## POETRY.

OLD FRIENDS TOGETHER.
Oh , time is sweet, when roses meet With spring's sweet breath around them; . And sweet the time when hearts are lost, If those who love have found them And sweet the mind that still may find A star in darkest weatherBut nought can be so sweet to see As old friends meet togetber.

Those days of old, when youth was bold, And time stole wings to speed it; And youth ne'er knew how fast time flew, Or knowing, did not heed itThough grey each brow that heeds us now, (For age brings wintry weather,)
Yet nought can be so sweet to see
As those old friends together.
The few long known, whom years have shown With hearts that friendship blesses; A hand to cheer, perchance a tear To soothe a friend's distresses, Who helped and tried, still side by side, A friend to face bad weather-
Oh, thus may we yet joy to see And meet old friends together.

I COULD NEVER SEE A GOOD REASON I could never find a good reason. Why sorrow unbidden should stay, And all the bright joys of life's season, Be driven unheeded away
Our cares would wake no more emotion, Were we to cur lot but resign'd, Than pebbles flung into the ocean, That leaves scarce a ripple behind

The world has a spirit of beauty, Which looks upon all for the best, And while it discharges its duty, To Providence leaves all the rest : That spirit's the beam ot devotion, Which lights us through life to its close Ard sets like the sun in the ocean, More beautiful far than it rose.

## Put a Pint in That.

Seaton, the humorous temperance lecturer, was once making a speech in New Hartford, Oneida Co., when the tollowing keen cutter was shot off with his usual pith. "There are some fine pretenders to temperance.They'll go into the temperance store and ask for something that they know is not there Then over they will go to the dry goods grog store and ask for some kind of goods and keep looking at them until there is none in but the stortkeeper, when out. of the coat bosom comes a little black bottle, "put a pint in that." Seaton suited the action to the word and the audience was convulsed with laughter, as it had been whispered round that some leading man was gailty of the trick

## Emphasising Words.

There is a good.stury on the subject of emphasis. "Boy," said a visiter at the house of his friend, to his little son, "step over the way and see how old Mrs. Brows is." The boy did his errand, and on his return reported that she did not know how old she was; and that he might find out by his own learning.

## BOILER WATER BALANCE.

Ine above engraving is a representation an invention, the object of which is to indicate with unfailing certainty, and under all circumstances, the actual quantity of water in Steam Boilers with unerring exactness, whether the boiler is foaming or not. The inventur alleges that it is superior to any thing ever invented for this purpose, and cannot be surpassed by any thing to be invented. and he challenges all those who are interested against the success of his invention to deny the correctness of the position he has assumed, and he submits in proof of what he alleges, the following description of his invention:-
In the diagram, A represents the Boiler. B, is a closed cast iron vessel which if entirely immersed in water would still sink with a force equal to four or five pounds. C , is a vessel attached to the boiler at the end or the side, and in which B can move up and down freely. This vessel or apartment communicates freely with the boiler at FF. E, is a platina or gold or other metailic wire (platina is preferred) which is large enough to sustain the weight of $B$ when not immersed in water. The lower end of this wire is attached to $B$, and passing through a small stuffing box the upper end is attached to a dial-plated spring balance D , as 18 shown in the diagram. It is seen that $B$ extends from near the top of the boiler to near the bottom and may be extended the whole distance. This being the case the actual quantity of water in the boiler by weight will be indıcated (without respect to its density) in pounds and ounces on the Spring Balance ; while the motion of B up or down, will be confined to the distance to the distance to which the beam or bar of the Spring Balance may be drawn out or in.
It will be seen at once, that none of the objections to a float are applicable to this contri-

## Suicide by a Gazelle.

A curious instance of affection in the animal, which ended fatally, took plece last week, at the country residence of Baron Gauci, at Malta. A female gazelle having suddenly died from something it had eaten, the male stood over the dead body of his mate, butting every one who attempted to touch it, then, suddenly making a spring, struck his head against a wall, and fell dead at the side of his
companion. companion.
vance, In the irst prace tne iriction (in the stuffing box) of a fine platina wire (which, as is well known, is not lable to corrosion) of sufficient size to sustain the weight of $B$, could not amount to enough to be felt or appreciated in practice-whereas a float requires a rod of such size as to produce a highly objectionrble amount of friction in the stuffing box. In the second place it indicates in pounds and ounces on the dial plate the weight of the whole column of water in the boiler. and therefore indicating its quantity, whether the boiler be foaming or uot ; whilea float although it may indicate nearly the point at which the surface of the water or foam stands, it can afford no indication of the density or specific gravity of the water or foam below it, and therefore can afford no reliable indication of the actual quantity of water in the boiler. This contrivance may be attached to the boiler at the end or side, and in cases where the form of the boiler will admit of it may be suspended init. Small projections are attarh ed to B, as seen in the diagram, the object of which is to make the inside surface of $\mathbf{C}$ act as a guide to $B$, to prevent it swinging to and fro at sea. By the adoption of this invention and by placing the Spring Balance where its dial plate will always be staring the engineer and the public in the face, the possibility of explosion for the want of water, will be extinct. It is a well known fact to all those who have had any practical experience in Steam Boilers that the best floats are but indifferent indicators, but here is a plan that is warranted to supersede all the objections to the float, the power of the steam and vomit having no effect upon this submerged fleat-the gravity of the water being the index to the quantity. Measures have been taken to secure a pa tent for this invention.
"Mr. Green"" said a tolerably dressed fe male the other day, entering a grocery in which where several customers, have you any fresh corned pork? "Yes ma'am." "How much is this sugar a pound ?" "One shil ing ma'm." " Let me have," she continued, lowering her voice, "half a pint of gin, and charge it as sugar on the book."

The common velocity of overshot wheels i thise feet per second.

## LIST OF PATENTS

ISUED FROM THE UNITED STATES PATENT office,
Our subscribers will forgive the absence of our list of patents from this number, as they had not arrived from Washington at the time of our paper going to press. This is a rare instance of necessity to make an apology for such an omission, and due allowance will be made for the same.

## INVENTORS CLAIMS.

## Design for Stoves

Design for Stoves.
Invented by C. J. Woolsen, of Cleveland, Ohio. Patented 17th July, 1847. Having distinctly represented and described the nature and arrangement of the respective ornaments and figures upon the front plate of his Franklin Stove; where he claims therein as new and secures by Letters Patent, is the configuration and arrangement of said ornaments.

## Fire Bricks.

Invented by David Cannon and Heman $S$. Lucas, of Chester, Mass. Patented July 24, 1847; No. 5198. What they claim as their invention, and desire to secure by Letters Patent, is the compounding of soap-stone, clay and borax in proportion as described, or in similar propertions to produce the like result.

Machines for Paring Appies.
Invented by Jesse Bullock, Jr., and Sewall Benson, of New York. Petented July 24th, 1847. Having fully described the nature of the invention, and described also the manner in which they put their machine in operation, what they claim therein as constituting their improvements and desire to secure by Letters Patent, are the following particulars. First, the arrangement of the spring shaft knite, for paring apples upon a drum wheel (with a knife attached) with the driving wheel, regulated in its operations by the pulley, band and lever, and brought back to its place of starting by means of the spring and cord, and the whole so arranged as to make the entire opwhole so arranged as to make the entire op-
eration by one revolution of the driving wheel.

Improvement in Straw Cutters.
Invented by Willliam Lewis, of Edgefield Court House, S. C. Patented June 19, 1847. He claims the securing the knives upon the driving wheel in an oblique position to the axle thereof, and combining the same with an oblique rest and feeding rollers tor the purpose of giving a horizontal cut upon the straw.

Design for Spoons and Forks.
Invented by Michael Gibney, of New York, N. Y. Patented June 19, 1847.-He claims as his invention and has secured by letters patent the configuration and ornaments to be applied o silver and other metalic spoons, forks and articles of table use.
improvement in Machinery for grinding Tools.
Invented hy William Hovey, of Boston, Mass. Patented Sept. 25, 1845, re-issued June 19, 1847.-What he claims as his invention, and has secured by letters patent, is the application of the stock and the arm in combination with the other parts as elements of machinery

Improvement in forming Briciss.
Invented by C H. Preston, of New York, N. Y. Patented June 19, 1847. - He states that he does not make any claim for the materials or mixtures used in making bricks in any of the three forms; neither does he at this time describe or make any arrangement of machinery to give these forms; and it is also to be understood that he does not claim to have invented interlocking bricks; neither does he claim the tapering of bricks for arches; but what be does claim as new and of his own invention, ard has secured by letters patent, is the making and burning of solid bricks of two, three or more parts, so placed together as te interlock and form londing when put in use.

Ornamental Metal surfuces.
M. Piarget, a French cuemıst, has discov ered a method of silvering metallic plates, which is said to be far superior to any other method. It is done by the deposition of metals during the electrotype process which is conducted in a peculiar manner with mixtures adapted to the effect desired to be attained.The form of his bath is also peculiar, for when the plate is taken out of it and off the model, it exhibits a burnished polish, or a dead appearance according to the preparation used. Metals which undergo this process, are said to be very flexible and the surface will not tarnish when exposed to the atmosphere.

## Platinising by the Moist Way.

Manufacturing and operative chemists will find it exceedingly valuable in order to produce a covering of platina for their copper, \&c., vessels, The experiment succeeds best when we make use of a dilute solution of the double chloride of soda and platina. Three immersions suffice; between each immersion it is necessary to dry the surface with fine linen, rubbing rather briskly, after which it must be cleaned with levigated chalk before re-immersion. When copper has been gilded in the muist way, the guilt surface has not a beautiful tint; but, if the copper be previously covered with a pellicle of platina, a very beautiful golden surface may be produced.Pharmaceutical Times.

## Scotch Courtesy to Amcrica.

The Anniversary of American Independence was celebrated in Glasgow, on the 5th inst., by a dinner in the Wellington Hotel, the American Consul in the chair. The Lord Provost allowed the American seamen belonging to ships in port to parade the streets, preceded by the striped flag. The ithhabitants seemed to enjoy the day equally with the Americans, as they boast Glasgow to have been the birth place of the intrepid Gen. John Stark's father.

## Ocean Steam Navigation.

It is stated in the Halifax Chronicle, that the Hon. Samuel Cunard, now in England, has entered into a contract with the British government, to carry the mails between Halitax and Bermuda, and Halifax and St. John's N. F. by steam, and that he was about to proceed to Scotland, to make arrangements for the building of four steamships suitable for the service,

## Large Fiarm.

The largest farm in Vermont is that of Judge Meech, at Shelburne, eight miles south of Burlington. A correspondent who has just been over it, says this year he will mow over 500 acres and cut 1000 tons of hay. He keeps 3000 sheep and has now 400 head of neat cattle. A few years ago he sold fat oxen enough to amount to the sum of $\$ 2460$. He has also sold this season 1009 bushels of rye,

Bread in a Barrel of Flour. 196 lbs . of flour, 11 gallons or 90 lbs . of water, 2 gallons or 16 pints of yeast, and 3 lbs of salt, make 305 lbs of dough, which evapo rates in kneading, baking, \&cc., about 40 lbs. leaving about 265 pounds net of bread.

