## Improved Bridge.

Public works, such as railroads, bridges, etc., naturally excite an interest in the public mind, and call attention in proportion to the magnitude and utility of the work in question. Any structure which serves ths public convenience and guards the lives and property of our citizens, is watched with feelings commensurate with its novelty, magnitude, and utility.
The application of iron, either cast or wrought, in

The improvement which is represented in the an nexed engravings, consists in combining together a number of cast-iron boxes, banded together and filled with concrete, making a homogeneous mass, and so placing it together as to gain the greatest amount of strength from a given quantity of material.
It is claimed fcr this method of construction that
it has greater strength, that a longer span can be
made with continued safety, and at less cost than
iron, if properly braced, can be built on to almost any extent before it can be crushed. So, in the construction of this mode of bridge building, the parts are so arranged tbat every portion of it is completely braced and kept in place, making it the strongest construction in which iron car be used.
This bridge was patented by Rembrandt Lockwood, No. 293 Broadway, New York, on December 5, 1865. Patents have also been secured through the

## LOCKWOOD'S COMBINATION BRIDGE.

 ern date The first structure of the kind was a castiron bridge over the river Severn, near Coalbsook Dale, Eng. This bridge was batic by Barby, enc consisted of ribs of cast iron supporting spandrel pieces of the same material, having a span of 100 feet. The work, at the time, was considered successful.Rennie, a celebrated En glish engineer, built an iron bridge over the river Witham, at Boston, in Lincolnshire, England, of 100 feet span, with a rise or verse sine of only 4 feet. The same engineer also constructed, in 1819, a large bridge over the river Thames, krown as the Southwark Bridge, consisting of three arches, all segments of a circle-the center one being 240 feet, and two side ones of 210 left, each arch consisting of eight ribs of fifteen pieces each and tied by transverse braces, ctc. Since that ime numerous bridges have been built both of wrought and cast iron.

During the erection of the carly iron bridges, and since that time, one great defect was found in all compound structures of wrought and cast iron, and points directly to the superiority of homogeneous structures. Ttis defect consists in the difficulty of making wrought and cast iron act equally together in bearing the load. The strength of cast iron depends upon its rigidity and power to resist compression, while wrought iron, in the form of truss rods, etc., is intended to act by the application of tensile strength. It is therefore indlspensable that the adjustment of the length of the bars during all the changes of temperature shall be strictly preserved-a condition physcally impracticable by any known arrangement.
the construction of bridges, is comparatively of mod-| that of any other kind of iron bridge known. Its $\mid$ Scientific American Patent Agency in France, Bel gium, and Great Britain.

## Oopper Ore Roasting-mal phuric Acid.

We extract the following from an able lecture delivered before the Scottish Royal Suciety of Arts, by Dr. Sfevenson MacAd-$\mathrm{m}:-$
'The large amount of sulphur which is burnel off from metallic ores in Swansea and elsewhere, and which escapes into the atmosphere as sulphurous acid, and thereafter becomes, in part at least, sulphur:c acid, has recently called forth the attention of scientific and practical men. In the neighborhood of works discharging such sulphurous smoke the ground is barren, scarcely any vegetation can be seen for miles, and even high chimney stacks are of little avail, as they merely carry away the sulphurous smoke, and distribute it over a wider and much more distant area.
One extensive firm of copper melters discharge in this manner into the atmosphere about 1,000 tuns of sulpburic acid every week, and it is estimated that annually there are burned off from shows a section of three boxes; Fig. 3 shows a plan the copper ores morked in Swansea about 70,000 of the same with the straps keys, etc.
Haswell, in his work on "Engineering and Mechanics," page 276, states that cast-iron gun metal will bear a compression of $105,000 \mathrm{lbs}$. to the square nch, while wrought iron begins to yield at $40,000 \mathrm{lbs}$. Now to crush cast iron (taking the above figares) it would take a column of orer six miles. So that cast
tuns of sulphar, of the value of $£ 455,000$, and which might prodoee no leas than upwards of 210,000 tuns ot sulphuric acid, of the strength of oil of vitriol. Many of the manufactories of sulphuric acid hav began to use the copper ore as a source of sulphur ${ }_{2}$ and, thereatter hand over the roasted ore to the copper smelter at Swansea. The ore is oltained in large
quantities from the Guadiana River, Fort Formosa, in Portugal, from mines which were workel by the Romans, and it is used extensively for making sulphuric acid in London, Newcastle, Bristol, and other places. This is an excellent instance of the sucessful and economic employment of a material in the arts and manufactures which was till lately, and in many places still is, a nuisance over extensive tracts of country. The smoke in a very modified condition occurs in all large towns, where much coal is burned and especially in manufacturing towns where the coal is olten of inferior quality. In such towns, by themere burning of the sulphur in the coals, many gallons of sulphuric acid must be formed, and in rainy weather be washed down on the people."

## REPORT OF THE COMMISSIONER OF PATENTS

U. S. Patent Office, January, 1866 SIr:-In accordance with the provisions of the fourteenth section of the act approved March 3, 1837, I have the honor to submit the following report of the operations of this office during the year 1865.
The receipts and expenditures of the office for the year, and the condition of the patent fund at its close, will be seen by a glance at the following state-ments:-

| No. 1. <br> Number of applications for patents duri <br> Number ot patents issued, including re Number of caveats fled during the year <br> Number of applications for extension of <br> Number of patents extended. Number of patents expired, <br> Of the patents granted there were:- <br> To citizens of the United states <br> To subiects of Great Britain...... |

It is here seen that the number of applications for patents received in 1865 exceeded, by nearly forty per number of caveats filed exceeded those of any previous year by more than seventy-five per cent. The number of patents issued exceeded those issied in 1864, the highest previous year, by more than thirty per cent. any former year by more than thirty-six per cent, over eight per cent, and a considerable surplus is left to the credit of the patent fund. If the cases brought to the attention of the Office continue to be as numerous as at present, it will become necessary to make such additions to the examming and clerical
force of the office as will absorb a portion of the surplus carnings; while, on the other hand, if the anticipated resumption of specie payments should be attended with any general inancial prostration, the receipts of the Office would undoubtedly fall below the rate of When the Patent
separate Bureau, in 1838, the act provided for the ap pointment of a single examining clerk. The numbe as been increased by additional legislation, at suc the limit was fixed at sixteen examiners and the same number each of First and Second Assistant Examiners. As will be seen by a reference to the comparative table given above, there was a material reduction in business of the Office immediately after the passage of the act just referred to, and it was found unnecessary
until recently to appoint the full number of examiners allowed by law. But so rapid has been the increase of inventive activity. that it is now found impossible o prevent the examinations falling largely in arrears. The number of applications in the hands of the ex aminers at the close of the year, on which no action had been taken, was 1,134 .
riven for the appointment remend that authority be given for the appointment of iour additional otficers
of each of the several grades. if their services shall be found necessary to the examination of the applications presented.
By the act of May 27,1818 , the salary of the Examiners was inxed at twenty-five hundred dollars per
annum, and by the act of March 3 , 1855 , that of the First Assistant and Second Assistant Examiners, was
tixed at eighteen hundred dollars, and sixteen hundred per annum, respectively. The position of First Assistant Examiner is one of great importance and responsibility, as he is frequently called upon to decide upon the merits of applications in the absence of his rincipal, and it is also of almost daily occurrence that the pressure of work will be such as to force the Ex aminer to reply mainly upon the judgment of his $\Lambda$ s-
sistant. I am satisfied that the interests of the Office and of inventors gencrally would be promoted if the salary of the First $\Lambda$ ssistant Examiners were raised to wo thousand dollars.
I would also most respectfully urge that the salary
of the Librarian be raised to twenty-five hundred of the Librarian be raised to twenty-five hundred
dollars per annum, the sum now paid the examiners. The library now contains upward of 15,000 volumes, exclusive of some 1,500 volumes temporarily in the number of volumes is not so large as may be found in many other public libraries, the works are almost exclusively of a scientific and technological character and it is doubtful if there is another library in the country in ments of practical knowled ve. During the past year upon the shelves, while the expenditures, exclusive of the sums paid for the binding and transportation of he specifications and drawings of English patents so liberally presented to the Office by the Great Sea Patent Office of England, have been less than $\$ 500$.
The library is constantly visited by inventors from all parts of the country, as well as by persons engaged
in the various branches of scientific investigation, and it is requisite that the Librarian shall be a man of
broad culture and familiar with the contents of all the works under his care, as these cover the whole domain of practical science, it is manifest that the salary of the Librarian should be at least equal to that of
In addition to the examining corps, the administra tive and ilinancial business of the Office requires a con several divisions such as who are distributed into most conducive to the rapid performance of the work.
I think there can be no doubt of the propriety of clerk of the highest regular grade, the charge of herefore recommend that authority be given for the ppointment of six clerks of the fourth class.
The disbursing clerk is now ranked as a clerk of the ourth class. An money's received or expended by the ible for the accuracy of his accounts.
I can see no reason why his salary shouid be less the several executive departments, and I would re commend that his salary be fixed at two thousand dollars per annum.
The act of March 2, 1861, provided for the appointment of a Board of Examiners-in-Chief whose duty it should be to revise and determine upon the validity of rant of Letters by examiners When adverse to the has fully confirmed the wisdom of the enactment, but it has, at the same time, demonstrated the necessity of additional legislation upon the subject. While a fee of twenty dollars is charged upon an appeal from the xaminers-in-Chier to the Commissioner, no charge is made tor an appeal from the examiners to the Board. it results from this that appeals are taken in many cases. merely for the purpose of delay. During the
year 1865 , there were 495 appeals taken to the board, of which number 166 remained undisposed of at the close of the year. If a fee of ten dollars wert charged
on appeal to the Board, it would check the number of on appeal to the Board, it would check the number of ventors who are confident of the justice of their claim, decision in place of the delay of months to which they are now so gene:ally subjected.
Aiter consultation with many inventors and with solicitors in extensive practice, I am satisfied that the proposed amendment would be received with almost The published
tions and illustrations of this Office, with the descriponly of great value to inventors and the country as in dicative of the directions in which mechanical and scientific skill is pushing its way into new channels, but their general diffision effects a very important reauction in the labor to be performed in this Office. By provenent in some usetul machine is in man im tances enabled to see at once whet is in many int is novel, and if so, the particular feature which has never been the subject of a patent. Again, when an existing
patent is referred to by the Onlice as a reason for the
rejection of au application, the applicant is saved the time and expense required to obtain a copy of such is especially true of the latest reports, inarmuch as when a necessity is felt by the public for an improve ment in some particular art or manufacture, the in genuity of inventors in different parts of the country
is stimulated into activity in that particular field is stimulated into activity in that particular field,
while at another period the excess of activity is turned while at another 1
into other paths.
This period of liro years is recognized in several in stances as the measure by which the rights of an in
ventor shall be determined, and I am convinced that f the same idea is extended to another case, not now within its scope, the occasion for much serious injus ice will be removed. Inder the existing law a paten is taken out in which the inventor mikes a clearly The claim, it may be, does not cove
The claim, it may be, dues not cover all that is deand whatever is thus left unclaimed nay be used by any whatever is thus protected by a previous patent any person unless protected by a previous patent to recognize the value of that which the inventor did not deem it worth his while to appropriate, invests his capital and begins to fiurnish the public with a valuable article, and afler this the inventor applies for so as to give him the monopoly of that which he had before left open to the use of ihe world. It it appears upon examination that the original specitication described the art or device in question, and that the holder of the patent was actually the original inventor, he is entitled to it reissue in such terms as to preclude the use of such device. except upon such conditions as
he may grant. It would not be difficult, in this manner, o entrap a person into such an arrangement of his business, or employment of his means, as to leave him at the mercy of the inventor or to compel him to pay an exorbitant royalty, when the patent is reissued with a broader claim. in my opinion it would be a udicious amendment of the law and would prove an fhe privilege of reissuing a patent in such terms as to broaden the claim were restricted to the first two years of the life of a patent, bearing reissues for other purposes to be granted at any time, as at present.
The act of 1861 allowed applicants to pay a portion of the fee required for the issue of a patent at the convenience of the inventor whenever he might de sire the patent to be engrossed. As it was found that many patents were allowed to lie indefinitely, it was urther provided in 1863 , that if the final fee were no paid within six months after the patent was passed and allowed, the invention should become public property as against the applicant. in thes it was further enact the time limited, may make a new application for the same invention at any time within two years from the date of the allowance of the original application. Under this state of the law, cases have been brought to hie attention of the oflice in which inventors have been nable to pay the ree within six months or to file new application within two years from the date of the from home in the service of the United States. 'ro con iscate the property of an inventor because he has mperilled his life for the sake of his country, is so glaringly uojust that it needs but to be mentioned to secure the adoption of a remedy. I would suggest hat whenevcr it be made to appear to the satisfac ion of this Oftice, that a failure to pay this linal fee,
or to renew an application within the time limited by aw, has been due to the absence of the inventor from home on duty in the army or navy of the United States, he forfeitnre shall be set aside and the patent issued The labor of the Oftice is much increased on ac count of the delay which has recently attended the publication of the annual reports, and the value of the eports to the public is much diminished by the late pressure upon the public printing office, occasioned by he increased business of all the executive department growing out of the war which has now been happily erminated, has been one cause of the delay; and if this were all, it would not be expected that this Oftrce hould complain. But the most serious obstruction to might say in the absence of any law on the subject Although it has long been the settled practice of the Government to publish the list of patents with the illus rations, there is no law authorizing such publication except as the printing of each report is ordered atte the same is submitted to Congress. Some time must then elapse before a contract can be made with the en ravers, and it is usually Aprif or Nay belore the en previous year. It is worthy of consideration whether authority might not be given in advance for the repa ration of the plates, so that the drawings could be placed in the hands oft he engravers as soon as the paents are issued, and the whole work be prepared for the printer immediately after the close of the year. The number of copies to be printed might be deterreport is submitted in the same manner as now. If this course be adopted the public will be placed in posses sion of the information nearly, if not quite, a year ear lier than they can under the present system, and the
charge upon the Treasury will be in no measure incharge up
creased.

