out so clearly that we imagine even the "fuel gas enthusiasts" of the ultra type will pause in their maunderings, when confronted by the Chollar law of reason. Great praise should be given to Egner for his paper "On the Abuse of the Patent System, as Bearing on the Gas Industry, with a Remedy." It was certain that he would be entertaining; it is also certain that he was instructive. The literary portion of the proceedings so far has been of a remarkably high order, and the direction of business has been of the firm style. Faben never lost his grip of the details. Over our joy one dark cloud constantly hovers, and that is the tempering sadness of the knowledge that he in whose hands the reins of power were placed a year ago is with us only in spirit to-day. The lamented King, however, still rules his subjects through the sway of memory; and all are faithful to the man whose impress on their craft was made with cleverness and without blot.

Those who planned the exhibition of gas appliances have received the greatest award that could be meted to them. The display is simply magnificent, both in plan and scope. I have no doubt that this exhibition will be worth (to the gas companies who have representatives in attendance at this meeting) thousands of dollars. So many valuable hints can be gleaned from inspecting the apparatus on display that it is impossible to go over it and not determine how the day gas consumption of any locality can be increased. I repeat it, the exhibition alone would make memorable the Thirteenth Annual of the Western Association. I shall send you some account of the second day's proceedings on Thursday evening.—*.*

ST. LOUIS, MO., May 22, 1890.

Here we are at the termination of the regular business sessions of the Association, and if I must confess it, just a trifle eager for the order to take up our part in the outing arranged for us by our hosts. In the hurry and confusion of the moment—a confusion, however, that is more pleasing than if straight-laced order prevailed—it is not the most simple task in the world to put down off-hand that which one wants to say respecting events that, though completed in fact, are yet transpiring in fancy. One who is not far from the table at which I write suggests it is a pity the mind cannot occasionally play a snap-shot trick, after the fashion of the followers of the Kodak—that is, "take things in" so that they shall remain "fixed." However, let me say that the proceedings of the second day were like unto those of the first—valuable, instructive and entertaining. To that summary of their worth I may add that the following officers were chosen:

President—Frederic Egner.

Vice-President—E. G. Cowdery.

Second Vice-President—B. E. Chollar.

Secretary—A. W. Littleton.

There; could that list be beaten? Hardly. Louisville, Ky., has been chosen as the next place of meeting, and Barret will probably insist that it is a case of "After the cyclone, a deluge." I would send you more, only the carriage waits.—*.*

BRIEFLY TOLD.

A BAD VERDICT.—Under the circumstances, however, we presume it would be almost an impossibility to secure a verdict that would embody justice. In our item columns will be found an account of a suit, and its unjust preliminary termination, brought by Mrs. Harriet A. Schwab, of Jersey City, N. J., against the United Gas Improvement Company, which, through lease or otherwise, is in control of the gas supply of that city. Complainant, who was a teacher of music, which is fairly good proof that she is a refined and intelligent woman, occupied a house which either was or had been lighted by gas supplied from the mains of defendant. It seems that a joint in the service pipe close to the rising pipe had in course of time become defective, permitting the gas to escape. Plaintiff, it seems, notified defendant of the defective condition of the service (but one notification was made), the notification, as we understand it, having been made about noon of a certain day. Defendant agreed to attend to the matter, but its agents not having arrived by evening of that day, plaintiff repaired to the point where the gas was escaping, and, to assist in a speedy discovery of the exact spot from where the gas was issuing, lighted a match—with the usual result. An explosion ensued, and plaintiff, as the result of her folly, was badly burned about the face, breast, and hands. Subsequently she sued the Company for damages in the sum of \$20,000, and the jury that had the case awarded her the sum of \$6,000. Now, in view of the plain facts—which are substantially as reported above—brought out in the trial of the case, we fail to comprehend the justice of this verdict; that is, if there is any saving merit in the submission of proof of contributory negligence, which proof seems best afforded in the very testimony of plaintiff her-

self. The Judge (Mr. Dixon) charged that the "jury must determine, before awarding damages to plaintiff, whether or not it was careless on her part to light a match in a place where the smell of the escaping gas was so strong, and whether a reasonably prudent person would have done so." His Honor then plainly charged that if she had committed an act of carelessness like this it would prove contributory negligence, which would debar her from recovery of damages. Well, what are the facts in this respect? The woman is a music teacher, and is intelligent and refined. Therefore she must have knowledge that gas and air form a most dangerously explosive compound; and she certainly must have read of a great many cases in which persons, under circumstances identical to those that then prevailed about her, were seriously injured. Does she treasure that knowledge and use it for her protection? No; simple curiosity prompts her to attempt to locate the leak. And in what respect could this knowledge benefit her? We fail to see; but we can and do understand how it could do her positive harm, even without the "aid" of the match. Might she not have been overpowered by the fumes of the gas, and thus suffer bodily ailment? Look at it in what way you will her contributory negligence is clearly proved, but the jury, swayed by sympathy, intensified by a desire to mulct a corporation, disregards law and reason and "mulcts the corporation." This case affords a good example of the necessity of extending the range of actions that should be decided by judges and not by juries. In the meantime we are not blind to the fact that the Company's agents might have acted with greater celerity. The policy of *festina lente* will not do when gas escapes are to be checked.

NOTES.—At the annual meeting of the Farmington (N. H.) Gas Company the following officers were elected: President, Hon. J. F. Cloutman; Vice-President, Edwin Wallace; Clerk, Hon. E. T. Wilson; Treasurer, Hon. C. W. Talpey.—A Halifax (Nova Scotia) alderman, who recently changed the system of lighting his house from gas to incandescent electric lamps, having been notified by the Gas Company that if he did not consume 3,000 cubic feet of gas per quarter his gas meter would be removed, unless he agreed to pay a rental of 50 cents per month for the instrument, threatens to bring suit against the Company. The latter would like nothing better.—The employees of the Wheeling (W. Va.) city gas works demand that 8 hours be fixed upon as the limit for a day's work. If the demand is acceded to it will put an additional expense on the system of not less than \$12,000 per annum.—At the stockholders meeting of the Ogden (Utah) Gas Light and Fuel Company the following officers were elected: D. F. Walker, Sr., President; V. M. C. Silva, Vice-President; Wm. Gill Mills, D. F. Walker, Jr., and John Kempf, Directors. The Company is in prosperous condition.—Mr. W. H. Snyder, who had acted for some time as Superintendent of the United Gas Improvement Company's properties in Paterson, N. J., died at his home in Topeka, Kansas, on the 15th inst.—At the annual meeting of the Montclair Gas and Water Company, Bloomfield, N. J., the following officers were elected: President, Dr. J. H. H. Love; Vice-President, M. M. Dodd; Secretary and Treasurer, W. H. Baldwin; Directors, Eugene Vanderpool, Mathias Plum, S. W. Carey, A. B. Howe and T. W. Langstroth.

THE following is the result of the election for officers at the annual meeting of the Macon (Ga.) Gas Light and Water Company: President, W. J. Goite, of Philadelphia; Vice-President, A. E. Boardman, Macon; Treasurer, Geo. F. Work, Philadelphia; Secretary, J. B. Hall, Macon; Superintendent, J. W. Wilcox, Macon.

The Market for Gas Securities.

The city market for gas shares showed a great deal of animation during the week, and transactions were on a large scale. Consolidated went above 107, and then sagged off on sales for realization. To-day (Friday) it opened at 104 to 104½, and the tone appeared to be weak. It is not at all improbable that an increase in the dividend rate will be made, and there is no doubt whatever that the Company's earnings are quite well in advance of even a 6 per cent. disbursement. It is somewhat amusing now to note the avidity with which the daily newspapers are advising the purchase of gas stocks, and the maunderings of the *Times*, in particular, are interesting. Two years ago that "authority" was all in favor of shares in the electrical companies. Our readers have no reason to find fault with our advice, which was given at a time when they could make money by following it. Brooklyn shares show no change, although the tone of the market is not as buoyant as it was some time ago. Chicago gas has been seen sawing a bit during the week, and is to day at 62½. We think it is high enough just now. Consolidated, of Baltimore, is steady to strong, at 52 to 52½, and there ought to be money in it at these figures, even without "State protection." Laclede common is weaker, while the preferred shows to the contrary. Bay State common is strong at 84. California gas shares are about as before.

Gas Burners For Illuminating Purposes.

The *London Journal*, in discussing this subject says: A prominent American Gas Manager who recently visited this country, and of course extended his peregrinations to the Continent, was heard to remark, with special references to burners and other appliances for the utilization of gas, that there was nothing new in the market. We believe that this verdict is in the main correct. There has been a fair amount of effort resulting in new developments in gas engineering, as we have lately had occasion to recognize; but consumer's apparatus has made little or no advance for several years. In the lighting branch, it is evident that if a comprehensive gas appliances exhibition were to be held this year, it would present hardly anything that could, by the greatest stretch of courtesy, be deemed a novelty. The great class of common open burners, whereby the mass of gas consumers obtain their light, remain absolutely without change, as it has done for these last ten years and more. It would appear as though invention can do no more for these humble yet most useful productions; and that, like the billhook of the Saxon churl, the union jet and the batwing burner have reached their utmost development, which they will keep for the remainder of time. If we turn to the more specialized and differentiated patterns of gas burners, in which (to follow Spencer) change will be more likely than in elementary forms, it is difficult to mark any notable advance. The principle of heat recuperation for the enhancement of the luminous brilliancy has been worked out with tolerable completeness by Mr. Frederick Siemens and his followers and rivals, several of whom appear to have a better appreciation of the requirements of the market than their prototype. There has been much refinement of detail and improvement of pattern in the modern competitive production of recuperative gas lamps; but it would be next to impossible to discriminate in print between the different makes, with a view to distinguishing the best. Some makers aim only at cheapness; others cultivate taste. Others again profess to observe efficiency and economy in use. Infinitesimal divergencies of construction are exaggerated by rival makers into important differences; but, fortunately for themselves, these competitors seem to be wholesomely afraid of taking their conflicting claims into Court. The history of gas burner patents' litigation is not encouraging to a trader who might otherwise be disposed to shift the scene of his struggle with a rival from the shopcounter to the Law Courts. So far as can be determined by a spectator, the competition between makers of the most improved forms of recuperative gas lamps, although keen enough, is conducted on commercial grounds alone. Whether there is much to choose between them, is not for us to say. Suffice it to acknowledge with satisfaction, out of regard to the general interest of the gas industry, that consumers have now at command a considerable choice of really scientifically made and truly efficient gas lamps, such as could not have been bought at any price only ten years ago.

Assuming, however, that the adoption of the regenerative principle for gas lamps has led to a great advance in their construction, which has been of vast benefit both to the industry and to the community, it must still be somewhat disappointing that, to all intents and purposes, a halt has been so soon called in the development of this class of lamps. The huge furnaces consuming 50 cubic feet of gas per hour and upwards, which were common enough on offer when the first makers of these lamps essayed to compete with electric arc lamps, have disappeared. Very few of such gas lamps now in active service take upwards of 20 cubic feet per hour; while the great majority in ordinary use are only half as large as this, or are even smaller. This change is in correspondence with the falling popularity of the electric arc itself, which is now perceived to be unmanageably powerful. It has been found that what the majority of consumers wanted for their warehouses, shops, etc., was an improvement on the amount and quality of the light obtainable from their ordinary gas burners, and not such a radical change of system in lighting as would have been entailed by the general introduction of light centres comparable to the electric arc in intensity. This improvement has been effected by the recuperative gas lamp of moderate power, and by the albo-carbon system of carbureting, which is the only thing of the kind that has really become established in public favor. Hence we see to day, in passing through a street of a good class in any British town, few shops which are not rendered more brilliant and attractive by one or other of these methods of improved gas lighting. The white flame of albo-carbon burners seems to be peculiarly effective for shop windows in which cloths and similarly non-reflecting goods are displayed. A tailor's shop is as difficult to render cheerful as a photometer room; and for the same reason. It is necessary therefore that the means of lighting should be placed in close proximity to the cloth which it is intended to exhibit; and nothing surpasses the albo-carbon burner for

this purpose. Regenerative lamps must be placed overhead and well out of the line of sight.

It is evident, without dissertation on the point, that the great gulf between the cheap and open flat flame burner—and even the refined Argand—and the close, costly recuperative burner is as wide as ever. Even if everybody could afford recuperative lamps, there are many purposes for which they are not so suitable as the less efficient form. The Argand, beloved writers and readers, may sometimes be replaced by the ceiling lamp, or the suspended regenerative lamp of small power; but the radiated heat of the latter is a distinct drawback. It is the increased heat in and surrounding the closed regenerative flame which makes it so much more brilliant than an open burner; but, although the average consumer may be made to believe this, he will none the less complain that the lamp does not keep its excessive heat to itself instead of pouring it on his head. The heat of a gas flame used for lighting an apartment is the same whether the gas is burnt in a lamp glass or in the open. But in the latter case much is taken off by convection, and sent up towards the ceiling, which the regenerative lamp converts into radiant heat that strikes the nearest solid object, whether it be the consumer's head or his walls and furniture. In fact, the regenerative gas burner is the best of all known gas heating stoves. We do not, however, want a stove for warming our heads, even though it sends light to our eyes.

The only practicable kind of gas burners—the incandescent varieties—do not enter largely into the general question. It cannot be argued that they have justified the expectations indulged of them by some people, although it would be too harsh to say that the idea has proved a failure. The difficulty with this order of gas burners is of two kinds. In the first place, it is to supply a material solid and bulky enough to give a good light when strongly heated; and at the same time to present it to the gas flame in such a tenuous or comminuted state that it will readily become white-hot. According to the generally accepted theory of the luminosity of flames—which ascribes this phenomenon to the presence in the highly heated gas of a vast number of particles of solid carbon—anything to surpass this carbon in facility of becoming heated, in fineness of division, and in radiant power when heated, must be hard to find. The makers of incandescent gas lamps profess, however, to have found this desiderated matter in the substances of which their “mantles,” or “combs,” or “meshes” are made. They are never so cheap as carbon, because carbon is one of the very cheapest of elements. In the ordinary way of burning coal gas, moreover, for illuminating purposes, the carbon which gives the light is supplied fresh as fast as required; whereas an extraneous radiant material has to serve for a longer or shorter time until worn out. Even the manufacturers admit that this material loses its efficiency in use, and sooner or later requires to be replaced. The precise point when this occurs is a cause for dissension between the manufacturers of these lamps and their customers; and upon it the whole question of the commercial efficiency of these systems turns. On the whole, we cannot accept as proved the contention that the laboratory efficiency of any incandescent burner, as tested with fresh radiating material, is maintained by its commercial durability.

Thus after passing in review the three orders of gas lighting burners—the open flame, the regenerative, and the incandescent—we cannot signalize any new departure in the utilization of gas for illuminating purposes later than the introduction of the two latter systems. Opinions may differ as to when this took place; and it is hardly worth while to attempt in this article to fix the exact time, which would be tantamount to an acknowledgment of the claims of some particular inventor. It is curious that a period of such activity in this respect as that which ushered in the last decade, should have been followed by such a pause. It is not that there has been indolence on the part of those who are identified with any of the recognized systems. Indeed, never since gas lighting came into vogue has the activity of burner makers been more conspicuous and more fruitful than during the last eight or ten years. The extent to which the knowledge of good and bad in regard to gas burners has been disseminated during this period, although by no means completely to the conviction of consumers, has been greatly in excess of previous years; and it is not too much to say that, in consequence, the average consumer now gets a great deal more for his money than did his predecessor of last generation, who perhaps paid twice as much as the present rates for his gas. Outside the established trade, however, there has been nothing doing for years. Siemens, Wenham, Welsbach, and Lewis were outsiders once. Are there never to be any more innovators, with fresh systems of gas burner construction? All that can be said in answer to this question is that it is a dull time at present, and has been so for some years. Yet, unless one is to accept the conclusion that the last word has been said respecting the best way to develop the illuminating power of gas, it follows that there must be plenty of room for the next inventor in this line, whoever he may be.

Cosh's Apparatus for the Manufacture of Gas.

On May 13th U. S. Letters Patent (No. 427,747) were granted to Wm. M. Cosh, of Baltimore, Md., for an improved process and apparatus for making gas. The current patent is supplementary to one issued March 26th, 1889, and numbered 400,060. The specification reads:

The invention consists of a special construction and arrangement of a generator and superheater or superheaters with their connecting pipes and valves, and also in the arrangement of steam, air and hydrocarbon supply pipes.

It consists, further, of special combination of the duplicate superheaters with the generator and with the connecting pipes and the hydrocarbon and steam supply pipes, whereby different processes can be carried on in the same apparatus, all as hereinafter explained.

In the accompanying drawings Fig. 1 represents the improved apparatus, partly in side elevation and partly in section, the view being from the front; Fig. 2 is a plan view of the same; Fig. 3 shows a rear elevation of the apparatus; Fig. 4 represents a side elevation of the apparatus.

The generator is represented at *A*. It is provided with a grate *M*, adapted to sustain the fuel, and underneath this grate is a space sufficient for the pipes hereinafter described. The generator is adapted to be used with coal, this being the preferred form of fuel and gas generating material; but the apparatus may be adapted to use any other equivalent material as a matter of course. The upper part of the generator is provided with a casting *F'*, which extends obliquely upward toward the front, and is provided with a cap *a*, with means for holding it in place. The opening in this oblique extension is designed for the admission of the fuel. The casting has also another extension *F*, projecting directly upward for connection with the top of the superheaters. This extension is closed at the top, excepting where it admits the lateral pipe of the heater, and it has two pipes *m m'*, extending down through the top, with coils in the lower part. The lower ends of these pipes terminate a suitable distance above the fire surface. The pipes are provided with cocks outside of the casting, and each pipe has also a steam pipe connection, marked respectively, *g g'* these being provided with suitable cocks. Through these pipes steam and hydrocarbon liquid or vapor are admitted and introduced into the top of the generator at a sufficient distance above the surface of the coal for a result hereinafter explained. Below the grate *M* is a pipe *f*, leading to a suitable source of air supply for the purpose of supplying blasts of air to the generator underneath the grate.

In rear of the generator and a little to each side are located chambers *B B'*, adapted to act either as fixing chambers or as superheaters. These are to be filled before using with fragments of brick, or of any other suitable refractory material having interstices through which steam will freely pass, or through which the products of combustion may be drawn, as the occasion in the use of the apparatus may require, as hereinafter explained. Underneath the chamber in which the firebrick fragments of refractory material are to be placed is a combustion chamber *h*. The top of this chamber has an opening upward and downward, with suitable covers, all as shown clearly in Fig. 1. There are passages from the combustion chamber in the base up to the superheating and fixing chamber above the base, and there is also an air supply *i*, which may be provided with a suitable valve (not shown) for supplying air regularly to the mouth in the combustion chamber. The combustion chambers are connected by pipes *C C'*, respectively with the space in the generator beneath the grate *M*, and these pipes are provided with valves *c c'*, for regulating the passage of the gases or cutting them off altogether. A horizontal pipe *E* from the upper part of the generator is connected with the vertical pipe *D*. The lower end of this pipe has horizontal branches (shown in Fig. 3) leading into the combustion chambers *h h*, and through these pipes *E D* and the branches communication is afforded from the top of the generator into the combustion chambers underneath the superheating and fixing chambers. The branches are provided with valves *b b'*, by means of which communication can be cut off between the upper part of the generator and either of the combustion chambers, while the valves *c c'* in the pipes *C C'* serve to cut off communication between the lower part of the generator and either of the combustion chambers. Another set of pipes connects the other superheaters and the generator with the wash-box *W*. Of these pipes *H* extends across from the top of one superheater to the top of the other, and at the latter point it connects with the pipe *H'*, which is turned to meet the pipe *G*. (Shown in Fig. 4.) The pipes *H H'* are shown in Fig. 2. The pipe *G* is on one side of the generator, and has connection with the top and bottom of the generator, and extends down into the bottom of the wash-box *W*. The pipes *H H'* have valves *d d'*, respectively, by means of which communication may be shut off between the upper parts of the superheaters, or

either of them, or the upper part of the generator and the wash-boxes. There are also valves *e e'* in the upper and lower extension of the pipe *G* above and below its junction with its pipe *H'*, which close these passages and may be used to shut off communication from either the upper or lower part of the generator. There are also valves *J J'* on outlet pipes in the bottom of the superheaters, which should be closed when the valves *d d'* are opened. These are the main elements of the apparatus by means of which the various circulations are kept up; but in addition to these there are also oil supply pipes and steam supply pipes, besides those which have been heretofore described in connection with the casing *F*. There are also two steam supply pipes, marked *k k'*, re-

spectively, with their valves, provided also with oil supply pipes *o o'*, also having valves and leading into the top of the superheaters *B B'*, also two steam supply pipes *s s'*, provided with valves and connected with oil supply pipes *R R'*, leading into the chamber of the superheaters *B B'*; also steam supply pipes *u u'*, provided with valves leading into the top of the pipes *C C'*, respectively.

The apparatus heretofore described is adapted to be used in accordance with several methods, slight and easy manipulations of these methods being productive of valuable results. The first of these methods is as follows: The generator is first charged with coal or its equivalent, this

being the material ordinarily used. The cover of the generator is secured in place, and during the first part of the operation the covers of the superheaters are removed.

In this method of use of the apparatus the blast is passed up through the mass of coal, thence to the bottom of superheaters and up through the superheaters. For this purpose the valves *b b'* are opened. The valves *c c'* in the other lower pipes, the valves *d d'* in the pipes leading from the upper part of the superheaters, the valves *e e'*, and the valves *J J'* are closed. The valve of the blast pipe *f* is open, and the air is admitted at the bottom of the generator and to the combustion chambers *h h'*. The blast under the coal in the generator brings it to the incandescent condition. The products of combustion arising from the upper surface of the coal pass down through the pipe *D* and through its lateral branches through the combustion chambers *h h'*. Carbonic oxide and

the unconsumed carbon in these products meet in the chambers *hh'* an additional supply of air and undergo complete combustion, the products of which rise up through the refractory material and bring this material to a high heat, while the coal within the generator is coming to a condition of thorough incandescence. When the coal has reached this condition, the covers of the superheaters (if both are used) are secured in place, and the air supply is cut off from the bottom of the superheaters and the bottom of the generator. Then the valves *dd'* in the upper outlet pipes of the superheaters are opened and steam is admitted at the bottom of the generator. This steam passes up through the body of incandescent coal, and by its decomposition hydrogen is set free, while the

oxygen unites with the carbon monoxide and a small percentage of carbon dioxide.

If it be desired to manufacture illuminating gas, naphtha or other hydrocarbon liquid is admitted to the top of the generator through pipes heretofore described, and is vaporized by heat. This vapor is taken up by hydrogen arising from the surface of the coal, and the whole mixture passes through the pipes *ED* and their connections into the bottom of the superheaters. The superheaters act upon this mixture as fixing chambers, and the gas passes over them to the wash box of the purifying chamber.

The construction of the apparatus is adapted to give still better results by another method of operation by which the quality of the gas is improved and a larger quantity obtained from the supply of coal. As in the method last referred to, the coal in the generator is brought to a proper incandescence, as heretofore explained. The blast from the pipe *f* is then shut off and the tops of the superheaters secured in place. The valves *bb'*, *dd'*, *NN'* and *JJ'* are closed. The valve *e* in the outlet pipe from the top of the generator and the valves *cc'* in the connecting pipes between the bottom of the generator and the bottom of the superheaters are opened. The steam is wholly shut off elsewhere, but is admitted to the top of the superheaters *BB'* through the pipes *kk'* and passes through the highly heated refractory material contained in the superheaters, where it is brought to a highly superheated and attenuated condition. It is then admitted through the pipes *CC'* into the bot-

tom of the generator, and in this dry and heated state steam is brought more readily into contact with the heated coal, and is more thoroughly decomposed. Hydrogen gas thus generated passes from the top of the generator through the opening at the valve *e*, thence down into the pipe *G*, and thence directly down into the wash box. If it be desired to have it take up hydrocarbon vapor in its passage, this vapor may be supplied by hydrocarbon pipes *t*, which, with the steam pipe *t'*, is located in the passage above the pipe *G*.

After this process has been continued for a time, the length of which may be easily determined by an operator skilled in the art to which the invention appertains, the point where the steam is admitted is changed. The valves *dd'*, *bb'*, *cc'*, and *e* are closed, and the valves *NN'* are opened, as is also *e'*. Steam is then admitted to the bottom of the superheater through the pipes *SS'*, and the steam is thus brought in its passage in contact with the first heated refractory material, which is in the bottom of the superheater, and is brought to a highly superheated and attenuated condition. In this condition it passes through the openings at the valves *NN'*, and thence through the connection in the casting *F'* into the upper part of the generator, where it comes in contact with a fresh surface of coal and passes downward through the mass, where it is decomposed as it expands. The resultant hydrocarbon gas passes through the valve *e'* at the bottom of the generator into the pipe *G*, and thence directly to the wash box.

If desirable, when the current is in one direction naphtha may be introduced at *RR'*, and in the other at *mm'*. In the manner above described the apparatus may be worked at a single heat repeatedly in opposite directions, the change in direction of the current being made as many times as desired; and if the supply of coal is exhausted it may be renewed and brought to a proper condition, as before explained. The apparatus is capable also of use in accordance with another method, which is specially adapted to the manufacture of illuminating gases. By this method, after the requisite heat has been obtained, as heretofore described, the valves *JJ' b d e e' c'* are closed, and the valves *cd' b'* are opened. Steam is admitted at the top of the superheaters *B*, and, passing down through the heated material therein to the bottom of the generator, enters through the pipe *C* in a superheated state. It then passes up through the incandescent coal and is converted into hydrogen gas. Rising from the coal in the top of the generator, it meets a hydrocarbon vapor from the coils in the casting *F*. This vapor is taken up by the hydrogen, and the whole then passes to the bottom of the superheater *B'* and as it ascends through the highly heated material therein it becomes thoroughly mixed and fixed, and then passes to the wash box. After the operation is continued in the manner above described for a sufficient length of time, which may be determined by an operator skilled in the art, the valves *n J'* are opened and the valves *d' b'* are closed. Steam and oil are admitted as before; but the gas resulting from the operation in other respects, as before described, passes through the valve *N'* into the top of the superheater *B'*, whereby the gas is brought into a fresh heating surface of the refractory material, passing down through the same and out at the valve *J'*, and through pipe (not shown) to wash box. It will also be apparent that the direction of the steam may be reversed in the above operation by closing the valves *J, J', d', b', e, e', and c*, and leaving *c', d* and *b* opened. Steam is then admitted at the top of the superheater *B'*, and passing downward, as before described, is superheated, and may be thence taken to the generator, where it is converted into hydrogen gas. The course of the steam may again be reversed by opening the valves *n' J* and closing *d* and *b*. The steam may also be made to pass downward through the coal and from *d' to b'* to the connecting pipes *CC'*, and steam pipes *ll'* on top of connecting pipes *CC'* are for the purpose of letting in a supply of steam to the hydrogen gas in case it should be hot enough to take up more steam and convert it into hydrogen.

Portable Photometer for Electric Lights.

The *Western Electrician*, in describing a portable photometer constructed by Queen & Co., of Philadelphia, says that to meet the demand created by the rapid adoption of the electric light for town and city lighting, and consequent necessity of making frequent tests for the purpose of conforming to certain standard conditions, the form of Bunsen photometer, shown in the cut, has been designed. The instrument is made especially for street work. The photometer is well made and exceedingly compact. It is 5½ inches square in cross section, and 38 inches in length, and is made of polished cherry. The lantern, as shown in the cut, slips into one end of the box, where it is firmly held; a small adjustable holder carries the standard light, which may be either one or two standard candles. This adjustment regulates the heights at which

the flame stands, and also its distance from the screen; by making this latter distance exactly one foot, computation is greatly facilitated. Distances are measured by a graduated bar which slides in grooves along the side of the box. To allow for the difference in vision between the right and the left eye, the instrument is made reversible—*i. e.*, it may be turned completely over, so that the right eye observes the side of the disc before observed by the left, and *vice versa*.

When not in use the lantern chimney slips out and can be placed inside the lantern itself. The entire lantern box may be pushed inside the photometer, and the two ends and the sight hole of the instrument may be covered with small slides. A brass handle on one side makes it possible to carry the instrument as easily as a small hand bag. If desirable, a small incandescent lamp may be used as a standard instead of the candles. The range of the instrument is from about 4 candle power up. It has already been very successfully used in several tests involving expert opinions.

The Poetsch System of Excavating.

By Mr. E. L. ABBOTT.

A series of vertical pipes are put down into the rock, or into material impervious to water. These pipes are arranged around the space in which the excavation is to be made, and are closed at the lower ends. There is in each an inner pipe open at its lower end and extending nearly to the bottom of the outer.

Through these pipes a cold fluid is circulated by means of a pump; this absorbs the heat from the surrounding earth and freezes it as hard as sandstone rock, most effectually cutting off the water. Then the excavation can be readily made without any trouble from water or flowing ground. Quicksand, when deprived of its water, is an easily worked material. The best arrangement of pipes is in a circular form, so that the frozen wall will be arched against the pressure. The practice has been to use pipes 8 inches in diameter and about 3 feet apart. The crushing strength of frozen quicksand has been determined to be from 700 to 1,000 pounds per square inch. The pressure from without, due to the weight of quicksand, cannot be known closely, as the mobility of the material is not known in advance. The assumption can be made that the pressure will be somewhere between that due to the weight of the water and the weight of sand and water combined, considered as a fluid. For safety the latter assumption should be made.

Experiments are yet lacking and needed to show what is the actual heat conducting capacity of saturated soils. It is known that there is generally a current of water percolating and flowing through ground saturated with water; this current keeps taking away the cold from the

pipes, and an excess must be constantly supplied, and the circulation of cold brine kept up throughout the time that the frozen wall is needed.

Refrigerating machines of the common types depend upon the principle, that when a gas is compressed its temperature rises, and conversely when it is allowed to expand its temperature falls.

Ammonia is found to be the most economical gas to operate with on account of its high specific heat.

There are several types of machines. In the compression type the ammonia is compressed mechanically, and in the absorption type it is compressed by the tension of its own vapor heated in a still, which still communicates with a coil of pipes immersed in cool, fresh water, which gives a fluid cooled to approximately the temperature of the cooling water, say, 60° F., while remaining at the pressure of the gas within the still.

In either type of machine the compressed gas is cooled in the same way, and is then allowed to expand through other coils, when its temperature immediately falls to a point far below zero. This gives the refrigerating effect of the machine, and the very cold gas may be circulated directly where the cooling is desired, or may be made to cool brine, which is more convenient to use as the circulating medium.

The actual efficiency of refrigerating machinery, as now made, and working between the limits usual in practice, is not over 25 per cent. of the energy applied.

The mechanical equivalent of changing the temperature of a pound of water one degree is 772 foot pounds, or one horse power per day of 24 hours is equivalent to changing 61,554 pounds of water 1° F. Taking a pound of water at 60° F., there are required 28 thermal units to reduce it to the freezing point, and then 142 more to freeze it, or 170 thermal units in all. Theoretically, then, one horse power per day would freeze 362 pounds.

In quicksand, where only a fraction is water, and the remainder having a specific heat of only one-fifth as much as water, the same refrigerating effect which would freeze a cubic yard of water will freeze, say, 2½ cubic yards of quicksand.

The first application of the process in this country was at Iron Mountain, Mich., where a shaft 15 feet square was sunk about 100 feet to the rock ledge through water-bearing strata. The site is a valley filled with glacial drift. The shaft is for pumping and hoisting from the Chapin mine, the owners being the largest producers of Bessemer ore in the Menominee district. Twenty-seven 8-inch freezing pipes were arranged in a circle of 29 feet diameter. An ammonia ice machine of the compression type was used, its capacity being 25 tons of ice, or 50 tons refrigerating capacity per day. The wall was frozen and the excavation made to the ledge in 2½ months from the time the ice machine first started. On starting the machine the earth commenced to freeze in the form of cylinders surrounding each pipe. In 10 days these cylinders were in contact, forming the frozen walls. From that time the freezing advanced within much faster than without the circle, for the reason that no heat could be conducted to the center by the surrounding mass, and also the currents, or percolations, of water through the sand could no longer warm the earth within the circle.

The unfrozen center became narrower as the excavation proceeded, requiring much difficult labor in loosening the frozen material. It was not considered wise to discontinue freezing, as trouble was anticipated at the ledge on account of springs or leaks coming in through the rock, and later developments justified this idea. Those strata of earth containing much water were frozen to much less distance than those containing little water.

Boulders were met with at different points. They were so firmly imbedded in the frozen mass that they had to be broken in pieces in order to remove them. It is proposed in the future to put in thawing pipes as well as freezing pipes, in order to thaw any excess of frozen material to facilitate excavation. When the excavation was approaching the ledge it became evident there was a leak, either in the ice wall or through the rock. There was an inflow of water requiring frequent bailing to keep it clear. About the time the rock was reached the leak had thawed a channel at the rock line so as to allow such a stream of sand and water to enter as to necessitate flooding the mine until the leak could be frozen off; but on pumping out the water other springs through the seamed and shaly rock showed themselves, and it was necessary to lay freezing pipes against the surface of the ledge and again flood the shaft and freeze a considerable part of the rock surface itself before the excavation into the sound rock could be completed and the timbering built in. This trouble would probably have been avoided if the freezing pipes had gone a few feet into the rock instead of only to it. In the case of a shaft now being built at Wyoming, Pa., the pipes are sunk 6 feet into the rock. In putting the pipes down it is of great importance that they be truly

vertical, so there will be no wide spaces between pipes at the ledge, where there is the greatest necessity for a perfect wall; also, the pipes must be absolutely tight, or the circulating brine will escape, and as it cannot be frozen it will keep the earth thawed near the leak.

In order to sink a pipe it must, of course, be open at the bottom, as various tools must be worked inside of it. A perfect closure of the bottom then cannot be made, therefore in practice a 10-inch casing pipe is put down the required depth, and then an 8 inch freezing pipe is placed inside, having its bottom perfectly closed by welding. The circulating fluid from the ice machine is a brine made with calcium chloride, which has the advantage of a very low freezing point together with a high specific heat, and also is nearly neutral in its character and does not corrode the iron pipes. It is circulated by pumping down an inner pipe and returning by way of the main freezing tank to be again cooled. The best results are obtained from such a rate of circulation that there is but little difference in temperature between the outgoing and incoming brine. A very efficient temperature for the outgoing brine is 10° below zero, F., and pumped at such a rate that the return flow is 2° higher.

The capacity of an ice machine varies as the temperature at which it is made to work. Its theoretical efficiency will be very much greater when worked at 20° above zero than when worked at 20° below, but at the extreme low temperature the conduction of the cold from the pipes through the earth is greater, so there must be a compromise made between theoretical efficiency of the machine and actual conducting efficiency of the ground. Sufficient experience has not been obtained to give a close idea of what this temperature should be.

Of all kinds of work for which the skill of the engineer is called into requisition, that of making excavations in earth, where a head of water is to be resisted, is conceded to be the most troublesome.

The name quicksand is given to any earth which, when mixed with water, will in some degree run like a fluid. Almost any sand, when mixed with a small amount of clay, will exhibit this faculty. The most troublesome kind has but a small percentage of sand and that very fine; the material being principally disintegrated soft rock. When rubbed between the fingers scarcely any grit can be felt. This material, when undisturbed, may have some consistency, but when once broken will flow with water through any minute opening. Its particles are so small and their specific gravity so light that they will float in the current of water to any distance, so long as the velocity of the water is kept up.

In excavations in running ground the great difficulty is not so much in keeping the water out as in preventing damage from quicksand shifting in its bed, which is likely when water is pumped from the excavation, as it destroys the equilibrium of the mass. In the case of deep excavation, like shaft work, it will bring an unequal or bending pressure on the walls of the shaft, which destroys its alignment or ruptures the shaft entirely.

In the development of the resources of any country, it is obvious that the nearest and most easily worked deposits will be opened up first, and similarly in all constructions for first internal improvements, easy and temporary expedients will be recommended as giving immediate results. That period of construction has already passed in this country.

The freezing process comes in its proper time to assist in some work urgently needed.

Deeper and better foundations are needed for bridges which will cross the great alluvial rivers, as the lower Mississippi. Tunnels are required under rivers where the importance of navigation must prohibit bridges, as across the Hudson at New York. The development of a good portion of the anthracite coal fields of Pennsylvania is yet to be accomplished, which the overlying quicksand has, until now, prevented.

In the kinds of work mentioned, the pneumatic process has been very valuable, but the depth at which it can well be used without causing loss of life or health is not great, and the freezing process is the only reliable method of penetrating water-bearing earth to the depths to which it is necessary to go to carry out many great works which the further development of our resources and commerce now demand.

Carcass Roofing.

By Mr. J. ROBINSON.

In small buildings all the rafters are of one kind; but in great buildings the whole weight of the covering is made to rest on a few principal rafters, which are connected by beams placed horizontally, and either mortised into them or scarfed on them. These are called purlins. Small rafters are laid from purlin to purlin, and on these the laths for tiles or the skirting boards for slates are nailed. Thus the covering does not immediately rest on the principal frames. This allows some more liberty in their construction, because the garrets can be so divided that

the principal rafters shall be in the partitions, and the rest left unencumbered. This construction is so far analogous to that of floors which are constructed with girders, binding and bridging joists. It may appear presuming in us to question the propriety of this practice. There are situations in which it is unavoidable, as in the roofs of churches, which can be allowed to rest on some pillars. In other situations, where partition walls intervene at a distance not too great for a stout purlin, no principal rafters are necessary, and the whole may be roofed with short rafters of very slender scantling. But in a great uniform roof, which has no intermediate supports, it requires at least some reasons for preferring this method of carcass roofing to the simple method of making all the rafters alike. The method of carcass roofing requires the selection of the greatest logs of timber, which are seldom of equal strength and soundness with thinner rafters. In these the outside planks can be taken off, and the best part alone worked up. It also exposes to all the defects of workmanship in the mortising of purlins, and the weakening of the rafters by this very mortising; and it brings an additional load of purlins and short rafters.

A roof thus constructed may surely be compared with a floor of similar construction. Here there is not a shadow of doubt that if the girders were sawed into planks, and these planks laid as joists sufficiently near for carrying the flooring boards, they will have the same strength as before, except so much as is taken out of the timber by the saw. This will not amount to one tenth part of the timber in the binding, bridging, and ceiling joists, which are an additional load, and all the mortises and other joinings are so many diminutions of the strength of the girders; and as no part of a carpenter's work requires more skill and accuracy of execution, we are exposed to many chances of imperfection. But, not to rest on these considerations, however reasonable they may appear, we shall relate an experiment made by one on whose judgment and exactness we can depend. Two models of floors were made, 18 inches square, of the finest uniform deal, which had been long seasoned. The one consisted of simple joists, and the other was framed with girders, binding, bridging, and ceiling joists. The plain joists of the one contained the same quantity of timber with the girders alone of the other, and both were made by a most accurate workman. They were placed in wooden trunks 18 inches square within, and rested on a strong projection on the inside. Small shot were gradually poured in upon the floors, so as to spread uniformly over them. The plain joisted floor broke down with 487 pounds, and the carcass floor with 327. The first broke without giving any warning, and the other gave a violent crack when 294 pounds had been poured in. A trial had been made before, and the loads were 341 and 482; but the models having been made by a less accurate hand, it was not thought a fair specimen of the strength which might be given to a carcass floor. The only argument of weight which we can recollect in favor of the compound construction of roofs is that the plain method would prodigiously increase the quantity of work, would admit nothing but long timber, which would greatly add to the expense, and would make the garrets a mere thicket of planks. We admit this in its full force; but we continue to be of the opinion that plain roofs are greatly superior in point of strength, and therefore should be adopted in cases where the main difficulty is to insure this necessary circumstance.

Dangers of Gas and Geyser Baths.

[Read by Mr. Arthur F. Chapple, before the Balloon Society of Great Britain.]

In asking for your indulgence and forbearance during the very few observations that I have the pleasure of addressing to you this evening, I may state that I am not going to attempt to deal with this subject in a scientific manner, for the simple reason that it is closely allied to chemistry and gas engineering, neither of which fields includes me as a student; but my object is, from my own sad experience and the experience of others, to raise some interest in the matter that shall eventuate through the able co-operation of the press, and those who have to do with the framing of our laws, in bringing about some enactment that shall enforce on all makers of gas apparatus (especially such contrivances as gas and geyser baths) the obligation of not issuing these machines to the public without certain safeguards, so as to avoid such dire calamities as those with which it has been my misfortune to be made familiar.

I regret for some reasons that you have not one here in my place to entertain you with some scientific or other matter of general interest, such as you have so often discussed in this room. In the place of that you have before you a member of only a week old, who having lately heard of several sad fatalities due to gas and geyser baths that happened

prior to his own great loss, and as many as two since last September, feels that he may venture to accept the kind invitation of your President to lay these few remarks on this special subject before you for your consideration, and in doing so I will ask you to regard it more as a text or of a peg on which to hang your consideration and discussion rather than that you should expect at my hands anything like an exhaustive treatment of the subject of this little paper which I have only very hastily prepared.

I have said that I regret the subject is not one of more general interest, for the number of persons using gas and geyser baths is, of course, comparatively small, though the number of itself is very large. I feel, therefore, that I can claim *some* interest at your hands inasmuch as the matter involves the safety of human life, but the possibility of death resulting from any act of our everyday life is not generally a welcome subject, and I suppose no question so keenly arouses general interest as those which affect the pocket! Only start a question of £ s. d., and you are sure of the popularity of your subject, or raise some cry against law and order, or allege some grievance, real or imaginary, and Hyde Park itself will be required to hold your audience.

I take it for granted that all present know something of the construction of gas and geyser baths, but as I have lately met with some who do not quite understand the difference between them, I will very briefly explain, for the benefit of any such, that a gas bath is an ordinary bath, heated by a series of burners underneath it, the water in the bath gradually increasing in temperature until it attains the required heat. A geyser bath, on the contrary, is an ordinary bath, with a geyser affixed to it, the geyser being a kind of urn and generally standing on the edge of the bath, and into which the cold water from the main runs over plates heated by a series of gas burners, which are contained in itself, and then runs out at the other side into the bath at a given uniform heat.

Without further preface I will now give you the benefit of my sad experience, in the hope that should it ever be your lot to have to do with gas or geyser baths, you will at least be forewarned. Had I been so forewarned by the experience of my predecessors in this direction, the probability is that my family would have been spared the affliction of losing, in his 21st year, one of the finest and noblest of sons, and one, too, as clever as he was good.

Last September I removed from a house where I had the ordinary hot water pipes for supplying the hot water to the bath, to a house which had no such hot water apparatus, and to supply this lost convenience a geyser was fitted up in the bath-room at the suggestion of the landlord. Now, I am not going to lay this particular geyser to the charge of any special maker, for though I have reasons for believing who the maker was, no name was stamped upon it. Nor is it necessary for me to particularize any special make of geyser as being especially dangerous, for the experience of others has taught me that those made by the best makers, as well as the most remote, are alike open to the same danger, in the absence of *special* precautions. With those precautions I admit that gas baths and geysers are convenient and perhaps desirable things, but until the necessity for those precautions is brought prominently before the eyes of those who use these machines, so long will fatalities continue to happen.

In my case, my son went to the bath-room to take his first bath there, at 8:30 on Sunday morning, the 22d of September. His continued absence causing surprise the door was tried and knocked at without response. An alarm was at once raised, and the door broken open, but only to find that we were too late, for he was under the water, dead. The gas was still burning and the water slowly flowing. The room was small and without special means of ventilation. This getting into the bath while the gas is burning has been the fatal step in those cases which have since come to my knowledge, as well as in this case. But who, lacking the combined knowledge of a chemist and gas engineer, is to know that if he enters the bath under such conditions he will never come out alive. I shall be supported, I believe, by our Chairman when I say that these oxide of carbon fumes generated by the atmospheric or bunsen burners of these appliances are so deadly that a thousandth part in the air will destroy life, and so heavy that immediately they cool on leaving the apparatus they fall to the ground, and so pour down over and surround the head of the victim, depriving him of the consciousness of knowing that he must get fresh air at once or die in a few minutes. This deadly gas, while acting on the brain and depriving the victim of consciousness, closes the air cells of the lungs, and kills the blood, in the sense that it paralyzes those ever-changing conditions which are kept in constant activity throughout life by the vitalizing property of oxygen contained in pure air.

I do not profess to be in any sense an expert on this subject even now,

but this great calamity naturally made me inquire with keen interest into the manner in which death was brought about. I then heard that my experience was by no means an isolated one—that a few years since the librarian at the free library at Anerley lost his life in the same manner also by a geyser, and Miss Cooke, the daughter of the well-known tourist, lost her life by a gas bath. I have also heard of several instances where help has been happily forthcoming in time, and the worst averted. I did what I could at the time to make my case known, and I have to thank the *Times* and *Globe* and some other high-class journals for the very valuable and kind assistance which they afforded me in this direction. But, unfortunately, this was not sufficient to avert the two other cases I have referred to, which have recently been brought to my notice, and hence my determination to endeavor still further to make this danger known. The press has again kindly assisted me. How many other cases may have happened that I have not heard of it is impossible to say. The first of these two last named cases occurred at Chelsea, on the 15th of March last, when a young married lady lost her life in precisely the same manner as my son, the maker of the geyser in this case being one of the best known. Two days after, namely, on the 17th of March, a youth lost his life at Haverstock Hill, also under exactly similar circumstances, and by a geyser by one of the best makers. He was an only son in his 16th year. I have been and now am in personal communication with those unhappy people, and am therefore in possession of all particulars.

It may now interest you to know the result of some experiments which I subsequently made in the presence of the doctor who was called in and pronounced my son dead. I lit the geyser and turned on the water, regulating the supply of gas and water to the same volume, as far as I could judge, that I found prevailing on the fatal morning. I then placed a lighted candle on the side of the bath, at the same level as the head of an adult would be while in the bath; I then shut the door of the bath-room, and reopened it in ten minutes. The candle was burning very dimly, but, of course, immediately revived on the admission of fresh air. I then turned off the gas and water and cleared the room of the fumes, and repeated the experiment, and opened the door at the end of 20 minutes. The candle was out, and from the appearance of the composition of the candle it had been out several minutes. I made a subsequent experiment, and on looking under the door and seeing no light I opened it at the end of seventeen minutes, and the candle was out. I thus infer that the candle would not burn under those conditions much beyond 12 or 15 minutes, which, of course, means the extinguishment of life in about the same time. I then repeated the experiment with one inch of the window open at the top, and on opening the door I found the candle was burning brightly at the end of 20 minutes, and it would no doubt have continued to do so as long as there was anything to burn.

I shall doubtless be met by the friends of the appliances with the observation that if the room is small, as it was in my case, and generally is, the window should be kept wide open while the bath is filling, and the gas and water in any case to be turned out before entering the bath.

All that I fully admit, and that is all I desire to be impressed on the public, and with that view I addressed a letter to the *Globe*, on the 14th of April last, in reply to one from Messrs. Ewart, gas engineers, who, commenting on a previous letter of mine, advocated the necessity for the enforcement of some regulations for the use of geysers, but they said that they would suggest that no apparatus should be fitted in a room containing less than 1,000 cubic feet of air, without a ventilating shaft. Now this to my mind, is only creating fresh complications, which may or may not be regarded by the person who fits up the apparatus, and further accidents will inevitably occur. I do not advise anyone to trust to ventilating shafts, or anything apart from the simple and special precautions which I advocate, for it is only when we trust to those things that are not within our immediate control, that the unexpected happens. At the inquests that are held on those who have been so needlessly sacrificed, we are simply comforted by the most elementary statement, that the apparatus would have been perfectly safe with proper ventilation. As well might we be told that dynamite is perfectly safe in the absence of friction or concussion, or that a loaded revolver, at full cock, in the hands of a child, is safe so long as the trigger is not touched. I therefore suggested in that letter to the *Globe*, that every manufacturer should be compelled to stamp into the metal of every apparatus of the kind a caution to the following effect, "Caution! The bath must be filled while the room is being ventilated, and before closing the door. When filled turn off gas and water. The bath must on no account be entered until this is done."

Why is it that a simple *modus operandi* of this kind should be objected to and contested? I trust that the motive is not so worthless as the fear of raising an alarm in the minds of the public, and thus injur-

ing the sale of gas and geyser baths, but I must say it has that appearance. I suggest that fatalities of the kind I have described occurring from time to time, hushed up as they may be, for the sake of trade interests, will eventually do more to shorten the life of the gas and geyser baths, than the stamping of such precautions upon them, and no such accidents being known. The publication of these disasters not having proved sufficient, I submit the time has now come, when the Legislature should take the matter up, and compel the enforcement of such precautions as I have suggested being stamped on these machines by the makers, and that its omission should constitute a penal offence, and with that view I hope still to work in this cause.

I am not here in any vindictive feeling against those who make these contrivances. I do not say they are one and all abominations, and should be suppressed, but I simply advocate the importance of necessary caution, nor do I find fault with the law for not having already interfered, but I do say that the time has now come when action is demanded, and when unsuspecting persons ignorant of the nature of these machines should be put on their guard before using them, and not be snared into deathly traps and cheated out of their lives for fear of exhibiting a notice that some might think would alarm the public and so injure the trade. The law is the guardian of the people, and this is no fancied or imaginary danger, that exists in so many of our homes. Unhappily, the danger has proved too real, and seeing how mindful the law is of things of far less value than human life, I do not despair of getting this important subject taken up by Parliament. Apart from this matter, there are many pressing things waiting for legislation, and I say nothing disrespectful to the law (for I hope I am far too conservative and constitutional in my views to do that) when I say that much useful law making is hindered by individuals in the House who will talk of nothing else but education, the Irish question, and the grievances of the working man—all excellent things in their way, and well deserving of a nation's care, but these poor worn out hobby horses, should now, I think, be allowed a little rest, while others are trotted out for exercise. It is right that trade and invention should be encouraged, but where human life is at stake, then the law should see that those who reap the harvest should not do so without due regard to safety.

I said at the commencement of my remarks that they would necessarily be very brief, and I have now little more to add. I wish it to be understood that it was not my intention from the first, nor have I attempted to discuss this question from a scientific point of view. Had I done so, and had been competent to fulfil the task, I have no doubt a very elaborate address could have been written, but my object, I trust, has been served as far as this evening is concerned. I could have wished that my audience had been composed of thousands, and I trust my feeble utterances may, by the good offices of the Press, extend beyond the limits of this room. I am already indebted, as I have before said, to the Press, for similar good services, for by its valuable agency, my voice of warning last September was heard far and wide, throughout the civilized world, and its echo has not yet passed away.

I will only add that there is a period in all human events when ignorance ceases and responsibility steps in by reason of acquired experience and knowledge. That period, to my mind, has now arrived in this matter with the makers of these contrivances, and I will go so far as to say also with the Legislature, for if the Legislature willfully disregards (after being informed of the danger) so simple a proposal, having for its object the effective protection of human life, then for every life, that may be lost, that responsibility will be theirs. Precautions are rightly taken by the law to regulate the sale of poisonous drugs and explosives; and why? Because they involve danger to human life. And so with gas and geyser baths the danger is self-evident.

I have just spoken of responsibility resting upon manufacturers and upon the law. I venture humbly to think that a like responsibility is imposed upon me, and all who have suffered the cruel sacrifice of a most valuable and beloved life, and that it is not enough to settle down under one's own trouble, without regard to others who may meet a similar enemy in the dark unarmed. By your kind co-operation and indulgence, I feel I have to some extent discharged that responsibility, and should it ultimately result in removing this existing evil, then our time will have been well spent, for it will inevitably be the means of saving precious lives. If, on the other hand, I have to let the thread drop almost where I took it up, but it results even in the saving of one life, who can say how great the price of that life may be to his or her belongings, and even to society at large?

THE miners of the New York and Cleveland Gas Coal Company are persisting in their demand for the institution at these collieries of the Columbus wage scale—79 cents per ton.

SPECIAL ENGLISH CORRESPONDENCE.

COMMUNICATED BY NORTON H. HUMPHRYS.

SALISBURY, May 10, 1890.

Enterprise in Gas Supply.—Gas and Ventilation.—Yeadon's Improved Retort.

The present is a stirring time for gas suppliers, yet amid all the wild talk about competition, the waving of petroleum lamps and the flashing of electric lights that we all experience, it is remarkable that a sure and immediate reward appears to await anything in the way of a little judicious enterprise in connection with the supply of gas. It is interesting to notice how our industry is gradually leaving the slow and stately step that it formerly arrogated to itself, and is being gradually drawn into the rushing round of ordinary business operations. There is every sign that this must increase with more and more rapidity. While electric light people are rushing here, there and everywhere, ready to take orders on almost the consumers' own terms, and others are willing, not exactly to give new lamps for old ones, like the magician in Aladdin, but to bring around lamps at regular periods, ready trimmed and replenished with petroleum, thus saving the householder the trouble and risk of carrying out that operation on his own premises, gas people cannot afford to sit in their offices and wait for customers to come in.

The Paris Gas Company have experienced a large increase in the consumption of gas during the past year. A fact, considering that they supply ordinary—very ordinary—quality gas at about \$1.50 per 1,000 cubic feet, which is very remarkable. The shareholders in the Paris Gas Company appear to be the "upper dog" (I have learned that simile from reading the transactions of American Gas Light Association) in this business, as they get a dividend of something over 30 per cent. A large number of houses in Paris are let out in flats, and the visitors to the gay city last year, who were puzzled by the little placards containing the words *gaz a tons etages*, that seemed to be rather plentifully bestowed about the streets on the fronts of houses, will find the explanation in the report of the Paris Gas Company, which sets forth that they have introduced the plan of laying a rising pipe, to bring the gas to each floor, at their own expense. No less than 2,400 such services were laid during 1889, and the Company now have over 100,000 consumers amongst the dwellers in flats. Rather more than one-fourth of the total number of houses in Paris are supplied in this way. It is also noticeable that the Gas Company average about two consumers for each house in the city, *i. e.*, that there are twice as many gas consumers in Paris as there are houses. The Company have an excellent day consumption, amounting to 26 per cent. of the whole. The city of Brussels, selling gas at about half the price, and for purposes other than lighting at one-third the price, fail to record such good results at present, although their day consumption is increasing so rapidly as to warrant the expectation that an equally satisfactory record will soon be reached. It is to be regretted that so few of our English gas undertakings publish any record of their day consumption. In many cases, looking at the number of stoves and engines in use, this cannot be far short of 30 per cent. of the whole. In small residential towns, where gas is sold at a moderate figure, it is easy to reach 20 per cent. or more of the total, by adopting the well tried means of extending day consumption, such as the supply of cooking stoves on hire, a moderate discount on gas engines in continual use, etc.

Some correspondence that has lately appeared in the *Times* (the principal English daily newspaper) furnishes a sad commentary on the ignorance of gas consumers as to the important subject of ventilation in connection with the use of gas, and also of a want of knowledge in that direction on the part of some persons who undertake the fixing of gas apparatus. The former have a greater claim on our sympathy than the latter, as if one employs a tradesman to supply and fix any apparatus, whether for gas or anything else, it is scarcely too much to expect that he should look for specific instructions that will enable him to use the appliance, of course assuming reasonable care and intelligence in such use, with safety both to life and property, from the person who supplies it. A Mr. Chapple writes to say that he had an apparatus for heating water rapidly fixed in connection with a bath, and that his eldest son was suffocated from the fumes of the gas burnt.* He has also heard of two other fatalities under similar circumstances. He therefore suggests that some member of Parliament should bring forward a measure making it a penal offence for a maker to sell such apparatus without full instructions as to use and mode of ventilating, etc., stamped on the iron-work of the machine, and that the same should not be fixed except by accredited agents. Looking at the large extent to which gas is applied, for so many different purposes, it seems almost absurd that any fairly

* See JOURNAL, p. 735.

educated person should be unaware of the fact that large quantities of gas cannot be used without producing their equivalent of carbonic acid and water, and that these products must be removed from the apartment in which they are produced; or that every gas burner requires a continual supply of fresh air proportioned to the quantity of gas used. It is stated, moreover, that in one of the fatal cases the apparatus had been fixed by a gas company; so it is not only gasfitters who appear to be in need of a full acquaintance with the laws attending the combustion of gas. Large quantities of water cannot be rapidly heated except by the combustion of a large quantity of gas in a short time, and one can readily perceive that if an apparatus for this purpose is fixed in a small, badly ventilated room, such as bath rooms in private houses usually are, there is a great risk of danger to health, and even to life. The only really safe plan is to cut the apparatus off from the air of the room by providing it with an independent air supply from outside, and a flue to take off the products of combustion. Even if a flue pipe connected to a good uptake is provided, it cannot be relied upon unless there is also an adequate fresh air inlet.

A well-known firm that makes the manufacture of rapid bath heaters a specialty agrees that mere publicity is not sufficient to prevent accidents from want of ventilation, and suggests that no apparatus burning more than a given consumption per hour should be fixed in rooms under certain dimensions without the employment of proper ventilating pipes. For instance, they suggest that a burner consuming more than 30 cubic feet of gas per hour should not be fixed in a room having less than 1,000 cu. ft. cubical capacity without proper ventilation. The root of the evil is want of ventilation. If a room is so badly provided for, or rather not provided for at all in this respect, as shown by the fact that the combustion of a few cubic feet of gas is sufficient to exhaust the life-sustaining properties of the air, it can scarcely be wholesome even if the gas is not used at all, and the consumption of gas is only a contributing cause, though possibly the principal one, to the fatal effect. It is only a question of time how soon the air becomes prejudicial to health by the emanations, and by the consumption of oxygen, on the part of the occupants of the room. If every apartment in a house was properly ventilated, according to the the known rules observed in hospitals, public buildings, etc., such accidents would not occur; but of course this is no palliation for the ignorance exhibited by those who fix such apparatus. The moral of the whole business, so far as gas companies and gasfitters are concerned, is not simply to order an apparatus from the maker, and then send a workman to fix it, possibly without ever seeing the appliance or the place where it is to be fixed, but to take care that its working is properly examined and tested by a competent person.

The increased cost of coal and wages appears to have had the effect of directing the attention of inventors towards the problem of effecting some labor saving improvement on the usual methods of heating coal in our retort houses. Amongst others, Messrs. Yeadon & Co., of Leeds, have taken up the problem of an automatic retort, by which I mean one that is continuously fed with a regular supply of coal, and that is continuously discharging coke, these operations being conducted without loss of gas and without admission of air to the retort. In this system the retort is a cylindrical conical shape, fastened to metal sockets at each end. It is fixed in a horizontal position in a furnace, and is so made that the sockets or rings project on each side and rest upon suitably disposed bearing rollers. This retort is made to revolve slowly by appropriate machinery. A number of projections or blades are arranged on the interior of the retort, which serve to stir up the charge during the act of revolving, exposing every part of it to contact with the red-hot surface of the retort. The coal, which may be small, slack, or even dust, is admitted at the small end of the retort, and the coke passes out at the large end into a chamber with a slide at the bottom, and from which the gas education pipe is taken off. The slide can be opened to allow the coke to fall into another chamber below, and from this it can be delivered direct into the furnace, into barrows, or to the hoppers of conveying machinery, as may be desired. In this arrangement the whole of the retort, with the exception of the ends, is exposed to the furnace, and is therefore equally heated throughout. The ends, bearing rollers and actuating machinery are all outside the furnace, and therefore beyond the reach of a prejudicial degree of heat. Amongst the advantages claimed by the makers are the use of the cheapest kinds of coal, and the dispensing with labor; the conducting of all operations without leakage of gas or admission of air, that the plan of distilling coal in thin layers, with regular and constant turning and mixing secures a great improvement, both in regard to quality and quantity of gas, also that the latter is more uniform, as compared with ordinary ways of working; that carbon deposits or choked ascension pipes are prevented; that the retorts are not subjected to the injurious effects of variations in temperature,

and that their shape admits of withdrawal when worn out, and the replacing of new retorts without disturbing the brickwork of the furnace. If Messrs. Yeadon can show the realization of all these claims in practice, without any corresponding drawbacks, they have introduced a valuable invention that will be a great improvement, as avoiding many of the objectionable features incidental to the ordinary methods of distilling coal for the manufacture of gas. A Mr. Woodhouse has also patented an improved scoop capable of introducing the charge into the retort at one operation instead of two, as usually required with scoop charging, and of depositing the same evenly upon the floor of the retort.

The Opinion of the Attorney-General of Massachusetts in Respect to the Right of Cities and Towns to Operate Gas and Electric Light Plants.

In response to several inquiries we herewith republish the full text of the opinion of Attorney-General Waterman, of Massachusetts, in the matter of the right (under existing laws) of municipalities in that State to operate gas and electric light plants. The opinion is:

HOUSE...No. 444.

COMMONWEALTH OF MASSACHUSETTS,
ATTORNEY-GENERAL'S DEPARTMENT,
COMMONWEALTH BUILDING, BOSTON, April 30, 1890.

To the House of Representatives of Massachusetts, now in session:

I have the honor to reply to your order adopted on the 11th inst., and which was received by me on the 15th, requiring me to transmit to your honorable body my opinion, with reasons therefor, "as to whether, under the existing statutes, cities and towns have authority, first, to construct and maintain within their own limits and for their own use systems of lighting by gas or electricity; and second, whether in connection with such systems they may sell gas or electricity for private use in such towns or cities."

And in pursuance with the order I respectfully comply with your request, and herewith give you my opinion upon the questions of law submitted to me, with my reasons therefor.

A town, as known to our laws, is a municipal corporation having jurisdiction to act only within a defined locality, established for public purposes, and to administer local affairs of public concern, and so peculiar to the locality as not to be common to the State or people at large, and the general government of which is administered in town meetings by its qualified citizens in person, with powers generally inferior and subordinate to the power of the Legislature, by which its powers may be curtailed and even extinguished by division and annexation to other towns.

The primary or fundamental powers and duties of the towns of Massachusetts are limited to objects of government which directly affect the reasonable necessities and prudential affairs of the general welfare of its inhabitants, resting upon the fundamental basis of right and justice, which powers, in the absence of a constitutional provision, cannot be diverted from their natural political and public application to such general welfare; but new obligations and duties not before exercised may be imposed upon towns at the pleasure of the Legislature which are not of a private or commercial nature, or inconsistent with such general and primary powers, or which are incidental thereto, even against their consent.

Towns do not exist under any express provision of the constitution of the State. Their powers and duties became fixed and established upon a foundation and identity of government long before our present form of State government was adopted; which they obtained by long usage and prescription and by express provisions of law all combined, and which gave them an existence as if by an unwritten constitution subordinate to the legislative power of the State, and under its control when exercised in such a manner as not to interfere with such fundamental or primary powers.

Towns, upon general principle as municipal corporations, have no power to levy taxes and assess money upon the inhabitants for general or indefinite purposes, but only so far as the same may be necessary to enable them to exercise the powers, enjoy the privileges, and perform the duties established as before intimated.

The statute of 1785, chapter 75, entitled "An act for regulating towns, setting forth their powers and for the choice of town officers, and for repealing all laws heretofore made for that purpose," is the re-enactment of an earlier law. By section 7 thereof, general authority is given towns to raise money, etc., and it provides that they may "grant and vote such sum or sums of money as they shall judge necessary for the settlement, maintenance, and support of the ministry, schools, the poor, and other necessary charges arising within the same town," and makes provision concerning the prudential affairs of the town conducive

to the peace, welfare, and good order thereof; and by section 11 of the same act, all laws theretofore made for the purposes mentioned in the act were expressly repealed and annulled.

The enumeration in the statute of objects for which towns might raise money are there cited as instances of the authority to raise money for objects, the cost and expenses of which could be legally paid by the town, including those which fairly came within the terms "other necessary charges."

In the Revised Statutes enacted in 1836, and in the General Statutes enacted in 1860, and the Public Statutes enacted in 1882, the enumeration of the objects contained in the act of 1785 for which money might be raised and expended by towns, is substantially repeated, and also there is an enumeration of other objects of similar nature of those enumerated in the statute of 1785. There is also given by section 37 of chapter 27 of the Public Statutes authority to towns to authorize a village or district to be accurately defined within its limits and containing not less than one thousand inhabitants, to organize for the purpose of erecting and maintaining street lamps, etc., and by section 44 of the same chapter towns may construct lines of electric telegraph for its own use along its public ways, and may construct lines for the same use and in the same manner for the transmission of electricity for the purpose of lighting, all of which objects are of the same class which pertain to the public welfare and prudential affairs of the town, and are incidental to the primary and fundamental powers thereof under the present existing state of things. And I can find no law or statute by which towns have been authorized to enter into business of a commercial or private nature such as requires an investment of capital and the employment or particular application of skilled labor or scientific knowledge therein. And I am of the opinion, for the reasons above stated, that, under the existing statutes, towns have no authority to construct and maintain, within their own limits and for their own use, systems of lighting by gas or electricity; nor can they, in connection with such systems, sell gas or electricity for private use in such towns.

A city is a municipal government established by the Legislature under the power vested in it by authority of the second article of the amendments to the constitution of the Commonwealth adopted April 9, 1821, and which provides that:

The General Court shall have full power and authority to erect and constitute municipal or city governments in any corporate town or towns in this Commonwealth, and to grant to the inhabitants thereof such powers, privileges and immunities not repugnant to the constitution as the General Court shall deem necessary or expedient for the regulation and government thereof, and to prescribe the manner of calling and holding public meetings of the inhabitants in wards or otherwise for the election of officers under the constitution and the manner of returning the votes given at such meetings; *provided*, that no such government shall be erected or constituted in any town not containing twelve thousand inhabitants, nor unless it be with the consent and on the application of a majority of the inhabitants of such town present and voting thereon, pursuant to a vote at a meeting duly warned and holden for that purpose; and *provided, also*, that all by-laws made by such municipal or city government shall be subject at all times to be annulled by the General Court.

This constitutional provision does not authorize the granting of charters; it only authorizes the Legislature to establish municipal or city governments in town or towns containing at least 12,000 inhabitants, under a government more convenient in form and better adapted to a large number of people than the form of a town government; that is, an organization that will allow the inhabitants to meet in sections or precincts, for the purposes of election and choosing representatives, who can meet to deliberate instead of the whole body meeting in town meetings in person; not giving and not intending to give powers or privileges to the inhabitants of a city as citizens of the Commonwealth, greater than those enjoyed by inhabitants of towns, they both being municipal, local governments, only differing in the form of the administration of their affairs. In accordance with this construction the Legislature has provided in chapter 28, section 2, of the Public Statutes that—

Chapter 27 (which treats of the powers and duties of towns) and all other laws relating to towns, shall apply to cities so far as they are not inconsistent with the general or special provisions relating thereto; and cities shall be subject to the liabilities, and city councils shall have the powers, of towns.

And in chapter 3, section 3, clause "twenty-third" of the Public Statutes, it is provided that the word "town" may be construed to include cities. It therefore seems that cities and towns are subject in principle to the same laws, excepting the forms aforesaid; and I am of the opinion, for the reasons hereinbefore stated, that under the existing statutes

cities as well as towns have no authority to construct and maintain within their own limits and for their own use systems of lighting by gas or electricity, nor can they in connection with such systems sell gas or electricity for private use within their own limits.

ITEMS OF INTEREST FROM VARIOUS LOCALITIES.

THE Troy (N. Y.) Gas Company will lay a 12-inch main from the works on Hill street, through Fourth to Grand street. Piping times these, beyond a doubt.

WE understand that the Coney Island (N. Y.) Fuel Gas and Light Company has again changed hands. The new proprietors have elected Mr. W. S. Doren to the Presidency, and Mr. T. W. Rieddale has been elected Secretary and Treasurer.

THE property and franchises, etc., of the Mutual Gas Light Company, of Bay Shore, L. I., are to be sold at auction.

SECRETARY AND TREASURER WALKER, of the Helena (Mont.) Gas Light and Coke Company, notifies us that the offices of the Company have been removed to lower Main street, corner of Lawrence street.

ARTICLES have been filed by Messrs. Miles C. Moore, W. F. Newell, Geo. D. Shannon, Edward T. Young and Edmund Rice, for the incorporation of the Olympia (Wash.) Light and Power Company. The stated objects are: To furnish and supply water and natural gas to consumers for domestic, manufacturing or other purposes; to manufacture artificial gas, electricity or other agents which may be used for light or heat or as motive power; to transmit sound by wire charged with electricity; to purchase, build, construct, equip, maintain and operate railways; and to buy and sell personal and real property. Capital stock, \$500,000. Place of business, Olympia, Wash.

THE new rates for gas supplied by the Montreal (Canada) Gas Company, which became operative on May 1st, are: Gross, for ordinary purposes, \$1.60 per 1,000 cubic feet, with 20 cents per 1,000 off for prompt payment; for cooking, heating and power uses, \$1 per 1,000, net.

FROM a local source we have the following details respecting the last trial of the case entitled "The United Gas Improvement Company vs. The Manchester (N. H.) Gas Light Company," some account of which has already appeared in these columns: "The trial of this case in the United States Circuit Court at Portsmouth, N. H., before Judge Colt, has awakened not a little local interest, though not many outside the ranks of the interested parties understand the real import of its bearings. The suit is brought by the United Gas Improvement Company to recover what it claims are damages caused by the Manchester Gas Light Company three years ago, when the latter sold out to the Peoples Gas Light Company. It appears that before the Company sold out it had in contemplation the introduction of a water gas plant, and to this end was in consultation with various manufacturers of such plants, among them the United Gas Improvement Company. The Directors carried their investigations as individuals to other cities, and received visits from representatives of several companies. Among the number was Mr. Granger, of the Improvement Company. Mr. Granger was very desirous to put in a water gas plant, and offered to do so for a certain sum; he also tried to buy out the Company, offering therefor the sum of \$450,000, but the proprietors held out for \$550,000. While the Company was considering Mr. Granger's proposition to furnish a water gas plant, the Manchester Company sold out its rights, etc., to the Peoples Gas Light Company. This, according to the testimony of the gentlemen comprising the Board of Directors of the Manchester Gas Light Company, constituted all the negotiations the Company had with Mr. Granger. On the other hand, Mr. Granger claims that the Company had gone so far as to contract with the Improvement Company for introducing his plant, that plans were drawn, and that this Company had begun the manufacture of machinery for the work when intelligence was received that the sale with the Peoples Company had been perfected. The damages set forth in the suit are general, except that of an alleged loss of a patent during the transaction, for which the sum of \$10,000 is claimed. As might have been expected, Mr. Granger made an excellent witness. He is fluent and plausible. His counsel are Bingham & Mitchell, and his leading witness is Lyman P. Gerould, ex-Superintendent of the Manchester Company, whose position in the case is rather peculiar. Naturally, he could not be expected to bear any great volume of love for the people who dismissed him—and his best efforts had always been put forward in managing for many years the fortunes of the old Manchester Gas Light

Company—hence it was only reasonable that he was to be found on the Granger side of the argument. In any case, Mr. Granger testified that he was present when the Directors of the Manchester Gas Light Company closed the contract for the water gas plant, that he overheard all of the conversation, was present when all of the consultations were held, and is positive that the Company made the contract claimed. Against the testimony of Mr. Granger and Mr. Gerould is the testimony of Judge Daniel Clarke, Ex-Governor Moody Currier, Hon. Nathan Parker, Hon. G. Byron Chandler, Chas. F. Warren, Hon. L. B. Clough and others, who swear that no contract was made, that the Directors were simply conferring with the Improvement Company with a view of possibly making a contract if satisfactory terms could be agreed upon, and had the offer in consideration when the Peoples Company came forward and purchased the plant. At the first trial, when the jury disagreed, Mr. Gerould was present and testified; at this trial he was represented by deposition. Hon. J. S. H. Frink, of Greenland, and Judge William L. Foster, of Concord, represented the defendant. The jury, after being out for several hours, reported an inability to agree on a verdict, and they were discharged. The understanding is that 8 were for plaintiff and 4 for defendant.—M. A.”

PRESIDENT McILHENNY, of the Washington (D. C.) Gas Light Company, has placed an order with the Laclede Fire Brick Manufacturing Company for a practical working set of the Coze Inclined Benches. We have no idea of the number of retorts provided for in the installation.

IN regard to this style of bench we may note that the bench of Coze 5's ordered by Mr. Jno. Gimper, for the Springfield (Mo.) plant is almost completed.

THE following, from the Cincinnati *Commercial Gazette*, of the 16th inst., will prove of interest: “I met General Hickenlooper yesterday and asked him what, if any, complications can arise from the operation of the new franchise of the Edison Company, in the face of the one for the nine city squares that is held by the Gas Company. He promptly answered in the negative, and added: ‘The Edison Company can operate anywhere in the city under the franchise it holds by virtue of the decision of the Probate Court—that is if the decision is confirmed by the Supreme Court, to which the case must still go, I think, except in the nine squares of the territory which we hold. That they cannot touch. But this is not a question of territorial rights; it is a question of rates, and the success of the new organization will depend simply on its ability to furnish light cheaper and better than anyone else.’ A statement has gained currency that the General did not want the Edison franchise, for the limited territory mentioned, included in the purchase he made for the Gas Company from Mr. Coffin when the latter was here in connection with the deal. Asked as to the truth of this, the General said: ‘That is true. I did not want it for the simple reason that it is not worth anything to us. And, indeed, there is nothing in the electric lighting business at all, and will not be for some time to come. But the territory included in that limited franchise is the most promising of any in the city, and we will see to it that the new company does not trespass upon it. To return to the matter of money in the business. These men from the outside have made a mistake concerning Cincinnati, having based their calculations upon their experience in other cities where gas is from \$1.50 to \$2.50 per 1,000. When they come here where it is furnished at \$1.15 per 1,000 they are at a loss. I will tell you what I want to see in this town and that is the time when a man can come to the gas office to order whatever he wants in the way of light. If he wants the electric send him to one desk, if gas then to another, and if he wants both gas and electric send him to both desks. We want to do business on a basis of 10 per cent. profit. It can't be carried on for less than that, as we are not in it for the glory of the thing. Just as soon as the electric interest reaches a point where the profits exceed the limit I have named the the prices will be lowered to meet it, and not till then. I do not believe in the plan of giving any one company the exclusive control of the conduit system. There are several other companies here with equal rights in the matter, and there is no reason why each one of them should not go to work and tear up the pavements, thus occupying the streets from curb to curb with trenches, none of them less than four feet in width. One conduit should be made to serve the needs of all companies, and it should be given to a conduit company to construct and maintain. Those utilizing it should pay a rate equivalent to 10 per cent. profit to the operating corporation for its use.”

THE proprietors of the Standard Gas Company submitted a bid to the Gas Commission for street lighting in the districts traversed by its mains. Its offer is to light a total of 2,505 lamps, at the rate of \$13.043 for each

lamp. The rate at which the Company's charter requires it to supply the city is \$12.50 for each light, burning during 3,833 hours annually. Under the city's specifications the lights are to burn during 4,000 hours, and the Company accordingly demands a proportionate increase.

AT the annual meeting of the Carlisle (Pa.) Gas and Water Company the following officers were elected: Directors, Dr. W. W. Hale and Messrs. John Hays, R. M. Henderson, J. H. Bosler, C. H. Woodward and L. L. Line.