Improvement in Orchestra Boxes. Mr. St. Luke, leader of the Orchestra, the Broad way Theatre. has invented an improvement in Orchestra boxes, which it is said will greatly improve the sound of the music. It is to be introduced in the new Theatre

## Large yield

A recent letter from the Hon. H. L. Ellsworth, of Indiana, formerly Commissioner of the Patent 0 ffice, states that he has 1,000 acres of corn, from which he expects to make 55 bushels to the acre. Only zmagine 55,000 bushels of corn on one farm

Experience a Good Teacher.
Having had the privilege of
Having had the privilege of being taxed
five dollars for not correctly understanding the Post Office law in regard to pubfishers forwarding in papers receipts to their subscribers, we subjoin the following information for the special benefit of those who may not have as yet been honored with like courteous de mands from that department :-
Pub. Doc-" The publishers of a newspaper may send a printed or written notice to subscriber stating the amount due on his sub scription."
But experience has taught us that a publisher has no right to attach his nam.e to a receipted bill and thereby render it receipted, without paying five dollars for the privilege of so doing. An unreceipted bill may be enclosed in a paper without violating the Post Office law, but if a publisher happens to be so fortunate as to get his pay in advance for year's subscription, it will not answer to send a bill receipted without exposing himself to a fine for violating the law. Is this true democracy Mr. Johnson ?

Singular Custom.
A singular custom prevails among the Si oux Indians. Whenever a white man has re sided among them for the space of a month he is required to take unto himself a wife. The chief of the band, among which he is at the end of this time, comes to him with a young and handsome squaw, whom he must es pouse and protect according to their customs, or leave the country immediately.-Prairie du Chien Patriot.

Wind Ship.

We see proposals in the Western Expositor published at Independence, Missouri, for a buffalo hunt on the praries in a Wind Ship, the invention of Mr. William Thomas. He proposes to take along a 6 pounder for defence against the Indians, and four horses to be used to draw the ship in case of a calm. The editor of the Expositer thinks this project is at least "something new under the sun ;" and we should consider it at least a very windy one

## Hditorial Courtesy.

The editor of a paper in Kentucky says that a brother editor has "cooled off in his ardor about going to Mexico since he learned that he Mexican churches were not to be robbed." Whereupon the " brother editor," rejoins that if it should be officially announced that " the Mexican grog-shops are to be robbed," the editor of the Kentucky paper would be in Mexi co in ten days.

Post Office Embezziement.
William T. Jones, son of Dr. William Jones of Washington city, a young man of twenty two years of age, has been arrested for stealing a letter from the Post Office in that city contaning $\$ 25$. The father of the young man was deeply distressed and entered into a bond of $\$ 5000$ for the appearance of his son at the Criminal Court in December.

## Coin Chart.

J. Thompson, publisher "Bank Note Reporter," at 64 Wall street, has just issued a ac simile of the different gold and silver coins in circulation in this country, with their relative value. It is very neatly executed and is invaluable as a reference for the business man.

## Channing on lnhalation of Ether.

Messrs. Fowlers \& Wells have just received the above work and offer it for sale, wholesale or retail at the publisher's prices- 131 Nassau street-price $12 \frac{1}{2}$ cents.
Likeness of Gen. Taylor and his Stced. Bedford \& Co. No. 2 Astor Huuse. have issued a new and most correct likeness of this brave general, with his hcrse, which they sell at the low price of 121.2 cents.
In representing Mr. Avery's semi-circular pump in our last number, the residence of Mr. A. should have read Tunkhannock, Pennsylvania, instead of Massachusetts.

A Yankee captain once sang out in a squall a raw hand newly shipped on board his craft, Let go that jib there! let go that jib!' 'I in't touching it,' said he.

A large iron furnace for smelting is soon to be established in Jacksontown, N. B. They begin now to talk about developing the resou cesin now to New Bruaswick.
ces of

Some place in Connecticut Greon tarted opposition to old Gretna fo have marriages, although an old blacksmith for priest or squire seems to be wanting to give a omantic zest of drollery to the scene on the one hand and a pistol shot or two, a touch of the sublime, on the other ; but for the rest of it, the Worcester Transcript says that sume balf a dozen of young persons belonging to hat town slipped down to Connecticut by the cars on Monday evening, and were there tied in the "noose matrimonial" jest as eezy as the boy knew his father. It is said they were very much surprised themselves to find they were " married folks" so soon, and that some other folks were more astonished than they.

## Spiendid Mirage in Paris.

The Journal des Debats gives the followng description of a mirage which occurred in Paris a short time ago. Between seven and eight in the morning the weather being cold and while the sun was rising brilliantly, from the point of the steeple of the Cathedral of Ulm rose a narrow ray of a dark color, almost vertical, with a slight inclination to the west. Near this ray the image of the upper half of the steeple of the cathedral was designed, with its towers and all the numerous and deliwith its towers and all the numerous and deli-
cate Gothic ornaments which decorated on cate Gothic ornaments which decorated on
all sides. This image was so correct that it night have been mistaken for a representation made by the daguerreotype. Eight times this phenomenon was repeated. Such an optical effect is unexampled in the country.

## Royal Jewers.

The European currespondent of the Boston Atlas, writing from Dresden, gives the following description of the jewels in the Royal Cabinet of Saxony:
"The old soverigns of Saxony must have possessed Aladin's lamp, to have amassed the rare jewels, carving in precious metals, and costly works of art, accumulated in the cases of the Grume Gewolbe, or green vaults. Large goblets composed of agates, chalcedony, and lapis lazuli-vases cut from solid rock crystal-sapphires, pearls, rubies, and diamonds, to the value of many millions, exceed any similar show I have ever seen,
One of the diamonds is a green brilliant, weighing 40 carats, and among the cornelians is a stone on which is cut a cross, set in a ring for Martin Luther. The seal ring of the Reformer is also here, bearing a death's head, around which is the motto, morisapa cogila. The most costly works of artare by Dillinger, the Saqon Benvenuto Cellini, whose maste.-piece represents an Oriental Emperor holding court, surrounded by his guards and nobles, in full costume, to the number of 138 figures, all of pure gold enamelled. This trinket occupıed Dillinger eight years, and cost $\$ 58,400$, at a period when not one Saxon in ten was taught to read. It is said that the diamondsalone in this collection would pay off the heavy national debt with which the country is burdened.

## Reflection of Heat.

One of the most curious speculations in natural philosophy is that of concentrating or multiplying the heat of the sun by plain mir rors, or convex lenses. As one plain mirror reflects the heat of the sun, so the reflection of two, three, or more, augment the heat. In this way archimedes burnt the Roman fleet at Syracuse; and Antheonus, an arcbitect at Constantinople, describes the method, as does also Leonard Digges, who wrote on the subject in the reign of Elizabeth, and asserted
that he had fired bodies half a mile distant.

## Lumber Destroyed.

The injury to the lumber trade by the recent lood in the Wisconsin pineries is heavier than was first anticipated. The loss of property is estimated at $\$ 250,000$. On the Wisconsin river there are now forty saw-mills, and a new one to runsixty saws is nearly completed.

A palace is building for the Pacha of Egyp at Beycos, on the Asiatic side of the Bosphorus, which is expected to be one of the finest buildings in the Turkish empire. It is to be of the finest stone, but adorned with 150 \$1,500,000.

## FROM MEXICO.

Although rumors have been afloat regarding the real occupation of the City of Mexico by our troops, and a number of papers have issued extras giving a glowing description of their entrance into the imperial city, we are not yet fully confident that our brave fellows not yet fully confident that our brave fellows
are " revelling in the Halls of Montezuma." are "revelling in the Halls of Montezuma."
The reports are too conflicting to be relied on. Although we have no doubt but that our sol diers are in or near the city. yet it is impossi ble for correct news to have reached here since the period General Scott left Puebla.

## Labor Saving Soap.

To make it, take 2 lbs . of sal soda, 2 pounds of yellow bar suap, 2 quarts of water, or in like proportion. Cut the soap in thin slices, and boil together two hours, and then strain through a cloth into a tight box or tub; let it cool and it is fit for use. Do not let it freeze To use it : Put the clothes in soak the night before you wash. The next morning put the water into your kettle or boiler. To every two pails of water, add one pound of the soap. As soon as the water with its dissolved soap boils, ring out the clothes from the water in which they had been at soak during the night, which they had been at soak during the night,
and put them in the boiler without any ruband put them in the boiler without any rub-
bing. Let them boil one hour, then suds and rinse them, and they will be clean and white. They will need no rubbing, except a little on such places as are soiled, and for that no washboard will be required. The clothes sl:ould be rinsed in two waters.
The above receipt we have taken trom a somewhat scientific paper, and we have only to say, that this trouble of making labor saving soap may all be avoided, just by soaking the clothes in the alkali and using the soap in the common way. They must be rubbed

## Disinfection.

The British Government has sent out two gentlemen with a certain description of chemical agent, recently invented by M. Ledoyen, and an English gentleman of scientific attainments, for the purpose of trying how far it may be useful for the purpose for which it is intended, viz: the destruction of the contagious and noxious qualities of the air arising from beds in hospitals and sick rooms, drains, \&c. These gentlemen are now on their way to Grosse Isle.

## Government Steamer.

A new government steamer called the "Kensington" was to have been launched at Philadelphia on the 9 th inst. She sails immediately for the Gulf of Mexico.

A New Regulator.
Uncle Sam's post office stamps are now used as a circulating medium for small remittances by mail.

Mr. J. W. Long, editor of a Southern paper, asks, " When will the editor the Louisville Journal learn to tell the truth?" To which Prentice replies, "There is no doubt but I shall tell it before Long."
The extensive mills belonging to $\mathrm{Mr} . \mathrm{S}$. Kirk, about two miles from Corydon, Ia., were destroyed by fire lately. Loss about' $\$ 8000$. No insurance.