## creased.

Concurrent with the establishment of this Office was illustrative of inventions in such disposing of the model conducive to a beneficial and favorable display thereof the rooms in which they were arranged to be kept open during suitable hours for public inspection. The act also contemplated the exhibition of specimens of un patented mars wactures and works of art. The thirt blanted expand into rurniticent nroportions, until the saloons on the upper flour of the Patent Ollice are now among the chicf public attractions of the seat of (Gov ermment, and thronged daiiy by visitors from all parts f the country as well as from beyond the ocean.

Here may be seon at a single glance, as it were, the
promessive stops in the invention and perfecting the promressive ctops in the invention and perfecting the wonderidi labor-saving machines of the past quarter of
a century from the dirst blind gropings of mechanical a century, from the inst blind gropings of meehanical ornims, up to the s
of the present day.
The modeis are nut only of great assistance in the examination of :ipilications, but it is my conviction, which I am happy to know is shared by many of those
most courersant with the subject, that from ideas gathmost conresint with the subject, that fromideas gath-
ered in a visit to these halls have sprung many inveneled in a visit to these halls liave sprung many inven-
tions of great value to the community. It is in view of this last sugrgestion the the wisdom of the framers of the act stands out in the boldest relief since the
benelits which are to flow in the future from this source are almost incalculable. If this policy is to be continued, which I hardly allow mysclf to doubt, the attention of Congress must be turned, at an early dav, to the consideration of the manner in which enlarged ac
commodations for this Oflice can be provided. Of three commodations for this Oflice can be provided. Of three twelve are now unoccupied, while one is barely sufficient for a single week's issue of patents. By removing the rejected models which now fill eighty-six cases,
and by crowding the whole to their utmost capacity, it and by crowding the whole to their utmost capacity, it whll probably be possible to exhibit the patented mod-
els of the next three or four years. al hough with much inconvenience. At the same time, it should be stated the models accompanying rejected applications are of ten of a high value for purposes of iliustration and sug-
The rooms in which the business of the Patent Office s now thansacted are even more inadequate for the purpose than are the galleries above. Under the administration of my immediate predecessor it became uecessary to use or other purposes some of the rooms
betore conying was given out to be done by copyists at their phivate residences. Although the practice involves the sending the files and records of the Oftice
through the streets and into various parts of the city, I hrough the streets and into various paris of the city, I
have thus fir found myself unable to make any change, iom the utter impossibility of providing desk room Within the biilding for the ifly-six copyists now em-
ployed, and the work of this division is constantly in reasing. The large increase in the number of patent requires a corresponding increase in the force employed in engrossing and recording, and the orders upon the Oflice for copies of records and for recording assignments have more than doubled in the last four
years. ears.
nd recording receipts into the patent rund for copie $\$ 16,47629 ;$ in $1864, \$ 20,055$ were $22 ;$ in $1865, \$ 27,21964$. A considerable loss of time inevitabiy results from the interruptions attendant upon placing two examin ass it is not unfrequently the cass, in the same room their counsel desire to appear in person and deliver their counsel desire to appear in person and deriver erence casses there are three or more contesting applicants, and while a cause of this character is being trled eess can be transacted upon the other side which requires any close attention or consecutive thought Notwithistanding this objection, six of the examiners
are obliged to accominodate themselves to such arare obliged to accommodate themselves to such arbe assigned to this branch of the business of the Office. It is worthy of note that the classes in which the work has fallen most bchind are in this situation. If addiional examiners shall be appointed, as I have recommended above, the evil will but be intensified, unless oy other bureans. The library is also crowded into a sace too narrow to allow the proper arrangement of the shelves, apd it is impossible to devote any convenient space for the use of those not connected with the Ottice who desire to' consult the books. In finc, while he occupation of some rooms, in addition to those now at my disposal, is a matter of immediate and pressing necessity, it is evident that many years cannot pass by nless some radical change shall be made in the organ zation and business of the Oflice.
The most feasible plan for attaining the relief which now so urgent, is undoubtedly that of providing ooms in some other building for the use of the Agriwhich that department has rendered to the services which that department has rendered to the country terms; and with the immense territory which is just pening for the first time for the application of intelligent fitming, the labors of the department will be poportionately increased as the bounteous stream of
knowledere which it dinnses spreads over a wider and nowledse
wider field.
vider field.
If a change of location could in any way impair its asetulne'ss, its removal would be a serious matter; but department. such would not be the result. Already portion of the clerks are placed in other rooms, and only by an entire abandoninent of the Patent Office can properly within the scope of this report, I might conproperly within the scope of this report, I might conhat subject to the Commissioner of Agriculture, with whom it appropriately belongs, 1 must reiterate that the absolute necessity of this Ottice demands additional way than by the removal of that department
The tav by the removal of that department
he practice of the Oflice in its general features has becn so nearly uniform for a long term of years that any violent innevation is objectionable, but there are some few matters of detail in which, in my judgment, the interests of bothi inventors and the public would be The twelfth section of the act of March 2, 1861, prc icles that all applications for patents shall be com he petition and in deftault thereof shall be regarded banduned. Inder the construction'given to this latute by my pre decessor, it has been the practice of the Oftice to regard applications as abandoned when
they have lain two years after a rejection without any action on the part of the iuventor to procure a recon ideration. She correctness of this interpretation o orlmitted that a strict adhereince to the letter wouid hardly sustain the rule. There is clearly no reason why in application shond be regarded as abandoned n the one case which will not weigh with even stronge orce in the other. If tre practice spoken of be not dhered to, it becomes impossible to determine when a rejected applicatiou can be referred to on the exam-
ination ol a subsequent one, or when the model and frawing may be submitted to public inspection, as nei ther is proper while the application is considered as pending. There can be no hardship in requiring onc who makes claim to an invention, and who has had one or more examinations by the oftice, and then allows the case tind delay, if he desires to call the matter up aner hi would therefore recommend such an enactment as wil eave no doubt of the legality of the course hitherto pursued.
When applications are made for the extension of patents, as the law now stands, the Commissioner no appeal. In my opinion this lodges with him too no appeal.
In the class of cases referred to there is often a very reds of thousands of dollars, and amounting to hunre, the patente of donars, and the adverse parties public on the other. The act of 1836 vested this power $n$ a board, consisting of the Secretary of state, the ury; but with the increase of business and the conse quent frequencr of applications of this character, it be ame difficult if not impracticable to assemble the board, so that in 1818 a change was made, and the law was tixed as now. since the establishment of the Board of Examiners in Chicr, the evil which led to the passage of the act of 1848 no longer exists, and it appears to me mined to this beard for decision. cases suould be reest would be rendered more certainly secureit the conurrence of the Board be required before a patent can be extended. The plan suggested possesses the advanage that the matters involved wond be considered by our minds instead of one, and there would be much eaus than where one alone deeides the case and that without appeal I suppose it to be prudent to so egislate as to guard as far as possible against fraud and corruntion, by making it dangerous to attempt and difcult to accomplish, rather than to seem to invite it by making it either easy or safe; and as courts for decidng important causes are seldom so constituted as to onsist or from in this instance where heavy interests are depending
The sixth section of the act of March 3, 1839, provided that in all cases where an invention had been patented in a forelgn country prior to the issue of a of courteen years from the date or publication of such oreign Letters Patent
$0 n$
0 patents thereaiter granted should remain in force for This was construed by my predecessor as merely ex tending the term, but as in no wise affecting the limit-
ation above quoted from the act of 1839 . The Office, therefore, continued to antedate all such patents in the therefore, continued to antedate all such patents in the and as my attention was not called to the point, on my assuming the direction of the office, the same practice has been followed until quite a recent period. My atention having within a short time been called to the subject, it has been hela, arter consultation with the ecretary of the interior, that the rule of the office for f past the a of 1861 plainly operating the repeal of so much of the act of 1839 as shortens the term of the patent. Although the language of the statute is so expicit as to necessitate this construction, I have reason believe that such was not the intention of the framrs of the act, but that they merely intended to extend he term from rourteen to seventeenycars, as an equiv The belief that such was the intention of the act was so eneral among inventors and putent lawyers that the ormer ruling of the office was almost universally acented for nearly five years.
Under this state of facts it is manifestly proper that those patents which were issued or a shortened term, nnder the former practice of the office, should be con rom the date of their issue, if the law in relation to the subject is to stand as at present. As, however, some egislation is necessary, I would invite attention to the ollowing considerations.
While an application for a patent is pending, the pecification, model, and drawing are held strictly con dential, no knowledge of them being allowed to go beyond the office without the express consent of the course would be full of peril to the honest inventor as nscrupulous men could readily adopt whatever was valuable in the invention, and there would be no redress. Secrecy is the only protection available before
the issue of the patent. But in cases of an invention the issue of the patent. But in cases of an invention which has been patented abroad, the fuling descripion is already open to the public, so that nothing is gained by are reasons of great force ior applying exactly the con rary rule to these cases, If any manufacturer or artisan meets with the published description of an in vention which, upon inquiry, he learns has not been patented in this country, it is surely legitimate for ng statute in denying a patent for an invention use in this country. But this provision has been hitherto almost a nullity in practice, since it is rarely is to the question of fact. No one but the applicant or
others in his interest is cognizant of the pendency of the application, nor would the knowledge be likely to were withdrawn. When the application is mede for the extension of the term of a patent, the law requires that notice of the fact shall be given to the public by advertisement in a newspaper in the city of washing ton, and in another published in that part of the country most interested adversely to the grant of the petition. I can see no reason why the same rule should ot be followed in the case of inventions alread patented abroad, and I would thercfore recommend an is about twenty-fve dollars for cach case, it would be necessary to increase the fee payable on such appli-
cations by that amount, but the inventor would be ully compensated for this by the full term for which噱 patent would run. The much greater probability nto use being made known to the office, would deter nventors from the risk of the delay which now so requently intervenes between the issue of the foreign patent and the applications here. In fact, I am strong $y$ inclined to the opinion that such a change in the aw would result in the much earlier introduction of heretofore prevailed.

