg-wrappings. Necklaces of seashell and turquoise beads, and pendants, ear-tablets, bracelets, and other ornaments were worn by both men and women, but the shell necklaces of the latter have been superseded by those of silver. Leather belts strung with large silver discs and silver-mounted wristguards are worn by the men who can afford them. Excepting the moccasins and leggings, skin has largely passed out



PUEBLO INDIAN VILLAGE

of use for clothing, cheap cotton prints and a woolen blanket being almost exclusively employed by the men.

Houses.— The typical pueblo is a many-celled, communal, defensive structure of several stories, opening on one or more courts or plazas in which dances and other ceremonies are performed. When the pueblo enclosed a single court, the outer wall was usually the highest, and was pierced with only small openings, or port-holes, to afford a view of the surrounding country. A slight elevation was usually preferred, but there are many instances in which the site is a lofty mesa or a level plain, while other dwellings were built in natural recesses in the rocky walls of cañons or cliffs, hence their popular designation, *cliff-dwellings*. The site depended on accessibility to water, to cultivable fields, or to the necessity for defense against enemies. Both rounded or polygonal structures were common, while some pueblos were semicircular in ground-plan, with a high rear wall and with the houses arranged in terraces, the tiers of dwellings successively retreating so that the roof of the lower formed the means of access as well as the «front yard» of the tier next above, and so on to the sixth or seventh story. The ground tier usually contained only small wall openings, access being gained by means of a movable ladder to the roof, which was provided with a hatchway. Most of the pueblos still follow this ancient form, but there are now but few whose ground-floor houses are not provided with doors and windows. Sometimes forming a part of and sometimes detached from the main house cluster, are chambers, wholly or partly under ground and usually circular, used in early times as gathering places and sleeping apartments by the men, and still employed for ceremonies and tribal councils. The fireplace was in the centre, the smoke escaping through the hatchway; so hot did these *kivas* become that the Spaniards likened them to stoves, hence their still popular name, «estufas.» The structural materials depended largely on the immediate supply. Slabs of sandstone, being abundant, were commonly used; they were sometimes neatly pecked and laid in adobe mortar or chinked with spalls, and although joints in the masonry were not «broken,» the result was frequently a marvelously straight and strong wall that has stood the ravages of centuries. *Pisé* construction was also employed in massive buildings, such as Casa Grande in southern Arizona. Molded adobe bricks, now so commonly used, were not made in pre-Spanish times, but balls of mud mixed with ashes and sage, and dried, were in vogue as a building material in pre-historic times. The roofs of the houses consist usually of pine or cottonwood beams, with light poles laid transversely, which in turn are covered with brush-grass, and adobe mud, well tamped. The introduction of the horse, which permitted the transportation of heavy roof beams, seems to have had a decided influence in increasing the size of the rooms, the compartments of the ancient structures being usually mere cells. Flakes of selenite were pieced together for window panes, but these have given way to stock frames purchased from the white traders, while the corner fireplace and chimney have been substituted for the central fire-pit, except in the kivas.

Industries.—As they are sedentary tribes, the Pueblos are agriculturists, their principal crops being corn, squashes, beans, and onions, to which were added wheat, watermelons, cantaloupes, grapes, peaches, etc., on the advent of the Spaniards. Corn is prepared in very many ways, and wild fruits form a not unimportant part of the Pueblo pabulum. Their meat supply was gained mainly through communal hunting, the mountains supplying bear, deer, antelope and elk, while the valleys and cañons abounded in jack-rabbits, cottontails, prairie-dogs, wild turkeys, quails, and doves. The buffalo was probably hunted to some extent by the Rio Grande Pueblos, who also conducted a brisk trade with the Plains tribes up to 25 years ago. For religious reasons, fish was probably universally tabooed, water, on which everything depends, being a sacred element. The turkey was domesticated, and eagles were and still are kept in captivity for their feathers. Cattle, sheep, goats, horses, and asses, which now form such an important part in the Pueblo economy, were unknown before the Spaniards went among them. The Pueblos are a provident people, their reserve food supply usually being sufficient for a year's use, thus succoring them in event of drought. Most of their agriculture is conducted by means of irrigation, although patches of corn, melons, squashes, etc., and small peach orchards are otherwise successfully cultivated in favorable localities. The Hopi raised large quantities of cotton, which they wove into garments and traded with other tribes. Indeed they are still the leading cotton weavers among the Pueblos, the industry probably having been introduced by clans from the far south. The Hopi and Zuñi also weave excellent blankets, sashes, dresses, garters, etc., of wool, and a few of the Zuñi men are expert silversmiths. The basket trays of the Hopi are noteworthy, although the art has greatly declined since the introduction of aniline dyes. Some of the other Pueblos make a coarse basket for domestic use. As potters the Pueblos are far in advance of all other Indians north of Mexico. Purely primitive methods are still employed, and the decorative motive is generally symbolic, intricate, and pleasing.

Social and Religious.—All the Pueblo tribes are composed of numerous clans, named after some animal, plant, or other natural object or phenomenon. Maternal descent is recognized, that is, the children belong to the clan of the mother. Marriage, which is not allowed between members of the same clan, is generally effected by mutual consent of the contracting couple and their parents, and is sealed after an exchange of gifts and a simple primitive ceremony. The vow, however, is not very binding and divorce is merely a matter of mutual agreement, the offspring, if any, invariably belonging to the mother. The status of the Pueblo woman is high. She owns the house and its furniture, while it is the husband's duty to provide for his family and he frequently makes his wife's clothes. The dead were formerly cremated or were buried in the houses or in the refuse heaps. Now, however, the dead are buried in a common cemetery in front of the Catholic Church, except among the Hopi, who deposit their dead in crevices in the rocks. The social and religious organization of most of the Pueblos was considerably affected by the Spanish missionary and civil authorities, and among all the tribes except the Hopi a civil governor and other officers are now annually elected, although their power in some instances is only nominal. Originally the religious and social organization was inseparable; each clan had its priest or priest-chief, while both the internal and the external affairs of the tribe, where they affected the complicated and far-reaching religious organization, were controlled by a priesthood. There were also other socio-religious societies, grouped according to the several regions — north, south, east, west, upper, and lower — some of which assumed control over certain affairs in winter, others in summer. The members of these societies, where they still exist, are the medicine-men of the tribe, some of whose functions are the prevention as well as the cure of disease, the regulation of the communal hunts, the extermination of witchcraft, and the intermediation between the tribesmen and the many nature gods which form the Pueblo pantheon. Communication with these nature powers was and is still conducted by means of secret or open ceremonies, consisting of the depositing of prayer-sticks, chants, dances, sacrifices, pantomime, masquerade, and the recital of rituals.

History.— From the Pueblo tribes which have been more intimately studied it has been learned that they consist of many small accretions from various stocks and from many localities, which left their former homes on account of drought and the consequent failure of crops, through superstition, the depredations of enemies, or other causes. The migrations of these component clans or parts of clans were sometimes very slow, many years being consumed in their journeyings and village after village being successively built, occupied, and abandoned before the final settlement was made. Thus are many of the ruins of Arizona, New Mexico, Colorado, and Utah accounted for. The nuclei of some of the Pueblo tribes, however, had their mythical origin in the north, at a place called Sipapu, where they are supposed to return after death, and which is symbolically represented by an opening in the floor of the ceremonial chambers, in front of the altars erected during religious rites. Indefinite knowledge of a populous region in the north gained by the Spaniards in Mexico early in the 16th century led first to the journey in 1539 of Fray Marcos de Niza to the «Seven Cities of Cibola,» the present Zuñiland, followed a year later by the expedition under Coronado. This was the first direct contact of the Pueblo Indians with the whites. For the successive Spanish expeditions and the later history of the Pueblos, see New Mexico, and also the subjects mentioned below.

Population.—At the time of Coronado's visit the Pueblo tribes were said to inhabit 66 villages and to number 20,000 men, but it is doubtful if the entire population exceeded this estimate. With the exception of Acoma and Isleta none of the 28 pueblos now existing occupy their 16th century sites, the remainder having been forced into new locations chiefly during the reconquest of New Mexico after the Pueblo revolt of 1680. The present aggregate population of the 27 villages is about 10,000, exclusive of several Hopi villages in Arizona and the two pueblos of Isleta and Senecu, below El Paso, which contain from 2,000 to 3,000 more. For their distribution see Keresan; Shoshonean Indians; Tanoan Family, and Zuñian.