THE proprietors of the Altoona (Pa.) Gas Company have decided to increase their storage capacity by adding an outer section to their 90-foot holder. The work will be carried out by the Kerr Murray Manufacturing Company, of Fort Wayne, Ind.

MR. M. A. BROWN is acting as Superintendent of the Perth Amboy (N. J.) Gas Light Company, and it is possible that he will receive the permanent appointment. In the meantime we might remark that Mr. Patrick Convery, the newly-elected President of the Company, does not intend to pose as a figurehead in connection with the management of the Company's business. He is the right man in the right place.

THE authorities of Napa City (Cal.) have instituted suit against the Napa Electric Light Company for the forfeiture of its franchise.

MR. C. M. WILLIAMS, the enterprising Superintendent of the Helena (Mont.) Gas Light Company, has about completed his plans for bettering the condition of that works, and the cost of the scheme will not be less than \$50,000. Briefly told, he will erect a new purifying house (40 feet by 100 feet), and install therein handsome and modern condensing, scrubbing and purifying apparatus. A station meter will also form part of the outfit. The main system will be improved by the placing of 5,200 feet of 12-inch pipe, and two miles of smaller sizes will be put down. The 12-inch pipe is to take the place of the present 4 and 3-inch mains in Broadway. When all is finished Supt. Williams will be so situated that he can manufacture and distribute 300,000 cubic feet of gas each 24 hours.

THE strike among the gas stokers at Hamburg, Germany, has assumed a serious phase. Conflicts have occurred between the stokers and the police, and several of the offenders have been jailed.

TREASURER FRANK S. RICHARDSON, of the North Adams Gas Company, having “bettered” the gas and electric light service of his city, has concluded to “better” his own condition. At least we infer so from an invitation now before us to witness a marriage ceremony that will bind him to Miss Alice Rudderow Bonnell, of Jersey City Heights. The ceremony will take place on the afternoon of June 4th. May fortune ever smile upon them.

THE following are the net rates charged for gas by the proprietors of the Milton (Pa.) Gas Light Company, the gross being fixed at \$2.50 per 1,000.

Monthly Consumption.	Discount per M.	Net per M.
200 feet or under.....		\$2.50
Over 200 feet, but under 500 ft.	50 cents	2.00
1,000 feet.....	60 “	1.90
3,000 feet.....	65 “	1.85
7,000 feet.....	70 “	1.80
12,000 feet.....	80 “	1.70
20,000 feet.....	90 “	1.60
25,000 feet.....	\$1.00 “	1.50

The time for prompt payment is fixed at 15 days. These are very liberal figures for a place like Milton, whose population is not in excess of 6,000. As in most every other instance where good management is displayed the number of meters set is far in excess of that usually returned from other places where the gas policy is not liberal. The Milton Company has 260 meters in use, and a fairly good return per month is made from each one. Secretary Folmer, to whom the credit of building up the Company's business is most largely due, will make a strenuous effort this season to popularize the use of gas for cooking.

WE understand that at the annual meeting of the Citizens Gas Light and Heating Company, of Bloomington, Ills., it was decided to build a new works at a cost of something like \$25,000. The old Gridley plant will be abandoned. The only change in the executive management was the election of Mr. H. Gapen to the vacancy in the Board of Directors occasioned by the death of Geo. A. Tryner.

SECRETARY WM. L. WELSH, of the Oswego (N. Y.) Gas Light Company, evidently believes in keeping close to the leaders, and we think so from the following notice that is now appearing in the columns of the *Oswego Daily Palladium*: "The Oswego Gas Light Company desires to give notice that on and after June 1st next the price of gas will be reduced to \$1.75 per 1,000 cubic feet. If bills are paid within 10 days after presentation the following discounts will be allowed: On all bills under 3,000 feet per quarter, 10 cents per 1,000; on all bills of 3,000 feet or over per quarter, 25 cents per 1,000, making net prices \$1.65 and \$1.50 per 1,000."

MRS. HARRIET A. SCHWAB, of Jersey City, N. J., has brought suit against the United Gas Improvement Company, as lessee of the Jersey City Gas Light Company, for \$20,000 damages occasioned plaintiff by a gas explosion in 1888. She alleges negligence on the part of the Company to repair certain leaks to a service pipe, defendant having received timely notice of the bad condition of the pipe. The defense interposed is contributory negligence, in that the service, which had been originally paid for by the one who ordered it, was private property, hence should be kept in order by its owner.

SINCE the above was written we have received the following further particulars respecting the suit and its outcome: "Counsel in the case took nearly four hours to sum up, the arguments being made by Counselor John A. McGrath for the plaintiff, and Ex-Governor Bedle for the Company. In charging the jury Judge Dixon touched lightly upon the facts of the case, confining his attention to points of law. He held that the evidence pointed to the fact that the leak in the gas pipe, the prime cause of the explosion, had occurred in the joint between the horizontal and vertical lengths, near the basement floor. Carelessness on the part of the Company was indicated by a failure to repair this leak when notified. The plaintiff's duty was to have notified the Company, not once, but as often as a reasonably prudent person for his own protection would do. It was a part of the Company's duty to inspect the pipes and keep them in repair to avoid danger. 'The evidence,' the court charged, 'showed that the plaintiff did notify the Company, and also that no repairs were made. If you believe this testimony, the plaintiff is entitled to receive such compensation as you deem sufficient for the sufferings she has undergone, for her disfigurement, and inability to earn a living.' Mrs. Schwab was a music teacher before the calamity, and her hands were badly mutilated. Continuing, Judge Dixon said: 'The jury must also determine, before awarding damages to the plaintiff, whether or not it was careless on her part to light a match in a place where the smell of the escaping gas was so strong, and whether a reasonably prudent person would have done so. If the plaintiff was careless in so doing it would be contributory negligence on her part, and she would not be entitled to any damages because of injuries so arising.' The jury, after an absence of two hours, brought in a verdict of \$6,000 for the plaintiff. The case will be appealed.—J. C. J."

THE Committee on Manufactures, Massachusetts Legislature, has reported for passage the bill to permit the consolidation in that State of gas and electric light companies. An amendment is recommended to the measure in its original shape so that the agreement for consolidation shall be executed by the presidents of the constituent companies only after it has been approved by a vote of two-thirds in number and interest of the stockholders of each corporation at a special meeting called for the purpose.

MR. ST. JOHN, as Agent for the company controlling the Pintsch system for lighting railway cars in this country, has closed a contract with Messrs. Alston & Boylston, of Atlanta, Ga., for the erection of a works in that city in which to manufacture a supply of gas for the illumination of the passenger coaches of the Georgia Central Railroad.

THE plant of the Gainesville (Fla.) Gas and Electric Light Company has been leased to the Southern Gas Trust and Construction Company, of New Jersey.

THE generating plant of the Columbia (Tenn.) Electric Light Company was "knocked out" by a lightning stroke. The Thomson-Houston Company which installed the apparatus had failed to provide "lightning arresters" in connection with it.

MESSRS. BISHOP & BARRET, of the Louisville Gas Company, have about completed a prolonged tour of inspection of Eastern and mid-West electric lighting plants. This looks as if the Louisville Company intends to speedily avail itself of the charter amendment permitting it to engage in the distribution of electrical currents.

THE Consumers Gas Company, of Reading, Pa., has been awarded a 5-years' contract for furnishing gas to the stations and passenger coaches of the P. and R. Railroad Company. The Gas Company will rebuild the gas works of the P. and R. Company, that were recently destroyed by fire. It will be remembered it was asserted, when these works were so destroyed, that the P. and R. Company would substitute electricity for gas.

MANAGER AFRICA, of the Peoples Gas Company, of Manchester, N. H., has vanquished the strikers.

MESSRS. HAMILTON DISSTON and Joseph B. Hancock have been re-elected Trustees of the Northern Liberties gas works, of Philadelphia.

WE understand that the franchises, plant, etc., of the Le Mars (Ia.) Water and Light Company have been purchased by Mr. J. H. Winchell, who paid \$45,000 for the same:

THE Galena (Ills.) gas works have also changed hands. The transfer price is not known to us.

THE proprietors of the Hamilton (O.) Gas Light and Coke Company assert that they will undersell the city, no matter what figure the latter may determine to charge ordinary consumers for gas supplied from the municipal works.

AN Associated Press despatch, dated Erie, Pa., May 15, says: "A few months ago the people of Erie undertook to boycott the Pennsylvania (natural) Gas Company, on account of a raise in the rates. The boycott failed, and the City Council asked the courts for an injunction to compel the Pennsylvania Company to take up its pipes and abandon its plant. The order was asked for on the ground that the Company had refused to furnish the manufacturing establishments gas as they had promised when Council gave the Company the use of the streets. The Company demurred, and the court sustained this by dismissing the bill, on the ground that Councils could vote the Company the use of the streets or not, but could name no conditions."

Two hundred and twenty-five shares of stock in the New Bedford (Mass.) Gas Light Company were sold at auction on Saturday last.

AT the annual meeting of the Glens Falls (N. Y.) Gas Light Company the following officers were elected: President, D. H. Cowles; Vice-President, F. A. Sabbaton; Secretary and Treasurer, F. F. Pruyn; Superintendent, H. A. Brooks.

THE Directors of the Street and Sewer Department, of Wilmington, Del., have refused permission to J. Edward Addicks to tear up the streets for the purpose of burying gas mains. The action of the authorities is based upon what they term the confusion of corporate titles under which Mr. Addicks seeks to operate, and the absence of what they consider any responsible organization to whom to grant the privilege of laying pipes.

THE Dowagiac Gas and Electric Company has been incorporated to operate in Dowagiac, Cass county, Michigan. Capital, \$15,000.

THE National Electric Manufacturing Company of Eau Claire, Wis., is under contract to install a plant of 100 arcs and 1,000 alternating incandescents at Asheville, N. C., and a 750-light alternating incandescent plant at Anderson, S. C. The 600-light direct current plant that is being installed by the Company at the Hotel Normandie, Washington, D. C., will be put in duty next week.

THE quarterly bills that will be handed to the consumers of the Poughkeepsie (N. Y.) Gas Light Company on June 2d will be made out on the following basis: \$2, \$1.75, \$1.50, \$1.35, \$1.25, or \$1.00 per 1,000 cubic feet. The quarterly consumption, of course, determines the charge, save in respect to the minimum figure named, which applies to gas used for cooking, heating or power. If bills are not paid in ten days from delivery, ten per cent. will be added.

ANYONE interested in the sick-benefit, funeral-aid and death-beneficiary associations of the United States can help make the statistics of their organization for the forthcoming census more complete and disseminate the knowledge of the good work they are doing by sending the names of such societies as they may know of and the addresses of their principal officers to Mr. Chas. A. Jenney, Special Agent of the Eleventh Census, 58 William street, New York city.

THE WALKER TAR AND CARBONIC ACID EXTRACTOR.

A very general demand exists, in both large and small Gas Works, for an apparatus that will be absolutely efficient in the removal of the tar which passes the hydraulic main and condenser. Many attempts have been made to accomplish this, but, I believe, without success, until the introduction, five years ago, in England, of the C. & W. Walker Patent Tar and Carbonic Acid Extractor. During these years this apparatus has been adopted by many of the most prominent Engineers, not only in England, but also on the Continent of Europe and in other parts of the world. It is only necessary to give here a partial list in order to convince any intelligent American Gas Engineer that this machine must have succeeded fully in accomplishing the desired results.

The following Engineers have personally given permission to refer to them:

G. C. Trewby, Esq., Engineer-in-Chief of the Gas Light and Coke Co., London. The manufacturing plant at Beckton is built in complete sections of 3,000,000 cubic feet capacity each. A Walker Tar Extractor has been fitted to each one of these sections. This was done after a long and thorough trial on one of its sections. The Tar Extractor has been supplied to other works of the Gas Light and Coke Co., including those of which John Methven, Engineer of the Gas Light and Coke Co. at the Nine Elms Station, is in charge. Also to G. E. Stevenson, Peterborough Gas Works; B. Green, Mitcham and Wimbledon Gas Works; W. H. Smith, Bedford Gas Works; F. Linging, Norwich Gas Works; J. T. Browning, Colchester Gas Works; S. B. Darwin, Portsmouth Gas Works; J. McCrae, Dundee Gas Works; W. J. Wells, Stamford Gas Works; J. M. Darwin, Longton Gas Works; J. Paterson, Warrington Gas Works; and J. Coulter, of the Dundalk Gas Works. All of the foregoing gas works are located in Great Britain.

Mr. Charles A. Gerdenier, Superintendent of the Bridgeport (Conn.) Gas Light Company, writes as follows, under date of Dec. 3, 1887:

"The C. & W. Walker Tar and Carbonic Acid Extractor has been in operation at these works for the past six weeks, and is an unqualified success. It removes every particle of Tar from the gas in once passing through the apparatus and a large percentage of the Carbonic Acid. I also feel quite sure that it prevents the formation and deposit of Naphthaline, because since I started the Washer I have had no stoppages from this cause. These works have been seriously troubled with Tar for many years, and I have used several kinds of apparatus and every expedient which has come to my attention for dealing with the difficulty, but without success. The Walker apparatus occupies comparatively small space, is less expensive than other systems, and requires but little attention. I carry 2½-inch seal, and have an automatic tar delivery valve. This Tar Extractor is indispensable to gas makers."

I have taken the Agency for the United States for this apparatus, and am now prepared to make contracts to erect it on the premises of any Gas Company. It would be manufactured in the following sizes:

No. 1,	50,000 to	100,000	cu. ft. per 24 hrs.,	3	ft. square,	5	ft. deep.
No. 2,	"	"	"	4	"	"	"
No. 3,	"	"	"	5	"	"	"
No. 4,	"	"	"	6	"	"	"
No. 5,	"	"	"	7	"	"	"
No. 6,	"	"	"	8	"	"	"
No. 7,	"	"	"	9	"	"	"
No. 8,	"	"	"	10	"	"	"
No. 9,	"	"	"	12	"	"	"
No. 10,	"	"	"	15	"	"	"

This Tar Extractor will perform its work with about one-fourth the usual back-pressure heretofore required. It is simple in construction, and can be supplied at a very reasonable price—less than any other ever before introduced. Satisfactory results will be guaranteed in every instance.

SOLE MANUFACTURERS OF THEIR PATENTED SPECIALTIES.

"IRON SPONGE." Saves money, saves labor, and is the most efficient purifying agent ever offered as a substitute for lime. Now used *in every State in the Union*, and purifying daily over *thirty-five million cubic feet*. Should be used in every gas works. Its own saving will pay for it many times over.

AUTOMATIC GOVERNOR. Has been on the market but *three years*, and in that time has been introduced *more generally* than any invention ever designed for use in gas works. Over *two hundred* of them now in use. Sensitive; reliable; perfectly automatic; reduces leakage; satisfies consumers, and gives great relief to the Manager. No gas works is *complete* without one of these machines.

STEAM JET EXHAUSTER. Designed particularly for small works. Combines Exhaust Tube, Steam Governor Gas Compensator, and Bye-Pass Valves in the most compact form possible; occupies but little space; uses very little steam; operated by ordinary workmen; saves formation of carbon in retorts; increases yield 10 to 15 per cent. Specially adapted for *mixing air* with oil gas. *No works* too small to use them profitably.

Prices given on all our specialties *delivered at any point in the United States*. Correspondence solicited.

A. J. DOTY, Supt.

The utility and convenience of the Gas Engine being no longer an open question, it only remains now for intending purchasers to select the BEST. We claim for the CLERK GAS ENGINE that it is equal to any other manufactured as regards steadiness in running, simplicity, and ease of keeping in repair, and that it gives the greatest amount of power for the least money (both in first cost and expense of running) of any engine made. In support of this claim we refer to the test of the Gas Engines made under the direction of the American Institute of New York, in December, 1885, and heretofore published in these columns. These engines are especially adapted for continuous running under heavy loads, and we can refer to Engines which have run 22 hours a day for months at a time!

Made In Sizes of 5 10 15 20, and 25 Horse Power. All Engines Guaranteed for One Year.

WM. HENRY WHITE,

No. 32 Pine Street, - - - New York City.

ENGINEER AND CONTRACTOR FOR THE

ERECTION AND EXTENSION OF

GAS, WATER, AND ELECTRIC LIGHT WORKS.

Correspondence with Gas Companies contemplating extending or improving their Plants respectfully invited.

Plans and Estimates Furnished.

GAS COALS.

CANNEL COALS.

GAS ENRICHERS.

JAMES D. PERKINS. **PERKINS & CO.,** F. SEAVERNS.
228 & 229 Produce Exchange, New York.

Cable Address, "PERKINS, NEW YORK."

Post Office Box 3695, New York.

GENERAL SALES AGENTS FOR

The Youghiogeny River Coal Company's

OCEAN MINE YOUGHIOGHENY GAS COAL.

HON. W. L. SCOTT, Prest. M. H. TAYLOR, Vice-Prest.

This Colliery is located at SCOTT HAVEN, PA., in the center of the Youghiogeny Gas Coal District, and produces the ONLY RELIABLE YOUGHIOGHENY COAL for gas purposes. (See Map on p. 87 of this JOURNAL, Feb. 16, '85.)

POINTS OF SHIPMENT,

Locust Point, BALTIMORE.

Pier No. 62, PHILADELPHIA.

Also, SOLE AGENTS for the

**BRECKENRIDGE CANNEL,
OF KENTUCKY.**

Within the past two years we have delivered this Cannel to over ONE HUNDRED COMPANIES IN THIRTY-THREE DIFFERENT STATES, and it is now in use in some of the large Gas Works

On the Continent and in South America,

where it successfully competes with the Australian Shale. It is the ONLY AMERICAN GAS CANNEL of sufficiently high grade to warrant EXPORTATION TO EUROPE AND SOUTH AMERICA, and it is the only economical substitute for OIL OR NAPHTHA. ONE GROSS TON will produce

10,000 Cubic Feet of 75 Candle Gas,	} equal to {	750,000 Candle Feet of Gas, and 26 Bushels
or 12,500 " " 60 " "		of merchantable Coke weighing 900 Pounds
or 15,000 " " 50 " "		

This is the ONLY GAS CANNEL that will produce a REALLY MERCHANTABLE COKE. It can be delivered in parcels of one carload or more to any point in the United States or Canada. Cargo shipments of any size required can be made from NEW YORK, PHILADELPHIA, BALTIMORE, or NEWPORT NEWS. Samples will be sent and particulars of price, etc., forwarded upon application to above address.

JAMES & WILLIAM WOOD,
Gas and Cannel Coal Contractors,

No. 40 St. Enoch Sq., Glasgow. No. 2 Talbot Court, London.

Proprietors of the BATHVILLE COLLIERIES (which produce the celebrated BOGHEAD CANNEL), Shields, Shieldmuir, Drumpeller, and other Collieries. This Firm offer

STANDARD CANNELS,

Unequaled as Gas Enrichers.

Also, WEST FAIRMONT GAS COAL, of W. Va.

Analyses, prices, and all further information furnished on application to

Agency for U. S., Room 70 Nos. 2 & 4 Stone St., N.Y. City.

The Standard Oil Company,

REFINERS OF

NAPHTHA AND GASOLINES.

ALSO MANUFACTURERS OF

A Special Grade of Naptha for Gas Companies

FOR ENRICHING COAL GAS.

Correspondence solicited.

GAS COOKING STOVE, No. 8 C.

SIZE.

Oven.	Roaster.	Top.	Length over Extension Shelves,
12 in. high.	12 in. high.	24 in. long.	36 in.
17 1/2 in. wide.	18 in. wide.	21 in. wide.	
12 in. deep.	13 in. deep.		

Has four burners on top, and double oven burner. Consumption of gas with all burners in use, 42 feet per hour, at 1 inch pressure. The front and oven door are made in sections, so that a greater variety of cooking utensils may be used. The oven door has covers and crosspieces and putting in a suitable forked ring, which is used for hanging a wash boiler or other large utensil may be set over two burners. A RIDDLE also fits in the same position. The roasting oven is provided with a door.

Front and Oven Door are Nickel-Plated.

GAS COOKING STOVE, No. 7 B.

SIZE.

Stove.	Oven.	Roaster.	Top.	Length over Extension Shelves,
31 in. high.	9 1/2 in. high.	10 in. high.	21 in. long.	32 in.
17 in. wide.	14 1/2 in. wide.	15 in. wide.	16 in. wide.	
	12 in. deep.	13 in. deep.		

This Stove has three boiling burners in the Top or Hot Plate, and one single oven burner.

This cut represents our New Style Cooking Stove. As will be seen, it has an ornamented cast-iron Base and Front, and extension shelves. The Oven Burner, which is atmospheric (unless otherwise ordered), is of an entirely new and improved pattern (patent). The ovens are of greater capacity than those of the old style. The Top, in conjunction with the Outlet Pipe, is designed to carry off all the products of combustion, if desired, but they are also supplied with a loose ring which converts it into an ordinary open top stove.

The consumption of this Stove is 35 cubic feet per hour at 1 inch pressure, with all burners in use.

All Fittings are Nickel-Plated.

BOILING STOVE, WITH ORNAMENTATIVE BURNER.

Consumption, 6 feet

HOT PLATE, No. 11.

Size, 36 in. long, 12 in. wide, with three double burners, 6 tips. Consumption, with all burners in use, 36 cubic feet per hour, with 1 in. pressure. 1/2 in. supply pipe should be used where the pressure is 1/2 in. or over.

AT a meeting of the Council of the American Gas Light Association, held on the evening of May 21st, at the Lindell Hotel, St. Louis, Mo., the following committees were appointed:

Committee on World's Fair.—Messrs. A. B. Slater, W. H. White, C. J. R. Humphreys, W. H. Pearson, A. E. Forstall, A. W. Littleton and J. P. Harbison.

Committee to Nominate Officers for Next Year.—Messrs. Thomas Turner, A. B. Slater, Jr., A. W. Littleton, J. F. Scriver and W. H. Denniston.

THE WESTERN'S THIRTEENTH ANNUAL.

We can, we fear, say but little that is new to our readers, respecting the St. Louis Convention of the Western Association, in that "Three Stars" availed himself so freely of the wire to furnish the main particulars of what was concededly one of the best meetings ever held by the Western. In the first place, the weather was good, albeit some of the hours were rather hot; the attendance was inspiring; the meeting hall excellent, and the gentlemen in charge of the arrangement details indefatigable. As for what might be considered or classed as the "outside convention"—that is, the exhibition of gas apparatus and the pleasuring trips—no words of praise can be too warm in expressing an opinion as to the complete success of these. To go back a trifle. President Faben occupied a peculiarly odd position, in that he presided over an assemblage whose predecessors of a twelvemonth had selected a man of exceptional popularity to guide its deliberations of this year. But the Great Authority decreed that Edward J. King should not carry out the will of his fellows, and so the mantle of direction was laid on the shoulders of a man who wore it worthily and well. Indeed it is not too much to say that in Mr. Faben the Association had an executive that could not have been surpassed. Exact, impartial and alert, his firm handling of the reins directed, but without strain, the travel of business routine. His address, which is given in another column, contains much that is of more than passing interest, and we hope that the chapters on "Electric Light," "Enriching Material" and "Legislation" will be closely studied. Perhaps the second and third divisions will appeal most strongly to the gas makers, in that each presents an important point for consideration—the one involved in manufacture, the other bound up with the very commercial existence of our craft. Lima crude oil, with all its faults, has been loved by the gas makers for its cheapness as an enricher, but that wonderful corporation—the Standard Company—which controls it is evidently not disposed to slip its opportunity for profit over its sale in future, as an advance of 100 per cent. in the price of the product at the mouth of the wells during the last few months amply testifies. The needs of the purchasers, however, regulate prices, and so we suppose the situation must be accepted at its face. In the other instance we are pleased to note the heartiness with which Mr. Faben indorses the soundness of the policy of the formation of State Gas Commissions. Such hammering cannot fail to make an impression of the right nature. Mr. Faben's tribute to those whom death claimed as his own from the Western's ranks during the year, brief though it is, is so beautifully framed that we will not mar it by any extended expression of our concordance with it. And this leads us to say

that the *In Memoriam* proceedings, both in the reports of the committee and the oral expressions uttered after their formal presentation to the meeting, were extremely impressive. Dark, indeed, was the death roll of the Association in the twelvemonth, but beautiful were the sympathies evoked from its bitter memories. This thought leads us on to the general excellence of the Special Committee work performed in the interim of the last meeting. The report of Committee on Gas Company Accounts is a model one, and carries on its face a lengthy record of labor and application. The paper list bore out the promise of its lines, and we congratulate the Association on the literary capacity of its members. In other numbers we may take the liberty of referring to the papers at greater length; for some of them certainly seem to call for comment. As remarked before, the exhibition of gas apparatus was a grand success. The goods were tastefully arranged, the exhibits were profuse, and every detail of management, both for the service of the exhibitors and the comfort of those who attended the display, was as it should be. Take it in any sense, the Western's meeting, in its business aspect, was an unqualified success. We shall have more to say about the gas exhibition at another time.

And as it was with the purely business side of the meeting so also was it with the social feature. We imagine we are not far wrong in our verdict that the banquet was not missed; but then, again, every city cannot boast of a river front of 16 miles on one of the river wonders of the world. However, the business of the session having terminated at the appointed hour on Thursday, the members and their guests were conveyed in carriages to the Washington avenue wharf, where the commodious and elegantly-appointed excursion steamer *Oliver Bierne* was boarded. How delicious the soft breezes from the broad bosom of the Father of Waters were in their searching ministrations, and how well did they succeed in their mission of cooling the heated and reinvigorating the wearied. The course was up the river as far as the fantastic Chain of Rocks, which permitted a view of the Eads and Merchant's bridges and the new water works, all tributes to the commercial greatness and growth of busy St. Louis. A feature of the up-trip was the reception that greeted the excursionists when passing the works of the Laclède Company. Every whistle on the works shrieked forth a welcome, and the grimy workmen, ranged on shore, joined in the chorus with their cheers. In fact you would not think that such a thing as a "strike" could ever have occurred or ever would occur in that vicinity. And from the heartiness of the response from those who thronged the steamer's decks one would not suppose that any demand that could be made by the men would ever be refused. More's the pity, then, that things are not always what they seem. On the return trip the steamer passed Carondelet, thus giving the excursionists a bird's-eye view of St. Louis' noble river front. It goes without saying that none could complain of lack of goods for the inner man, and those who would a dancing go had the inspiration of "fairy strains of music falling" to guide their twinkling steps. The committee, including particularly the "Russell Brothers," seemed to be ubiquitous. Home was reached at a seasonable hour, and all retired, anxious for the morrow with its renewal of the round of pleasure. Friday morning came at last, and with it the carriages that were to convey the visitors through the city and to the Fair Grounds on the west. St. Louis may not be Chicago, but it nevertheless abounds in fine buildings and handsome drives; and, take it all-in-all, we rather think "it will do" as either a good place to do business in or a spot wherein to make one's home. The Fair Grounds reached, an elegant luncheon was served in the Jockey Club House, and at 2:30 the horses were summoned to the post for the first race. The excitement over the "programme" culminated in the contest for the "Western Gas Association Cup," a magnificent and costly trophy in solid silver, donated by the Committee of Entertainment. The race was gallantly won by "Harry Clark," some of the boys insisting that the name of the steed as registered on the "correct card"—Churchill Clark—was a misprint. The day and its festivities were flawless, and the return to the Lindell was made in season sufficiently early to enable the early birds to board the evening trains. A feature of the proceedings was the "watching" of Chairman R. D. Walsh, of the Committee of Arrangements, who will hereafter be easily able to note the flight of time. Now that it is all over, we can say with satisfaction and truth that the Western's "Thirteenth" was an unqualified success. "Is gas the light of the present?" "Yes." "Is it to be the light of the future?" "Beyond a doubt."

NOTES.—The Elizabethtown (N. J.) Gas Light Company will sell gas at \$1.50 per 1,000 on and after July 1st.—Michael Murphy, who had been many years in the service of the Toledo (O.) Gas Company, died on May 24th. He was in his 48th year.

[OFFICIAL REPORT.]

THIRTEENTH ANNUAL MEETING OF THE WESTERN GAS ASSOCIATION.

HELD AT ST. LOUIS, MO., MAY 21, 22 AND 23, 1890.

FIRST DAY—MORNING SESSION—MAY 21.

The Thirteenth Annual Meeting of the Western Gas Association was held at the Lindell Hotel, St. Louis, Mo., beginning Wednesday, May 21, 1890. The President of the Association, Mr. Edward J. King, having died within the year, the First Vice-President, Mr. C. R. Faben, Jr., of Toledo, Ohio, took the chair, and called the meeting to order at 10 o'clock A.M. In opening the session the President said:

By the death of Mr. King, the gentleman whom you saw fit to honor with the presidency of this Association last year, it devolves upon me to preside over the meeting at this time. I am thoroughly conscious of the duties and responsibilities of the position, and I appreciate the honor which you did me last year by naming me First Vice-President. It will be my aim and endeavor to serve you well, and if I fail to do so it will not be through want of effort. With these few remarks I now declare the Convention open for the transaction of such business as may properly come before it.

ROLL CALL.

During the session the following members responded to their names:

Honorary Members.

Harbison, John P.	Leach, H. B.	Thomas, Joseph R.
Humphreys, C. J. R.	Slater, A. B.	White, Wm. Henry.

On motion of Mr. Howard, the reading of the minutes of the previous meeting was dispensed with.

President Faben here read the following

INAUGURAL ADDRESS.

Gentlemen of the Western Gas Association: Another year has passed into history, and with it the record of our individual successes and failures. We come together this day to the thirteenth annual meeting of our Association, armed with the valuable lessons learned by the experience of another year; with greater knowledge, better judgment and firmer convictions upon all matters pertaining to the business that we represent. Let us, therefore, make good use of the valuable material acquired since last we met in convention, remembering also that this can

best be done by full, free and thorough exchange of information between members.

The true condition and promise of the gas industry at the present time are certainly favorable; and this, in the presence of the fact that never before in the history of our business have we had the sharp competition in the field of lighting as at present, is of itself strong evidence of the desirability of gas as a source of light for all common purposes.

The present prosperous condition of the gas industry is largely the result of good business management of our affairs; not any one thing or act of and by itself will account for our continued prosperity, but constant study and inquiry, and prompt application of every device and suggestion that tend either to reduce the cost of manufacture and distribution, or improve the quality of our product, or create a market for the same, each and every item that is a contributing factor to our success, must be given the proper credit.

To learn of the success or failure, as the case may be, the result in practical operation of the many different devices offered, and practice suggested, and, also, to make and receive further suggestions, are the objects of the present business meeting of the members of the Western Gas Association.

Processes.—The past year has not been rich with startling development of new types of apparatus, nor radical changes in existing plans of operation; yet we have progressed. We have improved in many small matters of detail, and have progressed toward that goal that we call perfection. We have dismissed a large measure of the prejudice that formerly moulded many of our expressed convictions, even though we may have held at the time an honest opinion to the contrary, yet, on account of our prejudice, we would not give it expression in our utterances.

Water gas is one subject that clearly illustrates to what extremes our prejudice may lead us. The successful application of electricity as a source of light is another. To-day we speak of and regard these projects in an entirely different manner than formerly.

Electric Light.—The electric light as a competitor to gas, for purposes of light, presents a solid front. The arc light has established itself as the best means of lighting large areas, and for street lighting purposes it has no equal. The incandescent electric light is making good, fair progress in many places, and I might say generally. It presents some few advantages over gas that the promoters never fail to appreciate, and they always call the attention of possible patrons to these various little advantages. A naked flame is a dangerous thing to have exposed in many situations that gas jets have been used, and with the incandescent electric lamp quite a display is often made in show windows, stores and private houses, with the light placed and distributed in some unusual manner, the effect of which is novel and at once taking to the average person.

How very profitable to investors these electrical undertakings may be, I question. From statements recently made I find that out of about 100 electric lighting companies in Massachusetts only 15 declared dividends in the past year. Of these 15 companies 10 declared dividends of from 1 to 6 per cent., and only 5 declared dividends above 6 per cent. Leaving out the Boston companies, which by reason of the extent and value of their territory enjoy a greater demand for their light than exists in smaller places, the average of dividends paid by the electric light companies in the State, who paid dividends at all, has been only 4.9 per cent.

Another fact in this connection is that no fund has been created by these several electric light companies to compensate for wear and tear. No depreciation has been charged off. The usual and necessary repair is supposed to represent all of the depreciation, so that the dividends paid are virtually taken from the plant itself or its value. Electric light companies are opposed to having any depreciation charged off other than the cost of repairs and renewals actually made.

The use of the incandescent electric light has demonstrated to my mind the tendencies of the times in the matter of distribution of light. A few years ago many consumers of gas complained of the light produced from burning gas, that it was not of sufficient intensity, and they resorted to the arc light. In many of these situations since that time the arc light with all of its intensity and other desirable qualities has been discarded, and a great number of incandescent electric lamps are used in its stead, so that the present tendency seems to be in the direction of the use of a large number of small lights for indoor illumination, giving to the general illumination something more of a starry effect.

The custom or practice with incandescent electric light companies, in the matter of computing and establishing rates for lighting service, is certainly faulty. No matter how careful and conscientious a consumer may be, the privilege to the free and unlimited use of an article of light leads to great wastefulness. This wastefulness is an item of ex-

pense to someone, and, under the conditions cited, it must be a very serious item to the producer.

The question of whether or not gas light companies should engage in the supplying of electric light is a purely business proposition, and is determinable only by local conditions. In some situations, yes; in others, no.

Enriching Material.—The development of the Ohio oil fields led to the adoption of some type of water gas apparatus by many of the formerly strictly coal gas companies. The crude oil was sold at a very low price, and, with suitable apparatus, was a very cheap and desirable material for carbureting water gas. The price of this material, as well as the situation generally, has changed materially during the past few months. The price of Ohio oil has increased more than 100 per cent. at the wells, and the supply of this material is well under the control of one corporation. This corporation has no desire to sell crude oil for gas making purposes at any price. As I am informed, they intend to take from the crude oil the light products, and sell the residuum for fuel oil. The light products will be split up into gasoline for the stove trade, and naphtha for use by gas light companies for carbureting purposes.

If my information is correct we are at once confronted with a situation where the cost of material used for carbureting water gas will be nearly doubled in the average situation. The whole subject is entitled to the serious consideration of each interested member. Ohio oil may be worth intrinsically all that is asked for it, but at the present time, when gas light companies are working in every manner and employing every means to reduce the cost of producing gas, the sudden rise in the market value of any material, or, as suggested, the taking out of the market entirely the material desired or required in producing gas is certainly of serious moment.

Legislation.—The great agitation that is being made throughout our country by individuals in some places, and by many individuals banded together in the large centers, calling themselves Nationalists, who are advocating the "establishing of public water, gas and electric light works, to make the street railways municipal property, to work for general State laws permitting municipalities to assume these functions without special legislation, and ultimately forbidding them to be exercised by private corporations," is a subject well worthy of serious consideration by us at this time.

These are, of course, but a few of the "reforms" that the "Nationalists" contemplate; but as the industry we represent stands almost first among the industries that they wish municipalities to own and operate, it would be well for us to consider what real reform would be the most practical.

To my mind a "State Gas Commission," similar to the one now in successful operation in the State of Massachusetts, suggests itself as the most practical method of deciding all questions in dispute arising between municipal corporations and gas light companies.

If it were possible to render a "perpetual and exclusive franchise" to a gas light company, with a State Gas Commission as the arbitrator, whose decision was final, how much better it would be for both the investor in gas undertakings and the gas consumer.

The investor would have a permanent investment at a fair rate of interest, and the consumer would buy gas, of good quality, at a much lower price than is possible under the present conditions.

The number of bills that have been introduced within a reasonable time in the Legislatures of the different States, that are of serious interest to the gas light companies operating in those States, clearly indicates that some sort of legislation is being demanded by the people. The necessary legislation demanded will be enacted even though a number of "acts" are passed and experimented with before a satisfactory measure is finally adopted.

As we are more familiar with the situation than either the majority of our law makers or the people who are asking that certain measures be passed, we should see to it that measures are presented that we are willing to indorse heartily, and not wait for measures to be presented that demand our earnest opposition.

The question of "gas commissions" has been investigated by this Association, and a most valuable report was presented by a majority of the committee to whom the task was assigned, and I would recommend that each member interested in this matter peruse that report.

To accomplish what we may desire in the lines of gas commissions in our respective States, it is necessary that a State organization be perfected, composed of the gas light companies of the State. Very little can be accomplished by an association composed of individuals who have not been delegated the power to bind, by their acts and utterances, the corporations they are supposed to represent.

Papers.—The proper committee have selected a number of subjects

to be presented here by writers who will treat the matters fully and clearly from their points of view; and while we may not agree with them upon certain points, it is hoped that the discussion thereon may be thorough and complete, and result in bringing out the full facts on both sides of all the questions presented for your consideration.

"Relative Value of Gaseous Fuels" is the subject of a paper to be read by Mr. B. E. Chollar, of Topeka, Kansas. The subject is a live one, full of interest to every modern and progressive gas light company, and to gas engineers generally. It is, comparatively speaking, only a few years ago when the use of gas for cooking and heating purposes was of most rare occurrence. To-day it is an important factor in our total send-out of gas—more of an item than ever before in our history; and within a reasonable time, if properly presented, will not only be a feature of our business, but will prove to be the source of our greatest revenue, particularly during the summer months. A number of experiments are about to be made to demonstrate the feasibility of a "distinctive" fuel gas for fuel and light purposes—"fuel" as the first and principal business, and the subject of "light" as a sort of side issue. While we as gas company representatives feel a lively interest in all these experiments, our principal business here to-day is to learn how we can turn to best account the gas plant and business that we now possess.

Mr. Ed. G. Cowdery, of Milwaukee, Wis., in his paper on "Mixed Gases," will in effect give us the results of some practical experiments with fuel gas. This cannot help but prove interesting and profitable.

Mr. James Somerville, of Indianapolis, Ind., will present us a paper showing the effect of the presence of natural gas as a competitor of manufactured gas. While this subject may not apply to a large percentage of the gas companies represented here to-day, it is of great interest to quite a number of the members, and I trust that in addition to the valuable information we may receive from the paper itself, that the whole subject may be ventilated through the inquiries and replies provoked by the discussion thereon.

Mr. George G. Ramsdell, of Vincennes, Ind., will present a paper in the form of "An Argument in Favor of the Adoption of a Uniform System of Estimating the Cost of Gas in the Holder." This subject, to my mind, is a very important one indeed. Scarcely any two companies operating to-day employ the same method of keeping accounts, and it is thereby impossible for us to obtain a comparison with our neighboring company, either as to the actual cost of gas or quantity of materials used per 1,000 cubic feet, etc., etc. The matter of data upon all details pertaining to the manufacture and supply of gas is growing more important each year; but the argument I leave in the hands of Mr. Ramsdell.

Mr. Allen R. Foote's paper entitled "The By-Products of Experience" offers some new thoughts upon the value of data. Its application to the gas industry is particularly striking.

The subject of data brings us to another important question. This is what is known as "Census Year," and, for the first time, the industries directly pertaining to manufactured gas will be represented—separately and distinctly—in the industrial statistics to be gathered and published by the government of the United States. A decade ago an attempt to collect statistics was made, but the early death of the gentleman placed in charge of the work left the work unfinished. This was a misfortune felt less then than now, as at that time the gas fraternity had not yet been thoroughly awakened to the desirability of letting its light shine, in all sense of the term, before men, and the failure in the record was counted as of but little consequence. To-day, we appreciate how valuable these figures of ten years ago would be, compared with those of the present, for the purpose of showing the growth of the industries we represent. We certainly want to know just where we stand to-day, and our successors in the business in the year 1900 will want to know just what progress has been made; and in order to determine this, the facts of the present time must be on record as a basis of comparison.

The opportunity of 1880 was unfortunately lost; that of 1890 we have yet before us. I would recommend to all an earnest endeavor to furnish information asked for by the governmental officials, as fully as possible, even though to do this may require some little time and patience. It is to our interest, directly and indirectly, that the data be collected and presented in as complete and digestible shape as possible.

Especially must this be clear when we consider that the electrical industries will be fully represented in all branches and departments in the Census totals, and that no stone will be left unturned to render such statistical representation complete. To this end, leading representatives of these industries are asking Congress to set aside a large sum, in addition to the regular Census appropriation, for the further investigation of electrical energy in all particulars in which it enters the arts, sciences or general industries of the country.

With such an example before us, it is expressly necessary that we

shall not hold back any information sought, but rather aid, in all ways possible, those who have been selected to gather together the figures that must tell the story of our status as a manufacturing industry.

Mr. Geo. T. Thompson, of St. Louis, Mo., will give us his "Impressions of British Gas Works." We have several times been favored with some few remarks made by gentlemen from abroad traveling in our country, who have given us the impression created upon their minds after examining some of our gas works and holding conversation with some of the American gas managers; but in this instance we are to be treated to the impressions created upon an American mind after examining British gas works. The paper cannot but prove interesting to each member, and without doubt many points will be presented that can be turned to profit in our practice, particularly in the case of a strictly coal gas works.

The subject of "Wrought Iron, Cast Iron or Steel—which is the Best Material for Street Mains?" will be presented by Mr. Eugene Priutz, of Zanesville, O. This is a subject that many of our gas light companies are much interested in at the present time. It is to be hoped that during the discussion each member will contribute his mite to the fund of information desired upon the question.

Mr. Fred. Egner, of St. Louis, Mo., will present his views "On the Abuse of the Patent System, as bearing on the Gas Interests, with a Remedy."

"What Policy should the Gas Interests Adopt in Connection with the World's Fair" is the subject of a paper to be presented by Mr. Walton Clark, of Philadelphia, Pa. Upon this subject I desire to call your attention to what has been done during the past year by the Western Gas Association, and also the American Gas Light Association, in the premises.

At the Western Gas Association meeting, held at Cincinnati last year, your President, Mr. Geo. G. Ramsdell, in his address suggested that the gas industry be properly represented at the World's Fair, and the committee upon the President's Address reported upon this subject in the following language:

"We also suggest that this Association endorse the idea of properly observing, by an exhibition of appliances and otherwise, the centennial anniversary of the introduction of gas lighting, and that we respectfully suggest to the American Association that it take the general direction of affairs looking to that end." This report was adopted by the Association.

At the Baltimore meeting of the American Gas Light Association, last October, provision was made for the appointment of a committee to act officially on behalf of the American Gas Light Association to consider the question of proper co-operation between the several gas light Associations of America, and take such action and make such recommendations as may by them be deemed advisable.

I, therefore, recommend the appointment of a proper committee from this Association, to meet and co-operate with the committee of the American Association, to consider and take action for the proper representation of the gas industry at the coming International Exhibition.

And, also, that the committee be instructed to complete arrangements, if possible, for a union meeting of all the Gas Light Associations of America, to be held in the city of Chicago during the year, as suggested by the invitation extended by Hon. DeWitt C. Creiger, Mayor of Chicago, on behalf of the citizens of that city, and also a like invitation extended, signed by the Committee on Gas Industries for the World's Exposition, 1892, at Chicago, as presented and read at the last meeting of the American Gas Light Association, at Baltimore, Md., October 16th, 1889.

Obituary.—Death has demanded, during the year, more than a liberal harvest from our ranks. Five valuable and much respected members of this Association, who were on earth at the time of our last meeting, have passed beyond mortal vision, leaving to us the lesson of their virtues, and admonishing those who remain that death ever awaits upon the steps of life, and that with the grave there can be no controversy.

Death ever seeks a shining mark, and no words from me can add to the luster of the names borne by these gentlemen in life. Their qualities and achievements are too well known to require any words of mine to proclaim who and what they were.

The death of these gentlemen, in conformity with our custom, demands that suitable memorial resolutions be prepared and reported to this convention.

Conclusion.—In conclusion, gentlemen, the officers selected and assigned the duty of making the necessary preparations for the thirteenth annual meeting of this Association have put forth their best efforts to render the meeting a complete success, as far as it laid in their power so to do. To what further degree success is attained, is a matter that rests entirely with the effort put forth by each individual present,

I trust that each individual will appreciate the importance of his presence at the meetings during the convention, and will cheerfully contribute toward the fund of information demanded, remembering that, no matter how great or small his contribution to that fund may be, it cannot possibly reduce the fund that he may now possess, but possibly might prove to be of material benefit to his hearers.

Mr. Ramsdell—I know we have all listened with pleasure to the able address which has just been read, and as there are some points in it which need to be brought more particularly before the Association, I move a committee of three be appointed by the Chair to consider the address, and to report to this meeting of the Association.

The motion was agreed to, and the President appointed as the Committee Messrs. G. G. Ramsdell, B. E. Chollar and A. E. Forstall.

POSTPONING THE ELECTION OF NEW MEMBERS.

The President—The next business before the meeting is the receiving of applications for membership, and balloting thereon.

Mr. Jenkins—Quite a number of applications came to hand this morning, and as the committee have not had time to act upon all of them, I would suggest the matter be deferred until the afternoon session, when the committee can report at one time upon all the applications received.

The President—There being no objection, it is so ordered. The next business will be the reading of the reports of the standing committees.

The Secretary read the following

REPORT OF BOARD OF DIRECTORS.

ST. LOUIS, MO., May 20, 1890.

A regular annual meeting of the Board of Directors of the Western Gas Association was held at the Lindell Hotel, at 10 o'clock this morning, with the following members present:

Chas. R. Faben, Jr., E. H. Jenkins, C. W. Butterworth, J. S. Ambrose, B. E. Chollar, J. B. Howard, Z. T. F. Runner, E. G. Cowdery, J. W. Dunbar, and A. W. Littleton.

Absent, Frederic Egner and John Gimper.

President Chas. R. Faben, Jr., occupied the chair. On motion of Mr. Jenkins it was carried that the hours of 10 A.M. and 2 P.M. be recommended to the Association for adoption for the convening of the business sessions of the Association.

In the absence of Messrs. Emerson McMillin and A. E. Boardman, members of the Committee on Obituary Resolutions, it was moved by Mr. Runner and carried that Messrs. James Somerville and John McIlhenny be appointed in their stead.

On motion of Mr. Howard the following papers were favorably acted upon, with a recommendation that they be read before the Association:

"The Relative Value of Gaseous Fuels," by B. E. Chollar.

"The World's Fair and the Gas Associations," by Walton Clark.

"Bye-Products of Experience," by Allen R. Foote.

"Report of Committee on Gas Companies' Accounts," by George G. Ramsdell.

"Mixed Gases," by E. G. Cowdery.

"Effect of Natural Gas Competition," by Jas. Somerville.

"Wrought Iron, Cast Iron or Steel—which is the Best for Street Mains?" by Eugene Printz.

"Impressions of British Gas Works," by Geo. T. Thompson.

"On the Abuse of the Patent System as Bearing on the Gas Industry: with a Remedy," by Frederic Egner.

The Chair announced the appointment of the following committees:
On Applications for Membership.—E. H. Jenkins, C. W. Butterworth, and J. W. Dunbar.

On Examination of the Books and Accounts of the Secretary and Treasurer.—G. G. Ramsdell, J. S. Ambrose and E. G. Cowdery.

Mr. C. W. Butterworth moved that the Board here adjourn, subject to the call of the President, which was carried.

A. W. LITTLETON, Secretary.

On motion of Mr. Jenkins the report was received and its recommendations adopted.

APPOINTMENT OF SPECIAL COMMITTEES.

The President—With your permission I will appoint the special committees.

On Receiving and Introducing Visitors.—Messrs. J. S. Ambrose, L. K. Scofield and B. W. Perkins.

On Nomination of Officers.—Messrs. E. H. Jenkins, R. H. Canby, J. T. Lynn, Henry T. Pratt and J. D. Thompson.

On Place of Meeting.—Messrs. E. G. Cowdery, Eugene Printz and I. C. Baxter.

On Resolutions.—Messrs. Walton Clark, G. A. Hyde, Jr., and Edward Lindsley.

If the committee on reception of visitors is ready to report, the Chair would like to have it presented now.

Mr. Ambrose—Having not had opportunity to consult with my associates on the committee I will take it upon myself, in order that business may be facilitated, to introduce the visitors who are with us to day, and then give way and let them make the speeches. We have with us this morning, Mr. A. B. Slater, of Providence, R. I., an ex-President of the American Association; Mr. C. J. R. Humphreys, of Lawrence, Mass., the Secretary of the American Association; Mr. John P. Harbison, of Hartford, Conn. and Mr. R. B. Taber, of New Bedford, Mass., both ex-Presidents of the New England Association; Mr. H. B. Leach, of Taunton Mass., Mr. Jos. R. Thomas, of New York, and many others whom we are glad to welcome to our convention as visitors and guests. Times have somewhat changed. According to the old custom and teachings of our fathers, we were told that in order to find the true light we should look East; but now we find, instead of that, a body of representative gentlemen coming West to associate with a large body of gentlemen representing the true light; and the gentlemen are in search of light. And, further, these gentlemen are a little different to some of our ancient fathers, in that, whereas they traveled without the hope of fee or reward, these gentlemen have come out here, perhaps without hope of fee, but nevertheless expecting large rewards. I bespeak for these gentlemen kind treatment. I hope they will be allowed to roam through the forests of this Western City unmolested; that they will be cared for properly, and that, if necessary, a committee be appointed to see that their scalps shall not be taken off by the Indians who roam through these western countries. I will leave it to the President to see that they are properly cared for and protected.

The President—Gentlemen; I welcome you to this meeting of our Association, and hope you will feel entirely at home with us. I can guarantee police protection to you during your stay in St. Louis. One special committee under instructions to report at this meeting has, through its Chairman, asked for further time, stating that the committee will be prepared to report to-morrow. I refer to the committee appointed on the subject of the paper, read by Mr. Gimper last year, on "The Education of the Gas Engineer." Mr. Gimper will report on that to-morrow.

MR. GIMPER SURPRISES THE CHAIR.

Mr. Gimper—I have another report to make and it is this: One year ago the Association was called to order with a policeman's club. As a member of the Association I felt very much mortified that a body of such peaceable and intelligent gentlemen should be governed with such a weapon, and I made up my mind then and there that at its next meeting I would provide the Association with a suitable gavel. For this purpose I have chosen the upper part of the center-seal as the head of the gavel; for, as the gas flows from the center-seal, first through the purifier, so during your deliberations it passes to and from the presiding officer. This gavel, therefore, becomes an instrument of strength in your hands; and as a member of this Association I take pleasure in presenting it to you, and through you to the Association for future use. (Applause.)

The President—On behalf of the Association, Mr. Gimper, I accept from you this gavel. I can hardly add anything to what you have said of the necessity of an instrument of that kind in the hands of the President of the Association. While the gavel may prove a great and effective instrument in the hands of some of the presiding officers, yet I am afraid that your present officer is hardly able to wield it with that strength. But I shall use it with pleasure, and hand it to my successor; and I trust that its use in connection with this body will prove satisfactory.

On motion of Mr. J. B. Howard a vote of thanks was tendered to Mr. Gimper for his very appropriate present.

The President—I have omitted to name a committee on suitable memorial resolutions. I supposed that the Board of Directors would name the full committee, but as they did not do so I will appoint as a Committee on Obituary Resolutions, Messrs. J. B. Howard, James Somerville and John McIlhenny.

REPORT OF TREASURER.

Secretary and Treasurer Littleton presented his annual report, of which the following is a summary:

Receipts.

To balance, cash on hand, May 1, 1889.....	\$529.95
To membership fees.....	175.00
To annual dues.....	533.00
To badges.....	321.75

\$1,559.70

Disbursements.

By Secretary's salary.....	400.00
By badges (200).....	675.00
By sundry bills as per accompanying vouchers.....	380.39
By balance, cash on hand May 1, 1890.....	104.31
	\$1,559.70

Mr. Ambrose, from the Finance Committee, reported that they had examined the Treasurer's accounts and found the same to be correct. On motion the report was received and filed.

Mr. Ambrose also stated that the Secretary had on hand nearly 100 badges which he hoped would be taken by members during the session, as the sale of those badges would increase the amount of money in the treasury by some \$350.

READING THE PAPERS.

Mr. Frederic Egner, of St. Louis, then read his paper

ON THE ABUSE OF THE PATENT SYSTEM AS BEARING ON THE GAS INDUSTRY: WITH A REMEDY.

Prologue.—After having written the paper about to be read, a letter and a copy of the last annual report to Congress, of the Hon. C. E. Mitchell, Commissioner of Patents, were forwarded to me through the courtesy of that gentleman. With your kind indulgence the following interesting extracts from the report mentioned will be given as a fitting prologue to my paper.

"In entering upon the discharge of the duties thus imposed (writes Mr. Mitchell) I am reminded that this is the one-hundredth year of the American patent system. It was on the 8th day of January, 1790, that President Washington, in an address constituting his first annual message, said to the assembled Houses of Congress: 'I cannot forbear intimating to you the expediency of giving effectual encouragement as well to the introduction of new and useful inventions from abroad as to the exertions of skill and genius in producing them at home.' Both Houses of Congress sent cordial response to the President's address, and promised, especially to his suggestions for the encouragement of science and the arts, 'such early attention as their respective importance requires.' A bill was soon matured, which, after amendment in the Senate, became, on the 10th of April, 1790, by the signature of President Washington, the first American law authorizing the granting of patents for mechanical inventions. Mr. Mitchell proceeds to state that during the century 437,000 patents have been issued. During the first 50 years only 12,421 were granted, while in the single year ending January 1st, 1890, nearly 25,000 patents were allowed. The first patent issued for a 'gas apparatus' was to David Melville, of Newport, Rhode Island, March 18, 1813, for an 'Apparatus for Separating the Hydrogeneous Gas or Inflammable Air from the Carbon and Less Volatile Ingredients of Pit Coal.' Since then 2,550 patents have been issued for processes, apparatus or improvements connected with the manufacture of gas."

And now I will read my ideas on—

The Abuse of the Patent System.—The subject of this paper is one which, in the opinion of the writer, deserves more than a passing thought, not only of those who are directly engaged in the manufacture and sale of gas, but of those who purchase the product, and those also who by the people are chosen to make their laws. If any attempt was made before this time to attract the attention of professional gas men, and that of others as well, to the abuse—and its baneful effects upon all concerned—of the patent system, with particular reference to the gas industry, the writer is not now aware of it. Should this paper be the means of arousing some of those affected to seriously consider the matter, its object will have been accomplished. And if such action should cause proper steps to be taken to check or eradicate the abuse of this—one of the most valuable systems for the advancement of civilization and the amelioration of the condition of the human race, which the patent system certainly is—then the author would feel happy indeed in the thought that he had helped to do something which was worth the doing.

To make sure not to be misunderstood, a few general remarks about the patent system of our country as a whole will not be out of place here. That much good has been accomplished by stimulating the inventive genius of man may be seen by anyone who will look about, compare the state of civilized nations with that of the half-civilized or barbarian people of the world, and reflect upon the cause thereof. Usually the whole credit for these improved conditions is given to religion and education, but quite unjustly so. Because, although religion and education have done—and will continue, we hope, to do—their useful work, they have not helped man to the ease and comfort now enjoyed by the large majority of the people. The reader of history knows that religious zeal was at no time as powerful as in the so-called dark

and middle ages; and even in the records of the morning of our own country we can read of horrible atrocities having been committed in the name of piety and religion. So, you see, we had plenty of religion then and education, too—for the famous seats of learning, Oxford, Heidelberg and many others are centuries old; and even beyond these we can refer back to the ancient Roman, Greek, Arabic and other systems of education, which furnish us with the substance of the higher text-books in our own schools to this day. In those early days of religion and limited education only, inventors were called sorcerers, and were treated accordingly, as we are informed by historians. The masses were not educated, which was one of the chief difficulties in the way of the improvement of man. But gradually the light came. Not to waste your time in speaking of matters with which you are all familiar, it may yet be permissible to mention a few examples of what invention has done for the world, and the most of which was done *after* the introduction of the patent system, though some few of the most useful inventions were made before that time. But the patent system stimulated invention to noble exertions. First of all the useful inventions that occur to me now is the printing press or art of printing, which was the means of spreading knowledge where it had not reached before. Later on the newspaper followed. Too much can scarcely be said in praise of *the newspaper*—the educator and molder of the opinions of the masses.

Though the power of the press is sometimes (like the patent system) prostituted to selfish ends, it has, on the whole, done more good in the cause of humanity than sword or gun, warriors or orators; and I cannot conceive of a more noble, useful or honorable calling than that of the newspaper man, from the conscientious reporter up to the able editor and manager; and we may indeed exclaim with Axel Oxenstierna, "The pen is mightier than the sword." But it was the inventive genius of man who gave us the press and movable type, the steam engine, steamships, and railroads—the latter one of the greatest of all civilizers and beneficial institutions of the world, although it, too, like all good gifts of the Almighty, has been more or less abused in some notable instances to further the aims of avarice and fraud. Still, on the whole, railroads have been the means of developing this great North American continent, opening homes for millions of people, all of which would not have been possible in the same time but for the railroads, which therefore deserve praise and not the more frequent abuse which they get—let me say it with sorrow—like the gas industry, nearly always unjustly so—from our useful and esteemed friend, the daily press. It is not in the province of a paper like this to even mention all the great inventions, or to tell you what you all are acquainted with, as previously remarked.

And the subject of this paper is the *abuse* of the patent system, not the *praise of invention*. Let us get down to our subject, only mentioning in passing that the introduction of gas was acknowledged to be one of the most useful of all inventions, and it was admitted to have done much in the cause of morality, the safety of persons and property, and the comfort of man, in its early days; and we all strive to improve that article now—that is one of the objects of this meeting. And it has not been, nor is it likely to be, permanently displaced by electricity; and fuel gas, or at any rate gaseous fuel, is one of the sure things for all to enjoy very soon.

Now let us consider the *abuse of the system*, which my preceding words show to be fully appreciated by the author and not at all condemned. The patent system is abused by two classes of people, the self-deceived and the deceivers, for gain, and what the law makers and the community in general, as well as the gas maker, have to do with it; how they are all affected can best be told by relating a few examples which have come under my observation.

Some years ago certain parties organized what they were pleased to style "A Gas Economizer Company." Their stock in trade consisted of a working model of a carburetor, many forms of which you know all about. This carburetor was, of course, protected by letters patent, which gave the thing undeserved prestige in the first place. The Company was incorporated and had offices at East St. Louis, in Illinois, where such things can be done very cheaply. But the incorporators aimed at the bank account of any simple St. Louisians whom they might be able to catch in their net, and they succeeded very well. Take a tight paint keg—or even a good nail keg would answer—fill it with sawdust soaked in gasoline, make a connection in the bottom of said keg with the gas supply pipe of a house, and another connection at the top with the pipe through which the gas must pass to burners, bore a second hole in the top of the keg, which hole may be closed by means of a cork when not to be used for the purpose of pouring a fresh supply of gasoline over the sawdust within, and you will have a first-class carburetor. Now, if a branch pipe, with a burner attached, was connected with the inlet of this carburetor and a like arrangement made at the outlet of same, and

the gas lighted before and after passing through the material in this improvised gas machine, almost anybody—except a gas man of course—would be struck with the great improvement in the appearance of the light of the gas. All this is really too elementary to mention before this Association, and my only excuse for doing so is to illustrate, by relating actual occurrences of recent dates, the simple means often used by these abusers of a noble system; by its very aid, to defraud their fellow man and make no end of trouble for gas companies wherever they may strike them. The "Gas Economizer Company" disappeared from public view very quietly, and the victims did not boast of their losses as they had previously boasted of what they would do with the gas company. Another company soon after opened rooms in the business center of this city. This company also had a patent and a working model apparatus made of glass, and one much larger made of wood and copper. These people made gas from water, zinc, a little acid and *oyster shells*. The latter were possibly employed to add a little mystery to the process and make it commensurably more attractive to those who had the dollars to invest. The writer of this paper was consulted about the matter by two wealthy gentlemen, who had been partly convinced of this great discovery by means of the aforesaid glass model—for behold "there they could see with their own eyes, don't you know," the *modus operandi*, and who could doubt after that? On having the matter explained to them they withdrew, half angry at the consulting engineer, who no doubt saved them thousands of dollars, where they had up to that time only expended a few hundred, for destroying their "Castles in Spain," though it was done at their request. The process consisted simply of decomposing water by means of acid and zinc, carbureting the liberated hydrogen by means of gasoline, and the burning for exhibition of the resultant mixture, which of course gave a brilliant light. This method of producing gas is as old as gas making itself nearly, and is not used for the self evident reason that it is not financially practical; in other words, it don't pay by great odds. Without a patent, the schemers who peddled this "great invention" could scarcely have been able to obtain the support of any one wishing to invest money; for the common sense reason, which is or ought to be understood by everybody, that gas companies are not likely to employ any but the best practical processes to manufacture illuminating gas—a matter well worth thinking upon by people sufficiently interested in gas to use it, not to speak of would-be-investors and legislators. *That truth* seems to be forgotten in all such cases as those referred to, and yet we are bound to see how, with a recent patent for a worthless invention, such as described, even men endowed with good common sense, but who are not educated gas men, could be deceived. Such practices are simply swindles and ought to be dealt with according to laws not yet made to prevent them. The Massachusetts Gas Commission, however, is so far the only lawful safe-guard for consumers and producers of gas alike, and ought to be imitated by other States, and could not fail of beneficial results, more especially if the officials selected were of the stamp, ability and character of the gentlemen who constitute the Gas and Electric Light Commission of the Commonwealth of Massachusetts.

We next may consider those who, really skilled to a degree in the art of gas making, and supplied with some money, have adapted some well known principles or some other man's ideas in what they are pleased to call a process and apparatus of their own. Some of these people are honest, except as to stealing other men's brains, which they consider no crime, and some are everything but what they ought to be. These are the fellows who, after selecting a, to them, suitable locality, quietly enter business by at first showing to a few wealthy residents, who are known to have a grudge against the local gas company, their wonderful apparatus. Disregarding the cost of distribution of gas, the miles upon miles of mains, service pipes and meters, costing according to location from the simple tens of thousands to the millions of dollars, and gradually but surely growing worthless, until they must all be replaced; disregarding all this, the necessary attendance, unavoidable bad debts and dozens of items, all of which you fully understand, these men, who would be worthy descendants of the ancient pirates, without their courage, perhaps, simply compare the *manufacturing cost* of gas by their apparatus with the *selling* prices of the gas vendd by the local gas company; and thus they soon obtain interested listeners and sometimes strong partners.

Next, the law makers of the town, city or State are similarly approached and convinced in the same way of the alleged shameful practices of the gas company. The legislators, unless cool, clear headed men, often feel that their constituencies could not help but gratefully appreciate any efforts to have them more justly—as they imagine—treated by the gas company; and so it happens that sometimes braving obloquy and detraction by the opposition newspaper, or even friends, they give

charters right and left for gas undertakings opposed to the old one, and more than that, use all their power to enact laws absolutely ruinous to the very foundation of the social fabric, were said laws permitted to stand by the courts of the land; as was the case not long ago in this very city, when the local "Solons" passed a law that after April 1st the Gas Company *must* sell gas at the rate of 90 cents for 1,000 cubic feet of 18-candle gas. Not one of the influential newspapers of the city had a word to say against the act; never once apparently considering that if it is lawful to regulate the price of gas sold by a private corporation, it is also lawful to regulate the price of bread, clothing, everything, not forgetting wages, in the same way. Did any one reflect upon where such a course would lead to? If so, no matter, the blow was at the Gas Company, and that excuse seems to make any iniquity right in the eyes of the people and the daily press. But if that sort of thing is not stopped, that act is only the entering wedge of a powerful social revolution, and the day of reckoning will surely come for those who sat quietly by and allowed a great wrong to be done, because it was done, forsooth, to the Gas Company.

Do I appear to be wandering from my subject, "The Abuse of the Patent System?" No, I think not; for as great oaks from little acorns grow, so it is in this matter, because without abusing the patent system, the things, of which a few examples have been related, could not have happened in the first place. My paper is already too long, I fear; but it could not be shorter and begin to show the danger of the abuse of the patent system with especial reference to the gas industry. But it is contrary to my ideas of propriety to speak of an abuse without also to at least suggest a remedy. Meetings like those of this and kindred Associations do something toward checking the evil. Other means have been proposed but failed, and there is in my opinion at present not one which would meet the emergency as the measure so successfully established and working in the old and cultured State of Massachusetts—I mean the Gas and Electric Light Commission previously referred to.

If the members of this Association could organize State committees for the purpose of presenting this matter of gas commissions to their State Legislatures it would possibly do some good, and could do no harm. This matter of the abuse of the patent system is growing in importance year by year, and there is scarcely a gas company or a community which has not had to suffer from it financially in some way. The system and the U. S. Patent Office are not to blame. The system, as was shown in the beginning, has done much good to the country and the people. The Patent Office officials must be, and are known to be, able and conscientious persons, and the only trouble with the Patent Office is that the force employed is not half enough to properly do the immense amount of business which is so rapidly accumulating there; that some of the branches of it are hopelessly behind, to the injury of the office and the people, especially inventors. In conclusion, let me repeat that the abuse of the patent system, with special reference to the gas industry, can, in the writer's opinion, be met best in the interest of the people who buy and the people who sell gas by a measure like the tried and approved Massachusetts Gas Commission.

Discussion.

The President—You have heard a most excellent paper read by Mr. Egner, and it contains a number of suggestions which have not appeared in just that form before. As the subject is one to which Mr. Egner has given a great deal of thought I know he will be pleased to answer any questions. A great many of us have in a measure participated in the profits of patents, and some of us have had a share in the losses which have been entailed by reason of having patented processes forced upon us. The paper is now before you for your discussion.

Mr. Ambrose—It strikes me this matter is of too much importance to gas engineers and to the gas industry to let it pass by without comment. As has been stated by Mr. Egner, we see the result in Massachusetts of the adoption of the plan which he suggests; and I believe if proper steps were taken we could get an act of the same kind enacted in the State of Missouri. If we could have a proper committee to go before the Legislature and properly present the subject for their consideration, I am of the opinion that something could be accomplished; but even if nothing of that kind resulted from it it could do us no harm. The gas interests of this State have been pilloried in about every possible manner, and every company in the State has had to take its abuse for declaring large dividends, when, as matter of fact, very few of us see anything of them. It is a good deal like what the old gentleman said who had been induced to put a little money in a bank. He had never investigated a matter of this kind, and so when they brought him a paper he looked it over and said, "Well, I don't know anything about that, but I would like to see

my dividings." A good many of us are like him. We do not care what they say so much if we can only see the proper "dividings." While we have received the abuse, we have not received the dividends. I think this matter ought to be referred to a committee in order that it may be thoroughly investigated, and, if thought best, a committee appointed from this Western Association, not only to go before the Legislature of this State, but of all the States that desire it. This is too important a matter to be passed over lightly.

Mr. Scofield—I hope someone more able than myself will speak upon this subject; but I have thought a great deal of the matter, and it certainly is a topic of much importance to this Association. As yet the State of Massachusetts is the only State that has provided a way and means by which these interests may be protected and directed. Coming as I do from Kansas, where there are but few gas companies, we have been slow to take any action upon this subject: but I feel that this Western Association in its strength and in its power ought to take the matter up. I agree with Mr. Ambrose that a committee ought to be appointed—a committee to cover not only the State of Missouri but the rest of our territory—so as to bring these matters in some form before our Legislatures, and if it be thought best some law can be introduced which shall bring this thing to a point; which shall bring to bear upon our industry such measures as shall protect the industries that have been legitimately established, and rid us of the opposition of those who, as our friend Egner says in his paper, foist patent schemes upon the people whereby they are induced to invest their capital in things which they know nothing about. I am fully aware that our gas fraternity, as a business people, when they sit down to figure, to contemplate, and to consider what their real interests are, know just how to do it; but the object is to get a commission which shall bring to bear an influence to protect these industries; and such protection would not only benefit the gas fraternity, but it would benefit the consumer as well. We have felt that in the State of Kansas. You have felt that here in Missouri. When one reads day after day, as I have for the past four or five years, of what has gone on and of what is going on in the city of St. Louis, my blood boils in my veins, although I have had no interest in this city except my general interest in the welfare of the whole gas fraternity. When the people in St. Louis through their lawmakers attempt to pass laws to destroy your interests, you who are selling gas at \$1.15 per thousand on a contract made four or five years ago by which it is your privilege to take \$1.25, by saying to you that you shall only take 90 cents per thousand—well, I am afraid that I will say too much. There is not only this practice of browbeating, but there are other schemes and schemers. I do not want to call names; you know who I mean, and I would just as soon they would know. Now, the only way to avoid this, the only way to get around it, so as to protect the gas industries and the gas interests legitimately, in my opinion, is to bring a power upon our Legislatures and have laws enacted by which our interests can be protected. We do not want all the earth. We are willing to take fair and reasonable dividends on the capital invested; and the only way that we can do it, in my opinion, is by means of these gas commissions. I do not know that I should fully uphold this commission business, but I say that in order to protect our interests, and the interests of the public, we have got to adopt some such measure.

Mr. Watts—I would like to ask Mr. Egner if he has matured any plan to accomplish the organization of commissions in different States, or whether he expects that the gas companies can do anything through their State Associations.

Mr. Egner—I have not matured any plan. I thought that our gas Associations should be something more than mere social gatherings for the reading of papers on subjects with which we are sometimes already pretty well informed. We are not here merely to have a good time. We ought to do something. Plans have been formulated before this. I believe this very thing has been brought before the Association before, and I was in hopes that the paper would bring on such a discussion as would induce the Western Association to take some steps forward in the matter. The only plan that I had thought of was that the State Associations would appoint committees, or that the members of this Association in the different States would form State committees who would take this matter up, and not let it rest until there was something accomplished, because there is no such word as fail if you are determined, and act understandingly and together in the matter. I thought that a great Association like this, which would perhaps have the sympathy of the American Gas Light Association in this movement, ought to be able to accomplish much. We are all working for the same end—for the protection of our stockholders and ourselves; and we might confidently rely upon having the aid and advice of other Associations. I thought that I would introduce the subject, and then leave it in the hands of the Association.

Mr. Lansden—The American Association, as many of you are doubtless aware, put itself on record a few years ago as being in favor of Gas Commissions. I think this Western Association can do little or nothing acting as an Association. Each State has to work out its own salvation. The American Association, as I have said, expressed themselves in favor of Gas Commissions, at their meeting in Philadelphia, four years ago. I do not see that there is any way that this Association, composed of gentlemen from all the States, west and south, as an Association, can do anything, even with the Legislatures.

Mr. J. B. Howard—I understood that this paper of Mr. Egner's was on the abuse of the patent system. Now I would like to know what an Association, or what any commission, can do towards stopping the inventive genius of the American people. If you appoint a commission here to look after patents, and to determine whether they are worthless or not, I think you will have to appoint a very strong committee, and have a very large organization. I cannot conceive how this Association can touch upon the question at all favorably, or give the matter any attention that would accomplish anything worth having. As I said before, the inventive genius is here. I remember some twenty years ago a man came to our works with a patent that was going to save 10 per cent. of the gas. He was an elegant looking gentleman, 60 years of age, highly polished, a most interesting talker, well dressed, and altogether presenting such an appearance that you would not think for a moment he was other than an honest man. And I would not have doubted it had he not made a remark that, as a gas man, convinced me he did not really understand what he was talking about. As matter of fact he was a fraud from the start. Perhaps some of you are acquainted with, or have met just such men. I think he succeeded in selling his patent right in some cities; but the power of the press entered into the situation, and no doubt prevented quite a number from paying out what they would have done had they not read an article in the AMERICAN GAS LIGHT JOURNAL exposing the fraud. He went on to state that the article he had for sale would so improve lime purification as to save 10 per cent. in the cost of it, and it would also stop all the "sputtering" of the gas while burning. That remark gave him away.

Mr. Ambrose—Did he have anything that would stop the sputtering of members?

Mr. J. B. Howard—I asked him particularly as to that point of sputtering. He got confused and said, "Well, if you don't see the situation properly I will see the directors and try to get them to understand it." I told him I would be very glad to have him do so; that I had a wagon outside and would take him right up and introduce him to the President of the Company. He did not go, however, and I heard nothing more of him. Now, as to getting rid of the patents. You cannot stop them. They will be constantly cropping up. A man will think that he has struck a good thing, will patent it, and will eventually find out his mistake. Some years ago at Fort Wayne a man came to the gas works to get advice with regard to a patent fluid that was being hawked around for sale—a non-explosive fluid. Mr. Spencer asked him what he wanted to pay money for anything like that, and added, "I will give you a receipt which you can get patented, and then it will not cost you near as much money." The inquirer replied, "I don't know but what I will accept your proposition." "Very well," said Spencer, "I will give it to you now. Buy a barrel of naphtha, take out the bung, blow your breath in it, and you will have just as good a non-explosive fluid as this." Therefore, I cannot see how this Association really can prevent the multiplication of patents.

Mr. Egner—I think Mr. Howard has got hold of the idea wrong. Understanding it as he does I would be of the same opinion as he is; but as I understand it, in Massachusetts if one of these kind of people that I have described comes into town and wants to get up a scheme for a new gas company it has to be referred to that Commission, who look into the situation. If the thing does not look feasible to them they sit down upon it. I understand that all such things are referred to the Gas Commission. Now, a party will come here, get capital together, start an opposition company anyhow, and the people who put their money in it, of course, do not want to lose it. One company started in as a light, heat and power company, or as a fuel gas company, and when they found that the fuel gas would not work they made carbureted hydrogen gas. This practice has cost some people hundreds of thousands of dollars, and it has also cost the legitimate gas companies hundreds of thousands of dollars. By means of a Commission like the Massachusetts one that would have been prevented. If a man went to them with scheme for making gas from oyster shells they would look into it to see if gas could be made in that way, and if they found that it could, they would give the permission; if not, it would not be given. What this Association has to do is just this: If the members of the different States

would take hold of the matter, and as such would try individually to do all that they could to influence the members, or to set them in the right direction by telling the truth about the matter, and by getting proper memorials before the Legislatures, proper laws might be passed, whereupon, instead of having to deal with a lot of corner grocery men, or with men who do not know anything—some of whom cannot even write their own names, but who are elected to the House of Delegates of the State of Missouri—we would have to deal with one commission composed of intelligent and conscientious gentlemen. That was the idea I tried to bring out in my paper; and I think it is in that line that this Association can act. If you put it off for a while longer it will be harder to do next time, and you will all be hurt worse then.

Mr. C. D. Jones—I am much interested in Mr. Egner's paper on the abuse of the patent system as bearing on the gas industry, with the remedy which the writer has suggested. In the State of Iowa, within the last four years, a law has been enacted authorizing Councils in every city of over 7,000 population to fix the price to be charged for gas. We have no Association in Iowa, and the companies are not strong enough to take hold of this matter and secure any proper action by the Legislature. It looks to me as if it was a very important matter to get gas commissions appointed, whose duties could be made large enough so that every application of the kind referred to could be turned over to the commission. I think it would be a grand thing for the protection of the gas industry in our State, and in every other State as well.