The 26 letters of the alphabet make 403 quintillions of combinations; 20 maks 2k quadrillions, and 12 would make 479 millions.
The New York and Buffato Telegraph Company are putting up a strong iron wire on their ine.
The nerve of a tooth, notso large as the finest cambric needle, will sometimes drive a man to distraction.
The second Ocean Steamer the U. States, will be launched on Saturday or Monday.
The Chinese Junk it is said is going to Philadelphia.
There are now seventeen thousand Post Ofin.
es in the United States.
In Loadon and Paris the fashionable ladies

## THE METEOR

A Shepherd on the silent moo Pursued his lone employ,
And by him watch'd at midnight hour, His lov'd and gentle boy.
The night was still, the sky was clear, The moon and stars were bright; And well the youngster lov'd to hear Of those fair orbs of light.

When, lo! an earth-born meteor's glare Made stars and planets dim ;
In transient splendor through the air Its glory seem'd to swim

No more could stars or planets' spell The stripling's eye enchant He only urged his sire to tell, Of this new visitant

But ere the shepherd found a tongue, The meteor's gleam was gone; And in their glory o'er them hung The orbs of night alone.

Canst thou the simple lesson read, My artless muse hath given! The only lights that safely lead, Are those that shine from heaven

## Improving Time

Few seem to be fully aware of the importance of improving time. Yet there are those among the most considerate, who know how to appresiate the value of it. They evince this in their efforts to good, and to be useful in the world. Indeed the conduct of all tends to convince every one of the necessity of improving time, could they fully realize how soon their days on earth would be ended. This idea is often overlooked. This is perhaps one prominent reason why so many permit hours, days, and even weeks to run to waste. If man were created for no other purpose than to spend his time in idleness, it would not be so strange to see people manifesting so little concern about improving the passing moments. But as God has enjoined it upon man to improve the talents committed to his trust, it is astonishing to see multitudes living as though no such duty was imposed upon them. Time skould be improved to the best advantage, or but little will be accomplished. Time must be improved, or the cause of truth will suffer great loss. In short any person who neglects making efforts to promote, advance and extend the cause of truth, in literary attainments or otherwise, is guilty of a moral wrong, and may expect to make but little advancement towards happiness in this world, and for this neglect perhaps, may look back with regret in a dying hour, and die degraded as they lived; consequently, unprepared to make that advancement in a spiritual world that they otherwise might have done Therefore, what our hands findeth to do, let us do it with our might.

## HIUstrious Exemplars.

Industry in humble and laborious occupations has been honored and exalted by the example of the world's greatest benefactors-as may be seen in the following paragraph from the pen of the Rev. T. Spencer.
' In early life David kept his father's sheep, his life was a life of industry; and though foolish men think it degrading to perform any useful labor, yet in the eyes of wise men industiy is truly honorable, and the most useful is the happiest. A life of labor is man's natural condition and most favorable to bodily health and mental vigor. Bishop Hall says, Sweat is the destiny of all trades whether of the brow or the mind. God never ullowed a man to do nothing.' From the ranks of industry have the world's greatest men been taken. Rome was more than once saved by a mansent for from the plough. Muses had been keeping sheep furty years before he came forth as the deliverer of Israel. Jesus Christ himself, during the early part of hislife, worked as a carpenter. His apostles were chosen from amongst the hardy and laborious fisher. men. From this we inter that when God has a:ly great work to perform, he selects as hisinstruments those who by their previous occupation have acquired habits of industry, skill and perseverance; ard that in every department of society, they are the most honolable

## Application or Heat to water.

The pressure of the atmosphere effects the boiling of water. At the common pressure of about 15 lbs. to the square inch, water will boil, or attain the vaporific point, at 212 de pheric pressure by an air pump, as is done in the boiling of sugar, we can produce the phenomenon of boiling at a much lower tem perature. At the summit of Mount Blanc, where the atmospheric pressure is light,water is found to boil at 187 degrees.
Steam produced from boiling wate: is a transparent, colorless, and invisible substance like air. If we could look into the boiler of a steam-engine, we should see nothing but the water in a state of ebullition. The white cloudy-looking matter which is emitted in the form of vapour, is moisture produced by the partial condensation of the steam in the atmosphere-taking the form of vapor is a ste towards becoming liquid again.
A cubic inch of water produces exactly a cubic foot, or 1728 cubic inches, of steam, at 212 degrees of temperature ; in other words when water is transformed into steam, it oc cupies 1728 times its former bulk. In this ex panded condition steam is of a less specific gravity than air. Its density is expressed by 0.625, that of air being 1.

The elastic force of steam in the process of heating that is, the force with which it seeks to expand-differs at different temperatures; at first the force is inconsiderable, but it rapidly increases as the temperature is rais ed. At a temperature of 212 degrees, the elastic force is 15 lbs . on the square inch of the containing vessel, or equal to the external pressure of the atmosphere; at 250 degrees, it is 30 lbs ; at 272 degrees, it is 45 lbs ; at 290 degrees, it is 66 lbs .

Effects of Manufactures upon Population
Dr. Jessee Chickering has recently issued, through the Boston press, an interesting work, designed to exhibit the increase of the population or Massachusetts and the changes which have taken place as to number and populatio several parts of the commonwealth.
From this it appears that during the period from 1810 to 1820 inclusive, while the best
lands were settled and improved by agriculturalis's, the increase of population was com paratively slow.
About the year 1820 the manufacturing inerests opened new branches of industry for where surplus population, and in these parts lation became more numerous, and the popu lation became more numerous, and the emi-
gration to other states less; while the towns and districts exclusively agricultural have remained stationary.

## The Eritish Empire in India.

The Bombay Times gives us some useful hints on India. -The British, or British and East India Company's armies in India, num bering, on the 1st of January, 1847, consider ably above $300,000 \mathrm{men}$, and the yearly amount of military charges for tieir support is stated to exceed $\$ 70,000,000$ a year, or more than half the whole public revenue. The public debt of India is four hundred millions of dollars, one fourth of which has been incurred within the last ten y ears. The gross annual incerne of India, is estimated at $\$ 125.000,000$, and the expenditure at $\$ 135,000,000$. Before the Affghan war, the British armies in Inda numbered 163,477, exclusive of about 25,000 tronps from Britain-British regiments. There are thousands of European offlcers and their appointments 18 a source of effective patron age to men in power of England. In a few years, 110,000 men have been added to the East India Company's army, being about as many as the whule British military forces upheld elsewhere. Seven hundred British officers nave been appointed to native regiment since 1837 The Bombay Tanes considers bat the forces in India, are courageous and well disciplined, but its facts do not indicate hat India is well governed. It is asserted Euat the reasons why India does not supply England with cotton are, the distance, the
want of carriuge and the expense, the wantof roads for carts, and the watit of a great artery like a railway. The growis; are too poor to send their cottun to a distanies.

Steel of the ancients.
The steel of the ancients in consequence of not being cemented, suffered itself to be hammered, and was not near so brittle ass the hardestwith which we are acquainted at present. The Celtiberians in Spain prepared the steel used by them, according to the account of Diodorus and Plutarch, by burying the iron in the earth and leaving it in that state till the reater part was converted into rust. What remained without being oxydised was afterwards forged and made into weapons, and paricularly swerds, with which they could cut asunder bones, shields and helmets. However improbable this may appear, it is nevertheless the process still used in Japan. The art of hardening steel by immersing suddenly in cold water,' is very old. It is also a very ancient opinion that the hardening depends chiefly on he nature of the water ; many wells and rivers were therefore in great reputation, so that steel works were often erected near them, though at considerable distance from the mines. Instances of this may be found in Pliny and Justin. The more delicate articles were not quenched in water, but in oil.

## How to Preserve Health.

Do not expect sir, some wonderfui announcement, some fascinating mystery! No. It is simply the plain little practice of leaving your bed-room window a litte open at the top while sleeping, both in winter and summer I do not come before you as a theorist or an experienced teacher, in thus calling loudly up. on every family to adopt this healthful pracice. I am the father of ten children, all in pure health, and thank God never iost one, although their natural constitutions were not robust. But in addition to the salutary effect of the practice in my family, wherever I have advised others to try its effects, it has invaria bly been found to be both pleasant and berefi-cial.-Robinson.

Mon strous Regiment of Women.
A letter dated 1st May, Cape Coast Castle Africa says:-Captain Wimniett, the governor, has returned from a visit to King Dahomy, having succeeded in entering into treaties far beyond his expectations. King Dahomy has written a letter to her Majesty the Queen of England, and intends sending her presents, thereby. showing his amicable intention in his negociations with this country. King Dahomy's househeld troops consists of 10,080 women magnificently equipped and many in armour. Captain Winniett was received by upwards.of 20,000 troops, and Dr. Ridgway, who accompanied Captain Winniett on his visit, kept a comprehensive journal, which he has sent to England for publication.

Remarkable presence of Mind.
A workman employed in one of the mining hafts of the Scottish Cer.tral Railway, lately had a most miraculous escape. He had lighted he fuses connected with the charges of powder for the the purpose of blasting, and gave the signal to be drawn up, but the rope slipping, the poor fellow was suspended a few eet above where the explosion was to take place, with no other prospect before him but instant death. With great fortitude and presence of mind, he called out to lower him, which was immediately done, and advancing cautiously to the burning fuses he extinguished them. On examination, they were found o have burned within half an inch of the powder.

## New Tricks

Some thieves in Paris dress as servants, and visit the different tradesman, requesting certain accounts; they then dress as tradesman, take the accounts to the parties, receive the money and bolt.
A clever thief, named Chamescot, was brought up before the Correctional Police of Paris, charged with stealing lour five franc pieces. He hustled a man, who had money in his hands, and contrived to get possession of the several pieces by treading on them, ifter having covered the soles of his shoes with cobbler's wax.

Dr. Gregory, of Edinburgh, in visiting the poor, used often to begin his prescription by breaking a pane or two of the window with his walking stick, which he made good agann at the ead of the illuess.

Female Sculptor.
Propertia de Rossi, a female of Bologna of Propertia de Rossi, a female of Bologna of
obscure birth, handled the chisel as a profesobscure birth, handled the chisel as a profes-
sional artist for emolument, and was extremely successful in her eforts. She united the delicacy of Praciteles with the truth of Puget. In the pontificate of Clement VII. she made several statues for the facade of San Petronio at Bologna. She was also a good painter, and an excellent engraver. Propertia became enamored of a young artist, who did not make a suitable return to her love. This disappointment threw her into a lingering disorder, which brought her to her grave. Her last work was a basso-relievo, representing the history ot Joseph, and Portiphar's wife Her cruel lover was represented as Joseph; herself as the Egyptian Queen. It was alleged to have been her best work, and may be truly said to have been executed.