F. W. Hodge,
Museum of the American Indian, Heye Foundation.

PUELCHE, pwĕl'kē, South American Indian tribe of Araucan stock, living in the pampas region of the Rio Negro and the Rio Colorado in southern Argentina. They are a wild and warlike people, lead a nomadic life and know practically nothing of agriculture. They succeeded in driving away the Spaniards after the first settlement of Buenos Aires but later withdrew before the Spanish cavalry. They have great herds of cattle and horse, and their chief weapons are the bola and the lasso.

PUERPERAL ECLAMPSIA, a form of eclampsia occurring in pregnant women, usually arising from blood-poisoning and often fatal. The exciting causes may be many, but some form of increased irritability of the nervous system is one of the most important features of the condition. The symptoms come on suddenly, or following a headache, with irritability and perhaps slight impairment of sight or hearing, or with vomiting. Convulsions of an epileptic, hysterical or apoplectic variety constitute the main symptom. These convulsions may last for from one to five minutes, and are then usually accompanied by unconsciousness. They recur sometimes at very short intervals, most frequently hourly, and may vary from 10 to 30 or more in a day. Such convulsive seizures are always serious to both mother and child and prompt emptying of the uterus is the main remedy to be employed.

PUERPERAL FEVER, an infectious disease of women occurring shortly after childbirth, or following a miscarriage, accidental or induced. It is caused by a micro-organism, usually a bacterium (*Streptococcus*), and is communicated by contact with unclean hands, instruments or clothing which may have brought the infection, just before, during or after the birth of the fœtus. Only in the rarest of instances does it occur when due precautions as to absolute surgical cleanliness have been observed. It usually begins within a week after the termination of pregnancy, ordinarily from the third to the fifth day, and is attended with acute inflammation of the reproductive organs and with septic infection of the blood and body at large. It is always an infection from without, and is preventable by rigid aseptic midwifery. The symptoms will vary very widely according to the infecting organism and the severity of the infection. A slight amount of fever and some local extension of tenderness may be the only symptoms present in mild cases. In septicæmic cases there is usually a decided chill about the third or fourth day, and is attendant with acute inflammation of 102°, 103°, 104°, 105° F. with general depression and rapid pulse. The temperature usually remains high and then suddenly drops as the patient recovers. In the severest cases, the pyæmic infections, the blood-current becomes infected; chills, temperature, sweats occur and recur, and the patient usually dies. The treatment is purely medical, sometimes surgical, and needs the skilled physician and nurse. Prevention is the demand of the modern woman, and she is entitled to it. Unskilled and dirty midwives, unclean doctors and abortionists are responsible for practically all of the deaths due to childbed fever.

PUERTO CABELLO, pwăr'tō kä-bĕl'yō, Venezuela, port and capital of the state of Carabobo, on a low peninsula jutting into the Caribbean Sea and forming one of the finest harbors in the world. A lighthouse and fortifications protect the entry. Railroads connect the city with Valencia, 22 miles southeast, and with Caracas, 78 miles east. The exports are coffee (six-sevenths of the whole), cacao, hides, cinchona, oxen, sugar, cotton, timber, including dye woods, and some copper ore. The city was the last stronghold of the Spanish (1823); it was blockaded by the German and British fleets in 1902–03, as the most valuable port of entry and the best place to collect their claims on Venezuela. Pop. (est.) 18,000.

PUERTO LA MAR, lä mär. See COBIJA.

PUERTO PLATA, plä'tä, Santo Domingo, port of the Dominican Republic on the north side of the island of Haiti. The entrance to the harbor is extremely narrow. Steamship lines connect with Europe, Saint Thomas and Havana, and it is connected by rail with Santiago de los Caballeros. Puerto Plata is the export town of the rich tobacco, sugar and coffee plantations in the interior of the island. There are several valuable coal mines nearby and there is also an extensive trade in mahogany. A white cheesebox fort, a relic of the buccaneers, situated upon a small promontory, is the only defense of the town. Municipal authority is vested in a mayor and common council, elected by the people, the mayor being president of the council. The city has a police department, a school board and a very good school system and a street cleaning department. It is well lighted and has waterworks. The town was settled in the first decade of the 16th century by Spaniards. About 30 per cent of the population speak English. Population about 10,000.

PUERTO PRINCIPE, prēn'sē-pā, or **CAMAGÜEY,** Cuba, town, capital of the province of Puerto Principe, 170 miles northwest of the city of Santiago de Cuba. It was originally founded in 1515 at Nuevitas, the site of an old Indian village, on the northern coast, but was moved to its present site in 1516. For a time after 1800 it was the seat of government for the Spanish West Indies, and until the end of Spanish rule was an important military post. It is the largest inland city of the island, and is connected with its port, Nuevitas, by railroad. It is the centre of a cattle-raising district, and exports cattle, hides, etc. Sugar also is cultivated somewhat in the vicinity and exported. The town is very mediæval in appearance, the streets are narrow and the houses old. During the American occupation artesian wells were bored to obtain a pure water supply, the streets were repaired, a good drainage system introduced and buildings for schools remodeled. Pop. about 30,000.

PUERTO PRINCIPE or **CAMAGÜEY,** province, east of the centre of the island, bounded on the east by Santiago de Cuba, and on the west by Santa Clara; area 11,000 square miles. The north of the province is mountainous, the most of the surface being high tableland affording excellent pasturage. The chief industry is cattle raising, and the number of cattle has largely increased. The finest horses on the island are also raised here. The province is well wooded, and lumbering is an important industry. The minerals include iron, copper and asphalt, all of which are mined to some extent, asphalt being of the most commercial importance. General agriculture is carried on mostly in the vicinity of the town of Puerto Principe, and its port, Nuevitas. Sugar is the most important agricultural product. The province was a centre of the insurrectionary movement, and Cubitas in the northern part was the seat of the insurgent government in 1896–98. Puerto Principe is the second province of Cuba in size but is least densely populated. Pop. about 160,000.

PUERTO REAL, rä-äl', Spain, a seaport in the province of Cadiz, on the Bay of Cadiz, seven miles east of the city of Cadiz. The greater part of the town is modern, on the site of Portus Gaditanus, an old Roman place. It has considerable manufacturing; and the chief products are leather, pottery, linen goods, cements, vermicelli and starch. It has a good harbor and an extensive trade; the chief exports are salt, fruit and manufactures. Pop. about 9,000.

PUERTO RICO, rē'kō. See PORTO RICO.

PUERTO DE SANTA MARIA, generally known as «**EL PUERTO,**» dā sän'tä mä-rē'ä (PORT SAINT MARY), Spain, city in Andalusia, in the province of Cadiz and seven miles northeast of the city of Cadiz, on the Guadalete, near its mouth in the Bay of Cadiz. It is on the railway from Seville to Cadiz. It has a town-house, theatre, a bull-ring, where was given the grand bull-fight to the Duke of Wellington, described by Lord Byron; five promenades, one of them planted with orange and other trees; infantry and cavalry barracks; a custom-house, a good edifice near the mole, a courthouse and a parish church in the Gothic style. Leather, soap, hats, wines, liqueurs, brandies, starch, flour and glass are manufactured, and some fishing is carried on in El Puerto. This is one of the Spanish ports from which sherry is exported. Its vicinity to Cadiz, the centre of exchange, is favorable for trade. The principal articles of import are wood and iron. Steamboats ply regularly between the Puerto and Cadiz. Pop. about 18,000.