THOMAS C. THEAKER,

The French Iron-clads a Failure.
The fatal truth connected with the raisseaux blindes, about which so much Iustian has been talked and written, is at last made clear. These vessels are of no use whatever. These iron-plated vessels having made a hole in the budget through which have passed ne hundred million of the public money, are delared only fit to remain stationary in port, and wil ever be able to use their artillery at sea, the slighest motion of the sea paralyzing the action of the guns. his unexpected check to the dream of maritime power indulged in by the Emperor has given a errible blow to his amour propre; and Chasseloup Laubat has been made to bear the brunt of the wrath which should have been lavished on M. Dupy de Lome, the engineer who constructed the vessels. The mania for creating a monster navy and possessng those three great elements of power-ships, colonies, and commerce-which, according to the great Napoleon,' must be regarded as the very souls of national greatness in modern times, is increasing with the present Emperor's old age. He forgets, owever, that ships may be built-but neither will colonies flourish nor commerce prosper without lib-rty-and goes on persecuting the press with more bitterness than ever.-Liverpool Journal.

## Utilization of Blast-Furnace Gases.

An improvement in the utilization of the waste sases of blast-turnaces has been patented by Mr. J. Cliff, of Wortley, near Leeds; but the patent has become void from neglect to file a complete specification. It has heretofore leeen common to use the cases generated in the blast-furnaces for heating the hot-air stoves, and for generating steam in boilers, and for some other parposes. Instead of this, Mr. oseph Cliff proposes to blow them back into the blast-furnace itself. One mode in which this may be done is using an exhaust cylinder, which is connected by pipes with the waste gas-pipe, and is provided with a piston, which is worked by the blastengine, and thereby exhausts or draws the gases rom the waste gas-pipe or furnace, and then forces the said gases into a receiver at such pressure as may be desirable. The gases pass from such reeiver to the furnace either by an entirely separate pipe of suitable diameter, which shall deliver the ases close to the tweers, or shall join the air in the weers immediately betore il goes into the furnace, so that there may be a rapid and complete mixture of the air and gascs at the point of ignition in the urnace. By these means such portion of the waste gases as may be found most suitable will be made available for the more economical working of the blast furnace, coals or coke will be saved, a greater heat maintained in the furnace, and the yield or make of iron will be increased.

There are ten anchors weighing 8,000 pounds each, and one and a half miles of chains, costing ver $\$ 30,000$, attached to the Dictator and Now Ironsides, now anchored at League Island, to preserve them from the tremendous power of the ice.

Mr. W. R. Brooks, whose Lamp Trimmer was lustrated in No. 8 of the Scientific Americin, deires correspondents to address him in fiture at Syracuse, N. Y., Box 196.

Brooms are yuite an exueusive item in hnusekoeping, and many of them are woru ont in the conrse of a year. Recently st:veral platents on broom heads, or shauks, in which tine cori) is held, have been taken out by incentors, and we hear of their general success. The idea is to furuish a holter that can be readily filled by any person, so that those who live in the country, or the suburlis of ciiles, can plant a tew hills of broo.i corn and raise their own orooms, thus obtaining them at a tilhe of the costif purchased at stores.
The engraving here published illustrates one of these new broom heads, and the description appended will give a clear idea of the manner in which the operation is performed.
The material for the broom consists of single sta ks, so to speak, having a long stem; one of the stalks is shown at A. These are placed togother in a bundle and arranged as shown at $B$, the stems being passed throurh the metallic loop, C, and piled alternately one over the otber, until the loop is full. The position of the material at this stage is shown at D. This loop, filled with the corn, is then inserted in the shank, F , of the broom bandle, the holder, F, having been previously slipped over the top of the bundle so as to keep it together. The whole is then screwed into a nut ins:de the handle, and thus firmly held in a com pact form. This methed of constructing a broom makes a much better article than the old-fashioned one, tor the shank is stiff and held fast, thus obtaining a spring or elasticity which is valued by housekeepers. The holder is made of tin, sheet brass, or Ger man silver, and will last for years when properly used, and the broom can easily be refilled at any time when worn out
A patent was obtained on this invention Dec. 19, 1865. For further information adderess Silvers, Patent Bruom Company, No. 28 West Fourth street, Cincinnati, Ohio

## Water Freezing at a Depth of Twentyfive feet.

The Detroit Water Commissioners have for many years encountered a difficulty in obtaining water from the river in the winter.
The inlet pipe to the pump well is made of boiler tron; it is thirty inches diameter, its extreme lengch is about 230 feet, and it extends into the river 150 feet from the wharf, intowater 34 feet deep at the extreme end. On the river end of the pipe there is a bell-shaped mouth, elbow turned upward, the end of which is 36 inches diameter, over and surrounding which there is a strainer also made of boiler iron, 9 feet diameter and 10 feet high; above the end of the pipe the boiler plete in the strainer is punched with half insh holes- 144 to each square foot.
Under certain circumstances, during extreme cold weather, it is with difficulty a supply of water can be obtained, in constquence of the accumulation of ice on the strainer.
When the river is covered with ice over the strainer the ice does not collect at any degree of cold. The greatest difficulty occurs when the thermometer ranges from 7 to 8 deg. to 18 or 20 deg. atove zero, greater than when it is below zero, and when the mercury rises above 20 deg ., however sudden, the ice disappears. The greatest collection, it has been observed, occurs at night, and when the sun is obscured by clouds, but when the sun is unclouded no difficulty is ever experienced.
Dr. Pitcher addressed a letter to Professor Dovglass, of the State University, inclosing one from Mr. R. E. Roberts, Secretary of the Wate; Commissioners, dorailing the facts given above, and asking an explana-
tion ot this phenomenon. The following is the repis of Professor Din. lass:-

