

DREISONSTOK

## UNITED STATES NAVY DEPARTMENT HYDROCRAPHIC OFFICE

## HES awyer

The following two cases, illustrate the method of working problems with these tables. Case I covers the majority of problems. Sometimes, however, it will be necessary to use Case II.

## Case I (L. H. A. between $0^{\circ}$ and $90^{\circ}$, or $270^{\circ}$ and $360^{\circ}$ )

The U. S. S. West Virginia is making passage from the United States to Montevideo. At about 1650, on March 26, 1928, she was in D. R. position, latitude $31^{\circ} 04^{\prime} .7 \mathrm{~S}$., longitude $49^{\circ} 35^{\prime} .7 \mathrm{~W}$. At this time the sun was observed as follows: Watch $4^{\mathrm{h}} 52^{\mathrm{ma}} 27^{\mathrm{f}} ; \mathrm{C}-W 2^{\mathrm{h}} 47^{\mathrm{m}} 17^{\mathrm{s}}$; chronometer slow $12^{\mathrm{m}} 28^{\mathrm{s}}$; corrected observed altitude $18^{\circ} 16.5^{\prime}$. Required the line of position.

$\begin{array}{ll}\mathrm{h}_{\mathrm{c}} 18^{\circ} & 16.2^{\prime} \\ \mathrm{h}_{\mathrm{o}} 18 & 16.5\end{array}$
$a=0.3^{\prime}$ towards.

## Case II (L. H. A. between $90^{\circ}$ and $270^{\circ}$ )

On May 15, 1928, about $8 \mathrm{p} . \mathrm{m}$. the U. S. S. Mississippi making passage from Hampton Roads to Liverpool, while in D. R. position $40^{\circ} 43^{\prime}$ N., $68^{\circ} 30^{\prime}$ W., observed the star Vega as follows: W $7^{\mathrm{h}} 36^{\mathrm{m}} 12^{\mathrm{s}} ; \mathrm{C}-\mathrm{W} 4^{\mathrm{b}} 59^{\mathrm{m}} 12^{\mathrm{s}}$; chron. $1^{\mathrm{m}} 1^{\mathrm{s}}$ siow. True alt. $14^{\circ} 50.5^{\prime}$.

Price $\$ 1.20$

## STATUTES OF AUTHORIZATION

There shall be a hydrographic office attached to the Bureau of Navigation in the Navy Department for the improvement of the means for navigating safely the vessels of the Navy and of the mercantile marine by providing, under the authority of the Secretary of the Navy, accurate and cheap nautical charts, sailing directions, navigators, and manuals of instructions for the use of all vessels of the United States, and for the benefit and use of navigators generally. (R. S. 431.)

The Secretary of the Navy is authorized to cause to be prepared, at the Hydrographic Office attached to the Bureau of Navigation in the Navy Department, maps, charts, and nautical books relating to and required in navigation, and to publish and furnish them to navigators at the cost of printing and paper, and to purchase the plates and copyrights of such existing maps, charts, navigators, sailing directions, and instructions as he may consider necessary, and when he may deem it expedient to do so, and under such regulations and instructions as he may prescribe. (R. S. 432.)

## PREFACE

These tables were conceived, and the method and formulas deduced, by Lieut. Commander J. Y. Dreisonstok, United States Navy, whilie a member of the Naval Examining Board, Navy Department, Washington, D. C. This officer was later attached to the Division of Nautical Research of the Hydrographic Office, where he completed the calculations and put them into the present form.

Commander F. H. Roberts, United States Navy, of the Hydrographic Office, contributed valuable suggestions and criticisms in the preparation and revision of the book.

Acknowledgment is made for the constructive criticisms submitted by the fleet, the United States Naval Academy, and other sources. The work of revising the fifth edition was performed by Mr. Elmer B. Collins of the Hydrographic Office.

These tables are designed to facilitate the navigation of aircraft and surface craft. Used with the Nautical Almanac, no other books are required.

The method of solving navigational problems here given is applied to all problems regardless of the position of the heavenly body, be it sun, moon, planet, or star. It requires few figures and gives a quick solution for determining (a) line of position, (b) compass error, (c) meridian altitude, (d) Great Circle course and distance, (e) identification of unknown stars. The accuracy of the azimuth data fully justifies its use in obtaining compass error. The tables are simple to use.
Thile a small and handy size is desirable, space is given at the end of the book to a full explanation of the construction of these tables, together with numerous problems, in order that an opportunity for analysis may be afforded those who desire to investigate their soundness and uses.
W. R. Gherardi, Rear Admiral, U. S. Naıy, Hydrographer.

Conversion of Time into Arc and Vice Versa

|  | $174{ }^{\circ}$ |  | $173{ }^{\circ}$ |  | $172^{\circ}$ |  | 171 |  | 170 |  |  |  |

The azimuth is reckoned from the north when in north latitude, from the south when in south latitude, toward the east when body is rising or is east of the meridian, toward the west when body is setting or is west of the meridian. In zero latitude the azimuth takes the name of the declination.

The azimuth is reckoned from the north when in north latitude, from the south when in south latitude, toward the east when body is rising or is east of the meridian, toward the west when body is setting or is west of the meridian. In zero latitude the azimuth takes the name of the declination.

Table II- $\boldsymbol{d}+\boldsymbol{b}$

The azimuth is reckoned from the north when in north latitude, from the south when in south latitude, toward the east when body is rising or is east of the meridian, toward the west when body is setting or is west of the meridian. In zero latitude the azimuth takes the name of the declination.