The President—If the members will indulge the Chair for a moment I would like to state what has been done by the electric light associations. They have a national association, and that association has endeavored to secure the enactment of laws that would protect the electric light industry against the raiding of prices that they have been subjected to; for they have had an experience much the same as that which gas companies have gone through. They found it was not national legislation that was required; that national organization could accomplish very little. That a national organization could gather a large volume of statistics, and get very valuable suggestions, but that for practical operation it would devolve upon State organizations. For the purpose of facilitating matters they appointed a committee on State and municipal legislation, with one member from each State. It was found after trial that one member from each State could accomplish absolutely nothing. They could get together data and statistics relating to the different States; but they found when grievances were reported that they were absolutely powerless to resist attacks or raids when made against companies in the several cities. That brought up a suggestion that State organizations be formed. It brought up the further suggestion that State organizations with individual memberships amounted to nothing; that although a hundred men could get together once or twice a year and compare notes—although it was very pleasant, and there was a large amount of sentiment about it, yet it accomplished nothing practicable. If we contribute \$5 per year each it is only \$500 in the aggregate; and \$500 will accomplish very little in the maintenance of an organization, in collecting statistics, and in formulating the measures that the gas industry would want enacted. So that it led to the formation of State associations, composed of the local central station companies. The membership of the association was made up of the companies themselves, not of the presidents, or engineers, or general managers, or treasurers; all of those members could be present at the meetings, but only one could vote in the name of the company at the meetings of the association. It was made up of company membership. Now, that body of men, having that interest, and having delegated to them the power to bind the several companies by their acts, having power to levy assessments if necessary on the companies according to their capital stock, formed a strong organization, and one that enabled them wisely to formulate and properly present acts which would be desirable. The reason that the electric people have progressed so far and so rapidly, and have come to such a firm conclusion on this matter, is because the present status of their business demanded just such an organization. They recognized the fact that as State organizations simply they would be a very weak element, but that when combined together in one general organization—as the States of the Union are in one general government—it would be a very strong power. If the gas companies of Missouri were to perfect an organization—not necessarily as an incorporated body, with power to sue and to be sued—come to some conclusion as to what they want and then proceed to get it, they would accomplish much. They do not need to meet in conventions of this kind and have their proceedings published to the world, but they might meet as directors of companies. They would want the aid and counsel of other organizations, but that might come through the national organization. I think it is right and proper that

the Western Association or the American Association should investigate the merits or demerits of questions of that kind; but for getting the thing into practical operation I think we would require State organizations.

Mr. Ramsdell—I think the difficulty with this question is that as an Association we have no power to deal with it. This ground has all been traveled over before. At our meeting in Columbus several years ago majority and minority reports were presented, covering just the ground which is brought out by the discussion at this time. The majority report recommended State organizations, with a view to having gas commissions established. The majority report was adopted by a very large majority of the Association, but the work ended there. I was one of the committee, and I know that a great deal of work was done in getting this report into such a shape as really would represent the sentiments of the members of this Association. The vote as taken preliminarily to the meeting was very largely in favor of State organizations. The trouble arose, however, from the fact that to accomplish anything at all the work must be done by the gas companies in the State itself. Take for instance the State of Missouri. If anything is to be done here the initiative would have to be taken by some few persons in the State, gathering together those representing the gas industry of the State. They can then form an organization, bind themselves to meet the actual necessary expenses, and appoint their committees for carrying forward the different matters that would naturally come under their supervision, such as legislation, the procuring of suitable data, and work of that kind. It seems to me, Mr. President, the only thing we can do here as an Association would be to endorse this suggestion and recommend that State organizations be perfected in the different States which are represented in this Association. At the same time, if we do that we are only duplicating work which has been already done, because we are already on record as favoring Gas Commissions and as favoring State organization.

Mr. Egner—As Mr. Humphreys, of Lawrence, Mass., is present, perhaps he can give us some information as to the working of the Gas Commission of that State.

The President—We shall be glad to hear from Mr. Humphreys.

Mr. Humphreys—I hardly know what relation the gas commission question has to the patent question. I do not know that I can say anything more with regard to the working of the gas commission in Massachusetts than has already been said. The gas commission was originally appointed through a resolution introduced into the Boston Board of Aldermen, by Mr. Greenough, who was at that time a member of the Board. The resolution called upon the Legislature to investigate the question of the advisability of appointing a board of gas commissioners similar to the board of railroad commissioners then in operation in that State. The matter came before a committee of the Legislature; and the representatives of the different gas companies appeared before that committee. First, the representatives of the companies of the city of Boston were heard, as they were the originators of the scheme; and the representatives of the different gas companies throughout the State, as many as wished to be heard, were heard. After considerable investigation a law authorizing the appointment of a commission was enacted, and later three gentlemen were appointed on the commission. There has been no change in the membership of the commission since they were appointed. As to the relation of the gas commission to opposition gas companies, I think it is about like this. If there is a gas company in operation in a city, and another company applies to the board of aldermen for the right to dig up the streets and lay pipe, the decision given by the board of aldermen on that application is subject to revision by the gas commissioners. There is a right of appeal from the action of the board of aldermen to the gas commissioners. The commission will hear both sides, and it remains with them to say whether the new company shall come in or not. Upon their investigation they will consider the service which the old company has been giving, and if the old company has been charging exorbitant prices, or have given poor light, I think it very likely they would grant to the new company the right to come in. On the other hand, if the old company has been doing its duty, and has been supplying the people with good light, at a reasonable price, my impression is that the gas commissioners would not allow a new company to come in.

Mr. Walton Clark—I would like to say a word about the original question, which I understand to be a proposed remedy for alleged abuses of the patent system. I cannot see what connection there is between gas commissions and the issuing of letters patent. It seems to me if there is an abuse of the patent system, that the proper remedy is in the Patent Office. Mr. Egner has cited the case of the patentee of a form of carbureter which was old; certainly the remedy in that case would have been a better examination in the Patent Office. However valuable or otherwise a gas commission might be in preventing the establishment of

opposition companies, it can hardly be expected that a gas commission would be composed entirely of gas experts who could speak advisedly as to the value of patented inventions; in fact it is undesirable that a commission should be composed of such men. I think they should not have been identified with the gas business at all previous to their appointment as commissioners. I do not see what such a commission could accomplish in the way of remedying abuses of the patent system. They could perhaps prevent the starting of an opposition company based upon new patents, but I cannot see what protection there would be to capitalists. We know that many of the patents which are issued are of no value whatever. In fact, a patent issued by the United States commands for itself very little respect. That is shown by the vast number of patent suits which are carried on in the interest of different industries. To my mind the remedy lies in the Patent Office—in securing more intelligent examiners; and I am very much in doubt whether this body, or any other gas association acting independently, can do anything in that direction. It is a question a great deal broader than the gas business. It involves the manufacturing interests of the world; and I think we cannot hope to accomplish anything by acting independently of other manufacturing interests.

On motion of Mr. Ramsdell a vote of thanks was tendered to Mr. Egner.

A recess was then taken until 2 o'clock.

(To be continued.)

The Chemistry of the Dinsmore Process.

The London *Journal* notes that at the May meeting of the London section of the Society of Chemical Industry, Mr. Watson Smith, Lecturer in Chemical Technology in the University College, London, read a paper on the above subject, of which the following is an abstract.

It will be remembered that a paper on the Dinsmore process as worked at Widnes, comparing its efficiency and cost, and the illuminating power of the gas produced, with the usual process of carbonization, was read by Mr. Isaac Carr before the Liverpool Section of the Society last year; and in it a description of its working was given. It may be well to recall the broad principle on which it is based. It may be briefly described as a method whereby the crude gas, laden with much condensable matter—potential tar—is passed through a heated chamber; and there much of the less volatile vapor is permanently gasified. As worked at Widnes, the gas from a bed of six retorts is led through one of fireclay, termed the "duct," the inlet end of which is kept at a cherry-red heat (from 1,700° to 1,800° F.), and the outlet at a dull red (from 1,200° to 1,300° F.). From this it departs by the ascension-pipe, which is water-jacketed to prevent the formation within it of coke or pitchy matter. It was neglect of this, or a similar precaution, coupled with the adoption of the plan of first making the gas in the ordinary way, and then gasifying the resulting tar, instead of subjecting the crude gas before it had deposited its tar to the gasifying process, that led to the troublesome stoppages and unsatisfactory working of the original Dinsmore process before its modification by Mr. Isaac Carr. The idea of gasifying tar after its condensation is, of course, very old, and was at first attempted in order to get rid of a noxious substance, rather than with any view of cheapening or improving the gas.

At first blush it seems strange that a gas of increased illuminating power should be obtained by any superheating process such as this is. The plan of overheating ordinary gas—thus increasing its bulk at the expense of its luminosity—is sufficiently well known to have given rise to the classical story of a port where it was, no doubt scandalously, alleged that such gas was always supplied to the street lamps in the small hours of the morning, as drunken sailors were the sole occupants of the streets. But superheating *qua* superheating is not the true cause of the improvement effected by the Dinsmore process. It is even possible that a portion of the gas suffers a change, and that for the worse—just as in ordinary superheating; but any slight loss from this source is more than counterbalanced by the gasification of the tarry vapors already alluded to.

That this is actually the case, and, further, that the action is selective, is shown by the fact that the quantity of Dinsmore tar is only about two-thirds that of the tar usually produced, and that the tar is of a totally different character from the latter. The difference consists mainly in a notable poverty in light oils and tar acids; and there seems to be little doubt that the aromatic hydrocarbons constituting the former are broken down with hydrocarbons of the olefine and acetylene series, and so appear among the permanently gaseous products as illuminants, while the phenols of the latter are reduced to their corresponding aromatic hydro-

carbons, which then suffer change in the manner indicated above. At the same time there is a noteworthy absence in the purified gas of carbon dioxide, the diluting and light-reducing power of which must not be overlooked. The interaction of the hot gaseous products in the "duct," to which these remarkable results are due, is practically uninterrupted; for the gas from each retort is only diverted to the hydraulic main during recharging.

According to the figures due to Mr. Carr, 9,800 cubic feet of 20 to 21 candle gas is produced by the Dinsmore system, as against 9,000 feet of 15 candle power ordinary gas per ton of coal carbonized. The additional candle power, in view of the increasing difficulty of obtaining cannel, is specially important. The cost of applying the extra plant to existing retorts is said to average about £6 per mouthpiece. In considering the advisability of adopting any such process, two of the chief questions are the local demand for gas of high illuminating power and the price of residuals. Where the candle power required is low and easily obtainable by ordinary methods of carbonization, the best possible yield of the richest attainable tar would naturally be sought, provided good prices for tar products ruled. Further, the general adoption of any process which enriches the gas at the expense of the tar is of no little moment to color makers, who would see their raw material vanishing. Nevertheless, any plan which gives gas managers a fuller control over the quantity and character of their output, and throws light on the chemistry of gas making, must always be welcome.

Oil in India.

The location of new sources of petroleum in India still goes merrily on. Since the beginning of the year extensive deposits have been brought to light in new districts near Quetta, in several places close to the Khyber Pass, in the Punjab, and again in Upper Burmah, quite remote from the well known oil fields at Yenangyoung. Those near the Khyber Pass are to be shortly investigated, as they promise to provide fuel for the railway that sooner or later will run from India to Cabul. A survey of this line, as we stated a short time ago, has been ordered by the Indian authorities. Meanwhile, it is interesting to know on the authority of Mr. Boverton Redwood, our ablest technical expert in petroleum in this country, that the supply of oil at the Khatun petroleum fields is ample for the requirements of the Quetta Railroad. Five wells have been bored up to now, yielding each 400 to 600 barrels of oil a day, and the supply of any one of the five would be ample for the present fuel demand of the railway. In a lecture before the Society of Chemical Industry a few days ago Mr. Redwood declared the Beluchistan petroleum fields to be the best, as regards copiousness, in all India. The oil fields there belong to the State, the wells have been sunk at the expense of the government, and already have given such satisfactory results in regard to fuel that the saving will more than cover all the expenses incurred in well sinking up to now. The Beluchistan petroleum is heavier than the Baku oil, and by the present methods of distillation does not yield so much illuminating oil; but a recent discovery by Mr. Redwood and Professor Dewar in distilling heavy crude and waste oils has rendered it possible for the Beluchistan oil to yield 40 per cent. of kerosene, as compared with the 30 per cent. obtained from Baku petroleum. This discovery, the result of years of chemical research, promises to occasion a complete revolution in petroleum by bringing into use vast quantities of heavy crude oils hitherto considered too difficult for the refiner to deal with. This applies to Burmah quite as much as to Beluchistan. While drilling operations have been successfully progressing near Quetta large supplies have been tapped in Assam, and the American wells sunk in Upper Burmah have struck oil to an extent that would be considered most satisfactory either in Galicia or in the United States. The enormous gushers at Baku, however, have excited the appetite for similar abnormal wells elsewhere. It is forgotten that the real criterion of the value of a well is not the quantity of oil that flows up from it, but the market available for it on reaching the surface. In this respect the Caspian oil fields are so handicapped by difficulties of transport that a 50-barrel well in the States is a better one to own than a well yielding 5,000 barrels a day at Baku.

Resistance to Fire of Wood Posts.

The endurance of wood posts when subjected to the action of fire, is strikingly shown in a fire which occurred in a warehouse of enormous proportions, and raged with great fury for five hours, at the end of which time it was extinguished. According to the *Architect* (London) the warehouse was constructed of brick walls; it had wooden floors sup-

ported on wooden beams, which, in their turn, were carried on wooden story posts about twelve inches thick, and, although serious damage was done, not one portion of the heavy wood work was destroyed. After the fire, the proprietors allowed the chief of the fire brigade to remove one of the story posts, with a section of the beams and other parts surrounding it above and below. This post had been subjected to the full action of the fire during the whole of its duration, as already mentioned, or, making full allowance for everything, including the delay of the fire attacking the particular spot on which it stood, and the time at which the cooling process commenced, certainly not less than four and a half hours. As large quantities of water had been used, and it was probable that everything had been saturated, the wood was carefully dried before a strong fire until not a trace of moisture remained in it. It was then set on end in an open yard, exactly as it had stood in the warehouse, with the pedestal underneath, the cap above, and the beam across the cap. More than a ton of shavings, light wood and heavy wood were placed around it, and after the whole heap was saturated with petroleum, a light was applied to it, and after this large quantities of petroleum and turpentine were pumped on it. At the end of two and one half hours, the post, beam and other parts were withdrawn from the fire, and within a few minutes of the time they were withdrawn they ceased to burn. A few feet were then sawed off horizontally, at that part which had suffered most from the flames, and afterward the same piece was split longitudinally with steel wedges, in order to examine its condition. The post was of pitch pine—about the most inflammable wood known—and yet after exposure for seven hours to fire, the fury of which could not be exceeded, except in blast furnaces, it contained within a quantity of perfectly uninjured and apparently fresh wood, probably capable of supporting the whole weight which the original post was designed to carry. Immediately after the saw cut, and again after the cleaving with steel wedges, the center was carefully examined, and found to be just perceptibly warm to the touch, but nothing more, thus proving that the fiber, in which the strength lay, was quite uninjured.

ITEMS OF INTEREST FROM VARIOUS LOCALITIES.

AT the meeting of the Electric Construction Company, Rockland, Maine, the following officers were elected: President, A. M. Copp; Treasurer and Agent, G. C. Moses; Clerk, Chas. T. Frost; Directors, Messrs. G. C. Moses and F. H. Twitchell, of Bath, Me., C. T. Frost, of Rockland, Me., and F. H. Odiorne and A. M. Copp, of Boston, Mass. It pleases us to add that Mr. Chas. T. Frost was recently presented by the stockholders of the old Rockland and Thomaston Gas Company, in whose service he acted capably and conscientiously for a period of 17 years, with a handsome gold watch and chain in recognition of those services. Those acquainted with the lighting situation in Rockland will not be very greatly out of the way in supposing that the Electric Construction Company of that city is not inimical to the local gas interests.

WE understand that the plant and franchises of the Moberly (Mo.) Gas Light Company have been purchased by Messrs. Hammett & Davison, of Kansas City, the consideration having been \$22,500.

A CORRESPONDENT writing from Macon, Ga., under date of May 22d, says that "the people of this city will have to pay higher rates for incandescent electric lighting than those now prevailing. There can be no doubt that the Macon Gas Light and Water Company has been losing money on the current schedule—from \$1 to \$1.23 per lamp per month, the difference to be charged to hours during which current was supplied—and like a prudent retailer it has determined to place the price where a living profit can be made. As I understand it the rates will be raised to \$1.50 up to \$2 per lamp per month, the difference as before being based on hours of service and number of lamps in use. The schedule will take effect on June 1st, and I am curious to see whether this increase will not put an end to the determination said to have been reached by the Company some time ago to increase the capacity of the incandescent electric plant by something like a 500-light machine. In my opinion the addition will not be needed; for a 16-candle power incandescent lamp, at \$1.50 per month, even admitting that it could be used by the consumer whenever required by him, will not be near so economical as a gas burner supplied with gas of the quality now sent out in Macon, at the rate per thousand at present charged.—E. S."

THEY mean to have another opinion on this matter in Massachusetts—i.e., of conferring the right on cities and towns to manufacture and distribute electric light, gas light, etc.—for, following the Attorney-General's adverse decision in respect to it, Speaker Barrett, of the House,

succeeded recently in securing unanimous consent of the Assembly to a resolution asking that "the opinion of the Supreme Court of the State be required upon the question whether or not it is within the constitutional powers of the Legislature to confer upon cities and towns the right to manufacture gas or electric lights for use or for sale."

A NEW exhauster, rated to a duty of 200,000 cubic feet per diem, has been installed at the Northampton (Mass.) works.

FOLLOWING our notice of the proposed construction of a gas works in Summit, N. J., we may remark that the incorporators recently applied to the Township Committee for permission to open the streets and roads of the town for the purpose of putting down gas mains. The Committee, having looked over the application, returned the following answer thereto: "Your application * * * was considered. The Committee are in favor of granting the permission asked, but will require in return an agreement in regard to the proposed methods of doing the work, the time within which it is to be done, price of gas to be furnished citizens, and perhaps some other particulars which may be regarded as proper and necessary for the protection of the township, and which can only be made after the Gas Company has been fully organized. * * *." This, of course, sounds only proper, pretty and polite; but the real matter behind it all is that the proposition to operate a gas company in Summit has aroused the opposition of certain parties who wish to secure a contract for public lighting in the township by means of electricity. That this opposition has friends in the Committee is possibly well proven by the submission of the following resolution that was passed at the meeting of the Committee at which the Gas Company's application was so politely referred back. The resolution is: "Resolved, that it is the sense of the Township Committee that the contract for lighting the streets and roads of this Township should be awarded to a company or individuals who will offer and guarantee for such lighting electricity, and furthermore that such system of lighting is to-day the most effective and economical for the public lighting of the Township of Summit." This pronouncement takes on a closer resemblance to the celebrated "resolve" of the Tooley street tailors of ancient renown when it is borne in mind that the Committee is known to favor "incandescent electric lights of 25 candle power nominal," to the exclusion of manufactured gas. The crab-like advancers on the Township Committee need not go out of their own State—in fact they could easily walk over to Elizabeth—to examine one of the best lighted towns in the State, always excluding those in which the arc light is used—where gas is used for street lighting purposes, and then, if not too fatigued with the exertion, just take another pedestrian tour to Mount Holly—on sober second thought, perhaps they might better "take the cars" to the latter place—where a beautiful (?) specimen of incandescent electric public lighting is to be seen, if they desire proof that they write themselves down as asses in the assertion "that such system of lighting [incandescent electric] is the most economical and effective for the public lighting of the Township of Summit."

MR. NELSON SMITH, formerly of Newmarket, N. H., has been appointed Manager of the Ipswich (Mass.) Gas Company.

THE proprietors of the Salem (Mass.) Gas Company are to be complimented on the excellently arranged display of gas cookers and heaters now being made in the Museum Building in that city.

AT the annual meeting of the Winona (Minn.) Gas Light Company the following officers were elected: President, H. W. Lambertson; Vice-President, Henry Stevens; Secretary and Manager, H. C. Bolcom; Directors, the officers and Judges Thomas Wilson and William Mitchell, and F. M. Cockrel. The Company enjoyed a most prosperous year, and will duplicate this result, if not exceed it, when the returns for the current twelvemonth are in.

"THE annual meeting of the Portland (Me.) Gas Light Company, which was held something over a week ago, was called to order in the new office building recently completed for the proprietors on Temple street. It is a three storied affair, the lower floor being used as a meter-repairing shop, the offices occupy the second floor, and the third floor is arranged in apartments for the President and Treasurer. The building, which was erected under the direction of architects Fassett and Thompson, is really a credit to those who had anything to do with it, and is an addition of note to the many handsome building structures of the city. I do not suppose your readers are very greatly interested in matters of this sort but I must say that the ash-finishing of the apartments is really artistic, and I make bold to say that some visiting gas men will go away with the impression that they wished they 'had something at home' like

the Portland Company's new quarters. The meeting was well attended, and I presume I can hardly do better, by way of showing what the Company has done during the year, than give the following from President Daveis' annual report—it should be borne in mind in looking at the send-out figures that pretty much all the public lighting was done last year by electricity, and that Superintendent Yorke has been fixing up the mains of the Company: 'The consumption of gas for the year ending April 30, was 50,470,000 cubic feet, against 49,856,000 last year, a gain of 614,000 cubic feet. The number of consumers on the 1st inst. was 2,972, an increase of 51. There have been carbonized 4,984 tons of coal and 85 tons of oil, yielding 55,000,000 feet of gas, averaging 18.9 candle power. There have been sold 86,317 bushels of coke, 3,950 bushels of coke breeze and 90 barrels of tar. There have been laid 2,382 feet of mains, in West, Clark, Crescent, Gilman, Congress, Brackett, Taylor, Neal, Wescott, Carroll and Oak streets. A new exhauster has also been placed; a lot of land was bought on Temple street, and a new office has been built upon it, and nearly completed, at a total cost thus far of \$8,250, which has been paid out of our renewal and insurance funds. For the coming year we shall purchase and set 45 new retorts, costing, with the tiles, etc., about \$4,000. We shall build a new sewer through the sea wall costing about \$360. No other extraordinary repairs at the works are expected to be required, unless the old holders should give out. This is liable to happen at any time, and it will take a large part of our reserved fund to build a new one. A new meter prover has also been installed.' When the report was adopted an election was entered into, with the following result: President, Edward H. Daveis; Treasurer, Samuel Rolfe; Directors, E. H. Daveis, W. W. Thomas, Chas. B. Merrill, W. H. Moulton, Fred. N. Dow and John F. Rand. The other feature of importance was the declaration of a dividend of \$2.50 per share, payable to-morrow. The new office building was, of course, properly baptized. It gives me pleasure to add that a more harmonious working board does not exist in any other corporation in far-away Maine than that which directs the affairs of the Portland Gas Light Company.—OBSERVER."

THE new buildings of the David E. Paris Stove Company, at Sioux City, Ia., will be built of iron by the Berlin Iron Bridge Company, at the latter's shops at East Berlin, Conn. The foundry building will be 155 feet wide by 350 feet long, the mounting room 87 feet wide by 225 feet long, and the boiler, engine and plating room 50 feet wide by 196 feet long. The Berlin Iron Bridge Company also have the contract for the new foundry building of the Waterbury-Farrel Foundry and Machine Company.

THE name of the firm of Rumsey & Sigmeyer was omitted from the souvenir programmes for the outing-time of the recent St. Louis convention of the Western Association, through a mistake of the printers who were entrusted with the work. Very likely the "intelligent printer" concluded that Rumsey and Sigmeyer and the L. M. Rumsey Mfg. Company were identical, and that separate publication would be duplication. The correction is made now. And we might add that both firms were liberal contributors to the entertainment fund.

THE St. Louis *Globe-Democrat* says that the opposition which began in Europe against antipyrin, as a dangerous agent for the reduction of fever and the abatement of pain, has been the indirect cause of the introduction of a new remedy of the same class and the same general origin. It is called antikamnia, and is a product of coal tar, as is antipyrin. The new medicine is said to be a certain remedy for headache, neuralgia, locomotor ataxia, sciatica, and in fact for all pains that can be reached by medicine taken into the stomach and diffused into the blood. Antikamnia does not excite the heart, nor does its use grow into a habit, as it contains neither opium, cocaine, nor any other dangerous drug or chemical. It does not produce gastric disturbances.

MR. THEO. B. WELLS, as Secretary of the corporation, gives notice that the name of the Chicago Gas Trust Company has been changed to Chicago Gas Company, by virtue of and in accordance with the provisions of the statute of the State of Illinois in regard to the change of name of corporations. All holders of certificates of the capital stock of said corporation are notified to present such certificates to the respective transfer offices of the Company at which the certificates they hold were issued, to be exchanged for certificates bearing the new name of the corporation. Certificates issued from the Chicago transfer office are to be presented at the Union National Bank, Chicago; those issued from the Philadelphia transfer office are to be presented at the Fidelity Insurance, Trust and Safe Deposit Company, of Philadelphia; and certifi-

ates issued from the New York transfer office are receivable at the Central Trust Company, of New York.

THE proprietors of the Minneapolis (Minn.) Gas Light Company are also speeding on the good work of introducing the use of gas in kitchens, and in furtherance of this object, among other things, have distributed throughout the city copies of the following circular, which we think is worth reprinting:

What does it Cost?—In seeking to introduce the use of gas stoves we are frequently asked the question, "What does it cost to operate a gas stove?" We know of no better way to answer the question than by giving a statement of the actual experience of those using gas exclusively for light and for cooking and laundry purposes. The subjoined statement is one prepared from our books, and is the actual experience of 14 families, living in apartment houses where there are no means for light or cooking except by gas. It must also be borne in mind that the averages and monthly bills are for light as well as for cooking, as but one meter is used for each consumer, and there is no method of separating the amount used for light from the amount of gas used for cooking. We have selected 5 months of the year when the use of gas for lighting is heaviest, and in the face of the statement we maintain that the use of gas for cooking and lighting is one of the cheapest necessities one can have. Another strong point in favor of gas as a fuel is the absolute freedom from danger; no fuel to handle; no ashes; no soot; no bad cooking. We invite your inspection of our sales department, where we carry in stock all the most improved gas stoves, burners and appliances, which are for sale to our customers at cost prices.

Statement.

*Total days, 150.

THE latest oddity in "steals" is reported from the works of the Rochester (N. Y.) Gas Light Company, which mourns the loss of an 800 pound iron "drip" that was taken from the storage yard by a thief named John Gleisch. He has been impounded.

THE Managers of the Pottstown (Pa.) Gas and Water Company met on the evening of May 24th to award the contracts for their new reservoir, with pumping station, water mains, etc., the estimated cost of which is put at \$125,000. There were eight bids tendered for the reservoir work, and seven bidders handed in figures for the pipe laying and the pumping machinery. The contract for laying something over three miles of water mains was awarded to Howard E. Ahrens, of Reading, but the

reservoir and pumping station contracts were deferred. The Mellert Foundry and Machine Company got the contract for 1,500 tons of 20, 24 and 30-inch water mains.

THE Pennsylvania Globe Gas Light Company wants to perform the public lighting of Chester, Pa., by means of gasoline lamps. On a moontable they offer to light, extinguish and maintain each lamp, on a yearly contract, at \$23; on a two year contract, at \$22; on a five-year contract, at \$21.50.

THE Managers of the Capital City Gas Light Company have over 400 gas stoves now in service in Des Moines, Iowa, and Superintendent Pratt is confident that at least 600 will be in duty by October 1st. The handsome corner store in the Hotel Savery building has been rented as a show-room, and it is stocked with a large and varied selection of the best makes of gas ranges, cookers, broilers, heaters, etc. Mr. H. D. Willis, with a goodly number of assistants, will instruct the visitors in the art of gas cooking. This, of course, will be a permanent thing, and cannot fail of being profitable. To boom "the opening" the Company engaged Miss Stiles to deliver a course of 9 lectures on the art of gas cooking, the lecture hall being located in the Commercial Exchange Room. Miss Stiles illustrated her lectures in using a gas stove in full view of her audience. The first of the course (given on May 20th) was a lecture on bread making, and to this seance no admission was charged. Tickets for the remaining lectures have been placed at 50 cents for a single lesson, or \$3 for the course. The other lessons were arranged for as follows: On May 22d, subject, "Soups;" May 24th, "Fish;" May 26th, "Roasts;" May 28th, "Entrees;" May 30th, "Salads;" June 2nd, "Pastry;" June 4th, "Delicate Dessert;" June 6th, "Eggs and Omelettes." So far as heard from the lectures have been well delivered and well attended, which is perhaps the best augury for the future. Miss Stiles, who is a graduate of the Kansas City School of Household Science, has good command of her subject, and expresses herself so that her auditors are never mystified. The Company sets the stoves at net cost for apparatus and labor, and has made the special rate of \$1.50 per 1,000 cubic feet for gas used for purposes other than lighting. There can be no doubt about it that the Capital City Company's day sendout will soon figure as an important factor in its business.

THE latest news from St. Joseph, Mo., is to the effect that articles have been filed incorporating the St. Joseph Light and Fuel Company, the proprietors of which intend to assume the "rights, franchises, and privileges" recently granted to one Charles McGuire by councils for the operation and maintenance of a light and fuel gas works in that city under the Fahnehjelm system. The capital stock of the Company is put at \$500,000, divided into 5,000 shares, which are said to be held as follows: Charles McGuire, 800 shares; O. M. Spencer, 800; J. W. Heddens, 800; George E. Black, 800; John Donovan, Jr., 800; D. D. Burns, 800; J. G. Schneider, 200. Well, what next?

WE desire to call especial attention to the advertisement on page 779 of our current issue, inserted at the instance of Mr. William Daley, Engineer and Manager of the city of Dunedin Suburban Gas Company, Limited, of Caversham, New Zealand. The advertisement explains itself completely, and we have only to add that Mr. Daley is a thoroughly reliable man, who can be depended on to redeem all his promises. Our burner makers will likely find it to their interest to be represented at the proposed exhibition, and they should also bear in mind that as New Zealand is well on the other side from us no delay should be permitted in the matter of forwarding their parcels.

THE permanent residents of Coney Island are clamoring for an extension of the public lighting system. In fact under the present arrangement the Island might as well be without any public lamps, so injudiciously have the latter been located.

THE Yonkers (N. Y.) Gas Light Company's wharf, at the foot of Babcock street, is to be further improved.

THE proprietors of the Anniston (Ala.) Gas and Light Company, in order to increase the use of gas for purposes other than lighting, have put the rate for cooking, heating and power at \$1.75 per 1000 cubic feet. They will also supply and install the necessary stoves, etc., at net cost.

ELSEWHERE we make mention of the presentation to Mr. Charles T. Frost, by the holders of the Rockland and Thomaston (Me.) Gas Company, of an elegant gold watch and chain as a testimonial of their appreciation of his faithful and efficient services, covering a period of 17

years. Since that item was written we have received from a valued correspondent some further account of the presentation and of the services that led up to it. Our correspondent remarks: "I enclose you an account of the presentation to Mr. Chas. T. Frost, by the stockholders of the Rockland and Thomaston Gas Company, of a handsome gold watch and chain. Mr. Frost, who served the Company for 17 years as Superintendent, is well known to the Eastern fraternity, and that the testimonial is merited can be understood from the fact that the sendout of the Company has increased during his term of office from 1,300,000 cubic feet to 4,000,000 cubic feet, and the rate has been cut from \$4.50 per 1,000 to \$2.50 per 1,000. Again, not only have the works been gradually rebuilt out of earnings, but a dividend paying basis of 6 per cent. per annum has been reached. The former shareholders of the Company, having received an offer for their stock from certain capitalists more or less interested in local electric lighting ventures, agreed to sell out their holdings, hence the property is now in new control as to ownership, but its management still remains in the hands of Mr. Frost. He will also have charge of the electric annex. The outlook for the Company is of the most promising kind.—H. R."

THE property of the Edison Electric Light Company, Sunbury, Pa., is in the hands of the sheriff, because of an attachment sued out by D. D. Heim & Co., for \$1,610.76.

THE bill before the Massachusetts Legislature authorizing the consolidation of gas and electric light companies has been ordered to a third reading in the House, and it looks as if the measure would eventually become a law.

SUPT. HAYDEN has completed the work of overhauling the main system of the Fishkill (N. Y.) Gas Company, and as a result the Company has been enabled to announce a reduction in gas rates. The new schedule ranges from \$2 to \$2.25 per 1,000 for lighting purposes, the rate for fuel gas (through separate meter) being fixed at \$1.75. The former schedule called for a payment of \$2.25 to \$2.50, without any rebate on gas used for fuel purposes.

THE annual meeting of the Knoxville (Tenn.) Gas Light Company will be held on Friday.

THE electric annex of the Grand Forks (N. Dak.) Gas and Electric Light Company is driven by gas motors (70-horse power), and the scheme gives great satisfaction. The Thomson-Houston system is employed, and the dynamic capacity is equal to the maintenance of 1,200 incandescents (16-candle power), and 30 arcs of 1,200-candle power each. Superintendent Raycraft, however, thinks that the gaseous end of the establishment is the one that will earn the most money.

THE Appleton (Wis.) Fuel Gas Company is bound under its charter to supply street lights at \$20 each per annum, fuel gas for 75 cents per 1,000, and lighting gas for 90 cents.

The Market for Gas Securities.

The city market for gas shares was not particularly active during the week, although values in Consolidated were fairly well maintained. Today (Thursday, May 29) the shares are bid for at 103, with no stock offering. The action of the Trustees of the Company, in settling upon the rate of dividend for the past six months, effectually settled the hopes of those who looked for an increase. They determined that 2½ per cent. would be about the right thing, and the dividend checks will bear the date of June 14. There is no doubt whatever that the Company's earnings for the past six months would easily permit of a raise to 3 per cent., and there can be no doubt either that the refusal of the Trustees to change the rate is worthy of praise as a prudential measure. It is good management and careful financiering. That the floating stock on the market has found its way into strong hands is best shown in the fact that a 5 per cent. manufacturing company's securities are held above par. We consistently and constantly urged the purchase of these shares from the time they were first placed on the market, and we further advise their purchase now. We will also add that it is odds on that the next dividend declared will bring the rate to 6 per cent.

Citizens gas of Brooklyn is up to 82, and it may go higher. Other city and Brooklyn shares fully hold their own. The event of the week, however, was the decision of Judge Collins, of Chicago, in the suit of Charlton against the Chicago Gas Trust. The Judge sustained Charlton's side of the argument, and ordered that a Receiver be appointed to take charge of the Trust's affairs, and enjoined it from transferring its stock holdings, moneys, etc., to the Fidelity Insurance, Trust and Safe Deposit Company, of Philadelphia. Under this news the market broke from 62½ to 55½ on Wednesday, closing at 55½. To-day the opening price was 51½, and the tone was weak. Why holders should feel so panicky we cannot understand. There has been no Gas Trust for some time, hence we fail to see why shares in its successor, the Chicago Gas Company, are not worth to-day what they were worth yesterday in open market. Judge Collins and Mr. Charlton are a trifle late in their efforts to really injure the property, even though the market was successfully "beared" by them. Even judges cannot destroy property, hence we imagine that Chicago gas is a good thing to buy at present figures, although perhaps the lowest notch has not yet been reached in it. The general outlook is favorable.

CONNELLY & CO.,

SOLE MANUFACTURERS OF THEIR PATENTED SPECIALTIES.

"IRON SPONGE."

Saves money, saves labor, and is the most efficient purifying agent ever offered as a substitute for lime. Now used in every State in the Union, and purifying daily over thirty-five million cubic feet. Should be used in every gas works. Its own saving will pay for it many times over.

AUTOMATIC GOVERNOR.

Has been on the market but three years, and in that time has been introduced more generally than any invention ever designed for use in gas works. Over two hundred of them now in use. Sensitive; reliable; perfectly automatic; reduces leakage; satisfies consumers, and gives great relief to the Manager. No gas works is complete without one of these machines.

STEAM JET EXHAUSTER.

Designed particularly for small works. Combines Exhaust Tube, Steam Governor Gas Compensator, and Bye-Pass Valves in the most compact form possible; occupies but little space; uses very little steam; operated by ordinary workmen; saves formation of carbon in retorts; increases yield 10 to 15 per cent. Specially adapted for mixing air with oil gas. No works too small to use them profitably.

Prices given on all our specialties delivered at any point in the United States. Correspondence solicited.

A. J. DOTY, Supt.

The utility and convenience of the Gas Engine being no longer an open question, it only remains now for intending purchasers to select the BEST. We claim for the CLERK GAS ENGINE that it is equal to any other manufactured as regards steadiness in running, simplicity, and ease of keeping in repair, and that it gives the greatest amount of power for the least money (both in first cost and expense of running) of any engine made. In support of this claim we refer to the test of the Gas Engines made under the direction of the American Institute of New York, in December, 1885, and heretofore published in these columns. These engines are especially adapted for continuous running under heavy loads, and we can refer to Engines which have run 22 hours a day for months at a time

Made in Sizes of 5, 10, 15, 20, and 25 Horse Power. All Engines Guaranteed for One Year.

GENERAL SALES AGENTS FOR

The Youghiogeny River Coal Company's

OCEAN MINE YOUGHIOGHENY GAS COAL.

HON. W. L. SCOTT, Prest.

M. H. TAYLOR, Vice-Prest.

This Colliery is located at SCOTT HAVEN, PA., in the center of the Youghiogeny Gas Coal District, and produces the ONLY RELIABLE YOUGHIOGHENY COAL for gas purposes. (See Map on p. 87 of this JOURNAL, Feb. 16, '85.)

POINTS OF SHIPMENT,

Locust Point, BALTIMORE.

Pier No. 62, PHILADELPHIA.

Also, SOLE AGENTS for the

**BRECKENRIDGE CANNEL,
OF KENTUCKY.**

Within the past two years we have delivered this Cannel to over ONE HUNDRED COMPANIES IN THIRTY-THREE DIFFERENT STATES, and it is now in use in some of the large Gas Works

On the Continent and in South America,

where it successfully competes with the Australian Shale. It is the ONLY AMERICAN GAS CANNEL of sufficiently high grade to warrant EXPORTATION TO EUROPE AND SOUTH AMERICA, and it is the only economical substitute for OIL OR NAPHTHA. ONE GROSS TON will produce

10,000 Cubic Feet of 75 Candle Gas,	} equal to {	750,000 Candle Feet of Gas, and 26 Bushels of merchantable Coke weighing 900 Pounds
or 12,500 " " 60 " "		
or 15,000 " " 50 " "		

This is the ONLY GAS CANNEL that will produce a REALLY MERCHANTABLE COKE. It can be delivered in parcels of one carload or more to any point in the United States or Canada. Cargo shipments of any size required can be made from NEW YORK, PHILADELPHIA, BALTIMORE, or NEWPORT NEWS. Samples will be sent and particulars of price, etc., forwarded upon application to above address.

JAMES & WILLIAM WOOD,
Gas and Cannel Coal Contractors,

Every Meter emanating from our establishment will bear the State Inspector's BADGE, and will be fully warranted by us. Our Annual and Calendar will be sent to Gas Companies upon application.

GAS INTO POWER,

BY THE

OTTO GAS ENGINE.

GAS POWER.—A Source of Revenue to Gas Companies ready to engage in Electric Lighting, building of Water Works, Electric Street Railways, etc.

Coal for producing Gas is less in amount than that for producing Steam, both being measured on an equal amount of work performed. And, further, with Gas,

50 to 90 per Cent. of Value of Coal is Returned

by sale of Coke and Tar, according to the market value of these products.

Labor for handling fuel is reduced, by its becoming centralized and confined to the gas house, and frequently has not increased after the addition of a power station.

With Gas Power, cost of fuel is strictly limited to the time of use.

MANY VALUABLE
AND RECENT
IMPROVEMENTS.

SIZES,
1-3 to 100
HORSE POWER.

Wherever Gas Companies tried Gas Power with Steam Power together in one Station, the use of Steam was subsequently abandoned or restricted, and Gas Power made to take its place.

Where Gas Companies adopt Gas Power for Electric Plants, Water Works, Sewerage, etc., they not only choose the most economical power for their use, but secure to themselves the numerous advantages of increased production, without increase of expense, and benefit thereby their entire manufacture. They induce consumers, by their example, to abandon Steam for Gas Power, and, by establishing special rates, make

Gas Power the Leading Power of To-Day,
AND SOLVE AT ONCE THE QUESTION OF FUEL GAS.

THE AMERICAN

GAS LIGHT JOURNAL

REDMAN & KENNY, N. Y.

PUBLISHING OFFICE NO. 42 PINE STREET

DEVOTED TO THE INTERESTS OF ILLUMINATION, VENTILATION, WATER SUPPLY AND DISTRIBUTION, & GENERAL SCIENCE.

VOLUME LII.—No. 23.
Whole No. 783.

NEW YORK, MONDAY, JUNE 9, 1890.

{ \$3 PER ANNUM,
IN ADVANCE. }

A. M. CALLENDER & CO., Proprietors. C. E. SANDERSON, Manager.
W. R. THOMAS, C.E., Editor. T. J. CUNNINGHAM, Asst. Editor.

ENTERED AT THE POST OFFICE AT NEW YORK, N. Y.
AS SECOND CLASS MATTER.

Published on each Monday of the year, at No. 42 Pine Street, N. Y.

Terms of Subscription, Including Postage.—For the United States and Canada, \$3 per annum. European countries, \$4.50 (19 shillings—22½ francs). All payments to be made in advance. Single copies, 10 cents.

Remittances should be made either by post-office order, registered letter, or bank draft on New York, payable to the order of A. M. Callender & Co.

Collections are invariably made directly from this office, for subscriptions, advertisements, etc. We have agents to solicit the same, but they are not authorized to receipt for money.

THE Welsbach Company has purchased a controlling interest in the Siemens-Lungren Company, and will hereafter manage its affairs. The new officers of the Siemens-Lungren Company are: President, Col. W. E. Barrows; Secretary and Treasurer, E. C. Lee; Directors, Messrs. Gibbs, Bodine, Barrows, Lee and Morgan. The same capitalists have secured control of the United Gas Lamp Company, and these properties, together with the Welsbach, give the consolidated enterprise a wide field. The manufacturing department will be carried on at Gloucester, N. J. Mr. Edward Stein, who may fairly be called the father of regenerative gas lighting in this country, will turn his attention to sugar refining, representing in the East a large Western manufacturing firm. That he will be successful goes without saying.

THE ASSOCIATED PRESS ONCE MORE.

The following letter, from Mr. H. C. Bolcom, explains itself:

OFFICE OF WINONA GAS LIGHT CO.,
WINONA, MINN., May 24, 1890.

To the Editor AMERICAN GAS LIGHT JOURNAL: Why is there such a difference in the price of gas lamps for New York city? The letting of the contract to the Equitable Company for 3,600 lamps at \$12 was telegraphed to the West—by the Associated Press, I presume—but nothing in regard to the \$28 lamps, as you report. I presume other Western managers would like to know how it comes about. I hope to be able to do something with our City Fathers, as soon as their electric light contract expires, and would have preferred the whole truth in regard to the New York city contract, instead of what we got.

Yours truly,
WINONA GAS LIGHT CO., by
H. C. BOLCOM, Mgr.

In explanation of the figures quoted above we may say that the Equitable Company can charge no higher rate than \$12 per annum for each public gas lamp along its lines of mains, because its charter contains a provision to that effect. In other words, the \$12 rate—all public gas lamps in New York city are fitted with burners rated to 3 feet per hour, and each lamp is lighted during a total of 4,000 hours per annum—is in the nature of a concession to the city for the privilege granted the Equitable Company of occupying the streets with its mains. At the figures paid the Equitable, of course the Company operates its street lighting service at a loss. The \$28 lamps mentioned are in the suburban districts, and many of the posts are over lines of mains that were laid especially for the public lighting service. Of course, the Associated Press man, in order to be sensational, merely forwarded the low rate; there would be nothing sensational in the figures about the awards made on the basis of nothing better than a charge that would enable a bare living to the contractor. We herewith reprint the figures on which the present public gas lamp award was made:

Name of Company.	No. Lamps.	Price per Lamp.
Consolidated	17,150.....	\$17.50
Mutual	280.....	17.50
Equitable.....	3,600.....	12.00
*Central.....	2,675.....	27.00
*Northern	2,200.....	28.00
*Yonkers.....	557.....	28.00

* Suburban districts, sparsely settled.

BRIEFLY TOLD.

THE following is a complete list of the exhibitors and exhibits at the display of gas apparatus, etc., held in connection with the annual meeting of the Western Gas Association:

Home Comfort Range Co., St. Louis, Mo., gas stoves; Van Wie Gas Stove Co., Cleveland, O., gas stoves; Connelly & Co., N. Y., purifying material, automatic governors, etc., H. Muller Manufacturing Co., Decatur, Ills., tapping machines and fittings for water and gas pipe; Ringen Stove Co., St. Louis, gas stoves; Jewel Gas Stoves, Chicago; Hot Air Stove and Burner Manufacturing Co., St. Louis, gas heating

stoves; H. Heil, chemical apparatus for gas analysis, etc., St. Louis; Mutual Mining Co., Cannelburg, Ind., cannel coal; Automatic Safety Burner Co., N. Y.; Fay Gas Fixture Co., St. Louis, chandeliers, gas fixtures and stoves; Maryland Meter Co., stoves, meters, gauges, etc.; the Dangler Stove and Manufacturing Co., Cleveland, gas stoves; Goodwin Gas Stove and Meter Co., stoves, etc.; F. & L. Kahn & Bro., Hamilton, O., gas ranges; John Cabot, N. Y., purifier trays; Schneider and Trenholm Co., Cleveland, gas stoves; Chicago Gas Stove Co.; National Tube Works Co., 2 inch to 24 inch wrought iron gas pipe, bends, joints, etc.; Rumsey Manufacturing Co., St. Louis, lead pipe; Van Duzen Gas Engine Co., Cincinnati, gas engines; Economic Gas Engine Co., N. Y., gas engines; American Meter Co., test meters, photometers, gauges, registers, etc.; P. H. & F. M. Roots Co., Connerville, Ind., exhausters, valves, etc.; C. M. Keller, Columbus, Ind., coke crusher; Kerr Murray Mfg. Co., improved center valve for purifiers; Bailey, St. Louis, Mo., three-way valve for testing consumers' meters *in situ*.

NOTES.—The East Boston (Mass.) Gas Company is making extensive alterations on its main system. When these are finished the Company will have no "dead ends."—Mr. W. H. Snow, who has been Assistant Superintendent of the Holyoke (Mass.) works for some time, has been appointed Superintendent, vice the late Mr. L. D. Rhoades—Mr. Jas. A. Hadley, the efficient Superintendent of the Meriden (Conn.) Gas Light Company, was united in marriage, on the afternoon of May 28th, to Miss Marion P. Arnold, of Middletown, Conn. May they ever happy be.

THE advocates of municipal electric lighting stations are hereby informed of the fact that the authorities of Greenville, South Carolina, have sold out their municipal electric lighting station to Messrs. Asbury & Son, proprietors of the local gas works. The new owners agree to relieve the city of all pending liabilities in connection with the light plant, and the city agrees to take a certain number of lights at a fixed rental of \$100 per annum per lamp, the number to be not less than 40, the agreement to run for not less than 15 years.

THE 32d annual meeting of the shareholders in the Port Hope (Ont.) Gas Company was held in the last week of May, and the retiring Board of Directors was re-elected without opposition. Mr. John Smart was, of course, again chosen President. The earnings of the Company show a falling off from those of the previous year, which is accounted for on the ground that a reduction in gas rates of 20 per cent. was authorized, while the increase in sendout amounted to but a trifle over 5 per cent. This, however, is in reality a good showing, as the Company last year experienced the first effects of the competition of both incandescent and arc systems of electric lighting. The rates charged for the incandescent electric service are so ridiculously low that many consumers are now on the lines who will undoubtedly return to the use of gas when the electricians are obliged to put the rates at a figure anything like those which will yield a profit. President Smart, whose annual report is of an eminently practical nature, has firm faith in the stability of the Company, and gives it as his opinion that gas for cooking purposes will help him win the day at Port Hope.

MESSRS. CURRIER, of Boston, Mass., have secured the contract for the excavation and masonry for the new gasholder to be put up at the works of the Citizens Gas Light Company, Reading, Mass.

The Market for Gas Securities.

The feature of the week in the city market was the rise in Mutual gas, which sold at auction (90 shares) last Wednesday at 119. Consolidated is steady at 102½ to 103½, although there is little inquiry for the shares, speculators evidently holding the opinion that the maximum, at the present dividend rate, has been reached. Gov. Hill on Thursday last signed the bill regulating gas rates in New York State. Under it gas in New York city is put at \$1.25; in Brooklyn, \$1.50; in cities having between 100,000 and 500,000 population, \$2; elsewhere, companies may take what they can get. In the memorandum accompanying the signature, the Governor makes a strong plea for the appointment of a State Commission, like that of Massachusetts. Chicago gas is up to 54½, despite the appointment of Geo. H. Davis, a political hack of the Windy City, as "receiver" for the Trust under Judge Collins' decision. He won't have much to do, anyway. Bay State gas is up to 86. The Brooklyn situation may not be as smooth as it looks, for Contractor Devlin—of silent Equity charter fame—says that the Equity franchise will be sustained in the court of last resort.

[OFFICIAL REPORT—REVISED BY THE SECRETARY—CONTINUED FROM PAGE 777.]

THIRTEENTH ANNUAL MEETING OF THE WESTERN GAS ASSOCIATION.

HELD AT ST. LOUIS, MO., MAY 21, 22 AND 23, 1890.

FIRST DAY—AFTERNOON SESSION—MAY 21.

ELECTION OF NEW MEMBERS.

The business of the afternoon was ushered in by a report from the Committee on Membership Applications, who recommended that the following named gentlemen be elected to membership in the Association:

Active Members.

Adams, Dean, Little Rock, Ark.	Foster, R. M., St. Louis, Mo.
Bauer, T., Fort Scott, Kas.	Giesecke, G., San Antonio, Tex.
Bigger, L. A., Hutchinson, Kas.	Glover, Jr., J. B., Joplin, Mo.
Blodget, C. W., Brooklyn, N. Y.	Harper, Geo. H., Kansas City, Mo.
Boaz, O. T., Pittsburg, Kas.	Hill, J. M., St. Paul, Minn.
Bonnor, Alex., St. Louis, Mo.	Howes, S., Jackson, Tenn.
Brown, Geo. H., St. Louis, Mo.	Hunt, Hermon, Fort Dodge, Ia.
Butterworth, Irvin, Columbus, O.	McGaully, Peter, St. Louis, Mo.
Breithaupt, E. C., Berlin, Ont.	Miller, A. S., Omaha, Neb.
Byron, T., Birmingham, Ala.	Millington, D. A., Winfield, Kas.
Cathels, E., Joliet, Ills.	Penn, Jerome, Washington, O.
Clary, E. D., Burlington, Ia.	Ross, Alex., St. Louis, Mo.
Collins, Chas., Kewanee, Ills.	Rowe, John J., Cairo, Ills.
Darrah, S. M., Wheeling, W. Va.	Shaffner, S. C., Louisiana, Mo.
Davis, S. S., Moline, Ills.	Singel, Geo., Fort Smith, Ark.
Doan, F. M., Jacksonville, Ills.	Ward, Benj. A., Michigan City, Ind.
Ewing, G. W., E. St. Louis, Ills.	Wilson, W. M., Hot Springs, Ark.
Fitz, Robt. A., Elgin, Ills.	Woodman, F., Charleston, W. Va.
Foster, Jas. A., Montgomery, Ala.	Yuille, Geo. A., Chicago, Ills.

Associate Members.

Ashcroft, H. E., St. Louis, Mo.	Marquis, P. S., St. Louis, Mo.
Bingham, S. H., Chicago, Ills.	Morrell, E. E., Chicago, Ills.
Buss, J., New York, N. Y.	Reid, C. A., Chicago, Ills.
Gribbel, J., New York, N. Y.	Roper, Geo. D., Rockford, Ills.
Harris, A., Philadelphia, Pa.	Truesdale, J. R., St. Louis, Mo.
Higgins, C. M., Cleveland, O.	Weber, Oscar, New York, N. Y.
Hubbard, H. M., Chicago, Ills.	

On motion of Mr. Lansden, the Secretary cast the ballot of the Association for the election of the applicants.

ELECTING MR. LEACH AN HONORARY MEMBER.

Mr. J. B. Howard—We have with us to-day a distinguished member of the American Association and of the New England Association. He has visited us for many years, and in honoring us with his presence has traveled a great distance. He has, therefore, shown great appreciation of the Western Gas Association. He has every attribute of a gentleman and a good fellow, and I know there will not be a dissenting voice in this house when I move that the name of Mr. H. B. Leach, of Taunton, Mass., be placed on our roll as an honorary member of this Association. (Adopted unanimously.)

The President—We are happy to welcome Mr. Leach as an honorary member of our Association.

Mr. Leach—Mr. President, and gentlemen of the Western Association, I feel that I am entirely unworthy the honor you have conferred upon me, nevertheless I accept it with a great deal of pleasure, and thank you in all sincerity for your kind words and generous action.

Mr. B. E. Chollar, of Topeka, Kansas, then read his paper on

THE RELATIVE VALUE OF GASEOUS FUELS.

In the following estimates of value, common bituminous coal at \$3.00 per ton of 2,000 pounds has been taken as a basis of comparison, and the gaseous fuel considered wholly as an article of merchandise for general sale and distribution, and not as an adjunct for use in metallurgical or other manufacturing purposes.

While the term fuel in a general sense includes everything suitable to be burned for the purpose of producing heat, and covers a great variety of substances, yet the elementary kinds of fuel are only two in number—carbon and hydrogen. The value of a fuel as such will depend, therefore, upon its composition in respect to those elements.

The calorimetric value of hydrogen is 62,000 British heat units; that is to say, the perfect combustion of one pound of hydrogen will produce sufficient heat to raise the temperature of 62,000 pounds of water 1° F.

This value is the extreme limit, and is obtained only where the vapor of combustion is condensed into the form of water and its latent heat included in the estimate.

In the great majority of practical operations, however, the products of combustion pass off at a temperature considerably higher than that of boiling water, carrying with them latent energy to the amount of about one-sixth of the total fuel value of the hydrogen; therefore, 52,000 heat units will fairly represent the heat equivalent of hydrogen when burning it, and 62,000 when decomposing water.

The calorimetric value of carbon with perfect combustion is about 14,550 heat units; when burned to carbonic oxide, 4,450; of carbonic oxide, completely burned, 4,325. The heating power of carbon in the form of carbonic oxide is equal to the difference between its value when burned to carbonic acid and to carbonic oxide, and may be taken at 10,100 heat units per pound.

The analysis of 18 kinds of English gas coal gave an average of 82.2 per cent. by weight of carbon and 5.31 of hydrogen; but since it is probable that about one-fifth of the hydrogen will be combined with oxygen, and consequently have no heating value, only 4 per cent. by weight will be herein considered.

The computed heating power of coal can be represented in round numbers by $(.80 \times 14,550 =) 11,560 + (.04 \times 52,000 =) 2,080 = 13,640$ heat units per pound. Of this total, 11,560 heat units, or 84.75 per cent., is due to the carbon, and 2,080, or 15.25 per cent., to the hydrogen.

Since, therefore, the coal by hypothesis is worth \$3 per ton, $.8475 \times \$3 = \2.54 will represent the value of the carbon, and $.1525 \times \$3 = 46$ cents, the value of the hydrogen in a ton, the value of the carbon by weight will be $\$2.54 \div .80 = \3.175 per ton, and that of the hydrogen $46 \text{ cents} \div .04 = \11.50 per ton.

If we multiply 80, the number of pounds of hydrogen in a ton of coal, by 189.251, the number of feet of hydrogen in a pound, we have 15,140, representing the number of cubic feet of hydrogen in a ton of coal; and since this quantity of hydrogen is worth 46 cents, $46 \div 15,140 = 3.04$ cents, represents the value of hydrogen per thousand feet as it exists in the coal. The heating power of hydrogen per foot when burned to water is $62,000 \div 189,251 = 317\frac{1}{2}$ heat units, and when burned to steam $52,000 \div 189,251 = 275$ heat units. If we divide 3.04, the value of hydrogen in cents per thousand, by 275, the number of thousands of heat units per thousand feet, we obtain the constant .01105, expressing the ratio between the heat units per foot and the fuel value per thousand.

Although carbon in a free state is known only as a solid, yet, for hypothetical purposes, we may consider it as a gas. In such form its density would be .82995, air being 1; the weight of a cubic foot, .062349 pounds; feet per pound, 15.824; computed specific heat = $3.40 \div 12 = .283$. Making no allowance for loss of heat in converting it into gaseous form, it would have 920 heat units per foot, and its fuel value would be 10.17 cents per thousand.

The quantity per ton of coal is represented by $1,600 \times 15.824 = 25,318$ cubic feet.

The total quantity of hydrogen and carbon per ton of coal is $25,318 + 15,140 = 40,458$ cu. ft.; the total weight, 1,680 pounds; density of the mixture, .545; weight per foot, .041525 pounds; cubic feet per pound, 24.08.

Its composition by volume is 62.58 per cent. carbon and 37.42 per cent hydrogen. Its heating value is $(.3742 \times 275 =) 102.90 + (62.58 \times 920 =) 575.74 = 678.64$ heat units per foot, and its value $649 \times .01105 = 7.50$ cents per thousand.

According to Wanklyn's Hand Book, a ton of coal of average quality may be expected to produce about as follows by weight:

Gas.....	16.5 per cent.,	or 330 pounds	per ton.
Tar.....	5.5	"	110 " "
Liquor.....	8.0	"	160 " "
Coke.....	70.0	"	1,400 " "
	<u>100.0</u>		<u>2,000</u>

An analysis of coal gas of weight similar to the foregoing, quoted by Dr. Kidder, of Boston, gave by weight and volume:

Hydrogen.....	5,000 feet	26.42 lbs.
Marsh gas.....	3,800 "	160.31 "
Carbonic oxide.....	550 "	40.58 "
Illuminants (estimated as C ₆ H ₆).....	400 "	82.23 "
Nitrogen.....	200 "	14.82 "
Oxygen.....	50 "	4.22 "
	<u>10,000 "</u>	<u>328.58 "</u>

The density is .431; 30.45 cubic feet will weigh a pound. Its calculated heating power is 680 units per foot, as follows:

Hydrogen.....	.50	$\times 275 =$	137
Marsh gas.....	.38	$\times 1006 =$	382
Carbonic oxide.....	.055	$\times 320 =$	17.5
Illuminants.....	.040	$\times 3655 =$	143
			<u>679.5</u>

Its heating value is $680 \times .01105 = 7.51$ cents per 1,000, or practically the same as we found it when the whole substance of the coal was supposed to have been converted into gas.

Dr. Letheby gives the following as reliable for an average sample coal tar, by weight:

Carbon.....	86	per cent.
Hydrogen.....	7	"
Oxygen.....	6.5	"
Sulphur.....	0.5	"
	<u>100</u>	"

Making no allowance for oxidized hydrogen, we find its heating power to be 16,153 units per pound.

$.86 \times 14,550 =$	12,513
$.07 \times 52,000 =$	3,640
	<u>16,153</u>

By multiplying the heat units per pound by .00022, we get the value in dollars per ton. Its heating value is, therefore, \$3.55 per ton.

The composition of the liquor will be about as follows:

Water.....	143.72 lbs.
CO ₂	5.79 "
H ₂ S.....	4.49 "
NH ₃	6.49 "
	<u>160.</u> "

With what may be considered a fair quality of gas coal the purifiers will remove about 2 per cent. by volume of carbonic acid, and 1 per cent. of sulphureted hydrogen; or—

CO ₂ — 200 ft. =	23.18 lbs.
H ₂ S — 100 ft. =	8.98 "
	<u>32.16</u> "

Arranging the foregoing partial products with reference to their components, we will have—

	Gas.						
	Feet.	Feet per lb.	Lbs.	Lbs. H.	Lbs. C.	Lbs. O.	Lbs. N.
Hydrogen.....	5,000	189.251	26.42	26.42
Marsh gas.....	3,800	23.704	160.31	40.08	120.23
Carbonic oxide..	550	13.552	40.58	17.39	23.19
Illuminants.....	400	4.865	82.23	6.32	75.91
Nitrogen.....	200	13.499	14.82	14.82
Oxygen.....	50	11.858	4.22	4.22
		<u>10,000</u>	<u>328.58</u>	<u>72.82</u>	<u>213.53</u>	<u>27.41</u>	<u>14.82</u>

	Liquor.						
	Feet.	Lbs. per Foot.	Lbs.	Lbs. H.	Lbs. C.	Lbs. O.	Lbs. N.
Water.....	143.72	15.97	127.75
CO ₂	50	8.624	5.79	1.57	4.22
H ₂ S.....	50	11.140	4.49	.26	4.23
NH ₃	6.00	1.06	4.94
			<u>160.00</u>	<u>17.29</u>	<u>1.57</u>	<u>131.97</u>	<u>4.94</u>

	Removed in Purifiers.						
	Feet.	Lbs. per Foot.	Lbs.	Lbs. H.	Lbs. C.	Lbs. O.	Lbs. N.
CO ₂	200	8.624	23.18	...	6.32	16.86
H ₂ S.....	100	11.140	8.98	.53	8.45
			<u>32.16</u>	<u>.53</u>	<u>6.32</u>	<u>16.86</u>	<u>8.45</u>

Tar, 110 pounds; H., 7.70; C., 94.60; O., 7.15; S., .55. Collecting and tabulating the partial products, we have for the total products of a ton of coal:

	Pr. Ct.	Pounds.	H.	C.	O.	N.	S.	Ash.
Gas	16.5	328.58	72.82	213.53	27.41	14.82
Tar	5.5	110.00	7.70	94.60	7.1555
Am. liquor	8.0	160.00	17.29	157	131.97	4.94	4.23
Removed in purifiers	1.5	32.16	53	6.32	16.86	8.45
Coke	68.5	1,369.26	1,271.49	11.77	86.00
	100.0	2,000.00	98.34	1,587.51	183.39	19.76	25.00	86.00

This analysis, although got at in a practical sort of way, is probably pretty nearly correct. It accounts for the full weight of the coal, and indicates its composition to be approximately as follows :

Carbon	80.0 per cent.
Hydrogen	5.0 "
Oxygen	9.0 "
Nitrogen	1.0 "
Sulphur	1.5 "
Ash	4.5 "
	100.0 "

The proportion of ash is rather small ; but since the oxygen is correspondingly high, the sum of the two is not greatly too much.

If we allow 272 pounds of carbon as sufficient for distilling the coal, we will have an even thousand pounds of residual coke.

In heating value, we get from the coal :

10,000 feet gas, at 7.51 cents	\$0.751
110 pounds tar, at \$3.55 per ton195
1,000 pounds carbon in coke, at \$3.17 per ton	1.585
	<u>\$2.531</u>

or 84 per cent. of the total value of the coal.

If we estimate the tar at what is at present a fair cash value—\$10 per ton—and the ammonia at 5 cents per pound, we will get a better showing, as follows :

10,000 feet gas, at 7.51 cents	\$0.751
110 pounds tar, at ½ cent55
6 pounds ammonia, at 5 cents30
1,000 pounds carbon in coke, at \$3.17 per ton	1.585
	<u>\$3.186</u>

or 18 cents more than the estimated value of the coal.

In order to convert solid carbon into a combustible gas it must be partially burned. In making water gas, advantage is taken of the fact that steam in the presence of carbon at high temperatures (1,800° F., or thereabout) gives up half its volume of oxygen to the carbon, producing a gas composed theoretically, by volume, of one-half hydrogen and one-quarter each of oxygen and carbon ; or by weight, 1 part of hydrogen to 6 of carbon and 8 of oxygen.

Supposing the process to be conducted without loss of heat, 9 pounds of water (consisting of 1 pound of hydrogen and 8 of oxygen) will combine with 6 pounds of carbon to form 15 pounds of water gas.

The quantity of heat required to decompose 9 pounds of water is the same as that produced by the complete combustion of 1 pound of hydrogen, or 62,000 heat units ; but the burning of the 6 pounds of carbon to carbonic oxide will furnish $6 \times 4,450 = 26,700$ of these. At this rate, in order to get 62,000 units we must burn $62,000 \div 26,700 = 2.322$ times 6 pounds, or 13.93 pounds of carbon. Of these 13.93 pounds of carbon, 6 pounds will have become a part of the 15 pounds of water gas, and the remainder (7.93 pounds, with 1.33 times its weight, or 10.58 pounds of oxygen and 3.356 times the weight of the oxygen, or 35.51 pounds of nitrogen from the air) will have been formed as producer gas.

The weight of the water gas is .039536 pounds per foot, or 39.536 pounds per 1,000, as follows :

	Feet.	Lbs. per Ft.	Lbs.
Hydrogen	500	.005284	2.642
Carbon	250	.063249	15.812
Oxygen	250	.084327	21.082
			<u>39.536</u>

Its density compared with air is $.039536 \div .076182 = .519$; and its weight 25.29 feet per pound. Its heating power is, hydrogen ($275 \times .5$) = 137.5 + carbon ($320 \times .5$) = 160 = 297.5 heat units per foot, and its value $297.5 \times .01105 = 3.29$ cents per 1,000.

Since 13.93 pounds of carbon furnished material for 15 pounds water gas, our residue of 1,000 pounds should represent a yield of $(15 \times 1,000) \div 13.93 = 1,077$ pounds, or $25.29 \times 1,077 = 27,237$ feet, or 54,474 feet per ton.

The composition of the producer gas resulting from the decomposition of the water required for 1 pound of hydrogen is :

Carbon	7.93 lbs.	15.824 ft. per lb. = 125.48 cu. ft.
Oxygen	10.58 "	11.858 " " 125.48 "
Nitrogen	35.51 "	13.50 " " 479.38 "
	54.02 "	730.34 "

Its weight is $730.34 \div 54.02 = 13.52$ feet per pound, and its density $13.126 \div 13.52 = .975$. Its weight per foot is .074277. Its composition by volume is :

Carbonic oxide3436
Nitrogen6564

Its heating power $.3436 \times 320 = 110$ heat units per foot, and its value 1.22 cents per 1,000.

Our 13.93 pounds of carbon has furnished combustible material not only for 54.02 pounds of producer gas, but also for the water gas. At this rate, the 1,000 pounds of residual coke from a ton of coal will produce $(54.02 \times 1,000) \div 13.93 = 3,878$ pounds, or $13.52 \times 3,878 = 52,431$ cubic feet, or 104,862 feet per ton. If it were possible, therefore, completely to convert the carbon into water gas and producer gas, without loss of heat, the total product from a ton valued at \$3.17 would be :

2,153 lbs., 54,474 ft. water gas, at	3.29 cts. per 1,000	\$1.79
7,756 " 104,862 " producer gas, at 1.22 " "		1.28
		<u>\$3.07</u>

The density of the mixture would be .808, and its weight 16.24 feet per pound. Its composition by volume would be :

Hydrogen	17.00 per cent.
Carbonic oxide	39.66 "
Nitrogen	43.34 "

Its computed heating power is 173.66 heat units per foot—

Hydrogen17	$\times 275 = 46.75$
CO3966	$\times 320 = 126.91$
		<u>173.66</u>

and its value, $174 \times .01105 = 1.92$ cents per 1,000.

In practice it is impossible even to approximate the foregoing results. In the present condition of the art of water gas making, a yield of 40,000 feet of water gas, together with 80,000 feet of producer gas per ton of coke, would probably be considered not unsatisfactory.

At this rate the value of the product would be \$2.30 per ton, as follows:

40,000 feet water gas, at 3.29 cents, =	\$1.32
80,000 feet producer gas, at 1.22 " =	.98
	<u>\$2.30</u>

or a total return of 77 per cent. of the energy of the coal, of which 44 is in the water gas and 33 in the producer gas. The producer gas is too poor in quality to sell, too good to throw away, and there is too much of it for fuel for distilling its corresponding quantity of soft coal. Our associate, Mr. Walton Clark, proposes and has adopted the latter use for it, and it is quite probable that he will find it as satisfactory as any other way of getting rid of it. For this purpose the quantity required would be equivalent to about 300 pounds of coke per ton of coal used, representing a value of about 50 cents.

The return from a ton of carbon or its equivalent might be reasonably expected to be about—

40,000 cu. ft. water gas, at 3.29.	\$1.32
Fuel (for all purposes)68
	<u>\$2.00</u>

or in round numbers two-thirds of the value of the original material.

Illuminating water gas composed as follows would not be considered a bad article :

Hydrogen	45 by volume.
CO	40
Illuminants (C ₂ H ₄)	15
	<u>100</u>

Such a gas would have a density of .563; weight .0429129 per foot, and 23.33 feet per pound. Its heating value would be 471 heat units per foot.

Hydrogen45	$\times 275 = 123.75$
CO40	$\times 320 = 128.$
C ₂ H ₄15	$\times 1463 = 219.$
		<u>470.75</u>

and its heating value $471 \times .01105 = 5.20$ cents per thousand.

Crude petroleum contains approximately 84 per cent. by weight of

carbon and 14 of hydrogen, or something like C_7H_{14} . It is not improbable, by careful distillation, that it might yield nine-tenths of its weight of a gas of about the density of ethylene (C_2H_4).

One foot of the gas would contain one foot of carbon and two of hydrogen. Its density would be .96173; weight of a foot, .073813 lbs., and 13.547 feet per pound.

Its heating power would be 1463 heat units per ft.

1 foot carbon	913 units.
2 feet hydrogen	550
	1463

and its value $1463 \times .01105 = 16.17$ cents per thousand.

In estimating the fuel value of natural gas, if we consider it composed of nine-tenths marsh gas, and the remainder a diluent, we will be not far from right.

One foot of marsh gas contains one-half foot of carbon and two feet of hydrogen; its density is, therefore, .55365; weight, .042187 lbs. per foot, and 23.704 feet per pound.

Its computed heating power is 1006 units per foot.

Carbon	$\frac{1}{2} \times 913 = 456$
Hydrogen	$2 \times 275 = 550$
	1006

and its computed heating value, $1006 \times .01105 = 11.12$ cents per thousand.

The heating power of an average sample of natural gas would be, therefore, $1006 \times .9 = 905$ units per foot, and its value $905 \times .01105 = 10$ cents per thousand.

A foot of benzine vapor (C_6H_6) contains 3 feet of carbon and 3 of hydrogen. Its heating power is 3564 units per foot.

Carbon	$3 \times 913 = 2739$
Hydrogen	$3 \times 275 = 825$
	3564

and its value, 39.4 cents per thousand.

A foot of naphthaline vapor ($C_{10}H_8$) contains 5 feet of carbon and 4 of hydrogen. Its heating power is 5665 units per foot.

Carbon	$5 \times 913 = 4565$
Hydrogen	$4 \times 275 = 1100$
	5665

and its fuel value, $5665 \times .01105 = 62.6$ cents per thousand feet.

One foot of acetylene contains one foot each of carbon and hydrogen. Its heating power is, therefore, $913 + 275 = 1,188$ units per foot, and its value $1,188 \times .01105 = 13.13$ cents per thousand.

The foregoing comparisons are based upon the theoretic calorific values of carbon and hydrogen, and will agree fairly well with results obtained by experiment. The commercial value of the gases is quite a different matter, and depends entirely upon the useful effects that can be got out of them in practice.

One-quarter of a foot of common coal gas contains energy enough to boil a pound of water. We can do the work in practice with half a foot; while to start a fire and do it with coal probably not less than a pound of it will be required. The heat energy of the coal is 50 times that of the gas, and the gas would be cheap at the cost of a corresponding quantity of coal.

On the other hand, if we were to boil a ton of water with gas it would be difficult to increase the rate of efficiency above 75 per cent., or to use less than 750 feet; whereas, 50 pounds of coal, costing $7\frac{1}{2}$ cents, would be sufficient.

In generating steam with natural gas as fuel, the evaporative duty under favorable conditions has been as high as a pound of water for 1.35 feet of gas; or an efficiency of 80 per cent. of the energy of the fuel. With coal an evaporative duty of 12 pounds of water per pound is not at all uncommon, and 8 to 10 ought reasonably to be expected.

An average of 12 different trials with common boilers, mentioned in Box's Treatise, gives 7 pounds as the quantity of water evaporated to steam at working pressure per pound of coal consumed. This represents an efficiency of about 50 per cent.

In his work on warming buildings, Mr. Hood gives as a fair duty for hot air furnaces, 322,000 feet of air heated $1^\circ F.$ with a pound of coal. This represents a utilization of about 6,800 heat units per pound, or an efficiency of 50 per cent.

Hood (page 292) mentions a practical case where 536,000 feet of gas was heated $10^\circ F.$ with 225 feet of coal gas without a flue. The

quantity of coal required to do the same work was 16 pounds. With the flue the gas did about half the above work, or 225 feet represented 8 pounds coal.

The air in a room can be warmed with an incredibly small consumption of gas, particularly if the required quantity is burned rapidly and the products of combustion are not permitted to escape; whereas, in order to warm the whole building and provide for heat lost by radiation and ventilation, the consumption of gas would be so great that only a nominal price could be afforded.

In estimating the value of gaseous fuel where large quantities of heat at low temperatures are required, it is neither safe nor prudent to underestimate the value of coal by taking it at anything like 15 or 20 per cent. of its efficiency, while we see it in every day practice developing fully 50 per cent. of its energy.

For such purposes, if we consider the value of the fuel to be enhanced 50 per cent. by reason of its gaseous condition, and again doubled on account of its convenience and other advantages, we shall probably be within reasonable bounds. In other words, coal gas at 25 cents, or plain water gas at something more than 10 cents per 1,000, might find market for general domestic fuel purposes.

Although the computed value of coal gas is in round numbers about $2\frac{1}{2}$ times the value of water gas, it is by no means certain that its practical value is the same.

Investigations in regard to radiation of heat at high temperatures have shown that the rate increases enormously with increase of temperature. By applying a formula that had been found rigidly correct up to temperatures of about 600° , Mr. Box estimated that while the radiation at $1,860^\circ$ was represented by 300, the loss of heat at $2,580^\circ$ was 4,600. Now, since the flame temperature of water gas is considerably higher than that of coal gas, it is not unreasonable to expect it to develop a higher rate of practical efficiency.

The advent of natural gas has brought the question of fuel gas with it; it has come to stay with us, and it is a problem to be solved.

For cooking and similar purposes we have seen that gas is cheap at 50 times its assay value, while for warming and manufacturing purposes it might be dear at one-tenth of that rate.

Our customers are now as well satisfied with gas at \$1.50 per 1,000 for present uses as they would be at 25 cents for general purposes. If we attempt to supply the latter market, we must necessarily lose the former.

It would appear, therefore, that if we are unable successfully to compete with the grand laboratory of nature, we can at least keep abreast with the times in improvements, use up our material to the best advantage, make the best gas possible and sell it at the lowest price possible, and leave the rest to our customers.

Discussion.

The President—You have heard the very valuable and practical paper that was read by Mr. Chollar, and it is now before you for consideration and discussion. We shall be glad to have any member who has anything to contribute, either in furtherance of the claim made by Mr. Chollar, or in opposition, to present his views.