PUFENDORF, poo'fĕn-dŏrf, **Samuel**, BARON VON, German publicist and historian: b. Chemnitz, Saxony, 8 Jan. 1632; d. Berlin, 26 Oct. 1694. He studied theology and law at Leipzig and in 1657 philosophy at Jena; was tutor in the house of the Swedish ambassador at Copenhagen, and by his work, 'Elementa Jurisprudentiæ Universalis' (1660) secured the appointment, the first in Germany, to the professorship of the law of nature and of nations at Heidelberg in 1661. Here he taught till 1670, and wrote 'De Statu Rei Publicæ Germanicæ,' published in 1667 under the pseudonym of Severinus Mozambano, and which, from the hardy way in which some of the imperfections of the Germanic constitution are exposed, raised a storm of controversy. Partly with a view to escape unpleasant consequences, Pufendorf accepted in 1670 the post of professor of natural law in the university at Lund, offered him by Charles XI of Sweden. He there wrote his work on natural law, 'De Jure Naturæ et Gentium' (1672), which superseded the former; soon after appeared the abstract of this work, 'De Officio Hominis et Civis' (1673), which has passed through numerous editions and been translated into several languages. Pufendorf in these works deviated still further than Grotius from the scholastic method of philosophizing, and consequently excited violent opposition. About 1677 he was appointed secretary of state, royal counsellor, and historiographer at Stockholm. There he wrote in Latin the 'History of Sweden from the Campaign of Gustavus Adolphus in Germany to the Abdication of Queen Christina' (1676), and in German his 'Einleitung zur Geschichte der Vornehmsten Reiche und Staaten' (1682). These works so much increased his reputation that in 1686 he was called to Berlin as counsellor, historiographer, and judge of the Supreme Court of Judicature. In 1690 he was made privy-councillor of the Elector of Brandenburg, and in 1694 was created baron by the king of Sweden. Pufendorf's legal writings are regarded as marking an epoch in the history of natural law, treating it as based upon the social instinct and developing it as a philosophical morality, while allowing scope to revelation.

PUFF-ADDER, the popular name of an African viper (*Bitis arietans*), which should not be confused with the American puffing-adder or blowing-adder, of the genus *Heterodon*. (See HOGNOSE). The hognose adder is harmless, but the African viper is highly dangerous, its head appearing puffed, because of the large size of the poison sacs. See SERPENTS; VIPERS.

PUFF-BALLS. See FUNGI.

PUFF-BIRDS, a family (*Bucconidæ*) of tropical American picarian birds, resembling kingfishers in form, but living on insects like flycatchers. They are closely related to the barbets.

PUFFER. See GLOBE-FISH.

PUFFIN, a bird of the auk (q.v.) family, common on all far northern sea-coasts, where they breed on remote cliffs in large companies. The *Fratercula artica* is the most familiar, being distinguished by the large and greatly compressed beak, which is deeply furrowed by three grooves on each side of the mandible. The colors of the beak also add to its singular appearance; this structure being colored bluish-gray at its base, orange-red in the middle and bright red at the tip. A large portion of it is annually molted. The body is short, stout and rounded. These birds excavate burrows in sandy ground, each depositing a single egg of while color. They are able to bite and scratch severely by means of their bills. Puffins swim and dive with great ease; their food consisting of the smaller fishes and chiefly the young of the sprats and herrings. They are caught and their flesh is salted for food by the inhabitants of the Orkney and Shetland Islands. The appearance of the bill in these birds has gained for them the British provincial names «coulter-neb» and «sea-parrot.» The crested puffin (*Lunda cirrhata*) has long light yellow plumes rising back of the eyes. Compare AUK; ALBATROSS.

PUG. See DOG.

PUG MILL. See CLAY.

PUGAREE, or **PUGREY**, a piece of silk, muslin, etc., worn around a hat or helmet in hot climates, the ends being left hanging, to protect the back, head and neck from the sun.

PUGATSCHEFF, or **PUGACHEV**, poo'-gä-chĕf, **Yemelyan Ivanovitch**, Russian revolutionist: b. Simoweisk, on the Don, Russia, probably between 1730 and 1740; d. Moscow, Russia, 10 Jan. 1775. He was leader of a band of robbers in his early youth, served in the Seven Years' War in the Russian, Prussian and Austrian armies successively and on his return to Russia was implicated in a seditionary movement and imprisoned. He escaped and prompted by his resemblance to the murdered Peter III, pretended to be the tsar. The peasantry flocked to his standard and were promised relief from their oppressions. His forces constantly increased and success for a time attended him. With 16,000 men in his army he captured Kazan, the old Russian capital, and moved upon Moscow, where he was betrayed by his followers to Suvaroff, captured and taken in an iron cage to Moscow, where he was executed.

PUGET, **Pierre Paul**, pē-ār pōl pü-zhā, French painter, sculptor and architect: b. Marseilles, 31 Oct. 1622; d. there, 1694. He began his career in art as apprentice to a ship-builder named Roman, who set him to carving the figure decorations for the prow and poop of galleys which the prevailing fashion demanded. At 17, however, he gave up this pursuit and traveled to Italy on foot, visiting Genoa, Florence and Rome and in the latter place entered the school of Pietro da Cortona. This master's influence was always apparent in Puget's painting. In 1643 he returned to Marseilles and to ship-designing. Later he spent six years at Rome in company with a feuillant monk on a commission from Anne of Austria to make drawings of antique monuments. After 1653 he painted pictures for churches of Marseilles, Aix and Toulon; but finally abandoned painting on the advice of physicians. His first work as a sculptor, the caryatides supporting the balcony of the Hotel de Ville, Toulon, was a venture into realism, the figures being studied from the porters on the quays. These received the praise of Bernini. He produced two works similarly conceived, 'Hercules Overcoming the Hydra, (now in the Musée de Rouen) and 'La Terre' for the Chateau de Vaudreuil, Normandy. His other works are more in the manner of the Italians of the 17th century, an influence confirmed by another visit at the instance of Fouquet. The fall of that minister put an end to his commission and Puget settled in Genoa, where he sculptured a 'Saint Sebastian and Saint Ambrose' for the church of Santa Maria-in-Carignano and a 'Conception' for the Brignoli, now in the Albergo dei Poveri. His natural restlessness induced his return to France, where he became attached to the arsenal of Toulon as decorator of war vessels. But under the patronage of Colbert he resumed sculpture and executed the 'Milo of Crotona,' 'Alexander and Diogenes' (bas relief) and later the 'Perseus and Andromeda,' all three at present in the Louvre. The 'Alexander and Diogenes' has been called "the triumph of picturesque sculpture," though, as Delacroix has pointed out, its subject is one impossible for sculptural treatment as the ray of sunlight which Alexander intercepts cannot be represented. His architectural works are not numerous, though he erected the church of the Charité and the Capuchines at Marseilles. Consult Lagrange, 'Pierre Puget, Peinteur, Sculpteur, Architecte' (1868); Emeric, David, 'Histoire de la Sculpture Française' (1872); Auquier, 'Pierre Puget' (1903).

PUGET (pū'jět) **SOUND** is a large, irregular inlet from the Pacific Ocean into the State of Washington. The Sound proper begins at the junction of Juan de Fuca and Georgia straits and extends south, dividing into two main branches, the eastern one called Admiralty Inlet, and the western Hood Canal. Some of the largest Sound inlets on the east shore are Elliot, Poverty and Commencement bays; on the west shore, Dogfish Bay and Dye's Inlet, and on the south shore, Carrs, Budd and Totten inlets. The area of this great landlocked body of water is about 2,000 square miles. It has a number of islands, Vashon and Bainbridge being the largest. A number of rivers, having their headwaters in the Cascade Mountains, flow into the Sound, the principal river inlets are Duwamish, Nisqually, Nooksak, Puyallup, Skagit, Skokomish and Snohomish. The Sound has a number of large and safe harbors and many miles of deep-water front, and is mostly navigable by large vessels. The waters teem with fish; 95 varieties of food fish have been found. The shores are well-wooded, although there has been extensive lumbering in the surrounding forests. Shipbuilding is a young and growing industry. The annual tonnage entering exceels 2,000,000. A canal is being built to connect with Lakes Washington and Union. The cleared lands in the vicinity make most productive farms. Seattle, Tacoma and Port Townsend are the largest cities on the Sound; all natural conditions exist for an extensive commerce.

PUGET SOUND, College of, a coeducational institution at Tacoma, Wash. It was organized in 1903 under the auspices of the Methodist Episcopal Church as the University of Puget Sound, and was reorganized under its present name in 1914. It has a college preparatory grade leading to its college grade and schools of liberal arts, law, home economics, commerce, education, music and art. Its normal course is approved by the State Board of Education and it conducts a six-weeks summer normal school. The college owns seven and one-half acres of ground in the heart of the city and has excellent buildings. The total enrolment in 1918 was about 400, of whom 18 were with the colors. The president in 1918 was E. H. Todd.