The Vampire Bat of Brazil
There is one enemy which sometimes approaches even a hammock and take a tribute from the unconscious sleeper; this is the ' Vampire Bat.' During the day thev sleep in the tiles of the roof, but they go forth at sunset. Some of the largest measure upwards of two feet across the wings, but generally they are smaller. Of their fondness for human blood, and especialls that narticular por tion that constitutes the animisis of the great toe. If the foot is covered there is no danger, or if a light is kept burning in the room; and often we have slept unharmed thus guarded, when bats were flitting about and squeak the night long. Cattle and horses are not so easily protected; and a wound once made, the bat returns to it every night, until the proper precautions are taken, or the animal is killed by the loss of bluod.

## Female Form.

" In form, the Italian excel us. Large and fuller, they naturally acquire a finer gait and bearing. It is astonishing that our ladies should persist in that ridiculous notion that a small waist is, and per necesscita, must be beautiful. Why, many an Italian lady would cry with vexation, if she possessed such a waist as some of our ladies acquire only by a long and most painful process. I have sough the reason for this difference. and can see no other, ouly that the Italians lave their glorious statuary continually before them as mod els, and hence endeavor to assimilate to them whereas our fashionables have to models, ex cept those French stuffed figures in the win dows of miliner shops. Why, if artist should presume to make a statue, with the shape tha seems to be regarded with us as the perfection of harmonious proportion, he would be laughed out of the city. It is a standing objection a gainst the taste of our women, that they wil practically assert that a French milliner, un derstands how they should be made better than nature herself."一J. T. Headly.

## Good Farming

Here is the secret of good farming. You cannot take from the land more than you restore to it, in some shape or other, without ruining it, and so destroying your capital. Different soils may require differeat modes of treatment and cropping, but in every variety of soil these are the golden rules to attend to: -Drain until you find that the water that falls from heaven does not stagnate in the soil; but runs through it and off it freely. Turn up and till the land until your foot sinks into a loose powdery loam, that the sun and air readily pass through. Let no weed occupy the place where a useful plant could possibly grow Collect every particle of manure that you can, whether liquid or solid. Let nothing on the farm go to waste. Put in your crops in that course which experience has shown to lead to suc cess in their growth, and to as enrichment and not impoverishment of the land. Give every plant room to spread its roots in soil, and leaves in the air.

## John Steeprock's Five Mille Race

We learn from the Batavid Times of Tues day, that the "fat" Indian, John Steeprock, ran a five mile race in that village on Tuesday last. The time limited for the five miles was thirty minutes. The track chosen was half a mile in length. Steeprock performed the distance in 20 minutes and 31 seconds.

## NEW INVENTIONS.

Montgomery's Patent Steam Boller.
Mr. James Montgomery, of Memphis, Tennessee, has invented and patented a new steam boiler, with very excellent qualities. Professor Renwick and Mr. Wm. Burdon, of Brooklyn, steam engine manufacturer, highly recommend it. The opinion of the practical man is always the most valuable. This boiler is said to possess the following advantages over others :-
1st. It requires less water in the boiler.
2d. Prevention of explosion.
3d. Saving of one-third in fuel.
4th. The saving of one-half the space usually occupied by the best class of locomotive boilers.

One of these boilers is used in this city by Hooper \& Brothers, 333 Pearl street, and the mechanic who has charge of it pronounces it to be a " grand boiler." We have seen it and can say that we have never seen a boiler occupying so small a space, doing so much work. We have, on the contrary, seen boilers double its dimensions required to produce an equal amount of steam.

Metallic Carriage Shaft.
Mr. E. H. Ashcroft, of Boston, has made the shafts of a carriage from suitable wrought iron tubes. They are far superior to wood, neater and more durable, and they can be japanned and look exceedingly beautiful. It is a great improvement. Mr. Ashcroft has taken the necessary measures to secure a patent for his invention.

New Calculator.
Mr. W. M. Haines, of Rochester, N. Y. has invented a machine which can add and subtract columns of figures from units to billions, with the utmost accuracy. In the addition of decimals it is very valuable, for with a very limited practice a child can be made to work problems that would be very troublesome for any person to resolve. The model is a very neat machine capable of working four columns neat machine capable of working four columns
of figures. Mr. Haines has taken measures to secure a patent.

Glue made Waterproof
A mechanic in Albany has just made an experiment which promises to be of much advantage by making glue perfectly waterproof, and having the property of drying immediately after its application. His method, we learn, is first to immerse common glue in cold water until it becomes perfectly soft, but yet retaining its original form ; after which, it is to be dissolved in common raw linseed oil, assisted by a gentle heat, until it becomes entirely taken up by the latter, after which it may be applied to substances for adhesion to each other, in the way common glue is applied. It dries almost immediately, and water will exert no action upon it. It is unnecessary to say for how many valuable purposes in the arts this application may be used. For cabinet makers it is important, as mahogany veneers, when glued by this substance, will never fall off by exposure to the atmosphere. In ship building it will probably answer a valuable purpose, as it has infinitely more tenacity than common glue, and becomes impervious to water.

## Planeing Machine.

T. J. Wells of this city is the inventor of the Planeing Machine for which patents have been secured some time ago. It consists in an improved mode of adjusting the plane irons. "The method of fastening plane-bits or irons to their stocks (now generally in use) is by means of a wedge, which requires hammering to drive it in or draw it out, which in a short
time injures ths stock and disadjusts the set of the cuttıng edge. Various other devices have been suggested and and essayed to avoid this difficulty, but they have so far all failed, either in consequence of complexity and cost, or the occupying of too much room in the throat of the plane, and therefore impeding the discharge of shaving. But by this improvement all these difficulties are avoided. It consists in the employment of an eccentric metallic roller, which has its bearings in the sides of the throat of the stock and is situated immediately over the bit or iron; so thatby turning it the bit is either liberated or fastened. Its diameter is so small as anot to aflord the least
obstruction to the free discharge of the shavings; and by the turning of this eccentric to fasten the bit, if it be turned in the direction of the cutting edge, it will tend to set for the cutting of a thicker shaving, and by turning it the other way the reverse effect will be produced."

It is well known that the common soldering iron is sometimes very injurious to the sinews of the hand, and in some instances from 1ts great heat, the use of the hand has been entirely lost. Here is a plan to obviate this difficulty by substituting glass for wood.
fig. 1.

## Fig. 2.

Fig 1, is a copper bit of the ordinary construction, showing the application of a glass handle (seen in section,) and containing within it an iron nut, firmly imbedded by the aid of Plaster of Paris or some other suitable cement. The nut takes on to a screw at the termination of the rod, so as to make all firm.
Fig. 2, is a hatchet-bit for coppersmiths, \&c shewing the application of a glass handle in a similar way ; and exhibits the like improvement applied to a common soldering iron for plumbers, \&c.

## Vencering Machine

A superior veneering machine has been invented and patented by A Mac Burth, of this city, the nature of which consists in interposing between the veneers, or veneer and body to which it is to be attached or united, or layers of wood to be united, a cotton or linen canvass, or other cloth, (the cloth and parts of the wood to be adjoined being first covered or prepared with glue or other adhesive material,) and then placing the parts to be united in juxtaposition; the cloths prepared as aforesaid being interposed, and uniting them by any of the known or suitable modes of compression. The cloth thus interposed adheres firmly to every part of the adjacent wood, and prevents the veneer from splitting or cracking with the grain of the wood, or leaving the body to which it is attached; renders, two veneers minutely thin, thus united, stronger and more durable than if united in the usual mode, and than solid wood of many times its thickness or size.
This invention is peculiarly adapted to the veneering of formation of unequal surfaces, or to cases where the veneering wood is required to be bent or compressed out of its natural inclination. It is especially adapted to the construction of wooden tubes or pipes. The mode adopted in the constructing of tubes or pipes is the following: A veneer or layer of wood is first rolled around a rod or shaft attached to a crank, and turning with it and compressed by a cord, or other compression, into the required shape. The cloth, saturated with glue or other adhesive substance, is then rolled tightly around the veneer thus shaped as above, and then another veneer, or layer of wood, is applied upon the cloth and compressed, by the means above stated, into contact with every part of the cloth; by turning upon which, the veneers are shaped or rolled over a furnace, and the glue or adhesive matter is made to penetrate every part of the fabric."

## Discovery in Magnetism.

The phenomena in magnetism have been attracting the attention of scientific men for long time past, and it appears from investiga tions as it we were advancing to a knowledge
of many of the most secret operations of nature. A very interesting discovery has recently been made by placing ạ glass trough on the poles of a powerful magnet and filling it with a fluid from which a precipitate is slowly forming, when it is found that the precipitate arranges itself in the magnetic curves. Crystalization taking place under the same circumstances, exhibits also the influence of magnetism on their molecular arrangements -all the crystals tending and arranging themselves in the order of the magnetic curves.The experiment is very beautifully shown by filling the trough with a solution of the nitrate of silver and placing a globule of mer-
cury on the glass equi-distant from the poles cury on the glass equi-distant from the poles out in all directions in a very beautiful arborescent form, but it maintains in a striking marner the curvilinear tendency and distinctly marks out the lines of magnetic direction. From results already obtained it would appea that this influence is universal.

It is reported Greatinvention.
It is reported somewhere up the river that a entleman has invented an article he calls the Skirt Expander, tor which he is about to procure a patent.-The inventor says it will en tirely do away with the common cotton bustle. It is said to be principally made of India-rub ber, air-tight, and is capable of being inflated or nontracted at any time. If a lady should be walking and wish to appear larger, or smaller, the Skirt is so constructed that she may enlarge or diminish her apparent size at pleasure; and yet a person may be walking with her and not discover how, or by what means her apparent size is diminished or increased. The inventor, also, says that the appearance of a lady, with one of these Skirts, is much improved, the dress setting much better and easier: and that it will save the labor of carrying about the streets quite a small bale of cotton and from eight to twelve skirts.

## Razor Strops

A correspondent says he has tried with great satisfaction to himself, the following improvement on his razor strop: He uses, on two of the four sides, blacklead, and on the other two sides a powder made by gently rubbing two Turkey stones against each other, which produce a beautiful nowder, def ying in quality, any and all of the powders used on strops, and
in a year.