Mr. Walton Clark—I have made some few calculations on calorific values, and know the labor involved in them, and I am lost in admiration at the patience which Mr. Chollar has exhibited in this work. It is impossible for a man who has not attempted anything of the sort to appreciate the amount of labor involved in the preparation of the few pages which he has read to us. It is impossible at such short notice to criticise Mr. Chollar's statements. To go over these figures and verify them, as it would be necessary to do before any intelligent criticism could be made, would require the labor of days. Without wishing to depreciate the value of any part of the paper, I would state that what strikes me as particularly happy in it are the first and second paragraphs on page 9. I think those observations state the possibilities of fuel gas very correctly and very tersely. They mark the fact that while there is a large market for fuel which fuel gas can not hope to reach, yet there is another market that is simply waiting for it. I cannot say that I concur in or differ with Mr. Chollar in his conclusions, as it is impossible without a further and more careful reading of the paper and a consideration of the conclusions which he deduces, to make any intelligent criticism upon it.

Mr. Lansden—I would like to ask Mr. Chollar this question: Is the estimate of the value of fuel gas for domestic uses based on the difference in value between illuminating gas and a fuel water gas, or a fuel gas uncarbureted? What would be the relative value in price to the consumer of the same results in a gas cooking stove?

Mr. Chollar—The two gases will have their own value in respect to their composition, and they would have another value in practical use.

Mr. Lansden—I supposed Mr. Chollar had worked the matter up so that he could tell us. The matter is interesting to most of us in this way: We want to know whether we shall furnish a gas to our consumers which shall be at the same time a fuel and an illuminating gas, or whether we shall have to lay extra pipes and supply water gas?

Mr. Chollar—My personal opinion would be that the illuminating gas would be the one thing needed. According to my estimate of the value of water gas or producer gas, the latter would hardly be worth distributing for general use unless it was carbureted, as the heat comes mostly from the carbon that is not oxidized.

Mr. Dunbar—Have you any idea that it is practicable to manufacture a gas which can be used at the same time both for illuminating purposes and for fuel purposes?

Mr. Chollar—I have a very slight idea about it.

Mr. Dunbar—You can form an opinion?

Mr. Chollar—You can base your own opinion upon the figures themselves. I have not given an opinion in the whole paper.

Mr. Dunbar—But I would like to know what your opinion is, if you have one.

Mr. Chollar—Give me the question again, directly, and I will give you an answer.

Mr. Dunbar—My question is, will an illuminating gas, such as we are now producing, be used as a fuel gas in future, or will a separate gas be manufactured and used for fuel purposes.

Mr. Chollar—My opinion is that no fuel gas can be generally sold that is not also an illuminant.

Mr. Dunbar—That is just what I want to know. I thought my question covered that ground.

Mr. Judge—I do not think that the gentleman answered Mr. Lansden's question as he intended it, or at least as I understood it. I think that what he intended to ask was, for instance, with an illuminating gas at \$1.50 per 1,000, what would hydrogen gas be worth? That is what I would like to learn from Mr. Chollar, if he can answer the question.

Mr. Chollar—I do not clearly understand your question.

Mr. Judge—I ask, what relative value hydrogen gas must have as compared with coal gas? Supposing that coal gas as an illuminating gas can be sold at \$1.50, what price would you set on straight hydrogen gas giving the same heat?

Mr. Chollar—Coal gas is worth a little more than double what hydrogen is worth.

Mr. Lansden—I think that he misunderstands the exact point. Of course we cannot distribute pure hydrogen through the streets. The practical question before us is this: Suppose we can furnish the consumer a non-burning gas to illuminate his house which is worth \$1.50 per 1,000, and which can be sold for that, at what price can we sell an uncarbureted fuel gas which shall compete?

Mr. Chollar—I have not considered that subject at all.

Mr. Lansden—What is the value to the consumer of non-carbureted gas as compared with carbureted gas?

Mr. Chollar—Non-carbureted gas assays 3.29 cents per 1,000 feet, and coal gas at 7.5 cents, in actual heating power. What it can be sold for I have not considered.

Mr. Lansden—I take it that the value of the heating property is quite different.

Mr. Chollar—I figure it at 3.29 as against 7.5.

Mr. Forstall—As Mr. Chollar says, the heating value of coal gas would be about 2½ times the value of water gas. Or, if you sell the illuminating gas at \$1, the value of the non-carbureted gas would be 40 cents per 1,000.

The President—I think Mr. Lansden's question has hardly been answered yet. As I understand his question it was this: He desires to know what would be the proportionate value in practice, so far as the heating qualities of an illuminating or a non-carbureted heating gas are concerned.

Mr. Chollar—That would have to be determined by experiment. I have no idea.

Mr. Egner—I would like to say a few words on that point. If the gentleman will wait for three or four months that question will be determined for him, and it will not cost him one cent. We have a works and about 38 miles of mains in St. Louis which will soon become practically useless as conveyers of illuminating gas, and Mr. McMillin (who unfortunately is not here) has instructed me to convert those works into fuel gas works. The thing is going to be done, and an attempt will be made to distribute fuel gas on a large scale. The whole country will then know whether it will be a failure or a success. I am sorry Mr. McMillin is not here to speak for himself.

Mr. Lansden—The question I would like to have answered is this:

Have we to go before our consumer with two kinds of gas, or can we say to him we will furnish a gas at \$1 per 1,000 feet which will furnish both light and heat to his building? Can you do that with any non-carbureted water gas which is known to-day? At what price can you furnish such a gas—a gas which will give the consumer both illumination and heat? I want to get at the value of such a gas in dollars and cents.

Mr. Chollar—I think it would have to be so low that nobody could afford to make it.

Mr. Dunbar—The value of coal gas is put at 2½ times that of water gas. Then the paper states that the flame temperature of water gas is considerably higher than that of coal gas. That would bring the proportion down about how much?

Mr. Chollar—I did not make any calculation on that at all.

Mr. Somerville—This paper is certainly a very valuable one, but it seems impossible that we can discuss it properly, because it contains so many figures and calculations that we shall require time to study them over in order that his conclusions may be made plain. We cannot do it justice here this evening. But I would, however, like to draw your attention to one thing we ought to think over when we talk about fuel gas. Mr. Chollar says, on page 9: "Hood (page 292) mentions a practical case where 536,000 feet of gas was heated 10° F. with 225 feet of coal gas without a flue. The quantity of coal required to do the same work was 16 pounds. With the flue the gas did about half the above work, or 225 feet represented 8 pounds of coal." This is where we have to be cautious about the figures in a theoretical discussion of the value of water gas. The flue is the great trouble. The only safe solution to this question is that which will be furnished in Mr. Egner's report of what he is able to do with his fuel gas works. I regard all this talk about the efficiency of a gas being 70 to 80 per cent. as perfect nonsense. We have never got at the real efficiency of gas, and never will get at it, because of the very fact that you must carry the products of combustion out of the room, and with these products of combustion is carried nearly 50 per cent. of the heat in the fuel.

On motion of Mr. Egner a vote of thanks was tendered to Mr. Chollar for his paper.

IN MEMORIAM PROCEEDINGS.

EULOGIZING EX-PRESIDENT EDWARD J. KING.

The President—The next business before the meeting will be the reading of the eulogy upon our departed Ex-President and friend, Mr. Edward J. King, which will be presented by Mr. George G. Ramsdell.

Mr. Ramsdell's tribute was as follows:

When the gardener, passing in and out among his plants and flowers, culls one here and plucks one there, we question not his motive or wisdom, our comprehension being capable of discerning his tender love and interest, too genuine and sincere to admit of other than the most affectionate treatment. When the "Great Reaper, with His sickle keen," invades our circle, cuts down from among our number one we love, one whose early manhood gives promise of a well-rounded, useful life, finite minds fail to discern the motive or wisdom, and we stand lost in wonder and awe. We are startled into an appalling consciousness of man's transitory, uncertain existence; we stand face to face with the mystery of death, vainly seeking for some solution of the dark problem. Such, no doubt, was the general feeling when the unwelcome news was received that our friend, Edward J. King, had left us.

It is fitting that, before our meeting adjourns, we honor the memory of this friend, whose vacant chair is eloquent of the irreparable loss we have suffered, by giving some expression to the loving remembrance in which we hold him. Yet I approach the task with timidity born of my sense of inability to do justice to the noble character of "Ed." J. King.

There are many good men and true in our fraternity—indeed we think no better men can be found than those composing the Western Association; and our late President was conspicuous in its ranks, not only because of his honored position, but because he possessed those enduring qualities of mind and character which made the world better for his being in it.

I will give but a slender outline of his life and pursuits, as you are all familiar with his career.

He was one of the finest types of that modern creation known as the "Western man." Born in Jacksonville, Ill., in 1847, he came into a heritage of enterprise, energy and public spirit, which characterizes the sons of western pioneers, and in early youth gave promise of those distinguishing traits which mark the man of talent. We who knew him in mature manhood, full of ripe power, know that, more than most men, he realized all youthful ideals, and became a successful man, in the best meaning of the term.

Having supplemented a public school education with scientific courses in Illinois College, and in a Polytechnic school in Philadelphia, he brought to the gas profession a mind well trained to scientific thought, and an enthusiasm which never failed. In the many difficult problems which confront the gas engineer, his motto was "Excelsior." He was always a student, deeming no labor lost which was expended for the searching out of some truth which would benefit his profession. Though not despising the comfortable assurance that the balance was on the right side of his ledger, he looked above and beyond the mere material success to be attained in his profession, and was ever working in the interest of science.

Among America's gas engineers he stood well to the front, and his life of constant activity and faithful work in his chosen profession should be an inspiration to all gas men.

Not alone in the science of gas making was our friend recognized as a master mind, but also in other pursuits which engaged his attention he was pre-eminent for clear intelligence and sound judgment. To his energy and zeal for the public welfare, his native town owes the telephone system and electric lighting. He was one of the originators of the Business Men's Association, and its effective Secretary from its organization; President and actively interested in the Jacksonville Manufacturing Company; a Director in the Security, Building and Loan Association; a stockholder and director in the Jacksonville *Journal* Company; an efficient member of the fraternities of the Masons, Pythians, Odd-Fellows, United Workmen, and his college society, Phi Alpha.

Surely, without mentioning church or social duties, this was a busy life, and affords a striking example of the tendency to overload those who, after successfully managing their own affairs are too philanthropic and public spirited to refuse assistance to others less qualified. Naturally of a buoyant, progressive, temperament, he became a shining target for the ballot. To be identified with a society was to be pressed forward to its head, each step assuming new responsibilities, each bearing its quota of new duties. There are those who possess the happy faculty of enjoying official honor, and escaping its labors; but "Ed." King was not of that mold. Official life to him was a painstaking, conscientious service, involving thought and effort, until he had acquitted himself honorably, and could with a just pride relinquish the mantle of authority to his successor.

But, after all, it is not these recitals of his attainments that bring up before us the whole-souled, generous man, whose noble, frank countenance is absent to-day. It is when we speak of his social qualities, of his virtues, that he seems nearer to us, not wholly lost.

No manlier man, no truer friend, no better citizen ever passed beyond our view than our genial comrade and co-worker whom we mourn to-day. In him was that rare combination, that union of strength and gentleness which endeared him to all. His life's drama was not one of startling action, yet in deeds of quiet usefulness, in unselfish devotion to duty, it was not the less heroic; and who doubts the lasting influence for good such a life has left behind it? The world has lost a useful man, one of high aspirations and noble aims, one who lived purely.

In his home, which is the synonym for gracious hospitality, one saw him at his best. Who that has there received his sincere welcome, looked into his candid eyes, and felt the strong grasp of his hand, will ever forget Edward J. King?

He needs no tribute from any pen to perpetuate his memory. His good fame lives in the hearts of his friends. "His works do follow him."

He was modest and unassuming, yet withal a man of strong individuality, who gave the impression of reserved force. He had strong convictions as regards religion, and his daily life embodied his beliefs, yet he was notably free from those narrow ideas which too often obscure the virtues of the orthodox Christian. His was a big heart, filled with generous emotions and kindly sympathy toward all. His deeds of charity were known only to his family and intimate friends; he was not one to boast of his good actions; but many poor and unfortunate souls have reason to rejoice that "Ed." King came across their path. This was vividly apparent at the time of his death in testimony of self-evident genuineness and integrity, through the press, and in resolutions adopted by the numerous organizations wherein he had so abundantly contributed of his knowledge, judgment, skill, care and attention. Called in the flush of manhood's prime, his death enveloped in incidents of peculiar sadness, he passed away, leaving aching hearts, whose sorrow would be unbearable, but for the fragrant odor of a life unusually rich in all that goes to make a noble man.

My friends, if each of you were to bring a leaf from your own acquaintance with "Ed." King, this brief address would grow into a bulky volume, on every page of which would be recorded some noble

thought, some noble deed emanating from him whom it was our good fortune to have known and loved. Yet the beauty and significance of his life may be epitomized in the words of the poet. "He was a man; take him all in all we shall not look upon his like again."

On motion of Mr. Lansden, seconded by Mr. Scofield, the Ramsdell eulogy was ordered spread upon the record of the Association, and the Secretary was directed to send a copy to the family of Mr. King.

The President—It is good for us occasionally to lay aside the usual avocations of life, and dwell for a moment in the realm of recollection upon those who have gone before. We have with us to-day Capt. William Henry White, of New York, who had the honor and the pleasure of being an intimate friend and acquaintance of our departed brother; and I ask that he shall be permitted to place a flower of recollection upon the grave of our departed friend.

CAPT. WHITE'S TRIBUTE.

Capt. White—Mr. President and gentlemen of the Association, I came among you to-day without the slightest idea that you would make such a demand upon me; and yet who can refuse to do his part towards perpetuating the memory of so gracious an associate, and so genial a man, as was our late President, Mr. King. While I question somewhat the wisdom of interrupting the business proceedings of such a gathering as this for the purpose for which you have just ceased your labors, yet, like all rules, that, too, has its exceptions; and no better exception could be made than to pause for an instant to say something in recollection of that man. While my acquaintance with Mr. King is of much shorter duration than that of many of the gentlemen before me, yet in the time that I did know him I learned to appreciate his great worth as a man and his value to us as a brother engineer; and I also learned the high standard upon which he gauged his life, the standard which was the gauge not only of his daily life but of his business life and of his home life. In fact, there was no separation with him between the duties of the church on Sunday and the duties of the Christian gentleman throughout the week. Entirely unpretentious in his Christian beliefs, he lived them and carried them daily into practice. Every one of you appreciates, as I do, all the manly characteristics of this most manly man. Modest in all the affairs of life, ever ready to help either with his purse or with his advice, yet the very last man of all to press upon you any unasked for help, and the very last man who, having helped you, reminded you of the service rendered. It seems to me, Mr. President, if we can thank the active thinkers of the day for one thing more than for another, it is for the fact that they have stripped the human mind of that barbarous conception of death as a malevolent spirit stalking about the world, slaying the fairest victims and bearing them away to gloomy caverns. The grave now is looked upon not as the portal to a land of shadows and sorrows, but as the entrance to a home of lovely realities and wider knowledge and opportunity. The same sad parting may still mark our passing, but those who stand beside our grave no longer fear that annihilation has whelmed the dead friend. Rather do they stand as we look upon the loved child whom we place upon a ship and send across the ocean in search of added health and kindlier climate, there to bask in the sunshine of a brighter life, knowing full well that sometime we shall see him again, better, brighter and happier for the separation. I know to whom I speak thus. As we together recall the memory of our dead friend, each of us feels the pulsing of his own sorrows, and the years back of us speak to our hearts in voices eloquent and pathetic. Then in the kinship of kindred experience and surrounded by the memory of him we now mourn, believe with us further that somewhere in God's loving providence this dear friend to whom we have here in sorrow bade good night, will yet, with voice tuned to new sweetness, and heart and mind brightened and broadened by newer experiences, bid us good morning in some higher and better sphere of our unending life. That all of which we make seeming loss and shipwreck "upon the banks and shoals of time" will yet come safely back to us, like a ship, which, sailing away at night into the darkness and tempests of the ocean, some morning, with sails washed by the storms and incarnadined with the rising sun, comes sailing safely into port. Therefore, let us out from this tender our sacred season of recollection with our minds fixed upon the cumulation of the good we know to have been part of the earthly life of Mr. King, remembering that while it is to but few that some great deed or martyrdom is assigned, it is in the daily and unostentatious practice of amenities and virtues of life that the noblest part of our work is done and the most enduring record made. This thought I would leave in your minds symbolized as it is by the life of him whose removal from us we so regret, and may our hearts be as sweetly harmonized with the inimitable laws of God as now is the better and eternal part of him whose gracious memory we gather at this hour to keep green, and about

whose name we wreath the immortelles of loving and tender remembrance, thankful that—

“ Whether back to us they drift,
Who pass beyond our view,
Where life's celestial mountains lift
Their peaks above the blue—
God's will be done! Whose gracious will
Through all our mortal fret,
One sacred blessing leaves us still :
To love—and not forget.”

The President—If any other friends of our late President and comrade care to add a few words in memoriam we shall be glad to hear them.

TRIBUTE OF MR. SOMERVILLE.

Mr. Somerville—It is not the want of love that keeps us from talking—I know that; and it is not a lack of respect for his memory that keeps us quiet, for there is a silence which, in times like this, has in it more of eloquence than anything in words. In speaking of our departed friends the English language appears all too confined to afford a fitting expression to our thoughts, and so we find no appropriate words for the sense of loss which we carry in our hearts when we think of our departed friend and comrade, Mr. King. I am free to say that I always felt better after a fraternal interview or communion with Mr. King. Not long before his death he was at my house, and I could not but notice the power that he possessed of interesting himself with the children and of interesting them in him. They knew him and loved him. He laid aside for the time the scientific subjects in which he was so much interested, and the wonders of electricity that he knew so much about, and, joining in the prattle of the children, told them about his journey to London, and described to them the many beautiful things he had seen. To-day he is well remembered in our house. What can we do better than to follow his example? Let us try to do it. Nothing could please Mr. King better than to know that some little thing that he had done was pleasantly remembered; and I know that many of you can say with me that you always felt better after shaking hands and talking with our dear friend, King.

REPORT OF COMMITTEE ON MEMORIAL RESOLUTIONS.

Mr. J. B. Howard, from the Committee on Memorial Resolutions, read the following, which were, on motion, ordered spread upon the record:

THE KING MEMORIAL.

Edward J. King, the honored President of this Association, has been called to his final rest. In his death we, his surviving brothers, have lost a companion whom we loved and delighted to honor.

The deceased was born in Jacksonville, Ill., on the 14th day of June, 1847. His education began in the public schools of his native city, was continued through the scientific course in the Illinois College, and completed by taking a special polytechnic course in an Eastern College.

Returning to Jacksonville he engaged in mercantile business and assisted his father, the late J. O. King, in the management of the gas works. To this latter business he, after the death of his father, devoted his entire time, serving as Superintendent of the Jacksonville Gas Light and Coke Company. The acknowledged successful management of this Company by the father was transmitted to “Ed.,” as he was familiarly called, and he, by his skill, industry, and business habits proved to be in all respects a worthy son of a worthy sire.

Edward J. King was one of those who, in St. Louis, Sept. 19, 1878, organized the Western Gas Association, and from that day his interest in the Society was ever faithful. His personal influence, his eloquent voice, and his ready pen were ever active in its behalf and support. He was in fact, as we all know, untiring in his work filling well his place, whether as a private member or on the various committees, and as Second and First Vice-President, nor will we soon forget with what joyful acclaim, but one short year ago, his unanimous election as President of this Association was received.

We, his associates, then looked forward with fond anticipations to the present time, when we should hail our new and honored chief as presiding officer. Alas! he is not with us. No more will the echo of his foot resound within these walls. Nor will his pleasant voice again be heard in instruction, advice, or admonition. Never again will his genial smile and kindly glance warm up our hearts, nor the strong grasp of his friendly hand respond to ours in greeting. No, he is not with us; but his example and the memory of his good deeds remain with us.

“ Long, long be our hearts with such memories filled!
Like the vase in which roses have once been distilled,
You may break, you may ruin the vase, if you will,
But the scent of the roses will hang round it still.”

In view, therefore, of the fact that Brother Edward J. King was one of the founders of this Association, and at the time of his death was its President-elect, it is meet and proper that an expression of our appreciation of his manly qualities should be placed on record. Therefore be it

Resolved, That in the death of Brother King we are called upon to mourn the loss of one of our most worthy, upright, and intelligent members; a man of honest purposes, a true helper, full of generous and noble impulses, whose social qualities endeared him to all with whom he came in contact. He was wise in council, fearless in debate, and ever zealous in his efforts to promote the best interests of the Association. Official honors were conferred upon him in just appreciation of his eminent services. In his native city he was looked upon with pride as one of the most enterprising business men, foremost in good works, a genial Christian gentleman, whose benevolent disposition was evinced by his active membership in the church and in the several friendly and charitable societies of Jacksonville. As a good citizen he was honored when living and universally mourned when taken away. Death has robbed a happy home of its sunlight and joy. He was a devoted husband and an affectionate father. His genial, loving presence will long be missed from the family circle.

Resolved, That we tender to the bereaved family of our departed brother and co-worker our sincere condolence and sympathy, and instruct our Secretary to furnish them with a certified copy of this paper, and also that it be made a part of the records of this Association.

J. B. HOWARD,
JNO. MCILHENNY, } Committee.
JAS. SOMERVILLE, }

THE FORSTALL MEMORIAL.

“Died, in Chicago, Illinois, on the evening of the 19th day of January, 1890, Theobald Forstall, aged 54 years.” Such was the simple announcement that carried sorrow to our hearts. Although not entirely unexpected, it was feared by all his friends, for months preceding his demise, that he held his life by a very uncertain tenure; and, whilst hoping, still they feared.

Deceased was born in New Orleans, La., in 1836, and was of French lineage. At an early day he was thrown entirely upon his own resources, a perhaps fortunate circumstance, for it aroused and developed his latent power, made him the man he was, and caused his name to be known and revered wherever the art of gas making is practiced. In 1864 he accepted the position of bookkeeper of the New Orleans Gas Light Company, and shortly afterward was made General Manager of the Company. In addition he was appointed as the Company's Engineer. In 1874 he was elected to membership in the American Association, and at once took a leading stand among its brightest and best intellects. His able paper, contributed to the third semi-annual meeting (1875), on the subject of “The Proper Preparation of Lime for Use in the Purification of Coal Gas,” at once completely established in this country his fame as an engineer. He joined the Western Gas Association, in Chicago, at the meeting held in 1888, and there can be no doubt as to the fact that to his great ability and active service we owe much of the present prosperity and prestige of the Association.

As the President and General Manager of the Chicago Gas Light Company he achieved the most wonderful success. He served his employers but too well; anxiety and overwork completed the wreck of a constitution which at best was never strong, and he has paid the penalty. A great and good man has passed away, and it is fit that we should place his name as such on the records of the Association. Therefore, be it

Resolved, That in the death of Theobald Forstall our Association has lost a member whose great ability, earnest purpose and upright conduct honored us in his membership, and at all times contributed to raise the standard of the Association to the highest point of excellence, and individually we have lost a genial companion and a true friend, whose example we should all seek and labor to follow, and whose virtues we should try to imitate.

Resolved, That to the family of our deceased brother and associate we offer our tenderest condolence and sympathy.

Resolved, That this paper and these resolutions be entered upon the records of this Association and a copy thereof be presented to the bereaved family of our deceased friend and brother.

J. B. HOWARD,
JNO. MCILHENNY, } Committee.
JAS. SOMERVILLE, }

THE ARNDT MEMORIAL.

Alfred Arndt died at the Clarendon Hotel, in the city of Chicago, on the 17th day of October, 1889, aged 44 years.

Mr. Arndt was a native of Australia, but found a home and friends with the people of the United States of America, who are at all times.

quick to discover true manhood and genuine worth. He was elected a member of the Western Gas Association at the meeting held in Chicago, 1888, and at the time of his death was Engineer of the Chicago Gas Light Company, and was acknowledged to be a man of great industry and fine ability. We, his surviving companions, desiring to place upon record our appreciation of his many sterling qualities of mind and heart, and of our grief at the sad loss we have sustained by his untimely removal from his earthly field of labor, do hereby direct that this expression of our feelings be entered upon the minutes of our meeting, and that a copy thereof be sent to his surviving family, with kind assurances of our sincere condolence and sympathy.

J. B. HOWARD,
JNO. MCILHENNY, } Committee.
JAS. SOMERVILLE,

THE COSGROVE MEMORIAL.

Whereas, We have heard with much sorrow and deep regret of the death of Mr. Thomas A. Cosgrove, of Evanston, Ill.; therefore be it

Resolved, That in the death of Mr. Cosgrove, an old and valued member of this Association, we have met with a loss which we all deeply feel. The business and friendly relations we have sustained with him are closed. He has gone to his eternal rest. Living, he commanded our respect and esteem; dead, his memory will be ever cherished in that he has left behind him an unsullied name and a character free from blemish.

Resolved, That this preamble and resolutions be placed on record, and that a copy of same be forwarded to the family of deceased.

J. B. HOWARD,
JNO. MCILHENNY, } Committee.
JAS. SOMERVILLE,

THE FULLAGAR MEMORIAL.

Once again this Association is startled by the fact that death is in our midst, coming to us as a solemn warning, saying: "Be thou also ready."

Mr. John Fullagar, Ex-President of the Western Gas Association, is no more. He departed this life on Sunday, the 27th day of April last, at San Jose, Cal., where he had recently taken up his residence as Engineer and Chief of Construction of the San Jose gas works; a position which, by education and experience, he was eminently qualified to fill. As President of this Association, during the session held at St. Louis three years ago, he will be remembered for his ability, courtesy, impartial decisions and urbanity of disposition. Deliberate, thoughtful, prudent, with no effort at oratorical display, but endowed with a happy faculty of clothing his thoughts in appropriate language, he faithfully performed his every duty. Therefore,

Resolved, That, in the death of such a man as Brother Fullagar, we feel a great loss, and have reason to mourn his departure; for in all the relations of life he was faithful and true. As a husband and father, the sorrow of his bereaved widow and fatherless children who mourn his loss will abundantly testify to his love and devotion.

"Life's labor done,
Serenely to his final rest he passed;
While the soft memories of his virtues yet linger,
Like sunlight hues where that bright orb has set."

Resolved, That to the widow and children bereft in the death of Mr. Fullagar, we tender our deepest sympathy, and pray that God in his mercy may take them under his kind and protecting care.

Resolved, That these resolutions be spread upon the records of this meeting, and a copy thereof be sent to the widow of Mr. Fullagar.

J. B. HOWARD,
JNO. MCILHENNY, } Committee.
JAS. SOMERVILLE,

CALLING ATTENTION TO THE EXHIBITION OF GAS APPARATUS.

Mr. Egner—If not out of order I wish to state that an exhibition of gas apparatus is under way at the building occupied by the Laedle Gas Company, and I have been requested to invite the members to visit the exhibition, and that an especial invitation is extended to the ladies to inspect the display. It is very seldom that an opportunity is afforded to examine such a large assortment of gas stoves. Other appliances are there which will interest gas engineers.

(To be continued.)

ANOTHER example of the inutility of gasoline cooking stoves is afforded in a recent case, at Portsmouth, Ohio, of an explosion of one of these infernal devices whereby property to the value of \$50,000 was destroyed.

The Massachusetts Supreme Judicial Court Differs from Attorney General Waterman.

We gave in our issue for May 26 (page 738) the full text of the opinion of Attorney General Waterman, transmitted to the House of Representatives of Massachusetts, in response to the request of the latter for his views respecting the legal right of cities, towns, etc., of that State to engage in the manufacture and distribution of gas and electric light on municipal account. The Attorney General's opinion was adverse to the exercise of the right in question, but the House refused to accept that definition as final and thereupon appealed to the Supreme Court for a further opinion. This has since been prepared, and we give hereunder the language of the Judges, who are, as will be seen, in direct conflict with the Attorney General. Our correspondent in forwarding the "copy," introduces his subject by remarking:

In the House, on May 28, the following opinion was received from the Supreme Court in answer to the question of the House as to the constitutional right of the Legislature to enact laws conferring on cities and towns the power to manufacture gas and electric light for public use, and also for sale to their own citizens:

To the Honorable House of Representatives of the Commonwealth of Massachusetts.

We received on the 24th inst. your order of the 22d inst., a copy of which is annexed, and we respectfully submit the following opinion:

In considering the questions asked, we assume that the power to be conferred is not merely a power to receive and use property given in trust for the purposes named, but is a power to raise money by taxation, and by means of it to construct and maintain works for the manufacture and distribution of gas and electricity to be used by the municipalities for lighting the public streets and buildings, and by the inhabitants for lighting the land and buildings which are their private property. We also assume that the gas or electricity to be furnished to the inhabitants for their private use is to be paid for by them at rates to be established, which shall be deemed sufficient to reimburse to the cities and towns the reasonable cost of what is furnished, and that all the inhabitants of the cities or towns are to have the same or similar rights to be supplied with gas or electricity, so far as is reasonably practicable, and the capacity and extent of the works, which it is deemed expedient to maintain, will permit. Whether cities and towns can be authorized to give gas and electricity to their inhabitants, or to sell either of them at varying and disproportionate prices, selecting their customers, selling to some and arbitrarily refusing to sell to others, are questions which it is not necessary to consider.

By the constitution full power and authority are given to the General Court to make "all manner of wholesome and reasonable orders, laws, statutes and ordinances," not repugnant to the constitution, which "they shall judge to be for the good and welfare of the commonwealth," etc., and "to impose and levy proportional and reasonable assessments, rates and taxes upon all the inhabitants of and persons resident, and the estates lying within the said commonwealth * * * for the public service in the necessary defence and support of the government of the said commonwealth, and the protection and preservation of the subjects thereof," etc. [Part 2, Sec. 1, Chap. 40.]

The extent of the right of taxation is not necessarily to be measured by that of the right of eminent domain, but the rights are analogous. Private property can be taken without the consent of the owner only for public uses, and the owner must be paid full compensation therefor: otherwise he would contribute more than his proportionate share toward the public expenses. By taxation the inhabitants are compelled to part with their property, but the taxation must be proportional and reasonable and for public purposes. Taxes may be imposed on all the inhabitants of the State for general purposes, or upon the inhabitants of defined localities for local purposes, and when distinct private benefits are received from public works, special assessments may be laid upon individuals.

We have no doubt that if the furnishing of gas and electricity for illuminating purposes is a public service, the performance of this service can be delegated by the Legislature to cities and towns for the benefit of themselves and their inhabitants, and that such cities and towns can be authorized to impose taxes for this purpose upon the inhabitants, and to establish reasonable rates, which the inhabitants who use the gas and electricity, may be compelled to pay. The fundamental question is, whether the manufacture and distribution of gas or electricity to be used by cities and towns for illuminating purposes, is a public service.

The maintenance of public streets and buildings is a public service, and it may be reasonably necessary to light them in order that the greatest public benefit may be obtained from using them. To say nothing of

the usefulness of lighting streets as a means of promoting order and affording protection to persons and property, the common convenience of the inhabitants may require that they be lighted. Cities and thickly settled towns have for a long time been accustomed to light their public buildings and some of their streets at the public expense. If the streets and public buildings are to be lighted, the means are a matter of expediency. If the Legislature can authorize cities and towns to light their streets and public buildings, it can authorize them to do this by any appropriate means which it may think expedient. As a question of constitutional power, we can not distinguish the right to authorize cities and towns to buy gas or electricity for their use from the right to authorize them to manufacture it for their use. We therefore answer the first question in the affirmative.

The second question is one of more difficulty. It is impossible to define with entire accuracy all the characteristics which distinguish a public service and a public use from services and uses which are private. The subject has been considered many times in the opinions of the court of which we are now the justices, and *Lowell v. Boston* in 3d Mass. is a leading case. It is there said that "an appropriation of money raised by taxation, or of property taken by the right of eminent domain by way of gift to an individual for his own use exclusively, would clearly be an excess of legislative power;" that "the promotion of the interests of individuals, either in respect of property or business, although it may result incidentally in the advancement of the public welfare, is in its essential character a private and not a public object;" and that the appropriation of property for turnpikes and railroads "can only be justified by the public service thereby secured in the increased facilities for transportation of freight and passengers of which the whole community may rightfully avail itself." It is said that the essential point is that a public service or use affects the inhabitants as a community, and not merely as individuals.

It was clearly decided that "the prevention of damage by fire is one of the objects affecting the interests of the inhabitants generally, and clearly within the scope of municipal authority." [*Allen vs. Taunton*, 19 Peck, 485.] Although the protected is private property, the need of protection is felt by every owner in the city or town; the property of one may be endangered by the burning of that of another; efficient means for protecting his property cannot well be furnished by every inhabitant; and that is a necessity of common action which makes the expenditure of money for the purpose properly a municipal expense.

The maintenance of sewers and drains is a public service. One object is the preservation of the public health; but apart from this, they are a great convenience to the inhabitants, whose estates can be drained by them. It is impracticable for every owner of lands in cities and towns to construct and maintain sewers and drains exclusively on his own account; they cannot ordinarily be constructed over any considerable territory without using the public ways or exercising the right of eminent domain; they are therefore regarded as of common convenience, and are constructed at the public expense.

The furnishing of water for cities and towns for domestic use affords, perhaps, the nearest analogy to the subject we are considering. It was long ago declared that "the supply of a large number of inhabitants with pure water is a public purpose." (*Lumbord vs. Stearns*, 4 Cash. 60.) The statutes are well known which authorize cities and towns to maintain water works for supplying their inhabitants with water and the constitutionality of these statutes has not been doubted. Water cannot ordinarily be supplied to a large city or town from ponds or streams without the exercise of the right of eminent domain and the use of the public ways; every inhabitant needs water, and often the only practicable method of obtaining it is by the agency of corporations or of the municipality. The land for the public ways having been taken for a public use, it may be subjected to other public uses, but it cannot be subjected to strictly private uses without the consent of the owners of the fee when the fee remains in the abutters. There is therefore often a necessity of having water common to the inhabitants of a community which cannot well be met except by the exercise of public rights; and therefore the furnishing of water has been considered a public service.

In the case of water, as in that of sewers and drains, a portion of the service is exclusively public, and the benefit to individuals cannot be separately estimated from that of the community; but a part of the service is rendered to individuals, and the benefit of this can be separately estimated. The inhabitants are, therefore, required to pay for the water furnished for their private use, and special assessments for the use of sewers, and drains are laid upon estates especially benefited; and for the same reasons, while, in laying out highways, the expense is public, betterment assessments may be laid upon the owners of lands specially benefited.

Artificial light, perhaps, is not so absolutely necessary as water, but it is necessary for the comfortable living of every person. Although artificial light can be supplied in other ways than by the use of gas or electricity, yet the use of one or both for lighting cities and thickly settled towns is common, and has been found to be of great convenience, and it is practically impossible for every individual to manufacture gas or electricity for himself. If gas or electricity is to be generally used in a city or town, it must be furnished by private companies or by municipality, and it cannot be distributed without the use of the public streets or the exercise of the right of eminent domain.

It is not necessarily an objection to a public work maintained by a city or town that it incidentally benefits some individuals more than others or that from the place of residence or for other reasons every inhabitant of the city or town cannot use it, if every inhabitant is so situated that he can use it has the same right to use it as the other inhabitants. It must often be a question of kind or degree whether the promoter of the interest of many individuals in the same community constitutes a public service or not. But in general it may be said that in matters which concern the welfare and convenience of all the inhabitants of a city or town and cannot be successfully dealt with without the aid of powers derived from the Legislature, may be subjected to municipal control when the benefits received are such that each inhabitant needs them and may participate in them, and it is for the interest of each inhabitant that others as well as himself should possess and enjoy them.

If the Legislature is of opinion that the common convenience and welfare of the inhabitants of cities or towns will be promoted by conferring upon the municipalities the power of manufacturing and distributing gas or electricity for the purpose of furnishing light for their inhabitants, we think that the Legislature can confer the power. We therefore answer the second question in the affirmative.

We notice that the bill, a copy of which was enclosed with your order, relates to the manufacture and distribution of gas or electricity, not only for permitting light, but also for permitting heat and power. We have not considered whether the furnishing of gas or electricity, either for heat or power, can be regarded as a public service. We have confined our opinion to the questions asked, which, as we understand them, relate to the manufacture and distribution of gas or electricity solely for the purposes of furnishing light.

Note on a New Photometer, for Measuring Electric Lighting Values.

[Abstracted from a paper read by Prof. Edward L. Nichols, of Cornell University, before the American Institute of Electrical Engineers.]

The instrument which it is my purpose to describe has been designed to meet the need which exists for an instrument by means of which both the character and intensity of an illuminant can be readily determined. Existing types of the spectrophotometer may be made to give good results, but they are expensive instruments and so difficult to use that it is only in the hands of observers of considerable experience that accuracy is assured.

The new apparatus, the "horizontal slit" photometer, is, in point of fact, a spectrophotometer in which the polarizing device is entirely done

away with. In it the extremely simple principle of the Bunsen photometer is applied successively to the various regions of the visible spectra of the source of light which are to be compared. A direct vision spectroscopy of Browning's form is attached to the usual car of a Bunsen photometer, from which the disc and mirrors have been removed. The optical axis of the collimator is horizontal and at right angles to the photometer bar. The slit is horizontal and lies in a straight line joining the

sources of light which are set up in the usual manner at the ends of the bar. The bar itself is preferably of considerable length—in the case of the one upon which the original instrument under consideration was mounted, it was 500 cm. long—and should be divided into 1,000 equal parts.

In front of the spectroscope slit are placed two right angled prisms of the same size and made of the same glass (see cut). Their vertical adjacent edges bisect the slit, and light travelling from either end of the photometer bar is totally reflected by them and enters the right or left hand end of the slit in a direction parallel to the optical axis of the collimator tube.

The two sets of rays thus gathered into the spectroscope from the lights at the end of the bar are vertically dispersed by the prisms and appear in the field of view as two vertical spectra standing side by side. Equal wave lengths are in the same horizontal line and any desired region may be brought into the center of the field by an angular movement of the ocular telescope. The telescope moves along the arc of a suitably divided semi-circle, to which it may be clamped by means of a set screw. Wave lengths, corresponding to the various circle settings are determined once for all, by observation of the more prominent of the Fraunhofer lines.

When the instrument, thus mounted, is placed at the middle of the photometer bar, between lamps which are identical in intensity and quality, the two spectra are of equal brightness throughout, wave length for wave length, from red to violet. If the two lamps differ in intensity but not in quality, the two spectra will differ in brightness by the same amount from end to end, and a position may be found upon the bar for which they will be identical throughout.

Under these circumstances, which are the only ones in which the Bunsen method in photometry is strictly applicable, the instrument may be used as a simple photometer, the setting for any wave length whatever giving the candle power. For this purpose alone, viz., for the comparison of lights of similar character, the instrument offers certain manifest advantages over the various forms of the Bunsen photometer. In the course of the present paper I shall present some definite data concerning the relative sensitiveness of the two instruments when used in this way.

When the lights to be compared differ both in intensity and quality, ordinary photometric indications possess no perfectly definite significance. In this, which is the more general case, the relative brightness of the spectra of the two sources varies with the wave length. For each region of the visible spectrum, however, a position upon the photometer bar can be found at which the brightness of the two spectra in that region will be equal, and the observations thus obtained, when extended over the entire spectrum, will afford data by means of which the differences in quality of the two sources of light may be definitely expressed.

In a recent paper read before the Institute (Transactions of the American Institute of Electrical Engineers, Vol. 6, p. 135) it was stated that for a considerable range of temperature at least, the ratio between the intensities of a certain wave length of the spectrum of glowing carbon, is identical with the ratio of candle powers as determined by the Bunsen photometer.

When the wave length of this region has been established beyond question, the photometry of lights which vary in color will have been reduced to a definite scientific basis. Instead of attempting to use the Bunsen photometer in measurements to which it is not adapted, we shall be able to deduce the relative candle power of two sources of light from the comparison of a single wave length, and we shall be freed from the uncertainty arising from differences of color and from the personal errors due to the independent use of the two eyes in observation. The determination of candle power will then be an operation of precision, even when the sources of light to be compared vary widely in temperature. It is in the opportunity of performing such observations upon the photometer bar itself, under conditions which do away with many of the sources of error inherent in the usual methods of spectrophotometry, that the chief advantage of the new photometer will be found to lie.

A CORRESPONDENT at St. Louis, Mo., under date of May 29, writes: "Mr. J. T. Marsh, Superintendent of the Clinton (Mo.) Gas, Coal and Coke Company, is placing new lanterns on the public lamp posts, and—just think of it—burners rated to a consumption of 8 cubic feet of gas per hour are to be employed. The carbonizing capacity of the plant is to be increased by the addition of two benches of C's, and the condensing and purifying apparatus is to be doubled. The mains will be added to by the placing of 1½ miles of pipe. The use of gas in Clinton is rapidly increasing, and Superintendent Marsh is a very busy man just now.—A. F. T."

ITEMS OF INTEREST FROM VARIOUS LOCALITIES.

Mr. CHARLES B. HURLEY, General Superintendent of the Tacoma, Washington, Light and Water Company, has notified the residents that hereafter the Company will make no charge, on an application for a gas service, for the connecting pipes from street main to curb line. Concessions of this nature are always in order, and are always sure to result in profit.

THE suppliers of electric lighting in Paterson, N. J., evidently have determined that the practice of supplying light at a loss must be stopped, if they desire to remain in the field as an active business agent. In any event it has been determined that hereafter commercial users of the arc light must pay \$10 per arc per month—2000-candle power lamps, to run until midnight, and \$1.25 for each 16-candle power incandescent lamp for an uninterrupted service. The prior rates were: arcs, \$5 per month each; incandescents, \$1 00.

THE following is a copy of the testimonial (prepared by Messrs. Jerome Croul, Alexander Lewis and Chas. B. Lothrop, of the Detroit Gas Light Company) that has been forwarded by the Detroit Gas Light Company to the family of the late William Henry Williams, of Philadelphia, whose death was noted some time ago in the JOURNAL:

"The Directors of the Detroit Gas Light Company, believing that, when death removes a man like the late William Henry Williams, of Philadelphia, it is fitting and proper that his friends and associates should express their appreciation of his many virtues and good qualities; and believing that a good name is the best heritage, and the fact that a man has so lived as to be of aid and assistance to his fellows, admired and esteemed by all with whom he has associated, is one of the truest sources of consolation to the family circle made desolate by their loss, desire to place on record their testimonial to a well-spent life. Mr. Williams was not actively connected with the management of this Company, but his wise foresight and his sound business judgment made him the wise counsellor to whom for many years past this Company when in doubt or difficulty has turned, and never in vain. To his careful advice is attributed much of its financial success. The mental activity and clearness of perception for which he was so marked enabled him to carry in his mind the details of a large business so far from his home, and readily to solve questions that perplexed and troubled others. But those who were thus brought into business relations with him soon saw another side of his character. He seemed to possess that rare quality of making all with whom he was brought into contact feel as though they were friends of long standing, and his friendly and social manner drew all towards him by those ties of affection and regard that never come from the mere possession of business ability, however great. His unvarying kindness and courtesy, his clear and penetrating mind, and his strict honesty and uprightness of purpose, endeared him to all, and made his loss peculiarly hard to bear. His pure and upright conduct, and the fortitude and cheerfulness exhibited by him in spite of his physical infirmities from which he so long suffered, and which would have crushed one of less indomitable spirit, make his life a bright example, to be emulated by all. In his death we lose a careful and safe adviser and a true friend, whose loss to us is only less than to his family, to whom, in their great sorrow and affliction, we tender our most heartfelt sympathy. It is directed that this testimonial be spread on the records of this Company, and a copy sent to the family."

DIRECTOR WAGNER, of the Philadelphia Bureau of Public Works, has made the following awards for the supply of meters to the gas department of the service: American Meter Company, 1,800 meters, 5-light description; 240 meters (10-light) to J. J. Griffin & Co.; to the Goodwin Gas Stove and Meter Company, 144 20-light and 48 30-light meters.

THE Selectmen, of Marlboro, Mass., have officially notified the old Marlboro Gas Light Company that a franchise has been granted to the projectors of the opposition or Citizen's Gas Company. Now the Gas and Electric Light Commission of the State will have an opportunity to show its real value to vested interests.

NEWS from San Francisco is to the effect that the Supervisors have decided to recommend for adoption Supervisor Ellert's order providing for the quarterly inspection of gas fixtures in hotels, etc., and for the affixing of a card to such fixtures warning persons of the danger of blowing out the gas. The penalties for violation of this ordinance range between \$20 and \$100 fine, or an imprisonment ranging from a period of 5 days to 30 days. The great number of deaths from the accidental inhalation of illuminating gas reported during the last four years in San Francisco is the basis for this ordinance.

IN 1889 gas tar was a drug in the Lynn (Mass.) local market at the figure of \$1.50 per barrel, whereas now the demand exceeds the supply, although the rate has been advanced to \$2.50 per barrel.

THE Louisville (Ky.) Gas Company has determined to boom the local market for the sale of coke. Crushers have been purchased, and several sizes of the fuel will be kept constantly in stock. Engineer Barret has also purchased three handsome teams of Percherons, with a suitable complement of well-built drays, the appearance of which on the roads of the city cannot fail to attract attention to the fact that the Company has coke for sale.

THE Milwaukee (Wis.) Gas Light Company has awarded a contract, for a Wilkinson process and water gas plant, to Messrs. Bartlett, Hayward & Co., of Baltimore, Md. The capacity of the apparatus is fixed at one million cubic feet per diem. This plant is to include two 250 horse power Hazelton boilers, and the necessary cupolas, scrubbers, condensers, benches, blowers and exhausters. Another feature of the construction is to be a hydrogen holder, with a capacity of 100,000 cubic feet. The holder is to be constructed in and over an iron tank. Of course, new buildings will be a part of the equipment. The plant will be provided with all the latest improved appliances for mechanically handling all fuel and ashes, including mechanical stoking for the boilers, etc. It is the claim of the designers and builders that the apparatus will be so arranged that should the necessity ever arise one man in each twelve hours can perform the entire work of operation. The Wilkinson process was chosen after an extensive inspection trip, made by the President of the Company and its Engineer, Mr. E. G. Cowdery, who visited most of the larger cities where improved systems of water gas manufacture were in operation. This work will probably keep Mr. Cowdery away from the Gogebic section this summer—which is a lucky circumstance for the finny denizens of the Gogebic lakes.

WE understand that the proprietors of the new gas works, to be erected this season at Port Townsend, Washington, have determined to seal their holder in a tank built out of redwood timber. The works are to be of the 10-inch standard.

MR. JAS. BROWNLEE, Chairman of the "Committee on Proposals for Lighting the Public Lamps," Paterson, N. J., was rather disappointed over the bids received in response to his advertisement for lighting the public lamps (mixed system of arc and gas lighting) in the competition that closed last Monday. It is likely that new bids will be asked for.

THE estimate of probable cost of an electric light plant (to be operated on municipal account by the city of Milwaukee, Wis.), as returned by the Board of Public Works in response to a resolution of Common Council, is as follows—the figures being based on a plant capable of maintaining 1,745 lamps, of 2,000-candle power each: 1,745 lamps, \$47,115; 70,500 feet of conduit, \$70,500; 6,393 poles, \$22,375; 8,021 cross arms, \$1,764.62; 1,941 break arms, \$970.50; 18,000 wood pins, \$540; 15,424 bolts, \$462.72; 18,000 insulators, \$1,440; 460 miles of wire, \$84,000; 53 miles guy wire, \$636; 257,650 feet rope, \$3,145.89; 5,331 pulley blocks, \$2,398.95; 150 dozen lamp cleats, \$375; setting poles, \$6,393; cables in river crossings, \$20,000; incidentals, \$5,000; tools, \$1,000; real estate, \$20,000; buildings, \$20,000; four 500-horse power engines, \$60,000; 14 boilers, \$21,000; shafting, etc., \$20,000; 55 dynamos, \$55,000; 55 lightning arresters, apparatus, etc., \$5,000; incidentals, \$5,000; tools, \$500; total, \$575,442.18. We do not vouch for these figures; but they come from what is certainly a semi-official source.

THE authorities of St. Louis, now that public electric lighting is in vogue there, are anxious to retain the gas lamps in position at the street intersections, owing to the fact that they carry the names of said streets. They have asked the Laclede Company for a figure at which the latter will lease them to the city for street directory purposes.

SANTA MONICA, Cal., is to have a gas works; that is, if the authorities will hold out any reasonable charter inducements to the capitalists who have the project under consideration.

IN our issue of May 19th (p. 704) appears an item to the effect that the price received by the Grand Forks Gas and Electric Company, of Grand Forks, N. D., for its bonds was 80 per cent. This is an error; for the Company received par for an issue of \$80,000 worth of three-year bonds. This latter shows very much more plainly how good the credit of the Company is.

THE Laclede Gas Light Company, St. Louis, has purchased, at auction sale, the property, rights, etc., of the St. Louis Gas, Fuel and Power

Company, otherwise known as the Water Gas Company. The price paid was \$455,000.

LEWIS BALCH, Health Officer of Albany, N. Y., has called the attention of the Mayor to the dangerously defective condition of some of the distributing wires of the Albany Electric Illuminating Company.

THE proprietors of the Sioux City (Iowa) Gas Company are enlarging their cupola house, and the Kerr Murray Mfg. Company, of Fort Wayne, Ind., have engaged to furnish a wrought iron trussed roof (with slate covering) for same.

WHILE on the subject of contracts we might also note that the Kerr Murray Company has just completed, for the Jackson (Mich.) Gas and Fuel Company, a new cupola, rated to a per diem capacity of one-half million cubic feet. The same constructors will also erect a gasholder (80 ft. by 22 ft., capacity, 110,000 cubic feet) for the Butte City (Helena, Mont.) Gas Company.

OLD reliable, M. N. Diall, of the Terre Haute (Ind.) Gas Company has succeeded in putting out 97 gas stoves since March 1st. Pretty good, Mr. Diall.

MENTION of Terre Haute recalls the fact that the Stacey Manufacturing Company is to build a new single-lift holder there, the vessel to have a diameter of 80 feet.

A DESPATCH from Lowell, Mass., under date of June 1st, tells the following tale of woe: "A serious accident occurred here, Saturday night, at the electric light station in Middle street, causing the sudden extinguishing of 300 arc lights in the city. Two employees were working under the shafting when a rasping, buzzing sound warned them to fly to the next apartment. Their escape was effected none too soon, for a heavy counter-shaft, weighing two tons, fell, demolishing the dynamos. The shaft was 23 feet long, 2½ inches in diameter, and upon it hung 8 Hunter friction clutches and six belts. The damage is put at \$2,000.

MR. PRICHARD, of Lynn, Mass., is engaged on the construction of a building 75 feet by 35 feet, which is intended for the housing of a double set of improved water gas apparatus, the contract for which has been awarded to the United Gas Improvement Company.

THE Kansas City (Mo.) Gas Company's new holder (capacity 1,000,000 cubic feet), which is located in the district known as Turkey Creek Valley, has been completed. It is a credit to its builders and to its owners as well.

THE use of gas for cooking, heating and power purposes gains ground rapidly in Kansas City. Over 400 gas cookers are now in duty.

AT the stockholders' meeting of the Kansas City Company the following Directors were elected: M. J. Payne, W. W. Gibbs, L. F. Wilson, E. L. Martin and John A. McDonald.

A FRANCHISE for the construction and operation of a gas works at Riverside, Ia., has been granted by the City Council to Mr. John Hornick. This place is in Washington county, Ia., on the English river, and on the old Muscatine division of the Burlington, Cedar Rapids and Northern Railroad, at a point about 32 miles west of Muscatine. It is quite a manufacturing center, and will undoubtedly become an important factor in the commercial life of the State. Ten years ago it had a population of perhaps 500; now it can boast of 7,000.

ARRANGEMENTS are under way for the consolidation of the plants of the Batavia (N. Y.) Gas and Electric Light Company.

THE trust deeds conveying the plants of the Companies forming the combination of artificial lighting interests at Indianapolis, Ind., have been recorded. The trustees are the Central Trust Company, of New York, and Lafayette Perkins, of Indianapolis.

ONE day last week workmen in the employ of the Standard Gas Company of this city were engaged in laying on a gas supply to the private school for boys, under the tuition of Prof. Drisler, at No. 15 East 49th street. Through carelessness of the workmen an explosion resulted that caused damages to the amount of \$150. The Company might possibly find it advantageous to reorganize its street gangs.

AT a meeting of the Rockville (Conn.) Common Council, held the last week in May, a lively debate on the propriety of granting an opposition electric franchise took place. Mr. Charles Phelps appeared for the Rockville Gas Light Company—this Company has an electric light-

ing franchise, and supplies are lamps under it at the present time—and L. L. Tingier appeared for the projectors of the Merchants Electric Light Company. A remonstrance, signed by a large number of the local manufacturers, against granting the franchise, was presented by Mr. Phelps, after which Mr. Cary, special agent of the Thomson-Houston Company, was examined by the counsel of both Companies. Mr. Cary gave it as his opinion, from past experience, that a city of the size of Rockville was unable to support more than one artificial lighting company. Treasurer Stickney, of the Rockville Gas Company, said the Company had already expended \$25,000 on the plant now in operation, and that it was ready to put in incandescent lights as soon as a sufficient guarantee could be had from proposed users. Although Council refused to make a decision at the meeting in question, it is more than likely that the franchise will be refused.

The following is from the Kansas City (Mo.) *Journal*: "The matter of street lighting will soon receive serious consideration at the hands of the Council, and the facts and figures which will be presented to the two houses, will probably result in some very wholesome legislation. The Gas Committee of the upper house has been engaged for some time past in securing valuable statistics from cities throughout the country relative to the cost of street lighting, and the result shows that Kansas City pays more for her electric lights and gasoline lights, than any of the cities from which reports have been received. It cost this city \$77,542.58 to light the streets during the fiscal year ending April 21, 1890. This amount was paid to the different corporations in the following amounts:

Kansas City Gas Light and Coke Company.....	\$28,585.83
Missouri Valley Vapor Light Company.....	29,632.02
Kansas City Electric Light Company.....	17,432.98
American Electric Light Company.....	1,816.65
Westport.....	75.10
Total.....	\$77,542.58

The Committee has not yet secured all the information as to the cost of lighting the streets by gas, but the statistics at hand show that Kansas City is not paying a greater price for this kind of light than is paid by other cities throughout the country. This is explained, it is claimed, by the fact that other cities, like this city, are lighted by gas under old contracts, and, until new ones are entered into, there will be no material reduction. Other cities, like St. Louis, for instance, are abandoning gas for street lighting purposes and using electricity or gasoline, or both. The Kansas City Gas Light and Coke Company's franchise expires in a few years, and it will soon be necessary, therefore, for the city to enter into a new contract in case the Council deems it expedient to continue the use of gas for street lighting purposes. The Company will probably not seek a renewal of the old franchise as the capitalists who are interested in the present Company hold a franchise which was granted to another company some years ago and which they secured by purchase.

The statistics obtained by the Gas Committee show that the city is paying an exorbitant price for gasoline lamps, and that a new contract should be insisted upon at once. The present contract is between the city and the Missouri Valley Vapor Light Company, of which F. K. Hoover is President. It provides that the lamps shall be lighted according to moonlight schedule. That is, when the moon shines the lamps are put out; on nights when there is no moonlight, the lamps are kept burning. Four other cities from which the Committee obtained statistics, are lighted under similar contracts; a comparison of the prices follows:

Cities.	No. of Lamps.	Price per lamp per Month.
Kansas City.....	1,306	\$2.25
Lincoln, Neb.....	230	1.16 $\frac{2}{3}$
Wichita.....	480	1.70
Sioux City.....	300	1.40
Columbus, O.....	600	1.31 $\frac{1}{2}$

In the following cities the price is fixed on an all night schedule:

Cities.	No. of Lamps.	Price per lamp per Month.
Chicago.....	8,608	\$1.08
Omaha.....	900	1.41
Baltimore.....	829	90
Cleveland.....	6,028	1.24
Philadelphia.....	6,476	1.75
Lowell, Mass.....	416	1.80
Worcester.....	1,500	1.80
Cincinnati.....	1,709	1.63
New Haven.....	575	1.80
Providence.....	600	1.68

These figures will doubtless convince the members of the Council that it is time to enter into a new contract with the Company furnishing the gasoline lights. The Company is operating under an ordinance granted in 1883. This ordinance, according to the claim of President

Hoover, is a ten years' franchise. When Westport became a part of Kansas City an offer was made by a man named Powell to light that part of the new addition at a price greatly under that charged by the Hoover Company. The matter was referred to the gas committee of the lower house, and Mr. Hoover succeeded in killing off his competitor and inducing the committee to recommend that the new addition be lighted by his Company at the old figures. Judge L. C. Slavens, then City Counselor, held that the Missouri Valley Vapor Light Company did not hold an exclusive franchise or a franchise of any kind. That the contract even was no good, as the Council had no power to make any contract involving the appropriation of money, until the cash was in the treasury. For some reason, however, the committee ignored the opinion of the City Counselor, and Mr. Hoover carried his point. For several weeks, however, he was rather anxious as to the fate of what he calls his franchise, and almost daily haunted the city offices, and labored with the committee at its meetings. Mr. Hoover admitted to a *Journal* reporter at the time that he was making a good thing out of his contract, and did not want to see Powell get a foothold.

The following table shows that Kansas City is paying a pretty stiff price for its electric lights of 2,000 candle power:

Cities.	No. of Lights.	Cost per Light per Hour.
Kansas City.....	114	55 Cents.
St. Louis.....	1587	20 $\frac{1}{2}$ "
Philadelphia.....	1045	47 $\frac{1}{2}$ "
New Orleans.....	634	34 $\frac{1}{8}$ "
Omaha.....	109	47 $\frac{1}{2}$ "
Denver.....	216	53 "
Buffalo.....	1296	40 "
Montreal.....	850	40 "
Pittsburg.....	902	38 $\frac{3}{4}$ "
Providence.....	500	44 "
Cleveland.....	100	38 "
Baltimore.....	607	40 "
Sioux City.....	75	28 "
Toledo.....	530	27 $\frac{3}{4}$ "
Memphis.....	100	50 "
Duluth.....	186	35 "
Syracuse.....	304	40 "
Galesburg.....	118	33 "
Birmingham.....	109	33 $\frac{1}{2}$ "

There is set apart to the gas fund for the fiscal year, 1890, the sum of \$96,000. The gas committee estimates that it will take all this money to light the present lamps and pay for the electric lights now up. The councilmen from the new wards are flooding the council with ordinances for the location of gasoline lamps, but their streets will have to go unlighted unless the city forces the Vapor Light Company to reduce its prices. It is impossible to increase the fund, as every department is demanding more than has been given it. The committee is strongly of the opinion that it is time the city should cease paying a fancy price for street lighting.

THE auxiliary water gas plant for the Pittsfield Mass., Gas Company is to be completed by October 1st.

OBSERVER forwards the following, from New Bedford, Mass., under date of the 4th instant: "At the annual meeting of the New Bedford Gas Light Company, which will be held on July 1, the present President and Treasurer, Mr. Gilbert Allen, will decline a re-election, giving as reason therefor that the duties of the position take too much of his time. Mr. Allen is President of the Merchants Bank, Clerk of the Morse Twist Drill and Machine Company, President of the New Bedford Company, and is a Director in many other local business institutions. After the death of the first Treasurer of the Company (Mr. Jas. B. Congdon), the then President, Mr. William C. Taber, resigned, whereupon Mr. Allen was elected to serve in both capacities, which he has done ever since to the satisfaction of the Company and the public. It is whispered that the offices will be again divided, and that Mr. George R. Seaton will be named to the Presidency, and that Mr. R. Price will be chosen Treasurer."

THE Berlin Iron Bridge Company, of East Berlin, Conn., has received the contract for the iron buildings of the Huanchaca Company, of Bolivia, South America. The plans provide for a boiler house, 45 feet by 60 feet, an air-compressor house, 45 feet by 80 feet, and an engine house, 42 feet by 75 feet. These buildings will be made entirely of iron, put together at the Berlin Bridge Company's shops, taken apart again and shipped to Bolivia, where they will be erected by native workmen.

WE have it on good authority that the Warren (R. I.) Gas Light Company has again changed hands, the controlling interest most probably having been secured by Bristol capitalists.

THE Pawtucket (R. I.) Gas Company will add another gasholder to its possessions.

SITUATION WANTED

As Superintendent of a Gas Works,
By a man of 20 years' experience. Best of references. Ad-
dress JOHN COLLINS,
324 Clinton Street,
Schenectady, N. Y.

GAS STOVE SHOW ROOMS, No. 242 Sixth Avenue, New York City.

THE WALKER TAR AND CARBONIC ACID EXTRACTOR.

A very general demand exists, in both large and small Gas Works, for an apparatus that will be absolutely efficient in the removal of the tar which passes the hydraulic main and condenser. Many attempts have been made to accomplish this, but, I believe, without success, until the introduction, five years ago, in England, of the C. & W. Walker Patent Tar and Carbonic Acid Extractor. During these years this apparatus has been adopted by many of the most prominent Engineers, not only in England, but also on the Continent of Europe and in other parts of the world. It is only necessary to give here a partial list in order to convince any intelligent American Gas Engineer that this machine must have succeeded fully in accomplishing the desired results.

The following Engineers have personally given permission to refer to them:

G. C. Trewby, Esq., Engineer-in-Chief of the Gas Light and Coke Co., London. The manufacturing plant at Beckton is built in complete sections of 3,000,000 cubic feet capacity each. A Walker Tar Extractor has been fitted to each one of these sections. This was done after a long and thorough trial on one of its sections. The Tar Extractor has been supplied to other works of the Gas Light and Coke Co., including those of which John Methven, Engineer of the Gas Light and Coke Co. at the Nine Elms Station, is in charge. Also to G. E. Stevenson, Peterborough Gas Works; B. Green, Mitcham and Wimbledon Gas Works; W. H. Smith, Bedford Gas Works; F. Linging, Norwich Gas Works; J. T. Browning, Colchester Gas Works; S. B. Darwin, Portsmouth Gas Works; J. McCrae, Dundee Gas Works; W. J. Wells, Stamford Gas Works; J. M. Darwin, Longton Gas Works; J. Paterson, Warrington Gas Works; and J. Coulter, of the Dundalk Gas Works. All of the foregoing gas works are located in Great Britain.

Mr. Charles A. Gerdenier, Superintendent of the Bridgeport (Conn.) Gas Light Company, writes as follows, under date of Dec. 3, 1887:

"The C. & W. Walker Tar and Carbonic Acid Extractor has been in operation at these works for the past six weeks, and is an unqualified success. It removes every particle of Tar from the gas in once passing through the apparatus, and a large percentage of the Carbonic Acid. I also feel quite sure that it prevents the formation and deposit of Naphthaline, because since I started the Washer I have had no stoppages from this cause. These works have been seriously troubled with Tar for many years, and I have used several kinds of apparatus and every expedient which has come to my attention for dealing with the difficulty, but without success. The Walker apparatus occupies comparatively small space, is less expensive than other systems, and requires but little attention. I carry 2½-inch seal, and have an automatic tar delivery valve. This Tar Extractor is indispensable to gas makers."

I have taken the Agency for the United States for this apparatus, and am now prepared to make contracts to erect it on the premises of any Gas Company. It would be manufactured in the following sizes:

No. 1,	50,000 to	100,000	cu. ft. per 24 hrs.,	3	ft. square,	5	ft. deep.
No. 2,	"	125,000	" " "	4	"	"	"
No. 3,	"	250,000	" " "	5	"	"	"
No. 4,	"	500,000	" " "	6	"	"	"
No. 5,	"	750,000	" " "	7	"	"	"
No. 6,	"	1,000,000	" " "	8	"	"	"
No. 7,	"	1,250,000	" " "	9	"	"	"
No. 8,	"	1,500,000	" " "	10	"	"	"
No. 9,	"	2,000,000	" " "	12	"	"	"
No. 10,	"	3,000,000	" " "	15	"	"	"

This Tar Extractor will perform its work with about one-fourth the usual back-pressure heretofore required. It is simple in construction, and can be supplied at a very reasonable price—less than any other ever before introduced. Satisfactory results will be guaranteed in every instance.

CONNELLY & CO.,

SOLE MANUFACTURERS OF THEIR PATENTED SPECIALTIES.

"IRON SPONGE."

Saves money, saves labor, and is the most efficient purifying agent ever offered as a substitute for lime. Now used in every State in the Union, and purifying daily over thirty-five million cubic feet. Should be used in every gas works. Its own saving will pay for it many times over.

AUTOMATIC GOVERNOR.

Has been on the market but three years, and in that time has been introduced more generally than any invention ever designed for use in gas works. Over two hundred of them now in use. Sensitive; reliable; perfectly automatic; reduces leakage; satisfies consumers, and gives great relief to the Manager. No gas works is complete without one of these machines.

STEAM JET EXHAUSTER.

Designed particularly for small works. Combines Exhaust Tube, Steam Governor Gas Compensator, and Bye-Pass Valves in the most compact form possible; occupies but little space; uses very little steam; operated by ordinary workmen; saves formation of carbon in retorts; increases yield 10 to 15 per cent. Specially adapted for mixing air with oil gas. No works too small to use them profitably.

Prices given on all our specialties delivered at any point in the United States. Correspondence solicited.

The utility and convenience of the Gas Engine being no longer an open question, it only remains now for intending purchasers to select the BEST. We claim for the CLERK GAS ENGINE that it is equal to any other manufactured as regards steadiness in running, simplicity, and ease of keeping in repair, and that it gives the greatest amount of power for the least money (both in first cost and expense of running) of any engine made. In support of this claim we refer to the test of the Gas Engines made under the direction of the American Institute of New York, in December, 1885, and heretofore published in these columns. These engines are especially adapted for continuous running under heavy loads, and we can refer to Engines which have run 22 hours a day for months at a time

Made in Sizes of 5, 10, 15, 20, and 25 Horse Power. All Engines Guaranteed for One Year.

GENERAL SALES AGENTS FOR

The Youghioghenny River Coal Company's

OCEAN MINE YOUGHIOGHENY GAS COAL.

HON. W. L. SCOTT, Prest.

M. H. TAYLOR, Vice-Prest.

This Colliery is located at SCOTT HAVEN, PA., in the center of the Youghioghenny Gas Coal District, and produces the ONLY RELIABLE YOUGHIOGHENY COAL for gas purposes. (See Map on p. 87 of this JOURNAL, Feb. 16, '85.)

POINTS OF SHIPMENT,

Locust Point, BALTIMORE.

Pier No. 62, PHILADELPHIA.

Also, SOLE AGENTS for the

**BRECKENRIDGE CANNEL,
OF KENTUCKY.**

Within the past two years we have delivered this Cannel to over ONE HUNDRED COMPANIES IN THIRTY-THREE DIFFERENT STATES, and it is now in use in some of the large Gas Works

On the Continent and in South America,

where it successfully competes with the Australian Shale. It is the ONLY AMERICAN GAS CANNEL of sufficiently high grade to warrant EXPORTATION TO EUROPE AND SOUTH AMERICA, and it is the only economical substitute for OIL OR NAPHTHA. ONE GROSS TON will produce

10,000 Cubic Feet of 75 Candle Gas,	} equal to {	750,000 Candle Feet of Gas, and 26 Bushels of merchantable Coke weighing 900 Pounds
or 12,500 " " 60 " "		
or 15,000 " " 50 " "		

This is the ONLY GAS CANNEL that will produce a REALLY MERCHANTABLE COKE. It can be delivered in parcels of one carload or more to any point in the United States or Canada. Cargo shipments of any size required can be made from NEW YORK, PHILADELPHIA, BALTIMORE, or NEWPORT NEWS. Samples will be sent and particulars of price, etc., forwarded upon application to above address.

"SUN DIAL" GAS STOVES,

The Most Economical, Efficient, and Durable Gas Stove Made.

GAS COOKING STOVE, No. 8 C.

SIZE.

Stove.	Oven.	Roaster.	Top.	Length over Extension Shelves,
37 in. high.	12 in. high.	12 in. high.	24 in. long.	36 in.
20 in. wide.	17 1/2 in. wide.	18 in. wide.	21 in. wide.	
	12 in. deep.	13 in. deep.		

This Stove has four burners on top, and double oven burner. * Consumption of gas with all burners in use, 42 feet per hour, at 1 inch pressure. The top is made in sections, so that a greater variety of cooking utensils may be used. By lifting out the covers and crosspieces and putting in a suitable forked ring, which is sent with each stove, a wash boiler or other large utensil may be set over two burners. Our **No. 87 GRIDDLE** also fits in the same position. The roasting oven is provided with a cast-iron door.

All Fittings are Nickel-Plated.

GAS COOKING STOVE, No. 7 B.

SIZE.

Stove.	Oven.	Roaster.	Top.	Length over Extension Shelves,
31 in. high.	9 1/2 in. high.	10 in. high.	21 in. long.	32 in.
17 in. wide.	14 1/2 in. wide.	15 in. wide.	16 in. wide.	
	12 in. deep.	13 in. deep.		

This Stove has three boiling burners in the Top or Hot Plate, and one single oven burner.

This cut represents our New Style Cooking Stove. As will be seen, it has an ornamented cast-iron Base and Front, and extension shelves. The oven burner, which is atmospheric (unless otherwise ordered), is of an entirely new and improved pattern (patent). The ovens are of greater capacity than those of the old style. The Top, in conjunction with the Outlet Pipe, is designed to carry off all the products of combustion, if desired, but they are also supplied with a loose ring which converts it into an ordinary open top stove.

The consumption of this Stove is 35 cubic feet per hour at 1 inch pressure, with all Burners in use.

All Fittings are Nickel-Plated.

"RADIANT" BOILING STOVE, WITH REGENERATIVE BURNER.

Size, 6 1/2 inches diameter, 8 inches high. Consumption, 6 feet per hour at 1 in. pressure.

HOT PLATE, No. 111.

Size, 36 in. long, 12 in. wide, with three double burners, 6 taps. Consumption, with all burners in use, 36 cubic feet per hour, with 1 in. pressure. 1/2 in. supply pipe should be used where the pressure is 1 in. or over.

THE AMERICAN

GAS LIGHT JOURNAL

RODMAN & KENNY, N. Y.

PUBLISHING OFFICE No. 42 PINE STREET

DEVOTED TO THE INTERESTS OF ILLUMINATION, VENTILATION, WATER SUPPLY AND DISTRIBUTION, & GENERAL SCIENCE.

VOLUME LII.—No. 24.
Whole No. 784.

NEW YORK, MONDAY, JUNE 16, 1890.

{ \$3 PER ANNUM,
IN ADVANCE.

A. M. CALLENDER & CO., Proprietors. C. E. SANDERSON, Manager.
JOS. R. THOMAS, C.E., Editor. T. J. CUNNINGHAM, Asst. Editor.

ENTERED AT THE POST OFFICE AT NEW YORK, N. Y.
AS SECOND CLASS MATTER.

Published on each Monday of the year, at No. 42 Pine Street, N. Y.

Terms of Subscription, Including Postage.—For the United States and Canada, \$3 per annum. European countries, \$4.50 (19 shillings—22½ francs). All payments to be made in advance. Single copies, 10 cents.

Remittances should be made either by post-office order, express money order, registered letter, or bank draft on New York, payable to the order of A. M. Callender & Co.

Collections are invariably made directly from this office, for subscriptions, advertisements, etc. We have agents to solicit the same, but they are not authorized to receipt for money.

Correspondence.—Wishing to make this JOURNAL a gazette of intelligent discussion to those of our readers who may wish to gain or give information on the subjects to which its columns are devoted, correspondence is solicited for publication from all who make the study of those subjects a pleasure or a profession.

The American News Company, Nos. 39 and 41 Chambers street, New York, are agents for this JOURNAL. Newsdealers will send orders to them.

Books.—We will forward by express, at publisher's lowest rates, any book—scientific or otherwise—to any address in the United States or Canada. We would suggest to our patrons that to avoid the risk and expense consequent on sending us the money (we do not send books C.O.D.), that orders for books be sent us through the Purchasing Department of the American Express Company.

BRIEFLY TOLD.

MR. YORKE WRITES A BOOK.—It is with satisfaction and pleasure that we chronicle the appearance in the field of authorship of another gas man, who makes his bow to the fraternity in his new role from the precincts of beautiful and busy Brockton, Mass. To be more precise in our introduction of the last candidate for literary honors, in our especial field, we may say that the gentleman is Mr. Eugene H. Yorke, Superintendent of the Brockton (Mass.) Gas Company, and the title of his book—or pamphlet rather; for it is in paper covers, which inclose 24 pages of matter—is “The Essential Facts in Lighting with Kerosene, Gas, Electricity.” The principal divisions of the book, in respect to the subjects treated, are: The utility and value of lighting; the theory and laws of light; the advantages of brilliant illumination; means for producing light; the requisites in lighting; characteristics of kerosene, electricity, gas; points on electric wiring; cost of gas lighting; cooking by gas; heating by gas; gas for power; hints to gas consumers, etc. The matter is well arranged and intelligently composed, and the illustrations are both profuse and well drawn. Mr. Yorke has put the price of the pamphlet at 25 cents, but we presume a liberal discount from this could be secured in case copies were ordered, say, in lots of 50 or upwards. The Yorke idea, we presume, is that these pamphlets might be advantageously distributed to consumers by gas companies.

HOW THINGS ARE GOING ALONG AT IRONTON, O.—The following letter, from Mr. W. W. Prichard, Sec., Treas. and Supt. of the Ironton (O.) Gas Company, under date of June 10th, explains itself:

To the Editor AMERICAN GAS LIGHT JOURNAL: About December 25 the Ironton Electric Light Company started up their incandescent lights for the streets and private consumers. I have just made a comparison of the first four months of the year with the same four months of previous years, to see how much they were affecting our business; and if you think the figures of interest to your readers you may use them. During the four months of '89 we had 150 street lamps, Philadelphia schedule, up to midnight; in 1885 and 1875, Philadelphia schedule all night, though not so many lights.

Private Consumption.

1st 4 mos. of 1890	show a gain of 23.8 per cent. over same 4 mos. 1889
“ “ 1890	“ “ 73.2 “ “ 1885
“ “ 1885	“ “ 16.6 “ “ 1875

I go back only to 1885, as I took charge of the works on June 19, 1884. * * *

Total Sales.

1st 4 mos. of 1890	show a gain of 10.8 per cent. over same 4 mos. 1889
“ “ 1890	“ “ 33.7 “ “ 1885
“ “ 1885	“ “ 33.8 “ “ 1875

* * * Gas stoves are starting off well. I did not get away for the St. Louis meeting, much as I would like to have been there.

FURTHER HINTS FROM ALTON, ILLS.—A letter from Supt. Tracy, of the Alton (Ills.) Gas and Electric Light Company, under date of June 9th, says: “There is no let up in the gas business here. I have just closed a contract for a hot-tar scrubber with the Kerr Murray Mfg. Com-

pany, which I hope to have in place the last of next month. I have discontinued the use of native coal and am buying good Youghiogheny coal, and find that a good 18-candle coal gas gives the best results in Alton. I have 62 gas ranges in use and they are all giving the best of satisfaction. Not only so; but consumers are surprised at their small gas bills. This last is not a fish tale. We sell gas for fuel purposes at \$1.50 per 1,000."