PUGHE, pū, **William Owen,** Welsh antiquary: b. Tyn y Bryn, Merionethshire, 1759; d. 1835. Going to London at 17 he there met the Welsh literary student Owen Jones, and the two published in 1795 the poems of Dafydd ap Gwilym, a 14th century bard. They subsequently edited other Welsh poems, and, assisted by Edward Williams, published the 'Myvyrian Archaiology of Wales' (1801–07). Pughe edited also 'The Welsh and English Dictionary' (1793–1803); the 'Cambrian Biography' (1803), etc. He accomplished not a little in arousing interest in Welsh language and literature.

PUGILISM. See BOXING; PRIZE FIGHTING.

PUGIN, pū'jĭn, **Augustus Charles,** English architect and draughtsman: b. Normandy, 1762; d. London, 19 Dec. 1832. He settled about 1798 in London, where for many years he was assistant to the architect Nash. He subsequently devoted his attention to mediæval architecture, and published 'Specimens of Gothic Architecture selected from various Ancient Edifices in England' (1821–23). With John Britton he published 'Architectural Illustrations of the Buildings of London' (1824). Later works were 'Specimens of the Architectural Antiquities of Normandy' (1825–28) with Le Keux; 'Gothic Ornaments selected from various Buildings in England and France.'

PUGIN, Augustus Welby Northmore, English architect: b. London, 1 March 1812; d. Ramsgate, Kent, 14 Sept. 1852. He early displayed skill and facility in architectural drawing and acted as assistant to the Grieves in painting scenery for Covent Garden and Her Majesty's Theatre. His taste for Gothic art was turned to account in designing the furniture for Windsor Castle, and in supplying Messrs. Rundell and Bridge with designs for mediæval plate. He became a convert in 1834 to Roman Catholicism, and devoted himself thenceforth to the illustration and revival of Gothic architecture in connection with the Roman Catholic Church. His treatise 'Gothic Furniture and Iron Work' appeared in 1835, and attracted attention. In the following year he published 'Contrasts, or a Parallel between the Noble Edifices of the 14th and 15th centuries and Similar Buildings of the Present Day,' in which he expressed in no measured terms his views as to the decadence of ecclesiastical architecture. Other works of Pugin were 'The True Principles of Pointed or Christian Architecture' (1841); 'An Apology for the Revival of Christian Architecture' (1843); 'The Glossary of Ecclesiastical Ornament' (1844). He was employed by Sir Charles Barry in the decoration of the houses of Parliament, and was connected with Hardman of Birmingham in the manufacture of the renowned Gothic brass-work, besides having a share in the manufactory of stained glass in the same town. Latterly his intellect gave way, from the incessant excitement and labor to which it was subjected, and he was removed to an asylum.

PUISNE (pū'nĕ) **JUDGE,** *in law,* a former term for a younger or inferior judge.

PUJO, Arsène Paulin, American legislator: b. Lake Charles, La., 16 Dec. 1861. He was educated in the public and private schools of Lake Charles and was admitted to the bar in 1886, since when he has been engaged in practice at Lake Charles. He was a member of the Louisiana Constitutional Convention in 1898 and in 1903–13 served in Congress. He was chairman of the committee on banking and currency in 1912, and also chairman of the sub-committee which made the "money trust" investigation in that year. He was chairman of the district board under the Selective Service Act of 1917.

PUKET, poo-kĕt', or **TONKA,** a port of Lower Siam, the chief town of Junk Ceylon or Salang Island, on the west coast of the Malay Peninsula. The town is on the east coast of the island at the entrance to a wide and deep bay. It is the seat of the commissioner of the west coast. Its importance is due to its valuable tin mines yielding an annual average of 3,500 tons. Pop. est. 25,000.

PULANGUI, poo-län'gĕ, river of the Philippines, the upper part of the Grande de Mindanao. See MINDANAO, GRANDE DE.

PULASKI, pū-läs'kĭ, **Casimir,** COUNT, Polish soldier of the American Revolution: b. Lithuania, 4 March 1748; d. Savannah, Ga., 11 Oct. 1779. He studied law, served in the army under Charles, duke of Courland, and in 1769 engaged with his father and brothers in the uprising against King Stanislas Augustus. He commanded the insurgents for a time after the death of his father and brothers and in 1771 made an unsuccessful attempt to capture the king at Warsaw which resulted in a sentence of outlawry being passed upon him. Further resistance was soon rendered useless by the coalition of Russia, Austria and Prussia, and Pulaski made his escape to France where he met Franklin and offered his services to the cause of American independence. He obtained letters from Franklin to Washington and in 1777 joined the army of the latter as a volunteer. He performed distinguished service at the battle of Brandywine and received from Congress promotion to the rank of brigadier-general in command of a division of cavalry. He resigned his command after five months, joined the main army at Valley Forge and received permission from Congress to organize an independent corps of cavalry and light infantry which became known as Pulaski's Legion. In 1779 he marched with his men to join General Lincoln in South Carolina where he performed effectual service. In the siege of Savannah he commanded the French and American cavalry and in an assault on 9 October was mortally wounded and was carried on board the United States brig *Wasp* in Savannah harbor where he died two days later. Consult Griffin, 'Count Pulaski' (1910).

PULASKI, Tenn., town and county-seat of Giles County, on Richland Creek 78 miles by rail southwest of Nashville on the Louisville and Nashville Railroad. The Martin Female College and the Massey School for Boys are situated here. It is a well-built town with a central square; is situated in a prosperous agricultural and stock-raising district; and has planing mills, an ice plant and manufactories of tobacco. Pop. 2,928.

PULASKI, Va., town and county-seat of Pulaski County, 50 miles, direct, southwest of Roanoke, on the Norfolk and Western Railroad. It is a growing town with a considerable business as a mountain resort. The district is rich in zinc and iron ores and coal; and there are manufactures of iron and zinc and a sulphuric acid plant. Pop. 4,807.

PULASKI, Wis., a village of Brown County, northwest of Green Bay, the seat of the Polish Franciscan Monastery of the Assumption of the Blessed Virgin and of Seraphic College. Pop. 450. See POLISH FRANCISCANS IN AMERICA.

PULASKI, Fort. See FORT PULASKI.

PULCHERIA, pŭl-kē'rĭ-ą, Byzantine empress: b. 399; d. 453. She was the daughter of the Emperor Arcadius, upon whose death in 414 she became co-ruler with her brother Theodosius II, who was content to leave the reins of power in her hands. With her two younger sisters she took the vow of virginity, as she was determined that there should be no contests between three husbands for the empire. She condemned the Nestorian and Eutychian heresies and was on the friendliest terms with Cyril of Alexandria, Pope Leo the Great and other great men of the time. She was a fine scholar, earnest in her devotion to the Church and active in promoting the welfare of her subjects. She arranged the marriage of her brother and after the marriage of his daughter with Valentinian III, she retired for a time from the court. On the death of Theodosius, however, in 450 she again assumed the throne, for state reasons was absolved from her vow of virginity and married the general Marcian whom she raised to the throne as her colleague. After her death she was canonized and her feast is still celebrated in the Greek Church.

PULCI, Luigi, loo'jē pool'chē, Italian poet: b. Florence, 15 Aug. 1432; d. Oct. 1487. He came of a family in which poetical talents were hereditary; and had two brothers who were also poets, Bernardo, who wrote elegies on Cosmo de' Medici and translated Virgil's Eclogues, and Luca, who composed stanzas on the Tournament of Lorenzo de' Medici. Luigi far surpassed his elder brothers in talent, and became an intimate of the household of Lorenzo the Magnificent. At the instance of Lucrezia Tornabuoni, mother of Lorenzo, he composed an epic poem, 'Il Morgante Maggiore,' based on the tale of Roland, and recited it canto by canto at the table where such men as Poliziano, Ficino, Michelangelo Buonarotti, and Cristofero Landino gathered. This fact accounts for the diversity of its contents both in respect to the subject matter and the spirit in which it is handled. He assumed the tone of Florentine society at the time of its composition, and inserted at will or to suit the changeable temper of his audiences passages of moving pathos or sincere devotion amid others of coarse buffoonery and broad humor. He fell in with the general Italian tendency of treating the Carlovingian legend with less seriousness than did Northern peoples, but he infused a specially bourgeois spirit by his use of many words of the Tuscan dialect. It has been asserted that Shakespeare's familiarity with Pulci is evidenced in his creation of Iago and Othello. Byron was a confessed admirer, and translated the first canto of 'Morgante Maggiore' which he published with 'Beppo' and the 'Vision of Judgment.' See MORGANTE MAGGIORE; PUNCHINELLO.