Patent Safety Tubes for Life Boats.
Mr. Holdsworth, of Dartmouth, England, has invented life buoys or tubes of vulcanised India rubber, which have been thoroughly tested, we learn, by nautical men in England and pronounced to be perfectly successful, converting by their use, any boat into a life boat.
The tubes are about two yards in length and eight unches in diameter, each having a brass valve at one end for inflation, either by the nouth or a pair of bellows, and with a screw tap to prevent the escapement of air. Seve ral of these were lashed longitudinally along the interior sides of the boat, under the seat of the boat. The boat was perforated with four holes in her bottom, and two on each side above the water line, for the purpose of filling her, and as a temporary expedient, these were provided with cork bungs or plugs, so as to be closed when required. In a boat regularly constructed for an occasional lifeboat on this principle, lateral valves are made to act with readiness and effect. Four men, with two oars, were on board of the boat used, which, though they had on board 500 lbs . of iron in weights of 56 lbs it required some time to put he: down so as to be waterlogged. She was at length almost wholly submerged, yet maintained her upright positıon with 3 of the men standing on her bottom. On being lightened of several of the weights, which were proportionately too much for the comparatively small amount of buoyancy in the few tubes, she rose considerably, and freed herself of much of the water through the side valves under the gunnel. The operation was successful, and would have been.more so had she been in a tossing sea-way, in which case she would have discharged the water more freely by her undulating motion or lift, than in dead water. The principle is not assumed to be new, but it is claimed as a new adaptation, undoubtedly practicable, and may be the means of saving life on emergencies. The tubes are flexible, may be rolled'up in a small compass, and stowed away when not in use. One great advantage is, that the tubes are as strong as thick leather, and are not as liable to injury by any thing short of a cut or perforation ; and even if a hole be made in one of them, there are curious plugs or rivets of the same material that can easily be buttoned into the hole so as immediately to render it tight. The material is 16 Fper cent lighter than water of the same bulk, and the cost of the whole apparatus for a boat of considerable size is comparatively small.

Cotton in England.
Mr. McQueen stated in evidence before a Mr. McQueen the Huse of Commons last month, that in the course of the last 25 years, England has paid, for cotton alone, to the United States, £ $268,000,000$ sterling, or $\$ \mathrm{I}$,300,000,000.

NEW YORK, AUGUST 14, 1847.

## Relationship of Sclence

In our last number we showed how we were dependent on the elements that surround us for food, water and clothing, and how that in the one case, the utmost exertions of body and mind were necessary to bring from the elements around us, those things that sustain life The experience of every age has classified facts or phenomena, and by such we are enabled to tell if such phenomena would occur again by certain processes. Science, then, must be interesting to all ; for example, to know how sea weeds are turned into glassfragrant hartshorn made from putrid matter, or earthy matter made into metals, and how these are used to make machinery to clothe us, and houses to shelter us. Science is the result of labor, and therefore we may well say that to the workingman are we indebted for those successful experiments, which building one above another, present a beautiful and interesting and useful structure.
Nature indeed is the cause of many changes that affect us, but the operations of Art surely interest us most. These are of two kinds, relative to visible motion, what we are especially treating, viz. mechanical philosophy and chemistry. These are distinct and different. When a stone is raised by a lever, or pulley, or a piece of wood split with an axe, the nature of the substance remains the same, its position or shape is only altered.These are mechanical actions. But when wood is exposed to heat and converted into charcoal, tar, vinegar, \&c., the change is chemical one. These two distinct changes re late to two different sciences which are close ly related to us but widely different in themselves. The one treats of form, shape and magnitude, the other of the nature and com-position-the property of materials. We have shown before how nearly we are related to science, but we have not directed attention to the manner of classifying facts, and to carry out our sincere and always prominent desire, $a$ spread of true knowledge, we would say le none plead ignorance of a way to acquire it If we take up a wooden ball, we can direct attention to the intricate mechanical art of turning, \&c. and read read of the same and its relations in the article we have published," Mechanical Manipulation." If we take up a piece of charcoal we may inquire into its uses and the causes which changed it from wood to a hard ringing substance, and in the enquiry we will be led to consider the opera tion of gas making and a number of other phe nomena. By this mode of procedure any per son by very simple means. can lay past a grea amount of useful information; yes, can build up and arrange a system of facts, experiments, and master any science. In this mode of study too, the pursuit of knowledge becomes part of our existence and we become united by the ties of a nearrelationship.

## Steamboat Fare.

The laudable competition in steamboat travel on the western lakes, forms a striking contrast with that of the English steamers The voyage across the Atlantic is about 3,000 miles, and that from Buffalo to Chicago, as we travel it, near 1,000 . The price of cabin pas sage across the Atlantic, that now occupies about twel ve days, is $\$ 150$, while on this route, that occupies four days, is only $\$ 10$, and the fare is equal to the best hotelin the Union. Let us see-four days at a good hotel, at $\$ 2$ per day, is $\$ 8$, leaving a balance of $\$ 2$ for a voyage of a thousand miles through a region that would give a dying man an appetite for meat and drink.

## Copper Ore.

Examinations are making in Prince Wil liam Co., Va., for copper, and that the progress thus far have been favorable. 2500 lbs . of ore, from an excavation near Brentsville, were brought to town yesterday, to be shipped to Boston, and proof of its quality.

Cast-Iron Rall Road Bridges.
A short time ago a great sensation was produced in England by the fall of a rail road bridge over the river Dee From the nature of the accident many opinions have been ex pressed. The following opinions of a " Prac tical Man," are well worthy attention on both sides of the Atlantic:-
"Cast iron is a remarkably hard and rigid substance, but exceedingly brittle. and though it will bear an enormous pressure, gradually applied, without fracturing, it will break un der a comparatively trifling blow. Now, when a cast-iron girder is used to carry the wall of a building placed above it, the weight is gra dually laid upon the girer, and when finished it is subject to no particular variation, and the girder supports its burden firmly and secure y. But when a cast-iron girder is applied to carry a heavy train across a bridge, the weigh it has to bear is very suddenly (and with express trains almost instantaneously) thrown upon the girder, and as suddenly removed and hence it assumes, according to all intent and purposes, the character of a blow, and the girder is subjected to a strain which it is quite unfitted to bear. Rolled-iron rails ar invariably made use of, because it is a well established fact that cast-iron rails would frac ture under the rapid speed of a train, and ye cast-iron is recklessly employed in the furm of girders, which are only rails of a much larger kind. I am in the constant habit o seeing iron girders tested in the usual manne by the hydraulic press, but this ordeal does not prove their fituess for railway purposes because the power of the press is very gradully applied and as gradually relaxed. I saw a practical proof of this a few days ago; a arge cast-iron girder had an accidental fall and it immediately broke into three pieces.I could multiply this assertion by many simi lar practical proofs. but I will only add that it is my firm conviction-a conviction strength ened both by theory and practice-that a cast iron girder ought never to be trusted to bear vast weight suddenly placed upon it and a suddenly removed; and, therefore, cast-iron girders should never be used for the means of railway transit, as in every case they are subjected to a strain which, from their very na ture, they are unable to bear."

## Hours of Labor.

Below we publish the act recently passed by the New Hampshire Legislature, regulating the hours of labor. It will be seen that all the act does is to establish 10 hours as a legal day's work. Indviduals can contract to wor 12 or 14 hours, or night and day if they please. The law applies to all labor in the field as well as factory. It discriminates with regard to labor by minors, and makes it penal to employ them in factories more than 10 hours per day, without the consent of their parents or guardians. It is entttled
"An act for regulating the hours of labor in manufactories. Be it enacted by the Senate and House of Representatives in General Court convened.
Section 1. In all contracts for or relating to labor ten hours of actual labor shall be a day's work, unless otherwise agreed to by the parties ; and no person shall be required or holden to perform more than ten hours labor in any one day, except in pursuance of anexpress contract requiring a greater time
Sec. 2. No minor under the age of fifteen years shall be employed in any manufacturing establishment more than ten hours the day, in any labor, without the written consent of the parent or guardian of such minor first obtaind. If any manufacturer, or any corporation, or the agent of any manufacturer or corporation shall employ any such minor in violation of the provisions of this section, he or they hall be punished by a fine not exceeding one undred dollars. Approved July 3, 1847."

## Tankees Euverywhere.

The commander of a Russian exploring expedition in the Antarctic ocean, discovered or imagined he had discovered, an ssland previously unknown. He was proceeding to take possession of it in the name of the czar, when a snuglittle schooner came standing out towards him, and inquired, "Do you want a pilot?" The captain was a genuine yankee from Connecticut.

We have already presented a great number of combinations of machinery simple in them elves, but not the less beautiful. The sim ple forms of communicating motion by means f a crank is well known to all and the com inations resulting from this by other mecha ical instruments to communicate other mo ions are numerous. Here is represented shaft connected with a crank by a rope passing over a pulley, and the inference at firs ight is that by this movement rectilinear mo ion will be communicated to the shaft. Thi motion is partially applied as represented to he Clauseen Loom, only there are doubl pulleys connecting the treads and heddles.

Transmission of Power.

Various methods are and have been used for he spread of power from the first mover over a number of surfaces-in other words, to communicate the whole of the prime power in portions to drive a number of machines. Such as a single water wheel driving all the various kinds of machinery in a woolen factoy. The most common plans of transmitting power, are bevel gearing, the pinion and the belt. In the above cut we have an example of the transmission of power from a large wheel which is but partially seen to two smaller wheels, by means of a belt. The power communicated is to each shaft on the smal wheels, one half the whole power, but a dou le speed from that of the large wheel, as the small wheels are butkalf the size of the larg one Each small wheel performs two revo lutions while the large wheel performs one.

## New England Slavery and New England Newspapers.

Whatever may be said regarding the corruption of the Press in various paris of the country, this much at least can be said of our Eastern papers, they fear not to tell the truth, they do not cover up lniquity. There is an honest, open and sometimes a fierce in dependence exhibited. The Boston Atheneum gives publicity to the following institution up on which we cannot comment, because we ar not fully acquainted with all the minutia rela tive to its necessity or origin, or vice versa.
"A portion of our readers will doubtless be surprised to learn that slavery no v exists in New England, and that men and women are sold or leased at public auction. Such the fact. The persons who are thus barba rously treated, are guilty of the dreadful crime of poverty, and because they are unable to take care of themselves, and the town
in which they live has no accommodation, they are sold to individuals. The purchaser are obliged to feed and clothe these wicked paupers at the price agreed upon, which is paid by the town. and are at liberty to get as much labor out of them as they ean.
" Able-bodied men have stood by these sales and seen their own relatives sold into slavery -their cousins, uncles and aunts, and even parents !"

## Sad Accident.

A large limestone rolled from the top of hill in the vicinity of Pittsburgh, on Monday afternoon. In its descent it rushed against frame school house and instantly killed five children besides wounding three others, one of whom it is feared may not recover

The revenue collected at 'Tampico during the last two months, reaches $\$ 70,000$

The Western Trade milwaukie.
The arrivals and clearances at the port of Milwaukie from April 12 to July 1, 1847, and the number of barrels bulk of passengers goods, and number of tons of merchandise landed, were as follows
Steamboats propellors, brigs and schrs. 33 No. of passengers, 10,890
No. of barrels bulk of passenger's goods,

21,476
No. of tons merchandise.
2,786 chicago.
In 1839, the first cargo of wheat was shipped from Chicago The following shows the increase from that time :

During the month of June there passed through Lock No. 4 of the Welland Canal, 376 vessels- 188 down and a like number up -of which 126 were from and 118 to Oswe go, and 42 from and 42 to Kingston. 184 scows and 104 rafts also passed through.