Explana-
tion
of the
Construc-
tion and
Use of
Tables

The azimuth is reckoned from the north when in north latitude, from the south when in south latitude, toward the east when body is rising or is east of the meridian, toward the west when body is setting or is west of the meridian. In zero latitude the azimuth takes the name of the declination.

|  |  |  |  |  |  |  |  |  |  |  |  |  |

If $\mathbf{d}+\mathrm{b}$ exceeds $90^{\circ}$, prefix ( - ) to $\mathbf{Z}^{\prime \prime}$.
The azimuth is reckoned from the north when in north latitude, from the south when in south latitude, toward the east when body is rising or is east of the meridian, toward the west when body is setting or is west of the meridian. In zero latitude the azimuth takes the name of the declination.

## EXPLANATION OF THE CONSTRUCTION AND USE OF THE TABLES

## DEVELOPMENT OF THE FORMULAS

Let us consider the astronomical triangle MPZ (fig. 1) projected upon the plane of the celestial horizon.

Where $\mathbf{P}$ is the elevated pole,
Z is the observer's zenith, and M is any celestial body.
Then the side PZ is equal to the colatitude;
the side PM is equal to the codeclination;
the side ZM is equal to the coaltitude;
the angle at $\mathbf{P}$ is equal to the local hour angle, and the angle at Z is equal to the azimuth of the heavenly body.
Now, let fall a perpendicular ZD from the observer's

FIG. I. zenith upon the circle of declination. Call this perpendicular $a$. This will divide the astronomical triangle into two right spherical triangles and the side PM into two parts which we shall call $b$ and B respectively. It will also divide the azimuth into two angles $\mathrm{Z}^{\prime}$ and $\mathrm{Z}^{\prime \prime}$.

In the upper or "time triangle" (Napier's rules)
$\operatorname{Sin} a=\cos \mathrm{L} \sin t$
Tan $b=\cot \mathrm{L} \cos t$
$\operatorname{Cot} Z^{\prime}=\sin \mathrm{L} \tan t$
In the lower or "altitude triangle"-
Sin $h=\cos a \cos \mathrm{~B}_{1}$
$\operatorname{Cot} Z^{\prime \prime}=\sin a \cot B$
Now, since B is equal to $\left(90^{\circ}-d\right)$ minus $b=90-(d+b)$, equaticns (4) and (5) become

$$
\begin{align*}
& \sin h=\cos a \sin (d+b)-  \tag{6}\\
& \cot Z^{\prime \prime}=\sin a \tan (d+b) \tag{7}
\end{align*}
$$

Inverting equations (6) and (7) they become-
$\operatorname{cosec} h=\sec a \operatorname{cosec}(d+b)$
$\tan \mathrm{Z}^{\prime \prime}=\operatorname{cosec} a \cot (d+b)$
It is apparent that $\mathrm{Z}^{\prime}$ plus $\mathrm{Z}^{\prime \prime}$ is equal to Z , the body's azimuth. This azimuth is always reckoned from the elevated pole east or west from $0^{\circ}$ to $180^{\circ}$ and marked in the conventional manner depending on the sign of the latitude and whether the body is rising or setting; i. e., east or west of the meridian.

## CONSTRUCTION OF THE TABLES

Table I.-For every degree of latitude from $0^{\circ}$ to $65^{\circ}$, and for every degree of local hour angle from $1^{\circ}$ to $90^{\circ}$ there is tabluated four columns headed b, A, C, and $Z^{\prime}$.

Column b is the value of the side $b$ (fig. 1) in degrees, minutes, and tenths. It is found from equation (2).

Column A is the log secant of side $a$ (fig. 1) multiplied by $10^{5}$ power. The value of $a$ is found from equation (1).

Column $\mathbf{C}$ is the $\log$ cosecant of side $a$, to three places and multiplied by $10^{3}$ power. It, too, is found from equation (1).

Column $Z^{\prime}$ is the value of the angle $Z^{\prime}$ (fig. 1) to degrees and tenths. It is found from equation (3).

Table II.-Observe, now, equations (8) and (9). Table I gives us secant a (column A) and cosecant $a$ (column C). All that is necessary to obtain the values of $h_{\mathrm{c}}$ and $\mathbf{Z}^{\prime \prime}$ is to get the cosecant and cotangent of $(d+b)$. This value of $(d+b)$ is the basis of Table II. It is obtained by finding the algebraic sum of $d$ (the declination) and $b$ (the value found in the first column of Table I).

Table II, then, is merely a log cosecant and cotangent table of angles from $0^{\circ}$ to $90^{\circ}$ and given for every minute. It contains two columns, B and D.

Column B is the log cosecant of these angles multiplied by $10^{5}$ power.
Column D is the log cotangent of these same angles to three places and multiplied by $10^{3}$ power.

Adding the value of B, taken from Table II, to the value of A, taken from Table I, gives us the log cosecant $h_{\mathrm{c}}$. (See equation 8). Now, since the first column (B) of Table II is already a log cosecant column, the value of $h_{0}{ }^{\circ}$ (the computed altitude) may be found at the top of this column corresponding to its log. The minutes are found to the left of the table.