PULCINELLO, pŭl-chĭ-nĕl'ō. See PUNCHINELLO.

PULILAN, poo-lē'lăn, Philippines, pueblo, province of Bulacán, Luzon; on the Quinigua, five miles above its junction with the Grande de Pampanga, eight miles northwest of Bulacán, the former provincial capital. Pop. 10,100.

PULITZER, pū'lĭt-sėr, **Joseph,** American journalist: b. Budapest, Hungary, 10 April 1847; d. Charleston, S. C., 29 Oct. 1911. He came to the United States in 1864 and joined a Federal cavalry regiment, serving till the end of the Civil War; then became a reporter on the '*Westliche Post,*' which Carl Schurz had made the leading German newspaper in Saint Louis. Beginning upon the lowest round of a journalist's career, and at first enduring considerable hardship, he rapidly won recognition and rose to the position of managing editor and chief proprietor of the paper. In the meantime he had acquired a knowledge of law, had been admitted to practice and been active in politics in the Republican ranks. He was elected to the Missouri legislature in 1869, was a delegate to the convention of the Liberal Republican party at Cincinnati, which nominated Horace Greeley for President, then became a Democrat and in 1874 was a member of the Missouri State constitutional covention. In 1876–77 he was Washington correspondent for the New York *Sun,* and in 1878 bought the Saint Louis *Dispatch* and united it with the *Evening Post* as the *Post-Dispatch.* In 1883 he purchased the New York *World,* soon building up a large circulation. He was elected to Congress in New York in 1885–87 but resigned after a few months. In 1887 his health was broken, due to overwork, and was followed by a steady loss of eyesight until he became totally blind. Mr. Pulitzer's career as an editor was marked by great ability and genius. In August, 1903, announcement was made of the endowment of a College of Journalism by him at Columbia University. He also endowed several scholarships at Columbia College and gave largely to other educational and charitable causes.

PULKOVA (pool'kō-vä) **OBSERVATORY,** in Russia, founded by the Tsar Nicholas, and built in 1835–39, is at the village of Pulkova; lat. 59° 46′ 18″ N., and long. 30° 19′ 40″ E. It was intended for the study of sidereal astronomy. The chief instrument, the refractor, with a 15-inch aperture, was not equaled by any other like instrument in the world, until 1870 when the Newhall Observatory in Newcastle, England, secured a 24-inch refractor. Next came the 26-inch refractor for the Naval Observatory (q.v.) in Washington, D. C. In 1885 the Pulkova Observatory erected a 30-inch refractor made by Clark and Sons of Cambridgeport, Mass. The determinations of star places made at this observatory are regarded as most accurate and its investigations cover a wide field. The observatory is not only doing remarkable original research; but it is also a training school for astronomers and geodesists.

PULLEN, Henry William, English Anglican clergyman and author: b. 29 Feb. 1836; d. 26 Dec. 1903. He was educated at Marlborough and Cambridge, took orders in the English Church, became a minor canon of York in 1862, and was minor canon of Salisbury, 1863–75. He became chaplain of the *Alert* during its Arctic expedition of 1875–76, and for his services on that voyage was awarded the Arctic medal. He attained a sudden fame by the publication in 1870 of the brilliant 'Fight at Dame Europa's School,' of which 193,000 copies were sold and 14 translations made. He also wrote 'Modern Christianity, a Civilized Heathenism' (1872), the circulation of which reached 20,000 copies; 'The Ground Ash, a Public School Story' (1873); 'The Council of Canterbury' (1882); 'The House That Baby Built' (1874); 'Pueris Reventia' (1893); 'Venus and Cupid' (1896); 'Fred and Fritz' (1898). He edited Murray's 'Handbooks to Italy, Rome and Greece' (1886–96).

PULLEY, a mechanical device for the duplication and reduplication of the intensity of a force. By its application the power exerted may overcome a resistance much greater than itself, through a sacrifice of velocity.

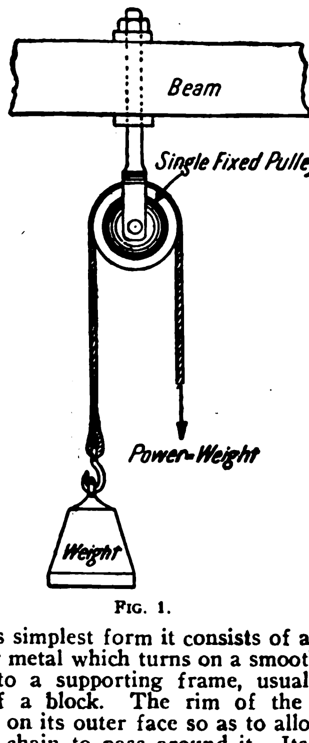

FIG. 1.

In its simplest form it consists of a wheel of wood or metal which turns on a smooth axle attached to a supporting frame, usually in the form of a block. The rim of the wheel is grooved on its outer face so as to allow a rope, cord or chain to pass around it. Its principle of action was first enunciated by Stevin, about 1610, based on the fact that the tension of a rope is the same at every point of its length.

Theoretically a fixed peg in the position of the axis of the pulley would serve the purposes defined just as well as a wheel. The latter is introduced for the specific purpose of reducing the friction.

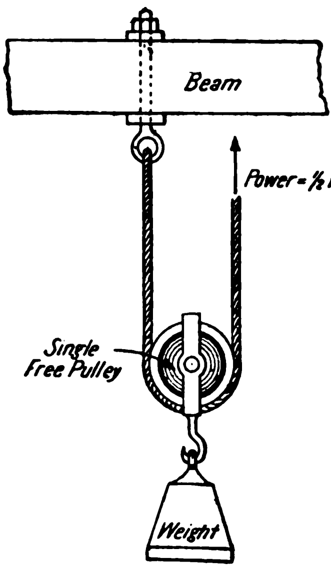

FIG. 2.

In the single "fixed" pulley, Fig. 1, to satisfy the condition of static equilibrium, the tension of the rope must be the same on both sides of the wheel, therefore, the power applied is equal to the weight, and although no mechanical ad-

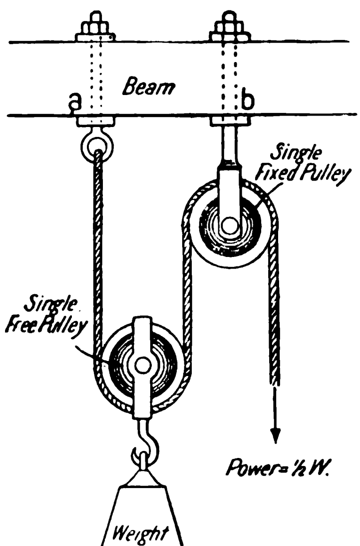

FIG. 3.

vantage is gained by its use, it serves to change the direction of the force applied. Incidentally, it loads the beam with twice the amount of that force.

In the single movable or "free" pulley with parallel cords, Fig. 2, as in the fixed pulley, the tension of the rope on both sides of the wheel is the same; but, since the weight is supported by two upward forces each of which is equal to the force applied, the power is equal to one half the weight, the beam supporting the other half. In other words, the power that will lift a given weight by the use of a single fixed pulley will lift twice that weight by the employment of a free pulley.

Fixed and free pulleys may be combined in various ways to obtain a mechanical advantage. In the combination shown in Fig. 3, the tension on the beam at (a) is equal to the power applied, and at (b) it is equal to twice that power; but the relation of the power to the weight remains the same as in case of the single free pulley.

If, however, the supporting cords pull at an angle (2ϕ), Fig. 4, the pulley is acted upon by three forces — the weight (w) acting ver-

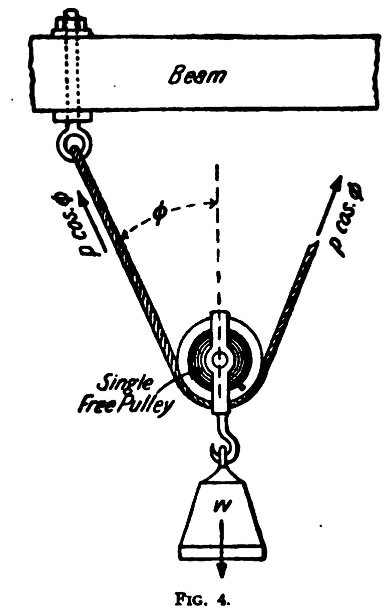

FIG. 4.

tically downward, and two equal forces ($p \cos \phi$) acting upward. The resulting effect, $2p \cos \phi = w$, shows a mechanical disadvantage, since the power required increases with the angle, and $p = \frac{1}{2}w$, as shown by Figs. 2 and 3, only when $\phi = 0°$, that is, when the strings are parallel. When $\phi = 60°$, the power is equal to the weight; and when $\phi = 90°$, or $2\phi = 180°$, an infinite amount of power would be required to draw the rope out horizontal.