University of Michigan, Jan. 29, 1866. Zasa Pixcier, M. D., Detroit Dear Sir: Your let Esq. in rel ition to the obstruction of the supply pipe at the water works in your city, was duly received and I have given the subject cureful consideration. With the facts which the letter aff)rds, I un unable to give an explan tion of the singular pheno nena enmrely satisfictory tomyself. Mr. Roberts states that shence does not form on the strainer when the sua probably no observ utions have been invds. I think probably no observations have been mide. Ithink,
however, on careful investiration that this will be found to be the most favorable condition for the depo

## SILVERS'S BROOM HEAD.

sition of ice. Should this prove true, I should explain sition of ice. Should this prove true, I should explain
the phenomena upon the principie of Wells's wellknown and acknowledged theory of the formation of dew, viz., by radiation.
The extremity of the pipe is a good radiator of caioric as well as a good absorber. When the water reaches about the temperature of 32 deg., the pipe parting with its caloric by radiation into space, is so far reduced in temperature as to cause the water to
congeal upon its surface. The clear water being to a grea, extent transcalent, would not interrupt the passage of the caloric. Nor would the great depth affect it, for it is well known that caloric that has been ransmitted through one layer of transcalent medium will be transmitted through any number of layers. The rays of the sun would also convey leat through thus dissipate the ice As soon as the ice forms upon the river, all radiation and transmission of caloric would be stopped by the intertranscalency of the ice. Upon this theory, we should have ice most freely on the strainer in clear and cloudless nights before ice has covered the river, It would also be dissipated in arloudless day. The last Ass
Assuming this as the true thecry, I would suggest the large scows or timber raft, and have them anchored directly over the pipe They will intercept the heat radiated from the pipe, and send it back to the source rom whence it came. If the evil is a serious one, the experiment is worthy of a trial. I think the scows will prevent the ice forming on the strainer

Silas H. Douglass.
The number of pumping engines reported in England for the month of December is 31 . These con sumed 2,769 tuns of coal, and lifted 209 tuns of Water ten fathoms high. Average duty 50,900,000 lbs., lifted one foot high by the consumption of 112 lbs of coal.

Water-Weed for Fodder.-At a recent meeting of the Chemical Society in London, Dr. Smee stated that the American water-weed is about as rich in nitrogen as clover, and may be used as catlle food.

Aniline, or coal tar colurs, have now been extended in number. so that all the colors ot the rainbow, and all the shatles, can be ontained from coal tar. Aniline was discovered $1 y$ Uovertortien in 1826, who procured it by the dest uctive distillation of indigo. It is now obtained in small quastities directly trom the destructive distillation of cral, as in gas-works, but is generally manulacinred trom the lighter coal tar naplitha. When t'ie naphtha is rectifird, the portion which disiils over at a temperature of $180^{\circ}$ Fab. is benzole, and this substance was discovertd by Faraday ir, 1825 By the action of strong nitric acid, the benzole is converted into nitribenzule, and this latter, when agitated with water, acetic acid, and iron filings, becomes aniline. By the action ol oxidizing agents, such as chloride of lime, bicuromate of potash, chloride of mercury, etc., the aniline, which is colorless by itselt, can be transformed iuto all shades of violet, mauve, mageuta, etc. By the researches of Hofmann, the number and beauty at the aniline colors have been increased. While numberless shates of reds and purples can be obtained, there is a splendid green, called verdine, dis coverel by Eusebe, and which remains a true, pure green even by candle or gaslight; a blue which is as clear as opal, a good yellow, and a fair black. In short, dyes of all hues can be obtained from aniline, which, in its turn, is procured from the coal tar. The intensity of these aniline colors may be incicated by the fact that one grain of magenta in a million of water gives a good red; one grain in ten millions of water exhibits a rose pink; one grain in twenty millions communicates a blush to the water; and one grain in filty millions tinges the water with a redulish glow. The powerful tinctorial virtues of these dyes may be learned from a circumstance which occurred during the passage of the Great Eastern between Liver pool and New York, when the sea was observed to exbibit a crimson hue for some distance around the vessel, and when it was afterwards discovered that the bloody sea owed its color to a wave having stove in a plate of the Great E'astern, and thus the water got access to certain vessels which contained magenta.-Mining Journal.

## Large Wire Manufactory.

At the Quinsigamond Iron Works of Messrs. Washburn \& Moen, Worcester, Mass., iron wire is made on a most extensive scale. Upward of eight tuns per day of iron wire of all sizes is manufactured, besides hoop-skirt wire to the amount of six tuns. They are the largest makers of iron and steel wire in the countrs.
Wire for hoop skirts is drawn out round, then flat tened by passing it through rollers, and, lastly, tempered by running it through a bath of melted lead ancl another of oil. It is subsequently covered with cotton yarn and is ready for market. The covering is also dote at these works.
The sizes of wire manutactured run from half an inch to forty-six gage. A curious item in the manufacture is the quantity of flour used. This would seem to be one of the last materials needed in an iron mill, but many hundred barrels are worked up in the course of a year. It is made into a paste and rubbed on the wires to "lubricate" them as they pass through the draw plate and prevent cutting.
A fine new mill is being built by the Company on the premises immediately adjoining their prasent works. This structure is five stories, built of brick, and is 146 feet long by 50 feet wide, and has in the aggregate an acre of flooring.
The quality of goods turned out from these works is unsurpassed, and they are used for all purposes,
from bridge bailding to pianoforte making.

## PROTEOJ--THE NEW OPTICAL DECEPIION.

We now redrem the promise made in our impression of the 5th ult., by describing and explaining an optical illusion, which, although simpler, is at first sight more astonishing than the famous Pepper's "ghost," and owes its origin, in some degree, to the same source. A cavinet-not unlike a sentry-box in form, althongh somewhat wider and depper-is brought in on the stage before the spectators, who must be seated in rront, and at a moderate distance from it. It is so arranged that the spectators can see underneath it, to prevent the idea being entortained of any possible communication with trap-doors in the stage. The door is opened, and a lamp is let down through the roof (railway carriage tashion), by which the interior is plainly seen. Nothing appears insile but a pillar of the apparent diameter of thrie or four inches, reaching from top to bottom. The sides and back of the cabinet are papered or painted to imitate wainscot.
A gentleman is now requested to step in and allow himself to be locked up tor a briet space of time. This is done, and in about a minute after, on the door bfing opened, out steps "Venus," not draped in the scanty habiliments in which Grecian sculptors have been accustomed to represent hat lady, but arrayed in true West-end styie, with satin skirts distended by means of crinoline over an area of some yards. She disappears at a side door, but presently reappears statiner that she has torgotten "Cupid"in the cabinet behind her. On the door being opened, "Cupid," armed with his bow and arrow, sprin $\because$ s out, and, making his bow, walks off with his Ma. Various other changes are effected-such as people entering, and being found, on the door being opened, 10 have disappearel. Lastly, at the close ot . he eutertainment, an inspection of the interior is invited.
To enabl? our readers to understand how this optical deception is produced, let them lollow us for a moment:-

$A$ and $B$ are ground plans of the cabinet, from which. for the sake of convenience, we cave removed the doors. In A two doors, binged at the back rorner. open rom the sides and stut up against the pillar in the centrr. One side of these dours is composed of a plate-glass mirror, the other ot wood, pain'ed or papered. When the doors are in the position sbown $a^{\prime} A$, any person may be hilden behind them concealed from the spectators, who are quite unable to discover that they are there, bolieving, a they must necessarily do, from the evidence of their ejes, that the cabinet is empty, This belie; is caused by the mirrors being placerl at the proper angle, by whirh the sides of the cabinet are reflectel forward, and appear, as in tae dotted lines, to be as far behiod the mirror as they are really distant from it at one side. The sides, tbersfore, by th,e simple law of refiection, appear to be the back, and when the outer door is closed, any one concealed behind the mirror laced doors mas easily pass from bebind them to the front, and step oul on the outer door being opened.
Before the last person comes out he caretully folds back the mirror-doors which fit neatly ints a recess in the sides; and, as the back of these mirrors is made of wood, and painted the same color as the back of the cabinet, it then assumes the form represented in B in our diagram, when any one of the spectators may be iuvited forward to examine if it be not really, what it seemed all along to be, an empty cabinet.
This is one of the neatest optical illusions which we have seen, and is even enjoyed better after a knowledge of how the deception is effected than before. It has been invented and patented by Messrs Peoper and Tobin,-British Journal of Photography, Feb. 2.

The whole amount of frctional currency in circulation is not far from $\$ 30.0!n, 0 \mathrm{n}$,

## CHESLEY'S GLOBE VALVE.

In all newly-constructed steam engines or stpam apparatus of uny kind, sard and scales become loosened from the inside of the castings and pipes forming the steam passages; and in old ones incrustations and scales from oxidization form and become detached, and are frequen'ly lodged between the valve and its seat, permitting the steam to leak in the valres.

Unless such valves are agrain accurately fisted to their seats by regricding, the steam soon cuts in'o them deep grooves and chanrels. The trouble attendiug this operation, in ordinary globe valves is so great thet it is generally nfglected until great loss is incurred by waste of steam, and sometimes serious iucidental damagus.
The valve bere represented is so constructed as to completely overcoms these il ficulties, and thereby rencler it of great value to every one using steam.
The tollowiog explanation will render its operation easily understood: - In the ordinary glo'e valves the ivterior screw-threaded portion of the raised rim or boss, $G$, and the exterior screw-threaded portion of the lint, $H$, are constrincted of just such leogit that they can only be employed to h ) l d the parts together, and they becone entrely separated in the act of unscresing, betore it is possihb to dishogace the screv ou the stem of the vaive, $E$, Irom the iuterior thread o' the hul, $H$, in which it works. And hence, when the valve requites regrinding it is ne:essary to strif, the wheel or handle from the stem, remove the kub, H , and substitute a fa'se ove, in which a smooth cylndrical perforation takes the plase of the interior screw thread of the bub procer, irequently involving the necessity of disconnecting the valve from the pipes or boiler and a trip to the shop. Thisis avoided in this ralve by the plan here described. Instead of termina! ing the exterior threaded portion of the hub, H , in just sufficient length to hold it to its place, it is prolonged downward, forming an annular rim which incloses a recessed chamber, as shown in the engraving. The boss, $G$, is also prolonyed upward to correspond with the lub in the number of its threads.
This construction enables the hub, H, to be instantly converted into a stem guide by simply screwing it back to the position shown in the engraving, and then screwing the valve, E, forward sufficiently to release the screw thread of its stem from that of the hub, H. In this condition for regrinding, the stuffing box, $I$, and the ridge of the interior thread of the hub, H, serve as upper and lower guides for the smooth portion of the valve stem, which they hold to its true center, and yet freely permit the rotary and longitudinal motion commonly employed in grinding valves to their seats.
In this improvement the valve stem is guided in the act of grinding by the same parts which serve to lold and guide it in actual operation, so that the chance of disparity between different guides and chancen of epnter: $\mathrm{i}=$ avonited.