Similarly, adding the value of D, Table II, to the value of C, taken from Table I, gives us the log tangent of $\mathbf{Z}^{\prime \prime}$. (See equation 9.) Now, since the second column (D) of Table II is a log cotangent column, and we are dealing with the $\log$ tangent $\mathrm{Z}^{\prime \prime}$, it is but necessary to find this value of the log tangent in column D and the complement is the value of $\mathbf{Z}^{\prime \prime}$. This value of $\mathbf{Z}^{\prime \prime}$ may be found at the top of the column containing its corresponding log. The tenths of a degree are found to the right of the table.
For simplicity and space, Table I is carried only to $90^{\circ}$. For values over $90^{\circ}$, subtract angle from $180^{\circ}$ and enter tables with supplement.

## GRAPHIC ILLUSTRATION OF SOLUTION

In equation
(8) $\operatorname{Cosec} h=\sec a \operatorname{cosec}(d+b)$.
(9) Tan $\mathrm{Z}^{\prime \prime}=\operatorname{cosec} a \cot (d+b)$.

Let $\mathrm{A}=\log \sec a$.
$\mathrm{C}=\log \operatorname{cosec} a$.
$\mathrm{B}=\log \operatorname{cosec}(d+b)$.
$\mathrm{D}=\log \cot (d+b)$.
$b=$ natural value of side $b$ in degrees and minutes.
$d=$ declination of body.
Then use the following arrangement for quick solutions:

## EXPLANATION IN DETAIL

1. G. A. T. is found from midnight in the usual manner. From this the G. H. A. is computed as follows: for the sun,

$$
\text { G. H. A. }=\text { G. C. T. }-12^{\mathrm{h}} \pm \text { Eq. of } \mathrm{T} .
$$

For star, planet, or moon,
G. H. A. = G. S. T. - R. A. *
(Add $24^{\mathrm{b}}$ to the G. S. T. if necessary to perform this subtraction).
2. Convert the G. H. A. to degrees (see short method p. IV).
3. Apply an assumed longitude [minus ( - ) if west, and plus ( + ) if east] such that the resultant local hour angle will be an integral degree. If west longitude, subtract the smaller from the larger.
4. With the hour angle ( $($ ) and an assumed latitude (use D. R. latitude to nearest degree), enter Table I and pick out quantities $b, A, C, Z^{\prime}$.
5. Add algebraically to $b$ the declination obtained from the Nautical Almanac; that is, add if the signs are alike, subtract the smaller from the larger if unlike.
6. With the quantity of $d+b$ thus obtained, enter Table II and pick out quantities B and D. Add B to A and D to C.
7. With $A+B$ enter column $B$ of this same table (Table II) and find the corresponding number. The heading at the top of the column will give the value of $h_{\mathrm{c}}$ in degrees; the minutes will be found in the extreme left column.
8. With $\mathrm{C}+\mathrm{D}$ enter column D of the same table (Table II) and find the corresponding number. The number at the top of this column will give the value of $\mathrm{Z}^{\prime \prime}$ in degrees; the tenths of a degree will be found in the extreme right column.
9. Add the $\mathrm{Z}^{\prime \prime}$ to $\mathrm{Z}^{\prime}$ previously obtained from Table I to get the azimuth. This azimuth is always reckoned from the elevated pole and is marked in the conventional manner, i. e., north when in north latitude, south when in south latitude, east when east of the observer's meridian, west when west of the observer's meridian.
10. The local hour angle (L. H. A.) is reckoned from the upper branch of the meridian westward through $360^{\circ}$.
11. When the local hour angle or its explement $\left(360^{\circ}-L . H\right.$. A.) is less than $90^{\circ}$, give $b$ the same name as that of the iatitude $(+)$ if north, $(-)$ if south. This is called Case I.
12. When the local hour angle is between $90^{\circ}$ and $270^{\circ}$, give $b$ the opposite name to the latitude. This is the Case II exemplified in the problems that follow. In it the azimuth is always obtained by subtraction.

When in latitude $0^{\circ}$ give $b$ the same name as the declination and the azimuth takes the name of the declination.

## NOTES ON SOLUTIONS

13. It will be noted that in Table I, $t$ is used only to $90^{\circ}$ (six hours). The manner in which the local hour angle is handled to accomplish this is simple and uniform in all cases.
(a) If the L. H. A. exceeds $00^{\circ} \mathrm{W}$., use the supplement as $t$.
(b) If it exceeds $180^{\circ} \mathrm{W}$., reject $180^{\circ}$ and use the remainder as $t$.
(c) If it exceeds $270^{\circ} \mathrm{W}$., use the explement as $t$.
(d) If it exceeds $360^{\circ}$, reject $360^{\circ}$, then treat as in (a).
14. In finding the quantity $d+b$ with which Table II is entered, should this amount exceed $90^{\circ}$, take quantity in degrees from bottom of page and take minutes from right-hand column, reading up. Give the resultant $\mathrm{Z}^{\prime \prime}$ a negative sign because $\cot \left(180^{\circ}-\theta\right)=(-) \cot \theta$.
15. In finding the azimuth when the value of $\mathrm{C}+\mathrm{D}$ exceeds 10000 , as, for example 13536, the 10000 is dropped and only the number 3536 is sought in Table II.
16. In the following examples the letter $a$ is used to indicate the altitude difference (also called intercept) from the assumed position of the observer towards the heavenly body, if the true altitude ( $h$ ) is greater than the computed altitude; AWAY if the true altitude is less than the computed altitude. The true altitude ( $h$ ) = the observed (or. sextant) altitude $\pm$ all corrections applied.
17. In lieu of a better position the intersection of the perpendicular from the dead-reckoning position at the time of the sight to the line of position obtained with these tables must be taken as the most probable position-afthe observer on the line.