THE WESTERN GAS ASSOCIATION CUP.—As said before, one of the most enjoyable features of the "outing" on the third day of the Western Gas Association convention was the racing card run off on the elegant track of the St. Louis Jockey Club. Good as the entire card was, of course, the gas men were most interested in the race for the "Western Gas Association Cup," which is a magnificent specimen of the silver smith's craft, and was designed by that celebrated St. Louis house, the

Mermod-Jaccard Jewelry Company. The cup was presented by the firms who contributed so generously to the entertainment of the Association and its guests. The race itself (the distance was $1\frac{1}{4}$ miles) brought out a good field of horses, and resulted in a stirring contest, at the end of which the judges first caught sight of the animal called Churchill Clark. In response to numerous queries about the appearance of the cup, we herewith print a very good illustration of it.

NOTES.—Mr. J. E. Rawn has been appointed Engineer of the Roanoke (Va.) Gas and Water Company.—At the annual meeting of the Newark (N. J.) Gas Light Company the following Directors were chosen: Eugene Vanderpool, Ira M. Harrison, Theo. Runyon, E. H. Wright, J. R. Emery, M. L. Ward, R. F. Ballantine, Franklin Murphy and Horace N. Congar.—The stockholders of the Louisville (Ky.) Gas Company have agreed unanimously to engage in the electric lighting business. The plant will be installed in buildings to be located on the site of the First Presbyterian Church on Green street.—The Pottstown (Pa.) Gas and Water Company elected the following officers: President, G. B. Lessig; Secretary and Treasurer, J. B. Maxwell.

The Market for Gas Securities.

Consolidated during the week about held its own at the figures last quoted. The range was narrow, and sales were restricted. The upward movement in Mutual still continues, 200 shares of that security having been sold at auction at $121\frac{1}{2}$ to $121\frac{3}{4}$. Higher prices are certain to be made in these shares, and speedily. It is possible that payment of the dividend on Chicago gas (due to-day) will be deferred for some days. Receiver Davis will likely appeal to the court for an order, and in the event of a favorable answer the Fidelity Trust Company will furnish him the funds to make the return to the shareholders. The stock is fairly strong at 53 to 54. We believe it to be a purchase. In Brooklyn shares nothing of moment is to be reported. Citizens gas still improves, being quoted at $85\frac{1}{4}$.

[OFFICIAL REPORT—REVISED BY THE SECRETARY—CONTINUED FROM PAGE 809.]

THIRTEENTH ANNUAL MEETING OF THE WESTERN GAS ASSOCIATION.

HELD AT ST. LOUIS, MO., MAY 21, 22 AND 23, 1890.

FIRST DAY—AFTERNOON SESSION—MAY 21.

Mr. Walton Clark, of Philadelphia, Pa., here read his paper on

THE WORLD'S FAIR AND THE GAS ASSOCIATIONS.

Our interest in the exhibit of mechanical appliances at the coming World's Fair will not be confined to articles, or the production of articles, immediately connected with the industry in which we are engaged. The gas engineer has an interest in every branch of engineering; and in almost every machine to be shown at Chicago, in 1892 or '93, will be able to find something to attract and educate him in his calling. No action upon the part of Gas Associations is necessary to insure an exhibit that will repay, in a purely business way, the money and time a member may give to visiting the World's Fair. Were there no gas industry, the immense collection of implements and machines would contain much that we now consider essential to a well built, economically operated gas plant; were there no American, or New England, or Western Association, to take action in the matter, there would yet be an exhibit of gas appliances such as has not had an equal on the American continent. The fact that adaptation, as well as invention, has had a share in supplying the mechanical features of a gas plant, *would* insure the former; the competition among manufacturers, and the importance to them of utilizing this, the first good opportunity of exhibiting their wares to thousands of possible purchasers, from all over the land, that has occurred in fifteen years, *does* insure the latter.

We are not then concerned as to the providing of an exhibit. Our responsibility is limited to providing, so far as we can, that there shall be such an arrangement of the things exhibited as will make the occasion of the greatest possible value to our members, and, through its effect upon the visiting public, to the owners of the properties we have in charge, and providing visiting gas men with such information and attention as shall make their trip to Chicago as enjoyable and inexpensive as may be. How may this best be accomplished? It is this question that I understand the committee desires to have presented by, and as it appears to, me, and discussed by you.

There are two points to be considered:

- 1st. What shall, or can, we do?
- 2d. How shall, or can, we do it?

What can we do toward insuring the greatest possible good to the visiting gas engineers and managers? Very much, I think, if the Associations act in concert; very little, if they do not. I think our action should be entirely independent of the manufacturers of appliances, up to the time of offering them room for the exhibition of their wares. Our aims and theirs are not similar. We desire an exhibit which shall instruct us, and give the visiting public a correct idea of the value of gas service in the generation of power, lighting of streets, and particularly, in domestic economy. The manufacturers' idea is to sell their goods. They will not be satisfied, naturally, to have us specify the number and class of articles of their make we may desire to have exhibited. Therefore, I would propose that we do not attempt to make our scheme cover the entire gas exhibit, but only such articles as refer to the utilization of gas for lighting, heating and the production of power; and the lighter appliances used in its manufacture and distribution. The latter to cover consumers' meters, cocks and valves of the smaller sizes, photometers, testing appliances, etc. Pictures and models of apparatus should also be included. Manufacturers could then have, if they so desired, their individual spaces in the general buildings and display their wares very much as if there were no gas Association's exhibit. This would probably be perfectly satisfactory to them. Lists of the appliances they had on show elsewhere, and the location of them, kept for distribution at the Association's headquarters, would be of mutual benefit. There is little doubt that the knowledge that there was to be a gas men's headquarters, where such wares as were shown would be appropriately grouped, and naturally command more attention from the people they desired to reach, than would isolated exhibits, would cause manufacturers to send their best goods cheerfully. The plan of grouping should insure the best attainable disposition of articles, both as affects convenience of inspection and efficiency of operation. The jealousies of manufacturers, and consequent annoyances, may probably be avoided by grouping all articles of a kind together; meters in one

room or stall, stoves in another, etc. By this means, charges, almost certain otherwise to arise, that one firm had been given a better position than another, would be avoided. The desirability of avoiding such jealousies, the recent unfortunate experience of the Gas Institute amply illustrates. In view of the importance of giving the various exhibitors an opportunity to explain the use and utility of their own wares, it is desirable that the Associations' headquarters be near that part of the building set aside for the exhibit of gas works appliances. It would be best located in the very midst of them.

If we have provided a suitable space convenient to the general gas exhibits, and the money appropriated to cover the expense of an attendant, the cost of gas, printing, etc., there should be no doubt of our ability to make a display of appliances, models, etc., creditable to the Associations, and of great value to the members of the fraternity. But we desire to do more. To realize the greatest benefit from the World's Fair for ourselves and our employers, we must impress upon the public mind the economy of the use of gas. To do this involves the exhibition of lighting, heating, cooking and power appliances, in operation for at least a part of each day. As already stated, the advantages possible to manufacturers from this display guarantee their hearty co-operation. Gas stoves and water heaters, with test meters and bakers' thermometers attached; engines with meters and Prony brakes; all ready for operation in a place certain to be visited by every man interested in gas works and visiting the Fair, and by tens of thousands of curious consumers of gas, would give the manufacturers more of an advertisement than they could otherwise obtain with an expenditure of an hundred times what this exhibit would cost them. The utilization appliances set conveniently for exhibition purposes, and in charge of a competent attendant; the spaces lighted at night by high power regenerative, incandescent and other forms of burners; everything arranged for convenient testing, and explained by cuts and text; these should make an impression upon a consumer that would result in good to the local company supplying him.

Having now considered what we desire to do in the way of an attempt to make the gas man enjoy and profit by his visit to the World's Fair, and to impress the layman with the superiority of our product for his uses, we come to the latter question: "How can we do it?"

The American Gas Light Association voted that the Council be directed to appoint a committee of seven, five from the Council and two from outside of that autocratic body. These will be appointed by the Council during this meeting of the Western Association. The New England Association has appointed a committee of three, two officers and an ex-president of the American Association. One of them will be on the committee of the latter. I suggest that the other Associations appoint committees of three; one, the chairman, to be one of the members of the larger committee of the American Association, and that the appropriations made be all turned into one fund at the disposal of the larger body. Each Association will have its representative in that body. No section nor interest can dominate the rest. To the attainment of any definite result of value a concentration of forces is necessary. It will cost more money to accomplish what we desire than any one Association will contribute, and if the effort is not all along one line the work done will amount to a little more than would result from the independent action of the American body. These men having control of the funds to be expended in carrying out our scheme, could best work through a sub-committee of three, at least one being resident in Chicago, to whom should be delegated the work of preparing plans and estimates during the coming year, to be submitted to the full body not later than January, 1891. These could be later endorsed by the Associations, if approved (the Council acting for the American, to save time), and appropriations made.

If space in the buildings were bespoken as soon as matters in Chicago are in condition to make it advisable, the proposed course would give the sub-committee ample time to perfect its arrangements after the appropriations had been made, and before the Fair opened.

I cannot estimate closely the probable cost of fitting up and maintaining the exhibit. The setting up of appliances exhibited should be at the expense of the owners. The preparing of the spaces, fitting up sitting rooms, providing conveniences for visitors, and paying salaries of two attendants, should be at the expense of the Associations. Probably five thousand dollars will cover the expense, if the Fair authorities do not charge for space.

Discussion.

The President—Any remarks upon the subject of the World's Fair, and the connection of our Associations with it—a subject in which we are all more or less interested—will be appreciated.

Mr. Harbison—Some action has been taken respecting the relation of

the gas industries to a World's Fair, to be held in Chicago, probably in the year 1893. As has been stated by Mr. Clark in his paper, the American Association have taken action by directing the Council to appoint a committee composed of five members of the Council and two members of the Association outside of the Council. The resolution provided further that this committee shall serve without compensation for services rendered, but that their actual expenses shall be paid from the funds of the Association. That action was taken at the meeting held last October. The New England Association, in February last, appointed a committee of three, and also passed a resolution that the committee should serve without compensation for services rendered, but that their actual expenses should be paid out of the funds of the Association. In the address of your President to-day allusion was made to this subject. Unfortunately I was not in the room when his address was read, and I do not know what action was taken upon it, but as the ordinary course is to refer the address to a committee, which course I take it for granted has been followed, I presume the committee will recommend to this Association what they think will be best for you to do in connection with the World's Fair. The Ohio Association will also undoubtedly take action in the same direction. It is exceedingly desirable that there should be co-operation amongst the different Associations, so that they may come together as a unit through such committees as may be appointed. In my opinion it would be well not to have this general committee too large. Some of the members will undoubtedly be members of the different Associations, so that the different Associations might name, for a part of their committee, those who have been named by other Associations. A committee of 10 or 12 would be more efficient than one of 25. I think the work of preparing, or of having prepared the exhibits of gas industries which may be made at the World's Fair, might be well relegated to such committee as may be appointed by the Associations.

It is probable that all the Associations will name on their committees men representing various sections of the country, and the various component parts of the membership of the Associations; and they will undoubtedly select men who would be likely to take a personal, as well as a professional, pride in the success of the exhibition. As a member of the committee appointed by the New England Association I cordially invite here any suggestions that may be made; and I would suggest that the matter of details might be left very largely discretionary with the committees, or with the general committee, when it is constituted; for I apprehend that the general committee selected, when gathered in council to discuss the measures to be adopted, will be able to reach a very careful conclusion and secure the best possible results. As to whether the exhibits shall be all in one department, or whether they shall be divided, as suggested by Mr. Clark in his paper, will be a question for careful consideration by the committee. They would undoubtedly be unanimous in every action which they might recommend to the World's Fair Committee. As representing the special industries which we have here, I shall be very glad if other members of the Association who feel interested in this matter will give expression to their views.

The President—The Committee on the President's address have not as yet reported, so that it is hardly fair or safe to prophesy what report they will make on the suggestion, relative to the World's Fair, that was contained in the President's address. The question, however, is now before the Association, and it is important that we should have a full expression by the members of this Western Association as to their wishes for the guidance and instruction of the committee, if we shall see fit hereafter to appoint a committee to co-operate with like committees from the American, New England, and Ohio Associations. I, therefore, trust that the members will not be backward in giving expression to their views.

Mr. Starr—I am much interested in this discussion. Mr. Clark proposes in his paper that the preparation of exhibits should be at the expense of the owners. I believe that, in all national affairs of the kind, the projectors or managers have had to pay for their gas also. Would it not be a good idea for some of the large companies who hold the right for different kinds of gas machinery to propose to light the building up on whatever days can be agreed upon. The electric light companies will most likely offer to do that. I have no doubt a moderate amount appropriated by the different Associations would fit up rooms where gas men would feel at home, and I would like to see that done. The \$500 in our treasury would not go very far towards the expense, but still it will help. I have no doubt the different patentees of water gas apparatus and the makers of gas apparatus generally could come to an understanding and bid for the lighting of that building, and then the electric light companies will come in and make their bids, which will afford an opportunity not before presented of showing the advantages of one sys-

tem over another. Let the gas section be a place for competition. The exhibition will be found of great interest and of great value to the country in the way of artificial lighting. I would be glad to see this thing carried out. I hope to see a splendid water gas apparatus put up in order to show the way it is done and the light that the product gives; also, a good coal gas works. If there is any virtue in coal gas yet—although I have quit it, and am wedded to water gas—I would like to see an exhibition of it. In the older times I stuck to the coal gas, but now I will take water in mine. I think such an exhibition will be interesting to the country at large. I also think it very desirable there should be some arrangement for a place where we can all go and feel that we have an interest. Most gas men in the country belong to some one of the Associations, and if he knows there is a place of comfort and of rest where he will be welcomed, he will feel more like going there than if he goes solely in the interest of some private or public corporation. I think the exhibition will be a great benefit to the gas interest. Some people declare that the electric light is the light of the future; well, it is an excellent thing, but I still think gas is a good thing yet.

Mr. Yuille—I can promise the cordial co-operation of the Chicago Gas Company in anything which the Association may see fit to do in Chicago.

Mr. Starr—Suppose that the Associations want to go into the plan I have suggested. In that event I would suggest that the gas companies of the United States contribute a small amount towards furnishing a place of entertainment for the members.

The President—I have permitted discursive remarks in order to ascertain the sense of the Association on this matter; but in order to accomplish what we want we must have an organization. If that organization is to be delegated to a committee, the committee can act only on their own judgment, and they would like to be guided by an expression of opinion from a large number of the members of the Association. For that reason we invite an expression from members as to what they would like and what they would object to. The Secretary suggests, if the Committee on President's Address is now ready to report, that the report be read, and that it be discussed in connection with the paper by Mr. Clark, which is still before the house. If Mr. Ramsdell is ready to report, and there is no objection, we will now hear the report.

Mr. Ramsdell then read the following

REPORT OF COMMITTEE ON PRESIDENT'S ADDRESS.

To the President and Members of the Western Gas Association: Your committee to whom was referred the President's Address beg leave to report as follows:

The address is so full and exhaustive in itself that it only remains for the committee to refer to certain portions for the purpose of emphasizing the suggestions made.

The remarks on the subject of the rise in the price of crude oil are of great importance to the large number of companies represented at this convention who are using it, and are worthy of careful consideration.

That part of the address which alludes to the subject of legislation is of paramount importance, and we cordially endorse the recommendation made, that in States affected or threatened with vicious legislation the gas companies of such States form a State organization for defensive action. And as such organization will in all probability result ultimately in State gas commissions, and as this Association stands committed to the wisdom of this policy, we, therefore, feel justified in recommending that this course be pursued.

Upon the remarks concerning the "Report of the Committee on Gas Companies' Accounts," we recommend that if the report be not adopted that it be referred to another committee whose duty it will be to further investigate the subject and submit another report at our next meeting; and, further, that if this report is adopted that another committee be appointed, who shall take up some other branch of this important subject and submit a report one year hence.

We desire particularly to emphasize the suggestions made concerning the collection of "data" with especial reference to the coming census. We would urgently recommend that as individuals we do all in our power to assist this work forward, by giving as complete details as possible, and would further recommend that the Secretary of the Association be instructed to communicate with the Superintendent of the Census and officially request him to obtain exhaustive information regarding the proportion of gas sold for purposes other than light.

In the matter of the World's Fair we recommend that the President appoint a committee of five to co-operate with similar committees appointed by the other Associations; that this committee shall have power to act for this Association in the arrangement of all details; that this

committee shall serve without compensation, but that this Association shall pay their actual expenses incurred while acting as such committee.

Respectfully submitted, GEO. G. RAMSDELL,
B. E. CHOLLAR,
ALFRED E. FORSTALL, } Committee.

On motion of Mr. Jenkins the report was received and adopted.

Mr. Shelton—Before this matter is closed up, as you have invited discussion, I would like to say a few words on the subject of the World's Fair. I am very sorry that the discussion has been left so largely to the Eastern members, who are not fully identified with this Association, and that they have to continue the discussion; and I am surprised that there has been so little discussion upon this topic, which ought to be one of the greatest interest to this Association. It seems to me it is eminently proper we should give all the information and all the suggestions for the guidance of the committee that we can possibly give. It would be presumptuous in me to attempt to occupy any time after what Mr. Clark has so well said, and after the remarks of Mr. Harbison as to the action of the various committees, for they are, of course, far better adapted to that than I. But I have considered somewhat with regard to the details of the exhibition, and as to the actual exhibit that we as gas people should make. There is no question but that we will have to hustle in order to make an exhibit which shall compare favorably with the electric light people. We may not like to admit it, but the fact remains the same. The electric light people will have an exhibit that they will certainly be most proud of. We, as gas people, do not wish for second place. We all wish to have a gas exhibit of which we shall be proud; and such an exhibit can be had only by the full co-operation of every one of us acting together. As to the question which Mr. Clark has touched upon, of co-operation between manufacturers connected with the gas industry and strictly gas engineers, of course, that needs to be considered carefully; but I think our committees will be able to handle such a matter in such a way as to secure the hearty co-operation of all hands, and in a way to secure a thoroughly satisfactory exhibit without arousing jealousies. I have no doubt the committee will be able to devise some plan by which that can be done. I think also very favorably of Mr. Starr's idea about illuminating the grounds so as to compete with the electric light people. There will be probably 8, 10 or 15 electric light systems, each one running full tilt, so that you will see the reflection in the heavens for miles outside of the city. I think the gas people should keep up their end of the exhibition, in respect to lighting the space that the illumination is required in. I think the committee should be instructed to let every manufacturer of gas apparatus put up a small plant according to his system. I do not mean to refer now specially to water gas, coal gas, rosin gas, or oil gas, but to every one of them; and we know that there are a great many new gas processes. There can be no better place to exhibit them than will be afforded at the World's Fair. We are all of us more or less interested in patented processes and appliances—of which there will doubtless be a full exhibit; but it seems to me that in addition to the exhibit of benches, retorts, generators, scrubbers, etc., we ought to have an immense volume of gas for illuminating the grounds. I would suggest that some arrangement be made for holders of sufficient capacity to store every kind of gas. Let the committee invite proposals for putting up holders, and let the expense be borne by the committee, or let that be a part of their exhibit; but let that holder receive the gas for all these different gas apparatus which may be used for illuminating the grounds. Let the piping extend from that all over the grounds. Let them make artificial gas, or furnish natural gas also if desired, and let that gas be supplied to illuminate the buildings and grounds, free of charge. There can be no question about having a perfect illumination if some such arrangement is perfected. With regard to the minor exhibits of drawings, models, etc., I think a special appeal ought to be made to every gas company to furnish something. A great many of us have something that would prove interesting to others. A great many of us have clever ideas of improvements in one direction or another, and they can be put in good shape. The thing can be made a success if we all pull together. If we do this we can get up an exhibition which will be creditable to ourselves, and will not suffer by comparison with the electric lighting exhibits.

Mr. Starr—I would like to see another test. Put up your gas apparatus—water gas or coal gas—light the whole building with it, and at the same time have an incandescent electric light put alongside of every gas burner, and let the place be wired for the electric light. Then alternate the lighting; that is, turn on the electric light, permit it to burn for some time, and then turn on the gas; first try one and then the other, which will permit everyone to say for himself which is the most effective. The electric light people always claim that their burners give more light than gas; but I notice when they replace gas burners with

the incandescent globes they always put in a room more globes than there were burners. Here in this room you notice that, when it was lighted with gas, they had 30 burners, but now that incandescent lamps are in vogue 36 bulbs are required. Here is a fair test. If the electric light is better than gas, let us have it. If you will make such a test as this you will draw every gas man in the country to see it; and you will draw a large number of other people to see it. The people are the ones who are really interested in this matter, since the people are the purchasers of what we have to sell. The manufacturers would like to know which light is the best, so that they may know which will please the public best. You can give a satisfactory test by turning out every gas burner in the house and then lighting the same amount of incandescent lights; then put out the electric lights and light up your gas burners. Such a test as that will settle the matter to the satisfaction of consumers.

Mr. Dunbar—I believe every member of this Association has an interest in and desires to have a satisfactory exhibit of gas appliances at the World's Fair. We are all most anxious that such an exhibit shall be a success, and we have confidence that any committee that may be appointed will successfully carry the matter into execution. About the only thing that we as individual members have to express our ideas on is the matter of finance. As I understand it, we now have about \$100 in our treasury. The probable expense to the Western Association will be about \$1,000 or \$1,200. Would it not be well for some of the gentlemen here to consider the best means to raise the amount of money that we will be required to contribute? I merely offer this as a suggestion for the consideration of the members. It might be well to appoint a committee to report at this meeting upon the best means to raise the amount required.

Mr. Jenkins—I think it will be impossible for us at this meeting to do what Mr. Dunbar suggests. In the first place, we cannot tell how much of an exhibit we will have. If we adopt the suggestion of Mr. Dunbar we shall have to call upon the companies for quite a large subscription to the gas fund, for the expense will go up into the hundreds of thousands instead of being a few thousands. Until we find out what we are going to do it will be impossible for us to know how much money we want to raise. There is no doubt but that the general committee will take those matters into consideration, and between now and the next annual meeting of the Association they will be able to find out, and can then advise us how much will need to be raised; and then we will raise it.

The President—I understand that the proposition is that the Association as an Association does not bind itself for anything more than the actual expenses incurred by the committee. If the committee after investigating the matter come back next year and report that it is desirable the Association shall raise a certain amount of money, the question will then come before us for action. Until that time the financial question does not concern us, other than so far as defraying the actual expenses of the committee. The object of inviting remarks on the subject at all was for the instruction of the committee. That committee will want one of two things. They want the advice of the Association as to what they shall do, or they want an unlimited privilege to use their own judgment as to what is best for the Association to do. Perhaps it may be best that I should name that committee at this time. I will appoint on that committee Messrs. George G. Ramsdell, A. W. Littleton, A. E. Boardman, A. E. Forstall, and Walton Clark. Now, if the Association is satisfied with the membership of the committee, and will delegate to them the power to act as representing the sentiment of the Association, the committee will use their best judgment; or, if you are not prepared to delegate that to the committee, they would certainly like to have a further expression as to the wishes of the Association.

Mr. Ramsdell—In adopting the report brought in by the Committee on President's Address the Association has already taken action in this matter. We recommended in the report that this committee be appointed with power to act for this Association in the arrangement of all details. Of course we do not yet know anything about what is to be done; but we all recognize that there must be a vast amount of work done before this exhibition, as we are talking about it to day, can be put on its feet. As to the money matters, we do not yet know anything about that; and, as it seems to me, we cannot arrive at any just idea of it until this joint committee of the various Associations get together and formulate some plan of action. Then it will become necessary for them to report back to the various Associations. The committee intended by their report to give to this committee, which has now been appointed by the Chair, power to act for this Association, in conjunction with the other committees, in the arrangement of details.

The President—As Mr. Ramsdell made the report he certainly knows

what it contains; but I imagined that the report read, "subject to the approval of the Association," and that the report of the committee would have to be referred back for the approval of this body. If that were so the committee could not act very strongly until we met in convention again and confirmed the action which they had taken in the meantime. Now, if the Association is prepared to endorse the report as recommended, and the report gives the committee the right to judge for the Association, and if the Association is further satisfied with the committee as named, I will put the question. I will first read the report of the Executive Committee as to the World's Fair:

"We recommend that the President appoint a committee of five to cooperate with similar committees appointed by other Associations, and that this committee shall have power to act for this Association in the arrangement of all details, and that this committee shall serve without compensation, but that this Association shall pay their actual expenses incurred while acting as such committee."

The report of that committee has been adopted. If there is no objection to the committee as named, they will serve. A motion was offered some time ago by Mr. Egner that a vote of thanks be tendered to Mr. Clark for his paper. Are you ready for that question. [Adopted.]

Mr. Somerville—I observe that in the report gas was the only thing mentioned. We must remember that gas is not the only thing we make. I think some attention should be given to the products—to what we derive from the coal tar. You have all noticed the drawing which is hung on the wall—a tree illustrating what is taken from the coal. It is a very beautiful idea, and I think it could be illustrated very nicely in a series of bottles showing the various dyes extracted from tar, and also the extracts from ammonia. I would suggest that these bye-products be taken into consideration by the committee.

The President—I suppose all that would come under the head of "details," if the committee took hold of the matter. I am requested by Mr. Egner to again call the attention of the delegates to the exhibition of gas appliances that will be held on Eleventh street this evening. The Laclede Gas Light Company has gone to considerable trouble and expense in the preparation of this exhibit, and it is well worthy of a visit and an examination by each member. I hope that the attendance there to-night will be sufficient in numbers to repay in a measure the members of the local committee and others who have arranged for the exhibit of manufactures, for the trouble and expense to which they have gone.

Mr. Harbison—The Council of the American Association are to hold a meeting at this house to-night to consider the question of the appointment and to name their committee for the World's Fair. When we have acted we very much desire that the committee you have named by authority of this Association should join with us for consultation on this general subject. If the members of the committee that you have named will kindly make their arrangements for this evening so that they can give us an hour of their time, we should be very glad to have the five gentlemen whom you have named as members of this committee confer with us. With your permission I will say a single word further: That, so far as I know the opinions of the members of the New England Association upon this subject, and knowing the personnel of the members of this Association appointed by the President, and knowing something of the personnel of the Council of the American Association, I think I can assure every gentleman here that the gas industries shall be well taken care of in Chicago. I apprehend it will be in the opinion of your committee, and of the general committee, necessary to ask the committee of the World's Fair for at least one quarter of their entire territory. (Applause.) We have the assurance of the Manager of the Chicago Company that all that can be done by the Chicago Gas Light Company towards favoring the object in view shall be freely given by them. We know their ability, and hence there need be no fear on the part of any gentleman that the gas industry will not be well taken care of. It has been suggested that the natural gas business also should be taken care of. The edification which I have had in attending your meetings for the last eight or ten years gives me abundant assurance that the natural gas exhibit will be a success. I have always been highly gratified to listen to the eloquence and freedom with which the natural gas comes forth in your discussions. I do not believe that any part of the gas industry will be neglected. The residuals will be well taken care of. I was told not long ago it was probable that gas works would soon be run not for the making of gas, but for the making of residuals. So that we will have the residuals to take care of. I am quite sure all the manufacturers will be only too ready to send you everything of interest to them for exhibition at Chicago; and, therefore, I think that at least one-quarter of all the territory which will be devoted to the World's Fair Exhibition will be required for gas appliances.

The Association then adjourned to Thursday, May 22, 1890, at 10 A.M.

SECOND DAY—MAY 22—MORNING SESSION.

The Association was called to order at 10 A.M.

The President—The business of the day will be introduced by the reception of the

REPORT OF THE COMMITTEE ON NOMINATION OF OFFICERS.

Mr. Jenkins—Before I read this list, I wish to make a statement with regard to the Presidency for the present year. We all understand that Mr. Faben was advanced from the first Vice-Presidency to the position of President by reason of the death of President King. Considering that matter the committee concluded that inasmuch as he had served as President for this year it would not be necessary to elect him as President for another year. We suggest that when the records are made up Mr. Faben's name be placed upon the list of ex-Presidents. We think that is all that is required.

Your committee appointed to nominate officers of this Association for the year 1891 report the following :

President.—Frederic Egner, St. Louis, Mo.

First Vice-President.—E. G. Cowdery, Milwaukee, Wis.

Second Vice-President.—B. E. Chollar, Topeka, Kas.

Secretary and Treasurer.—A. W. Littleton, Quincy Ill.

Directors.—Edward Lindsley, Cleveland, O. ; M. N. Diall, Terre Haute, Ind. ; W. H. Odiorne, Springfield Ill. ; C. W. Butterworth, Florence, Ala. ; E. H. Jenkins, Columbus, Ga. ; John Gimper, Leavenworth, Kas. ; K. M. Mitchell, St. Joseph, Mo. ; I. C. Baxter, Detroit, Mich. ; I. S. Post, Chattanooga, Tenn.

J. D. THOMPSON,	} Committee.
E. H. JENKINS,	
J. T. LYNN,	
R. H. CANBY.	

ELECTION OF OFFICERS.

Mr. Ramsdell moved that the report of the committee be accepted, and that the chairman of the committee cast the ballot of the Association for the election of the officers named. This having been done, the President declared that they were duly elected officers of the Association for the ensuing year.

INTRODUCING THE PRESIDENT-ELECT.

The President—It gives me great pleasure, gentlemen of the Association, to introduce to you, as my successor in the office of President, Mr. Egner. (Applause.)

Mr. Egner (President-elect)—Mr. President, and gentlemen of the Western Gas Association : I was scarcely prepared for the mark of distinction which you have conferred upon me. I expected that my friend Mr. Faben would be elected to this office, until quite recently. I cannot help feeling highly honored by this expression of your confidence, because I know there is hardly a member of the Association who is not as able as I am to fill the Chair, which has always heretofore been so well filled. I will not attempt to make a longer speech because I fear that if I do, you will be sorry that you elected me. Gentlemen, I thank you. (Applause.)

REPORT OF COMMITTEE ON NEXT PLACE OF MEETING.

The President—We will next hear the report of the committee appointed to select the next place of meeting.

Mr. Cowdery—The committee, after carefully canvassing among the members, and obtaining an expression of their wishes, have determined to recommend that Louisville, Ky., be selected as our next place of meeting.

Mr. Egner—Before that report is adopted I would like to say that I have been informed we have with us a gentleman from St. Paul who desires to extend us an invitation to meet there next year. Louisville seems to be a pretty warm place for meeting in the middle of May, although I think we ought to go there some time. I understand that we are promised an invitation from the city authorities of St. Paul and Minneapolis, and I think we had better accept the invitation, if we have one.

The President—I will state that the selection of St. Paul was considered, but as no formal invitation had been extended, other than a verbal one, the committee were forced to decline to further consider it, as I understand they had in a measure committed themselves to report in favor of Louisville. The question is on the adoption of the report of the committee in favor of Louisville.

(The report was adopted.)

REPORT OF COMMITTEE ON THE GIMPER PAPER, CINCINNATI, 1889.

The President—We will now have a report from the committee specially appointed to consider the suggestions contained in a paper read

by Mr. Gimper last year at Cincinnati, entitled "The Education of the Gas Engineer and Superintendent."

Mr. Gimper—Before reading the report I wish to say that the chairman of this committee was our worthy President, the late Mr. King. His untimely death, however, disarranged the plans of the committee, and, as my time has been so much occupied during the past year, I fear that the report will be all too brief. Our action, however, was based on the following :

Your committee to whom was referred the further investigation of the subject-matter of a paper entitled "The Education of the Gas Engineer and Superintendent," beg leave to submit the following correspondence as their report :

CHEMICAL LABORATORY, UNIVERSITY OF MICHIGAN, }
ANN ARBOR, MICH., March 5, 1890. }

MR. JOHN GIMPER, Supt. Leavenworth Gas Light Company, etc. :

Dear Sir—In January I received from you a letter of inquiry, in the interest of the Western Gas Association, as to opportunities for technical training in gas engineering at this Institution. The President of this University received a letter on the subject. The matter has been under consideration, at request of the President, by Prof. M. E. Cooley and myself. We have had here all the necessary branches of instruction and facilities of experimentation, and your very pertinent and suggestive inquiries have caused us to *organize* these branches and facilities, by planning out an advisory course for students—indeed, two advisory courses, one of two years' extent and one of four years' extent. These facilities are, however, separately available, under the conditions stated herewith. I inclose a brief descriptive announcement.

Very truly yours,

ALBERT B. PRESCOTT,
Director Chem. Laboratory.

Applied Science for Gas Engineering. A College Course of Two Years' Extent. (University of Michigan, Ann Arbor.)

Chemistry.—Laboratory work and lectures throughout two years, as follows :

- General chemistry, first year, first semester.
- Qualitative analysis, first year, second semester.
- Quantitative analysis, second year, first semester.
- Organic chemistry, second year, first semester.
- Analysis of gas, coal, and tar, second, year, second semester.

Physics.—Through one year, as follows :

- Mechanics, light, etc., first year, first semester.
- Heat, etc., etc., first year, second semester.

Mechanical Engineering.—Through one year, as follows :

- Mechanism, steam, and gas engines, second year, first semester.
- Machinery, second year, second semester.

Drawing.—Preparatory to mechanics, as follows :

- Geometric drawing and mechanics, first year, first semester.
- Descriptive geometry, first year, second semester.

Surveying.—Sufficient to establish levels, etc., etc.

Mathematics.—As needed, in addition to entrance requirements, to prepare for physics and for mechanics. In first year.

Other studies are accessible. This order of studies can be modified to suit the advantage of the student. As here given it presents the amount of work that can be done in two collegiate years of nine months each. Applicants for admission must pass the entrance examination for the courses of engineering in this University, as follows : In the use of the English language ; in geography ; in arithmetic, algebra, and geometry ; in history ; in natural philosophy ; and in chemistry. For particulars, see the calendar of the University. But persons over 21 years of age, able to show that they have a good knowledge of English, and if found prepared to pursue profitably the studies they desire to take up, are received without the above-named examinations.

A college course of four years' extent, for gas engineering, and leading to the degree of Bachelor of Science in Chemistry, is offered in this University. All the branches of the two years' course as given above are comprised in this course, with additional technical studies, by laboratory work and lectures. The laboratories of chemistry, physics, and engineering are employed. Three years' work in chemistry is obtained. The French and German languages are included, as are brief courses in geology and mineralogy. A schedule of technical studies for the gas engineer takes the place of the elective studies for B.S. in chemistry. Further information can be obtained by addressing the Director of the Chemical Laboratory, University of Michigan, Ann Arbor, Mich.

UNIVERSITY OF MICHIGAN, ENGINEERING LABORATORY,
ANN ARBOR, March 17, 1890.

JOHN GIMPER, ESQ., Leavenworth Gas Light Company, Leavenworth, Kan.:

Dear Sir—Replying to your favor of 20th January, bearing upon question of establishing a course in gas engineering. I would say that I conferred with Dr. Prescott about the same, and that he agreed to write you further in regard to it. Assuming that the question was one more chemical than mechanical, the matter rests in his hands. In my opinion a course could be easily established here filling the bill so far as my knowledge of the subject suggests. Yours very truly,

M. E. COOLEY, Prof. Mech. Engineering.

After receiving this hearty response to our appeal from a University of such high reputation, we feel that it would be ungrateful, to say the least, toward our respondent to seek or encourage other correspondence upon this subject before reporting the same to this Association.

By a careful perusal of the descriptive announcement of the University of Michigan it will be seen that it offers two full and comprehensive courses for technical training for gas engineers and superintendents; and in view of this we would recommend that the influence of this Association be extended for the hearty and cordial support of this Institution.

All of which is respectfully submitted.

JOHN GIMPER,
B. E. CHOLLAR,
GEO. T. THOMPSON, } Committee.

Discussion.

The President—You have heard the report of the Committee. Are there any remarks?

Mr. Forstall—I would like to ask Mr. Gimper if the instruction there will have any relation to gas works, or whether it will be purely with regard to the subjects mentioned, chemistry and engineering, without reference to gas works, or will the studies have special reference to their use in gas works?

Mr. Gimper—I take it the studies which are here offered would be sufficient to give a man sufficient scientific knowledge to subsequently apply in practice. I am inclined to think the title of the paper has probably led to a misunderstanding. You may have thought that "The Education of the Gas Engineer" had reference solely to the matter of education; but if you read it carefully you will see that I mention particularly the necessity of proper *training* in connection with the education. In order to be successful in our business, men must be both trained and educated. By "training" I mean the practical part of it. I also mention that there is that which is called "practice" and that which is called "theory," and that while either may be had without the other, yet I think no man can justly style himself a gas engineer without being familiar with both theory and practice. When it comes to a choice I would prefer to have a man run the gas works that I had charge of who had merely the practical knowledge rather than one who had only a theoretical knowledge; for I should consider that he would make it more of a success. But if I could combine the two I would always do so. I do not think any of us will go to college again, but if we can only lead in the right direction those who are to come after us and take our places we shall feel that we have done something for the good of our profession.

On motion of Mr. Jenkins the report was received and the thanks of the Association voted to Mr. Gimper for his able and efficient work.

Mr. Geo. T. Thompson, of St. Louis, Mo., then read his paper, entitled

IMPRESSIONS OF BRITISH GAS WORKS.

To an American engineer one of the first contrasts between the gas works of Great Britain and those with which he is more familiar would, I think, be the ratio existing between the quantities of gas made in winter and in summer. Owing to the high latitude, this is usually in British works about as five to one. The next point noted would probably be the relation of annual sendout to the population of the district supplied. This may be roughly placed at two to three times the ratio in England than is the case in America.

A visit to nearly 40 works throughout Great Britain during the summer of 1889 showed the case to be the same there as here, that the largest works are not always the ones to show the most valuable or original ideas. The points that may be mentioned in a paper such as this may best for convenience be arranged in the order of the manufacturing apparatus.

In general, as transportation is not interrupted for any considerable period through the year, large coal stores are unnecessary, and suffi-

cient space for about four weeks' average supply is provided under the same roof as the retorts. Newcastle coal does not differ greatly from our Pittsburgh coal, and the Midland coals are somewhat similar to that which we get from Indiana, though perhaps yielding more tar and carrying less sulphur. Ten thousand feet per ton of 2,240 pounds is the standard yield of 15½-candle gas, enriched to 16 candles or upward by small percentages of cannel. Except where, as in Scotland, cannel is the sole or principal gas making material, the illuminating power of gas seldom exceeds 17 candles.

The buildings of the works appear more solidly constructed than do ours—a characteristic of English structures in general. Newbigging's condemnation of the practice of permitting waste gases from the bench furnaces to enter the air beneath the retort house roof has no application there, as chimneys are always provided. The latest constructed retort houses are ventilated by square or circular openings at the apex of the roof, several in the length of the house, in place of louvres. At Rochdale Road, Manchester, and the Portslade Works, Brighton, the chimneys pass through these ventilating shafts, which arrangement is said to be additionally effective in clearing the house of smoke.

In the two great London Companies, the "Chartered" and the South Metropolitan, two contrasting arrangements of retort houses are to be seen. In the Beckton works of the former the 12 houses are placed in two rows of six each, *end to end*; while at the Old Kent Road station of the second named Company the several houses are side by side, with coal stores between, thus saving to each house the cost of an entire side wall.

The retort house windows are set above the level of the benches and care taken to prevent ill effects to the heats by draughts—a matter which, though recognized as a partial necessity by American engineers, does not always affect their plans in construction. For works of medium or large size the ground-floor house has more advocates in England than in America. In the stage-floor houses the openings in front of the ranges are without doors or covers. The retort settings are built with firebrick cut to fit, instead of having blocks and tiles to lessen the number of joints in the oven, and thus make work easier in building. Except in small works the retorts used are "throughs;" and as these are credited with greater ease of scurving, while the singles work better to the hydraulic and give less chance of trouble with workmen, Mr. J. Ferguson Bell, Engineer to the Stafford Corporation, suggests that the throughs be blocked in the middle and worked as singles until requiring scurving, at which time the block can be knocked out and the retort be scurfed as a "through."

There are some strong advocates of brick retorts, and the benches at the new Greenwich station of the South Metropolitan Company are entirely set with these. Tiles with sides curved upwards are used for the bottoms, and the "D" built upon these with soap brick, with continuous joints. At Old Kent Road the mouthpieces were attached to brick retorts by having the entire bench front of cast iron lined with firebrick; but at Greenwich the mouthpieces were bolted to a cast iron shell, into which the end of the retort was built. I do not remember having seen a cylindrical retort in any American works, but in England they are frequently met with; while there, as here, ovals and "D's" are about equally in favor. Their "D's," however, have quite a sharp lower edge. The sizes of retorts are about the same as are used here, but the charges are rather heavier, and their duration usually six hours, and in some places even eight. The consumption of coke as fuel, except where a considerable proportion of cannel is carbonized, will not exceed an average of 30 per cent. of the make in direct firing, and is of course still less where regenerators are used. This lower figure than our own is possible by the use of the longer charges and somewhat lower heats, and to some extent by the greater average number of retorts per setting. An estimation of the fuel on the carbonization is made in some places, the result being also stated in a percentage; on this basis 18 per cent. fuel would indicate that 18 pounds of coke were consumed to carbonize 100 pounds of coal. Six thousand cubic feet of gas per day is accounted a fair yield per mouthpiece.

In the Scotch works mixtures of (say) two parts cannel coal and one part splint coal are made, which at 3-hour charges yield about 11,000 feet of 29-candle gas per ton. Even with regenerators 45 per cent. of the coke from this would be used as fuel, but its quality must be remembered.

In general the English gas stoker is better provided for at the works than his American brother. The retort house almost invariably has a "lobby," in which the workmen have lockers for their clothing, a wash room, and a larger room with a range or an open fireplace for heating coffee, cooking eggs or steak, etc. In addition to these there is often an "assembly room" for concerts or other entertainments, and a reading

room; and of these the men are very proud. In large works, such as Beckton, Nine Elms, Old Kent Road, Stepney and the principal provincial stations, the men have organizations of their own, varied in character, but all tending to good effects. At Leicester there is a thriving literary society and an efficient ambulance corps; at Beckton, a fire brigade; at Southall, a cricket team, having grounds placed at their disposal, and these and many other works have brass bands. The employees of the Brentford Company have also a mutual aid society, into which each man pays 6d. a week, drawing 15s. a week if sick or disabled, and with a fund for his family in case of death.

Sunday day labor is very generally avoided, though the men always hold themselves in readiness to work if required. But usually only enough men are kept to lunch the fires perhaps twice, the dampers being closed and the spent charges not withdrawn. In case a retort requires scurfing, the coke is drawn and in one operation with the through retorts the carbon is loosened and the standpipes cleared, without channel tiles.

The workmen are paid much less than they would receive here, but the prices of staple articles range considerably below our standard, on rents and clothing in particular. The 8 hour system has been adopted in a number of works during the past year. Several forms of power stokers are to be seen—West's, Foulis's and Ross's—but owing to the cheapness of labor their use is not attended by such a saving as with us.

From the hydraulic main the gas is led to the condensers by a so-called "foul main," which often entirely circles the retort house. The condensers are nearly all atmospheric, set in the open air; and the annular, battery and return tubes are popular forms. I heard of but two cases of trouble with naphthaline. In one of these the steam jet exhauster was the cause—and in the other the deposit was found at the holder inlet, where the connecting mains were carried down in the water, in a recess in the tank wall; so neither case was remarkable, and neither was difficult to handle. One engineer told me that he avoided naphthaline by keeping a uniform temperature of 67° Fahr. at the condenser outlet. But I think the lower heats carried in England and the freedom from sudden atmospheric changes are mainly responsible for the absence of this trouble.

The exhauster most in use is the Beale, very similar to our McKenzie. In many American works the gas is led to the exhauster before passing the condenser; but this practice is seldom seen in England, and moreover, in two of the works visited the exhausters were placed between scrubbers and purifying boxes. Some use of compound engines, even of the triple expansion type, is made for driving exhausters.

The pressure gauges used are very deep compared to those employed by us, and 48-inch gauges are by no means uncommon. The lack of holder counterbalances and the comparative cheapness of iron, and its consequently more extensive use in holders, enter as factors to necessitate this; and the purifier lutes and other seals are, of course, correspondingly deep. The simplest gauge seen consists of a 1-inch glass tube closed at bottom, with a loosely-fitting cap at top, through which passes a quarter-inch tube, with the gas connection at its upper end, and with the lower end notched. A scale behind or at the side completes the instrument. The jet photometer for detecting the production of gas of low illuminating power is usually placed by British engineers at the *exhauster* outlet, that the poor gas may be more quickly noted. The photometer generally stands on a case in which are two cast iron boxes a foot square, with faced cast covers, controlled by two four-way valves and filled with an oxide of iron tray each. The gas is thus sufficiently purified for the approximate test required.

The washers and scrubbers employed are almost as varied in patterns and methods of use as the works themselves. But the accepted practice at this stage of the purification seems to be the treatment of the foul gas by a washer charged with ammoniacal liquor, designed to combine a portion of the sulphureted hydrogen and carbonic acid impurities as sulphide and carbonate of ammonium, and to this extent to lighten the work of the dry purifiers. The last of the tar is also removed in this apparatus. Then follows a tower scrubber, into which clear water is admitted to complete the extraction of ammonia. The yield of ammoniacal liquor, of course, varies with the works, and as large an amount as 35 gallons of 10-oz. liquor per ton is reached.

The absence of extreme temperatures in English weather permits the purifiers to be set out of doors. But lest rain should interfere with the work of emptying or refilling open boxes, sheds usually cover the sets; though sometimes a portable roof is provided, or the box lid itself used. When either dimension of a box exceeds 20 feet the cover is usually lightly trussed.

The very general parliamentary or local restrictions regarding the amount of impurity—particularly sulphur—in the gas as delivered, and

to some extent as affecting the opening of foul boxes, have resulted in numerous systems being advanced to simplify or cheapen the process or to avoid the nuisance attending it. In this, valve systems have largely aided; and where center-seals are in use a catch-box is provided to prevent the output of foul gas, which might pass through the seal when a change is made. In the materials for purification, a large amount of oxide of iron and Irish bog ore is used, not always revived *in situ* by any means; indeed, I received the impression that in proportion to the number of works using oxide there is more reviving *in situ* in the United States than in England. But air is very considerably used in lime purification, and was the forerunner of Valon's oxygen process. With lime the effect of the air introduced seems practically the same as with oxide—sulphur is partly fixed in the material, and the frequency of purifier changes is much diminished, while the spent lime is largely deprived of its obnoxious smell. In most of the works iron and lime are used in conjunction.

Like the purifiers, the station meters can be set out of doors, and in some cases the housed and the unprotected meters may both be seen in the same works, notably at Beckton. Generally, though, the meters are within buildings, as with us; but the form of the instrument, except in the smaller sizes, is the square-cased. The unprotected meters at the South Metropolitan's Old Kent Road and Greenwich stations are the invention of Mr. Geo. Livesey. In these, the lower three-quarters of the case is of concrete, set into the ground, while the part above ground is cased in zinc and covered with tongued-and-grooved boarding, with a non-conducting packing between boards and metal. The drum is of the usual form, and the dials are protected in a padlocked case at one end.

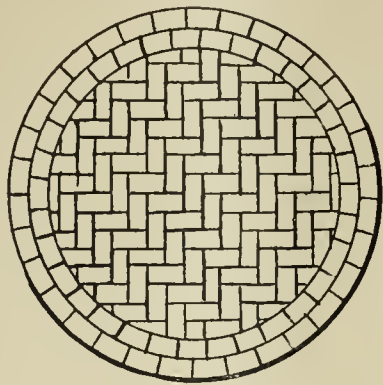

Many of the meters have for the water line indicator a differential pressure gauge, which also shows the levels of water within and without the drum. In some of the French meters brass discs, bearing the ten numerals on their edges, are substituted for the usual dials; these edges face outwards, and the discs turn as do the registers on some of our street cars, exhibiting but one figure of each disc, so that the reading can be taken at a glance without error.

The most sweeping change in holder construction is that seen at the Rotherhithe station in London, in dispensing with upper guide framing. The structure on which this has been tried was a double-lift of one million feet capacity, working in an annular iron tank which stands about three-eighths above ground. On the addition of the third lift the spar columns were each tied to the tank by two additional angle irons, the channel-iron tank curb was reinforced by curved plates placed horizontally and riveted to the channel-irons and to an additional angle iron within, and a cement filling was added between the back of the guide rails and the inner face of the columns. The second and third lifts carry both radial and tangential rollers, but the topmost section has only the radials. The channel guides on the columns are carried about 2 feet above the caps, and then curved outward and braced to the entablatures. The sections are each about 29 feet deep, and the tank stands about 12 feet out of the ground, so that the columns are 70 feet high and the unsupported lift rises 25 feet above this, and in this position withstood several storms in the winter of 1888-9. Nearby another holder in a cast iron tank, 80 feet in diameter, was also being rebuilt, to have five lifts 23 feet in height each (exclusive of cupping), and columns to the top of the third lift, thus leaving 46 feet in 115 clear of the framing. It is no doubt the case that many holders are in use whose framing, owing to having been built by "rule of thumb," or with more than ample margin for safety, is considerably in excess of the needs of the accompanying lifts, and in such cases this system might profitably be applied if the strength of the existing framing were known. But in new constructions it seems to be a question of supplying strength in heavier bottom curbs, cups, guides, and rollers, and more firmly anchored framing, if absent in the upper structure. This problem, however, is receiving much attention, and between this solution and that offered by Mr. Gadd and others the future of holder construction may show many changes.

The English holders in general carry no counterweights. Those above medium size are mostly fitted with both radial and tangential rollers, and in France are a number of holders with only tangentials. While most of the structures erected lately show the use of channel guides instead of channel rollers, those less recently built have only single-flanged guidewheels, set alternately right and left. The side sheeting is nearly always made with the vertical joint continuous as well as horizontal. Piggott cups are extensively used. Dry wells for the inlet and outlet pipes are more common than with us, though they are not now built for tanks of large size; and in France the articulated pipes are much in favor.

Among the new points now introduced are two brought forward by

S. Cutler & Sons, which deserve special notice. The first is the placing of the web of the lattice cross girders horizontally instead of vertically between the columns. The second is the arrangement of the crown plating as shown in the sketch. The plates are all cut and punched

alike, two widths in length at the joints, all double riveted; the center plate overlaps on all sides and the others have a uniform fall downwards and outwards until near the curb a strong construction of concentric rings of steel sheeting meets the rectangular plates. This system, by lessening the unbroken joints, dispenses with the necessity for heavy center plating and graded concentric sheeting, except at the curb, thus simplifying and cheapening the construction as well as strengthening it.

At the works of the Crystal Palace District Company the ashes, breeze, broken retorts, etc., are being used with tar to form a new holder tank. The blocks are being made on the spot where they are to be used after the excavation is done. This tank wall is intended to brace the clay only, as the latter is of good quality and firm. Tank framing is superseding crown trussing, and several tank crown supports of iron are in use.

The main pipes about the works are generally made with the turned and bored joint, and this is also considerably used for the street mains. The street pressures carried are about $\frac{1}{10}$ minimum and $\frac{2}{5}$ maximum, for in localities at all hilly, district governors are used. The leakage averages but little above 6 per cent. of the make. A large proportion of the consumers' meters are of the wet description.

With regard to residuals, the coke brings about 7d. per cwt. (or 4½ cents per bushel of 36 lbs.) at the works in London, and in the provinces the price is yet lower. The enormous production of coke by gas makers (no water gas being made) keeps the price down to even a greater relative extent than is done in this country by our Pennsylvania ovens. The manufacture of sulphate of ammonia by gas companies and corporations is much more extensively carried on than here, and in some places the tar and sulphur are also worked up.

The price of gas averages about as charged in the metropolis, 2s. 6d. per 1,000, but in one place it is sold for 1s. 8d. These lower figures than our own are possible by the less cost of labor, coal, lime, etc., by the proportionately greater amount sold with its reduction of fixed charges, by the greater return from residuals, by the lesser candle power supplied, and by the fact that the laws do not permit—much less invite—competition, but they rather protect the companies in a rigidly restricted monopoly.

In concluding I cannot speak too warmly of the hearty welcome accorded by every gas engineer whom I visited. Many of them entertained me at their homes, and I found everywhere a cordiality, a willingness to afford all desired information, and an interest in and respect for American engineering that produced an impression as lasting as it was agreeable.

Discussion.

Mr. G. T. Thompson—In connection with the paper I would like to call the attention of members to a number of views which I took with a Kodak, that are on exhibition at the back of the hall. Those in the two lower corners represent the two forms of unprotected meters. In the righthand corner is the form in use at Beckton, and in the lefthand corner that in use by the South Metropolitan Company. The upper views are of French gas works.

The President—You have heard a very interesting paper from Mr. Thompson, and I know he will be glad to answer questions. The paper is before you, and I trust that it will be thoroughly discussed.

Mr. Dunbar—I visited, last fall, several gas works in Great Britain, and Mr. Thompson has given a very correct idea of the existing state of affairs so far as my limited observations permitted me to judge. One thing, however, he did not mention, and that is the universality of gas lighting. It is only in exceptional cases where the arc light is used. In Liverpool at night, I was unable to count over half a dozen lights on

the docks—the latter extend out into the harbor—and it is with considerable difficulty that gas can be brought to them, yet such is the almost universal use of gas that they had it out on the docks instead of the electric light. They were burning gas there, where one would naturally think that electric lights would most be in demand. In London the street lighting is all done with gas. I think I did not see to exceed half a dozen arc lights there, although at the hotels one has the choice of incandescent light or gas. One reason for the great amount of gas being used is the cheapness with which it is furnished. I do not know why they should furnish gas there so much cheaper than we do. Of course they obtain their labor cheaper, yet, as Mr. Thompson has suggested, the capital invested in the plants is much greater than in ours, for the reason that in the winter season they have to supply about five times the amount of gas that they do in summer. At any rate the amount of gas they sell will permit them to furnish it at a cheaper rate. That accounts for the absence of the electric light. To my mind a gas company which is not disposed to enter the electric lighting field can only successfully compete with the electric light by furnishing cheap gas. The streets of London are as well lighted as any city that I know of which is lighted with the electric light, and perhaps better. The lamp posts are only about 50 feet apart, and in the center of the streets they also have lamp posts, so that the light is very thoroughly diffused, and at no place is there the strong contrast that you find in towns lighted with electricity. Water gas has not yet made any inroad there. In the suburbs of Glasgow a plant was in process of erection, but I do not know what success it will have. Their construction of works is similar to ours with the exception that a great deal of the apparatus is out-of-doors. My experience is also that while their stokers do nominally much more work than our stokers, yet the peculiar construction of the retort houses is such as to make that work easier. A large number of stoves are used there for cooking purposes, and everything is kept in good order.

Mr. Lansden—I would like to ask Mr. Thompson whether the price paid the stokers is less than that we pay; also the price of coal as compared with the price paid here, the prices paid stokers per day, and the number of pounds a stoker ordinarily handles as compared with what they do here, in order that we may compare what they do with our ideas of cheap gas.

Mr. G. T. Thompson—I have some notes here which, although not figured in the form of Mr. Lansden's questions, may enable him to get at the idea for himself. Of course the price of coal varies very greatly with the locality. In the London companies it is close to twelve shillings per ton; in the provinces rather less. The amount of work which is done by the men in the retort house is rather difficult to state in such a way as to compare with our American works, because while here a stoker generally attends to some extent to the coke, and to the firing of the benches, there each man to a great extent has a special branch of the work only. For instance there there will be stokers, firemen, coke-wheelers, coal trimmers, barrow-men, lid-men and men who do nothing but attend to the stand-pipes. In the retort house the wages run about as follows: Fireman, caring for 8 direct fires, or 10 regenerators, (5s. 4d.), one scoop-driver or "tee-man" (at 5s. 6d.), and two "second-stokers" or "lifters," (at 5s. 3d.), form a gang for drawing and charging, working 90 mouthpieces per watch of 12 hours, at 6 hour charges. Sometimes to each five or six gangs there is provided another who helps whenever needed—filling scoops, helping draw, luting lids, etc. He is paid about 5 shillings, and is called the trimmer, barrow-man, etc. In the Dublin Works I was shown about by one of the retort foreman (it was in the evening, and the Superintendent was absent) and in showing me the arrangement of gangs he explained the manner in which the four or five gangs were formed, and then showed me the extra man. I asked him what he called him, and he replied: "He do be the 'lob lolly mon'"—quite an expressive term. The amount of coal charged would vary with the size of the retorts,—350 cwt. to the largest size of retorts, an average of 3 cwt. to the smaller. They have some very large retorts—22 feet long. Scoop charging is almost universal; and the men receive about 5s. 4d.

Mr. Odiorne—Do they use self sealing lids there generally?

Mr. G. T. Thompson—Yes; very generally.

Mr. Odiorne—Do they give good satisfaction?

Mr. Thompson—Excellent satisfaction.

Mr. Watts—I think Mr. Lansden's question could be better answered by giving the cost of labor per thousand cubic feet of gas made in the works that are working by hand, and without mechanical stokers.

Mr. Taber—I made some average estimates from the returns of the English companies sent me the other day, and found that the cost of coal there on the average was \$2.37, and the cost of labor, repairs and

other items which made up their cost of gas in the holder amounted to 18 cents per thousand feet. This may have some bearing on the question that Mr. Lansden asked.

Mr. Watts—Will you repeat those figures again? Where was that?

Mr. Taber—That was the average of 24 gas companies in England of which I had the returns. The general average for coal was \$2.37 per ton, and the cost of all the other expenses necessary to what we would call gas in the holder, including the cost of purification, labor and repairs, was 18 cents per thousand feet.

Mr. G. T. Thompson—Is that for the cost of retort house labor only?

Mr. Taber—For retort house labor, repairs, purification and everything.

Mr. Watts—Does that take into consideration the by-products?

Mr. Taber—No; the by-products brought it down eleven cents per thousand on the average to a ton of 2,240 pounds.

Mr. Lansden—The 18 cents included the cost of labor, repairs, purification and everything?

Mr. Taber—Yes; not including coal, of course; and 11 cents would be deducted from this for the residuals.

Mr. Egner—In connection with this one would naturally ask why it is that they can sell gas so much cheaper in England than we can in America and that leads me back to what we were talking about yesterday—the legislation which we have here. Our works are usually capitalized at a much higher rate per thousand feet of gas made than they are in England; and the consequence of the unreliable, often adverse legislation is, that they try to make all the money they can while they are able to, because to-morrow perhaps the town or city Council may pass a law, without any apparent reason, requiring them to sell gas at 25 cents or any other arbitrary figure per thousand, and the gas company must then go to law and spend a lot of money to save themselves, or else lose their business. This is discouraging to those who desire to sell cheap gas, and is an experience unknown *anywhere* but in the United States; and is beginning to become unpopular there in enlightened communities, I am happy to say.

Mr. J. B. Howard—I notice that at the conclusion of Mr. Thompson's paper he says: "I cannot speak too warmly of the hearty welcome accorded by every gas engineer whom I visited. Many of them entertained me at their homes." Can it be wondered that they would take to their homes a typical American youth—especially if they had marriageable daughters? (Laughter.)

Mr. Watts—I would like to ask Mr. Thompson about what percentage of regenerative furnaces were used in England.

Mr. G. T. Thompson—I think that is a matter which I mentioned in my paper. I say that, "For works of medium or large size the ground-floor house has more advocates in England than in America." That statement would naturally carry with it the impression that the regenerative furnaces as used in stage-floor houses are less in use there than here for works of medium size.

Mr. Watts—Are there any regenerative furnaces at the Beckton station?

Mr. G. T. Thompson—Yes; they are all regenerative.

On motion of Mr. Ambrose the thanks of the Association were voted to Mr. Thompson.

(To be continued.)

The "Express Company" System of Collecting Gas Accounts.

Treasurers and managers of gas companies have watched with increasing interest the arrangement now in vogue in several of the largest cities—notably Chicago, St. Louis, Buffalo and Boston—by which the American Express Company, which has a very large number of branch or sub-agencies for sale of its money orders, generally in drug stores or stores of similar character that are open through the day and evening, has arranged with the local gas companies to receive payment of their bills at all such agencies. The bills so paid are taken up each day by clerks from the main office of the express company, properly scheduled, and the schedules, with the cash or a check to balance same, is handed to the gas company at an early hour on the day following that on which the bills were paid. This system relieves the gas offices of all the rush on days when bills are due, decreases the liability to errors by clerks in receiving a great number of payments, and turns a very large number of small payments over to the gas company in such shape that they can be credited upon the books with the greatest facility.

The arrangement was originally contemplated for the convenience of people in large places who, living at some distance from the gas office, it was supposed would be willing to pay a 5 cent fee for a money order at the nearest drug store rather than to spend time, and perhaps 10 cents in car fare, to go to the gas company's office.

The large number of payments that are being made in this way in the cities mentioned goes to show that a large number of people appreciate the advantages offered, and we believe that, even in the smallest cities, gas companies will find it to their profit and convenience to make a similar arrangement with the express company, even if they pay the fees themselves. A thousand bills can be collected in this way at an expense of only \$50, and with the unquestionable responsibility of the express company, and consequent elimination of all possibility of losses by dishonest collectors and of the expense for salaries of collectors, it would seem to be a step in the direction of greater economy in the transaction of the business, which, in these times of competition, is well worth consideration.

We are told that the money order department of the express company will furnish complete information on the subject, on request.

A Brin's Process Company for New York.

The Brin oxygen process for the purification of coal gas is taking fairly rapid strides in England, as shown in the fact that the Ramsgate, Shrewsbury and Rochdale Gas Corporations have erected works for the practical carrying on of the process in their gas plants. The Montreal (Canada) Gas Company has entered into a contract with the Brin Oxygen Company, of London, for the erection of an oxygen producer to treat the whole of the make at one of their works.

What will interest American gas engineers most, however, will likely be found in the statement that a company has been formed in New York, and the capital subscribed, for the erection of a works in this city. Mr. James, the Engineer in charge of the Paris (France) section of the Continental Oxygen Company, has arrived to superintend the construction, and it is intended that the works will be completed in September. Gas engineers will then have an opportunity of witnessing the separation of oxygen from the atmosphere on a large scale, and if anything like the results obtained on the other side are borne out, we may look forward to a rapid development of this interesting process in the United States and Canada.

How to Manage Steam Engines.

By B. TAYLOR.

It is a rather difficult matter to write about the management and repairing of engines, as nearly all the repairs are what should be a machinist's job, as nearly all would require machine work to properly complete it, therefore it cannot be classed as a part of an engineer's business.

As regards the management of steam engines, it will be necessary to begin at the foundation, and give a minute description of the manner of setting up and adjusting work, which every engineer should understand in order that he may know what his engine needs when not doing its work properly. Every foundation for an engine requires the skill of a stone or brick mason to build, and when that is properly done then the engineer's duties begin, the first thing being to place the frame or engine bed upon the foundation, seeing that it is banded up and firmly bolted in its proper position. The next thing in order is to place the shaft in its bearings, seeing that it is on a proper level and fits its bearings properly, to run easy and smooth. Then place the fly-wheel in position upon the shaft, taking care that it runs true (as it should be properly fitted when made), placing it equal distance between the shaft bearings, so that the weight will be alike on each. Next in order is the placing of the cylinder on the bed in its proper position; there should be no mistake about this, as there should be what are termed steady pins to hold it in its place.

To prove that the shaft and cylinder are properly placed, attach to the outer end of cylinder a small piece of board long enough to reach across its end and fasten with one of the bolts which hold the head on. Attach to this piece a fine strong cord or wire that will not break on being drawn tight; fasten on the farther end of the bed another piece of board, leaving enough to stand up as high as the center of cylinder, attach the other end of the cord to the latter piece, bringing it exactly to the center of cylinder, which can be done by calipers. Turn the fly-wheel over, bring the wrist-pin to the line, and be particular that it is exactly in the center of the bearing on the pin; then reverse the fly-wheel, bring it to the line on the other center. If the line is on the center of cylinder, also on the center of wrist-pin when turned on both centers, then your engine is in line; but if not then the cylinder must be out of line, or else the shaft is not square with the cylinder, in which case it must be brought to a perfect line, either by moving the cylinder or pillow block at the outer end of shaft. When these points are in a perfect line, put in

the piston and attach the connecting rod to the cross head, being sure that the cross-head comes in a perfect line with the center of cylinder.

When this is accomplished, all is ready for connecting the smaller parts, such as cut-off, rod valve, etc. This brings us to an important part of the work, viz., the setting of the valve, of whatever kind it may be. I find this the most simple way to adjust in a slide valve engine. Turn the fly wheel to its farthest point, or, in other words, to its center point, which will bring the piston head to one end of cylinder; now set the valve so as to cover the port, leaving not more than one forty-fourth of an inch for the introduction of steam, when the crank is on its center, and see that the valve stands in the same position; if not, it must be adjusted by the length of connecting cut off rod, until the valve stands in the same position at each central point. When this is done see that the exhaust port is clear, to relieve the cylinder of the steam at the proper time. I have seen engines set up with the valve of a length not to admit of a free exhaust, which caused the engine to work heavy.

Another important point in the arrangement of an engine is the steam feed and exhaust pipes. The rule generally adopted is, to have the exhaust pipe one-half inch larger than the feed pipe, but I find by experience that the exhaust should be one inch larger, which will cause the machine to run much freer, causing less strain than when a smaller pipe is used.

Another important point is the setting of the piston packing rings; these should be set very carefully, taking great care that the piston head is exactly in the center of the cylinder, using a pair of calipers in adjusting it.

As regards care and management of an engine, after being put in order according to the above-named points, but little work is required, but it must be constantly watched and kept well lubricated in all its parts, the cylinder receiving special care. It should have a lubricator attached to the feed pipe just before it enters the cylinder, emitting two or three drops per minute, according to the load the machine is carrying, and great care must be taken with the packing rings, to keep them just tight enough to prevent any leakage of steam, and not tight enough to cause any great friction.

I have found that one good qualification in an engineer is to know enough to let his machine alone when it is working well, and to know when it is doing well. I have known men in charge of machines to be constantly at work at them, and often getting them out of order instead of benefiting them.

Great care should be taken to keep all the bearings just tight enough to run easy without any slack motion, which causes them to thump or pound at each revolution.

In setting up the keys I find it best to use a soft metal hammer, which will not bruise the end of the key. In using, hit it one blow on the point, which will give it a little back motion, just to give the bearings a free working motion.

It is the custom of many engineers to oil the cylinder three or four times per day with about one gill of oil, but this is not the proper way. A cylinder needs oil, the same as any other bearing, in very small quantities, and often.

Another important matter is in starting the machine. All drips should be opened and the water drained out, by letting a little steam in to warm up the cylinder before it is started, and then slow for one minute, giving it time to work off all water which has settled in it, getting it well warmed up before running at full speed.

The great point in management is to keep close watch and to know when the machine is not running right; then, if wrong, learning just what the trouble is before any changes are made, as the machine may be injured by not doing the right thing. An engineer should be a good machinist, as well as a careful man, possessing good judgment, never doing repairs or making changes until he knows what is necessary to be done.

If the above rules are strictly observed very little repairs will be needed, except in case of breaks, and as to directions about repairs, no mechanic can tell just what to do until he sees just what the break is and determines its cause. Any other plan for repairs would be much like "ideal farming;" practical knowledge is the best.

BERTHA LININGER, of Detroit, Mich., has brought suit for \$50,000 damages against the Michigan Gas Company, of that city. In her complaint she alleges that, while driving over the Boulevard, close to Fort street, on the evening of February 5th, last, the buggy was overturned because of an excavation made by defendant and allowed to remain in an unguarded state. In consequence of the upset she sustained severe personal injuries; hence the suit.

ITEMS OF INTEREST FROM VARIOUS LOCALITIES.

A NEW gas scheme has been introduced in the St. Louis City Councils, the putative father of the same being Mr. Sloan. The projectors ask for a franchise for the construction of a complete gas works, who in turn bind themselves to furnish illuminating gas to ordinary consumers, for a period of 50 years, at the rate of 90 cents per thousand for lighting uses, and at 40 cents per thousand for fuel purposes. The city has the right to purchase the works, under an option, 10 years after their completion, and every 10 years thereafter until the end of the franchise term. The value of the plant, if the city wishes to buy it, is to be returned by three appraisers, one to be named by the Company, one by the City Assembly, and one by the Circuit Court bench. For the franchise the projectors propose to give the city all the net profits of the works over and above 8 per cent. on the net earnings, and when the proprietors have received \$50,000 per year out of the 8 per cent. they agree to release to the city one-half of the earnings in excess of that amount. Our informant adds that there is ample capital behind the project, and that Mr. R. D. Walsh, son-in-law of Mr. Socrates Newman, who was prominent in the affairs of the old St. Louis Gas Company, is one of the incorporators.

At the annual meeting of the Consumers Gas Company, Reading, Pa., the following officers were chosen: President, Henry Baumgardner, Lancaster, Pa.; Secretary, John H. Keppelman; Treasurer, William Elkins, Phila., Pa.; Manager, Martin Maloney, Phila., Pa.. Solicitor, R. L. Jones; Superintendent, John H. Keppelman. Directors, Henry Baumgardner, Martin Maloney, Wm. L. Elkins, Jr., and R. L. Jones. The annual reports disclosed a satisfactory year's business. On the adjournment the Directors inspected the elegant new plant (now almost finished) underway at the South Fifth street station, after which they repaired to the Mansion House for dinner.

THE following new schedule of rates has been formally promulgated by Mr. F. M. Acton, Secretary of the Salem (N. J.) Gas Light Company, discounts to be available when bills are paid within 10 days from time of presentation:

Quarterly Consumption.	Gross.	Net per M.
2,000 cu. ft. and under.....	\$2.00	\$1.80
2,000 to 5,000 cu. ft.....	1.80	1.62
5,000 to 7,500 ".....	1.70	1.53
7,500 to 10,000 ".....	1.60	1.44
10,000 to 20,000 ".....	1.60	1.36
Over 20,000 ".....	1.60	Special.

The quality of the gas sold at Salem averages 18.70-candle power, and is remarkably free from impurity. Although the figures are eloquently expressive of the Company's liberality, we cannot forbear the remark that the Salem gas men are to be congratulated on the fact that, relatively, their gas prices are the cheapest in the State of New Jersey.

MR. JOHN E. JEFFRIES, a well known and popular resident of Birmingham, Ala., died suddenly in that city on the night of the 2d inst. He had been a resident of Birmingham for 19 years, and had been prominently identified with the local gas company.

ON May 31st the Richmond (Ky.) Water Works, Electric Light and Gas Companies were consolidated, under the title of the Richmond Water and Light Company, the capital stock being placed at \$200,000. The officers are: President, A. E. Boardman, Macon, Ga.; Treasurer, Edward H. Yorke, Portland, Me.; Secretary, Chas. S. Powell, Richmond, Ky.; Directors, A. E. Boardman, J. A. Jullian, Theo. C. Woodbury, W. B. Miller and Chas. S. Powell. The Company has acquired location for source and reservoir of water works branch on a plot (160 acres) 2½ miles east of city, and a new location for gas works on a plot (1½ acres) in lower part of city, on which a complete gas plant will be constructed. The elevated water tank and tower structures contracts have been awarded, and the work of construction will be pushed. Public lighting and water contracts to the value of \$6,000 per annum have been ratified, and the Company has filed a bond in \$10,000 to faithfully carry out its agreements.

MR. THOMAS EVANS, the clever and capable Secretary of the Hartford (Conn.) City Gas Light Company, accompanied by his wife and son, sailed for Europe, on the 4th inst., per steamer City of Chester, to enjoy a well-earned vacation of two months.

WE understand that during a recent violent storm of lightning and thunder in South Dakota the electric current sought "earth" by way of the gasholder of the Sioux Falls Gas Company. Several of the sheets

were twisted sufficiently to permit the stored gas to escape. The holder held at the time about 60,000 cubic feet of gas, all of which was lost.

THE Board of Directors of the Kansas City (Mo.) Gas Light and Coke Company organized in the re-election of the following officers: President, M. J. Payne; Secretary, Walter Woolcott; Superintendent, Geo. S. Clarke. An efficient staff, surely.

PRESIDENT JOSEPH BARSTOW, of the Atlantic City (N. J.) Gas Company, is very much elated over the economy that has resulted in the electric lighting department of the Company's business as a consequence of the partial displacement of steam power by gas power in the dynamo room. A 50-horse power Otto engine has been installed in the works on Michigan avenue, and its operation is pretty close to perfection. The Company, which has the contract for the public electric lighting of the city, operates the Thomson-Houston system of full arcs and has over 100 lamps in circuit, with the probability that that number will be doubled by July 15th when the "board walk" will creak with the weight of Philadelphians of all grades. By the way, the rate charged for arc lighting on public account is very reasonable—25 cents per lamp per night.

OWING do the courtesy of Manager H. M. Stocum, of the Tonawanda, N. Y., Gas Light Company, we are enabled to print the following revised schedule of gas rates that has ruled there since the first inst.:

Monthly Consumption.	Net, per 1,000 cu. ft.
200 cubic feet and under.....	\$1.50
300 " to 900 cubic feet.....	1.45
1,000 " " 2,900 "	1.40
3,000 " " 6,900 "	1.35
7,000 " " 11,900 "	1.30
12,000 " and over.....	1.25

The only condition is prompt payment—that is, within 10 days from date of bills. In his letter to us on the subject Manager Stocum says: "The Directors of this Company believe that the success of all gas companies depends on the institution of minimum prices, because gas as an illuminator is thus placed within the reach of all. We have contracts for street lighting for ensuing year at the rate of \$18 per lamp per annum, all-night table; the authorities assuming the expense of lighting, extinguishing and repairing. Our ordinary consumers are giving us good and substantial patronage; and our send-out shows a good increase." The Tonawanda Company's proprietors are evidently shrewd business men, and their Manager fills the bill in every sense.

AT the annual meeting of the Camden (N. J.) Gas Light Company the following result was reached in the election: President, B. F. Archer; Secretary and Treasurer, Charles Watson; Directors, B. F. Archer, Jno. McIlhenny, Samuel C. Cooper, Charles Watson and Richard F. Smith. The Company enjoyed a very prosperous year.

AT the meeting of the stockholders of the Hollidaysburg (Pa.) Gas Company, held on the 2d inst., at the Drexel building, Philadelphia, the following officers were chosen: President and General Manager, Henry W. Brooks; Secretary and Treasurer, Ivan Prowattain. Managers, George N. Torrence, William Barritt, Jr. and Ernest Prowattain. Having remarked that the Company ought not to suffer from lack of "Managers," it is next in order to say that when the Brooks process was arranged for at Hollidaysburg the chief claim made in its favor was that the residents were going to have much cheaper gas. The fact is, however, that the Hollidaysburg rate is likely to be put at \$1.75 per 1,000, whereas in the not far-away district of Altoona gas is sold at \$1.20, and even little Tyrone bobs up serenely at the \$1.25 rate. To be sure, Altoona is quite a large and bustling place, and Manager Cole is kept pretty busy in keeping pace with the demand; but the disparity between Hollidaysburg and Tyrone as gas towns is not worth mentioning, save that the Brooks process is not in vogue in the latter place; nor will it ever be, if Manager Dieffenbaugh has the verdict to prepare. The correspondent who forwards us the above hints is authority for the statement that, "the Brooks Process Company, in proposing to charge \$1.75 per 1,000 for gas, will be no improvement over the old plant and practices, and hence is of no use to Hollidaysburg."

THE proprietors of the Cohoes (N. Y.) Gas Light Company have cut their selling rate to \$2 per 1,000. Former price, \$2.50.