This invention was patented on Oct, 3, 1865, bs Wm. Cbesley. These valves are kept constanily on hand and all orders promptly filled by the Greenwood Pipe Co., corner of Canal and Walnut streets, Cincinnati, Ohio. Parties dosirous of obtaining riehts to manulacture can address the inventor, Wm. Chesley, care Greenwood Pire Co., Cincinnati, Ohio.

## GARRETT'S HAY FORK.

As the haying season approaches those interested in relieving themselves of some of the hard work common about that time, will be glad to know where they can obtain the most approved machinery. The power hay fork is certaınly entitled to much consideration, for in the list of labor-saving tools there are none more valuable.
The one here illustrated is entirely without machinery; that is to say, it bas no ratchet teeth, sprines, or other devices, but loads and uuloals by a simple direct pull on a rope. The points of the fork are always down and work from below, grasping the hay as a man would with his fincers, taking a good load each time. The forks are opened by a pull on the line, $A$, and hoisted by the otber one, $B$, running on the pulley; this action also draws the forks together, so that they hold the hay between them.
The manufacturers claim that this is a light, durable, and easily managed tool, that it has no projecting points to catch in beaıns, and that for its office it has no superior. It will elevate barley or oat straw without scattering. The steel in this implement is all made to order and cut in lengths so as to prevent welds.
In order to use the fork the operator steps on the axle, which causes it to enter the hay; be then places the link, which is attached to the end of the rope, $B$, over the hook, as shown; as the rope tightens the fork will firmly grasp its load, when it is elevated to the proper point, a slight pull with the little finger

will cause it to discharge its load. The fork is warranted to elevate hay as fast as any other, it properly managed. No pay is required until the purchaser is convinced of its merits. The marufucturers have orders now for nearly a thousand.
Patented by D. M. Garrett, of Sbelby, Ohio, Aug. 29, 1865. For turther information address Billow, Garrett \& Co., manufacturers, at that place.

Planting Flower Seeds.-Sow hardy annuals about the 5th of April. Press a bowl, edge downward into the earth, until you have made a circular drill to the required depth, and plant the seeds in this drill. You may then bury any special manure in the center, and there place the label; when grown, the stalks of the flowers will form a circle, and the effect and mutual support of both will be improved.

## Crude saltpeter cannot be used in the manufacture

 of gunpowder. The crystalline flour, quite free from cbloride, is the best material for the purpose. In France, the amount of chloride is not allowed to exceed ${ }_{3} \frac{1}{00} \delta$. At the Waltbam Abbey mills the washing process is carried so far that nitrate of silver produces no precipitate in a solution of the purified ca!tnotpr.
R. S., of Iowa.-If an insulated wire is wound around a sott iron bar, aud a magnet is brought in contact with the end of the bar, or sutficiently near to maznetize it , a current of electrici iy is excited in the surrouading wire, but the current instantly ceases. On removing the excliting magnet another current of electricity passes through the enveloping wire in the op-
posite direction from the first. As these electric currents are but momentary, they would not work in the way you propose.
o. S., of Ohio.-Meerschaum is silicate of magnesiacomposed of the same substances as soupstone. It occurs native in a very pure state, and is also manufactured artiftitilly. For pipes the meerschaum is soaked in oil and wax, and then baked. It is very porous, and the coloring by use is doubtless due to tha absorption of smoke. The white spots in your pipe are probably carbonate of lime or :sowe other foreign substance that will not absorb smoke.
R. H., of N. Y.-Your request, that we should republish for your special benefit a recipe that appeared in our paper in December last, is uoreasonable. Every line, even in our ad vertising columns, is worth 40 cents, and you can get a copy of that paper for 10 cents.
G. F., of Minn.-The substance which you send us is a misture mostly of clay and carbon, the proportion of carbon being perhups sutticient to call the specimen limpure coal. The occurrence of this substance is some indication, though by no means a proof, of the existence of good coal in the vicintty
H. B. M. asks:-"In case a man buys a patent, has he 4 right to use the recommendations which the previous owner received fron those using the patent, without asking permigsion of the owner or those that gave the recommendetions!" Ans.chaser, of the recommendations
W. T., of N. H.-After the velocity is imparted to your millstones it will require twice the power to run them at 80 revo lutions per minute that it takes to drive them at 40; to impart double velocity requires four times the work.
W. IV., of Iowa.-Commencing at a teinperature of $32^{\circ}$, the pressure of air is doubled bs raising its temperature $490^{\circ}$; with a turther increa:

Recerirts.-When money is paid at the office for subscriptions, a receipt for it will always be given; but when sulscribers remit their money by mail, they may consider the arrival of the tunds.

Messrs. Editors:-Mr. C. II., of New Haven, ap pears to be very anx:ous to have the popular fallacy of large pulleys corrected (see page 132, Scientifio American, current volume).
Now, I have been criticised for the last thirty years about a "fallacious" idea I had of making pulleys probably twice as large as the ordinary size, but I could eudure the criticism better than I conld endure the breaking and slipping of belts. Then again, I was too stingy of power to be constantly wasting it in bending a heavy stubborn belt around a small pulley, and straightening it again as it leaves the pulley -a serious loss when belts are heavy and strong enough to transmit much power through small pulleys. I have seen saw mills (and sash mills at that) running with pulieys on the crank shait of ouly 16 to 18 incbes in diameter, heavy belts of two or more thicknesses, and 14 to 16 inches wide, and a half tun weight on the tightening pulley to make the belt adhere to the small pulley sufficient to turn the crank shalt with an eight-inoh lever; the consequence was, that the tug of such a tight belt on the journals, and bending and straightening such a stiff heavy belt around so small a pulley wasted about balf of their driving power.
Many grist mills have small pullegs on the spindle, and belts sufficient to drive four run of stone it the belt had speed, as it would have if the pulleys were large enough. Tue miller levels the belstone all so nice, then trams the spindle from the face of the bedstone and has it all quite right; but before he grinds he must put on the tightening pulley with a tremendous pressure to make the belt atick on the small pulley, which tightening operation frequently springs the bridge tree, and the spindle is not plumb while grinding, which makes ball work. It he tries to plumb up again, he must take off the tightening pulley before he can turn the spindle, and when the tightening pulley is off the spindle is plumb as before; so he will continue to do bad grinding without knowing the cause, until some "fallacious" individnal is sent for to hunt the mysterious mischief out of the mill.
A pulley on the spindle near the diameter of the stone, and driving drum to correspond, and a light and pliable belt make a good rig; and the miller will ise pleasel to grind thereon four bushels per hour with such an one more than he could with the tashion-able-sized pulley and belt tight enough and stiff nough to waste a great portion of power. P. D. Jersey City, N. J., Feb. 26, 1866.

## Pittsburgh Rolling Mills.

Messes. Editors:-As your rolling-mill readers are sumbered by hundreds throughout the country, a letter on the subject may not be uninteresting from this appropriately named "Iron City." Pittsburgh conains between thirty and torty rolling-mills and steel works, five manufactories of gas pipe, four nut and bolt works and founderies innumerable.
The rolling-mills have heen pretty generally stopped during the past four weeks, owing to an attempt of the proprietors to reduce the wages of the employees twenty-five per cent; it is supposed by many that this movement on the part of the ironnasters is lone more for the purpose of impressing Congress with the necessity ot increasing the tarint than any real desise to reduce the workmen.
Five years ago it would have cost some trouble o get a sheet of irou sereu or eight lect wide, but ince the beginning of the war a revolution has been worked in this as in many other things. The demand for large and heavy plates made by the Government, caused the proprietors of rolling-mills to increase the size of their machinery and furnaces, and now, when the mills are running, making plates of the above size is a daily occurrence. The other day I witnessed them making, at Lyon Shorb \& Co's. Works, a plate thirteen feet long, and six and a-lall feet wide, three-eighth-inch thick, with surprising ease. The rolls at this mill will weigh fourteen and a half tuns each.
At Morehead \& Co's. I also saw them rolling a
plate weighing twenty-eight hundred lbs.; the rolls at these works are reverserl, so that the iron enters at either side, doing away with the necessity of passing the iron over the top roll to be entered again at the same side. The making of fancy or eccentricshaped iron is now more common than formerly; the architect or engineer now sends for almost any geometrical shape and has it made. Angle L and T iron are now as common in the rolling mills here as bar iron, almost even cast steel is rolled in nearly as many shapes as iron-agricultural im. plements demanding almost, every conceivalle shape in the vast quantities used for that purpose; here it is made perfect and in quality to equal any in the world; in fact, Pittsburgh cast steel is getting a reputation that is creditatle as well as protitable to the manuiacturers.
Pittsburgh, Fel. 26, 1860.