18. The difference in the azimuth of the heavenly body due to the adoption of an assumed position differing from the D. R. position may be neglected for nearly all practical cases. However, when high altitudes are observed within an hour of the meridian the correct azimuth can be obtained only by using the data for a point at or near the observer's position. Therefore, under these conditions the assuming of a position to fit the tables may produce an appreciable error in the azimuth, with consequent deflection of the line of position. This source of error may be avoided by interpolating to minutes of latitude within Table I.
19. A study of azimuth tables shows that rapid changes of azimuth occur within an hour of the meridian, and this, coupled with difficulties of observation, makes such azimuths of little value in the accurate determination of compass error. The most favorable time for the determination of compass error is when the heavenly body is low and near the prime vertical (when the body bears to the eastward or westward.)

## USE OF THE TABLES

## Altitude and Azimuth

Case $I$ (L. H. A. less than $90^{\circ} ; d+b$ less than $90^{\circ}$ ).-For the sake of brevity, the corrected observed altitude will be given in each case instead of the sextant altitude, index correction, and height of eye.

Problem 1.-The U. S. S. Richmond is making passage from the United States to Montevideo. At about 1650, on March 26, 1928, she was in D. R. position latitude $31^{\circ} 04.7 \mathrm{~S}$., longitude $49^{\circ} 35.7 \mathrm{~W}$. At this time the sun was observed as follows: Watch $4^{\mathrm{h}} 52^{\mathrm{m}} 27^{\mathrm{s}} ; \mathrm{C}-\mathrm{W} .2^{\mathrm{h}} 47^{\mathrm{m}} 17^{\mathrm{s}}$; chronometer slow $12^{\mathrm{m}} 28^{\mathrm{s}}$; corrected observed altitude $18^{\circ} 16^{\prime} 5$. Required the line of position.

(Assume a longitude such that the L. H. A.-------- 67 W. resultant L. H. A. will be an integral degree.)
Enter Table I with $t=67^{\circ}, \mathrm{L}=31^{\circ}$, and on page 37 pick out for these values the value of $b, \mathrm{~A}, \mathrm{C}$, and $\mathrm{Z}^{\prime}$. Com-
t----------- $67^{\circ}$
Assumed lat. $31^{\circ}$
(To nearest even degree.) bine the value of $b$ thus found with the declination obtained from the Nautical Almanac to obtain $d+b$. ( $b$ takes the same sign as the latitude; $d$ and $b$ are added when the signs are alike; subtracted when the signs are unlike.) With the value $d+b$ thus obtained enter Table II and pick out the corresponding values of B and D. These will be found on page 55 .

Lay off from the assumed position latitude $31^{\circ}$, longitude $49^{\circ} 37.7$ the bearing (Z) S 104.5 W ., and, at a distance $a=0.3$ towards the body on the bearing line, draw a line at right angles to it. This is the required line of position.
Important.-It must not be forgotten that the bearing of the body and the intercept must be laid off from the assumed position and not the dead reckoning position.
Case I (L. H. A. less than $90^{\circ}$; $d+b$ greater than $90^{\circ}$ )-Problem 2.-The U. S. S. Corry is making passage from San Diego to Honolulu. At evening twilight on December 15, 1928, in D. R. position latitude $24^{\circ} 30!9$ N., longitude $147^{\circ} 14.9 \mathrm{~W}$., the navigator observed the star "Deneb" as follows: W. $5^{\text {b }} 41^{\mathrm{m}}$ $13^{\text {s }}$; C-W. $9^{\text {h }} 51^{\mathrm{m}} 23^{\text {s }}$; chronometer slow $8^{\mathrm{m}} 22^{\text {s }}$; observed altitude $49^{\circ}$ 4.9! 5 . Required the line of position.

(In this problem $d+b$ exceeds $90^{\circ}$; therefore, take angle $102^{\circ}$ from bottom of page 64 of Table II and $30^{\prime} .3$ from right-hand column at side. The resultant $\mathrm{Z}^{\prime \prime}$ is given a negative sign. This illustrates note 14.)

[^0]Case I-Problem 3.-The U. S. S. Idaho is making passage from Rio de Janeiro to Cape Town. During evening twilight on September 29, 1928, the navigator observes the star "Rasalhague" as follows: W. $6^{\mathrm{h}} 38^{\mathrm{m}} 15^{\mathrm{s}} ; \mathrm{C}-\mathrm{W} .11^{\mathrm{h}} 58^{\mathrm{m}} 45^{\mathrm{s}}$; chronometer slow $1^{\mathrm{m}} 04^{\mathrm{g}}$; corrected altitude $40^{\circ} 33$. 1 . Position by D. R. at time of sight was latitude $30^{\circ} 57^{\prime} \mathrm{S}$., longitude $0^{\circ} 08^{\prime} 6 \mathrm{E}$. Required the line of position.