GOVERNOR HILL, in giving his sanction to the Jones bill for regulating the gas rate in New York city at \$1.25 per 1,000, in Brooklyn at \$1.50, and in cities holding between 100,000 and 500,000 population at \$2, filed the following explanation: "I have heretofore recommended

the creation of a State Gas Commission (which should also include in its jurisdiction all telephone and electric light companies), to be invested with limited powers somewhat similar to those possessed by the Railroad Commission over railroads. I have during the past few years approved several bills regulating the price of gas in various cities, but more than once I have intimated my reluctance to approve any more such bills until such Commission should be created, by which the propriety of such measures might be carefully investigated, and legislative action might be based upon the recommendations of such Commission. The regulation of the price of gas, as well as the charges for electric lights and telephones in different cities by legislative power is liable to abuse, and should only be exercised after proper investigation by a competent Board. Corruption, prejudice, fickleness, unfairness or favoritism is too apt to characterize or accompany legislation upon such an important subject, particularly in the absence of a semi-judicial investigation of the conditions and circumstances which should naturally affect its determinations. I am still impressed with the desirability of such a Commission as I have suggested, and trust that another Legislature may in its wisdom pass a carefully guarded measure carrying out this recommendation, to the end that the possibility of hasty, arbitrary or ill-considered legislation upon this subject may be avoided. The present bill, however, as I understand it, made very slight changes in existing prices, and in the present statute applicable to the various cities of the State; and as such changes seem to be in the right direction and reasonable, it is believed, upon the whole, that the public interest will be best subserved by the approval of the measure."

THE suit of the United Gas Improvement Company against the Milwaukee Gas Light Company—in restraint of the use of certain apparatus in gas manufacture by the latter, the right for the sale of which is exclusively claimed by plaintiff—was called up in the local Circuit Court (June 6th) on a motion to fix a date for the hearing of a motion for an injunction. Mr. J. R. Bennett, of New York, who represented the Improvement Company, asked that the date be fixed for a day in July, but Mr. Miller, of counsel for defendant, asked that it be postponed until September or October. Mr. Bennett then asked for a continuance bond, whereupon Judge Gresham wanted to know if Mr. Bennett doubted the solvency of the defendant. Mr. Bennett said that he had not made inquiry as to defendant's solvency, which reply created a ripple of suppressed merriment in the court room. Judge Gresham thereupon delivered an extempore opinion as to his belief in defendant's reliability, and the case went over to the fall term. Plaintiff originally asked for a hearing in April, but defendant secured a postponement until the current month. The latter was ready to go on at the present time, but plaintiff desired a postponement until July. Defendant would not agree to so short a lapse, but would accept a transfer to the fall term, with the result stated above.

AT a special meeting of the Birmingham (Conn.) Borough it was voted to abate the taxes of that portion of the plant of the Derby Gas Company, to be located on the east side of the Housatonic river, in the Borough of Birmingham, for a term of 5 years. The Company asked this concession with a view to transferring its electric plant from Shelton.

JUDGE LEARNED has made an order giving Attorney-General Tabor leave to bring action to dissolve the corporation known as the West Troy (N. Y.) Gas Light Company and to dissolve its affairs. The order was issued on a petition by the Attorney-General, in behalf of Robert Bryce, a stockholder of the Company.

AT a recent meeting of the Gas Committee of Philadelphia City Councils the petition of the Weil Enriching Company for an investigation of its process, with a view to the adoption of the same in the plants of the municipal gas works, was referred to the sub-committee on extensions and works. Mr. Meehan's resolution to charge property owners with frontage for gas mains was ordered reported back, with the request to refer the same to the Municipal Government Committee to prepare a bill.

THE gas war at Aurora, Ills., is at an end, the competing companies having agreed to consolidate. The gas rate will be advanced to \$1.50 per 1,000. During the contest the price had been cut to less than \$1. Thus ends the first Peter English process strike.

THE Covington (Ky.) Gas Light Company has been worsted in its contest in the Circuit Court with the city over an attempt by the latter to oblige it to pay taxes on an assessment of its franchise at the ratio of \$75,000. Hitherto the Company paid taxes only on its real estate, and Assessor Whitney brought the case into court. Mr. Fisher, for the

Company, argued that no corporation franchise had been taxed in Covington, and further pleaded that in any event the Gas Company should not be so taxed, no matter what was the ruling practice in other cases, as the Company's service to the city at a cheaper rate than its service to ordinary patrons was in the nature of a direct payment on account of the franchise it enjoyed. Mr. Byrnes, on behalf of the city, argued that the franchise was property pure and simple, and as such was subject to taxation for whatever value it possessed, the same as any other species of property, and that it held no qualifications that should exempt it from tax burdens on account of alleged public service. Judge Arthur decided in favor of the city. The case will go to the Court of Appeals.

GEO. W. LITTLE, of 4925 Lake Avenue, Chicago, has brought suit against the Hyde Park Gas Company for \$5,000 damages, the case to be called in the Circuit Court. He alleges trespass, and asserts that until recently defendant delivered its bills by messenger. Lately, however, the bills have been sent by mail, and if the Company does not receive payment by the 12th of the month the "big burly man who turns off the gas" performs his duty. About May 15th the "big burly man" visited Little's house and shut off the gas, much to the discomfiture of Mrs. Little, who averred that the bill had been paid. Little asserts that the "big burly," etc., used "unparliamentary language" in replying to Mrs. Little; but the gas was cut off. Little thinks the "big burly" should have cut off the gas at the sidewalk and not entered his house; nor should he have used the unparliamentary, etc. Hence Little's claim for \$5,000. It is not the first time that Little's gas has been cut off for non-payment, which leads us to believe that he is a bit of a chronic growler, who also suffers badly from impecuniosity.

THE franchise for a gas company at Rapid City, So. Dak., has at last been granted. The grantee is a Chicago syndicate, headed by the Hon. W. T. Coade. The projectors say they will invest \$75,000, and begin construction work on or before July 10th.

AT a meeting of the Akron (O.) Heat, Light and Power Company no change in the executive management was made. Arrangements are said to have been made for an extension of the main system.

ELSWHERE we reprint the Governor's action in respect to signing the new gas rate laws for this State. As usual, the smart gentlemen up in Albany have about "over-done" themselves, in that the only essential change effected by the bill will be to keep the maximum gas rate in Brooklyn at \$1.50 per 1,000, whereas under the effect of an older special law, putting the price of gas "in cities having a population of 800,000 or over" at \$1.25 per 1,000, Brooklyn companies would undoubtedly have had to come to the \$1.25 rate when the present census enumerators finished their work; for there can be no doubt about it that Brooklyn's population is now in excess of the stipulated 800,000. Some assert that much of the latest Albany gas law is traceable to "the fine Italian hand" of Henry H. Rogers, who is not unknown to those who have incurred the displeasure of the Standard Oil Company. In any event, the Brooklynite who is responsible for the present measure is to be congratulated on his *finesse*. Prof. Collin, the "I-am-a-Democrat" man's legal adviser, is a bit uneasy over the situation, and to show how ragged are his waking hours we herewith republish some remarks uttered by the Professor when his woe was evidently deep: "Several newspapers seem to have misapprehended the effect of this bill upon the price of gas in Brooklyn. If the new law affects Brooklyn at all it makes a reduction of 10 cents per thousand cubic feet upon the maximum price that may be charged for gas in that city. Before signing the bill the Governor referred it to me with instructions to examine and report upon this precise point, and I gave him the result of my investigations, substantially as follows: By the general law of 1886, Chapter 922, the maximum price of gas in cities having a population of 800,000 or over was fixed at \$1.25 per 1,000 cubic feet. By a later special law relating to Brooklyn only the maximum price of gas in that city was fixed at \$1.60 per 1,000 cubic feet. The later special law, of course, controlled the previous general law, so that I advised the Governor that if he did not sign the bill before him the maximum price of gas in Brooklyn would remain \$1.60 per 1,000, even if Brooklyn should show a population of more than 800,000 by the new census. The bill signed by the Governor yesterday fixes the maximum price of gas in cities having a population of over 500,000 and less than 1,250,000 at \$1.50 per 1,000. So the new law, if it affects Brooklyn at all, reduces the price 10 cents per 1,000 in any event, whether the new census shall show the population to be over 800,000 or not. But there is some question whether Brooklyn will not still be governed by the special law

of 1887, rather than this new general law of 1890. It is a familiar principle of statutory interpretation frequently applied of late by our Court of Appeals that special and local laws are not repealed by subsequently general legislation unless the subsequent general law expressly indicates an intent of the Legislature to repeal the previous special law, and that such intent will not be presumed from mere general language (see 69 N. Y., 209, at p. 212, and cases cited). Nevertheless, it was with the expectation that the new law would be held to apply to Brooklyn, and that it would effect a reduction of 10 cents per 1,000 in the price of gas in that city, whatever its population should appear to be by the new census, that the bill was signed. There is not even room for argument that under previous laws the maximum price of gas in Brooklyn would continue at \$1.60 and would not be reduced to \$1.25 per 1,000 even if the new census should show a population in Brooklyn of over 1,000,000. No arguments or memoranda either for or against the bill had been filed with the Governor, and I suppose he acted upon my advice as to the effect of the bill upon previous legislation."

MR. J. PORTER WHITTIER, who makes a specialty of gasholder tank work and gas works masonry of all descriptions, has changed his headquarters from 499 Myrtle avenue, Brooklyn, to No. 70 Rush street, same city. Mr. Whittier's contracts in hand include a gasholder tank at Flatbush, L. I.

MR. JOHN CLUNE has been appointed Manager of the Brockport (N. Y.) Gas Light Company, vice G. H. Williams, resigned.

THE Board of Health, of East Liverpool, Ohio, has determined to so arrange the old gas plant (it has been unused for some time) that it may be employed as a garbage crematory.

AT the annual meeting of the Pawtucket (R. I.) Gas Company, Mr. Lyman M. Darling acted as President *pro tem.*, Mr. S. G. Stiness serving as Secretary. The annual reports were read and approved, after which the following Board of Directors was chosen: Darius Goff, Gideon L. Spencer, Lucius B. Darling, Geo. L. Walker, Edwin A. Perrin, Stephen Jenks, Olney Arnold, Lyman M. Darling, James G. Fales, Hezekiah Conant and Alfred H. Littlefield. The yearly reports were most flattering to the hopes of the proprietors.

THE residents of Oswego, N. Y., complain bitterly over the poor quality of the electric light supplied under the contract awarded to Mr. Graves.

THE proprietors of the Cleveland (Ohio) Gas Light and Coke Company are again arranging for an extension of their works. This time the betterments are to consist of additional retort house plant, and a new holder, rated to hold one million cubic feet. The growth of Cleveland in population and wealth is little short of surprising, and it goes without saying that the Cleveland Gas Company is keeping up with the procession.

THE following, from the *Chicago Herald*, of 3d inst., will show that the Connelly motor is almost ready for marketing on a large scale: "The Connelly gas motor which the property owners on West Lake street were promised some months ago in lieu of a cable system was formally tried yesterday afternoon. The machine performed all its owners claimed for it, which was that it would work with efficiency and cleanliness and with a minimum amount of noise. The motor is light and airy in appearance, and neat in construction and finish. It weighs about 5,800 pounds, and in the run from Western avenue to Fortieth street fully demonstrated its strength. It drew an ordinary summer car which was comfortably filled, and made the distance, including stops, in about 8 minutes. The trailer jumped the track twice during the trip, but the little machine went on just as if nothing had happened, and readily proved its ability. The engine is a simple affair. The power is gained from the vapor of crude naphtha, which, on passing into a cylinder, is exploded by means of an electric spark supplied by a miniature dynamo. The first spark is produced by the turning of a small wheel with the hand, and in a second the explosion follows and the machinery is in motion. The subsequent action of the engine impels the dynamo, the naphtha vapor taking the place of steam, and thereafter the speed of the little worker depends on the frequency of the explosions, which are entirely in the control of the person in charge. It can be run with safety at the rate of 12 miles an hour at a cost of \$1.50 a day, and it is so easily manipulated that a schoolboy could be educated to run it in 30 minutes. Further trials of the device will be made, and if it meets the approval of the West Side Railroad Company it will probably be put in regular service on several of the streets of that division as a present means of solving the rapid transit question."

Position Wanted

As Superintendent of Gas Works, or Gas, Electric Light, or Water Works.

Have been Superintendent of gas works for the past 17 years. Formerly acted as Superintendent of water works. Can give the best of references. DAN'L DOUGHERTY,
Late Supt. Jeffersonville Gas Co.,
Jeffersonville, Ind.

CONNELLY & CO.,

SOLE MANUFACTURERS OF THEIR PATENTED SPECIALTIES.

"IRON SPONGE." Saves money, saves labor, and is the most efficient purifying agent ever offered as a substitute for lime. Now used in every State in the Union, and purifying daily over thirty-five million cubic feet. Should be used in every gas works. Its own saving will pay for it many times over.

AUTOMATIC GOVERNOR. Has been on the market but three years, and in that time has been introduced more generally than any invention ever designed for use in gas works. Over two hundred of them now in use. Sensitive; reliable; perfectly automatic; reduces leakage; satisfies consumers, and gives great relief to the Manager. No gas works is complete without one of these machines.

STEAM JET EXHAUSTER. Designed particularly for small works. Combines Exhaust Tube, Steam Governor Gas Compensator, and Bye-Pass Valves in the most compact form possible; occupies but little space; uses very little steam; operated by ordinary workmen; saves formation of carbon in retorts; increases yield 10 to 15 per cent. Specially adapted for mixing air with oil gas. No works too small to use them profitably.

Prices given on all our specialties delivered at any point in the United States. Correspondence solicited.

A. J. DOTY, Supt.

The utility and convenience of the Gas Engine being no longer an open question, it only remains now for intending purchasers to select the BEST. We claim for the CLERK GAS ENGINE that it is equal to any other manufactured as regards steadiness in running, simplicity, and ease of keeping in repair, and that it gives the greatest amount of power for the least money (both in first cost and expense of running) of any engine made. In support of this claim we refer to the test of the Gas Engines made under the direction of the American Institute of New York, in December, 1885, and heretofore published in these columns. These engines are especially adapted for continuous running under heavy loads, and we can refer to Engines which have run 22 hours a day for months at a time

Made in Sizes of 5, 10, 15, 20, and 25 Horse Power. All Engines Guaranteed for One Year.

(NEAR U. S. PATENT OFFICE.)

Personal attention given to the preparation and prosecution of applications for Letters Patent. All business before the U. S. Patent Office attended to for moderate fees. No Agency in the United States possesses superior facilities for obtaining Patents, or for ascertaining the patentability of inventions. Copies of patents furnished for 25 cents each. Correspondence solicited.

GREENOUGH'S

"DIGEST OF GAS LAW."

Price, \$5.00.

This is a valuable and important work, a copy of which should be in the possession of every gas company in the country, whether large or small. As a book of reference it will be found invaluable. It is the only work of the kind which has ever been published in this country, and is most complete. Handsomely bound. Orders may be sent to

A. M. CALLENDER & CO.,

42 Pine Street, N. Y.

THE NEW HANDY BINDER.

This article may be described as elegant in appearance, strong, durable, and possessing many special qualities of its own. It allows the opening of the pages perfectly flat, whether one or several numbers are in the binder. Any number can be taken out and replaced without disturbing the others. The papers are not mutilated for subsequent binding in permanent form. The binder is supplied with gilt side file, and is an ornament to any desk or reading table. The JOURNAL, filed in the Handy Binder, becomes a volume of great value, always convenient for instant reference. Handy Binder, Postage paid, \$1 00.

Every Meter emanating from our establishment will bear the State Inspector's BADGE, and will be fully warranted by us. Our Annual and Calendar will be sent to Gas Companies upon application.

GAS INTO POWER,

BY THE

OTTO GAS ENGINE.

GAS POWER.—A Source of Revenue to Gas Companies ready to engage in Electric Lighting, building of Water Works, Electric Street Railways, etc.

Coal for producing Gas is less in amount than that for producing Steam, both being measured on an equal amount of work performed. And, further, with Gas,

50 to 90 per Cent. of Value of Coal is Returned

by sale of Coke and Tar, according to the market value of these products.

Labor for handling fuel is reduced, by its becoming centralized and confined to the gas house, and frequently has not increased after the addition of a power station.

With Gas Power, cost of fuel is strictly limited to the time of use.

MANY VALUABLE
AND RECENT
IMPROVEMENTS.

SIZES,
1-3 to 100
HORSE POWER.

Wherever Gas Companies tried Gas Power with Steam Power together in one Station, the use of Steam was subsequently abandoned or restricted, and Gas Power made to take its place.

Where Gas Companies adopt Gas Power for Electric Plants, Water Works, Sewerage, etc., they not only choose the most economical power for their use, but secure to themselves the numerous advantages of increased production, without increase of expense, and benefit thereby their entire manufacture. They induce consumers, by their example, to abandon Steam for Gas Power, and, by establishing special rates, make

Gas Power the Leading Power of To-Day,
AND SOLVE AT ONCE THE QUESTION OF FUEL GAS.

BRIEFLY TOLD.

PUTTING THE BLAME WHERE IT BELONGS.—Residents of this not small or poor city—making one's estimate of its scale of magnitude and riches on the basis of reputed population and known wealth—have often had their attention attracted in forcible manner to the fact that many pipes and conduits lie beneath the pavements of the roadways. We suppose we may be held as speaking by the card in saying that the New Yorker's attention is forcibly called to this underground situation, especially when it is remembered that the local resident is occasionally called upon to dodge through a shower of paving stones, or to rush blindly away from a sandy simoon, or to scurry breathlessly along in an envelopment of steam, or to be startled by a sheet of flame, not infrequently accompanied by a loud report. He may be seated at a restaurant table endeavoring to satisfy his appetite for food; or he may be in Knox's to re-inforce his headgear; or he may be anywhere in the district in which run the pipes of the New York Steam Heating Company; and, if so, he is never safe. All of those disjointed utterances are directly traceable to the wonderful exhibitions that have recently been made of the power of steam in this city, and especially with reference to the square at Broadway and Fulton street. Indeed the only peaceable and safe spot for a pedestrian on or over this now famous crater would seem to be at a point well back in the fronting graveyard that surrounds St. Paul's Church. A week ago last Thursday, at an early hour, and about coeval with the announcement that the "repairs" to the New York Steam Heating Company's pipes, that were in process of carrying on for some days, were completed—Fulton street and Broadway is the district under consideration—the many who are always to be found in the neighborhood of that busy spot were shocked and startled by a loud report and a sheet of flame, the latter springing into the air to a height of perhaps 7 feet, and having a base only limited by the excavation made by the Steam Company's men. The simple history of the uproar and outburst is this. The Steam Company's mains are at a much greater depth than the mains of the Gas Companies—at least two Gas Companies have more than one set of gas pipes in the district—and the steam pipes seem to be always out of repair. The Steam Company, with delightful disregard of anything above or around them, when it comes to the streets at least, digs out its property, repairs its breaks and restores the ground. In the June 12th instance, at least six gas mains were uncovered for several yards, and with scarcely any attempt at suspension. The genial Italians shoveled clods and stones and all that came in the way of their shovels right over, on and about the gas mains with the inevitable result that joints were broken, gas escaped, and the handy naked light completed the conditions necessary for explosion and fire. To make a long story short, the loss occasioned—to the Gas Companies, the steam concern, the subway operators and the adjoining householders—will not fall short of \$100,000, and all because of the infernal recklessness of the Steam Heating Company. On last Wednesday morning the same section of steam pipe gave way, but this time the movement was not so much on the surface as it was "towards centers." The steam simply smashed out a goodly-sized hole in the cellar wall of Knox's building, filling that headgear emporium with a hot mist, and loading the Mack restaurant and kitchen—located in Knox's

cellar—with sand, stones, old iron, etc. In less than an hour the breaks were again repaired, temporarily, that is. While awaiting the next flare-up in that doomed district we may remark now that the public has at last managed to absorb the idea that the Gas Companies are not after all responsible for these disasters, and, stranger still, the daily newspapers agree with the public in holding up the New York Steam Heating Company as the real offender. In fact we should not be at all surprised if the courts, when called upon to say who is at fault, in their trial of the damage suits that are sure to follow, shall seal the opinion that the New York Steam Company is a public nuisance and an unwarrantable trespasser.

DEARER GAS FOR LONDON, ENGLAND.—The proprietors of the Gas Light and Coke Company have notified the public that an increase in gas rates, of 3d. per 1,000 cubic feet for "ordinary" candle power gas, and 4d. per 1,000 cubic feet for cannel gas, has been determined upon. This puts the charges respectively at 2s. 9d. and 3s. 5d. The reasons assigned for this action are: The expiration of advantageous coal contracts and the great increase in labor charges on account of the new arrangement with the workmen.

A CORRECTION.—Mr. John Gimper, of Springfield, Mo., who at the last meeting presented the Western Association with a handsome gavel, desires us to say that the language used by him in making the presentation was as follows:

"Mr. President—A year ago, when, at Cincinnati, our Association was rapped to order with a policeman's club, I was very much mortified that so peaceable and intelligent a body of men as this should be governed with a policeman's club; and I made up my mind then and there that, if spared another year and the means to spare, I should provide the Association with a suitable headblock and gavel. For this purpose you will please observe I have chosen the upper part of a center seal for a headblock; for as the gas flows to and from the center seal, first crude and at last purified, so do our deliberations pass to and from the presiding officer, and are at last sealed by the blow of the gavel. This, Mr. President, therefore becomes an instrument of strength in your hands, and as a member of this Association I take pleasure in presenting these to you, and through you to the Association."

DOINGS OF THE DAVIS & FARNUM MFG. CO.—This bustling Waltham (Mass.) firm reports progress in a right satisfactory manner. Its recent contracts include an 82-foot holder, brick tank and building, for the New Britain (Conn.) Gas Light Company—the holder to have a cup, ready for the reception of a second section, when the latter is needed; a 28-foot holder for the McLean Insane Asylum, at Somerville, Mass., and a very great likelihood for the award of contract for an 80-foot holder at another Eastern point, the bids for which are all in. The 82-foot double lift for Malden (Mass.) and the 78 foot single lift for Gloucester, Mass., are well under way, and the tank for Malden is being rapidly prepared.

CONSOLIDATED AT KENTON, OHIO.—Mr. Thomas Espy, President of the Kenton (O.) Gas and Electric Company, informs us that that Company now owns and operates all of the lighting plants of the city—both electric and gas—and the natural gas plant, formerly owned and operated by the Scioto Natural Gas and Oil Company. The combination has just completed its electric construction (Western Company's type), which has a capacity of about 100 arcs—public and commercial.

The Market for Gas Securities.

The range for city gas shares during the week was unimportant, although a fairly good volume of trade is reported.

Consolidated is at 100½, ex-div., and Mutual moves steadily upward. We quote it at 123 to 125, but we doubt if a good block of the stock could be secured even at an offer of the asking price.

The feature of the week in this vicinity was the sharp rise in Fulton Municipal (Brooklyn), which is quoted at 142 to 145. We might also add that all Brooklyn shares are steady to strong.

Chicago Gas is at 54¼ to 54¾, and we have no doubt whatever that this stock is a purchase at anything under 60.

Bay State common is strong at 87¾. Baltimore Consolidated is rather weaker than before, but well-informed brokers maintain that the shares are easily worth 60.

The Hartford City (Conn.) Gas Light Company has declared a regular semi-annual dividend of 4 per cent., payable July 1. Rumor has it that Mr. George R. Stetson will be chosen to the Presidency of the New Bedford (Mass.) Company. Some inquiry has been made for Laclede, but the rates are very uneven.

[OFFICIAL REPORT—REVISED BY THE SECRETARY—CONTINUED FROM PAGE 846.]

THIRTEENTH ANNUAL MEETING OF THE WESTERN GAS ASSOCIATION.

HELD AT ST. LOUIS, MO., MAY 21, 22 AND 23, 1890.

SECOND DAY—MAY 22—MORNING SESSION.

The President called for the report of the Special Committee on Gas Companies' Accounts, and in response thereto, Mr. Geo. G. Ramsdell, of Vincennes, Ind., submitted and read the following, entitled

GAS COMPANIES' ACCOUNTS—REPORT OF COMMITTEE.

To the President and Members of the Western Gas Association:
Gentlemen—Your Committee, to whom was referred the paper written by Mr. J. D. Thompson, of this city, and read at the Chicago meeting, on the subject of "Gas Companies' Accounts," found in the beginning of its labors considerable difficulty in determining a plan of action. After carefully examining the subject, however, we decided that the amount of labor involved to properly cover the entire theme of gas company's accounts was too great and the topic too important to condense into one report, and the work of preparing such a report more than the Association could profitably exact of one committee; we therefore concluded, the subject being susceptible of subdivision, that to take one branch and thoroughly exhaust it would in its results prove more beneficial and be of more ultimate value to the Association, than to less thoroughly incorporate too much material. This being determined, it became necessary to decide what part of the subject we would embody in our report. In considering this we concluded that, inasmuch as the original idea of the work was particularly to arrive at a uniform system of computing the cost of gas in the holder and distributed, that should form the basis of our work, and we herewith present the result of our labors.

That some uniform system would prove beneficial is apparent—to reach a system meeting the approval of all an impossibility—but your Committee has given the matter its earnest attention, sought every avenue of information that has suggested itself and has formulated a plan, as nearly as lay in its power, meeting the varied requirements. Any form submitted must be flexible in its composition, rigid in its results, equally applicable to large or small works and suitable for the various modes of manufacture. Your Committee has also endeavored to so arrange the form that it may readily be inserted in a complete balance-sheet, if that is considered desirable, or can be carried on separate sheets and conveyed by totals to such a sheet.

The contrasts between the manner of keeping gas accounts of to-day and in the early days of gas manufacture are very marked. Formerly meagre accounts were kept, the prevailing high prices rendering greater economy unnecessary; but as competition and pressure of public opinion became more active, necessity for more rigid scrutiny arose, until now a company whose accounts were not kept in detail would be an anomaly. It is probably true that in an individual case, for its own exclusive use, it would be immaterial what form of computation a company adopted so long as each year the same items regularly entered into it, for this in a measure would afford the desired result—a similar basis year by year for comparison; but while this plan, which may be very perfect or very crude, affords a means of comparison for the individual company it affords no means whatever for comparing one's work with that of another. For example: According to his system of accounting A puts his gas into the holder at a net cost of 25 cents per thousand, while B, similarly situated, computes his cost at 50 cents, yet an analysis of the two methods of accounting may demonstrate that the latter is actually putting his gas into the holder at less cost than the former; therefore, for any reliable comparison it is incumbent to ascertain the exact elements of cost that enter into the computation. The same general features arise in the division of distribution charges and other details that go to make up the expenditures of a gas company, and your committee has found it a perplexing question to satisfactorily determine some of the details of division—or division of details—at the same time keeping in view the complex requirements in other directions.

Our business relations with the public are such as to render us inviting targets for the penetrating shafts of public criticism. One of our many annoyances arising from this lack of uniformity in computing cost is the constant citing of marvelous cheapness of manufacture in some remote city and the patronizing sympathy tendered for our lack of equal ability. We could easily excel as dividend distributors if our cost of gas consisted of coal and lime only and we received a good price for our residuals. Such a system of figuring to us seems too ridiculous

for serious notice ; yet the writer is familiar with a case wherein the local press, in an attack upon the gas company, based its warfare and made its strongest arguments upon the cost of manufacture at a public institution making its own gas, and whose books, upon subsequent investigation, disclosed the fact that the above items only were included in the cost. The pernicious feature of the case rested in the credulous public believing the papers whose disinterested (?) figures "were incontrovertible, being actual figures taken from the books of the institution."

In Massachusetts, owing to the uniformity required by the Gas Commission, each company in the State prepares an annual return upon an established form, so that in that State when the cost of gas is computed each company's computation rests upon exactly the same basis, embraces the same details, its footings forming an equitable aggregate for comparison ; by this uniformity each company can not only reliably ascertain its own progress or the reverse, but precisely how this compares with the results of other companies of similar size and surroundings ; this either incites to greater excellence or causes a strict examination into details where an exhibit exposes inferior management or unsatisfactory results.

We have carefully examined a large number of forms from various companies and desire to acknowledge the courtesies extended to us in this direction, as well as other assistance rendered your Committee in reaching some of our conclusions, entailing as it has a very considerable mass of correspondence. We are especially indebted to Mr. Barker, of the Board of Gas Commissioners of Massachusetts, and Mr. Humphreys, of the United Gas Improvement Company. The forms used in Massachusetts and the one used by the United Gas Improvement Company are each very complete, the latter particularly so, embracing more of detail than your Committee has thought best to recommend, and while the form we present in many points resemble these it is not identical with any of the forms submitted to us.

Before proceeding with the analysis of the form itself we wish to say a few words relative to the reception it will receive. Its success does not rest in the formal vote taken by this Association, but will depend entirely upon individual adoption and operation. As suggested at the outset no plan will be equally acceptable to all, but if a well formulated plan meets the approval of a majority of us would it not be advisable and advantageous on the part of all to give some uniform plan a cordial adoption and a fair trial ; if actual experience demonstrates weakness, or greater wisdom points to improvement, we can still retain the desired uniformity by adopting a desired change and simultaneously entering upon its use. Your Committee does not pretend that its labors have resulted in an absolutely perfect system, but has given you the result of its combined effort ; and if the plan as a whole is not acceptable it can be referred to another committee and thus a perfect system sooner or later secured. Our investigation has taught us that in actual practice there is a desire to avoid some of the items that should rightfully be used in arriving at the cost of gas, thus making the cost apparently less than it really is. If our gas cost us 50 cents per thousand in the holder it is far better to know it and aim for better results, than to deceive ourselves and companies into a belief that it is only one-half that sum. Every item entering in, no matter how trifling, is as essential to an accurate and equitable result as the undisputed items of coal and labor—as in any other line of business—we want an exact balance.

No question arises as to weights and measures, this Association having adopted a standard as follows :

- 2,240 pounds 1 ton.
- 2,150.42 cubic inches . . . 1 bushel of lime.
- 2,747.70 cubic inches . . . 1 bushel of coke, (heaped bushel).
- 231 cubic inches 1 gal. tar, naphtha, oil and ammoniacal liquor.

To arrive at the component parts (aside from chemical details) of a given quantity of gas would be to arrive at its cost in the holder—upon most of these there will be no argument—others will probably invite discussion. In the form we submit for your approval we embrace :

- 1, coal ; 2, oil ; 3, labor ; 4, purification ; 5, fuel ; 6, water ; 7, expense ; 8, maintenance.

And apply the following rules in connection with them. We would say at this point by way of explanation, that the figures we will recommend as fixed charges are in each instance the result of a consensus of opinion derived from sources we considered particularly well qualified to testify from experience and who were equipped with reliable data.

Manufacture.

Coal.—Total cost, initial and ultimate.

This should include every additional expense after its first cost, storage, insurance or any similar charge, and as nearly as possible a just allowance for shrinkage. If coal is sold or in any other way a profit de-

rived the account, should be credited with the amount. In the matter of shrinkage, instead of periodically marking off for discrepancy, between coal weighed in and coal accounted for, there should be a fixed charge sufficient to cover the loss in weight and waste ; your Committee recommends for this a fixed charge of 1 per cent. That is to say, if the coal used in a given month figured as above \$1,000, before dividing to ascertain the cost per thousand 1 per cent. should be added, making the cost of coal \$1,010.

Oil.—Apply the same rules as for coal, except that in the use of naphtha we recommend for evaporation and waste a fixed charge of 5 per cent., and in the use of crude oil, 3 per cent.

Labor.—More difficulty has been experienced in finding a satisfactory solution of this feature than in any other part of the problem, owing particularly to the fact that each size of works develops different assignments of duties of officers, the division being more intricate as the works diminish in size ; in the larger works the lines being more clearly defined this difficulty largely disappears. We therefore present the following : In the distribution of this item to arrive at the proper distribution of official salaries, we must first define the significance of the various titles in use, or define titles that may be used to afford a basis for distributing the amount so as to as nearly as possible assign an equitable division to its proper place. We therefore define the various titles as follows :

General Manager.—One having supervision of and supreme authority over all departments and affairs. Salary—One-fourth, manufacture ; one fourth, distribution, and one-half, management.

General Superintendent.—One having supervision of and authority over manufacture and distribution, but not over office affairs. Salary—two-thirds, manufacture, and one-third, distribution.

Superintendent.—One having supervision of and control over manufacture alone. Salary, manufacture.

Superintendent of Distribution.—One having supervision of and control over distribution. Salary, distribution.

By selecting or combining these a suitable apportionment may be secured in almost any case. In a small works, where one man is the Poohbah of the entire plant, occupying all the offices and practically doing all the work, outside of manual labor, he should for our purpose style himself General Manager and distribute his salary as shown above. This part of the labor will be placed under the heading "Salaries" in each department—manufacture, distribution and management. Labor would thus comprise, salaries, wages of foremen, wages of stokers, wages of coal-handlers, wages not specified above.

Purification.—Cost of labor, cost of lime, cost of oxide.

Regarding the item of labor, where a purifying crew is constantly employed, or in smaller works, where only part of a crew or even part of one man's time is employed, the charge should be made for the actual time.

If oxide is used, we recommend the following : Determine and use a fixed charge per 1,000. For example, if the material costs 48 cents per bushel delivered at the works, and its lifetime is equivalent to purifying 120,000 cubic feet of gas, this would equal a charge of $\frac{4}{10}$ of 1 cent per 1,000 for material ; add to this the cost of labor at, say, $\frac{5}{10}$ of 1 cent per 1,000, and we arrive at a fixed charge of $\frac{9}{10}$ of 1 cent per 1,000 as the cost of purification, where this material is used. Some works will do better than this—others not so well. We consider the above, from our investigation, a fair average charge:

Water.—Where water is purchased, the rate per 1,000 is readily obtained ; if pumped, the cost would appear in the two items, Fuel and Maintenance.

Fuel.—All fuel, other than coke, used for boilers, generating or furnace firing. No coke should be charged, inasmuch as the credit to cost of gas in holder is from coke sold. In the manufacture of water gas it would, of course, be necessary to keep an accurate account of coke used to determine the cost of that gas, as compared with coal gas, but this would not affect the cost of the combined gas, in the holder.

Expense.—This should include the minor items of expense at the works, such as oil, waste and similar supplies.

Maintenance.—This item should embrace all repairs, including renewal of retorts ; we, however, recommend a fixed charge, inasmuch as the variation is not only in months but in years. As near as your committee can ascertain, this amount is variable in different sized and situated works, varying probably from 3 to 7 cents per 1,000, making presumably a fair average charge of 5 cents per 1,000.

Less Residuals Sold.

Coke.—To include all receipts for coke, less expense of delivery, or preparation for market. To include any coke on free list at a fair valuation.

Tar.—Sales, less expense of delivery, cooperage, or preparation for market.

Ammoniacal Liquor.—Sales, less expense.
This would give "Cost of Gas in Holder."

Distribution.

Salaries.—Already explained.

Meters.—Wages of meter takers, wages and expense in meter department, including repairs and renewals; wages of collectors and collection expense.

Mains and Pipes.—Renewals and repairs of mains and service pipes, less income from rental where meter rent is collected. This would give "Cost of Gas Distributed."

Public Lamps.—Expense: Lighting, extinguishing, repairs, renewals and maintenance.

Management.—Salaries, as explained; officers; general, to include salaries not apportioned in former distribution; directors' allowances, office rent and office expense.

Sundries.—Taxes, insurance, inspectors' fees, legal expense, bad debts, sundries—to include items not readily distributed to other accounts.

The form is now complete except for the item of leakage. Usually the custom adopted is to carry the items of cost into columns of Gas Made and Gas Sold. Your Committee believes, however, that a preferable way is to place this item, after the items of cost are summed up, as a calculation based upon that sum, multiplied by the per cent. of leakage, divided by the percentage of sales. For example:

- 10 per cent. of leakage equals $\frac{1}{10}$.
- 12 per cent. of leakage equals $\frac{1}{8\frac{2}{3}}$.
- 14 per cent. of leakage equals $\frac{1}{7\frac{1}{4}}$.

And so on. The rule, then, for figuring this item would be: Multiply the net cost of gas made by the percentage of leakage, and divide the quotient by the percentage of gas sold.

This arrangement does not interfere with the clearness of the detailed statement of cost, saves a considerable amount of unnecessary calculation, and gives the desired result in an accurate and crystallized form. In the present instance we have chosen to adopt as the charge for leakage, 10 per cent. We therefore present the plan suggested, formulated upon the foregoing basis. The figures used are taken at random while seated at the type-writer, and are only accurate as an illustration of the form.

Respectfully submitted,

J. D. THOMPSON,
GEO. G. RAMSDELL, } Committee.
A. W. LITTLETON,

Discussion.

The President—You have heard the report of the Committee, and we would like to hear what the members have to say as to the suggestions of the Committee. A great amount of labor has been expended in preparing this valuable report, and those members who are seriously interested in the matter are anxious not only to get an expression from the Association of the desirability of adopting such report, but would also like to get an expression from the Association to the effect that the members would agree to take up this matter, or this form of keeping accounts, so as to form a basis of comparison by one company with another. The Committee have labored well, but are not entirely satisfied with the details which they have presented, and would like to have suggestions from members. I hope you will not hesitate to make remarks.

Mr. Ambrose—The Committee have really done their work so thoroughly that they have not left much for us to debate on, except in a general way. It is evident we have a great many accomplished accountants here, and it seems to me that they can agree upon some uniform system in order that abuses may not arise. We know that often one man will report he can put his gas into the holder at 25 cents per thousand; and the public, through the newspapers getting hold of that statement, figure on it without taking into consideration any of the other items of cost—probably he has not figured in one-half the labor that enters into the cost of putting gas into the holder; but the public noting only the bald statement cry out that if gas can be put into the holder for 25 cents per thousand we ought to sell it for 35 or 50 cents. That is really the way that so many abuses of the gas interest have arisen all over the country—from the very fact that these statements have been made without any thorough investigation of the question, and without taking into consideration all the items that enter into the cost of gas making. I heard it stated that the people of St. Louis could put their gas into the holder for nothing, and still make money; that is, that the by-products which they sold amounted in value to more than sufficient to pay all expenses. The public got that from some false data given them, or from conclusions based on statements made by parties who are not disinterested, or from estimates, without considering all the items which should enter into the cost of gas making. I understand it is now proposed to adopt some uniform system by which we can ascertain the cost of gas, and then, when our statements go out to the public, they will be uniform, and each and every one of us who are interested in the gas business can take up the cudgel and help the man out who is the under dog in the fight. Indeed, whenever the generous public, and all the newspapers of the country, jump upon one company, unless other companies come to the rescue they will be considerably "woolled" before they are through. That has been the case in some of our extreme Western towns. It has got so now that in some of the small Western towns (those having a population of only 4,000 or 5,000) the claim is made that the local companies ought to sell gas at 50 cents or 75 cents per thousand, when in fact it costs the company that much or more to put the gas into the holder, owing to the fact that they manufacture such a small quantity, because of the small demand, that they cannot afford to sell it at the price they could if there was a greater demand. We are not exactly like our Jew friend who said he was selling his goods ten per cent. below cost, and was asked how he managed to make a living? Said he, "Because I sell so much of it." That is not exactly the way with us. We want a little larger margin of profit.

Mr. Egner—In buying coal we have to pay for it at the rate of 2,000 pounds per ton, but I understand that it is the established rule of the Association to call 2,240 pounds a ton. I think that ought to be changed. It would be much better for all of us if we could agree upon 2,000 pounds to the ton. We have to buy our coal in that way in all the Western States.

Mr. Shelton—I think we all agree upon the necessity of a uniform system of charging up the cost of gas in the holder. I do not desire to criticise the report of the Committee, but for the sake of provoking discussion there are one or two things about which I should like information. I would like to ask the reasons that guided the Committee in coming to the conclusion about charging up the shrinkage of coal. It is a very hard thing to determine what the whole shrinkage is. It is an extremely difficult thing to go into a coal shed and tell just how much

coal you have on hand. As to the item of oil, the Committee seems to lay down an arbitrary rule of charging off three per cent. for crude oil and five per cent. for naphtha. With the coal we cannot find out very definitely what the exact waste or shrinkage is; but there is no trouble in charging off the oil account. I think also that three per cent. for crude oil or five per cent. for naphtha does not give a sufficiently wide margin. For crude oil the evaporation may not be more than three per cent., but for the naphtha I have frequently found it to exceed five per cent. Another point is as to the cost of maintenance. It is suggested that some companies should charge off three cents, and some seven cents, or that, perhaps, an average, or a fixed charge, for maintenance would be five cents per thousand. I think a company that could figure out an actual cost of three cents per thousand would not be satisfied to charge off five cents per thousand, because some of their neighbors did not do better than that. I think we ought to charge off in each case the actual cost of the labor, and not the average cost to all the companies. I would like to ask the reason for that recommendation.

Mr. Ramsdell—In the matter of the weight of a ton of coal, the point that Mr. Egner suggests occurred to the Committee, in fact they started out on the assumption that 2,000 pounds was the standard for a ton of coal. But in looking that matter up we found that this Association, at its meeting in Cincinnati, several years ago, adopted the standard of 2,240 pounds to the ton. I thought myself that, for this Western Association particularly, it should be 2,000 pounds; for we all buy our coal in that way, and it is much easier to figure. As to the items charged off for shrinkage of coal and in oil, the Committee, of course, had very limited knowledge themselves of these things, but they obtained data from all parts of the country—more particularly from companies which we thought would make statements that could be depended upon—and then made a general average of those amounts. In the matter of oil, I think we could get at it very closely, because we have the actual figures. I think, if I remember rightly, the data represented something like four or five million gallons of oil. So that, having that large amount, and taking the average in that way, your Committee thought they would arrive at very close figures. As far as the repairs are concerned—that was a very difficult question for the Committee to decide upon, owing to the fact that there is so much variation. Every company will at some time pretty nearly remodel its entire works. If that expense were charged in in any one year it would make the cost of gas for that year very high. The Committee endeavored to distribute that in proper proportions. As I say, the returns we received on that subject varied from three to seven cents per thousand, in round figures. We judged from that, considering the sources we had drawn those figures from, that to adopt 5 cents per thousand feet would make a fair charge. Of course, if we all charged 5 cents per thousand for repairs it would make no difference just how much or how little repairs we made, as the cost of our gas would then figure just the same. The items that there can be economy in should be put in here at just what they actually cost. The only reason why we adopted the plan for oxide purification was that your oxide may last for three, four or five years; it does not all give out in one year. If you buy a certain amount of oxide the first year, and then buy more the next year, it would be easy to calculate it in that way; but inasmuch as the cost of the oxide covers more than one year, and it is difficult to equitably apportion the cost between the different years, we adopted this plan.

Mr. Shelton—I do not think the Committee got at a very exact average. The amount spent for labor or repairs speaks for itself; but those other expenses we cannot definitely determine, and it is very hard to make an estimate. Those items which we can determine—which we know exactly how to charge up each year—I think should be stated exactly. I think it would be difficult to explain to our directors, if we were only actually paying two cents per thousand feet for repairs, why we charge up 5 cents per thousand each year. I think they would be apt to want to know why we charged more than two cents.

Mr. Ramsdell—I will say one thing more. Mr. Shelton is in the U. G. I. Co., and that Company's system of keeping accounts is very fine indeed. They are kept in detail, and it would be very easy to keep them year by year if that system was adopted. But that plan involves a large amount of work—more than the Committee felt authorized to recommend for adoption by the Association. We do not expect even that the plan we have suggested will be at once adopted, but that the ultimate form will be like it. Unquestionably there will be changes. We thought it would be better to adopt some simple standard now, and then work into a more perfect system by-and-by.

Mr. Lansden—The object of this Committee, as I understand it, is to induce our members to bring in these accounts in such a way that we can make comparisons among ourselves, so that the Association can un-

derstand exactly what we mean when we say that gas costs so much in the holder, or so much distributed.

Mr. Ramsdell—I was just going to say that of course we can present no report which will bind anybody. As a matter of fact each of us now has some system upon which he is keeping his accounts. The object we had in view was this: We come together as an Association, and here and in our conversations we ask a man how much his gas costs him in the holder; sometimes the figures given are very satisfactory, and sometimes they are somewhat paralyzing. The reason is because they are based upon false data. In other words, one man has figured one way and another in another way. If we could adopt some system by which, when we ask a man what his gas cost him in the holder we knew that in his reply he embodied just what we represented in our own case, then we would know whether we were or were not doing good work. The original idea in this paper was to cover that point. Of course it would be impossible for the members of this Association to go home and change their whole system of bookkeeping to adopt anything like this; but if the Association would adopt this report or any similar form of keeping accounts, we could gradually grow into its general use. If the Association prefers, this report can be referred to another committee to devote more work upon. I will say that in my own case I have adopted this form and am now using it to my satisfaction.

Mr. Starr—Does it not increase your labor very largely?

Mr. Ramsdell—Not at all; on the contrary, lessens it.

Mr. Cowdery—I move the Secretary of the Association have a set of blanks printed, corresponding with these forms proposed by the Committee, and that they be distributed among the members, and that the members carry them home, figure it out on their own account during the coming year, and come prepared at the next meeting to discuss the subject and to say whether their companies are ready to adopt this form, or some one similar to it.

Mr. Murdock—I would like to have that motion amended so as to correspond with Mr. Egner's suggestion that 2,000 pounds be considered a ton of coal.

Mr. Forstall—I think there is an error on the 12th page. It says: "Cost distributed, .4367." I think it should be "Cost of distribution."

Mr. Ramsdell—The cost of distribution would be .1450; the cost of distribution added to the .2917, cost of gas in the holder, gives us the cost distributed as .4367. In other words, that is the cost in the holder and the cost of distributing.

The President—You have heard the motion of Mr. Cowdery—that the Secretary be instructed to prepare forms based upon this report to be submitted to the members of the Association for their consideration during the coming year and discussion at our next annual meeting. Mr. Murdock moves to amend that by fixing the standard of a ton of coal at 2,000 pounds instead of the standard of 2,240 pounds which was adopted by this Association some time ago. The question presented is susceptible of division. I think that to keep the matter clear we had better put the motion of Mr. Cowdery as originally made, and then the matter of fixing the number of pounds to the ton of coal can be taken up as a separate motion.

Mr. Murdock—I will withdraw my amendment.

Mr. Egner—I would like to know what I am voting on. I understand that the Committee report recommends certain forms to be used, and that these figures are simply given the better to explain these forms.

Mr. Ramsdell—They are simply illustrations.

Mr. Egner—I suppose every one understands that, and that we are to figure the coal and all the other items at whatever they actually cost us. I think it would be well not to allow a fixed charge of 1 per cent. I have found it sometimes to exceed that, and sometimes to be nothing at all. I think we should add the waste as we really find it in our several works. As to the oil, I do not lose any oil at all; hence I would not like to add 5 per cent. for leakage to the cost of the oil. I suppose the intention is to take the form proposed and to use the figures as we actually find them.

The President—As I understand the report as read it is necessary that some percentage be adopted. The Committee, as the result of their investigation, found certain percentages which they have recommended. The discrepancies between the actual and the calculated percentages would readily be removed in our inventory. Our inventory would show how far we had erred in them. For the information of the members (myself included) I would like to ask Mr. Shelton, if this 5 per cent. is an error, what percentage he would recommend according to his experience?

Mr. Shelton—I would not recommend any fixed percentage. Sometimes we have no loss at all; then again we have a loss. On the naphtha I have known the loss to run from 5 to 15 per cent. I do not think

we ought to charge off any arbitrary percentage for the evaporation of oil. You can determine the exact amount in each case, and should state it, leaving the arbitrary percentages to those things which cannot be determined.

Mr. Ramsdell—The Committee thought that matter over very seriously. This is not put in without a great deal of thought with regard to that particular point. I presume there are very few men in this room who charge off for any loss in oil or coal. There may be some, but I think I am not overstating it when I say there are few in this room who charge off anything. I mean by that to say that there is nothing charged off regularly. Once in a while, as it happened in my own case at one time, I got my coal house cleaned out—I very seldom get the entire lot of coal taken out—and I was surprised at the discrepancy which I found. It extended over a number of years, and I was surprised at the large shortage that I found in my coal account. It is a very easy thing to keep your books so that your coal account is charged off with the amount of coal used or sold; and that is the way it is almost universally done. As Mr. Falen has suggested, the inventory will take care of that. In my own case I found that over 100 tons of coal had been lost through waste, or in weighing, or in some such way as that. That is an actual loss as far as gas manufacture is concerned, and it should be charged up to the actual expense of the gas made during that time. And in the same way with oil. It is lost either by evaporation or waste, or by measuring. It was to cover that and to get what we thought was a fair charge to be put in regularly that this suggestion was made. If every man here would balance his accounts, as Mr. Egner says that he balances his oil account, every day, or if every man balanced his coal account every day, we could get at the figures accurately, and it would be better for every man to keep his accounts in that accurate way; but the trouble is that it is not done, especially in the smaller works. It was to cover that point and to get a fair charge that the Committee recommended that course.

Mr. Ambrose—If I understood Mr. Cowdery's motion it was that printed forms be furnished by the convention to each of the companies, and that the matter be referred to the Association as a Committee of the Whole to report at the next annual meeting.

The President—That is the idea.

Mr. Egner—I want to say I am heartily in favor of this system, and I know that it has taken a great deal of work to get it up. I believe if we all follow it out it will lead to good results.

Mr. J. B. Howard—I move to amend the Cowdery motion, by suggesting that the reports made by different members during the year be made upon the form taken from the report of the Committee. If they see fit to make any different reports, these can come in also. It would entail too great hardship upon the Committee to get up the exact forms and send them to every member of the Association. It is asking too much of the Committee. I think the report itself is sufficient.

Mr. Starr—I think that that system is asking too much of the companies. You might just as well, in making up your family expenses, have a column for onions, one for meat, and one for flour; why not? The system we pursue is this. We charge up to the gas the cost of everything that we purchase to make gas of. We have an account for construction, and of expenses for repairs. We put in the cost of putting in street mains, if any have been laid. We charge the pipe and labor at cost. Where we put a new pipe in a new place we charge that as construction. We charge what we buy to the expense of the gas. We take an account of it at the end of the year and see how much we have got left. I think this makes it much more simple, and it would suit small works. In large works where you have large accounts, you may take something like the Committee plan. The loss in the coal account is principally due to the moisture in the coal. As to the oil, I do not think we lost a barrel of oil out of a year and a-half supply. I have a tank in which the oil is water sealed, the tank being constructed on lines suggested by Mr. Forstall.

Mr. J. D. Thompson—As I understand the report of the Committee it is not their intention that any company shall charge itself with a loss which does not actually occur. If the experience of the company is that its loss is not one per cent., and know it to be the fact, they will charge off exactly the proper amount. It is no more right to charge off one per cent. for loss of coal when the loss does not exist than to charge \$5 per ton for coal when you do not pay that much for it. Ordinarily the coal is not inventoried except at stated times. We inventory our coal once a year; that is we use up all the old stock of coal, and then we know exactly what loss there is, if any. But during that time, instead of the loss coming all at one time, we each month charge off what we suppose to be the proper amount. In the case of oil, as Mr. Egner says, we balance that every day, and it is done in this way. We have a certain

amount of oil on hand, as indicated by our tank; next morning the amount of oil is taken—the amount then actually on hand—and the difference is the amount used besides whatever may have been put in the tank during that time. So that in all these things, where the Committee recommend certain percentages, they do it simply as a basis to figure on, with a view of letting each company make the actual figures as their experience suggests.

Mr. Jenkins—I want to make a reply to the suggestion made by Mr. Starr. If we were each individually to take a balance sheet every month, and put down what we paid out for onions, and for beefsteak, etc., I believe that after a few months we would find our expenses would be just a little bit less the coming year. If we were to do the same thing in the gas business I think we would be surprised at the results. I am heartily in favor of this plan, and think we should adopt it as soon as possible. I have within the last few months, on several occasions had an opportunity to see the reports made out by our friends of the United Gas Improvement Company, and have been struck with their minuteness of detail in every respect. I know it entails a good deal of trouble to carry out such a plan, but I believe it will be found entirely satisfactory when once put in practice. I have in my mind a friend who says now that he would rather follow out this plan than any other that he has ever tried; for he knows at the end of every week just where he stands. I think we would profit very much by the same experience.

Mr. Cowdery—My only idea in calling upon the Committee to prepare these blanks was to prevent a misunderstanding. If each member should prepare his own blanks from this report there might be a dozen different styles of blanks. If it is thought best to have some amendment to this motion, I will accept it.

Mr. Ramsdell—Before the motion is put I want to say that as I understood it, it referred the matter back to another committee for consideration for another year. This Committee does not want to continue the work. The Committee has perfected all they can do, and desires to be discharged. If there are any blanks to be prepared I understand that the motion instructs the Secretary to prepare them.

The President—The question is on the amendment offered by Mr. Howard, which I will ask him to state again.

Mr. J. B. Howard—My amendment is that a statement be made up on the report of the Committee; that instead of having this Committee, who have devoted so much time in getting up the plan, assigned more work, that each member of the Association prepares blanks in accordance with the suggestion of the report and submit them to the Association.

The President—The original motion, as offered by Mr. Cowdery, was that the Secretary be instructed to prepare blank forms based on the report of this Committee, and that a copy of those blank forms be submitted to each member for his consideration during the year, and that the matter come up for discussion at the next meeting. That original motion was amended by Mr. Howard, who proposes, instead of the Committee doing this work, that each individual prepares a blank form from the report. The question is now on the amendment.

Mr. Harbison—I hope the amendment will not prevail, but that the original motion, that the Secretary prepare uniform blanks, shall prevail, so that every member of the Association may work on the same basis.

The Howard amendment was put and defeated.

The President—The question now is, on the motion of Mr. Cowdery: That the Secretary be instructed to prepare blank forms based on the report submitted by the Committee, and that a copy of those blank forms be submitted to each member during the year for consideration.

Mr. Lansden—I wish to offer an amendment—that each man receiving blanks fill them in according to his experience and return them to the Secretary.

The President—That matter comes up for discussion next year. The amendment is not in order.

Mr. J. B. Howard—I want to place myself right. I did not understand the motion of Mr. Cowdery was that the Secretary furnish those blanks. I presumed the motion directed the Committee to do it, and I did not want to impose any more work on the Committee. (The motion of Mr. Cowdery was agreed to.)

The President—The question now is on the report itself.

Mr. Shelton—I move that the report be accepted, and that the hearty thanks of the Association be given to the Committee for the evidently great amount of work that they have bestowed upon the report. (Agreed to.)

Mr. Murdock—Now I move, before those reports are sent out, that the standard weight of a ton of coal be changed from 2,240 to 2,000 pounds.

The President—I will have to ask for information from the Secretary whether the change can be made in this way by motion.

Mr. Ramsdell—Of course, it would be very easy to change that by motion as has been proposed, but I think we should not act hastily in this matter. When this standard was adopted, Mr. King, who was chairman of the Committee, told me at the time the reasons (they were sufficiently good then to carry the day) why the Committee recommended 2,240 pounds instead of 2,000 pounds. One reason suggested was that it would enable us more readily to compare results with the gas manufacturers in the East and abroad. I would suggest that, instead of adopting a motion at this time changing the standard (there is no trouble about doing it at any time, because it is neither a by law nor part of our Constitution, but simply a part of our routine business), it be referred to a committee to be instructed to report at the next meeting, or at the same time that this other matter comes up.

Mr. Harbison—I trust that this will not be referred to a committee. I think the members of this Association must see that it is not a wise movement. This matter has been very thoroughly discussed in years past by the American Association and New England Association, as well as by this Association, and all three have adopted the standard of 2,240 pounds. The English have also the same standard. Many of the members of this Association are also members of the American Association, and if they are to bring in statistics for comparison to the American Association they will have to do their figuring all over again, if they do it in the first place on the basis of 2,000 pounds. If our reports of results are worth anything to us by way of comparison they must be all on the same basis. There is no use giving our boards of directors reports of what we have done in juxtaposition to the work of other companies, and then to ask them to compare results, if it is necessary for them to go through so much figuring in making the comparisons. I trust this Association will stand by the action already taken after careful consideration. I remember that our late brother, King, gave very earnest attention to this subject. It was earnestly discussed at a meeting of the Association, who unanimously decided to adopt 2,240 pounds as the standard for a ton of coal. I trust the Association will stand by its former action and not make any change now. We thus keep the standard uniform with that of the other associations in this country as well as with our friends across the water.

Mr. Murdock—I believe this is now the largest Association in the country, therefore it is about time we gave them something to follow after. I insist upon my motion.

Mr. Jenkins—I distinctly remember why it was that 2,240 pounds was adopted as the standard a few years ago. The object was, as Mr. Harbison says, in order that our results might be on the same basis. As each of the other Associations has now adopted this same standard, why should we start in and stir them all up again on this question? If we do they will come to us next year with something else. I think we had better let it stand just as it is. (The Murdock motion was lost.)

The Association then took a recess until 2 o'clock P.M.

SECOND DAY—MAY 22—AFTERNOON SESSION.

The Association met at 2 P.M.

The President—We will first take up the paper by Mr. Allen R. Foote, which probably will not provoke much discussion, but which nevertheless is well worthy your attention.

In the absence of Mr. Foote Mr. E. H. Jenkins, of Columbus, Ga., read the Foote paper entitled

BY-PRODUCTS OF EXPERIENCE.

1. Write the history of the utilization of by-products, and you will write the history of cheap gas. Make a record of the by-products of experience, and you will lay a solid foundation for successful management. Intellect makes a mammal a man. Wisdom makes man a god. Judgment is the highest attribute of intellect. Acts of judgment proceed from a knowledge of antecedent conditions and logical reasoning regarding the ultimate effect of things to be done.

2. Every agent of force under your control yields obedience in unvarying accord with the degree of correctness of the judgment with which it is directed. Accuracy of judgment depends upon the reliability and scope of the data, and the power to determine effect by knowing the cause upon which it is founded.

The true value of a correct judgment can not be determined. You may form an approximate estimate of it by taking account of what an unsound judgment has cost you. For you the day of judgment comes ever with the rising sun. You may choose whether you will pay the price of knowledge and enjoy its benefits, or do without and suffer cor-

responding disadvantages. This is the meaning and limit of your liberty—the power to choose. One thing or the other you must do.

3. You keep accounts. Accounts are records of experience. If you could manage your business equally well without them, you would not keep them. They are essential to good business management, therefore you have to keep them. The value of accounts depends upon their accuracy, the details they cover, and the relation they bear to the accounts of all others in the same business. To acquire accurate accounts covering all details of the business being managed, is the best possible discipline, safeguard and guide for its manager. It is the best and most helpful discipline that he can acquire from his employees. Without such discipline, intelligent, economic management is impossible.

4. How many years have you been in business? If for every year you now had an absolutely perfect record showing in aggregate amounts for each year, the exact receipts and expenditures for every detail of your business; another record showing the prices paid and received; another showing quantities consumed with quantities produced; and still another showing all the details of the mechanical construction, by which the processes of consumption, production and distribution were carried on, how much value think you, would such records have as a foundation and guide for the management of this year's business? Ample as such records would be, they would not cover the whole scope of your business experience. They would leave untouched many of the by-products of experience.

5. You are not a perfect man doing business in a community of perfect people. For this reason there have been in the course of years many complaints against the business under your management from without, and it may be, from within. Had you a judicial record of these complaints, showing by whom and how made, by whom and how answered, by whom and how settled, would not such a by-product of experience have a very great value for you now?

It may be that your troubles have not always been settled out of court. If not, then you have had an opportunity to open a record of legal actions, in which to find the names of plaintiffs and defendants, names of attorneys for both sides, complaints and answers, when, where, before what judge tried, together with the names of the jury, and the decision. If an appeal was taken or a new trial granted, a similar record should be kept of each step, tracing the case from start to finish. Again, in your local record should be found copies of all legal papers, so-called. This record would be another by-product of experience of solid value.

In the revolving cycle of years, you must have been called upon to play an engagement with the municipal authorities of your city in the drama of securing a franchise or public lighting contract, a permit to open streets, extend lines, place lamp posts, or to do some other act of public or private enterprise. Like all other dramas, the plot is involved in mystery. Of these negotiations you may say:

"There was the Door to which I found no key;

There was the Veil through which I could not see;

Some little talk awhile of *Me and Thee*

There was—and then no more of *Thee and Me.*"*

A municipal record of such "talks," as well as of the public proceedings, and accounts of all negotiations with municipal authorities, also containing clippings from the press—the uncrowned king in political affairs—would be a by-product of experience that you would treasure with most jealous care.

Your interests are not wholly contained within your city limits. Every bill introduced into the Legislature of your State, pertaining to gas interests, affects you. A legislative record containing in complete detail the history of every such measure, and, if enacted into law, the effect of the law upon the business being done under it, would be a by-product of experience of great value.

So manifold are your interests, and so far reaching are the causes that affect them, even the State is not large enough to place a limit upon the influences and procedures of which you should take account. The laws of one State relating to the interests of gas companies affect the interests of gas companies in other States. For this reason there should be a national record of State legislation, sufficiently complete to, at least, serve the purpose of an index to all laws and decisions of every State affecting in any way the interests of gas companies. Such a record would enable the companies in any one State to quickly bring to their support the legislative experience of the whole number of States regarding any point of issue. The value of this power will not be questioned. This record would be a by-product of experience of far-reaching value.

6. "Man is infinitely related." You are a man. By a decree of nature, for which you are not responsible, you were made related to your kin. By the business in which you are engaged, you have made your

* "Rubaiyat of Omar Kahyyan," p. 41.

self related to your kind. Nature fused into your blood bonds of union with your kin. So surely as you are the creator of your own fortune, will you fuse into your brain bonds of union with your kind. One is not a family. By a decree of political organization all gas men in a State are made kin. They constitute the family of the State. The laws of the State have fused into their organization the bonds of kinship. They are of one blood. "A touch of nature makes all men kin." One family is not a people. Reaching far beyond the limits of kinship, grouping together all families, is the relationship of kind—nationality. In these facts are found the reasons for and foundations of State and national organization.

7. Reliable data covering a broad scope, and the power to determine effect by knowledge of cause, are the sure foundations of an accurate judgment. Such a foundation cannot be laid in isolated or unrelated records.

If you see value for yourself in the records of your own experience, kept as indicated, you must concede that the privilege of comparing your records with others of the same character will be a decided advantage.

"One swallow does not make a spring." One experiment does not establish a rule, nor will the records of one company prove the soundness of a business policy. If you wish to know that you are doing the best that can be done in the management of your business, you must compare all details with as many other companies as possible. The larger the number, the more value will there be in the conclusions. You know the value of your own records. Do not be egotistical. Concede the same value to the records of each company in your State. Form a State Association, to include every member of the family, and make an even exchange of experience with them. What will be the result? Without the loss of any of the value of your records for yourself, you will gain the benefit of the records of every company in your State. It is a peculiarity of the by-products of experience that the more they are used the more value they produce.

8. No man is content to live always within the limit of the sphere of his own family. He has a natural desire to know more than such a narrow world contains. He instinctively reaches beyond his kin and forms associations with his kind. To do this, State associations can be brought into affiliation through a national association. The individual company losing nothing in the value of the by-products of its own experience for its own use, may gain the value of all such products of the companies in the whole country. With experience of a thousand companies at his command, the judgment of any manager will be so confirmed and guided that a cause of mistaken judgment will be all but impossible. In this arrangement you buy the experience of all others in even exchange for your own, without parting with it; you only show it.

9. Your experience kept to yourself is the one talent rolled in a napkin and hidden in the earth. Give it to the companies of your State, and it will produce fifty talents. Give it to the companies of the nation, and it will produce a thousand talents. By co-operation all benefits are multiplied and expenses are divided. For your own experience you pay the whole cost. For the experience of the companies of your State you will pay your pro rata share only—say one-fiftieth of the expense of collecting, tabulating, and publishing. For the experience of the companies of the nation you will pay only one-thousandth of the expense, provided all companies enter into the plan.

10. Something more must be done, however, than the mere submitting of records for inspection. That they may be properly compared and tabulated, an agreement must first be had as to the form in which the records shall be kept. Uniform names for accounts must be adopted, the items must be specified that are to be charged into each account, and a uniform date for closing accounts and reporting must be fixed. In other words, a system must be established, and you must become an integral part of it. I use the word "must" because no other word is suitable. If you would receive the benefits you must comply with the conditions. These conditions are not of my making. They are prescribed by natural law. *If you wish to receive, you must give.*

Without a uniform system of record, all attempts at a comparison of details and results with other companies will be as unsatisfactory as an attempt at railroad travel would be if each company had a track differing from all others in gauge. Without such a system you are like an army in which each regiment has an individual style of uniform, and carries arms differing from all others in caliber. Such regiments are hopelessly incompetent to support each other in any action or extended campaign.

11. This is the proper place for the objector to put in his work. He should talk about "the abridgement of personal liberty;" "the invasion of private affairs;" about being required to "give away" his business.

Were such objections to be heeded, the human race would be turned back into a herd of wild animals. Such ideas are genuine soul shrivellers. There is an ignoble personal liberty, as of the beast, that helps no one and is helped by none. There is a noble personal liberty, as of the volunteer soldier who maintains the touch of the elbow with his comrades, as the army of progress moves forward in the grand march of human destiny.

12. In all that I have said there is nothing that is peculiar to your Association. The principals I have elucidated apply with equal force to every form of business and to every organization.

On the 5th of March, 1889, at the invitation of the Inter-State Commerce Commission, a general conference of railroad commissioners was held, in which nearly every State and territorial railroad commission was represented, as was also the department of internal affairs of Pennsylvania; the American Railway Accounting Officers, by its President and other officials. In an address of welcome, on behalf of the Inter-State Commerce Commission, its Chairman, Thomas M. Cooley, said:

"We are all engaged in kindred work, and not kindred work merely, but in a large degree in the same work. It is of the utmost importance that we should be moving upon the same lines in respect to the railroad statistics of the country; that our respective methods for collecting the statistics should look to like results; that the legislation in respect to them should be as nearly as possible identical, or at least harmonious; and that we should make sure when we use the same terms in gathering statistics that we are using them in the same sense, so that when we gather statistics and place them before the public they should represent actual facts, be reliable, and therefore have value."*

Henry C. Adams, Statistician of the Inter State Commerce Commission, read a paper before the Conference on the subject of "Uniform Railway Statistics." In it he says:

"Uniformity of procedure presents the only feasible plan by which accuracy of conclusions may be insured. Unless statistics are compiled according to uniform rules, it is impossible to use conclusions arising from them for comparative study. Uniformity of method is of such vital importance that this convention ought to be unwilling to separate until some definite plan has been adopted for harmonious and co-operative statistical work."†

After discussion, the following was adopted without dissent:

"Resolved, That it is the sense of this convention that a uniform method of collecting and publishing statistics, both as to time and to matter, should be adopted."‡

Better guides than these do not exist. This convention can do no better than to re-affirm this resolution and then adopt practical measures for carrying it into effect.

13. Co operation is secured by the voluntary exchange of the results of isolated effort for a share in the product of organized action. It does not take from, but adds to the power of the individual. By using the power of co-operative action you can send a message from Maine to California for 1 cent. To get the message there by isolated effort, you must take it yourself and walk all the way. Two courses I set before you: pay your money and use all the resources of civilization that it will place at your command to enable you to keep up with the procession of progress, or, keep your money and hoof it in the rear. You do not want for ability, but for *will*.

"Be but willing, and it shall be done."

Discussion.

The President—If anyone has any questions to ask, although Mr. Foote is not here to speak for himself, I have no doubt that others will answer for him.

Mr. Somerville—It seems to me a pity to pass this over and say nothing about it, because it is really a very important subject. If it is possible to get a uniform system of accounts no one will be more delighted than I, and all of us might say the same thing. Mr. Ramsdell's excellent paper, and the discussion upon it, all tend in the direction of getting a uniform system of accounts. I do not see why it is not possible, although it is not in the near future. In this country many different conditions enter into our plans which make attempts in this direction more difficult than they are in England. And for this reason I think it is almost impossible that you can realize the consummation that Mr. Foote desires in his paper. In England they have a uniform system of accounts by which they can readily compare what they are doing with what others are doing; and no doubt that is a great incentive. When

* Third annual report of the Inter-State Commerce Commission, 1889, pp. 41 and 42.

we see what our neighbors are doing, if they are doing better than we are, we are apt to seek to know the reason why. What Mr. Foote aims at is a very good thing, but there is great difficulty in doing it. I remember one thing that may possibly bring it about. In my address before this Association when serving as President I remember using these words—and I have been struck by them in view of recent events: I said that I could see that the time is coming when the gas industries of this country would be in the hands of one gigantic monopoly. When that time comes I suppose that we shall have a uniform system of accounts. It really looks as if it were coming to that. I think the paper is a most excellent one, and it would be a good thing if we could all strive to this end; but I confess I do not see how it is possible at present.

On motion of Mr. Ramsdell the thanks of the Association were voted to Mr. Foote.

(To be continued.)

Matheson's Patent Lock-Joint Pipe.

The advantages claimed by the American Tube and Iron Company (50 and 52 South Canal street, Chicago) for the Matheson lock-joint pipe are: First, economy as compared with any other joint, the surplus thickness of metal required for a screwed joint being unnecessary; as all other lead or screw and socket joints have a double connection, and as the "Matheson" has but a single one at each joint, a saving of 50 per cent. in this respect is made, and also a corresponding one in maintenance. Second, simplicity in construction, permitting of handling without the aid of skilled labor. Third, a reliable joint, whether used on light or heavyweight tubing. Fourth, a saving in cost of transportation as compared with any other style of wrought or cast iron piping.

The Matheson joint is constructed by enlarging or bellng one end of the tubing, and at the same time forming a lock recess, so that when placed in position the joint is securely locked, and thus prevented from drawing apart through expansion or other causes. On the bell end of the pipe a heavy wrought iron ring is shrunk, giving body and strength at the point of connection for the purpose of calking the lead filling, as shown in the cut. This tubing, when placed in position, is

practically flush and smooth on the inside surface, thus offering less resistance to the flow of gas or fluids, and attending loss in delivery through friction, than in the case of other styles and classes of tubing. The Matheson joint is now in use to a great extent by several of the largest natural gas lines in the country, as well as for water and many other purposes. The Company offers no price list on this class of tubing, for the reason that no fixed or arbitrary weights or thicknesses of metal are necessary. External diameters of either standard wrought iron pipe or tubing can be furnished, and of any desired weight or

gauge in connection with the Matheson joint, and in maximum lengths and diameters as follows:

4 to 6 inches diameter,	25 feet long.
8 " 12 " "	28 " "
13 " 18 " "	27 " "

Flames.

Mr. Thos. Fletcher, F. C. S., of Warrington, England, has made another appearance in the field of lectures, this last time before the Corn Exchange, Oxford, where he spoke most entertainingly, before a very select audience, on the subject of "Flames." He commenced by remarking that flames had not received that attention which they deserved, either from a commercial or scientific point of view. Flame, he said, was really nothing but a sign of an incomplete or transition state of chemical combination, and its presence under practical conditions in commercial use always indicated a loss of work. Compared with a boiler whose flues were full of flame, the efficiency of one with hardly any flame was 30 per cent. more. The fact was that the flame was a delusion, hollow and cold inside, and not coming into contact with the boiler at all. A cotton handkerchief saturated with proof spirits of wine would not burn because the flame of the spirits was a comparatively cold and "wet" one, and also hollow—all the space between the handkerchief and the flame was filled with cold vapor; and the amount of heat absorbed in converting the water formed into steam was such that the flame actually became too cold to maintain its existence. The lecturer then proceeded to show, by a number of experiments, how a cold zone exists within a large flame; how the cold zone disappears when the proper portions of gas and air are used; and how flameless combustion takes place when the surrounding solid is at a high temperature. He next showed that a flame does not touch a cold surface, but is separated from it by a cold and flameless zone—a phenomenon which, he thought, had not yet been satisfactorily explained. He believed that it was due to a thin film of air adhering to all substances, but the weak point in this theory was that the zone was also impassable to radiant heat. By another experiment Mr. Fletcher showed that the so-called air gas (air saturated with gasoline) was neither a gas nor perfect mixture, the gasoline being unequally diffused, and, therefore, forming separate and distinct centers of combustion. Continuing, he said it was a very common thing to hear of white flames, but so far as he was aware white flames did not exist. The source of light which was really white was not flame, but some solid intensely heated. He next exhibited the powers of a blow-pipe supplied with gas and pure oxygen, and informed his audience that this destructive apparatus, which can make a slot 3 inches long in a $\frac{3}{4}$ -inch plate of tempered steel in about a minute, can, at some cost, be made to work absolutely silently; and by directing the same blow-pipe upon a block of lime he produced a light strong enough to throw shadows of ordinary gas flames. The fusing of a crucible which would withstand the temperature of fused wrought-iron was another example of the power of this apparatus. Mr. Fletcher next referred to how flame contact can be obtained with water vessels by means of projecting studs, and said that from careful experiment he had come to the conclusion that the effective value of such a surface was about six times as great as that of surfaces with which water is in direct contact—one square foot of surface on a projecting stud is equivalent to six square feet of ordinary boiler or water-tub surface. In conclusion, he referred to the problem of converting a large bulk of heat of low intensity into a small bulk of high intensity, which if solved, would reduce our waste of fuel to zero. This conversion, he said, was possible with all other natural forces, such as light, electricity, etc., and he believed it to be possible with heat also. The only objection, so far as he could see, was that we do not know how to do it at present; but he had no doubt the time will come when the problem will be solved by some one who will be rewarded by fame and fortune.

The Gas Light and Coke Company and Their Men.

We are indebted to Mr. G. Shepard Page, who writes from London, England, under date of May 31, for the following:

The *Press Association* (similar to our *Associated Press*, but perhaps a trifle more trustworthy) claims that through inquiry yesterday (Friday, May 30) it was discovered that the present trouble at the works of the Gas Light and Coke Company has a twofold source. One subject of dispute between the employers and the union is the introduction of labor-saving machinery without the granting of what the men conceive to be a fair compensating wage; and another reason for the present quarrel is the new agreement, proof-sheets of which were sent to the

gas stokers two days ago. The system of inclined retorts reduces manual labor, and in this direction gas engineers are now working. On the introduction of the mechanical appliances into the works at Beckton, the Company offered a wage of 5s. 4d. per day, but their union rule is that no work shall be done on a labor-saving machine for less than 5s. 9d. As this maximum is slightly in advance of the wage of men rated in the first class, the company refused to concede the terms asked, the men on the new machine being given second class rating. The Company maintain that 5s. 9d. a day as a wage would be altogether destructive of any advantage from the use of a labor-saving appliance, and would in fact cost them more than handwork as hitherto used. Seventy-two union men were affected. They withdrew, and non-union men are now inside the works under the protection of a force of 34 policemen. All necessary accommodation has been provided for them within the gates. The inventor himself has been superintending the new hands who are employed on the machine, and is said to be satisfied with the results.