## Cotton Thread

Very few of the thousands of our countrywomen who are in the daily and constant hab it of using the needle, are probably aware that they are indebted for the invention of that important article of domestic manufacture, cotton thread, to one of their own sex-the wife of the patriarch of American manufacturers, Samuel Slater. A writer in the Woonsocket Patriot, states that in 1794, while spinning a quantity of sea island cotton, the evenness and beauty of the yarn attracted the attention of Mrs Slater, and the question arose whether if doubled or twisted, it would not make good sewing thread. The experiment was tried, aud in order to be fully satisfied with the result, a sheet was made, one-half with linen, and the other half with cotton thread, and immediately put in use. The cotton wore the best, and the linen was the first that was rent. From this period Mr. Slater commenced the manufacture of cotton thread, and it soon spread into England, France and all other European Countries, where it is generally supposed to be of English originthough the credit of the invention belongsalmostentirely to an American matron.

## Railroad Bridge.

A Railroad Bridge over the Housaonce is to be a very handsome and imposing structure. It will cross the river about $\mathbf{i 0 0}$ rods above the Washington Bridge. In length it is to be 1079 feet and the elevation above low tide, we believe, is 29 ieet. It will have a turn table draw, giving an opening of 60 feet in width on one side side of the pier and some 40 feet on the other. This will be sufficient for all he purposes of navigation. About forty men are now at work in laying the foundation of the piers, \&c.

New York State proảuces annually about $30,000,000$ bushels of potatoes. Maine produces about $12,000,000$ bushels.

## To New Subscribers

Those subscribing to the Scientific American will be furnished, if desired, with all the back numbers of the present volume. Bound ogether at the end of the year, they will form handsome and valuable work.

THE
SCIENTIFIC AMERICAN.
Persons wishing to subscribe for this paper ave only to enclose the amount in a letter diected (post paid) to

MUNN \& COMPANY,
Publishers of the Scientific American, Nex York City
Terms.-\$2 a year; ONE DOLLAR IN ADVANCE-the remainder in 6 months.
Postmasters are respectfully requested to eceive subscriptions for this Paper, to whom discount of 25 per cent will be allowed.
Any person sending ws 4 subscribers for 6 months, shall receive a copy of the paper for the same length of time

FOREIGN MISCELLANY.
[Compiled from Foreign Journals receiv Enormous Raliroad Receipt
$W$ egive below a list of a tew of the most productive railroads in England, with the receipts of each for the 6 months, ending June 30th, 1847.

In the astronomical line there are a few items, viz. The discovery by Mr. Hencke, of Altona, of a new Planet, which has since been seen from the Observatory in Regent's Park, London. It is a star of the ninth magnitude and lies nearly midway between Zeta and Ophiuchi, and has an orbit very similar to Juno. It has an hourly motion of about two seconds of time in right ascension and of about ten seconds in declination and can be found on a fine evening without much difficulty. Its approximate place on the 30th July, at 11 o'clock at night, was put down at right ascension $1655^{\prime} 27^{\prime \prime}$; south declination 715 22.'

A satelite the new planet Neptune, has also been discovered. And Bombay papers mention that this planet (Neptune,) has been seen at Poonah, distinctly visible in a common night glass. appearing as a star of the ninth magnitude.

The comet of 1264 and 1566 is expected soon to make its appearance, and the astronomers in their searches after it, have discovered a new comet near the Pole

Discoveries in Central Africa.
A Liverpool merchant and a sea captain have succeeded in penetrating the interior of Africa by the River Niger, which river and its banches pass through, it is found, an immense delta, containing thousands of miles of richly fertile and wooded country, and with iron steameis of small draft and great engine power, not only the Niger, but its principal branch, may be navigated at all seasons of the year. The unhealthy climate is found to extend but a little way inwards, and as the river was ascended the healthiness became equal to the tropics generally. Ivory, vegetable tallow, pepper, indigo, cotton wool, palm oil dyewoods, skins, and a great variety of produce but slightly known as yet, invite th trader. The highest point of the Niger reach ed by the enterprising voyagers was within 40 miles of the lowest point reached by Park who it will beremembered went from the other side of Africa through Abyssinia and down the Niger to Roussa, so that only 40 miles of the river remain unsurveyed. This is truly successtul private enterprise.

Telegraph, Railroads, Ether. \&c.
An electric telegraph has been fixed in the House of Commons for the purpose of trans mitting communications between the lobby and the committee rooms. Members attend ing committees are thus enabled to learn in stantaneously who is speaking in the House and at what time a division may be expected.

One hundred and thirty six railway bills have received the royal assent at the presen session of Parliament, authorising $£ 25,865,89$ ! ( $\$ 129,400,000$,) to be raised by capital and loan for the construction of 1,145 miles ol railway. During this session the mere expense of railway bills in parliament have been cotimated at half a million pounds sterling, and during the last sessions at three millions! This is lubbying to some purpuse

A novel first class railway carriage is to be constructed expressly for through trains between Scotland and England. The body o. the carriage will be of the usual size, divided into two apartments, the one larger than the other. Buth divisions will be fitted up with cushions, pillows, and everything suitable foi laying duwn at full length. The larger divi sion will accommodute six persons; the sma ler one, communcating with the other, mineaded for ladies, aud will afford roum fou
two. In this latter division there will be all will appreciate
will appreciate.
A useful label for passengers' luggage has been invented by a Mr. Hope. These labels are printed with each a different number, and on a diversity of striking patterns, all dissimlar, and passengets may readily fix them on packages, so that they may be easily recogni sed, and no mistakes occur.
By a decree of the government of Hesse Darmstadt, dentists and midwives are forbidden to use the vapor of ether in their pracice, under heavy penalty
It has been found by experiment that sensiive plants are as susceptible of the influence other as animals. By subjection to the vapor of a small quantity of ether they lose their irritability, which they do not recover for some time.
A French surseon asserts, that by exposing men and animals to a galvanic current from Clarke's magneto-electro apparatus, he has succeeded in rendering them as insensible to pain as if they had inhaled sulphuric ether. Artificial Water Power
An Italian Engineer has received the verict of the Paris Academy for a water mill of rom five to fif $1 y$ horse power, worked by an rtificial water-fall, and which can be placed p as a motive power in any manufactory, oc cupying a small space, requiring little labor and of course producing vast economy ascompared with the steam engine, as it requires no combustable.
It consists of eight pumps, worked with reat ease by a single man, (it is said that two men would suffice for an eight horse power machine,) by means of an admirably disposed counterbalance system. The pumps supplya reservoir placed at a proper height above the water-wheel, as in the case of a nature fall, and the water falling upon the wheel to which the strap for the machinery of the manufacory is affixed, the whole goes round and puts he machinery in motion. The paradox of his invention is the return of the water to the fountain head in such a way as to keep up a ontinuous fall.
A writer in the Railway Magazine suggests the idea of using india rubber fenders on ships while lying at the wharf. An idea wor thy the consideration of ship-owners every where.
A patent has been granted to a man in $\mathrm{Bel}-$ gium for a method of increasing the ouantity of cream procured from milk !

The marine glue, for caulking ships, is found to be an effectual substitute for pitch, especially under the influence of a stron sun. A saving too, of $£ 20,000$ a year is anti cipated from its use.
The Commissioners of the Northern Lig'st houses of Rangland have purchased several tons wight of lenses of French manufacture, fur the use of the li"hthouses under their management.
It is announced that the Emperor of Russia has determined to construct forthwith a vas line of railroads, to counect the three capitals f St. Petersburg, Moscow and Warsaw.
Father Maces, Professor of Natural Philosophy at Nemour's, has succeeded in " trans forming the solar light into electricity." The Professor is now engaged in preparing for pubication his theory of electicity which has led o this discovery.
The electric current, according to the calculation made by Professor Wheatstone two or three years ago, travels, as near as can be estimated, at the rate of 288,000 miles per second, or, if we multiply the large number by ixty, $17,250,000$. miles per minute.
The journey from London to Southampton, distance of 78 miles, 13 now daily performed on the South-Western Railway, in the space of 105 minutes, so that the average rate of speed including stoppages, is a mile in 1.3 minute.
The consumption of caoutchouc (\{ndia-rub ber) has prodigiously increased, as shown by the fact, that, in 18:23, the quantity of that article exported from Brazil did not exceed 20,000 pounds, whilst that of $1845 \cdot 6$ amouned to 800,000 pounds, besiles 415,000 pairs $f$ shoes.
Tue yearly amount of in ovency in En, and is no lese than £ $60,0,0,040$.

A Mechanics' Institute has been founded recently at Constantinople by the English resi dent mechanics, in which lectures are to be delivered on the mechanic arts not only in English, but in Armenian and Turkish. Sev eral Arme
nembers
A wholesale emigration was carried on from Liverpool in the three months ending Jun 30th. In that time 141 passenger ships clear ed for the United States with 32,258 emigrant and 53 ships for Canada with 23,267 , making with children under twelve years of age which are not counted, and those under four teen which are counted two lor one, an aggre gate of 100,000
At a late meeting of a London Antiquarian Society, one of the members produced, fo general inspection, the heel bone of Edwar VI., pilfered from his coffin.

The highest honors at King Edward's School Birmingham, have this year been gained by Jewish scholar
The London Times charges 8 shillings ster ling for announcirg a death, and averages nearly one hundred such notices per day.