L. H. A_--------.-. $25^{\circ} 0.0 \mathrm{~W}$.

a 20.1 (towards)
Case I-Problem 4.-A seaplane is making passage from New York to Ponta del Gada, Azores. . During evening twilight on June 24, 1928, while in position by D. R. latitude $38^{\circ} 14!8 \mathrm{~N}$., longitude $31^{\circ} 48^{!} 5 \mathrm{~W}$., the navigator observed the moon's lower limb as follows: W. $7^{\text {b }} 51^{\mathrm{m}} 00^{\mathrm{s}} ; \mathrm{C}-\mathrm{W} .2^{\text {b }} 08^{\mathrm{m}} 29^{\text {s }}$; chronometer fast $8^{\mathrm{m}} 31^{\mathrm{s}}$; corrected altitude $48^{\circ} 39^{\prime} 1$. Required the line of position.

Case I-Problem 5.-The U. S. S. Texas is making passage from San Diego to Valparaiso. During the forenoon of June 25, 1928, while in D. R. position latitude $30^{\circ} 05$ ! 8 S., longitude $74^{\circ} 34!5 \mathrm{~W}$., the navigator observed the sun's lower limb as follows: W. $8^{\mathrm{h}} 15^{\mathrm{m}} 26^{\mathrm{s}}$; C-W. $5^{\mathrm{h}} 07^{\mathrm{m}} 12^{\mathrm{s}}$; chronometer fast $7^{\mathrm{m}} 42^{\mathrm{g}}$; corrected observed altitude $14^{\circ} 07^{\prime} 5$. Required the line of position.

Case I-Problem 6.-The U. S. S. Stewart is making passage from Hainan, China, to Manila. During the afternoon of May 18, 1928, while in position by D. R. latitude $17^{\circ} 01^{\prime} 3$ N., longitude $116^{\circ} 34^{\prime}$ E., the sun's lower limb was observed as follows: W. $4^{\mathrm{h}} 00^{\mathrm{m}} 10^{\mathrm{s}}$; C-W. $3^{\mathrm{h}} 45^{\mathrm{m}} 32^{\mathrm{s}}$; chronometer slow $14^{\mathrm{m}} 18^{\mathrm{s}}$; corrected observed altitude, $35^{\circ} 38!9$; sun bore $281^{\circ}$ per gyro compass. Required the line of position and the error of the gyro compass.

Case II (L. H. A. between $90^{\circ}$ and $270^{\circ}$ )-Problem 7.-On May 15, 1928, about 8 p. m., the U.S.S. Mississippi making passage from Hampton Roads to Liverpool, while in D. R. position, latitude $40^{\circ} 43^{\prime}$ N., longitude $68^{\circ} 30^{\prime}$ W., observed the star Vega as follows: W. $7^{\mathrm{h}} 36^{\mathrm{m}} 12^{\mathrm{a}}, \mathrm{C}-\mathrm{W} .4^{\mathrm{b}} 59^{\mathrm{m}} 12^{\mathrm{s}}$, chronometer $1^{\mathrm{m}} 1^{\mathrm{B}}$ slow. True altitude $14^{\circ} 50.5^{\prime}$.

Case II (L. H. A. between $90^{\circ}$ and $270^{\circ}$ )—Problem 8.-On June 22, 1928, about 6 p. m., the U. S. S. West Virginia in D. R. position lat. $50^{\circ} 55^{\prime}$ N., long. $30^{\circ} \mathrm{W}$.: observed the sun's lower limb as follows: Watch $6^{\text {b }} 5^{\mathrm{m}} 30^{\mathrm{g}}, \mathrm{C}-$ W. $2^{\mathrm{h}} 1^{\mathrm{m}} 20^{\text {a }}$, chron. fast $0^{\mathrm{m}} 20^{\mathrm{s}}$. True alt. $17^{\circ} 14.5^{\prime}$. Required line of position.

## MERIDIAN ALTITUDES

A new and short method for working meridian altitudes is here developed. (Refer to fig. 1, p. 67.) When the heavenly body is on the meridian, $t$ equals zero. The side $a$ becomes zero, and point $D$ coincides with point $Z ; b$ therefore equals the colatitude. Likewise, B will equal the coaltitude. Since B equals co $(d+b)$, it is apparent that $(d+b)$ will equal $h$ (the computed altitude). Hence, whenever $t=0^{\circ}$ (when the body is on the meridian or near enough to the meridian such that the assumed longitude makes $t=0^{\circ}$ ) the work of finding the resultant latitude at the time of the sight is exceedingly simple. Subtract the D. R. latitude from $90^{\circ}$. This value equals $b$. Apply the declination in the usual manner to get $d+b$. This value of $d+b$ equals the computed altitude ( $h_{c}$ ), except in one case when it exceeds $90^{\circ}$, in which case use the supplement as $h_{c}$. Applying the observed altitude gives us an altitude difference. Now, the azimuth is assumed to be $0^{\circ}$ or $180^{\circ}$ according as the observer faces the elevated pole or has his back to the elevated pole when taking the sight. The latitude is thus quickly obtained without entering the tables. This method is much more simple than the usual methods of meridian altitudes given in Bowditch. It has the added advantage of disposing of the necessity of remembering confusing signs. An example follows:

Problem 9.-The navigator of the U. S. S. Raleigh, on January 11, 1928, in D. R. latitude $15^{\circ} 08^{\prime} 6$ N., longitude $157^{\circ} 19!1$ E., observes the sun at L. A. N. as follows: $h_{s} \odot 52^{\circ} 39^{\prime}$; I. C. (+) $1^{\prime}$; height of eye, 41 feet. Required the latitude at L. A. N.