## Burying Creans.

Messrs. Editors:-I will state, for the information for all parties interested, that while living on the Republican Fork River, Kansas, in 1860, I frequently made butter loy burying the cream, but found that it did not succeed well when quantities of cream larger than 3 pints were used. The difficulty might be obviated hy having tie sack long and mall round so as to have a sufficiently large sur face of the soil in contact with the sack to aleorb the cream rapidly. It should be kept in the ground about eighteen hours, and as mavy inches deep. I used to lay it down at sumset and mearth it the last of the forenoon. The cream should be stiff without curd. Of course where there is much cream it would not do to waste the buttermilk in such a mode as this.
J. H. Sman.

Boston, Mass., Feb. 19, 1866.

## POLYTECHNIC ASSOCIATION OF THE AMERICAN INSTITUTE.

The Association held its regular weekly meeting at its room at the Cooper Institute, on Thursilay eveningr, March 1st, 1866, the President, Prof. S. D. Tillman, in the clair.
rusting of armor plates and iron buildings.
The President, in his usual summary of scientific news, read the statement, that has appeared several times in our colunns, in regard to the risting of the armor plates on the French iron-clad ships.
Mr. Dibben remarked that he had seen the statement repeatedly, but it was very unsatisfactory from its incompleteness. There was no explanation of the manner in which the plates are secured.
Dr. Rowell observed that there are numbers of iron slips, with comparatively thin plates, which have lasted many years without suffering materially from rust.
Capt. Maynard said that he could probably $e x$ plain the matter. Iron ships are protected liy heing painted inside and out, but the paint upou armor plates can be renewed only on the outside, and the rusting takes place on the back side-next the ship. Capt. Maynard continued-
"There is a large and beautiful irom building witbin a bundred yards of this place-I allude to Tompkins Market-which can be painted on the outside, but which is plastered inside, so that the iron cannot be reached; and the iron of that building is heing very rapidly corroded--it will last but a tow years."

## walingi on artifichll lega.

Mr. J. W. Weston exhibited an arlificial leg inrented and manufactured by him. It is marle ol sheet brass, struck up into form and soldered on the inside, with rings and straps of steel to strengthen and stiffen it in the proper places. The toot is secured by a simple joint with a cushion of pure indiarubber, and the socket for the stump is lined with cork. A young man present, who was wearing one of the legs, walked about beiore the audience without any cane, and with a very easy gait.
Mr. A. A. Marks then presented the leg invented and manufactured by him. It is a hollow wooden limb, and its principal peculiarity is the foot, which is made of solid india-rubber attached to the legr without any joint whatever. 1 young man present, wearing one of these limbs, was called on to exbibit his gait, and as he walked back and forth
through the hall, without any cane, it was difficult to helieve that lis legs were not both those which nature gave him.
Mi. Marks-"Gentlemen, which is the artificial leg ?"

Voices--" The right--the right- the right."
Mr. Marks--" "They are both of wood."
Every one was impressed with the immeasurable value of the limis to this young man, in place of the two stumps leit to him on the battle fiell. It was further stated that he could skate will them very well.
The subject was coutinued to the next evening, when legs, invented by others, will be exhibited.

## NEW INVENTIONS.

Machineriy for Cutting Files.-Files to the value ot between seven and eight millions of dollars are annually imported into this country from Europe; which value is predicated upon a gold hasis. Besides this foreign sapply, there are files manufactured in various sections of the Unitel States every year, which are worth het ween three and four millions of dollars. Thus it may he seen, that upwards of eleven million dollars worth of files are nsed in this country alone, every twelve montlis. Ail of the files thus used, with very few exceptions, are manufactured entirely by hand, at a cost which is necessarily immense. The expense of the cutting alone, of an ordinary twelve-inch file in this manner, is two dollars per tozen. The same work, upon the same file, can be done with this machine at an expense of twelve cents per dozan; and not only so, nut the article produced from this machine is of a better quality, and superior in every resjuect, to that manutactured by hand. Of the many machines tor this purpose is one of a very ingenious yet simple character, patented by James C Cooke, of Niddletown, Conn., who has devoted much time and attention ot this branch of the subject. The machine consists in a novel construction and arrangement of a cutter stock, applied to a sliding head in such a manner that the cutter is rendered capable of being adjusted, with the greatest facility, in the several positions relatively with the file blank that it is necessary to have in order to cut the file properly. The machine has, also, a novel manner of securing the file blank in its hed, wherely the blank may be secured in the hed and the finished file removed therefrom very expeditiously. The machine also ennsists in certain means ifr automatically adjusting the file bed, for the purpose of compensating for any variation in the thickness of the blank, and insuring a cut of uniform depth throughont the entire length of the blank.

Machine for Rollug Iron.-This invention relates to a new and useful improvement in machinery for rolling irou, and it consists in the application of side rollers to the crdinary rolling machines, whereby the edges of the metal, both previous to its passage between the rollers and atter leaving the same, are subjected to a pressura, causing the metal to he rolled of an uniform width throughout, and with smooth edges. The invention also consists in a novel means employed for operating and adjusting the side rollers, wherely said rollers may be placed at a greater or less distance apart to suit the width of the metal being rolhel, and the rollers at the discharge side of the pressure rollers made to rotate with a greater speed than at the feed side. John F. Lauth, of Reading, Pa., is the inventor.

Treating Peat.-This invention relates to the preparation of crude peat tor use as fael. It consists in a method ot treatment, and in devices, by means of which, the cellular character of the peat is destroyed and the tubular fiber:3, which interlace it in every direction, are broken and crushed, such fibers, after they are broken up, being also thoroughly mixed with the rest of the mass. The peat is brought into a fine, soft, plastic state, the water present in its tubular fibers and in its uumerous cells being released and mixed through the mass during the process. In this state it is capable of heing molded into blocks of a convenient size for handling or burning. In reducing the peat to this state, any air which is confined in its cells is also released. The result of this destruction of the cellular character of the peat, and of the tubular character of its undecomposed vegeta-
air, and the intimate incorporation of its decomposed and undecomposed elements with each other, is to bring the peat into a condeused state, in which its bulk is greatly decreased, while yet it retains all, or nearly all, the water which was present in it when dug up. The water is afterwards got rid of to a greater or less extent by evaporation in the open air, or ly currents of warm air, or in any other way preferred by the operator. T. H. Leavitt, of Boston, Mass., is the inventor.
Elevator.-This invention relates to a new and useful device for elevating building materials-such, for instance, as brick, stone, mortar, etc.-during the process of the construction or erection of a building. The object of the invention is to supersede the use of the common hod and the windlasses now employed for such purposes. John C. Wandell and James W. Wandell, of New York City, are the inventors.
Tailors' Measure.-The object of this invention is to obtain an implement of simple construction by which any one of ordinary ability may, after obtaining the measure of a person, lay out or mark the cloth so that the same may he cut in the most economical manner, and the garment, when made, fit perfectly the person mensured for the same. The cutling out of garments so as to economize in cloth equires considerable skill and practice, and a good cutter can always demand a large salary in readymade clothing estallishments-in fact, a good cutter is not always readily obtained at any price. George Beard, Philadelphia, Pa., is the inventor.
Derice for Cleanng Flues of steam Boilers.-This invention relates to an improved method of cleaning the flues of tubular boilers, whether of locomotive or other engines, or tubular boilers used in other connections. The flues of such boilers very rapidly become foul with deposits of soot, ashes, and cinders, which choke some of them and consequently diminish the steam-generating capacity of the boiler. The usual method of cleaning the flue tubes is by the use of scraper and brush, which implements are sometimes usel with great carelessness, and when used with diligence and carefulness they demand a great expenditure of time and labor. If the flues are not well and properly cleaned a great waste of fuel is one of the results. This invention is intended to accomplish the cleaning of the flues with ease, expedition and economy of time and labor, and consists in connectivg a steam pipe with the boiler or steam chest at any convenient point, and placing a suitable nozzel or jet at its end which can be inserted withiu the flues at either end of the boiler. The pipe may be gas pipe or any other which will endure the pressure of the steam which in locomotive engines is often very great, and it is made with joints at convenient places therein, so as to be capable of being turned in any direction. A cock is placed on the pipe near the boiler to shut off steam from the apparatus when not in use, and another cock is placed on the nozzel, or near it, to shut off steam when running from tube to tube. It may be applied to the tules through the smoke box or through the fire box, and ly its use a boiier with one hundred tubes can be cleaned in tive minutes, and done so periectly that only adhesive particle of crust and dirt will be removed, and the flame and heated air from the fire be allowed to act with full efl'ect on the clean surface of the metal, thereby saving a considerable amount in fuel. Daniel McDowell, Kingston, Jamaica, W. I., is the inventor.