The Countess of Mornington, the wife of nephew of the Duke of Wellington, has advertised in the London papers for assistance, to prevent her going to the parish workhouse s a pauper
As the present mode of branding deserters has been found inefficient, the Duke of Wellington has given orders that the operation shall be hencef, rth performed with needles and gunpowder, so as to make the letter " D" indelıble.
The parish clerk of Winkleigh has a salary of a guinea a year for winding up the church clock daily. To earn this sum he has to travel 108 miles, ascend and descend 29,000 steps and haul up eighteen tons weight 26,000 yards. Verily this is not an ecclesiastical sinebure.
A vessel had arrived at London with an en tire cargo, 300 tons, of granite from the west coast of Africa !
" Durkee's Green Mountain Vegetable Oint ment, prepared from a vegetable peculiar to the Green mountains of Vermont," a nostrum which the green proprietor has consid ered his bounden duty to introduce to th use of the inhabitants of Great Britan ; a " na ational desideratum" in the shape of "rat and mouse destroying pills;" and a " novel" medicine for coughs, professing to be a " Pectoral Syrup of Calves' Lights," are advertised, the two forner in a London, and the latter in a Paris paper

What Temperance can do.
In Mrs. Hall's book on Ireland, occurs the following passage, which a person will hardly ead without emotion :-
"We entered one day a cottage on the su burbs of Cork; a young woman was knitting stockings at the door. It was as neat and comfortable as any in the most prosperous dis. trict of England.-we tell her brief story in her own words as nearly as we can recollect them :-' My husband is a wheelright and always earns his guinea a week; he was a good workman but the drink was strong in him, and it was'nt often he brought me home more than five shillings out of his one pound on Saturday night, and it broke my beart to see the poor children too ragged to send to school, to say nothing of the starved look they had out of the little I could giva them. Well Godbe praised he took the pledge and the nex Saturday he laid twenty-one shillings upor the chair you sit upon. 0 ! didn't I give thanks upon my bended knees that night? Still I was feafful it wouldu't last, and I spent no more than the five shillings I used to, may be the money will be more wanted thar it is now. Well, the next week he broaght me the same and the next, and he next, uatil eight weels had passed; and, Glory to God ' there was no change for bad in my husband, and all the while he never asked me why there was nothing better for him out of his earnings, so 1 felt there was no fear for him, and the ninth week when he came home to me, 1 had this table bought and these six chairs, one for myself, four for the children and one for him and I was dressed in a new gown, and the children all had new cluthes and shots and
new suit, and upon his plate I put the bill and receipt for them all just the elght sixteen shillings, the cost that I'd saved out of his wages, not knowing what might happen, and that always went for drink. And he cried, good lady and good gentleman, he cried like a baby, but 'twas with thanks to God; and now where's the healthier man than my husband in the whole country of Cork, or a hap pier wife than myself, or decenter or better fed children than our own ?"

## Race with an Indian.

The Editor of the Batavia Spirit of the Times has some of the rarest and raciest literary scraps that fall to our lot to read, and it makes no matter what the subject is, it is dash ed off with rare wit and spirit. The following race with Indian John, beats the Hoboked eat all hollow.
On Saturday last, a small party, on their reurn from a pic-nic excursion to the Indian village, happened to meet about a mile this ide the council house, the "fast" Indian, John Steeprock, (he who came so near winning the great ten-mile foot-race at Hoboken.) As some of the party was on their first visit to the Indian settlement, and were desirous of seeing an Indian foot-race, John was bantered or a run, and, by way of an inducement, was told that if he would reach the council-house (distance one mile and a trifle over) before we could drive there with our two-horse team and waggon, containing four persons, be should have a small purse, which was made up on the spot. John in a gutteral "na'h-wy" consented; and, after divesting himself of boots and hat, and tying a handkerchief tightly around his waist and another round his head, was ready for a start. At the word "go," and with a crack of the whip, away he went -team and Indian-the latter "looping" off $s^{\prime}$ eadily, but rapidly, after the Indian style, and we crowding on with our team-a fastone -as swiftly as we dared. The road was un. dulating, winding, and, in some places rough We thought it would be no "chore" at all to "distance" him, but very soon discovered ou mistake, and commenced "paying out." I was no use. Mr. Indian now and then glan sed back, and whenever we whipped up, be would whip up too. Several times he crossed and re-crossed the road, to get the best track -sometimes taking the foot-path beside the road, and occasionally bounding over a log, or bush, with a stride that was wonderful. A one time we came upon a smooth, "straight stretch," of thirty or forty rods, and by a lit tie extra effort, shot ahead; but it wouldn't do-we "were sold"-for, at the next hill, John respectfully raised his coat-flaps and bade us good-bye. He won the race by about six rods, and ran it in four minutes and 40 sec onds! It did rot appear to fatigue him in the least.

Steamboat Race on the Lakes.
The new steamer Sultaria had a race lately with the old broom carrier, the Empire, from Chicago to Detroit. When the Sultana arri ved at.Manitou Island, the Empire had jus left, and there was a great commotion on board. The woodman on the dock informed them that the Emprre had been there two hours, taken in forty cords of wood, and had been gone about forty minutes. There was shout on board the Sultana when they heard his, which told that the passengers were getting up steam for the chase. The dancing which was going on in the after-cabin wa broken up, and all hands fell to wooding. A man with a lantern could have seen the editor of the Cleveland Herald 'toteing' in wood sweating like a wood-chopper, and a little further en the dock the editor of the Plaindeale might have been seen doing his best at 'hustling in the wood."

## Great Fire at Nashua.

## TO CORRESPONDENTS．

＂T T．L．of Michigan．＂－Cast iron pipe is the best for your purpose，but it is most ex－ pensive at first．Hydraulic cement pipe migh stand the pressure，but we cannot recommend any thing about which there is a doubt．－ There is one objection to iron pipe，viz．your water，the lime will sometimes corrode it．－ Wooden logs would answer your purpose well enough．They will stand all the pressure，－ and will not corrode as iron，and you can preserve them from freezing and decaying by covering them with about three inches of charenal dust．
＇J．H．W．of S．C＂－We shall endeavor to give you the information you desire regarding the Barometer and Thermometer，next week． week．To fasten the cotton black－after it is finished in the logwood run the piece or yar in the bundle through a weak solution of chrome．We had intended to give a number of receipts on dyeing before this，but have not been able to lay a system，as they will have to extend through a good many numbers．Wash the goods before they get the crome and dry out of it．The green in the 0 ．Cultivator can be dyed as well in one hour as in three．You are correct regarding the keenness of the acid If the boiler has an excess of acid in dyeing green too，it kills the fustic．Chemic shouid not be worked for nine days after it is made．
＂S．L．D．of Pa＂－Your article is delay－ ed till next number．Nothing short of neces－ sity is the cause of this．

E．G．of Mass．＂－Although we are al most compelled to be no more sceptical about the success of any invention，because of the astonishing discoveries of the present age，yet we are sometimes in doubt．Your plan of try－ ing to propel machinery by the elasticity of a fluid，we compare to the self internal power of that machine of machines，the human bo－ dy．We are glad that you are going to build a model，to test the self－power of your machine． It is certainly original，and if successful，will fully prove that you have no common mecha－ nical penetration We hope it may be so，and that you will inform us of the result of your experiment，whatever it may be．Its advanta－ ges would be very great for durability and eco－ nomy．
＂W．M of Ill．＂－We can furnish you with a good work on the principles of Mechanics for $\$ 1,50$ ．If you communicate with Rapalje be Briggs，No． 18 Front st．Rochester，you can be supplied with the best of winnowing ma－ chines，and they can be easily exported from there to your state
＂A F of Ill．＂－We shall answer you next week．
＂H．J．B．C．of N．C．＂－Your plan for a good well，by keeping out the brackish surface water is good，and if you burn marl shell and mix it when burnt with a portion of lime and sand you will have a good hydraulic ce－ ment．Or if you had plenty of good tough blue clay and puddle round the drum，it would keep out the water．You must at least raise the mouth of the well to an elevated mound and slope it to some distance．Common hy－ draulic cements are to be found in every city， and they are composed almost entirely of burned oyster shells in powder．Thesets of the last half of volume 1 ，are all sold．The ex－ pense of binding the present volume will be $\$ 1$ ．
＂S．M．of Maryland．＂－The erection of windmills will soon be imperative in some dis－ tricts of our Continent－those places where fuel is ligh and where there is but little wa－ ter power．The nature of your country seems to demand the erection of one，and you are just the person to do it，for there has been no attention whatever paid to improvements in this old and usetul engine．The mechanical mind appears to have been exclusively devo－ ted to steam engines and water wheels．The old vertical vane mill is the best yet，having the roof movable，to be turned round on fric－ tion rollers when needed．
＂W D．D．of Ohio．＂－You have not ex－ plained how your $u$－heels are to receive rota－ ry force from the steam．This is the most par－ ticular part in the construction of a rotary en－ gine．In describing improvements in the steam engine，or rather new modes of apply－ ing the power of steam，the first impulse of the power should be distinctly stated－when it 18 applied，and in what manner．We prefer
the one cyliader rotary to a two cylinder，be－ cause there will be less friction，and the only advantage endeavered to be gained by a rotary ver a parallel engine，is the having no dead oints to contend with
＇－W．C．of Mass＂－We would inform you and all others who do not arready under－ stand it，that we are not desirous of procuring any travelling agents to carvass for our jour－ nal． S.
ne
＂S．N．of W．T．＂－Your papers have all been forwarded to Columbus，Ohio，as first or dered．
＂A．T．P．of Ill．＂－The American Mecha－ ic is a paper that we know not of
＂J．D．of Rochester，N．Y．＂一The dollar that you mention as having enclosed in the letter did not come．
＂L．M．W．of Ct．＂－A person called at our office a short time since and ordered your pa－ per discontinued．
＇J．C．of Hector，N．Y．＂－Please send us $\$ 1$ and we will comply with your request． ＂R．M．W．of Summit Point．＂－The back numbers of the present volume cost $\$ 1,75$ per set．

render visible the opposite current
into which
they change their temperature.
Fill a common eight-ounce phial, or cylindrical glass jar, but 2 inches or more in diam eter, and five or six inches long, with cold wa ter, and diffuse through it a small portion of pulverized amber : let the phial of water be mmersed into a tumbler, or larger vessel, containing hot water; this being done, two currents, going in different directions, will be observed in the inner vessel, the one ascending, and the other descending; that is to say the minute particles of amber, which were diffused through the fluid, and were at rest before the heat was applied to the water in the inner vessel, will be seen in motion; those particles that are situated towards the side of the glass, or which are nearest to the source of heat, will move upwards, whilst those that are in the centre move downwards; and thus wo distinct currents are formed in opposite directions; the central one being directed downwards, and the exterior one upwards. These currents gradually diminish in velocity and, when the water in the inner vessel has acquired the same temperature as that in the outer one, the particles of amber will again be brought to a state of rest.
If the position of the two vessels be reversed, namely, if the glass containing hot water be immersed into a vessel containing cold water, the motion of the currents will alsobereversed; the particles next to the sides of the glass are thrown into currents, directed downwards whilst the particles in the centre torm a current directed upwards. The equil ibrium of these two currents will also be restored, when the equalization of temperature of the water within, and that without has been effected.

Singular Galvanic Experiment.
Weinhold the philosopher, cut off a cat's bead, and when its arterial pulsation had ceased, took out the spinal marrow, and placed in its stead an amalgam of mercury, sil ver and zinc ; immediately after this was done, the pulsation was recommenced, and the body made a variety of movements. He took away the brain and spinal marrow of another cat, and filled up the skull and vertebral canal with the metalic mixture. Life appeared to be instantly restored-the animal lifted up its head, opened and shut its eyes, and looking with fixed stare, endeavored to walk, and whenever it fell, tried to raise itself upon its legs. It continued in this state 20 minutes, when it fell down and remained motionless. During all the time the animal was in this state, the circulation of the blood appeared to go on regularly; the secretion of the gastric juice was more than usual, and the anima heat was re-established.