Subtract the D. R. latitude from $90^{\circ}$ _.............- $90^{\circ} 00 \% \mathrm{G}$
$15 \quad 08.6$

$Z=180^{\circ}$ since the observer's back is toward the elevated pole. $\therefore$ the resulting latitude equals $15^{\circ} 08!6+1!0=15^{\circ} 09!6 \mathrm{~N}$.

Problem 10.-The U. S. S. Los Angeles while making passage from Midway Islands to Shanghai was at L. A. N., on July 22, 1928, in D. R., position latitude $28^{\circ} 40^{\prime} \mathrm{N} ., 175^{\circ} 14^{\prime} \mathrm{E}$. The navigator observed the sun for latitude as follows: $h_{s} \odot 82^{\circ} 06^{\prime}$; I. C. (-) $1^{\prime}$; height of eye, 1,050 feet. Required the latitude at L. A. N.

$a_{\text {------ }} \quad 6.2$ towards 号 $180^{\circ}$.

Therefore latitude at L. A. N. $=28^{\circ} 40^{\prime} \mathrm{N} .-6!2=28^{\circ} 33!8 \mathrm{~N}$.

## NOON CONSTANT

If, to the value $d+b$ (or $h_{c}$ ) we apply the index correction and the correction for height of eye for this $h_{c}$ with reversed signs, we thereby obtain a noon constant K. At L. A. N. simply observe the sun's altitude and apply to K thus obtained to get the altitude difference. This method eliminates the necessity of finding an approximate altitude with which to find the height of eye correction. It also eliminates confusing signs.

Problem 11.-In problem 9:
$h_{c}(d+b)$ equals------------------------- $52^{\circ} 50!4$
Reverse sigus I. C----------------(-) 1 ( ${ }^{\prime} 0$
Height of eye correction------------(-) $\quad 9^{\prime} 4$
(華) Noon constant (K) ------------------------ $52^{\circ} 40.0$

$a=1.0$ (away) $180^{\circ}$

## REDUCTION TO THE MERIDIAN

## (Near meridian)

The method of finding altitude and azimuth as set forth in these tables is accurate to the time of meridian passage when the altitude of the observed body is less than $75^{\circ}$.

When a sight is reduced to the meridian, the resultant latitude is not the latitude at meridian passage, but is the latitude at the time of taking the sight. (See Bowditch, 1933, art. 330.) With this method a line of position is quickly obtained; and, should the intercept be sufficiently small and the azimuth close to $0^{\circ}$ or $180^{\circ}$, we have practically a latitude line of position at the time the sight is taken.

Problem 12.-On June 26, 1928, about noon, the U. S. S. S-21 in lat. 21 S. long. $60^{\circ} \mathrm{E}$., by D. R. observed altitude of sun's lower limb bearing northeastward, as follows: Watch $11^{\mathrm{h}} 38^{\mathrm{m}} 35^{\text {s }}, \mathrm{C}-$ W. $7^{\mathrm{h}} 59^{\mathrm{m}} 10^{\mathrm{s}}$, chron. slow $0^{\mathrm{m}} 10^{\mathrm{s}}$. True altitude $45^{\circ} 0^{\prime} 0^{\prime \prime}$. Find position line.

The true latitude is on the position line at a point in the correct longitude.

## IDENTIFICATION OF AN UNKNOWN STAR

Refer to Figure 1, page 67. In the problem of finding the altitude and azimuth there is given two sides ( $d$ and L ) and an included angle ( $t$ ) of a spherical triangle and it is required to find the third side $(h)$ and one other angle (Z). In the problem of identifying an unknown star, there is given two sides ( $L$ and $h$ ) and an included angle (Z) and it is required to find the third side (d) and one other angle $(t)$ with which to find the body's right ascension. The problems are therefore similar; and, if in the tables we interchange Z for $t$, and $h$ for $d$, we may readily identify the unknown body.

Azimuths are reckoned from the north in north latitude, and from the south in south latitude, from $0^{\circ}$ to $180^{\circ}$ to the east and west of the meridian, so that for any azimuth over $90^{\circ}$, Table $I$ is entered with the supplement, then the sign of $b$, and $t^{\prime}$ (used as $Z^{\prime}$ ), become negative values. $h$ is always positive. If $h+b$ is algebraically negative, then $d$ is named contrary to latitude, and $t^{\prime \prime}$ (used as $\mathbf{Z}^{\prime \prime}$ ) is minus. $t$ is the hour angle named from the initial point north $\left(0^{\circ}\right)$ to the east or west, to agree with the observed bearing of the star. When the algebraic sum of $t^{\prime}$, and $t^{\prime \prime}$ (to give $t$ ), is negative, subtract it from $180^{\circ}$; the remainder is the hour angle $t$, east, or west, of the meridian.

Problem 13.-The U. S. S. Lardner is making passage from Colon to the United States. During evening twilight on October 7, 1928, while in D. R. position latitude $15^{\circ} 05^{\prime}$ N., longitude $76^{\circ} 40^{\prime}$ W., a star is observed through a break in the clouds and the following data recorded: W. $6^{\mathrm{h}} 06^{\mathrm{m}} 20^{\mathrm{s}} ; \mathrm{C}-$ W. $5^{\mathrm{h}} 10^{\mathrm{m}} 06^{\mathrm{s}}$; chronometer fast $10^{\mathrm{m}} 06^{\mathrm{s}}, h_{s} 20^{\circ} 55^{\prime}$; I. C. ( + ) $1^{\prime}$; height of eye, 36 feet; bearing of star by gyro, $285^{\circ}$ (N. $75^{\circ} \mathrm{W}$.). Identify the star.