## oil smellers.

The wizard characters who figured so extensively in locating wells, in the incipient stages of the oil excitement in Venango county, are not all dead yet. Unlike other prophets, they seem not to be without honor in their own country. Strange as it may seem to those who trust to the more legitimate sciences ot geology and mineralogy as guides in searching or petroleum, there are men who profess by means of magic to locate the deposits of oily treasure. While geologists are carefully noting the succession, din and strike of different strata of rock, and searching or signs of upheaval from which to infer fissures full of petroleum in the sandstone of one period or another, the "smeller" with his magic stone and forked willow in hanil, marches with dignified gravity over the land, purchased on suspicion of oil, until
his magic wand informs him where to strike. It is strange what a hold these professional humbugs have upon the credulity of those who are afflicted with oil on the brain.
The Titusville Herald, noticing the fact of the strike near Petroleum Center, mentioned in another column, says: "From the fact this territory has produced but little oil lately, the peculiarity of this strike is noticeable. The 'spot' was located by Messrs. P. \& D., who were, as are all ' oil smellers," confilent of success. That they succeeded beyond a doubt, the well is positive proof. The question whether or no they can locate a good producing well every time is yet to be decided by actual test. So far they have not missed. The big well on Smith Farm, Cherry Run, lately struck, was also 'smelt out by them. They have in their possession a kind of chemical, or 'magic stone,' with which they operate. Several parties have tried to prove their mode a humbug, but so far have always failed."
One of the failures referred to is stated as follows: A bucket of oil was placed in the cellar of a house, unknown to the gentlemen. They were invited in, and during the conversation were asked to try their chemical stone. The magic stone was balanced, and behold it indicated the spot so correctly that had a hole been bored in the floor directly under the stone, a plummet dropped through it would have fallen into the bucket. Our friend of the Herald does not say whether the chemical stone indicates the depth at which the oil will be struck, but we would advise Messrs P. \& D. to offer to show this also. They might, in addition, indicate whether the oil will be lubricating or not. For such additional information they might add to their fee. They need not fear that by promising too much they will create doubts in the minds of their employers, for it is just as reasonable that they know the depth and quality of oil as to discover its locality.
But the "chemical stone" is not the only material hat possesses this wonderful oil-indicating power. A forked brancl: of willow in tha hands of one of these professional gentleman, is just as efflcacious as the "stone." The prophet of the willow school, having selected a suitable branch, bolds the stem of it firmly, keeping the branch in a horizontal position, and proceeds upon his inspecting tour with no less gravity than he of the chemical stone. When the place where oil is to be found is reached an irresistible and unknown power turns the branch directly in the direction of the charmed spot, and the employer's fortune is made. The willow knows its friends, and cover requires to operate except for certain favored individuals. A third class of "smellers" have made their appearance in the Canadian oil field who use neither stone nor willow. This set are disciples of a more spiritual school than their cotemporaries of Venango. They probably have imbibed their inspiration trom the pages of " Footfalls on the Boundary of Another World," or the more recent and eloquent "Man and his Relations." An exchange thus describes the modus operandi of one of them: He leaves his comfortable quarters at the hotel, and proceeds at his leisure across the fields, or along the bank of the winding river, ever and anon tracing up ravines, and occasionally may be seen standing on one foot like a lame duck in a puddle, with his eyes riveted upon the ground. He claims that while both feet are on terra firma the magnetic circle is formed, and the same sensation is not felt in his nervous system as when the connection is broken, and all the charge is received in one limb, and whenever oil is beneath him, no matter how distant from the surface, he experiences a certain oily sensation. There are those who are earnest helievers, while others re:use to receive the " revealed science."-Petroleum Times.

Fortune plays some queer pranks. One occurred o a poor willow woman, who dill washing for a living in Pithole. She owned a small piece of ground, and some friends got her consent to sink a well upon it, the result of which is a barrel of oil every en minutes. She has had several offers of matrimonial engagement from disinterested parties, since.

Billiard Contest.-Messrs. John Deery and John McDevitt, both professional billiard players, contest for the championship, at the Cooper Institute, on Tueslay evening, March 13th.

Improved Thrasher and Separator.
Machimes for thrashing, separating, and cleaning grain at one operation, have long been in use, and the many improvements on them have, in most cases, been on the working parts or internal arrangements.
The thrasher here illustrated, so far as relates to its working parts, is similar to those now in use; the change being in the construction of the frame of the machine, whereby it is greally simplified and rendered capabie of being constructed at a much less cost than heretofore; besides, the machine is so nearly balanced on its wheels as to greatly facilitate its operation and transportation. The following description will render the principal improvements familiar to the reader:-
The frame of the machine is constructed of wood, and is almost complete in two wide boards or timbers, $A$, which run parallel to eachother the entire length of the machine; they are of sufficient strength to suppor all the working parts of the separator. Near the center is an axle, $B$, on which the machine is nearly balanced, and may be readily moved from place to place, and also adjusted for operation. This is a very important feature as it admits of its being adjusted for use where the ordinary machines cannot be conveniently placed. It is supported while in operation by two wheels. The trcnt or cylinder end is lowered to the ground, which is but the work of one man, and the machine is then in a most convenient pusition. Every man is on the ground to work, and the thrashing cylinder, being low, is convenient to supply with gra'n. The machine will set much more steady and run ligbter than the ordinary machines. The accompanying engraving represents the separator ready for operation, and all tbat is required to prepare it for transportation is simply to raise the front-done by one man-and place it upon the trucks. This brings the machine level and renders it capable ot bein. $r$ transported over rough or sidelieg roads, without danger ol upseting.

This thraslopr was patented through the Scientific American Patent Ag $3 n:-y$ by C. B. and W. T. Brown, on June 6, 1865, aud it will be known by the name ot the "Star of the West." For intormation in relation to buyiug or lea:ing rights addres the patentees al Bux 345, Alcon, Ill.

## PLIMPTON'S PARLOR AND ICE SKATES.

A few weeks ago we alluded to the private skating rooms of Mr. Plimpton, on the corner of Tenth street and Fourth avenue, in this city. Many incuiries having been made in resard to the kiud of skate made and used by Mr. Plimpton, we have had engraved and present herewith illustrations of both the parlur and ice skate; or, strictly speaking, the patcut skate, with the roller and ": unner" atiachment - (he same frame answering the purpose for both in-door and out-door sport.
In the accompanying illustration, Fig. 1 represents a roller skate with a pair of wheels at the toe and heel. These rollers are turned or guided so as to make any desired curve by the recking of the sole plate, or the proper inclination ot the foot of the skater. The rollers set squarely upon the floor, whether the foot be inclired or upright; in this manner sufficient adhesion is obtained to prevent the skate trom slipping sideways while turning short curves, etc. By thus dispensing with all rough, soft, or elastic substances, as formerly used upon the rollers, a very easy running skate is obtained. The point upon which the skater rocks, or changes from the inside and outside edge balances, is quite near the fool; and the screw with elastic washer that holds the wheel, hangs in place, can be adjusted so as to afford more or less support for the ankle, while the foot is prevented from turning sidewass beyond a
given point, thus obviating one of the first and great-/with the movement of the skate. Therefore an ice est annoyances in the art of skating. These skates skate, working upon the same principle as the roller, do not require tight strapping that interferes with is desirable, as then, whatever is learned upon the the tree play $0^{\text {: }}$ the muscles or circulation of blood in the foot, hence it may be readily attached to any ordinary boot or shoe by the perfectly adjusted fastening of the inventor, as shown in Fig. 1. But if th ice is attainable upon the floor; and this new s ystem of roller skating can be practiced at all seasons as a popular entertainment and beneficial exercise for old or young of either sex.

BROWN'S THRASHER AND SEPARATOR.
boot or shoe is unnecessarily loose, straps can be falling, etc.
readily applied to the same fastenings, as shown in Fig. 2.

As these skates are guided through all the evilutions of skating wholy by a proper and educated adiustment of the toot, persons learning upon the

ordinary ice skate, which can be readily forced to accommodate balance, are unable to use the new sk ate until they acquire, by much practice, this careful ad. justment o! the toot, and conform their hal ance strictly

The convertibility of the roller to a skate for the ice, as shown in Fig 2 , is of no little importance This cbange is quickly made by removing the roller $p$ ortion of the skate and subslituting the ice lunners, which are arranged to rock freely, so that either pair of runners may be rased from the ice wiihout d:sturbing the bearing of the other, and also to accommodate the runners to inequalities, etc. The steel bar beneath the canter of the skate comes quite near the ice and prevents the runners catching in cracks and other imperfections in the ice, thus greatly lessening the liability of accidents from

Each skate has four steel runners, the edges of which are ground straight across and slightly curved lengthwise. These runners are set so as to present an edge to hold upon the ice. When the skate becomes dull from use, the screw that secures the runners is loosened and the rumners turned halt round, thus presenting smooth sharp corners, and ty taking out the screws and turning the runners over, the two remaining edges can be used; and thus the skate is made sharp from time to time without the trcuble and expense of grindiug.
For the ice alone the expensive construction of these skates would seem to prevent their general use, but when we consider tbat the two skates combined form the ready means of skating ai all seasons and in the most agrepa!!p manner, thip expense necessary to their proper construction will not be considered by those who require the exercise or cunsult their own coufurt and elijoyment.

On the Fith Aveuue pond, and at private in-door skatil.g parties, we have seen some of the most dexterous movements periormed upen these ska!.es that we have ever witnessed, a simple enumeration of wbich would encruach upon our limited space, therefore we retar our readers to the inventor, J. L. Plimpton, Nu. 145 Teuth sıreet, this city, an enthusiast on the sulijesı, who, atter devoting many years and a vast exper diture, takes much pleasure in illustrating to thcse interested, that skating is a science as welı as an art, and that the bighest perfection in the art is by no means confined to the ice.

## Work at the Patent office.

We are happy to observe that the work ot the Patent Office is beitg rapidly brousht up. For six months past the number of applicants for patents bas been so great that it has been impossible for the Examiners in some of the classes to keep their work up, but we are happy to learn tha, the delay experienced by inventors along back is not likely to exist much longer.

6 The Summit Radiating Paddle Wheel., 9
The inventor of the paddle wheel illustrated on page 134 of the current volume states that the title was incorrectly given by us, and that it is known as the "Summit Radiating Paddle Wheel" in distinction to other feathering wheels, the buckets of which radiate trom the center. A model of this wheel can be seen at our office.

Heavy Week's Work. -For the week ending March 2, EIGHTY FOUR patents were ordered to issue at the United States Patent Office in cases prepared at the Scientific American Patent Agency.

## т <br> 当rimutifi <br> Ameriram.

Detroit Water-works; the account being accompanied by an explanation of the phenomenon by Prof. Douglass, of the University of Michigan. Prof. Doug. lass attributes the freezing to the radiation of heat from the extremity of the pipe, and remarks: "The clear water, being to a great extent transcalent, would not interrupt the passage of the caloric." It will be ob served that he prefers to express the power of transmitting heat by the word transcalent, from the Latin trans, through, and calor, heat, instead of the word diathermic, from the Greek, dia, through, and ther mos, hot, employed by Melloni and otber writers.
Making, however, no objection to the term, we should like to know whether Professor Douglass has the authority of any later investigations than those of Melloni for the statement that water would not interrupt the passage of the caloric? Melloni found that water prevented the passage of is larger propertion of heat than any other of the liquids that he tested.
The following table of Melloni's results is from Mil ler's Chemical Physics. The figures give the number of rays that were transmitted by each of the liquids from 100 rays that fell upon them:-
diathermacy of liquids contained in glass- -stratum
OF Liquid 0.362 INCH. THE SOURCE OF heat in each
ase was an argand oil hamp
Bisulphide of Carbon (colorless)
Chloride of Sulphur (red brown)
Terchloride of Phosphorus..
Solza (il (yellow)
Olive Oil (greenish)
Ether
Sulphuric Acid (colorless)
do.
Nitric Acid
(brown)
Alcohol
(brown)..................................................................... 15
15
.