## Diamond Dust.

Recently there has been a discovery-dus upon steel-it gives the finest edge to all kinds of cutlery, and threatens to dethroue the hone of Hungary. It is well known that in cutting a diamond (the hardest substance in nature, ) the dust is placed on the teeth of a saw, to which it adheres, and thus permits the instrument to make its way through th gem. To this dust, too, is to be attributed solely the power of man to make brilliants from rough diamonds: from the dust is obtained the perfection of the geometrical symmetry which is one of the chief beauties of the mineral, and also that adamastine polish which nothing can injure or efface, save a substance of its own nature. The power of diamond upon steel is remarkable; it is known to paralize the magnet in some instan-ces-and may there not be some peculiar operation upon steel which philosophers have not yet taught us to be familiar with? How is it that a diamond cast into a crucible of melted iron converts the latter into steel?Whatever may be said, it is evident that the diamond dust for sharpening razors, knives and cutlery, is a novelty which is likely to command the attention of the public, whether or not it is agreed that there is anything be-
yond the superior hardness of the dust over the steel to give it that keenness of edge that has surprised all who have used it. And if the best carbon (charcoal) be used, what would be the advantages? Let this be tried. We know that it possesses the same electrical properties of the diamond, and the diamond is just a piece of carbon.

## Preparation of Coffee.

In Silliman's Journal, we find a notice of memoir on Coffee by the distinguished French chemist, M Payen. The results brought out by his chemical researches agree exactly with facts previously known in regard to this article. A great error in the preparation of coffee, is that it is burned too much by which the liquid when it is brought to the table, is destitute of agreeable flavor, and has a bitte unpleasant taste. The reason of this is shown " Coffee roasted only till it becomes slightly red, preserves the maximum of weight and of aroma, but gives out less coloring matter. In this state, 100 pounds are found to have lost 15, but have increased to the bulk of 130 . Roasted to a chesnut color, as is commonly done, the loss is 20 per cent, while the in crease in volume is from 100 to 153 . This swelling of the grain depends upon the property which the nitrogenous matter deposited within the tissue has of puffing up remarkably when heated.
"If the heat is continued until a dark brown color is produced, and the grain is covered with a sort of glaze, the loss is twenty five per cent., while the original quantity of nitrogen, 2. 45 per cent, is reduced to 1.77 , being a loss of one-fourth."
The soluble matter was also found to be much greater in the coffee subject only to a low degree of burning-the brown giving 16, 15 , the chesnut-colored 19,00 per cent. The difference in " the aroma," it is added, " being nearly the same, the lower degree of roasting will produce not only the best and most nutritious beverage but one tree from the harsh and bitter flavor caused by the action of too high heat upon the nitrogenous matter

The Arehimedean Balloon.
Balloons are queer things and Douglas Jerrold speaking of one lately invented in London gives it some queer hits. We had lately (he says) to record in our columns how Mr Gale had succeeded in furnishing that pur blind, deat and giddy creature, the old balloon, with a pair of excellent eyes and ears. We have now to state that Mr. Joseph Pitter of Hastings, has explained his plan for construcling a new aerial machine on perfectly shipshape principles, having little or no affinity to the aerial ship of nearly forgotton notoriety. The Archimedean Balloon is to be worked by paddles, and steered vith a screw; it is to have a handsome deck, and above it, a long cylindrically-shaped silken bag or sail inflated with gas, and below the deck a number of bags of gas are to be fastened, to add to the buoyancy of the whole machine. Mr. Pitter proposes to procure a motion at any angle with the horizon, by the revolution of four paddlewheels, which have their float boards broadways during any required half of their revoluion, and edgeways while passing through the other half. A motion to any point of the compass is procured by means of an apparatus at the stern similar to the Archimedean crew, and being made to revolvein a vertical plane on an axis at right angles to the course of the machine, it brings the stern round to the right or left, according to the direction in which the screw revolves, and thus the head of the machine is pointed in the right direction. The probability is, however, not very small, that the Archimedean Balloon when its powers are absolutely tested, will be found an ' airy nothing.'

## Recipe for Burns.

The London Lancet gives the particulars of an attorney who burnt his hanảs by endea voring to extinguish the flames which had caught his bed curtains,-the blisters were not broken, and the patient immersed his hands in a solution of chloride of soda in water, and wrapping his hands in lint, in the morning only one patch remained.

The coral rock which causes a navy t founder is the work of an insect.

THE ART OF PAINTING.
(Continued from $\boldsymbol{N}$ o 46.)

In finishing up 1 andscapescenery, it is neither necessary or expedient, in all cases to imitate nature. There are a great variety of beautiful designs, which are easily and quicky produced with the brush, and which exce nature itself in picturesque brilliancy, and richly embellish the work, though not in perfect imitation of anything. This remark is particularly applicable to various wild shrubbery suitable for filling up the foreground. and usually based on the bottom of the first distance, and painted in full size, being suppo sed to be somewhat nearer than the large trees of the foreground. Of this variety we have presented a few samples at the head of this ar ticle. The first in order in the form of poplar prouts, are often placed at the sides of doors or windows of the room, to form a sort of border to other scenery. The second, a tall fern, is al ways convenient to fill a vacancy, or con ceal any defect in the painting on the first or second distance ; and this, as well as the clus ter of sage-willow below, is produced in one minute by the dexterous use of the cuttingbrush, properly adjusted. These are first painted with dark green, but each leaf is heightened on the light side with bright chrome yellow. The stems of the sage wilow may be drawn with vermillion; and the cluster of barberry on the first ground may be heightened with yellow, and finished with judicious and tasteful touches of vermillion, representing clusters of the ripe berry. The low oak shrubbery on the lower ground, is first formed with a large tree-brush, and fancifully heightened with venitian red, French green, and yellow ochre, interspersed. The flags are unitormly heightened with bright French green. A variety of bowers, especi ally the wild sun-flower, lilacs, lillies, lupines Chinese pinks and snow-balls, may be expeditiously produced by the cutting brush, and without the use of the hair-pencil. Rough ledges of rock, are also often applied to give variety to the first distance. Two dark horizontal stripes, about two inches apart, should bedrawn round the room at the base of the scenery,-this is very readily accomplished by means of a straight rod, or four feet rule, and a cutting brush,-and the space between these stripes and the floor should be painted plain, with a dark stone color, the better to give good effect to the scenery. We sball proceed in our next number to give a variety of outline designs
(To be continued.)

## Stone Rope.

A rope, nearly three miles long, now lies at Gateshead, England, which was the other day a stone in the bowels of the earth! Smei ted, the stone yielded iron. The iron was con verted into wire. The wire was brought t the wire-rope manufactory near Gateshead and there twisted into a line 4,660 yards long It is the stoutest rope of the kind ever made It weighs 20 tons 5 cwt . and will cost the pur chasers $\$ 5,508$. It is intended for the inche on the Edinburgh and Glasgow Railway rear the latter city. A rope of hemp, of equal strength, would weigh $33 \frac{1}{2}$ tons and cost $\$ 1$,400 more.

## Bathing.

Bathing or washing, keeping the body clean and the pores open, must be more healthy and desirable, but the application of a bucket or two of cold water pouring upon the head every morning, is something whicb after getting used to it, a person mirht endure, for purposes of cleanliness, but there is another
which involves no expense, makes no extra labor, and avoids the lumberage of a shower bathing machine, which in many cases, people cannot procure and have no room for. A arge sponge and a tub of water can make a very good bath.

Freezing Water.
Water in freezing crystalizes in filiments, which are uniformly joined at angles of 60 or 120 degree. The word crystal originally signified ice. In a boiler the water nearest the bottom is the hottest, because it is bearing an additional pressure proportioned to the depth, and does not, therefore, give out the steam which it would part with if a little higher up.

Deaiths from Punctures in Dissection.
From accurate researches, it appears that during a period of 21 years, from 1826 to 18 46,33 students belonging to the Faculty of Medicine of Paris, died of supperative fever, rising from punctures received in dissection. It appears also, that during the same period, the rate of mortality was only 1 in 80 mong students of law, and 1 in 75 among students of the Polytechnic (Military) School, t was at least 1 in 50 among the students of Medicine.

## Food of Man.

The ancient Athletie of Greece were fed upon new cheese, boiled grain and water and sometimes on bread, water-cresses and salt.

The Pearl-leat has 24,000 pores to the under s de. The Pink has about 38,500 . Some plants bave as many as 160,000 .

## THE NEW YORK

SCIENTIFIC AIMERICAN :
Published Weekly at 128 Fulton Street., (Sun Building,) New York, and No. 13 Court Street, Boston; the principal office being at $\mathcal{N}$ ew York.

## BY MUNN \& COMPANY.

The SCIENTIFIC AMERICAN is the Advocate of Industry and Journal of Mechanica. and other Improvements: as such its contents are probably more varied and interesting, than those of any other weekly newspaper in the United States, and certainly more useful. It contains as much interesting Intelligence as six ordinary daily papers, while for real beneft, it is unequalled by any thing yet published ach number regularly contains from THREE o SIX ORIGINAL ENGRAVINGS, illustrated by NEW INVENTIONS, American and Foreign,-SCIENTIFIC PRINCIPLES and CURIOSITIES,-Notices of the progress of Mechanical and other Scientific Improvements Scientific Essays on the principles of the Sciences of MECHANICS, CHEMISTRY and ARCHITECTURE,-Catalogues of American Patents,-INSTRUCTION in various ARTS and TRADES, with engravings,-Curious Philosophical Experiments,-the latest RAIL ROAD INTELLIGENCE in EUROPE and AMERICA,-Valuable information on the Art of GARDENING, \&c. \&c.
This paper is especially entitled to the pat ronage of MECHANICS and MANUFACTU RERS, being devoted to the interests of those classes. It is particularly useful to FAR MERS, as it will not only apprise them of MPROVEMENTS in AGRICULTURAL IMPLEMENTS, but INSTRUCT them in various MECHANICAL TRADES, and guard agains impositions. As a FAMILY NEWSPAPER it will convey more USEFUL Intelligence to children and young people, than five times it cost in school instruction.
Being published in QUARTO FORM, it is conveniently adapted to PRESERVATION and BINDING.
TERMS.-The Scientific American is sen subscribers in the country at the rate of $\$ 2$ a year, ONE DOLLAR IN ADYANCE, the remainder in 6 months. Persons desiring to sabscribe, have only to enclose the amount in a letter, directed to