With $\mathrm{Z}=75^{\circ}$ (used as $t$ ) and $\mathrm{L}=15^{\circ}$ enter Table I.

Problem 14 (here Z is over $90^{\circ}$ hence $b$ and $t^{\prime}$ are negative).-The U. S. S. Argonne is making passage from Midway Islands to Shanghai. During evening twilight on July 20, 1928, while on D. R. position latitude $28^{\circ} 18^{\prime}$ N., longitude $179^{\circ} 47^{\prime} \mathrm{W}$. , an unknown star is observed and the following data recorded: W. $7^{\mathrm{h}} 16^{\mathrm{m}} 24^{\mathrm{s}} ; \mathrm{C}-$ W. $11^{\mathrm{h}} 52^{\mathrm{m}} 20^{\mathrm{s}}$; chronometer slow $7^{\mathrm{m}} 28^{\mathrm{s}} ;$ I. C. ( - ) $1^{\prime}$; height of eye, 41 feet; $h_{s} 22^{\circ} 58^{\prime}$; bearing by gyro $91^{\circ}$ (south and east). Identify the star.
$Z=91^{\circ}$; since this value is greater than $90^{\circ}$ use the supplement as $Z$. Therefore, with $Z=89^{\circ}$ (as $t$ ) and $L=28^{\circ}$ enter Table I.

(Approx.) R. A.----- 19 49)From Nautical Almanae star is identified as (Approx.) dec. --.-(+) $\left.9^{\circ} 39^{\prime}\right\}^{\prime}$ Altair.

Problem 15 (here Z is over $90^{\circ}$, hence $b$ and $t^{\prime}$ are negative).-A seaplane is making passage from San Juan to Hampton Roads. No sights were available until the morning after departure (November 20, 1928), when, through a break in the clouds "Procyon" and an unknown star were observed. The pilot estimated his D. R. position at the time of sight to be latitude $27^{\circ} 35^{\prime} \mathrm{N}$., longitude $70^{\circ}$ $26^{\prime}$ W. Other data as follows: G. S. T. at time of sight (by G. S. T. watch) $2^{\text {h }} 46^{\mathrm{m}} 34^{\mathrm{s}}$; corrected altitude $28^{\circ} 52$. 5 ; bearing of star $120^{\circ}$ (south and east). Required to identify the unknown star.

(Star is identified as Spica.)

## GREAT CIRCLE COURSE AND DISTANCE

Like all other problems in navigation, this problem can be approached and solved with the same astronomical triangle; i. e., having been given two sides and an included angle, it is required to find the third side and one other angle.

Let $L_{1}$ and $\lambda_{1}$ be the latitude and longitude of the point of departure and $L_{2}$ and $\lambda_{2}$ be the latitude and longitude of the point of destination, respectively. Now, if in the astronomical triangle we make the following substitutions, we may use these tables with which to solve the problem:

For $t$ substitute the difference of longitude between the two places.
For $L$ substitute $L_{1}$ (the latitude of the point of departure).
For $d$ substitute $L_{2}$ (the latitude of the point of destination).
Then Z will equal the initial Great Circle course and co $h_{c}$ will equal the Great Circle distance between the two points. The method of computing the course and co $h_{c}$, or $90^{\circ} \pm h_{c}$, is given by the following rules:

When $t$ (diff. long.) is less than $90^{\circ}$, both $b$ and $Z^{\prime}$ have + signs.
When $t$ (diff. long.) is greater than $90^{\circ}$, both $b$ and $Z^{\prime}$ have - signs.
When $\mathrm{L}_{1}$ and $\mathrm{L}_{2}$ are in same latitude, $\mathrm{L}_{2}$ is always plus.
When $L_{1}$ and $L_{2}$ are in different latitude, $L_{2}$ is always minus; combine algebraically $L_{2}$ and $b$, having regard for signs; should the result be less than $90^{\circ}$, give $\mathrm{Z}^{\prime \prime}$ the same sign, but if $\mathrm{L}_{2}+b$ is greater than $90^{\circ}$ give $\bar{Z}^{\prime \prime}$ the opposite sign to $\mathrm{L}_{2}+b$.

Add algebraically $Z^{\prime}$ and $Z^{\prime \prime}$, naming the initial course from the elevated pole, if the resultant Z has the plus sign, but name course from the depressed pole if Z has a minus sign.

When $\mathrm{L}_{2}+b$ has a plus sign, the distance is $90^{\circ}-h_{c}$.
When $\mathrm{L}_{2}+b$ has a minus sign, the distance is $90^{\circ}+h_{c}$.
Problem 16.-Given two places, one in latitude $40^{\circ} \mathrm{N}$., longitude $70^{\circ} \mathrm{W}$., the other in latitude $30^{\circ}$ S., longitude $10^{\circ} \mathrm{W}$., find the Great Circle distance between them; also the initial course. Diff. long. $=60^{\circ}\left(\mathrm{H}\right.$. A. between $0^{\circ}$ and $\left.90^{\circ}\right)$.