Combinations of pulleys or compound pulleys are usually arranged according to one of the three systems represented by Figs. 5, 6 and 7, which indicate the action of the supporting forces.

In the first system, Fig. 5, five independent pulleys are supported by an equal number of branches from the main cord. The mechanical advantage stated in terms of weight (w) and power (p) is $w = 2^5p, = 32p$; or in general $w = 2^n$ p, when (n) represents the number of pulleys.

In the second system, Fig. 6, the weight is supported by the four forces, $p + 2p + 2^2p + 2^3p = 15p = (2^4 - 1)p$, or in general, $w = (2^n - 1)p$.

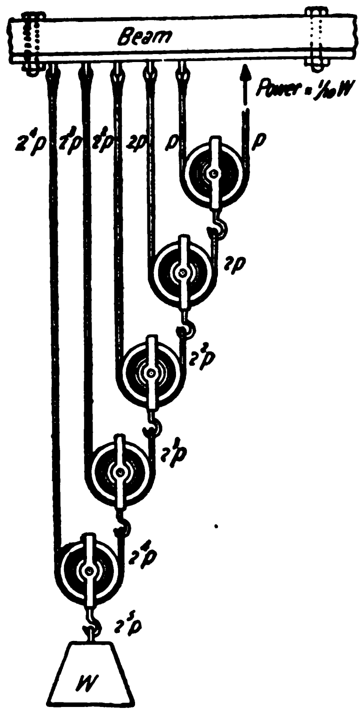

FIG. 5.

In the third system, Fig. 7, one continuous string is divided into six branches by six pulleys, and since the tension of each branch is

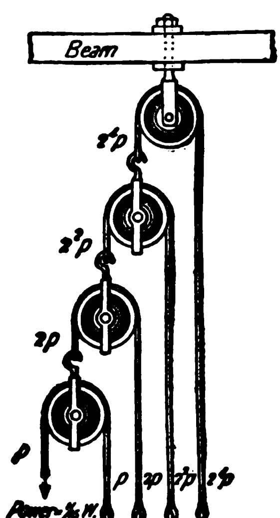

FIG. 6.

equal to (p) the power applied, $w = 6p$, represents the mechanical advantage, or $w = np$, when (n) is the number of cords rising from the movable pulley. This is the form most frequently used practically, its most extensive application being the block and tackle devices of the running rigging of ships. See BLOCK; TACKLE.

The differential pulley is made up of two pulleys of slightly differing diameter, so fastened together that they act as one. An endless chain passes around both, and in one of the bights is a movable pulley: the other bight is used to operate the pulley. As the chain is hauled down from the larger pulley it hoists the chain on the other side, but at the same time the nearer chain on the smaller pulley is unwinding, so that the lifting bight is lessened in length very slowly. The closer the two fixed pulleys approximate the slower the lift, and the greater the power — usually 1 to 60.

The term pulley is used in quite a different sense when applied to the belt-wheels used in

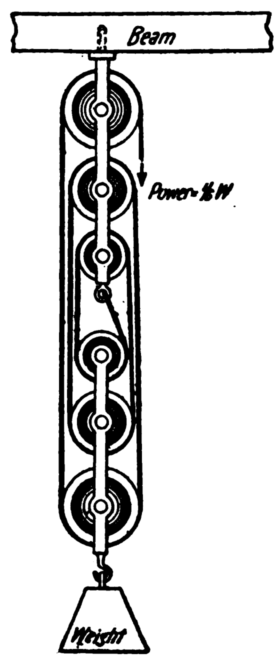

FIG. 7.

power transmission (q.v.). The many formulas given for calculation of their dimensions vary indefinitely with the material of which the pulley-wheel is made, the material and thickness of the belt, and the volume of power transmitted. The width of face of such a wheel is from one-eighth to one-fourth wider than the belt, whose width is determined by the power. In the case of shifting belts the pulley-wheels have a flat face, but otherwise they are slightly crowned, from one-ninety-sixth of the width of the face to as much as one-tenth of such width — as advocated by different authorities. The relative speed of any two pulleys carrying a given belt is inversely as their diameters. To vary the speed at will «step» or «cone» pulleys are in use, the smallest wheel on the driving cone being opposite the largest wheel on the driven cone — and vice versa. Consult Collins, H. E., 'Shafting, Belting and Rope Transmission' (New York 1914); Goodeve, T. M., 'Principles of Mechanics' (London 1908); Kent's 'Mechanical Engineer's Pocket Book' (New York 1915).

PULLMAN, George Mortimer, American inventor: b. Chautauqua County, N. Y., 3 March 1831; d. Chicago, Ill., 19 Oct. 1897. He learned the cabinetmaker's trade, and during the construction of the Erie Canal he successfully filled contracts for removing various large buildings in its proposed route. He then settled in Chicago and engaged in building, but devoted much time to the problem of making long railway journeys less tedious, the result being the conversion of two ordinary railway coaches into sleeping cars. They were a success and created a demand for more, and in 1863 he built the «Pioneer» at a cost of $18,000, which was the first of the cars which have since borne his name. He organized in 1867 the Pullman Palace Car Company, of which he was president, and in 1887 originated the vestibule train. He amassed an immense fortune, founded a model town near Chicago, which he named Pullman (q.v.), and was interested in various other large commercial enterprises.

PULLMAN, Ill., a former town, now part of the city of Chicago, on Lake Calumet, 12 miles south of the centre of Chicago. It was founded in 1880 by George M. Pullman, and intended especially for the benefit of the employees of his company. Besides the Pullman Palace Car Company, which is located here, there are car wheel works, a foundry. and other industrial establishments. It was formerly under the government of the Pullman Company, but in 1889 the town voted for incorporation with the city of Chicago (q.v.).

PULLMAN, Wash., city in Whitman County, near the eastern border of the State, 70 miles northeast of Walla Walla, on the Northern Pacific, the Oregon-Washington and the Navigation Company's railroads. The State Agricultural College and School of Sciences are located here as well as a United States Government Experiment Station. The surrounding district produces grain and livestock and dairying also is carried on. The water supply is from artesian wells. The town is growing steadily. Pop. 2,603.

PULMONATA, an order of non-marine gasteropod mollusks, characterized by breathing atmospheric air; the snails. They are usually small, asymmetrical, and provided with a shell. The sexes are always united in the same individual, and the operculum is always wanting, except in *Amphibola.* The respiratory apparatus, which seems to have been modified from that of ancestors who breathed oxygen mixed with water, by means of branchiæ, is not lung-like in structure; it is simply a pouch lined with blood-vessels, and is properly called a pulmonary sac.