An extension of the new system is anticipated at Beckton, and on the point now in dispute the Company express their determination of not giving way. In respect of the second cause of the quarrel it is clause 2 in the new agreement to which the men object. The first clause establishes the principle of 28 days' notice on either side. The proviso to which the union men refuse assent is in the following words: "If a workman absents himself from work, or leaves without notice to the Company, or shall neglect or fail to perform his work in any capacity in a proper manner by reason of drunkenness or otherwise, or shall refuse or neglect to obey or carry out the directions of any officer of the Company, or be guilty of any insubordination or other misconduct, it shall be lawful for the Company forthwith, and without any notice, to dismiss the workman. In such cases all wages which at the time thereof shall be due, or accruing to the workman, shall be absolutely forfeited to the Company, without prejudice, nevertheless, to any proceedings which the Company may be entitled to take against the workman." The Company have yet obtained no explicit declaration from the men as a body, but a formal reply is expected to be received at the offices on Tuesday, after a meeting of the executive council. The Press Association learns from an authoritative source that such a concession is likely to be made in respect of clause 2 as will meet the men's views, and thus practically secure the withdrawal of terms which the men would regard as constituting a serious grievance if insisted on.

Another Loomis Patent in England.

Mr. B. Loomis, of Hartford, Conn., appears on the register of English patents as the proprietor of No. 9,279. The invention—an improvement on patent No. 15,983 of 1888—relates to the manufacture of illuminating gas by producing a cheap high-grade heating gas, and then carbureting and enriching it with hydrocarbon oil or vapor, and finally combining and fixing the carbureted gas in heated retorts or brickwork flues.

The patentee proposes to make two kinds of heating gas—first, producer gas, resulting from the combustion of coal or other fuel with air, which gas is used for heating the carbureting retorts or brick carbureting chamber, and steam boilers; and, secondly, water gas, resulting from the decomposition of steam in contact with the incandescent fuel, which gas is carbureted with hydrocarbon oil or vapor in manufacturing the illuminating gas. In the operation of heating the fuel to incandescence and making producer gas, the air is drawn into the furnace, and down into the body of fuel, by an exhauster connected with the base of the generator furnace, thus causing a down-draught. By the operation of the exhauster air is drawn into the furnace at top, and down into the ignited fuel; and the resulting gases are drawn off at the bottom of the furnace. In this way a number of advantageous results are claimed to be produced, as follows: First, dust and ashes are blown or drawn into the ashpit, and the formation of clinker almost prevented; second, the oily and tarry vapors distilled from the top layers of freshly charged coal are caused to pass down into the heated coal below, and are thereby converted into fixed carbureted hydrogen gas, instead of passing off at the top and being condensed into tar of little or no value; third, cheap low-grade fuel (such as bituminous coal slack, or mixture of bituminous and anthracite slack or coke dust, etc.) can be advantageously used and more rapidly and uniformly gasified; fourth, the furnace can be much more rapidly charged, and the fresh fuel so placed as to prevent the formation of channels through the bed of fuel, since the attendant can readily work over the top of the furnace and inspect its interior through the fuel opening, by reason of the smoke and gases being drawn away from the top opening and down through the charge by the exhauster.

The highly-heated producer gases are passed from the base of the generating furnace through a tubular or other cooler, and their heat utilized for heating water or air; thus cooling the gases to such a degree that they will not injure the exhauster in passing through it. In this way provision is made for economically manufacturing water gas when using bituminous or soft coal or slack, partly by reason of the down draught used (with the results above mentioned) in heating the coal to incandescence, preparatory to decomposing steam, and partly by reason of passing the hot water gas out of the bed of fuel at a considerable distance below its surface, and then out of the furnace, whereby the injurious melting and caking of the fresh layers of coal at the top are prevented, and the oily and tarry vapors evolved from the fresh coal are caused to pass downward into the hot fuel below, where they are converted into a fixed rich hydrocarbon gas, which mixes with the water gas as it passes into a circular flue and out of the furnace. When the highly-heated water gas is passed up entirely through the bed of soft coal or slack, it produces much trouble by melting the fresh coal and causing it to cake; but by passing the hot gas off below the top of the fuel bed, these difficulties are overcome. The fuel, too, is evenly distributed around the side walls of the furnace, and this prevents the formation of channels and the passage of air, steam, and gases through the channels along the walls. The air and gases are also drawn away from the side walls by constructing a solid hearth or floor next to the walls at the bottom of the fuel chamber, so as to form a contracted grate opening at or about the central portion of the hearth.

It will, of course, be understood that the water gas is generated intermittently; one period being used for heating the fuel by the air draught—during which time a large volume of valuable producer gas is given off—while the next period is used for decomposing steam in contact with the incandescent fuel for the production of water gas composed of hydrogen, carbonic oxide, and carbureted hydrogen. The water gas is thus partly carbureted or enriched with carbureted hydrogen distilled from the coal, and should be a more valuable heating gas than water gas made in the ordinary way. The inventor also provides for thoroughly atomizing the hydrocarbon oil, so as to form a vapor, and intimately mixing such vapor with the hot water gas to be carbureted, by means of a rotary mixing apparatus; and then he converts the hydrocarbon vapor and water gas into a homogeneous fixed gas, by passing them first into retorts or flues at a comparatively low temperature, and thence on through other retorts or flues of an increasing temperature, whereby the oil vapors are gradually expanded and converted into fixed gas and combined with the water gas, without danger of being burned and converted into lampblack.

The generating furnace is built preferably of firebrick covered in the usual way with an outer iron jacket, and provided at the top with a fuel opening closed by a lid. A conical coal distributor, in two parts, is used to direct the coal to the side wall of the furnace, where it is apt to burn away the fastest, so that the fuel will lie at the top in a dish-shaped form. An inclined hearth or floor extends inwards from the walls, and is formed with a central opening into which the grate may be set. The ashpit is of about the same horizontal dimensions as the grate opening; having a brick or tile floor supported on parallel division walls built in the wide outlet flue in the base of the furnace, and forming a superheater. A passageway leads from the ashpit into a flue, and a take-off pipe, having a valve, connects this flue with the base of a retort furnace, from which a pipe leads to a cooler. As an alternative arrangement, the generator may connect directly with the gas cooler.

In the construction of large generating furnaces which are made from 8 to 12 feet in diameter, the patentee preferably forms the ashpit with its outer walls contracted, and of much less diameter than the fuel chamber, so that bars may be readily run up into the fuel through the contracted opening in the circumferential hearth for shaking down the ashes and spent fuel. When the furnace is thus constructed, with a contracted ashpit, the main part of the furnace is partly supported upon pillars. With this construction the bricks or tiles are set in a flue leading to a cooler.

The flue for the producer gas may lead directly from the base of the generator to the base of the retort furnace, where it connects with a combustion chamber. Air, admitted through a passage, flows into the gas through the perforated partition, causing combustion in the chamber; and the flame and products of combustion pass through a perforated partition up into the furnace and around the retorts. Hot producer gas may be passed alone, and without being burned, up around the retorts for heating them, and thence through the cooler to the exhauster, by means of which they are drawn off and forced either through a pipe to a steam boiler, or through a pipe to be mixed with water gas if desired. Or the producer gas may be drawn by the exhauster from the

base of the generator to the base of a brick carbureting chamber, where it is burned by the admission of air supplied through a suitable pipe. Or, again, the producer gas may be passed to the combustion chamber in the retort furnace. Air also flows through the burner to the combustion chamber for burning the gas and heating the retorts.

The retorts are made of iron, and are provided at their rear ends with necks which are set in openings in the rear wall of the furnace. These necks are provided with plugs; while the openings have caps or other stoppers for convenience in setting the retorts in the furnace. The necks are free to slide in the openings so as to permit of expansion and contraction of the retorts. The retorts are provided with horizontal partition plates; and they are connected in vertical series by pipes having openings for inserting a scraper or cleaning bar. Carbureted water gas is admitted from a rotary mixer to the top retort; and the fixed illuminating gas is passed off from the bottom retort.

Instead of the retorts above described, a carbureting chamber may be used provided with brick flues. The walls of the chamber are built of brick, covered with an iron jacket; and it is provided with a central brick partition wall, which extends only through part of the diameter of the chamber, and serves to strengthen the chamber and support the partition plates. A transverse bridge-wall is formed in the combustion chamber at the base of the carbureting chamber; and at the front side of the combustion chamber two bridges are formed, and provided respectively with ports. An air pipe opens into one set of ports, and the gas supply pipe into the other set; and the air and gas are supplied to the combustion chamber through these adjacent rows of ports. The horizontal partition plates extend alternately from opposite sides of the carbureting chamber nearly across it, so as to leave passageways between their free ends and the wall of the chamber. The partition plates form flues between them; and the flues connect with each other alternately on opposite sides by passages. The brick flues, of course, take the place of the carbureting retorts described above.

The rotary mixer used is provided internally with numerous blades connected with the central shaft like a fan blower; and it is connected with a small motor. The hot water gas and a small stream of oil flow together into the mixer, and, by means of the revolving blades, the oil is thrown into fine spray or vapor, and thoroughly mixed with the water gas. The carbureted water gas then flows into the retorts or brick flues, to be therein combined and fixed.

In order to make illuminating gas, the producer gas which is drawn from the base of the generator is conducted to the base of the retort furnace, and there burned by the admission of air for heating the retorts. The lower retorts will be most highly heated; and those above will be heated to a gradually decreasing temperature to the top of the furnace. The water gas is passed from the generator or holder into the rotary mixer, into which the hydrocarbon oil is at the same time admitted from a tank. The mixer is made to rotate, and it beats the oil into fine spray or vapor, and thoroughly mixes it with the water gas; and when the water gas flows hot from the generator, it aids in vaporizing the oil. The mixed water gas and oil vapor pass from the mixer into the upper retort, where the heat is lowest; and then successively pass through the retorts below, in which they are subjected to an increasing temperature, till they are combined and converted into fixed illuminating gas, which flows successively through a scrubber and purifying boxes to the holder.

ITEMS OF INTEREST FROM VARIOUS LOCALITIES.

IN our report of the *In Memoriam* proceedings at the last convention of the Western Association will be found the tribute paid by Mr. Somerville, of Indianapolis, to the memory of Ex-President King—see JOURNAL, June 9, p. 808. We regret to have to say that an error occurs in the report, and we herewith take opportunity to say that in the following sentence Mr. Somerville used the words "the mountains," instead of the word "London." The corrected sentence is: "He laid aside for the time the scientific subjects in which he was so much interested, and the wonders of electricity that he knew so much about, and, joining in the prattle of the children, told them about his journey to the mountains," etc.

THE charter for a gas works at Florence, Ala., granted by the authorities to Mr. C. W. Butterworth and associates, provides for a Company capitalized in \$50,000. The plant is to be of the 8-inch standard, and coal gas will be manufactured. The price of gas (maximum) to ordinary consumers is fixed at \$2.50 per 1,000 cubic feet, and public street lights are to be supplied at the rate of \$33 per post per annum, on an all night and every night table. The officers of the Company are: Presi-

dent and General Manager, C. W. Butterworth; Secretary and Treasurer, C. H. Tatum. Four miles of mains will be put down the first year.

SECRETARY BOGART'S cleverly arranged circular respecting the annual convention of the American Society of Civil Engineers is before us; and from it we learn that the sessions will be held at Cresson, Pa., commencing on the morning of next Thursday. This situation is at once central and charming, and the wonderful recuperative power of the district is shown in the rapidity with which the traces of the terrible disaster of a year ago are being blotted out. A hotel-rate—the house is commodious and well managed—of \$3 per day has been secured. The Trunk Line Association, the Southern Passenger Association and the Central Traffic Association (except in Michigan) have assented to a decreased rate of fare—full fare to Cresson, and one-third full fare on the return. The New York delegation will leave by special train from foot of Cortlandt street, on Wednesday morning, the special to run to Cresson as a second section of the Pennsylvania Company's famous "Chicago Limited," and to leave on her schedule time of 10 A.M. There can be no doubt that the convention will be a grand success from any and all standpoints.

AT the annual meeting of the Willimantic (Conn.) Gas Company, which was held in Newport, R. I., about a fortnight ago, Mr. Howard Manchester, of Bristol, was elected Superintendent and Treasurer, and Mr. Chas. H. Manchester was appointed Secretary. The Directors are: A. P. Sherman, John Hunter, J. C. Swan, J. H. Tilley and Robt. S. Franklin.

SOME time ago we reported the purchase of the Moberly (Mo.) works by Messrs. Hammett & Davis. The latter in reality acquired the property for Mr. James Green, of St. Louis, Mo.

THE Mount Joy (Pa.) Gas Company has changed hands, and important improvements are contemplated.

A CORRESPONDENT, who is well posted in regard to the fuel gas process now in *partial* use at Terre Haute, Ind., sends us the following, which explains itself in the easiest style imaginable:

"ROSE POLYTECHNIC INSTITUTE, CHEMICAL LABORATORY, }
TERRE HAUTE, IND., April 21, 1890. }

"Mr. * * *: Dear Sir—I have completed the analysis of the fuel gas now in use in the city, with the following results:

Carbon dioxide.....	4.6 per cent.
Illuminants.....	13.8 "
Oxygen.....	0.7 "
Carbon monoxide....	8.6 "
Methane.....	6.5 "
Hydrogen.....	6.4 "
Nitrogen.....	59.4 "

Total.....100.00 per cent.

"The small per cent. of oxygen shows that the nitrogen is introduced in the process of manufacture, and does not come from air in the pipes. The illuminants have the average composition of propylene, and the calculated heating power of the gas is about 116,000 calories for 1,000 feet. This is a little less than one-half the heating power of natural gas. From 50,000 to 60,000 feet of the gas would be required to give the same theoretical heating power as 1 ton of good coal. At 30 cents per 1,000 the gas is the equivalent of coal at \$15 to \$17. Since the best of gas could be more completely utilized, however, the real value of the gas is somewhat greater than this would indicate. The gas contains 35 grains of sulphur in 100 cubic feet. The English law requires that gas shall not contain more than 20 grains in 100 feet. The gas in its present state is, therefore, not suited for use for illuminating purposes, or for use in gas stoves where the products of combustion escape into the air of living-rooms. Yours very respectfully, W. A. NOYES."

IN supplementing Prof. Noyes' rather cold figures, we have to remark that the Fuel Gas Company—save the mark, a fuel gas containing 59.4 per cent. of nitrogen—has been distributing its product in Terre Haute for something like 3 months, and now has 22 consumers, 8 of whom are stockholders. We imagine it would be fair to assume that the "faithful 8" are trying to help the scheme along. The Company charges 35 cents per 1,000 cubic feet.

WE understand that though the wires for the electric lighting of the government buildings in Albany have been strung for several weeks, gas is still the illuminating agent employed. The reason for the delay in making the change is a rather odd one, in that there is a clash over the construction of the contract between the United States authorities

and the electric lighting company. The latter insists that the government was to furnish the fixtures, but the former assert the contrary. In the meantime the authorities announce their intention of holding the electricians responsible for the value of the gas consumed.

MR. H. D. FITCH, of Louisville, Ky., who is connected with the ownership of several gas plants in the South, writing under date of the 12th inst., says:

"To the Editor AMERICAN GAS LIGHT JOURNAL: Can you not direct some of your inventive readers to the necessity existing for a combined gas cooking and coke heating stove which will keep gas cookers in use all the year? In my effort to compete with electricity at several points where I control gas properties I recognized the importance of such a cooker. It means an advance of 100 per cent. in the price of coke and doubling the present sales of gas for cooking purposes. Some one who can invent a cooker, combined with a *crushed coke* apartment, which can be used at pleasure to heat the kitchen, and probably do some of the cooking, will make his fortune and do gas companies a great service. I suggest a *crushed coke* apartment, with a gas burner to start the coke fire, with some kind of construction which will utilize the coke fire to heat the oven and yet not prevent the use of the gas apartment when the coke fire is not needed. I suggested this to one or two stove makers, but as yet no good results have been reached."

MR. JOHN K. DAVIS, Superintendent of the Sherman (Texas) Gas Light Company, in his practice of introducing gas cookers follows this course. He recommends the following numbers and table of cost, with terms of purchase:

	List Price.	Gas Co's. Price for Cash.	Co's. Price for Time.
No. 513.....	\$23.00	\$16.00	\$18.00
No. 53.....	20.00	15.00	17.00
No. 33.....	19.00	14.00	16.00

In addition to these prices must be charged the cost of placing the stove, with the necessary connections. The purchaser must pay the first cost of placing the stove and \$5 in cash, and the balance at the rate of \$1 per month until paid for, they to have the privilege, however, of paying up at any time the deferred amounts, deducting therefrom 10 per cent.

THE following from a valued correspondent in Louisville, Ky., who is pretty close to the powers-that-are in the well-managed local Gas Company, is under date of June 11: "Yesterday there was a meeting of electric light and Gas Company officials in the office of the Louisville Electric Light Company, and in a short time it was whispered abroad that the Louisville Gas Company had gathered in the Louisville Electric Light Company. For some time the gas men had been buying up electric light stock, and they bought it not in vain. At the meeting spoken of the following gentlemen were elected to the Directorate of the Electric Light Company—and they are also all in the Directorate of the Gas Company: George W. Morris, astute even if lean, J. M. Atherton, the genial and gentlemanly Harry Bishop, Jas. A. Leech and Brer. A. H. Barret. Messrs. Chas. D. Pearce and T. G. Gaylord, of the electricians, still remain in the Board. All the stockholders who have not parted with their shares can dispose of the same to the parties now in control, at a price that I am not permitted to name. The Gas Company will guarantee the bonds of the Electric Light Company, which will make them worth something more than their former owners ever could rate them at. The Brush Electric Light Company has not sold out, but it is thought to be only a matter of time before the Gas Company will have it also. President Muldoon, of the Brush, said yesterday that the Gas Company had not made them an offer, but that \$65,000 would purchase the entire outfit. And I have no doubt it would, only that the gas men will never give that sum for it."

WE regret to chronicle the death, on June 9th, at his home in Springfield, Ohio, of Mr. Nathaniel Kinsman, who for 33 years has been permanently identified with Springfield's growth. His death resulted from a complication of diseases, and his illness covered a period of several months. Mr. Kinsman's long service with the Springfield Gas Company is a matter of record with the Western fraternity, and a faithful servitor of its best interests he surely was. He was born on June 6th, 1818, at Ipswich, Mass., where he was in due time apprenticed to a joiner, and later removed to Salem, where he drifted for a time into railroading. Emigrating, in 1855, to Ohio, he acted in various capacities on several of the railroads in that State, but finally joined his brother at Springfield in the management of the gas works, remaining in that service when the plant was sold to the corporation known as the Springfield Gas Light and Coke Company. A faithful and conscientious

worker, he refused to relinquish his life's work till failing health compelled him to retire. Energetic and painstaking, he caused the plant under his charge to keep pace with the times. Personally, "Uncle Nat," as he was familiarly known, endeared himself to a wide circle of friends. His brusque manner never veiled his warm, great-hearted kindness, nor ever dimmed the merry twinkle of his eyes. Quick to help where help was needed and deserved, many a youngster owed to Uncle Nat. a debt of gratitude for a timely word of encouragement or more substantial aid. In his business transactions he was scrupulously honest and unusually sagacious and far-sighted. He always believed in the future of Springfield, and was enthusiastic in aiding every project and movement for its best growth. A type of the men who evolved an Ohio from out of Nature's wilderness and into her present prosperity, the death of Mr. Kinsman cannot fail to cause the busiest of Springfield's denizens to reflect, for a brief spell at least, on the caliber of the men who paved the way to their present ease or opportunity. The funeral services were celebrated in Springfield on the 10th inst., after which the remains were sent to Salem, Mass., for interment in the family plot in Harmony Grove cemetery.

MR. M. N. DIALL'S Company (Terre Haute, Ind.) will place at least 125 gas cookers this month. But, then, Diall only charges \$1 a thousand for a fuel gas that does not contain any nitrogen.

THE Paterson (N. J.) authorities will not re-advertise for bids for public lighting, the Committee on Wells, Pumps and Lamps having recommended that the following contracts be awarded: To the United Gas Improvement Company, gas lamps at the rate of \$20 per post per annum, on the basis of a 3-year agreement; to the Edison Electric Light Company, for arcs, first year, \$110 per lamp; second year \$120; third year, \$125; fourth and fifth years, \$135, or an average of \$125 per lamp, on the basis of a 5-year contract.

THE authorities of the adjoining town of Oxford (Ala.) have contracted for a public lighting (arc) supply with the Anniston Gas and Light Company.

CHARLES FRAZIER, colored, was recently killed by an electric light current in the cellar of Chas. Kern's saloon, No. 523 South Fremont street, Baltimore, Md. The following account of the accident is taken from the *Baltimore Sun*. Our authority says: "Frazier went into the cellar to get a keg of beer, and as he did not return promptly, William Lindenmeyer, a youth who attends to the bar, started down to hurry him. As he was descending he smelled a disagreeable odor as of something burning. The first thing that met his eyes was the colored man standing with bent knees, his face turned upward and his hand on the glass globe that was suspended from the ceiling. Lindenmeyer shouted to Frazier that he was in danger, but he did not answer. The barkeeper then ran upstairs and told Mr. Kern what he had seen. The proprietor went to the assistance of his colored man and tried, it is thought, to shove him away from the light, but in an instant Kern was lying unconscious on the ground. Lindenmeyer shut off the current and several men went down the cellar and found both men lying side by side in the darkness. They were carried into the yard and a physician pronounced Frazier dead. The electric lamp was swung in front of a refrigerator, so as to light its interior. It is thought that Frazier, in moving the light to see his way, had caught hold of the metallic socket of the globe, as it is blackened with burned flesh. The glass is also marked. One of Frazier's arms was burnt and cut, and the hand that held the light looks as if it had held a red-hot coal. Mr. Kern regained consciousness shortly after the accident, but said he could only remember seeing a blue light. He does not know whether he touched Frazier or even saw him. He fell or was thrown against a pipe and cut his forehead, marking the iron with blood and hair. Frazier was taken to his home, No. 131 West York street. An electrician states that the wire was charged with 2,000 volts, which is considerably more than enough to kill. The light was one of a circuit belonging to the International Telegraph District and Construction Company, whose motor house is on West Pratt street, near Fremont. Coroner Benson made an investigation, and decided that the death was accidental. Six months ago Mr. Kern's son William climbed in the second story window frame to examine the wires strung near it. He placed his hands on one, and in an instant he was thrown to the pavement and broke one of his arms. Mrs. Kern says that the light will have to be removed."

ACCORDING to *Associated Press* dispatches, dated the 16th inst., Judge McConnell (Chicago) spent the forenoon of that day in listening to the arguments in the People's demurrer to the pleas of the Chicago Gas Trust in the *quo warranto* proceedings brought on relation of Fran-

cis C. Peabody. The main point in the *quo warranto* is the allegation that the Trust, by buying up the stock of other Companies, defeated competition and created monopoly to control the production and sale of all gas manufactured in Chicago. The contention of the Trust, as made by its attorney, was that proceedings by *quo warranto* were not properly brought under this plea; that the remedy of the people must be brought in another way. Finally an order was granted authorizing the Attorney-General to file an additional count denying the right of the Trust to hold any stock at all in other Companies.

MR. AMOS W. R. HENNING, who for the past two years has acted as Secretary and Treasurer of the Niagara Falls (N. Y.) Gas Company, died suddenly, at Suspension Bridge, on the afternoon of June 10th. He was born at Annetta, Pa., on May 5th, 1842, and graduated from Eastman's Commercial College (Poughkeepsie, N. Y.) with the class of 1859. He was a prominent Democratic politician, and served for some time on the Democratic State Committee. He was very much respected by his fellow-townsmen.

THE proprietors of the Randolph (Mo.) Coal and Gas Company have filed a statement of increase of capital stock from \$75,000 to \$200,000.

MR. ALLEN R. FOOTE, of this city, notifies us that the twelfth convention of the National Electric Light Association will be convened at Cape May, N. J., on Tuesday, August 19th. Full details of the arrangements made for the convention will be published later on. Mr. Foote entered upon the duties of Secretary and Treasurer of the Association on Tuesday, the 17th inst.

THE Macon (Ga.) Gas and Water Company has decided to return to the former rates of \$1.25 and \$1 per month for incandescent lamps, in cases where customers agree to shut off their lights on closing their places of business. Those who continue to burn their lights all night must pay the full rates.

A CORRESPONDENT writes that the Gardner (Mass.) Gas Light Company has offered a reward of \$50 for the detection of the miscreant who maliciously opened one of the street valves, thus permitting the escape of a large quantity of gas.

THE proprietors of the New Britain (Conn.) Gas Company will in all probability authorize the addition of a gasholder to the present plant. It is badly needed. [The holder has been ordered.]

SECRETARY CALDWELL, of the Youngstown (Ohio) Gas Company, says that the Company will install an auxiliary water gas plant, work on which will be commenced at once.

THE Louisville (Ky.) Gas Company has notified the citizens that the manufacture and distribution of an exclusively fuel gas has been discontinued. Hereafter consumers can obtain a fuel illuminating gas at the rate of 75 cents per 1,000 cubic feet.

AT the annual meeting of the Exeter (N. H.) Gas Light Company the following officers were elected: President, F. H. Odiorne; Treasurer and Agent, A. M. Copp; Clerk, A. F. Cooper; Directors, F. H. Odiorne, A. M. Copp, W. Burlingame, A. Parker Brown and Samuel Hatch.

PATRICK FLOYD, through his attorney, A. R. Taylor, has instituted a suit for \$10,000 in the St. Louis Circuit Court, against the St. Louis Gas Light Company. Floyd alleges that on April 15, 1889, while engaged in hoisting material for the Company, a defective chain and block caused injuries to his person of a nature sufficient to incapacitate him for work for a long period. The Company's defense is contributory negligence.

THE annual meeting of the Moncton (N. B.) Gas Light Company was slimly attended. The existing Board of Directors was re-elected, the members thereof being the Hon. A. E. Botsford, and Messrs. Josiah Wood, J. L. Harris, C. P. Harris, John A. Humphrey, and Dr. C. W. Weldon. The Directors reported a satisfactory year's business, and a dividend of 4 per cent. for the half year ending May 31, payable July 12, next, was declared. The Directors selected the following executive management: President, John L. Harris; Secretary, R. A. Borden; Treasurer, C. P. Harris.

MANAGER CATHELLS, of the Fredericton (N. B.) Gas Light Company, has been instructed by the management to investigate and report upon

the various systems of incandescent electric lighting, with a view to engaging the Company in the supply of such lighting service.

THE Omaha (Neb.) Gas and Manufacturing Company offered to furnish gas to the local public buildings at the rate of \$1.50 per 1,000. The Thomson-Houston Company offered to wire the buildings and to furnish all lamps, switches, etc., in consideration of the receipt of 1 cent per hour for each 16 candle power incandescent electric lamp in service.

THE bill to give a franchise to the People's Gas and Electric Light and Power Company, of St. Louis, Mo., has been referred by the City Council to the Committee on Local Improvements.

MR. STANLEY and his principal lieutenants in the recent "Emin Bey Relief Expedition" were entertained to a banquet, at the Portman Rooms, Baker street, London, England, on the evening of May 30. A distinguished group of diners faced the board, and the Vice-Chairman of the evening was G. Shepard Page.

THE Long Island City (N. Y.) Board of Aldermen were, on the 16th inst., served with a writ of mandamus to show cause why they failed to audit the bills of the East River Gas Light Company, of Long Island City. The Board have paid no attention to the Company's bills rendered during the first half of the year, and there is no averment that the Company is not fairly entitled, because of services rendered, to full payment. The sum involved is \$14,191.61. The order is returnable before Judge Bartlett.

THE Olympia (Wash.) Gas and Electric Light Company has filed an injunction against the Olympia Light and Power Company, restraining the latter from placing poles so as to interfere with the wires of complainant.

THE proprietors of the Troy (N. Y.) Gas Company are satisfied that the Smith avenue site is ample for their needs.

SUPT. BYRNE, of the Citizens (Brooklyn) Gas Company, is enthusiastic over the development and increase of the business of that corporation.

HERR F. MUCK, in a German contemporary, prints some remarks on the valuation of coal tar pitch. The author considers the test of placing a sample between the teeth a good one for testing consistency. To test the softening point a cylindrical piece of the pitch of 4 mm. diameter and 100 mm. long is bent round the bulb of a thermometer, so that there is a length of 20 mm. on the one side of the bulb and of 80 mm. on the other. The longer limb is fixed parallel with the stem of the thermometer, and the whole placed in a beaker filled with water, and provided with an agitator. The water is then gently heated till the longer limb of the little rod of pitch bends round; this is taken as the "softening temperature" of the sample. As a rule, the softening temperature and the consistency test agree with one another. In the manufacture of briquettes it is important to know whether the pitch used will yield a firm briquette—i.e., one that does not fall to pieces in the fire. Pitch yielding a vesicular coke does not form firm briquettes, whereas that yielding a disintegrated coke does do so.

AT an election for Directors in the Paterson (N. J.) Gas Light Company, the following gentlemen were chosen: John Reynolds, E. B. King, Jas. Dunn, W. L. Williams, John S. Cooke, John H. Reynolds and Wm. H. Williams. The Directors named the following officers: President, John Reynolds; Vice-President, Wm. L. Williams; Secretary, Robt. Schoonmaker.

THE BOILING OF WATER IS NOT A GUARANTEE OF PURITY.—We are accustomed to be told that the most impure water will be rendered pure by boiling, and that in this we have an absolute safeguard against the danger of water containing disease germs. Now, while it is true that boiling will kill the germs of disease, yet the fact has been brought to our notice, says *Annals of Hygiene*, by so high an authority as Dr. Chas. M. Cresson, that while boiling kills the germs of a particular disease, it yet, in reality, renders the water more impure than it was before, because by the very death of these germs, dead organic matter is allowed to remain in the water, which is polluted by putrefaction. Hence, while boiling is a most excellent precaution against the occurrence of typhoid fever or similar diseases, when we have occasion to think that the germs of these diseases exist in the water that we drink, yet we must remember that this boiling does not purify the water; it simply removes from it the specific power to produce a specific disease,

SUPERINTENDENT WANTED

For a small but nearly new and fairly well built and arranged Gas Works. Qualities required are, first, that the interests of the owners and superintendent shall be identical; second, ability and willingness to work; third, tact to deal with consumers in such a way as to hold trade in spite of opposition. Temperance a pre-requisite. Supt. engaged will have entire charge of plant, including books, with no interference except an occasional consultation with the undersigned. Salary, \$1,200. Address 785-2 C. E. BURROWS, Walla Walla, Washington.

Position Wanted

As Superintendent or Assistant in a Gas Works,
By a man who can give the best of references. Thoroughly understands the manufacture and distribution of gas and the construction of works.
785-2 Address “D. D.,” care this Journal.

SITUATION WANTED

As Superintendent of a Gas Works,
By a man of 20 years' experience. Best of references. Address JOHN COLLINS, 324 Clinton Street, Schenectady, N. Y. 785-tf

POSITION WANTED

As Superintendent of Gas Works.

Eleven years' experience in the manufacture of coal gas. Best of references given.

778-8 W. L. CARVER, Supt., Carthage, Mo.

WANTED, A Six-Inch Exhauster.

SECOND-HAND.

Must be in good condition. Roots' make preferred. Address POUGHKEEPSIE GAS CO., Poughkeepsie, N. Y. 783-

WANTED TO LEASE, A Small Gas Works,

By a practical gas man. Address 784-8 “W. E. F.” care this Journal.

FOR SALE.

THE WALKER TAR AND CARBONIC ACID EXTRACTOR.

A very general demand exists, in both large and small Gas Works, for an apparatus that will be absolutely efficient in the removal of the tar which passes the hydraulic main and condenser. Many attempts have been made to accomplish this, but, I believe, without success, until the introduction, five years ago, in England, of the C. & W. Walker Patent Tar and Carbonic Acid Extractor. During these years this apparatus has been adopted by many of the most prominent Engineers, not only in England, but also on the Continent of Europe and in other parts of the world. It is only necessary to give here a partial list in order to convince any intelligent American Gas Engineer that this machine must have succeeded fully in accomplishing the desired results.

The following Engineers have personally given permission to refer to them:

G. C. Trewby, Esq., Engineer-in-Chief of the Gas Light and Coke Co., London. The manufacturing plant at Beckton is built in complete sections of 3,000,000 cubic feet capacity each. A Walker Tar Extractor has been fitted to each one of these sections. This was done after a long and thorough trial on one of its sections. The Tar Extractor has been supplied to other works of the Gas Light and Coke Co., including those of which John Methven, Engineer of the Gas Light and Coke Co. at the Nine Elms Station, is in charge. Also to G. E. Stevenson, Peterborough Gas Works; B. Green, Mitcham and Wimbledon Gas Works; W. H. Smith, Bedford Gas Works; F. Linging, Norwich Gas Works; J. T. Browning, Colchester Gas Works; S. B. Darwin, Portsmouth Gas Works; J. McCrae, Dundee Gas Works; W. J. Wells, Stamford Gas Works; J. M. Darwin, Longton Gas Works; J. Paterson, Warrington Gas Works; and J. Coulter, of the Dundalk Gas Works. All of the foregoing gas works are located in Great Britain.

Mr. Charles A. Gerdenier, Superintendent of the Bridgeport (Conn.) Gas Light Company, writes as follows, under date of Dec. 3, 1887:

"The C. & W. Walker Tar and Carbonic Acid Extractor has been in operation at these works for the past six weeks, and is an unqualified success. It removes every particle of Tar from the gas in once passing through the apparatus, and a large percentage of the Carbonic Acid. I also feel quite sure that it prevents the formation and deposit of Naphthaline, because since I started the Washer I have had no stoppages from this cause. These works have been seriously troubled with Tar for many years, and I have used several kinds of apparatus and every expedient which has come to my attention for dealing with the difficulty, but without success. The Walker apparatus occupies comparatively small space, is less expensive than other systems, and requires but little attention. I carry 2½-inch seal, and have an automatic tar delivery valve. This Tar Extractor is indispensable to gas makers."

I have taken the Agency for the United States for this apparatus, and am now prepared to make contracts to erect it on the premises of any Gas Company. It would be manufactured in the following sizes:

No. 1,	50,000 to	100,000	cu. ft. per	24 hrs.,	3 ft. square,	5 ft. deep.			
No. 2,	"	"	125,000	"	"	"	4	"	"
No. 3,	"	"	250,000	"	"	"	5	"	"
No. 4,	"	"	500,000	"	"	"	6	"	"
No. 5,	"	"	750,000	"	"	"	7	"	"
No. 6,	"	"	1,000,000	"	"	"	8	"	"
No. 7,	"	"	1,250,000	"	"	"	9	"	"
No. 8,	"	"	1,500,000	"	"	"	10	"	"
No. 9,	"	"	2,000,000	"	"	"	12	"	"
No. 10,	"	"	3,000,000	"	"	"	15	"	"

This Tar Extractor will perform its work with about one-fourth the usual back-pressure heretofore required. It is simple in construction, and can be supplied at a very reasonable price—less than any other ever before introduced. Satisfactory results will be guaranteed in every instance.

CONNELLY & CO.,

SOLE MANUFACTURERS OF THEIR PATENTED SPECIALTIES.

"IRON SPONGE."

Saves money, saves labor, and is the most efficient purifying agent ever offered as a substitute for lime. Now used *in every State in the Union*, and purifying daily over *thirty-five million cubic feet*. Should be used in every gas works. Its own saving will pay for it many times over.

AUTOMATIC GOVERNOR.

Has been on the market but *three years*, and in that time has been introduced *more generally* than any invention ever designed for use in gas works. Over *two hundred* of them now in use. Sensitive; reliable; perfectly automatic; reduces leakage; satisfies consumers, and gives great relief to the Manager. No gas works is *complete* without one of these machines.

STEAM JET EXHAUSTER.

Designed particularly for small works. Combines Exhaust Tube, Steam Governor Gas Compensator, and Bye-Pass Valves in the most compact form possible; occupies but little space; uses very little steam; operated by ordinary workmen; saves formation of carbon in retorts; increases yield 10 to 15 per cent. Specially adapted for *mixing air* with oil gas. *No works* too small to use them profitably.

Prices given on all our specialties *delivered at any point in the United States*. Correspondence solicited.

A. J. DOTY, Supt.

The utility and convenience of the Gas Engine being no longer an open question, it only remains now for intending purchasers to select the BEST. We claim for the CLERK GAS ENGINE that it is equal to any other manufactured as regards steadiness in running, simplicity, and ease of keeping in repair, and that it gives the greatest amount of power for the least money (both in first cost and expense of running) of any engine made. In support of this claim we refer to the test of the Gas Engines made under the direction of the American Institute of New York, in December, 1885, and heretofore published in these columns. These engines are especially adapted for continuous running under heavy loads, and we can refer to Engines which have run 22 hours a day for months at a time

Made in Sizes of 5, 10, 15, 20, and 25 Horse Power. All Engines Guaranteed for One Year.

PATENTS.

FRANKLIN H. HOUGH

Solicitor of American & Foreign Patents.

925 F. ST., WASHINGTON, D. C.

(NEAR U. S. PATENT OFFICE.)

Personal attention given to the preparation and prosecution of applications for Letters Patent. All business before the U. S. Patent Office attended to for moderate fees. **No Agency in the United States possesses superior facilities for obtaining Patents,** or for ascertaining the patentability of inventions. Copies of patents furnished for 25 cents each. Correspondence solicited.

GREENOUGH'S

"DIGEST OF GAS LAW."

Price, \$5.00.

This is a valuable and important work, a copy of which should be in the possession of every gas company in the country, whether large or small. As a book of reference it will be found invaluable. It is the only work of the kind which has ever been published in this country, and is most complete. Handsomely bound. Orders may be sent to

A. M. CALLENDER & CO.,

42 Pine Street, N. Y.

THE NEW HANDY BINDER.

This article may be described as elegant in appearance, strong, durable, and possessing many special qualities of its own. It allows the opening of the pages perfectly flat, whether one or several numbers are in the binder. Any number can be taken out and replaced without disturbing the others. The papers are not mutilated for subsequent binding in permanent form. The binder is supplied with gilt side tile, and is an ornament to any desk or reading table. The JOURNAL, filed in the Handy Binder, becomes a volume of great value, always convenient for instant reference. **Handy Binder, Postage paid, \$1 00.**

A. M. CALLENDER & CO., 42 Pine St., N. Y.

NEWBIGGING'S HANDBOOK FOR GAS ENGINEERS AND MANAGERS.

The present (the fifth) edition marks an important advance on those that have gone before. Considerable additions have been made to the text, and much of it has been rewritten and otherwise improved. Price, cloth, \$6. A. M. CALLENDER & CO., 42 Pine St., N. Y.

GENERAL SALES AGENTS FOR

The Youghioghenny River Coal Company's

OCEAN MINE YOUGHIOGHENY GAS COAL.

HON. W. L. SCOTT, Prest.

M. H. TAYLOR, Vice-Prest.

This Colliery is located at SCOTT HAVEN, PA., in the center of the Youghioghenny Gas Coal District, and produces the ONLY RELIABLE YOUGHIOGHENY COAL for gas purposes. (See Map on p. 87 of this JOURNAL, Feb. 16, '85.)

POINTS OF SHIPMENT,

Locust Point, BALTIMORE.

Pier No. 62, PHILADELPHIA.

Also, SOLE AGENTS for the

**BRECKENRIDGE CANNEL,
OF KENTUCKY.**

Within the past two years we have delivered this Cannel to over ONE HUNDRED COMPANIES IN THIRTY-THREE DIFFERENT STATES, and it is now in use in some of the large Gas Works

On the Continent and in South America,

where it successfully competes with the Australian Shale. It is the ONLY AMERICAN GAS CANNEL of sufficiently high grade to warrant EXPORTATION TO EUROPE AND SOUTH AMERICA, and it is the only economical substitute for OIL OR NAPHTHA. ONE GROSS TON will produce

10,000 Cubic Feet of 75 Candle Gas,	} equal to {	750,000 Candle Feet of Gas, and 26 Bushels of merchantable Coke weighing 900 Pounds
or 12,500 " " 60 " "		
or 15,000 " " 50 " "		

This is the ONLY GAS CANNEL that will produce a REALLY MERCHANTABLE COKE. It can be delivered in parcels of one carload or more to any point in the United States or Canada. Cargo shipments of any size required can be made from NEW YORK, PHILADELPHIA, BALTIMORE, or NEWPORT NEWS. Samples will be sent and particulars of price, etc., forwarded upon application to above address.

“SUN DIAL” GAS STOVES,

The Most Economical, Efficient, and Durable Gas Stove Made.

GAS COOKING STOVE, No. 8 C.

SIZE.

Stove.	Oven.	Roaster.	Top.	Length over Extension Shelves,
37 in. high.	12 in. high.	12 in. high.	24 in. long.	36 in.
20 in. wide.	17½ in. wide.	18 in. wide.	21 in. wide.	
	12 in. deep.	13 in. deep.		

This Stove has four burners on top, and double oven burner. Consumption of gas with all burners in use, 42 feet per hour, at 1 inch pressure. The top is made in sections, so that a greater variety of cooking utensils may be used. By lifting out the covers and crosspieces and putting in a suitable forked ring, which is sent with each stove, a wash boiler or other large utensil may be set over two burners. Our **No. 87 GRIDDLE** also fits in the same position. The roasting oven is provided with a cast-iron door.

All Fittings are Nickel-Plated.

GAS COOKING STOVE, No. 7 B.

SIZE.

Stove.	Oven.	Roaster.	Top.	Length over Extension Shelves,
31 in. high.	9½ in. high.	10 in. high.	21 in. long.	32 in.
17 in. wide.	14½ in. wide.	15 in. wide.	16 in. wide.	
	12 in. deep.	13 in. deep.		

This Stove has three boiling burners in the Top or Hot Plate, and one single oven burner.

This cut represents our New Style Cooking Stove. As will be seen, it has an ornamented cast-iron Base and Front, and extension shelves. The Oven Burner, which is atmospheric (unless otherwise ordered), is of an entirely new and improved pattern (patent). The ovens are of greater capacity than those of the old style. The Top, in conjunction with the Outlet Pipe, is designed to carry off all the products of combustion, if desired, but they are also supplied with a loose ring which converts it into an ordinary open top stove.

The consumption of this Stove is 35 cubic feet per hour at 1 inch pressure, with all Burners in use.

All Fittings are Nickel-Plated.

“RADIANT” BOILING STOVE, WITH REGENERATIVE BURNER.

Size, 6½ inches diameter, 8 inches high. Consumption, 6 feet per hour at 1 in. pressure.

HOT PLATE, No. 111.

Size, 36 in. long, 12 in. wide, with three double burners, 6 taps. Consumption, with all burners in use, 36 cubic feet per hour, with 1 in. pressure. ½ in. supply pipe should be used where the pressure is 1 in. or over.

OBITUARY—JAMES HENRI ROLLINS.

It is with much sorrow that we announce to the fraternity the death, on the evening of June 19, at his home in Oread Place, Worcester, Mass., of Mr. James H. Rollins, whose name and fame had earned for him a prominent place in the ranks of Eastern gas engineers. Of course, we can but sorrow over the gap thus caused in the ranks, still to de-ceased there can be no question that the ending was release from severe bodily affliction, borne with fortitude and heroism for three long years. The disease from which he suffered was neuritis, or inflammation of the nerves, which is about as acutely painful a malady as the human frame can be called upon to bear. James Henri Rollins was born at Melvin, N. H., in the spring of 1836, and having acquired a common school ed-ucation, was early attracted to the possibilities involved in the develop-ment of the gas business. The first safe record that we have of his con-nection with the business is his service with the Boston Gas Light Com-pany. Apt and bright, he mastered the details of the craft with such speed that, the opportunity offering, he accepted a contract to build a

works at Cairo, Ills. This task completed he returned East to accept a position with the Brookline, Mass., Company, where he remained until October, 1870. At that time an inviting field opened up to him in the shape of the position of Manager and Superintendent of the Minneapolis, Minn., Company, in the service of which he remained 5 years, acquit-ting himself with signal ability, as the records of that Company amply prove.

In 1875 a call for duty summoned him once more to the East, and in the fall of that year we find him in harness as successor to Mr. F. C. Sherman (who resigned from Worcester in order that he might take ser-vice at New Haven, Conn.) as Agent for the Worcester (Mass.) Gas Com-pany. His faithful and valuable labors at this point are too well known to the fraternity to call for extended comment. Suffice it, then, to say that they were of a nature which gave credit to himself, profit to his em-ployers, and satisfaction to the Company's patrons. Failing health alone compelled him (in the spring of 1887) to resign from active duty, and since his retirement, as noted at the beginning of these lines, his failing days have been those of acute bodily pain. His strong mentality, how-ever, remained to the end, and his anguish was, in consequence, all the more pronounced. Ever active in promoting the best interests of his profession, it is therefore not to be wondered at that his name appears on the rolls of several of our Associations, and that it was so written in the early days when many doubted whether or not the policy of meeting in open communion was a safe means for the advancement of gas engi-neering. Whether or not Rollins was a doubter in this regard is best answered by noting that his name appears on the roster of the Ameri-can Association at the meeting held in October, 1873, although we be-lieve the first meeting he attended was that held in New York, in 1875. He was an ardent supporter of the Association, and although the only office held by him in it was as member of the Executive Committee ('82-'83), he often assisted in guiding it smoothly in trenchant debate. He was elected to membership in the New England Association at the meet-ing held at Boston, in 1876, and served on its Board of Directors during 1879, '80, '81 and '82. Here his counsel was often sought, nor was he ever appealed to in vain. He was one of the founders of the Guild of Gas Managers, who perhaps will miss him most, since it was at their gatherings that his genial nature was shown at its best. Of all these or-ganizations he was a member at the time of his death, and it seems su-perfluous to add that all will miss him sadly.

He was a man of great strength of character and mind, an engineer of marked ability—both executive and technical—whose methods and re-sults were always abreast the times. As a manager he caused every-thing to be secondary to and for the advancement of the interests of his employers. Honest and trustworthy as an employee, he was equally rated to acquire and retain the esteem and unrestrained affection of his friends. True as steel, his steadfastness to his friends was a type of that manhood which safely passes through the crucible of time; each successive year but proving the fine grain of his af-fection. In Masonic orders he attained high rank, and claimed kin-ship with the Quinsigamond Lodge of Masons, Eureka Royal Arch Chapter, Hiram Council and Worcester County Commandery of Knights Templars. The burial services took place at his late residence, on Mon-day, June 23, the Reverend Dr. Means, of Piedmont Church (of which

Mr. Rollins had long been a faithful member) officiating. A large assemblage was present, and amongst those who assisted in the last sad rites were Messrs. Bill, Learned, Prichard, Coffin, Leach, Andrew, Taber, Quinn, Slater, Rogers, Humphreys, Spaulding, Coburn, Tarbell, Waldo, Langford, Sherman, Spear, Wetherbee, Cogshall, Davis and Lamson—a list that resembles very much the roll-call of the Guild of Gas Managers or that of the New England Association.

Grief we must feel at the death of the gifted and genial Rollins; but may we not temper it in the remembrance of the cessation of his suffering and in the brighter glory that surrounds the memory of those who having worked faithfully and well in life leave to us the records of that life work as mute guides to us in our approach to the revealment of the life that is beyond.

BRIEFLY TOLD.

MR. STEDMAN TELLS THE WHOLE TRUTH.—Not that he does not always do so, but memory cannot always be trusted, when time presses, to report everything and at once. Early last week Col. Stedman paid a brief visit to the JOURNAL office, and in conversation said he expected to pass the summer (or a part of it) in Alaska, whereupon the interviewer got in his fine work, a condensed report of which is to be found in our item columns. Since then, however, we have received a somewhat amendatory letter of explanation as to matters connected with the Colonel's proposed summering in Alaska, and it is so characteristic of him that rather than mangle his words we reprint them verbatim. The letter is under date of the 25th inst., and is as follows:

To the Editor AMERICAN GAS LIGHT JOURNAL: "It occurs to me that in our interview on Monday I failed to give you a complete statement of my purpose in making my journey to Alaska, and that in putting you off with a remark about the glaciers and icebergs I was needlessly leading you into an error which might not accord with the usual reliability of editorial statement in the JOURNAL. Now I will tell you the whole truth about it. I am acting in the interest of a Rochester syndicate whose purpose is to obtain, if possible, a controlling interest in the Northern Lights and to transfer them to Rochester for its exclusive use in lighting the streets. Of course, we don't expect to confine their radiance within our own civic boundaries. Enough light will probably be reflected from the sky to tantalize the citizens of Buffalo and surrounding cities, and gradually lure them to become residents of a place so blessed as Rochester with its natural and to be acquired advantages; for allow me to introduce Secretary McClintock, of the Rochester Chamber of Commerce. This gentleman is in hearty accord with every measure intended to benefit this beautiful and enterprising city. He is intent on introducing natural gas here, and has already so excited the interests of the natives in the environs of Rochester that several new sources of supply have been very nearly discovered in the immediate vicinity. But the Secretary casts his eyes further afield, and in the event of a deficiency in wells which may be driven within a few miles of the city, the pipes will be laid to the big producing fields already developed and a bountiful delivery assured. The same gentleman has another scheme for so hoarding the surplus of the Genesee river as to compel that somewhat variable stream to be reliable and constant in its work the year round. An estimate, indorsed by the State Engineer, gives 30,000-horse power per day as the minimum which, under this storage plan, would turn the wheels of our industries every day in the year.

"With heat, power and light thus secured, Rochester will in the next decade enormously outrun its 80 per cent. increase in the last."

THE MESSRS. WILBRAHAM BROS., of Philadelphia, have purchased the patent of the late R. K. Huntoon, of Franklin, Mass., for his gas governor, together with all rights, patterns, stock, etc., and are prepared to fill orders for same.

The Market for Gas Securities.

There is no change of moment in the market for city gas shares. Summer dullness may now be said to have set in. Consolidated is around par, with but few transactions. Mutual is stronger. Brooklyn shares are steady. In our item columns will be found mention of the incorporation of a Company in Trenton, N. J., with a capital of \$50,200,000. This Company is the result of certain negotiations that have been in progress for some time whereby English capital becomes interested in the United Gas Improvement Company. The new corporation takes over the capital of the latter, paying therefor at the rate of 200. English and American capital in the venture are about equally balanced. The negotiations were conducted by Sir Henry Goldsmid on behalf of the foreign capital, and Messrs. A. C. Humphreys and Randal Morgan for the Americans.

[OFFICIAL REPORT—REVISED BY THE SECRETARY—CONCLUDED FROM PAGE 881.]

THIRTEENTH ANNUAL MEETING OF THE WESTERN GAS ASSOCIATION.

HELD AT ST. LOUIS, MO., MAY 21, 22 AND 23, 1890.

SECOND DAY—MAY 22—AFTERNOON SESSION.

Mr. E. G. Cowdery, of Milwaukee, Wis., read his paper on MIXED GASES.

Gentlemen of the Association:—It is but little more than two weeks since I accidentally discovered the announcement in the AMERICAN GAS LIGHT JOURNAL that I was booked to read a paper before this Association upon "Mixed Gases." It had been my intention to give you a paper upon an entirely different subject, and I had so expressed myself to the gentleman entrusted with the records of this body; how he ever got so badly "mixed" over a gaseous subject is beyond my power to explain. Having, then, one thing as a subject and another written, it remains for you to apply the subject as best you can.

My paper was intended to lay before you the result of some practical experiments with "gaseous fuel." The subject of fuel gas has been variously presented to you by different members for the past three years, but it has seemed to me, as it has to many others, that while all these efforts towards solving the question in a theoretical way have beyond question been very able, they have nevertheless lacked enough of the practical to convince many of their ultimate success. For this reason it seemed that the result of a few practical experiments would not come amiss.

To be able to judge how far practice would bear out theory I conceived the idea of trying an experiment to find the comparative heating value of different gases, as it would be accomplished in the ordinary practical way. To do this and make the experiment under conditions as favorable as practice would allow, I had made a pan, 9 inches in diameter and 5 inches deep, with tin sides and copper bottom; this to hold 10 pounds of water, and to be used over a gas stove having an equalized flame spreading over a diameter of 5 inches. With 10 pounds of water in the pan, a thermometer suspended so that the bulb was in the center of the body of water and the top of the dish covered with glass, the gas was lighted and as soon as the mercury reached 70° the statement of the meter was taken. When the mercury reached 210° the gas was shut off. If there had been 4 feet of gas used to raise this 10 pounds of water 140° the 4 feet would have raised 1 pound of water 1,400°, or 1 foot would have raised 1 pound 350°. We judge from this that we have obtained in practice 350 units of heat from 1 foot of the gas; the balance of the theoretical heat units in the gas was, of course, wasted.

Care was exercised in obtaining the proper length of time to raise this body of water 140° in temperature with the minimum waste of heat, which in this case was found to be about 20 minutes. The gas stove was so constructed as to allow of adjustment of air and gas separately. These were so adjusted for each gas tried as to produce the best result. The following results were obtained:

Ordinary coal gas, 16 to 17-candle power	311 units.
Uncarbureted water gas (no air)	157 units.
Carbureted water gas, 25 to 30-candle power	408 units.

It was found that the burner we were using for the uncarbureted water gas was not best adapted for it, and another was substituted, which is specially made and adapted for that gas.

The results for coal gas were also improved by using a different burner. With these improved burners the results from the same gas were:

Uncarbureted water gas (no air)	183 units.
Coal gas, 16 to 17 candle power	345 units.

It happened at this time to be convenient for me to test with the same apparatus in the same way a fuel gas said to be a combination of coal gas and uncarbureted water gas, and, of course, superior in heating qualities to uncarbureted water gas alone. The result was as follows:

With original burner	127 units.
With special burner	153 units.

Against uncarbureted water gas straight:

With original burner	157 units.
With special burner	183 units.

The so-called fuel gas in this case was 16 per cent. less in heating quality than the straight uncarbureted water gas.

With this result of a practical experiment with various gases, with the same apparatus and under precisely similar conditions, and so nearly

bearing out the theoretical comparison, what conclusions are we to draw? Simply that we must accept the comparative values placed below as facts, with the value of

Uncarbureted water gas placed at.....	100
Ordinary coal gas, 16 to 17 candle power, will be..	200
Carbureted water gas, 25 to 30 candle power.....	250
Mixed, $\frac{3}{4}$ coal, $\frac{1}{4}$ water gas	215

So far, where "fuel gas" has been practically applied, the products of combustion, either partially or altogether, have been thrown into the heated rooms. No doubt this was done to save heat; for if we are to attempt to reach a price equal to the cost of coal every available means must be taken to reduce the waste heat to the minimum. I do not hesitate to say that I believe any scheme which fails to dispose of all the products of combustion is doomed to absolute failure.

Believing this, I set about devising a way to heat the office building at the works in our city the past winter, and carried out a plan, which was perfect in its plan for heating, which disposed of all the products of combustion by throwing them into the chimney and which reduced the waste of heat to the minimum, as they never entered the chimney above 75°. It was a hot water circulating system, direct radiation, and I believe for either gas or for coal is the cheapest system of heating to operate. A boiler or heater composed of copper tubes was built for the purpose and so arranged that the gas flame played upon the upper portion of the coil, the products of combustion being drawn down through the heater around the tubes by the draft of the chimney, thus coming in contact with the coldest water before entering the chimney. As the temperature of the water entering the heater at the bottom was never above the temperature of the room, the products of combustion could not enter the chimney at a higher temperature. The room heated was 43 x 24 feet and 12 feet high, equaling 12,384 cubic feet of space. To get a comparison with coal I commenced burning anthracite coal at my house on the 1st of November last, the same day as these gas heaters were put into operation. As both buildings are solid brick and about equally exposed, and the rooms in each case 12 feet high, I consider the comparison very fair. The space heated with coal equaled 53 feet by 33 feet and 12 feet high, and equaled 20,988 cubic feet of space. From November 1st to March 15th we burned at the one place 57,500 feet of gas, at the other $9\frac{2}{3}\frac{5}{10}\frac{0}{10}$ tons of anthracite coal.

Again: At one place, 4,643 cubic feet gas to heat 1,000 cubic feet space; at the other, 917 pounds coal to heat 1,000 cubic feet space. It thus appears that 10,000 cubic feet of gas equaled, in this case, 1 ton of anthracite coal. As it took 4,643 cubic feet of gas to heat 1,000 cubic feet of space for 4½ months, and these the coldest months of the season, it certainly would not increase the proportion for the remaining 1½ months. Allowing the same proportion, it would cost \$4 per 1,000 cubic feet of space for a season of 6 months, from November 1st to May 1st, for gas at 65 cents per 1,000 feet, and same price for coal at \$6.50 per ton. As the gas we were making the past winter was three-fourths coal gas and one-fourth water gas, and had a comparative heating value of $2\frac{1}{10}\frac{5}{10}$ times uncarbureted water gas, its value would be placed at 35 cents, against uncarbureted water gas at 30.

As Mr. Evans is selling an uncarbureted water gas at 30 cents, and as he stated in his paper at the Ohio meeting, recently, that at that price for his gas, it cost about \$4 per 1,000 cubic feet of space heated, it appears to me that these figures are somewhere near reliable. I should have stated that the coal was used in a new and what appears to be a good hot air furnace.

I do not know that any of us care to, or can afford to sell our illuminating gas at 65 cents per 1,000 feet; but if we cannot, then we certainly cannot afford to sell uncarbureted water gas at 30 cents. If we can get 40 cents for an uncarbureted water gas—which we ought—and can, at that figure, make a profit, we can make a larger profit in selling illuminating gas at 80 to 90 cents for the same purpose.

It is no argument that a fuel gas plant making uncarbureted water gas would require less capital in the works; for this would be more than offset by the additional cost of mains to carry twice the amount of gas.

It is an inevitable fact that so far as we have progressed at present, a successful "fuel gas" must be some kind of an illuminating gas.

The President here intimated that the Association was pressed for time, and suggested that as the paper by Mr. Somerville was somewhat in the nature of the one read by Mr. Cowdery, that the Somerville paper be read so that a joint discussion might be held. This was agreed to, and Mr. James Somerville, of Indianapolis, Ind., read his paper on

THE EFFECT OF NATURAL GAS COMPETITION.

This paper, on the "Effect of Natural Gas Competition," can only interest those of our number who are enjoying the blessing of this most

wonderful of Nature's products. The Committee were kind enough to suggest the subject to me, and as I happen to be one of those unfortunate people who have a peculiar difficulty in saying "No," at the right time, I had just to comply with their suggestion.

It is a little over two years since natural gas was introduced into our city, giving it ample time to show its effects as a competitor with the manufactured article. The natural gas is found in great abundance at a point 20 miles distant, and is brought to the city by three lines of pipe. One line is part 16-inch and part 12-inch; the second line is all 12-inch; the third line is part 8-inch and part 10 inch. The pressure at the wells is 300 pounds to the square inch, and it is estimated that these three lines of pipe will deliver into the city forty million cubic feet per day. The illuminating power of the gas is 9.5 candles. Its specific gravity is .570. It is practically free from impurities. When first introduced it showed decided traces of sulphureted hydrogen, turning the test-paper black the moment it was applied. But about one year after its introduction, from some cause which I am unable to explain, it ceased to show the slightest trace of this impurity. There were four companies organized to supply the city, but only three of them went to work. So great was the desire of the people for the new and cheap fuel that they readily granted the freedom of the city to the companies, and the contractors took full advantage of that freedom. The way the streets were torn up, ditches left open for weeks, entire squares of the city cut off from traffic, was somewhat surprising to the regular gas man, who had been accustomed to conduct his main-laying with the fear of the municipal authorities before his eyes. It was the great desire of the companies to get into the creamy part of the city first. The better and least expensive plan would have been to have given each of the companies a district to itself, as the price of gas was fixed by ordinance. But as this was not done, we have often three main-pipes in one street, when one would have been sufficient.

I found it next to impossible to properly watch and protect our mains and services during these operations. A number of gangs would be working at once in different parts of the city, and if a service-pipe came in the way of their main, the handy crow-bar was brought into requisition with telling effect. The service-pipe would either be broken or pulled clean out of the main and covered up, to be revealed in the near future in the usual way. I must give the companies credit, however, for doing the best they could under the circumstances to protect our property, and when we presented the bill for repairing the damages they paid it without a murmur.

Before the natural gas was turned on the mains were all carefully tested. The high pressure mains, which encircle the city, had to stand an air pressure of 80 pounds to the square inch. The low pressure, 15 pounds to the square inch. The city engineer, to whom was intrusted the testing operations, performed his duty faithfully and well. The consequence is, we have had no accident whatever from leaking main-pipes. The gas is burned at a pressure of 7 oz., equal to a water column of 13 inches in height.

The great number of houses waiting to be fitted up for the use of the new fuel brought a host of gas-fitters from all parts of the Union, chiefly from the natural gas regions. Every person in the city who had ever handled a pair of pipe-tongs turned gas-fitter. It was not an unusual occurrence to see the shoemaker take down his sign which read "Boots and Shoes Neatly Repaired," and put up one with this legend on it, "Natural Gas Fitting Done on Short Notice." Of course it was impossible to control such a crowd or specify the size of pipe to be used, for they went into the lighting business also. But natural gas companies took in the situation, and promptly issued an order that no gas should be turned on unless the occupant of the house had a certificate, signed by their inspector, to the effect that the fittings had stood a pressure of 10 pounds to the square inch. The order was faithfully carried out, and I have known instances where the fitter would spend two days in fitting up the house and be occupied four and five days in stopping the leaks. The troublesome mercury would insist upon obeying the laws of gravitation.

When the work of fitting up 19,000 houses was completed the business began to slacken, and the question of earning an honest penny by our army of gas-fitters was an important one. They went from house to house amongst our customers, representing that the natural gas was just as good for illuminating purposes as the artificial. This plan met with considerable success. The method they employed was to shut off our gas, disconnect the meter, connect the riser to the natural gas pipe, remove the burners and put in their place the Jumbo burners. We lost for a time by these means some 500 consumers. Nearly all the stables, workshops, cellars, small stores and other places, where a good light was not an absolute necessity, adopted the Jumbo burner, which is a common flat flame, consuming from 10 to 50 cubic feet per hour. Apparently the natural gas companies made no conditions, for the consumer uses these

burners night and day for the sum of 15 cents each month. For a heating or cooking stove, which consumes about the same amount of gas, the companies receive \$1.50 per month. During the hot weather the heat from these large burners is very oppressive, but a number of people are willing to put up with a little discomfort of that kind for the sake of cheapness. As we anticipated, we lost our entire day consumption for cooking and heating purposes. There was no competition. It was a clean walk over the course with natural gas. It burns just as well in a common gas stove as our gas does. The stove requires no alteration whatever. Where the gas stove is not connected with the natural gas it is carefully put aside for future consideration. As some of you know, we had by some energy and perseverance built up a remarkable stove consumption; fully 10 per cent. of our output was used for cooking and heating purposes. Therefore we gracefully yielded to the inevitable. In other words we could not help ourselves.

Numerous devices for carbureting the natural gas, and thereby increasing its illuminating power, were experimented upon and brought out by a number of hopeful inventors. But, from some cause or other, these inventions have not proved successful. The gas thus carbureted was consumed in an Argand burner, and the fluctuations of the flame were very marked, arising either from the alteration of the specific gravity or from uncontrollable pressure. There was also some danger and trouble in handling the carbonizing material. These causes, with the liability of the chimneys to break from the intense heat, proved fatal to the success of this plan, for, I observe, in these days the people desire to have their artificial light with as little trouble as day light.

Natural gas has proved a veritable godsend to the Welsbach lamp. As you are all aware, this burner is of the incandescent order, and only requires heat for its successful operation. On the introduction of natural gas a company was immediately formed for the sale of this lamp. They charged \$2.50 for putting it in position. The gas cost 25 cents per month for each burner. It is claimed that the company sold 3,000 at these figures. This method of introducing the lamp did not apparently prove a financial success, for the company gave us several opportunities to purchase the sole right to use it. Our chief reason for declining to purchase was, if it was a good and cheap burner, we did not desire to place any obstacle in the way of the people having the full benefit of it. Recently one of the natural gas companies (the Consumers Gas Trust) bought the Welsbach people out, and the lamps are now being put in free of charge. They rent them for the average sum of \$2 each per annum. The gas is included. The conditions are that the contract is to be of one year's duration and the lamp to be returned in good condition, the consumer paying for all renewals and broken chimneys. The lamp gives a beautiful, soft, white light, and is well adapted for desk purposes where the person can get near enough to it, for, like all other incandescent lamps, it is very deficient in diffusive power. Much disappointment has been experienced by placing one on the usual store pendants. It requires two, and in some instances three, to diffuse the same amount of light as a common 6-foot jet of 18-candle gas, and at the exceedingly low price at which they are offered the consumers can afford to put up a sufficient number of them. There must be from 7,000 to 8,000 of these lamps in use at present; but it must not be understood that they have displaced a like number of our lights. At least one-third of that amount are being used by people who never burned gas before. No meter is used for these lights, and no limit is placed to the number of hours burning. Like all human inventions, the lamp has its drawbacks. The mantles require to be renewed once a month. The chimneys have to be kept clean, which, if neglected, reduces very materially their illuminating power. There are some other burners in this fruitful field, but I have only mentioned those that may fairly be called competitors.

In conclusion, it may be asked, What have we done to meet this extraordinary competition? We have done nothing more than we have always done these many years—sending out a pure 18-candle gas at as low a price as we could, cheerfully taking out a meter at the request of the consumer, and as cheerfully putting it back again; promptly attending to the wants of our customers, and treating them the best we knew how.

The law of compensation to some extent comes in here, as in other cases. Natural gas is an ideal fuel. We use it entirely under our benches and boilers, with a consequent reduction of labor. We sell our coke at a fair price in those benighted localities that are less favored by nature than we are, and with a reasonable price for our other residuals we manage to put our gas into the holder at a satisfactory figure. The great advantages of natural gas have brought increased business to the city, of which we receive a share of the benefit; and I think it a remarkable circumstance, and speaks well for the vitality of our industry.

that amidst this keen competition—cheap oil, a well-equipped arc and incandescent electric light plant, and a natural gas company giving its gas free for lighting purposes—we not only hold our own, but we actually sent out 700,000 feet more gas last month than we sent out the corresponding month of last year. We feel it is an advantage also that our people are being thoroughly educated in the use of gas for lighting, cooking, and heating purposes; and when natural gas fails, as I believe it will do in a few years at most, there will be an unresisting demand for the manufactured article to take its place.

Discussion.

The President—We are much indebted to the authors for these contributions. The papers are before you for discussion.

Mr. H. T. Gerould—When was natural gas introduced in Indianapolis?

Mr. Somerville—Two years ago.

The President—I think Mr. Cowdery's paper answers some questions, asked yesterday by Mr. Lansden, when Mr. Chollar's paper was under discussion.

Mr. Lansden—What Mr. Cowdery says with regard to mixed gases coincides exactly with my experience. I do not find any test that he has made which I have not myself verified.

Mr. Ramsdell—I would like to ask Mr. Cowdery what his system of radiation is—whether through ordinary radiators or through the pipe system.

Mr. Cowdery—Through four lines of 1½-inch pipe running around the room close to the base-boards.

Mr. Ramsdell—I tried some experiments with the same system exactly, and with just about the same result. I think my figures were 7 cents per thousand for heating.

Mr. Somerville—I would like to ask Mr. Cowdery if he took any unusual precautions to save the heat from going away; or was it, for practical purposes, just the same as anyone would use it for heating water?

Mr. Cowdery—Just the same as a person would use in it the house in an ordinary gas stove for heating water, only I took as good a type of gas burner as I could find. I took no unusual precautions to save the heat.

On motion of Mr. Forstall the thanks of the Association were voted to Messrs. Cowdery and Somerville for their papers.

A BATCH OF INVITATIONS.

At this point the Secretary read letters, from the Municipal Electric Light and Power Company, and from the Ringen Stove Company, inviting the Association to inspect their respective plants. After a vote of thanks for the invitations had been adopted, Mr. John Dell announced that those interested in the Coze system of inclined retorts could witness a good working specimen of the same in operation at the Howard street works of the Laclede Company, and added that he would be very pleased to explain the system to those who visited the works.

Mr. Eugene Printz, of Zanesville, Ohio, next read his paper, entitled **WROUGHT IRON, CAST IRON OR STEEL—WHICH IS THE BEST MATERIAL FOR STREET MAINS?**

In answering this question, are there not many others to be taken into consideration? The particular purpose for which the main is to be used; the kind of soil in which the pipe is to be laid—that is, does the ground contain any chemical combination that might be more detrimental to one kind of pipe than to another; has the pipe in its manufacture been so made as to be able to resist the action of the destructive agents that may be on the ground? Then, again, the cost of the pipe and the figure at which it can be placed in position, and the cost of maintenance thereafter, are serious matters for consideration. Which, if either kind of pipe, will give the least percentage of gas unaccounted for?

Wrought iron mains have some advantages not possessed by cast iron; owing to its greater strength, it will resist heavier internal pressures; less liable to fracture by sudden jars or by the disturbance of its foundation; can be joined together with less expense and greater speed; has fewer joints and can be laid in some situations where it would be almost impossible to lay cast iron; but it has two disadvantages considered serious ones—the first cost of the pipe and the limited life, as claimed by the friends of cast pipe, when compared with cast iron in many kinds of earth.

In making comparisons as to the cost between wrought iron screw-jointed pipe and cast iron pipe, I have figured as to the price by car loads delivered in Ohio. One mile of 6-inch wrought iron pipe would be \$3,485. One mile of 6-inch cast iron pipe would cost \$1,930, a difference in favor of the cast iron pipe of \$1,555 per mile. One mile of 8-

inch wrought iron pipe would cost \$5,710. One mile of 8-inch cast iron pipe would cost \$2,700, a difference in favor of the cast iron pipe of \$3,010 per mile. The labor for digging and refilling trench would be at least 25 per cent. in favor of the wrought iron pipe, as a trench much less in width will answer the purpose, and no bowl or bell holes are required. The labor, lead and yarn necessary to lay and join 8-inch and 6-inch cast iron pipe would be about \$400 for the one and \$300 for the other per mile, while the labor and paint cement to join a mile of 8-inch and 6-inch wrought iron screw pipe would be about \$150 and \$120, respectively—making a difference of \$250 for the 8-inch, and \$108 for the 6-inch, per mile, in favor of the wrought iron pipe.

The labor figures and cost of pipe on the wrought iron pipes are based on the supposition that screw-joints and standard weight pipe are used. If the patent leaded joint with the light weight wrought iron pipe is used the difference in the labor and lead account will be very much increased in favor of the wrought iron pipe over that of the cast iron—there being a saving in lead alone of 2,800 pounds for the 8-inch, and 2,100 pounds for the 6-inch pipe per mile; and as the pipe is so much less in weight, and a less number of joints to be made, it can be handled and laid with less labor and with greater rapidity.

It is claimed by those who advise the use of wrought iron pipe, and they have strong evidence to substantiate their claims, that there is less leakage, in fact a very large percentage less, than when cast iron is used: this we must admit would naturally be the case, owing to the more porous character of cast iron; but why there should be less leakage at the joints, only in proportion as there are fewer of them, we fail to understand; a joint that is gas-tight ought to be as good with one kind of pipe as with another. But it is urged that it is impossible to make a lead joint with cast iron pipe that will remain tight; that with the continual expansion and contraction of the pipe, although the movement may be very slight, will, with the rough surface of the spigot end, soon start the joint to leaking; and that with a lead joint on wrought iron pipe this is not the case, for the reason that while the movement may be greater, the surface of the pipe is smooth—sliding easily back and forth, without tearing or disturbing the joint.

Mains have been made of cast iron ever since the general introduction of gas for illumination (nearly three-quarters of a century), and when examined or removed are found, with the exception of a slight coating on the outside, to be, as far as the texture of the iron is concerned, in as perfect condition as if just placed in the ground. There are, of course, exceptional cases, but not many, where the ground has become impregnated with some foreign matter, which will and does act on and destroy the cast iron in a comparatively short time.

My own experience with cast iron for mains is limited to that of pipe, at present, used at my home. Some of it was placed in position 41 years ago. We are at present, and have been every season for the last 10 years, replacing the old lines with larger ones, and using the old ones again on streets where their size will be sufficient. To be sure, we find many pipes that are imperfect in their construction, but the iron itself is as sound and perfect as when first cast.

We have but very little wrought iron pipe in use for street mains—one short section of 3-inch, about 400 feet long, which has been down 10 years. It formerly did duty to convey gas on a bridge; it was at that time protected from the weather, and kept well painted; last week we had occasion to tap it for a service connection, and we found, to our surprise, after the 10 years' duty, it was in perfect condition.

As a means of comparison in the life of wrought and cast iron (when neither is covered with a protective coating, and is equally exposed to a very severe test), I will cite an actual experience which happened on one of the short streets in our city: On this street was a 2-inch cast iron main, with a number of service connections all three-quarter inch except one (an inch-and-half) which conveyed gas to a machine shop; going south from a certain cross street there was no difficulty whatever; but north from this point we were compelled to renew the service pipes every two or three years. Now, for the cause of this trouble: For a number of years this portion of the street had carried as surface drainage, the sulphur, or commonly called "copperas" water from several coal mines. The street was paved with limestone, the spaces between the stone filled with sand, but not cemented with tar or pitch. The drainage from the coal mines percolated through the sand and saturated the ground, which was composed of a mixture of clay and gravel, in which the 2-inch cast iron main was laid. In 18 years the texture or composition of the pipe was so changed or destroyed that the pipe, on being removed, was so soft that it could be shaved with a common pen-knife as easily as the plumbago in our lead pencils; there was not strength enough in a 7-foot length to carry its own weight when placed upon supports at the ends. You will notice the life of cast iron pipe as

compared with wrought in this instance, after making due allowance for the difference in the thickness of the metal, is as $3\frac{1}{2}$ is to 1.

On another street we have two short lines of 2-inch main,—one a cast iron and the other a wrought. The cast iron has been in 20 years and is in fair condition; the wrought iron has been in only 15 years and will of necessity have to be replaced in a very short time.

In this connection I will quote a few lines received from Mr. Cantine, of the Alliance Gas Light Company, Alliance, Ohio. He writes as follows:

"We had a 4-inch cast iron pipe leading from our main line through the Pennsylvania Railroad Company's yard to supply their ticket office and eating house; and, that after having been laid some 6 or 8 years, we found it leaking badly. This pipe was extra heavy and of sufficient weight to be known as water pipe. The ground in which it was laid was mixed with cinders from locomotive ash pits. The action of the impurities in the cinders had rendered the pipe utterly worthless, it having no more strength than unburned clay. The process of decomposition is or would be much more rapid in wrought iron or steel than with cast metal. The contact of one cinder no larger than a walnut will eventually eat its way through any pipe."

I have called attention to these instances, in a measure, in the first two, to compare the life of the two kinds of pipe under the same circumstances, and in the first and third to show that even cast iron may be readily destroyed when subjected to certain conditions.

Will not the question be asked, Why is it, that one kind of pipe will last so much longer in the same kind of earth than will the other kind of pipe? A gentleman to whom I put this question, suggested: Is it not that cast iron and wrought iron are different in their construction, different in their chemical formation? In cast iron, the particles of iron of which it is composed retain their crystalline or natural shape, and contains a proportion of carbon; these crystals are in nature hard, bright, and in a measure polished, and are more or less coated with graphite, depending greatly on the quality of the iron; all tending to preserve the metal from oxidation. In the manufacture of wrought iron a portion of the carbon is eliminated, rendering the metal softer; the crystal or natural form is broken up; the crystals are elongated or drawn out, presenting a stringy or fibrous appearance through the length of the metal. The graphite coating or protection of the crystals is removed, rendering the pipe more open to the action of the destructive agents.