( $90^{\circ}-0^{\circ} 35^{\prime} .5=\mathrm{D}=89^{\circ} 24.5=5,364.5$ nautical miles.
Problem 17.-Find the Great Circle distance and initial course between $1^{\circ}$ N., $122^{\circ} \mathrm{W}$., and $35^{\circ} \mathrm{N} ., 139^{\circ} \mathrm{E}$. Diff. long. $=99^{\circ}\left(180^{\circ}-99^{\circ}=81^{\circ}\right)$.

$$
\begin{aligned}
& \left.t-81^{\circ}\right)=b \quad 83^{\circ} 38.0(-) \\
& \left.\mathrm{L}_{1} \quad 1^{\circ}\right\}=\mathrm{L}_{2} 35^{\circ} 00.0(+) \quad \text { A } 80302 \\
& L_{2}+b 48 \quad 38 \quad(-) \quad \text { B } 12465 \\
& h_{0}=6^{\circ} 47^{\prime} \\
& \text { A+B } 92767 \\
& 90^{\circ}+6^{\circ} 47^{\prime}=\mathrm{D}=96^{\circ} 47^{\prime}=5,807 \\
& \text { nautical miles. }
\end{aligned}
$$

Problem 18.-Find Great Circle distance and initial course between Cape Town $34^{\circ}$ S., $18^{\circ}$ E., to New York $40^{\circ}$ N., $73^{\circ}$ W. Diff. long. $=91^{\circ}$ (H.A. between $90^{\circ}$ and $180^{\circ}$ ) supplement $=89^{\circ}$.

$90^{\circ}+21^{\circ} 44.8^{\prime}=111^{\circ} 44.8^{\prime}=6,704.8$ nautical miles.

## LATITUDE BY POLARIS

Problem 19.-On January 26, 1928, p. m., the U. S. S. S-21 in D. R. lat. $27^{\circ}$ N., long. $118^{\circ} 36^{\prime}$ W., observed Polaris as follows: W. $8^{\mathrm{h}} 10^{\mathrm{m}} 20^{\mathrm{s}}$; C-W. $7^{\mathrm{h}} 23^{\mathrm{m}} 10^{\mathrm{s}}$; chron. fast $7^{\mathrm{m}} 29^{\text {s. }}$. True altitude $27^{\circ} 50!1$. Find line of position.

Lat. $=27^{\circ}-3.4^{\prime}=26^{\circ} 56.6^{\prime} \mathrm{N}$. (It is the practice to disregard the position line and regard it as a parallel of latitude.)
The line of position is identical with that obtained with Table I a of the Nautical Almanac. (The Nautical Almanac solution is shorter for Polaris.)

The aviator can find from this table the radius of his vision under good weather conditions. It will also aid in estimating the distance of a place within or on his horizon.

Distance of visibility of objects at sea or distance to horizon

| Height, <br> in feet | Nautical miles | Statute miles | Height, in feet | Nautical miles | Statute miles | Height, <br> in feet | Nautical miles | Statute miles |

## EXPLANATION OF THE TABLE

This table contains the distances, in nautical and statute mules, at which any object is visible at sea. It is calculated by the formula:

$$
d=1.15 \sqrt{x}, \text { and } d^{\prime}=1.32 \sqrt{x,}
$$

in which $d$ is the distance in nautical miles, $d^{\prime}$ the distance in statute miles, and $x$ the height of the eye or the object in feet.

To find the distance of visibility of an object, the distance given by the table corresponding to its height should be added to the distance corresponding to the height of the observer's eye.

Example: Required the distance of visibility of an object 420 feet high, the observer being at an elevation of 15 feet.

Distance corresponding to 420 feet is 23.5 nautical miles.
Distance corresponding to 15 feet is 4.4 nautical miles.
Distance of visibility
27.9 nautical miles.

| Dist. | 1 |  | 2 |  | 3 |  | 4 |  | 5 |  | Dist. |

| $\stackrel{\uparrow}{\text { Course }}$ | $p$ | $l$ | $p$ | $l$ | $p$ | $l$ | $p$ | $l$ | $p$ | $l$ | $\begin{gathered} \uparrow \\ \text { Course } \end{gathered}$ |
| $\overrightarrow{\text { Dist. }}$ | 1 |  |  | 2 |  |  | 4 |  |  |  | $\stackrel{\leftarrow}{\text { Dist. }}$ |

Explanation: Difference of latitude and departure is tabulated for every degree from $0^{\circ}$ to $90^{\circ}$ and for every mile from $1^{\prime}$ to $10^{\prime}$. To find $l$ and $p$ for distances greater than $10^{\prime}$ use corresponding multiples.

Thus, to find $l$ and $p$ for $20^{\prime}$ on course $20^{\circ}$ :
$l$ for $2^{\prime}=1.88$; for $20^{\prime}$ it equals 18.8 .
$p$ for $2^{\prime}=.68$; for $20^{\prime}$ it equals 6.8 .

| Dist. |  | 6 |  | 7 |  | 8 |  | 9 |  | 0 | Dist. |

To find $l$ and $p$ for $36^{\prime}$ on course $20^{\circ}$ :
For $30^{\prime} l=28.20 \quad p=10.30$
For $6^{\prime} l=5.64 \quad p=2.05$
For $36^{\prime} l=33.84 \quad p=12.35$
Should the course exceed $90^{\circ}$ proceed as follows:
For courses $90^{\circ}$ to $180^{\circ}$ use $180^{\circ}$ minus the course.
For courses $180^{\circ}$ to $270^{\circ}$ use course minus $180^{\circ}$.
For courses $270^{\circ}$ to $360^{\circ}$ use $360^{\circ}$ minus the course.