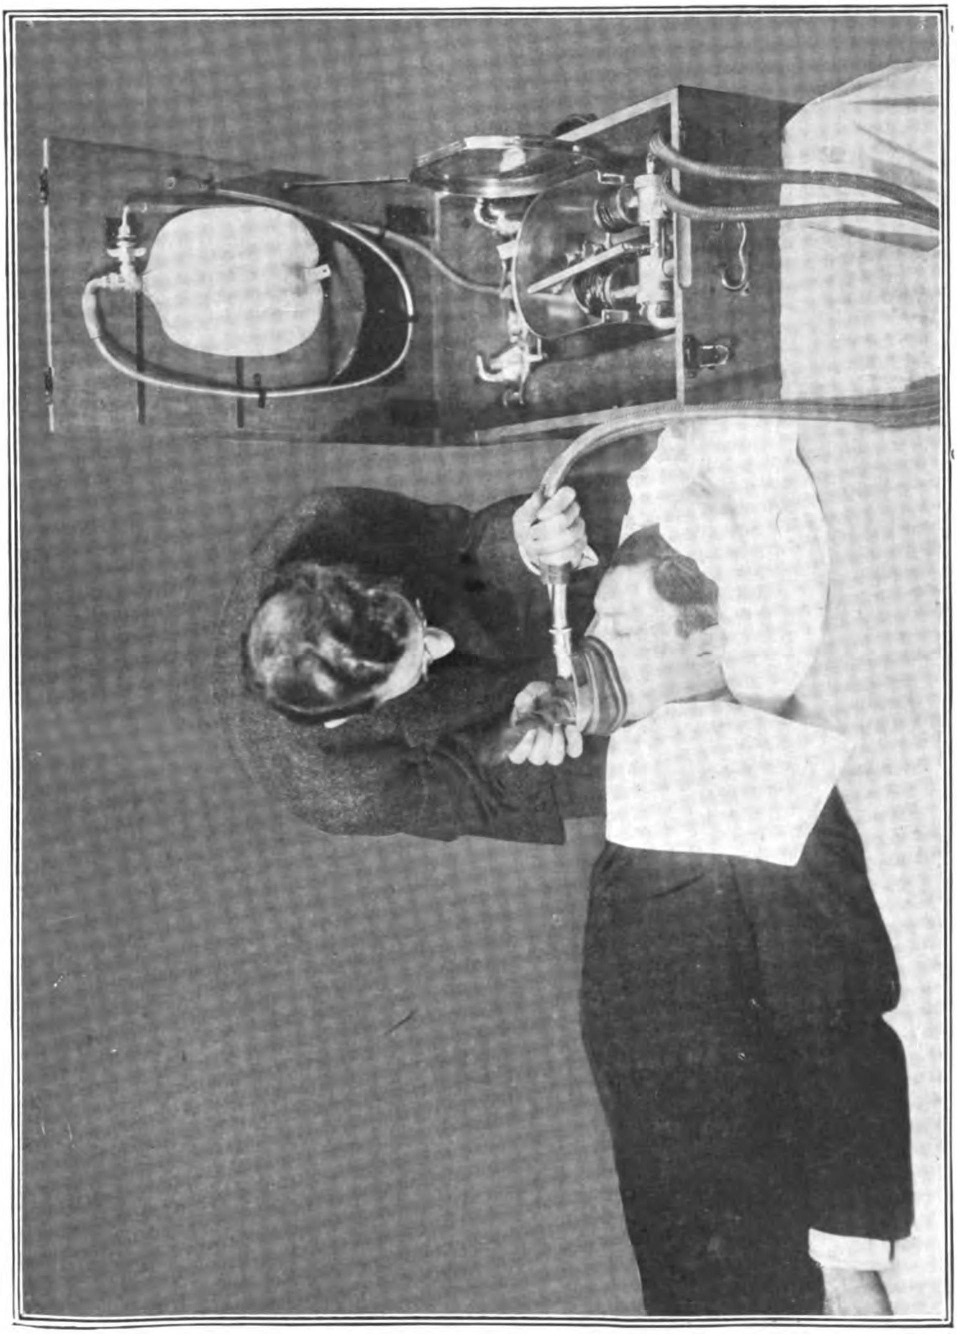
PULMOTOR, a machine invented by Bernard Draeger for producing artificial respiration. It was first used in Europe in connection with mine rescue apparatus. Later it was used by the United States Bureau of Mines in similar work. It was found to be so satisfactory in resuscitating after all kinds of suffocation, such as asphyxiation from gas, electric shock and cases of apparently drowned, that large gas and electrical companies have installed them; also many hospitals and fire and police departments.

Formerly in cases of asphyxiation, morphine poisoning, drowning, or electric shocks, efforts to restore respiration consisted in laying the patient on his back and alternately pulling his arms over his head and forcing them down upon his chest, thereby causing an expansion of the lung cavity, and then compressing it, thus first producing artificial breathing. In such cases it became necessary to force the patient's mouth open and pull out his tongue, thereby affording free passage for the air, which alternately was drawn into the lung cavity and immediately expelled. This process is superseded by the application of the pulmotor, which operates as follows: An iron cylinder $3\frac{1}{2} \times 21$ inches contains the oxygen at a pressure of about 2,250 pounds when completely filled and will operate the pulmotor 40 minutes continuously. This life-sustaining gas also furnishes the energy which is required to induce breathing, in the following manner: The oxygen from the tank flows through a reducing valve, which at the outlet side maintains a pressure of about 75 pounds, and from there to the controlling valve. Initially, the passage to the lungs is open through this controlling valve. The latter connects two flexible braided copper tubes leading to a metallic face cap with a rubber rim, which closely fits the patient's face. The patient's tongue is drawn down over the lower jaw and under the mask, by means of a set of tongue forceps which is provided. The oxygen then has free access to the lungs.

When the pressure in the lungs has reached a certain value, 20 centimeters, a bellows interconnected with the lung cavity through the flexible braided copper actuates the controlling valve. The pressure of oxygen is now directed so as to create a suction over the connections which lead to the lungs, thereby causing exhalation of the gases previously forced into the lungs. When a vacuum of 25 centimeters is reached in the lungs and bellows, the outer atmosphere acts on the latter, which in turn operates the controlling valve and again admits the oxygen to the lungs. The frequency of these reversals depends upon the size of the lung cavity, a larger space requiring greater time, while with smaller lung cavities the operation is correspondingly more frequent. This process is continued until the patient shows signs of natural respiration. The pulmotor action is then discontinued and the patient is allowed to breathe the pure oxygen through another small face cap connected by a hose directly to the oxygen tank.

PULP. See PAPER.

PULSE (from Latin, *pulsus,* a beating), the rhythmical motion of an artery, with alternate expansion and contraction, in practice considered as a beating. This motion is strongest in the heart (q.v.), which is the centre of the arterial system; and from that organ it is propagated through all the minutest branches of the arteries. In those which lie immediately under the skin it can be felt with the finger, as is the case with the radial artery, the pulsation of which is very perceptible at the wrist. The state of the pulse is therefore an indication of the action of the heart and the whole arterial system and of the condition of the blood and the physical functions in general. The circum-



The Pulmotor and Its Application

stances to be attended to in the pulse are either the number of pulsations which take place in a given time and the regularity or irregularity of their occurrence, or the character of each pulsation. In the former case the pulse is said to be quick or slow according to the number of pulsations in a given interval; regular or irregular, as they occur at equal or unequal intervals. In the latter case it is strong or weak, hard or soft, full or small. It is affected by the age, sex and temperament of the individual, and by accidental circumstances, as sleep, food, exercise, heat.

The pulse is most rapid in infancy, making from 110 to 140 beats per minute. During early childhood it makes from 100 to 110 and is regular and rather soft and small. In youth it is much slower, making from 80 to 90 beats per minute. At this period it is regular, strong, rather soft than hard, moderately full. In mature age the number of beats is on the average about 75 per minute and the pulse is regular, strong, or moderate, fluctuating between hard and soft, between full and small. In old age the number of beats sinks to about 60. In the female the pulse is more rapid, softer and smaller than in the male. In persons of a sanguine temperament it is quicker and fuller than in phlegmatic individuals. Sudden agitation and violent passions make the pulse rapid and irregular; joy makes it quick and strong; long-continued grief, languid and soft. The pulse is, therefore, a highly important indication of the state of the system. A deviation from the regular pulse of an idividual indicates a disordered state. When the irritability of the system is so heightened as to produce fever or inflammation the pulse is accelerated. If the action of the nervous system is irregular, or unduly heightened, the pulse becomes frequent and irregular. In case of mechanical obstructions to the circulation, as in dropsy of the pericardium, polypus in the heart or in the great arteries, the pulse is irregular and interrupted.

The study of the pulse began with the ancients. Galen wrote several works on it and for several centuries the subject of pulsation remained much as he left it. The demonstrations of the circulation of the blood by Harvey and of the irritability of the muscular fibre by Haller threw new light on it, and medical science at last has brought it under full investigation and has explained it in all its physiological aspects. See ARTERIES, DISEASES OF THE; HEART.

PULSE GLASS, an instrument invented by Franklin to exhibit the ebullition of liquids at low temperatures. The bulbs are connected by a slender stem and partially charged with water, the supernatant air having been expelled by boiling and the opening hermetically sealed by a blow-pipe. By grasping one of the bulbs the heat of the hand will cause the formation of vapor and drive the liquid into the other bulb, producing a violent ebullition in the latter.