Again: The question is asked, Why will the same kind of pipe last longer in one formation of earth than in another? Have you not noticed when your pipe, particularly cast iron, was buried in sand for a number of years, that a thin, hard coating impenetrable to almost anything, had formed on the outside of the pipe? This coating forms to a certain thickness; there the decomposition stops. Nature in this case has provided a nearly perfect and perpetual protector. Is not this combination of sand and iron, which is almost like glass in its hard appearance, silicate of iron? And have you not further noticed, that where this formation does exist, there is no escape of gas unless it be at the joints—the coating forming a gas-tight covering.

On the other hand when your pipes of either kind have been buried in white clay, the tendency has been to deteriorate, in many cases, quite rapidly. Can we not account for this in this wise? In nearly all cases white clay veins or banks are overlaid with coal in some form; sulphur, in solution from the coal, saturates the clay, comes in contact with and surrounds the pipe; the sulphur having a strong affinity for iron, combines with it; sulphuret or sulphide of iron is formed and the pipe is destroyed, more or less rapidly, in proportion to the amount of sulphur. This same action takes place where the pipe is exposed to coal cinders, similar to the case referred to in the quotation from Mr. Cantine's letter,—there the free sulphur in the cinder combining with the iron.

Again: If your pipe is laid in ground so situated as to absorb, or in any way to contain matter likely to ferment, near by, or in contact with the pipe, there is great danger; for, during the process of fermentation, carbonic acid is evolved. This acid is particularly destructive, and very persistent in its combination with iron; once it takes hold it never releases its grip until it has accomplished its purpose. An example of the action of carbonic acid on wrought iron is very clearly shown by the rust or pitted spots on the sheets of our gas holder. We notice first a little yellow dust; the carbonic acid of the atmosphere has combined with the iron forming carbonate of iron. This dust, in a very short time is oxidized, gradually becoming more red in color. In the meantime, the carbonic acid has moved on, and is working on the way to new iron, which it will continue to do as long as there is any iron to be found. We have often wondered why it was that after cleaning and painting the sheets of our gasholders, that in a few months we would find indications of rust, and that, too, right under the protective (as we supposed

covering of paint; but the carbonic acid was surely there and you cannot remove it, unless you scrape right down into the clear iron; every particle of rust must be removed before you can hope to be relieved of this troublesome destroyer of iron.

While not exactly germane to the question we have before us, yet bearing in that direction, I have thought it might be of interest to some of our members to examine a section of 6-inch wrought iron pipe which I submit for your inspection. This piece of pipe was in use just 2 years and 7 months as a stand-pipe to convey the gas from the retort to the hydraulic main. You will observe that it is completely used up. In the same gas works there are cast iron stand-pipes that have been in service for over 30 years, and from all appearances are good for another 30 years. I think you will agree with me in the statement that there is one purpose for which it is surely best to use cast iron pipes.

When the question is asked, "Which is the best material for street mains—cast iron or wrought iron?" we would likely answer at once, cast iron. Why? Because we have been accustomed to purchase the same for a great deal less money; it is cheaper, and it will last longer; and then we say again we have to renew our wrought iron services, and we do not the cast iron mains. Have we not overlooked the fact that the wrought iron services are less than one-half the thickness of the cast iron mains; that where we have had occasion to make renewals, the wrought iron had been more exposed than the cast iron. The services mostly gave out at gutter crossings, where the pipe was not of sufficient depth, and was exposed to air, and dampness, and frost. Is it not true that many of us have wrought iron services in use to day, and in good condition, that were connected to our cast iron street mains, when gas was first introduced to our towns, 40, and in some cases, 60 years ago. We know what to expect as to the lasting qualities of cast iron pipe. We know that with cast iron mains the leakage of gas will average as much as 10 per cent. This we gather from the reports received from a majority of the gas companies.

Now, we will see just what is claimed and we may say proven as to the lasting properties of wrought mains; also, as to the leakage where they have been used.

From Mr. J. B. Overton, Virginia City, Nev., we quote as follows:

"I have to say, that the 10-inch lap-welded pipe furnished by you appears to be as good to-day as it was when first put down in 1875. The light 18-inch pipe which I bought of your company in 1876, has been in constant use, and has given no trouble, nor has it cost a cent since laying."

Under date of November 14th, 1882, we have the following:

"Gents—In reply to yours of the 9th inst., inquiring about the lasting quality of wrought iron pipe for gas mains, I would say: We put in some wrought iron main in 1858; before laying it, we coated it with tar and let it dry in the sun; used tar on the threads and couplings freely, mixed with sand. In 1874 we had some of the same mains taken out, being too small to supply the consumption. In all cases the pipe was sound and clean; all we had to do was to re-tar it and then re-lay it in other streets. We now have in use over 8 miles of wrought iron pipe from 1½ to 4 inches in diameter, and all of it giving the best of satisfaction. Our leakage account will compare more than favorably with any other works, and we claim that wrought iron pipe is the cause of it." (Signed, THOMAS BUTTERWORTH, Rockford, Ill.)

The following is a telegram from Mr. O. P. Shaffer, Treasurer Standard Gas Light Company, New York City:

"We find wrought iron gas mains practically stop all leakage; only leaks we have are on cast iron crosses and sleeves; leakage in cast iron lines in this city averages 14 per cent.; ours does not exceed 1 per cent."

Mr. W. W. McCleary, Superintendent Gas Company, Braddock, Pa., writes the following:

"Our whole gas system is composed of the Converse light-lock joint wrought iron pipe. Is giving perfect satisfaction; less than 1 per cent. leakage."

The following extract accompanies the sample pipe from the McKeesport Gas Company:

"I send you a section of 4-inch O. D. line of our special wrought iron gas pipe, which was laid by me in 1875. We took it up in September, 1887, and found it in as perfectly serviceable a condition as when it was put in the ground. I must say it was a surprise to me to find it so perfect. Cast iron could not have made such a record under similar circumstances. I have taken up cast iron pipe from the same soils here, which had not been buried for nearly so long a time, and the result has been just the reverse of this. Our soil is a very severe one, and the showing in this case proves durability of your coated wrought iron pipe." (Signed, W. C. NEEMES, Supt.)

I have here a report from Mr. C. E. Manly, Chemist:

"The following is my brief report relative to a piece of wrought iron taken from a 9-mile line of 22-inch riveted pipe, working under a head of 530 feet, and having been in the ground 13 years at the mines north of San Francisco. Sample submitted by Mr. T. W. Brooks.

"On making my inspection of this piece of iron I find it is in good condition and as perfect as any piece of iron just newly rolled. The iron is smooth and has a uniform gauge of No. 11. I notice there is not a particle of rust to be found adhering to the iron. This state of preservation is undoubtedly due to the protection of prime asphaltum coating. That metallic iron will rust in contact with water, which latter contains free oxygen, air, or carbonic acid gas, nature demonstrates every day; and no matter how perfect the iron may be, yet oxidation will show itself sooner or later upon unprotected iron, especially with cast iron, due to the impurities therein. These impurities amount to 100 per cent. of the bulk of the cast iron, due to the graphite, silicon and sand; and it is therefore possible for the entire iron to be dissolved out whenever galvanic action exists, in patches destructive to cast iron; the result is a mere shell of graphite and silica, representing the original curve and thickness of the pipe. With wrought iron, this peculiarity of galvanic action is unknown, due to its purity and absence of crystallization; but to insure perfect safety, means are taken to prevent any disaster of this kind, defecting even to a small degree the surfaces of wrought iron, by the use of asphaltum or any hard surface impervious to moisture. We have 14 years' experience to substantiate the above statement, and as the iron does not show a sign of blemish after the 14 years' service, I consider it will be found in as good condition 100 years hence as it is to-day." (Signed by C. E. Manly, Chemist.)

Is it not a serious question, "Which is the best—wrought iron or cast iron for street mains?" The wrought iron costing, in the first place, from 50 to 100 per cent. more than does the cast pipe. (This difference is greatly reduced in proportion as you get further away from the points of manufacture. The freight rates—a very important item—being very much in favor of wrought iron, as the same car will carry many more feet of the light wrought iron than it will of the heavy cast pipe.) The wrought pipe does not cost near so much to lay, and the saving in leakage will in a very short time balance the extra expense for the wrought iron pipe. The most important question appears to be, Will the wrought pipe last? On the other hand, why not have our cast iron pipe, which we think, under ordinary circumstances will last, properly coated with some material that will close the pores and protect the iron beyond a doubt; also, have the spigot end of the pipe turned or ground smooth, so that a permanent and tight joint could be made. This certainly would not add a great deal to the price of the present cheaper pipe, and you would save quite a large percentage on the outlay.

Steel Mains.—Engineers and experts are of the opinion that to weld, or properly join two pieces of steel, requires that blows as with a hammer should be given; that they will not join by being rolled or crushed together, as will wrought iron, for the reason that the fiber is too short; that the two surfaces merely stick together as with a flux, just as two boards are glued together one upon the other.

In welding wrought iron pipe with the machinery constructed for the purpose, the long fibers of the iron are firmly interlaced and joined—the joint or weld being as firm as any other portion of the pipe. I have here a sample of welded steel pipe which I hope you will examine.

Again, it is claimed that steel, being short in the grain, gives a great deal of trouble by fracturing near the joints at the threads. For these two reasons it is not considered advisable to use steel mains.

Converse Joint.—Our worthy Secretary intimated to me that a word in regard to the Converse jointed pipe would likely be of interest. Not knowing anything of it personally, I visited the shops of the manufacturers to learn how it was made, what it was made of, and to see a joint tested under pressure. The joint I saw tested was made in my presence—two short lengths, about 4 feet each, of 6-inch outside diameter pipes (the thickness of the metal was not quite ½ inch), were joined with the short sleeve used in this style of joint—no yarn or tarred rope was necessary—just simply slide the ends of the pipes in the sleeve, give them a slight turn to tighten the lock, then the usual clay roll, pour in the molten lead, caulk the joint in the usual manner (which appeared to be very easily done, as there was not the old-time yarn cushion); the lead was driven solid against the iron, and did not consume so much time as the ordinary joints for cast iron pipes. After the completion of the joint the open ends of the pipes were closed with bolted blank flanges, the pipe laid loosely on trestles, a force pump with pressure gauge was connected to an opening in one of the pipes, and water forced in; a pressure of 500 pounds to the square inch was raised, and allowed to remain for some time, without a sign of leak at the joint. This was

a thrusting strain of 14,000 pounds to force the pipes asunder. The pressure was then raised to 800 pounds per square inch; one of the pipes at this began to slide out from the sleeve; and the joint to leak slightly. I asked that the pressure be reduced and the lead re-caulked, which was done and the pressure again raised to 300 pounds before a leak was started. Again the pressure was raised to 850 pounds per inch, or a thrusting strain of 22,800 pounds, to part the joint.

During my investigation I learned the pipe was manufactured of the best grade of wrought iron, similar to that used in the manufacture of boiler tubes or flues. After the pipes have been tested for imperfections they are thoroughly coated inside and out by being boiled in a mixture called "kalamein." Kalameining consists in "incorporating upon and into the body of the iron a non-corrosive metal alloy, largely composed of tin." The surface thus formed is not fractured by blows, or by bending the pipe either hot or cold. The sleeve or coupling is made of the toughest and best grade of cast iron, and is boiled in paraffine to close up the minute pores of the iron. The outside of it, as well as the pipe, is then, if desired, coated again with asphaltum. By request, the manufacturers have submitted here for your inspection samples of the pipe and joint.

The Converse jointed pipe is used very extensively by a number of water companies and natural gas companies. Engineers of these companies, by their testimonials, freely given, speak very highly of it as being so well adapted to resist the high pressures and the unusual strains brought upon it by the slips on the mountain sides. They refer to it as giving less trouble from leaky joints than any other pipe they had ever used (not excepting the screw and jointed pipe).

An idea as to how much engineers appreciate the use of wrought iron for mains for water, manufactured and natural gas, oil, compressed air, and other purposes, may be imagined when it is understood that of the Converse jointed pipe alone there was sold in the eight years preceding January, 1890, pipe ranging in sizes from 22 to 24 inch, a total amount of nearly 7,000,000 feet, or nearly 1,300 miles.

The Laclède Gas Light Company, St. Louis, Mo., have, up to this time, placed orders to the amount of 18,000 feet of 12-inch, 12,000 feet of 6-inch, and over 6,000 feet of 4-inch Converse light lock-jointed wrought iron pipe.

The Philadelphia Natural Gas Company say:

"We have used perhaps 75 miles of the Converse joint pipe, and have found it first-class pipe in every respect. The joint is a good one, very easily put together, and after the line is connected the pipe is tight under a pressure of 250 pounds to the square inch. We do not carry this pressure, however, on our line in actual use, but test it up this high. We have just taken up considerable of this pipe from a field abandoned, and relaid it in a new field, and find it is just as good as the day we put it down, and as easily put together. In short, we take pleasure in saying the Converse pipe is all that is claimed for it by the makers." (Signed by T. A. Gillespie, General Superintendent.)

Friction.—From Prof. John C. Trautwine we have this opinion:

"As the Converse joint produces an absolutely smooth interior, reducing friction to a minimum, the increased flow and delivery of gas will be readily appreciated. The cast iron pipes themselves are not cast perfectly straight, or smooth, or of uniform diameter, and irregular swellings produce eddies and retard the flow. Under the most favorable circumstances, therefore, it is expedient to make the diameter of cast iron pipe, even for temporary purposes, sufficient to discharge at least 20 per cent. more than the quantity actually wanted; and still larger allowance should be made in permanent pipes. Natural and manufactured gas mains are usually for permanent lines."

From Prof. Haswell we quote the following:

"The difference in friction between a line of ordinary spigot and bowl-jointed cast iron pipe, and a line of seamless wrought iron pipe, with flush connections alike to the Converse joint, would be fully 25 to 35 per cent."

I have written thus fully in reference to this joint, not because it was my wish to foster or bring to the front any particular patent, but as there appeared to be an especial interest manifested in it, and as far as lay in my power to oblige our worthy Secretary.

Discussion.

The President—This is a most interesting paper, and Mr. Printz will be glad to have you question him.

Mr. Tracy—Once, when I had occasion to lay about half a mile of mains I was undecided whether I should lay cast iron or wrought iron pipe, but after taking up some wrought iron pipe that had been laid in my streets, I made up my mind I would not lay anything but cast iron pipe. The gasfitters and plumbers tell me that in less than four years

wrought iron pipe is so completely eaten up that they cannot do anything with it. On the other hand, some cast iron pipe which had been down for 40 years, upon examination was found to be in as good condition as could be desired; but the wrought iron pipe was completely eaten out. This pipe which I took out was taken out on account of being shut up by a drip.

Mr. Miller—I think that steel pipe is somewhat summarily disposed of in Mr. Printz's paper. I have had occasion to put in about four miles of steel service pipe in the past year, using pipe from an inch to an inch and a half. I have also bent some of it hot, and cold, for different purposes, and have given up the use of iron pipe entirely for our services. I find that the steel pipe is softer and cuts nicer. Hence you get a better thread, and can do better work with it. I have had no trouble with that as I have had sometimes with wrought iron pipe.

Mr. Forstall—Our experience with steel pipe is much the same as that of Mr. Miller. We have given up the use of wrought iron pipe almost entirely for services in sizes under two inches. All our pipes, up to two inches, are put in of steel. I find it cuts a better thread, makes a better joint, and does not corrode as fast. There has been no trouble from splitting.

Mr. Thomas—One statement in Mr. Printz's paper ought to be explained. He says:

"The following is a telegram from Mr. O. P. Shaffer, Treasurer, Standard Gas Light Company, New York city:

"We find wrought iron gas mains practically stop all leakage. Only leaks we have are on cast iron crosses and sleeves; leakage in cast iron lines in this city averages 14 per cent.; ours does not exceed 1 per cent."

I have always contended that the term "leakage," as usually employed, is a misnomer. It ought to be called unaccounted-for gas. There has been a great hue and cry in New York city of late, especially in the sections in which the subways have been laid, about gas escapes and gas explosions. It is claimed that the subways are little else than gasholders, and the subway builders and controllers claim to be at a loss for the reason of the presence of the gas in their oddly-built construction. Independent authority could easily explain its presence. The carelessness of the subways workmen, when "picking around" the gas mains, accounts for the leakage and escapes. Mr. Shaffer admits there has been a great deal of leakage from the crosses and sleeves of the Standard Company. The fact that there is such a leakage is evident to anybody who has ever been in New York city. Let me say again, in discussing this question of leakage in New York city, I have always claimed, as I claim now, that with pipe well laid the actual leakage therefrom cannot exceed three-quarters and possibly not more than one-half of 1 per cent. I think the total average loss, between generating house and consumers' burners, in New York city, does not amount to 14 per cent., and the unaccounted for gas can be practically traced so as to bring the main leakage down to less than 1 per cent. The Standard Company have been about 2 or 3 years putting their wrought iron pipe down, and I have never seen any place uncovered, where they had put their pipe down, that I could not smell the escaping gas. All the companies suffer alike in that respect. The upper part of the city is underlaid with rock formation, and in putting sewers through the streets (gas mains have frequently been laid in this section before the sewers were put down, and house drain connections are being constantly made) the blasters pay no attention to gas services or mains. Of course, this causes a great deal of loss. With the best quality cast iron pipes, in works that I have managed, we kept our leakage down to about 6 per cent.; and about 1 per cent. of that was chargeable to over-consumption in the street lamps. We uncovered cast iron pipes that had been in good ground for 30 years, only to find them sound and serviceable. Again, as stated by Mr. Printz, in made ground, or in low spots which had been filled up with coal cinders, coal lime, etc., the pipe, which looked perfectly good in the trench, could be cut through with a jack-knife. Our wrought iron services had to be renewed about every seven years. In my experience, in uncovering pipe that had been laid by my predecessors, I found they had used small pieces of wrought iron pipe, to make what we term a "spring," in the top of the main, and I invariably found that they would leak by reason of stretching of the iron. I adopted what I termed the "brass spring," made with a nipple to screw into the main and a socket for the service pipe. After they had been in use for 20 years, and changes had to be made, they have been removed and used in other places. I suppose if in New York the pipe was permitted to rest in the ground as it ought, the main leakage all over the city would not exceed one-half to three quarters of 1 per cent. Gas was introduced into New York city about the year 1824. It has been claimed that the leakage has amounted to about 25 per cent., and that from 1824 up to the present time, that leakage has been stored in the

ground. In laying the subways they put in a bed of cement then place the pipe, next put in another bed of cement, then lay another layer of pipe—they lay three or four layers of pipe and of cement together. Then the pipes are led into manholes, which are built of cement and brick, and made perfectly tight, and there they seal them up as they would seal a preserve jar, yet you cannot go along the street at night without noticing the escape of gas from them.

Mr. J. B. Howard—Some 5 years ago we had occasion to renew our mains for about three-quarters of a mile. The pipes were mostly 6-inch and partly 4-inch. We replaced them with 10 inch. The pipes had been in the ground for 34 years. In looking at the services as they were taken out I noticed that in the black loamy soil, although the pipe had been laid for 34 years, it was still just as shiny in appearance as when first laid, with no deterioration whatever. In sandy soil, mixed with clay, the deterioration was somewhat greater, and in soil that was of pure sand we found the deterioration in some places to be considerable. In fact it was really a wonder how the services had remained tight; but they had. The pipe was coated over with quite a considerable substance of sand, which had become hardened at certain portions of the pipe length. When we knocked that off we found holes in the pipe at the particular spot where the hard substance had collected. We have some pipe in other parts of the city that has been laid over 30 years, and which I have had occasion to tap once in a while—it is a 2-inch wrought iron pipe, and lays on hills where the pressure is great. I have found on tapping it, to put in $\frac{3}{4}$ -inch connections, that it is just as sound to day as when it was laid. It is of course somewhat discolored, but there does not seem to be any deterioration. This, I think, is due entirely to the peculiar nature of the soil. As to the durability of wrought iron pipe, I think that depends altogether upon the locality where it is laid.

Mr. Egner—I am not authorized to speak for Mr. McMillin (some of you may be pleased to hear that he has arrived safely on the other side of the Atlantic), but I will say when we undertook to readjust our mains, Mr. McMillin (who is the President of the Company, and an able gas engineer, as you all know) called his heads of departments in consultation and he remarked that he would not lay any cast iron pipe over certain sizes. We were about to lay $3\frac{1}{2}$ miles of main from one of the works to the station, to be used just for pumping gas from the works to that station. We decided to try wrought iron pipe. We have laid most of that now. I know that after a little more than a mile had been laid we put the pressure on this pipe with a Westinghouse air pump, up to about 10 pounds per square inch, in the evening, and let it remain so until the next morning, and it did not seem to have leaked any. As to the relative cost and durability I can only speak from hearsay; but I know that Mr. McMillin seems favorably impressed with it, and has determined that we shall not lay any more cast iron pipe of less than certain sizes. I simply desire to tell you what we have done, and why we have done it, and what we know about it. I cannot speak about the durability, nor can I say anything about the cost just now; but I can say that what we did lay was remarkably tight.

Mr. Ramsdell—On that same topic I would say I was in St. Louis recently when this subject came up, and Mr. McMillin made the same remark to me that he made to Mr. Egner. He also stated recently in Ironton, Ohio, he saw some wrought iron pipe taken out which had been laid 17 years before, and that the pipe was in an almost perfect condition. I got an impression from what he said about it that that had something to do with his decision.

Mr. Lansden—I may say, for the benefit of those who may want to test this question, that sixteen years ago I acted as engineer in construction of the works at Chippewa Falls, Wisconsin, and that we laid wrought iron pipes in sandy soil. I know nothing about how they have lasted, but those desiring information can ascertain by writing to the works. I laid wrought iron pipe entirely.

Mr. Tracy—I would like to ask Mr. Printz if, after looking at that pipe, he would advise me to lay half a mile of 3-inch wrought iron pipe.

Mr. Printz—I would not advise you to lay 3-inch wrought iron pipe unless it was protected from the impurities in the soil. You certainly have soil there of a nature that would be destructive to wrought iron pipe.

Mr. Tracy—My specimen example was not taken at one special place, but from different parts of the city. I find it on the hills as well as in the low places; and my services I find are in the same condition. I am protecting my services with a coating of two-thirds tar and one-third naphtha, mixed together. I paint them over with that, but whether it will eventually preserve them or not I do not know.

Mr. Odiorne—A great deal of leakage is attributable to the joints. I use lead joints, and find that they are perfectly tight. If there is too great a strain on the pipe it will break square off before the joint will

give. I think if Mr. Tracy is obliged to use cast iron pipe, it would be a good idea to investigate the cement joints.

Mr. Tracy—I have used cement joints for years. I use four parts of cement to one of lead—I use one of lead for expansion—and never have any trouble with the joints.

Mr. Scofield—Some years ago I adopted the plan of laying my pipe during hot weather, in the summer, and coating them with coal tar, and I find that it makes a thorough coating, and is a real protection. I have taken up pipe which has been down for 12 years, and I find the coating as perfect as when it was put down.

Mr. Printz—I think our President has had some experience with the use of wrought iron pipes. I notice he has coated wrought iron pipe with coal tar, heating the pipe by passing steam through it, and then coating with tar. I saw his services put down in that way.

Mr. Somerville—I think you will remember that in Cincinnati all the stand-pipes were of wrought iron; and anyone here who is connected with that works would oblige me by telling how the stand-pipes have stood. I have been laying wrought iron pipes for 20 years, and they are still just as good as new. I do not see why stand-pipes should be affected in that manner by crude gases, for the same crude gases have to go through the hydraulic mains as well as through the stand-pipes and through the scrubbers; and yet you know that the scrubbers last as long as most of us wish them to.

Mr. Forstall—I cannot give Mr. Somerville any information about Cincinnati, but I can say that in Chicago we have wrought iron stand-pipes that have been in use for 6 years; and the last time they were taken down, when we reset the benches, they were apparently as good as new. We have used the same stand-pipes right straight ahead, and have not had to renew any of them.

Mr. Lansden—I will say that the Company I am connected with tried wrought iron stand-pipes for several years. We had a good deal of trouble immediately at the mouthpiece. Five or ten per cent. of them would have holes formed within 18 or 20 inches of the mouthpiece. We are now putting in cast iron entirely whenever one of them gives out.

On motion of Mr. Tracy the thanks of the Association were voted to Mr. Printz for his excellent paper.

APPOINTING THE SPECIAL COMMITTEES.

The President—I desire to announce the appointment of the following special committees:

Committee of Arrangements, Louisville Meeting.—Messrs. A. H. Barret, Jas. Somerville and Geo. H. Wells.

Committee on Place of Meeting, 1892.—Messrs. Geo. G. Ramsdell, J. B. Howard and Irvin Butterworth.

VOTES OF THANKS.

The President having announced that the regular business order had been finished, Mr. Lansden moved that a hearty vote of thanks be passed to the President for the able manner in which he had directed the meeting. The motion was seconded by Mr. Tracy, put by the Secretary, and adopted unanimously amid great applause.

In reply to the compliment, President Faben said: Gentlemen, I can simply say that I thank you. It was with great misgiving that I attempted the task. If my efforts have pleased you I feel more than rewarded by the happy manner in which you have recognized them.

Mr. J. B. Howard—If we were to leave this room without thanking our worthy Secretary we would be very remiss. I, therefore, move a vote of thanks to our worthy Secretary for his indefatigable attention to his duties.

The resolution was adopted by rising vote, and Secretary Littleton responded in his usual clever fashion.

REPORT OF COMMITTEE ON RESOLUTIONS.

The Secretary read the following report from the Committee on Resolutions:

Mr. President and Gentlemen of the Association: Referring to the programme (which, by the way, is in itself a work of art), your Committee find the names of the Committee of Arrangements, also the names of the Reception Committee—we will not undertake here to enumerate the names of the committees, but will quote the concluding sentences of the programme, which are as follows: "The various entertainments are given with the compliments of the above named gentlemen and the concerns which they represent." Those of us who have been in St. Louis on occasions similar to this before, know something of the hospitality and entertainment that can be developed here. The programme and the names of the committees would lead to the belief that the old spirit still lives, and that this gathering of the Western Gas Association will have occasion, as in former times, to carry to their homes many pleasant mem-

ories of the 13th annual at St. Louis. We, therefore, propose that the hearty thanks of this Association be tendered to the Committees of Arrangements and Reception and the concerns which they represent.

EDWARD LINDSLEY,
WALTON CLARK.

On motion of Mr. Jenkins the thanks of the Association were voted to the Committees of Arrangements and Reception, as proposed in the report.

The convention then adjourned.

Modern Measurements.

Our English contemporary *Invention* remarks that the progress of measurements in modern times was aptly illustrated in an address recently delivered before the Engineers' Society of Western Pennsylvania, as reported by the secretary of that society. Progress is to-day, he said, written upon every page of the world's record, and particularly in the realms of science is it making its unmistakable mark, from thence extending outward to the vast range of correlated studies that go to make up the sum of human knowledge and economies. In astronomy and astronomical engineering, in physics and chemistry, in civil and mining engineering, in meteorology and in metrology and in mechanics, to say nothing of many other branches of science, do we find progress as the watchword and the theme that excites and moves the human brain to grander and better achievements. The day has forever passed when we are willing to say or believe that "three barleycorns make one inch." Nor is the advanced mechanic of to-day satisfied with his boxwood rule, graduated to thirty-seconds of an inch, save for the coarsest approximate measurements; but he must have his standard graduated to $\frac{1}{100}$ inch for his coarse measures, and his micrometer gauges reading to $\frac{1}{1000}$ for ordinary work. Even in our iron and steel works, the old-time wire gauge, that for a long time held its own, has been displaced by the micrometer gauge of infinitely greater accuracy.

Prof. Wm. A. Rogers has shown that many of our modern mechanics can caliper to $\frac{1}{30000}$ of an inch. These, however, are coarse, rough measures when compared with others that may be mentioned. In the domain of astronomical measurements great progress has been made of late years; by the use of refined instrumental means, as well as the many methods devised for the elimination of instrumental errors, divisions of the meridian circle have been brought to astonishing accuracy.

The various enlightened and civilized nations have standards of weight and measure that have slowly been evolved from the cubit, the span, the finger length and the barleycorn, if you please.

Nations have their standards. On what are they based? The French meter is presumed to be $\frac{1}{10000000}$ of the earth's quadrant, the English yard evolved from the barleycorn, etc., but the measurements of precision in our day demand an indestructible, absolute and unalterable basis for our standards, so that if they all be destroyed the original is still available. Prof. Michelson has chosen a wave length of sodium light as the basis for a new standard, a something that will remain forever of the same absolute linear value. Now a wave length of sodium light is, roughly speaking, about $\frac{1}{42000}$ of an inch long. Now, as this is an appreciable figure, it is evident that any method proposed to measure its absolute value must be of the highest accuracy. The method devised by Prof. Michelson in the refractometer has certainly brought the work to marvellous perfection. He has shown that the error was not greater than 1 part in 2,000,000, and possibly would be made not greater than 1 in 10,000,000. Gentlemen, can you appreciate such a quantity? Yet here is a physicist, with a high ideal of perfection, taking the pulsations that are sent earthward by the sun, and by methods within the reach of human skill, actually recording them upon a standard bar immersed in a freezing mixture, and giving us a universal standard based upon the absolute value of a wave length of light.

We have to thank Sellers, Bement, Warner, and Swasey and others, for their valuable contributions of metrology, and their standards of various kinds that have contributed so much to advance the mechanics in this country. The standard measuring devices made by Brown and Sharpe have become a power for accurate work. The standard gauges of the Pratt & Whitney Company now find an honored place in all high-class machine shops; and our American machinists are greatly indebted to the labors of Prof. W. A. Rogers and Mr. George M. Bond, who designed and carried into execution that wonderful instrument of precision called the Rogers-Bond comparator, from which has emanated many standard tools, and has assisted so largely in the introduction of interchangeable parts in American machinery. It is true that human brains must have a limit to their capabilities; but where shall we place

that limit? Watt gave us the horse power as the unit of measurement, Joule gave us the better one of the foot-pound unit; King Henry's arm may have served for the long measure, and the barleycorn for the short measure, but the meter and the micron are infinitely superior; yet we still hope for better standards, and are now reaching out for waves of radiant energy from which to make them, and which shall remain as constant as the universe, "whose builder and maker is God."

SPECIAL ENGLISH CORRESPONDENCE.

COMMUNICATED BY NORTON H. HUMPHRYS.

SALISBURY, June 10, 1890.

The Gas Institute.—The Labor Question.—Sulphur Recovery.—Improvements in Sulphate Apparatus.

The final programme for the Gas Institute meeting next week has just been issued, and affords even greater promise for the ensuing meeting, than I ventured to indicate two months ago. The list of papers comprises eleven, including almost every subject of current issue to the gas industry. Three papers deal with gasholder construction, one with stoking machinery, one with the labor question, one with inclined retorts, and the remainder with sulphate of ammonia, the extension of the gas companies responsibility to fittings beyond the meter, oxygenated oil gas, illuminating water gas, and the supply of electricity by gas companies, respectively. The proper discussion of all these subjects will fully and profitably occupy the time at disposal. The public part of the proceedings is on an equally substantial scale, comprising a smoking concert, a musical *soiree* with a dance afterwards, a visit to a rose show, an open air promenade concert and a steam boat trip around the Isle of Wight. Altogether the programme is the best that has ever been set before the members of the Institute, and reflects the greatest credit on all concerned in getting it together, and especially on the President, Mr. Geo. Garnett, who has had the lion's share of the work.

Amongst the matters treated in the report of the Council to be presented at the meeting, will be an acknowledgement of the kindness and courtesy extended to a party of some 120 members of the Gas Institute, by the French Gas Engineers, on the occasion of their visit to Paris at the close of last year's meeting. The Council will also give their reasons for wishing to incorporate the Institute as a limited company under the Companies' Acts. An extraordinary meeting will be held at the close of the general business, for the consideration of this question. Of the members removed by death during the year, special reference will be made to the late Mr. G. W. Stevenson, and the late Mr. Lewis Thompson. It is proposed that the Birmingham medal shall be awarded to Mr. Thos. Newbigging. The Institute now numbers 649 members of all classes.

The labor question has again come to the front in London, and this time it is on the North side of the Thames. In this case, also, the policy of the leaders of the laborers and stokers Union has been to promote distrust, antagonism and insubordination on the part of the men towards their employers. Mr. John West had fitted up a retort house at Beckton with his patent stoking machinery, and agreed with the Gaslight and Coke Company to work it for a time under his own superintendence. Having arranged all in readiness for a start, and engaged a gang of stokers, he was met by the refusal of the men to carry out their engagement. Acting under the advice of their Union, at the hour for commencing work, and not before, the men announced that they would not work unless paid 5d. a day more than the sum agreed upon. The object of this advice is not very apparent, seeing that the only difference it made to Mr. West was that it hindered him for an hour or two. There were plenty of men about who lost their regular employment at the strike at the South Metropolitan last winter, and were only too glad to get into work again. One of the leaders of the Union, in commenting upon the defeats experienced in Manchester and London last year, stated that the next strike would be a momentary one, and that the men would throw down their tools without notice, and take the consequences of breaking their engagements. If this was intended as a trial of such an illegal mode of action, the result must be anything but satisfactory to the Union, as neither the members nor the policy of the Union has been benefited in the least. Mr. West is now carrying on his operations satisfactorily with non-union men, but he has found it necessary to provide special accommodation for them on the grounds, and to have extra police protection. The necessity for this arises, however, more on account of the personal feelings of individual members of the Union, rather than for any organized plan of individualism; though it must be said that a Union that would not hesitate to instruct its members to defy the law in one way, is not likely to be scrupulous about breaking it in another, if it suited the purpose in view to do so.

The Union, to be consistent, ought to welcome and support anything in the way of retort house machinery, seeing that when appealing to public sympathy last year, a great deal was said about the sweltering atmosphere of the retort house, the necessity for working like madmen in order to escape the raging fury of the flames, and the work being so exhausting as to make a man old at the age of 40. They ought therefore, to publicly recognize Mr. West as a benefactor in trying to devise a practical remedy for such a wretched state of affairs. But actions speaking louder than words, and although they make great protestations about not being antagonistic to machinery, it is quite evident that they do not intend to facilitate its introduction in any way.

This matter, however, is only a little side skirmish. The main point of dispute is the fact that the Directors of the Gas Light and Coke Company are endeavoring to make such arrangements as shall preserve them from the misfortune that befell their neighbors last year, and which, besides costing some £50,000 or more, involved a great deal of inconvenience to the consumers. In this they are to be commended, as recognizing the irresponsibilities both to the consumers and to the shareholders, and seeking to meet them. But this, of course, does not suit the Union, who wish to get a grip upon every board of gas directors in the kingdom. Once possessed of such power they would not hesitate to use it on any and every possible occasion, and no body of employers would be safe for two days together. The Directors propose that every workman in their employ shall sign a monthly agreement. The first clause specifies that notice to terminate the engagement must be given on the same days of the month as that on which the agreement commences, in writing. The second provides for the summary dismissal of the workman without notice in case of drunkenness, neglect of duty, insubordination, or other misconduct. According to the third, the workman agrees to observe all instructions, rules and regulations issued under the authority of the Company; and the fourth agrees that duties shall be performed in a proper manner, at the customary rates of pay. The men are to be offered an opportunity, through their representatives, of discussing the terms of this agreement, and while not objecting to meet the men by modifications in details, the Directors must hold firmly to the main principles of the agreement as absolutely necessary to the proper carrying out of the undertaking.

The sulphur recovery process, by which is meant the precipitation of solid flowers of sulphur from any gas that is rich in sulphureted hydrogen, is becoming quite a recognized thing. It has already been adopted by the leading alkali manufacturers, and is rapidly making its way in large gas works, as a means of treating the waste gases given off during the manufacture of sulphate of ammonia. The general plan in small works is to pass the gases coming off from the saturator through an oxide purifier, whereby the sulphureted hydrogen is absorbed, and in a sense utilized, since the sulphur can be extracted from the spent oxide. Turned to account in this way, however, the cost of conveying the material to the chemical works, and other charges, leaves very little profit to come in from this source to the gas undertaking; and therefore the Claus kiln and settling chamber are considered to be preferable. In Lancashire, especially, the erection of sulphur recovery apparatus is proceeding with energy, and at a gas works in the Midlands, nearly 1 cwt. of sulphur is obtained for each ton of sulphate made. This represents $1\frac{1}{2}$ pounds of sulphur from each ton of coal. Various difficulties, that at first proved a great hindrance to the adoption of the Claus apparatus, are gradually being done away with, so that the next few years will see its general introduction, for it is simple, and when properly under control, automatic in its operations. A proper quantity of air is mixed with the waste gases, according to the proportion of sulphureted hydrogen present, and the mixture is passed into the kiln, which is simply a small chamber about a foot or so each way. Here the sulphureted hydrogen is decomposed with separation of the sulphur in the solid form. The latter is deposited in large condensing chambers provided for the purpose, from which it can be removed at convenient intervals.

The last few years have also seen considerable improvements in the apparatus for manufacturing sulphate of ammonia in gas works. The plain boiler, with which intermittent work only is possible, since it must be emptied when exhausted, and fitted with a fresh charge of liquor before a fresh start can be made, is gradually giving place to improved forms of still, several makes of which are in the market. In one respect these new stills all agree, and that is in being worked continuously. The liquor flows in without cessation, so long as the apparatus is at work; it may be for several weeks if desired. The whole process thus proceeds with perfect regularity. There is no need for the cumbersome overhead tank, large enough to hold the fresh charge for the boiler, or for a cooling tank to receive the exhausted charge. The liquor flowing in regularly, can be pumped direct from the store well as wanted, and as

the effluent passes off with equal regularity, a large stock of it at boiling heat does not accumulate, and it can be readily disposed of as fast as it is made. Recently an improved automatic discharger has been introduced, by means of which the sulphate is raised from the saturator to the draining board.

If this invention will work properly it is likely to be valuable, as at present one man's time is almost entirely occupied in fishing the sulphate out as fast as it is formed with a perforated bowl fixed to a handle; and the continual rubbing and scraping of the bowl on the bottom of the saturator wears out that part much sooner than would otherwise be the case. Steam has almost entirely replaced the open furnace as a means of heating up the liquor for distillation. Sulphate apparatus is also being introduced into the smaller sizes of gas works with advantage, and it is now no uncommon thing for a works carbonizing only 400 or 500 tons of coal a year to have its little sulphate apparatus. Under these circumstances 4 or 5 tons of sulphate can be made per annum at a profit of at least \$20 per ton, whereas formerly the liquor realized practically nothing.

Assay of Coal.

A contemporary, in a sensibly-prepared article on this subject, says that those who are prospecting after coal often have difficulty in determining to what class their finds belong. The principal varieties of coal are as follows:

Anthracite or hard coal—hardness, 2 to 2.5; specific gravity = 1.32 to 1.70. Contains volatile matter after drying, 3 to 6 per cent. Contains carbon 80 to 95 per cent. It has a high luster and burns without flame, as it contains little or no bitumen. It is totally devoid of impressions of plants, and is, geologically speaking, the oldest of all kinds of fossil charcoal, and is regarded as the last stage of carbonization. It yields from 1 to 7 per cent. of ash, but 3 per cent. may be called the average.

Brown coal, or lignite, much of which is found in California, contains from 57 to 70 per cent. of carbon, and represents the first stage of carbonization, being a coal of comparatively recent formation. It is composed of fossil plants more or less mineralized, and when burnt evolves much smoke and affords a dull flame, generally yielding a large quantity of ash. It contains from 2 to 19 per cent. ash.

Caking coal is a bituminous coal, which softens and becomes pasty in the fire, and after the heat has become continued for a time, the volatile ingredients are driven off, and a grayish-black fretted mass is left. The coke obtained from this coal varies from 50 to 85 per cent.

Non-caking coal resembles the above in its external character, but burns freely without softening or showing any appearance of incipient fusion.

Cannel coal is a bituminous coal which generally cakes. It is compact, with little or no luster, and has a dull black or grayish-black color. On distillation it affords, after drying, 40 to 66 per cent. of volatile matter. When held in the flame of a candle it easily ignites, burning with a steady, bright flame. It is used extensively for making illuminating gas, of which it affords a better quality than any other species of coal.

It is well to know that no very extensive apparatus is required to determine many points about coal. It can be examined and its commercial properties determined by the blow-pipe with great accuracy. Mr. Geo. Attwood (eldest son of Melville Attwood, of San Francisco), in his work on "Practical Blowpipe Assaying," gives the following methods of determining the character and properties of coal, by means of the blowpipe:

The assay is divided into five heads.

1st. The moisture determination.

Select from the mass of coal to be examined a few lumps representing as nearly as possible the average quality. Crush them up in the agate mortar into small pieces about the size of a mustard seed.

Weigh out 5 grains, place in a small porcelain dish, and dry at a gentle heat over the spirit lamp. Hard coals sometimes fly when heated, so it is best to cover the dish with a watch-glass while heating. After about 5 minutes, remove the assay and weigh; then repeat the heating and again weigh. As soon as the weights agree the assay is ready to be converted into coke. Plattner states that the percentage of moisture is lowest in anthracite; in bituminous coals it is usually 3 to 4 per cent., seldom 6 to 7, and reaches its maximum in lignite and brown coals, which contain 20 per cent. and sometimes more.

2d. Determination of the coke production.

Take the dried coal and remove to a clay or platinum crucible, and cover with a small roasting clay dish or platinum cup. Place the crucible on a triangle of platinum wire on the blowpipe stand under the flame, using alcohol, and cover it with a small sheet iron funnel (the

same that is used in roasting copper ores). The heat is continued until all the volatile gas has escaped, when the assay generally will appear to possess a fused, porous appearance, and to have a metallic luster.

The coke so made is now removed and weighed. It should be weighed quickly, as coke absorbs moisture from the air rapidly. The coking takes about 10 minutes, and the crucible should not be allowed to get beyond a red heat.

3d. The estimation of the amount of ash.

After the percentage of coke has been determined, remove the assay to a small clay or platinum capsule, and, without using a cover, again heat over the lamp—this time to a bright red color—until all the carbon has been consumed. The operation is much facilitated by occasionally stirring the assay with a piece of platinum wire, also by applying the blowpipe flame to the bottom of the cup when the assay is nearly finished.

If alcohol cannot be obtained, the assay for coke and ash can be conducted in the chareol furnace by using the blowpipe flame, as in the copper assay, and if the ash amounts to more than 5 per cent., the value of the coal is much diminished. If the ash presents a brown, red, or gray color, sesquioxide of iron has been formed by the oxidation of the pyrites in the coal.

4th. Determination of the absolute heating power by Berthier's process.

Take an average sample of the coal and crush it up to the finest powder. Weigh out 0.3 grain of the coal dust and mix it with 12 grains of oxychloride of lead, and after placing the mixture in the crucible cover it with an additional 12 grains of oxychloride of lead.

Oxychloride of lead fuses more readily than litharge; therefore, owing to the large quantity of material which must be brought into a state of fusion in this determination, it is employed instead of litharge.

The assay is next covered with a little powdered glass, also with a few spoonfuls of borax glass. A clay cup is placed over the crucible, and the assay is then fused in the chareol furnace in a similar manner to the silver assay when litharge is used.

About 7 or 8 minutes suffice to melt the assay, and the lead button produced by the carbon in the coal acting on the lead oxychloride will be found lying upon the bottom of the crucible when the assay is cool and the crucible is broken.

The weight of the button, when cleaned from the slag, divided by 20, gives the quantity of lead that one part of the fuel under examination can reduce; and since one part of carbon reduces 34 parts of lead, the heating power of the fuel may be easily ascertained. The amount of lead reduced by one part of coal varies with the different pit coals between 21 and 32 parts, with the lignites between 16 and 25 parts. In making this assay the heat must be applied at first very gradually, and afterward increased to a bright redness.

Dr. Ure's experiments, published in the "Supplement to the Dictionary of Arts, Mines, and Manufactures," have appeared to be unsatisfactory in regard to the accuracy of Berthier's method. Mitchell, however, has found the method correct, and the author has found it equally so. The lead oxychloride should always be pure.

5th. Estimation of sulphur in a sample of coal.

Sulphur generally exists in coal as a sulphide of iron, and as the presence of more than 2 per cent. of sulphur depreciates the market value of coal, owing to its destroying the iron boilers and grates under and over which the coal is consumed, is always an important part of the examination of coal to ascertain the quantity present.

Mitchell, in his "Manual of Practical Assaying," recommends the following process:

Take one part of the finely pulverized coal and mix with 7 to 8 parts of niter, and 16 parts of common salt, and 4 parts of carbonate of potash, all of which must be perfectly pure. The mixture is then placed in a platinum crucible and gently heated at a certain temperature; the whole ignites and burns quietly. The heat is then increased until the mass is fused: the operation is finished when the mass is white. It must, when cold, be dissolved in water, the solution slightly acidulated by means of hydrochloric acid, and chloride of barium added to it as long as a white precipitate forms. This precipitate is sulphate of baryta, which must be collected on a filter, washed, dried, ignited, the filter burnt away, and the remaining sulphate of baryta weighed; every 116 parts of it indicate 16 of sulphur.

The above described methods of examining coal are all that are required for commercial purposes. The assay may be carried on still further by estimating the iron oxide contained in the ash. The ash can also be examined qualitatively for silica, lime, soda and potash.

THE proprietors of the Ilion and Mohawk (N. Y.) Gas Company have commenced work on their proposed electric lighting annex.

ITEMS OF INTEREST FROM VARIOUS LOCALITIES.

THE charter of the Hempstead (L. I.) Gas Light Company has been renewed for 30 years, and a special meeting of the shareholders will be held on the 14th prox., the object of the same being to vote on a proposition to increase the capital stock to \$25,000. It is likely that important plant betterments will be arranged for at Hempstead this season.

Mr. W. H. HAYDEN has resigned the Superintendency of the Fishkill (N. Y.) Gas Company's plant in order to accept the position of Manager and Superintendent of the works at Schenectady, N. Y.

PRESIDENT D. T. ROOTS, of the P. H. & F. M. Roots Company, of Connersville, Ind., writing under date of June 19th, says: "We are glad to report that our exhauster business is beginning to look up. Our business in foundry blowers, rotary pumps, forges, etc., has been very good at all times, but at the beginning of the year our exhauster trade was not what we expected. We now look for a good trade during the rest of the season, as inquiries are very much better than at any time of the year. Below we give some of our recent orders: Wheeling (West Va.) Gas Light Company, one exhauster and engine combined on same bed-plate, with gas and bye-pass valves, pipe fittings, governor, etc., capacity, 1,500,000 cubic feet per day; Florence (Ala.) Gas Company, one exhauster (valves, fittings and arrangement same as at Wheeling), capacity, 300,000 cubic feet per day; Shreveport (La.) Gas and Electric Light Company (same as above) capacity, 160,000 cubic feet per day; Chillicothe (O.) Gas Company, one exhauster (as before), 160,000 cubic feet per day; Galesburg (Ills.) Gas Company, one exhauster and engine combined, capacity, 300,000 cubic feet per day; Portsmouth (O.) Gas Company, one exhauster, capacity, 160,000 cubic feet per day; Brunswick (Ga.) Gas Company, one exhauster and engine combined, capacity, 100,000 cubic feet per day; Macon (Ga.) Gas Light Company, one exhauster, capacity, 675,000 cubic feet per day; Litchfield (Ills.) Gas Company, one exhauster, capacity, 160,000 cubic feet per day; Fort Worth (Texas) Gas Company—order given by Bouton Foundry Company, of Chicago—one exhauster, etc., capacity, 675,000 cubic feet per day." That certainly looks like business.

ON and after July 1st the Providence (R. I.) Gas Company will sell gas at the rate of \$1.30 per 1,000 cubic feet. At least so we have been informed by Treasurer A. B. Slater, who is pretty good authority on such matters.

THE holder tank of the Metropolitan Gas Light Company, of Elizabeth, N. J., was to have been finished last week. The people in interest claim that the backward state of the storage construction is all that prevented them from supplying gas before this date.

MESSRS. J. M. CRITCHLOW, Edwin Fuller and F. W. Perkins, as Liquidating Trustees of the American Gas Improvement Company, through their attorney, Mr. D. F. Patterson, 96 Diamond street, Pittsburgh, Pa., have published the following notice of dissolution: "Notice is hereby given that the American Gas Improvement Company, Limited, a partnership association organized under the Act of Assembly of June 2, 1874, and its supplements, at a regular meeting of its members, at which all its shareholders were present, resolved by unanimous vote to dissolve said association, and elected the undersigned Liquidating Trustees to settle its affairs. All persons indebted to said association will please make immediate payment, and all persons having claims against the same will please present them to the undersigned, who will proceed at once to settle its affairs and distribute its assets under the direction of the Court of Common Pleas, No. 1, of Allegheny county."

THE "Chicago capitalists" in control of a certain fuel gas process, acting in concert with "Asheville (N. C.) capitalists," are said to have organized in Asheville the North Carolina Fuel Gas Company, with a capital of \$50,000. It is said they intend to construct a fuel gas plant at Asheville, which proposition is eminently absurd.

A CORRESPONDENT at Albany, N. Y., writing under date of June 23, says: "I note your reference to the proposed winding up of the affairs of the Troy (N. Y.) Electric Light Company, and forward you the following particulars concerning the same: On the application of Mr. Anthony N. Brady, of Albany, and Chas. E. Davenport, of Troy, a majority of the Trustees of the Troy Electric Light Company, Justice Fursman has granted an order for all persons interested in the corporation to show cause before R. C. Jenness, Referee, at the office of Smith & Parmenter, September 19, why the corporation should not be dissolved.

Parmenter and Smith are attorneys for the petitioner, and the moving affidavits made by Messrs. Brady and Davenport allege that the corporation is insolvent and unable to pay its debts. The assets of the Company are given at \$165,666.67, inclusive of \$32,000 in real estate, \$31,920 in machinery and tools, and \$79,980 in electric dynamos, wires and other apparatus. The liabilities are given at \$346,284.38, and this includes the following indebtedness: Travelers National Bank, New York, \$5,000; Union Bank, Troy, \$21,000; National Bank, \$18,000; Central Bank, \$15,000; D. Powers & Sons, \$18,000; Troy City Bank, \$10,000; National Park Bank, New York, \$20,000; Thomson Houston Electric Company, \$7,500 1st mortgage bonds, \$57,000 2d mortgage, and \$30,000 mortgage on real estate, with \$9,000 interest. The stockholders of the Company and the amount of stock are given as follows: E. Murphy, Jr., \$1,000; E. W. Hydorn, \$4,000; J. Bartlett Hydorn, \$2,000; John E. Healey, \$2,000; A. N. Brady, \$104,200; John B. Powell, \$20,200; G. Robertson, Jr., \$2,000; M. R. Mosher, \$2,600; M. A. Tierney, \$5,000; W. F. Walsh, \$1,500; J. C. Minahan, \$500; J. D. Robinson, \$1,500; Frank B. Abbott, \$2,000; Dennis Maloney, \$5,000; C. E. Davenport, \$1,000. Mr. Brady purchased the stock of Mr. A. E. Powers, President of the Company, and the above order and proceedings were necessary to complete the formal transfer of the property to Messrs. Brady & Davenport, who represent the Troy Gas Company, which succeeds to the property of the Electric Light Company."

A CORRESPONDENT at Evansville, Ind., under date of June 21, writes: "Evidence of the very substantial growth of our city is found in the extension that will shortly be commenced by the Evansville Gas and Electric Light Company. Additional territory has been purchased by the Company in Heidelbach and Elsas' Enlargement, for the extension of its already large electric plant. The business has grown to the full capacity of the works, and the demand upon the resources of the latter is such as to warrant the betterment arranged for. A new building will be erected, the contracts for same having been let to Bedford & Wiechel and Bippus & Kanzler for the brick and carpenter work, respectively. The new structure will cost about \$5,000, and will be constructed on modern lines. A 500-horse power engine will be installed in the new house, and, together with the cost of the electrical apparatus in connection with the plans, an expenditure of \$100,000 will be involved. This electrical station will probably be the largest in the West, with the exception of that at St. Louis. It gives me great gratification to be able to add that ground has also been broken on adjacent property at the gas works for a tank to hold a gasholder with a capacity of 1,000,000 cubic feet. The site of the new holder is just opposite the present plant, on block 113, Lamasco. The cost of this will not fall short of \$50,000. The city has grown fully up to the present capacity of the works, and these extensions are quite in line with the practice of the enterprising men—home capitalists, too—in control of the artificial lighting supply of Evansville."

THE contract for the new stock house (which is to be of iron) of the Isabella Furnace, at Barneston, Pa., has been awarded to the Berlin Iron Bridge Company, of East Berlin, Conn. The Bridge Company's design calls for the construction of an iron house, 54 feet in width by 100 feet in length, so arranged that loaded trains can pass beneath the structure. The Company is figuring on some retort house roof work.

ABOUT a fortnight ago two workmen entered a gas tank at Superior, Wis., that had been unused for 12 years. No attempt at ventilation had been made, and it was by the merest chance that the experimenters were rescued from death by suffocation.

BROTHER JUDGE, of the Rock Island (Ills.) Gas Company, is at his old trick of reducing gas prices, as he informs us, under date of June 18th, that, beginning with June 1st, an additional discount of 25 cents per 1,000 cubic feet will be allowed on all gas consumed at any residence where a gas cooking range is actually in use. This means a net charge in such situations of \$1.50 per 1,000. Good judgment, that.

THE Charlestown (Mass.) Gas Company is making a very extensive series of improvements on its electric lighting plant. The betterments include an additional Armington & Sims engine, and a new boiler house (with an imposing chimney) rated to the satisfactory placing of 1,000-horse power. After a careful trial of different boiler settings the Company has determined to set the new boilers over the well-known Jarvis patent furnace, Mr. Neal being satisfied that the Jarvis plan is much superior to the other types tried at the Charlestown works. It looks somewhat superfluous to add that Treasurer and General Manager Neal, who is known to the gas men of this country as an able and conserva-

tive engineer, still keeps up in the front rank. He was one of the first to advocate the combination of gas and electric interests (we, however, still hold our opinion that locality alone can determine the wisdom of such a step), and the rapidity with which the Charlestown attempt has succeeded speaks for itself. Mr. Neal has been ably assisted in his work by his painstaking Superintendent, Mr. Coyle, who had full charge of the laying out and erection of the new plant. Those who visit Charlestown can count on looking over an excellently appointed and complete electric lighting station.

MR. HENRY D. HILL, of St. Louis, says that the erstwhile popular gasoline stove in that section is fast being replaced by the gas stove, and then adds: "With gas at the present rates it is true economy to use it in preference to gasoline, and with the probable introduction at an early date of fuel gas at 45 cents per 1,000, the use of gas stoves will not be confined to the summer months, but the greater part of domestic cooking will be done on them."

THE proprietors of the Las Vegas (New Mexico) Gas and Coke Company are well satisfied with the progress making on the betterment plans, the adoption of which was noted some time ago in these columns. Supt. Hart is our authority for the statement that the electric annex will be in working order by July 15th.

COL. WAGSTAFF, representing the bondholders of the Bay Shore (L. I.) Gas Company, bid in the property (which was offered at sheriff's sale) for the sum of \$5,000. The liens amount to \$30,000. Mr. John H. Golding will act as Superintendent. This ought to be a good place for a gas company, as Bay Shore is quite a pleasuring ground with a desirable class of summer residents, to say nothing of those who reside there permanently.

A VAGRANT flash of lightning at McKeesport, Pa., the other night caused quite a commotion in that usually placid burgh. Having burned out an electric lighting switch on an arc light at a clothing shop on the corner of Market street and Fifth avenue, nature's current found its way to a gas service that led into the house of Dr. Black. The Doctor was considerably worried over the prospective size of his next gas bill, but his mind is now at ease, as Superintendent Neemes, of the Gas Company, promised to "make it all right" if the Doctor would surrender the section of gas service that had been tapped by the electric visitor.

MISS ELLA KINGSBURY the accomplished daughter of Col. William A. Stedman, and Mr. Marion McAllister Smith were united by marriage at Newport, R. I., on the evening of Wednesday, June 18. The wedding took place in the Channing Memorial Church of that city, and was witnessed by a large assemblage of friends of the contracting parties. After the ceremony a reception was held at the home of the bride's parents, in Mount Vernon street, where a supper was served by Pinard. We extend to the newly-married couple our congratulations upon the happy event, and also our sincere wishes for their future happiness.

DEPOSITIONS are again being taken as a preliminary to the third trial of the case of the United Gas Improvement Company vs. the Manchester (N. H.) Gas Company.

WE are indebted to a St. Louis correspondent for the following, respecting the "strike" at gas capital in Quincy, Ills.—we make bold to say that when the Chicago cormorants succeed in bleeding Steinwedell and Littleton, they will have to come to the attack with sharper beaks than those now so prominently exposed: "A joint stock company has been organized by Chicago capitalists, with an asserted capital of \$400,000, to put up an electric and gas light plant and a fuel gas plant for Quincy. The projectors ask the right to make such use of the city's streets as may be necessary for their purpose. The Company proposes to put its wires either above or below ground, as the city shall direct, and binds itself to furnish lighting gas for the next 5 years at \$1.50 per 1,000 cubic feet. It will furnish fuel gas for the next 5 years at \$1 per 1,000, provided, however, that if at the end of two years the total consumption of lighting and fuel gas amounts to 300,000 cubic feet per day then the price asked shall be \$1.25 per 1,000 for illuminating gas and 90 cents for fuel gas; but, in any event, after 5 years the price of gas shall not be more than \$1.25 and 90 cents for lighting and fuel gas respectively." This is a strike, pure and simple; and it will undoubtedly fail of its purpose.

MISS KREMERS, the accomplished daughter of the Secretary of the Milwaukee Gas Light Company, was united in marriage to Mr. H. A. Salzer on the 26th inst.

COLONEL STEDMAN has two months' leave of absence, and will leave Rochester to-morrow for Tacoma, Wash., from whence he will, on July 8th, sail for Alaska. He expects to be back in Rochester about September 1st, and does not expect to establish gas works in Sitka this trip, but will inspect the icebergs in Glacier Bay with a view, possibly, of utilizing their surfaces to reflect Northern lights over into the State of Washington. We hope the Colonel will have fair skies and balmy days as companions on the trip.

OUR contemporary, the *Berliner*, reports the invention of a soft alloy which adheres so firmly to metallic glass and porcelain surfaces that it can be used as a solder, and which, in fact, is valuable when the articles to be soldered are of such a nature that they cannot bear a very high degree of temperature, the composition consisting of finely pulverized copper dust, which is obtained by shaking a solution of copper sulphate with granulated zinc. The temperature of the solution rises considerably and the metallic copper is precipitated in the form of a brownish powder—20, 30 or 36 parts of this copper dust according to the hardness desired, being placed in a cast iron or porcelain-lined mortar, and well mixed with some sulphuric acid having a specific gravity of 1.85. To this paste thus formed are added 70 parts by weight of mercury, with constant stirring, and when thus thoroughly mixed, the amalgam is well rinsed in warm water, to remove the acid, and then set outside to cool; in 10 or 12 hours it is hard enough to scratch tin. On being used it is heated to a temperature of 375° C. and when kneaded in an iron mortar it becomes as soft as wax. In this ductile state it can be spread on any surface, to which, as it cools and hardens, it adheres with great tenacity.

THE Fort Wayne Electric Company has issued the following circular, under date of June 16th, to its shareholders: "Pursuant to the authority given by the stockholders' vote adopted at the recent annual meeting of this Company, its capital stock has been increased by \$1,000,000, divided into shares of \$25 each. By this increase the Company acquires valuable patents, licenses and contracts, besides \$450,000 in cash for working capital. The Company is thereby enabled to make still more complete and effective its present system of arc and incandescent lighting, and to prosecute its business more extensively and successfully than ever before. Arrangements have been made whereby each stockholder of record at the close of June 20, 1890, will have the right to purchase, within the time specified below, one share of the new stock for every three shares of the old that shall then be standing in his name on the books of the Company, the price at which the stock may be so purchased being \$12.50 per share in cash. The rights of purchase pertaining to the new stock are assignable in writing. Fractional parts of shares cannot be issued either to stockholders of record or to parties acquiring 'rights' by assignment; and purchases of the new stock can be made only on 'rights' presented in lots of three or some multiple thereof. Agreements in writing for the purchase of the new shares will be received at the office of the International Trust Company, No. 45 Milk street, Boston, Mass., until and including Wednesday, June 25, 1890, but not afterwards, and the payments must be made to said Trust Company, in cash, on or before Saturday, June 28, 1890, on which day the stock certificates will be ready for delivery. All agreements to buy, though seasonably made and filed, may be declared void by said Trust Company unless the required cash payment shall be made to it on or before said June 28. By order of the Directors of the Fort Wayne Electric Company its transfer books will be closed from June 21 to June 25, both days inclusive.

IT is reported that a controlling interest in the Edison Illuminating Company's proposed plant at Milwaukee is owned by the Milwaukee Gas Light Company, or by certain of the shareholders in the latter corporation.

A SPECIAL from Yankton, S. Dak., bearing date of June 17th, says that a climax in the contest between the local electric light company and the Gas Company has been reached, in that Judge Smith has granted a temporary injunction restraining the city from contracting with the Gas Company for lighting, on the ground that the city cannot incur further indebtedness than exists. The case, which is attracting much attention in the Northwest, will be heard June 26. It seems likely the electric company will fail to secure a permanent injunction. If it is granted the case will be appealed and carried through to the bitter end.

THE Hon. Joseph H. Hanes has been appointed receiver of the assets of the Cape Island (N. J.) Gas Company.

THE Superior Court (Montreal, Canada) has given judgment for plaintiff (J. S. Brown) in the sum of \$631 in his damage suit against the

Montreal Gas Company. Although we gave the main details of the case (in our notice of the filing of the suit) some weeks ago, we herewith reproduce a summary of the same. The suit was for damages owing to the illness of plaintiff's wife from an escape of gas into their dwelling house, No. 13 Bishop street. Judge Gill held that the Gas Company was liable for all the costs Mr. Brown was put to in connection with Mrs. Brown's illness, and for the general discomfort occasioned in his household, especially as the Company was frequently notified to repair the leak from which the gas escaped in the Bishop street main. The Gas Company have a suit in warrant against the city, which they accuse of having done the damage by breaking the main with the heavy street roller.

A CORRESPONDENT at Wheeling, W. Va., says the Board of Trustees of the City Gas Works are bending all their energies at present in the direction of putting the works in first-class condition, and also increasing their capacity. To this latter end 4 new benches of 6 retorts each are being put in, and 12 benches of 6's are being thoroughly overhauled. The gasmaking machinery is also being overhauled, and repairs made to the big \$40,000 holder, which has been leaking for some time back. As far as they are able, the Trustees will put in duplicate machinery at the works, to avoid jeopardizing the gas supply in the contingency of a break-down.

ASSOCIATED PRESS despatches, dated Trenton, N. J., June 24, are to the following effect: "The American Gas Investment Company filed a certificate of incorporation here to-day. The capital stock is \$50,200,000, but only \$10,000 is paid in. The stockholders named are: Geo. S. Bixby and Hector W. Thorne, of New York, and Wm. Talcott, of Paterson. The objects of the Company, as set forth in the charter, are to construct, acquire, own, manage and operate works for the manufacture, distribution and supply of light, heat and power by gas, electricity or otherwise, and generally to carry on any business incidental thereto, and to acquire the stocks and securities of other corporations formed for any similar purpose, and to deal in the same. The charter is worded like that of a trust, and it is believed here to be a reorganization of the Chicago Gas Trust, although it is also stated that it is a venture of English capitalists. The fee for the filing of the charter is \$10,040, the largest the State has ever received.

THE Committee on Public Buildings, Salem, N. J., advertised for bids for lighting the Mayor's office and jail, for the term of 1 year, and in response thereto received tenders from the Salem Gas Light Company and the local Electric Light Company. The former offered to do the work for the sum of \$140, while the electricians asked \$160. The Salem Gas Company secured the award.

THE London *Journal* notes that the *Electrical Review* asks when we are to have a really reliable electric meter, which will be direct-reading, will not increase its records unduly as more current is passed through it, and will be fair alike to user and supplier. There is at present, we are informed, a meter in use which reads direct; but as fresh lamps are added to the circuit in which it is placed, it records an excess of current. Another gives indications which have to be multiplied by a constant, which is, of course, a decimal quantity, and therefore an unknown tool in the hands of the average householder. A third meter is a box of mystery, of the nature of which the consumer is in absolute ignorance, not unmixed with fear. He is told by the official of the electric lighting company who supply the instrument that so many hours' use of the current in the house will be recorded by an increase of weight in a plate inclosed in the box; and he is entirely at the mercy of the company. Consequently, it is no wonder that disputes arise. We know how it is with gas meters and consumers; and the gas meter is not only a positive measurer, while most, if not all, electricity meters are inferential, but it is also cheap and reliable in a degree that arouses the envy and despair of electricians.

THE Fidelity Trust Company, of Philadelphia, has been ordered to pay all money in its possession belonging to the Chicago Gas Company over to Receiver Davies. The latter will on receipt of the cash pay to shareholders the dividend recently declared.

MR. THOMAS E. LILLY, of St. Louis, Mo., has designed a sign to take the place of those formerly displayed on the gas street lamps for identifying the names of streets at crossings. It is a label triangular in form, and made to fit on the top of a post, to which it is fastened by a set screw. The lettering is white on a black ground, occupies two sides of the triangle, and is very distinct. The cardinal letters of the compass are also properly placed. The sign can be fitted to the electric light or telegraph poles.

SUPERINTENDENT WANTED

For a small but nearly new and fairly well built and arranged Gas Works. Qualities required are, first, that the interests of the owners and superintendent shall be identical; second, ability and willingness to work; third, tact to deal with consumers in such a way as to hold trade in spite of opposition. Temperance a pre-requisite. Supt. engaged will have entire charge of plant, including books, with no interference except an occasional consultation with the undersigned. Salary, \$1,200. Address 785-2 C. E. BURROWS, Walla Walla, Washington.

Position Wanted

As Superintendent or Assistant in a Gas Works,

By a man who can give the best of references. Thoroughly understands the manufacture and distribution of gas and the construction of works. Address "D. D.," care this Journal. 785-2

SITUATION WANTED

As Superintendent of a Gas Works,

By a man of 20 years' experience. Best of references. Address JOHN COLLINS, 324 Clinton Street, Schenectady, N. Y. 783-tf

WANTED, A Six-Inch Exhauster.

SECOND-HAND. Must be in good condition. Roots' make preferred. Address POUGHKEEPSIE GAS CO., Poughkeepsie, N. Y. 783-

FOR SALE,

- One 12-Inch Air Condenser.
- One Multitubular Condenser.
- One Anderson Washer.
- Six 12-Inch Chapman Valves.

For particulars apply to NEW HAVEN (CONN.) GAS CO.

FOR SALE,

The Ironwork for Ten Benches of Fives (5's).

Cast iron Hydraulic Main, 16 by 18 in. Stand Pipes, 5 in. at bottom, 4 in. at top. Bridge and Dip Pipes, 4 in. Address DAYTON GAS LIGHT AND COKE CO., 120 East Third Street, Dayton, Ohio. 783-tf

Engines and Boilers For Sale

- Five 80-H.P. Ft. W. Bass Automatic Cut-Off Engines, 12 by 16 in.
- Three 40-H.P. Armington & Sims Automatic Cut-Off Engines, 9 by 12 in.
- One 50-H.P. New York Safety Automatic Cut-Off Engine, 10 by 12 in.
- Four Tubular Boilers, Steel, 16 ft. by 60 in., forty-four 4 in. flues. Full front.
- Two Tubular Boilers, Steel, 16 ft. by 60 in., eighty 3-in. flues. Full front.
- One No. 5 Dean Pump.
- Three Sets J. H. Turner Patent Heaters.

The above are in good condition and in operation. Write for particulars.

JENNEY ELECTRIC LIGHT AND POWER CO., Peoria, Ills. 783-tf

FOR SALE.

GAS LIGHT PLANT,

In a growing town of 5,000 inhabitants. Oil Gas Process. For particulars address LATROBE GAS COMPANY, 784-6 Latrobe, Pa.

FOR SALE.

One 5-ft. Station Meter,

8-inch Connections.

In good order. Price, \$300, L.o.b. at Poughkeepsie, N. Y. POUGHKEEPSIE GAS CO., Poughkeepsie, N. Y. 783-tf

WANTED TO LEASE

A Small Gas Works,

By a practical gas man. Address "W. E. F." care this Journal. 784-8

Proof against Ammonia, and Absolutely Waterproof. Send for Prices and Particulars.

THE GOVERNMENT WATERPROOF PAINT CO., 122 Milk Street, Boston, Mass.

The Hot Water Problem Solved.

The most serious drawback to the general introduction and use of Gas for domestic purposes has been the supply of hot water. The only way of heating water heretofore has been by a separate attachment, which is both inconvenient and adds materially to the expense.

We are pleased to say to those interested that after many experiments we have been entirely successful in making a Gas Range with an ATTACHMENT FOR HEATING WATER AS A PART OF THE RANGE, direct from the burners, while the Range is being used for cooking and general domestic work, in the same manner as water is heated by the ordinary coal or wood range. A large number of these Ranges are now in DAILY USE, GIVING PERFECT SATISFACTION, not only for supplying hot water, but in all other respects. Our price and discounts to the trade are liberal and satisfactory. For further information address

CONNELLY & CO.,

SOLE MANUFACTURERS OF THEIR PATENTED SPECIALTIES.

"IRON SPONGE." Saves money, saves labor, and is the most efficient purifying agent ever offered as a substitute for lime. Now used in every State in the Union, and purifying daily over thirty-five million cubic feet. Should be used in every gas works. Its own saving will pay for it many times over.

AUTOMATIC GOVERNOR. Has been on the market but three years, and in that time has been introduced more generally than any invention ever designed for use in gas works. Over two hundred of them now in use. Sensitive; reliable; perfectly automatic; reduces leakage; satisfies consumers, and gives great relief to the Manager. No gas works is complete without one of these machines.

STEAM JET EXHAUSTER. Designed particularly for small works. Combines Exhaust Tube, Steam Governor Gas Compensator, and Bye-Pass Valves in the most compact form possible; occupies but little space; uses very little steam; operated by ordinary workmen; saves formation of carbon in retorts; increases yield 10 to 15 per cent. Specially adapted for mixing air with oil gas. No works too small to use them profitably.

Prices given on all our specialties delivered at any point in the United States. Correspondence solicited.

A. J. DOTY, Supt.

The utility and convenience of the Gas Engine being no longer an open question, it only remains now for intending purchasers to select the BEST. We claim for the CLERK GAS ENGINE that it is equal to any other manufactured as regards steadiness in running, simplicity, and ease of keeping in repair, and that it gives the greatest amount of power for the least money (both in first cost and expense of running) of any engine made. In support of this claim we refer to the test of the Gas Engines made under the direction of the American Institute of New York, in December, 1885, and heretofore published in these columns. These engines are especially adapted for continuous running under heavy loads, and we can refer to Engines which have run 22 hours a day for months at a time

Made in Sizes of 5, 10, 15, 20, and 25 Horse Power. All Engines Guaranteed for One Year.

PROPRIETORS OF THE

OAKHILL GAS RETORT & FIRE BRICK W'KS

Our immense establishment is now employed almost entirely in
the manufacture of

Materials for Gas Companies

We have studied and perfected three important points. Our re-
torts are made to stand changes of temperature, the strongest
heats of the furnace, and the abrasion of feeding and emptying.
We have the exclusive Agency for the West of the celebrated

**Kloenne-Bredel Full Depth and
Semi-Recuperator Benches,**

And also furnish and build

Our Own Styles Semi-Recuperator Furnaces
for the use of Coal or Coke as fuel.

GENERAL SALES AGENTS FOR

The Youghiogeny River Coal Company's

OCEAN MINE YOUGHIOGHENY GAS COAL.

HON. W. L. SCOTT, Prest.

M. H. TAYLOR, Vice-Prest.

This Colliery is located at SCOTT HAVEN, PA., in the center of the Youghiogeny Gas Coal District, and produces the ONLY RELIABLE YOUGHIOGHENY COAL for gas purposes. (See Map on p. 87 of this JOURNAL, Feb. 16, '85.)

POINTS OF SHIPMENT,

Locust Point, BALTIMORE.

Pier No. 62, PHILADELPHIA.

Also, SOLE AGENTS for the

**BRECKENRIDGE CANNEL,
OF KENTUCKY.**

Within the past two years we have delivered this Cannel to over ONE HUNDRED COMPANIES IN THIRTY-THREE DIFFERENT STATES, and it is now in use in some of the large Gas Works

On the Continent and in South America,

where it successfully competes with the Australian Shale. It is the ONLY AMERICAN GAS CANNEL of sufficiently high grade to warrant EXPORTATION TO EUROPE AND SOUTH AMERICA, and it is the only economical substitute for OIL OR NAPHTHA. ONE GROSS TON will produce

10,000 Cubic Feet of 75 Candle Gas,	} equal to {	750,000 Candle Feet of Gas, and 26 Bushels of merchantable Coke weighing 900 Pounds
or 12,500 " " 60 " "		
or 15,000 " " 50 " "		

This is the ONLY GAS CANNEL that will produce a REALLY MERCHANTABLE COKE. It can be delivered in parcels of one carload or more to any point in the United States or Canada. Cargo shipments of any size required can be made from NEW YORK, PHILADELPHIA, BALTIMORE, or NEWPORT NEWS. Samples will be sent and particulars of price, etc., forwarded upon application to above address.

GAS INTO POWER,

BY THE

OTTO GAS ENGINE.

GAS POWER.—A Source of Revenue to Gas Companies ready to engage in Electric Lighting, building of Water Works, Electric Street Railways, etc.

Coal for producing Gas is less in amount than that for producing Steam, both being measured on an equal amount of work performed. And, further, with Gas,

50 to 90 per Cent. of Value of Coal is Returned

by sale of Coke and Tar, according to the market value of these products.

Labor for handling fuel is reduced, by its becoming centralized and confined to the gas house, and frequently has not increased after the addition of a power station.

With Gas Power, cost of fuel is strictly limited to the time of use.

MANY VALUABLE
AND RECENT
IMPROVEMENTS.

SIZES,
1-3 to 100
HORSE POWER.

Wherever Gas Companies tried Gas Power with Steam Power together in one Station, the use of Steam was subsequently abandoned or restricted, and Gas Power made to take its place.

Where Gas Companies adopt Gas Power for Electric Plants, Water Works, Sewerage, etc., they not only choose the most economical power for their use, but secure to themselves the numerous advantages of increased production, without increase of expense, and benefit thereby their entire manufacture. They induce consumers, by their example, to abandon Steam for Gas Power, and, by establishing special rates, make

Gas Power the Leading Power of To-Day,
AND SOLVE AT ONCE THE QUESTION OF FUEL GAS.

“Otto Gas Engine Works,”