PULSOMETER. See PUMPS AND PUMPING MACHINERY.

PULSZKY, pul'skē, **Franz Aurelius**, Hungarian archæologist and publicist: b. Eperies, 1814; d. Budapest, 1897. When only 22 he was nominated to membership in the Archæological Institute of Rome. Joining the Liberal party under Kossuth he was elected a deputy to the Hungarian Diet in 1840 and later under-secretary to the Hungarian Prince Esterhazy, Minister of Foreign Affairs in Vienna. He followed Kossuth to England and after the catastrophe of Villagos accompanied the ex-dictator to America. His impressions of this country were embodied in a book entitled 'White, Red, and Black.' Condemned to death by his country for treason, he lived in Italy and joined cause with the Garibaldians. The sentence was removed in 1866; in 1872 he became inspector-general of museums and public libraries. He wrote 'Philosophy of Hungarian History' (1882); 'My Life and Times'; and 'The Jacobins in Hungary' (1887).

PULTE, pult'ĕ, **Joseph Hippolyt**, American physician: b. Meschede, Westphalia, Germany, 6 Oct. 1811; d. Cincinnati, Ohio, 24 Feb. 1884. He took his M.D. at the University of Hamburg and in 1834 came to the United States where he engaged in practice at Cherrytown, Pa. He then adopted homœopathy and later established himself in practice at Cincinnati. With others he founded the American Institute of Homœopathy in New York in 1844; and in 1872 he was instrumental in establishing a homœopathic college in Cincinnati, where he held the chair of clinical medicine. He also held that chair at the Homœopathic College at Cleveland in 1852 and of obstetrics in 1853–55. He edited the *American Magazine of Homœopathy and Hydropathy* in 1852–54 and the *Quarterly Homœopathic Magazine* in 1854. Author of 'The Homœopathic Domestic Physician' (1850); 'A Reply to Dr. Metcalf' (1851); 'The Science of Medicine' (1852), etc.

PULTENEY, pŭlt'nĭ, **William**, EARL OF BATH, English politician: b. London, 22 March 1684; d. there, 7 July 1764. He was educated at Oxford, and in 1705 entered Parliament. He was a partisan of Walpole, and after the accession of George I was made privy councillor and secretary of war, 1714–17. In 1725 he became a political opponent of Walpole, gained great popularity by his crusade against his former friend, and when Walpole was forced from the ministry in 1742 Pulteney organized under the Earl of Wilmington a new ministry. The public was disappointed in the cabinet, and his acceptance of a peerage further destroyed his popularity. As member of the House of Lords he was not prominent, and when appointed premier in 1746 he held office but two days, being unable to form a cabinet.

PULTOWA, pool'tŏlvä, or **POLTAVA**, Ukraine, (1) capital of a former Russian government; on the Vorskla River, 450 miles southwest of Moscow. It is walled and defended by a citadel on a small eminence. It is the commercial centre of a large farm and stock-raising region. The annual fairs, three in number, are of less importance than in former years. Here in 1709 Peter the Great defeated the Swedes under Charles XII. A monument in the principal square commemorates the event; and three miles from the town is the tomb of those who fell in this battle; it is still called the Swedish tomb. Pop. about 85,000. (2) The government is bounded on the north by Tchernigov, on the east by Kharkov, on the south by Ekaterinoslav, and on the west by Kiev; area, 19,265 square miles. The surface is a plain sloping from the northeast to the southwest, and drained chiefly by the Dnieper and its tributaries. It is one of the most fertile and best cultivated departments of Russia; it exports about one-fourth of the whole produce of wheat, oats and barley of the whole country. Tobacco is increasing in acreage. Stockraising and bee-keeping are given much attention. Manufacturing is limited; the chief products are leather, coarse woolen goods, brandy and saltpeter. Oil is made from the seed of the sunflower and of flax. Pop. about 3,000,000.

PULTUSK, pool'toosk, Russian Poland, town in the government of Lomza, on the Narev, about 32 miles north by east of Warsaw. It has several old buildings of historic interest, some manufactories and considerable trade. It is noted as the scene of the defeat of the Saxons by Charles XII, in 1703, and of the Russians by the French in 1806. Pop. est. 16,000.

PULU, a substance resembling fine silk, of a rich brown color and satin lustre, used largely as a styptic by the medical practitioners of Holland, and introduced into some other countries for the same purpose. It consists of the fine hairs from the stipes of one or more species of tree-fern, referable, to the genus *Cibotium*. It was exported from Hawaii into Britain first in 1844, under the name Pulu, or vegetable silk, and was proposed as a substitute for silk in the manufacture of hats, but could not be applied. In 1856 it was exported from Singapore under the Malay names Penghawar Djambi and Pakoe Kidang, and was said to have been used in Dutch pharmacy for a long period as a styptic. Several importations into western Europe have since taken place.

PULVERMACHER-CHAIN, a form of galvanic battery consisting of a series of small wooden cylinders on which a zinc and a copper wire are coiled side by side, but without touching each other: the zinc of one cylinder, touching the copper of the adjacent one, forms a couple. The whole is immersed in vinegar diluted with water. A chain of 120 couples forms a very powerful battery.

PUMA, or **MOUNTAIN LION.** See COUGAR.

PUMICE, a variety of lava of a porous and fibrous structure, resembling that of a sponge in appearance, containing from 60 to 75 per cent of silica, with alumina, iron, lime, soda, etc. It varies in color from whitish-gray to yellowish-brown and will float in water. It is essentially lava from which steam or gas has escaped in large quantities while it was being consolidated, the bubbles rendering it highly porous. It results from explosive volcanic eruptions. Its extreme roughness fits it for use in polishing. In the solid state it is used to polish paint, wood, metal, etc.; and, as a powder, for marble, ivory, bone, glass, and in the composition ot tooth-powder. Pumice may be considered because of its glassy composition as a porous variety of obsidian (q.v.). Pumice is obtained in Mexico, Iceland and Hungary, but chiefly from the Lipari Islands.

PUMPELLY, Raphael, American geologist: b. Owego, N. Y., 8 Sept. 1837. He was educated at the Owego Academy, and later studied sciences and mining engineering in Paris and at Freiberg, Saxony. He made geological investigations in Corsica, and after his return to the United States in 1860 visited Arizona, and in 1861–63 was engaged in scientific explorations under the government of Japan. In 1863–64 he made a private investigation tour through central, western and northern China and Mongolia, and in 1864 engaged under the Chinese government in examining the northern coal fields. In 1866–73 he was professor of mining at Harvard, State geologist for Michigan in 1869–71, and in 1871–73 directed the State geological survey of Missouri. He was appointed to the United States geological survey in 1879–81, 1884–91, in charge of the Archæan division, and was organizer and director of the Northern Transcontinental Survey in 1881–84. The development of the iron ore industry in Michigan and western Ontario was largely due to his investigations in 1867–1901. In 1903 he explored the Transcaspian country. He has published 'Geological Researches in China, Mongolia and Japan' (1866); 'Iron Ores and Coal Fields of Missouri' (1873); 'Geology of the Green Mountains' (1894); 'Explorations in Central Asia' (1905); 'Prehistoric Civilization of Anan' (1908), etc.

PUMPERNICKEL, a coarse brown bread, originally made in Germany from unbolted rye. It is baked in large square loaves. Its proper manufacture depends upon the treatment of the dough, which must contain neither yeast nor leaven, and also on the management of the oven in which the batch must remain a long time.

PUMPKIN, any of the several annual vine-like herbs, especially *Cucurbita pepo,* of the order *Cucurbitaceæ,* probably of tropical America, but not known in a wild state. It is a coarse tendril-bearing vine frequently exceeding 20 feet in length, with prickly stems and leaf stalks; bears large rough leaves; large yellow flowers, the pistillate being followed by large variously colored but generally yellow fruits, with hard rinds, thick flesh and many seeds. The plant is widely cultivated in warm and temperate countries for its fruits, which range in weight from 10 to 40 pounds but in some varieties weigh far more. They are largely used for stock feeding and for making pies. The cultivation is essentially the same as for squashes; but in America the plants are most frequently grown in corn fields, the seeds being sown at intervals of about 12 feet and the plants allowed to shift for themselves after the corn is laid by. It is affected by the same insect-enemies as the squash (q.v.).