The source of the heat in this case was the naked flame of an argand lamp, and water is doubtless more diattermic or transcalent to heal of this high intensity than to heat of lower temperatures-as this is the case with all known substances with the single exception of rock salt. Miller gires, also from Mellori, the tol lowing tab'e of the diathermacy of several solis.s to heat of different temperatures:-

## diathermacy of different solids

It will ',e observe $i$ tbat while ice transmits six per cent of the beat from a naked flame. it passes but ove-balf per cent ot the heat tro.u red-hot pla.inum, aud none from copper at $750^{\circ}$. As the heat emitted trom the Detroit water pipe is of very low tempera ture, we should suppose that the surrounding water, dowever clear, would alniost, it nut entirely, prevent its passage.

## TOWN SEWAGE AS MANURE

At a meeting of the Chemical Snciety, at London, on the first of February, Dr. Gilbert delivered a very instructive lecture "On the Composition, Value, and Utilization ot Town Sewage," which was illus rated by a series of tables showing, in detail, the analytical results obtained by himself and previous observers. From these analyses it seems that at English pices of guano, the value of the ammonia in town sewage for manure is about $\$ 2$ per annum for each individual of the inhahitants. Besides the ammonia, there is some phosploric acid and potasb, which are valuable as manure. Both analysis and practical trials showed that sewage water is of more value for grass land th an for wheat. In a three years' trial at Rugby on four grass plats, of an acre and a quarter each, the following weights of green grass were obtained:-
I. Not watered-9 tuns 6 cwt .
II. Sewage 3,000 tuns -22 tuns, 5 cwt .
III. Sewage 6,000 tuns -30 tuns 6 cwt .
IV. Sewage 9,000 tuns- 32 tuns, 12 cwt .

The application of sewage meadows at Lochend bad raised the average rent to $\$ 105$ per acre; and at Darry Hules to \$155 per acre.

Dr. Gilbert stated, in conclusion, that as the two dollars' worth ot sewage per head is diluted in towns y at least 60.tuns of water, to pump it up by artiticial means would cost more than it is worth. It can be profitably used only where towns are situated on grounds so high that water from the sewers will luw by gravitation over meadows in the vicinity As in this country manure is worth much less than in England, while the cost of raising water by steam is much greater, the idea of utilizing the sewage of New York and other Amrrican seaports must be abandoned until the increase in population makes manure more valuable. At all events, it must be understood that the problem now is, to raise and distribute 60 tuns of water at a cost of less than wo dollars.

## FARMERS' CLOB. <br> LICE ON CATtLE.

At the last meeting of the Farmer's Club, Mr. Stewart inquired what substance would exterminate lice from the Angora goat without injurisg the animal.

Mr. Solon Robinson replied, "Petroleum."
Mr. Stewart said, "We tried petroleum and it killed the lice, but it came very near killing the goat. In a few days all the wool came off, so that we had to blarket the animal."

Mr. Will'ams stated that he had found mercurial ointment effectual in clearing sheep and cows of lice. It is generally sufficient to saturate a string with the ointment and tie it round the animal's neck, taking care to work it under the wool and hair so that it may come in contact with the skin.
Dr. J. V. C. Smith explained that lice, as well as all similar insects, breathe tbrough boles in the body. These holes are minute su,irules constantly kept npen by an elastic ring, and surrounded by a tringe of exremely delicate bair which prevents the intrusion of any solid particles. To kill the iosect it is or ly neces ary to close these breathing boles, and this is lone by smearing them with any kind of grease or oil. You may catch a caterpiller and examue him with a magitilying glass, and you will tind these spirules ranged in two rows, one on each side; then, it you take a moth or bu ter fly. you will tind the brearhing boles in the borly corresponding with tho:e in the body of the caterpilar Irom which it was produced - the same body, in fact, remaining alipr ti, e wings are developed. It jon dip a feather in oit, and smear the two spirules nearest the tail, the lower portion of the body will be paralyzed, so fur a : trese holes; proceeding upward, and closing the other holes in surcession, you may piara's ze the w'role lody till you come to the last two, which are siluated just below the jaws. So long as these remain open lbe insect will continue to l,reathe, but it ihese are now closerl be dies immediately.
To extermionate lice upon any animal, it is orly eces ary to cover the avimal completely with grease or oil. The simpleat and cheapest oil is the bestlard, fish oil, or any other that is at band.
Mr. Stewart sa:d that be had tried lard and sulphir without success.
Mr. Dodge remarked that the sulphur wou'd make the mix:ure so stiff that the lard would not come in coutact with nearly all the vermin.

Tricks.-Of all the " smart" instances of Yankee ingenuits perhaps the smartest is the trick played upon the authorities of New Brunswick, after their recent offic if $\$ 3$ tor the snout of eve:y bear killed within the colony. A large number of snouts were recently brought in chiefly by Indians, but in course of time it was discovrred that most of the trophies were imitations only, cunningly manufactured of india-rubber and gutta- percha by clever manipulators in the State of Maine, who sold them to the Indians at half a dollar each.

In order to test the purity of otto of roses, all that is necessary is to mix five drops of the otto with twenty of pure concentrated sulphuric acid. Whether the oil be adulterated or not, a thick, yellowishbrown mixture is the result. When this mixture is cold it is shaken up with three drachms of absolute alcohol. It the otto is pure the solution is clear, and remarns so when hoiled, but when it is adulterated the solution remains curbid.

fssued from the u. s. p.itent office fone the week exjina mabelf o, 1sibi.

Firrs, I claiu the cunbination and arrangement of the bevel
geare. f and q . crank u, and phtman, , with the hollow stationary
axle. $x$, substantially as herein described and for the purpose set Second, I claim the iointed connecting rod, m, in combination
with the hollow axle, substantially as herein described and for the 53.0 +1 . - Invalid Bedstead.-Stephen Puffer (assignor
to himself and William F. Lyons), Oxtord, N. Y.:

 the pun pose hertin set, forth.
53,0 0 2.-Automatic Boiler Feeder.-Emmett Quinn, Washington, D. (., Antedated Feb. 3, 1866:

Second, the arrangement of the pipe, f, for supplying the cham
ber. e, s eam pite, 5 . cor neced wil hithe builer at the :team space

 53,043. - Preparing Cheese for Market.-L. J. Randall, Chardon, Ohio:
I clainm the herrein-described mode of pressing cheese separately
n a s seri.s ot hoops un er pressure smultaneously by the atition of
the screw, tor the put 53,044. - Crane.-F. Bumpf, Cold Spring, N. Y.:

 53,045.-Trunk and Bureau.-Alfred W. Ryder, New York City:
I claim the cccit bined trunk and bureau herein described, the
same cunsisting of t e parts. A B, hiuged together a. C, and pro-
sived witi drawers, $D$, as and ior tue purpose explained. 53,046.-Treadle Mrition.- E. P. Ryder, Brooklyn, N. Y.: I a sewing or other machine. cords, M M2, onnect.ug sad rod with on said seeeve, which through $j$ wivs, s. ccs upon the pawl. R, Rhung on said sieere, which through jiws, cls upon the tixed annuar
ring, or, of the driving siant, arranged togetter and so as to operate
substantially in :he mavner anu fur the purpose descrived. This invention con ists in connecting the :readle to and with th ${ }^{\mathrm{e}}$ driving shaft of the machine, through a novel arrangement of parts, by means of which the liability of turning the driving shaft
in the wrong direction, when the machine is first star ed, is entirely obviated.」
53,017.-Telegraph Cable.-Peter $\Lambda$. Salvoti, New York I claity the cond ctinz cor of a cable for telegraphic purpo:es, core, sulst, nt ially as set forth.
Second, the use of protect ings, $C$ in comhination with the Second, the use of protect ng rings, C, in comhination with the
connenti, wire and the armor wres, ubsuntially as deecribed.
ihird, The combination of the pliable tilling with the
 53,048.- Turning Cheese.-Rufus Scott, Watertown, N. Y :
First. I clam the method herein described of turning cheese for
the purpose of drving the same by the employment of a rall counter
 second ine use aud emp oy anent of cl cular fianged disks, in
combination with a rall connter, ubstantially as and for the pur53,019. Apparatus for Rolling Metals.-Joseph S. Seaman, l'ittsburgh, Pa.:

 cti bar rod or tube substautidy lu the manner here nbelure de-
scri ed. 53,050 . Scale for Wंeighing. - Levi Shepard, Gold Hill, Nevad:

 , Tisis invention consi its in a new and pecullar mode of hanzing and arranglug the pan of a scale to be ust d for weighing various ar hele.s of co unerce, wher by tife amount of $t$ pir weigit is indicated $u_{p}$ on a p openly graduated arc or disk, thirough any sultathe index
or woi ter connected with and operated by the depresion of the scale-pan fron the weight of the mateitil or materials p aced upon it.)
53,051. - Harvester Rake. - Samuel and Jeremiah Sherman, Mc.tenry, Ill.

 $53,05 \%$ - - Washing Machine. Israel E. Smith, York, Pa.:
 and in t .e nuanater bertin set for th. 53,053. Farm Gate. - Wiliam Snyder, Wooster, Ohio:

 and lortut The swivel, E F, jourgaled both above and below and in-
Tlosiug one of tue bars of thogate, as and tor the purposes siuwn and. escrived.
Hourth, 1 further claim the r,oller, $L$, in the described combination Fourth, 1 further claim the romler, $L$, in the described combination
will, the low post. $K$, and a sliding gate constructed as and for the
purpose specified. 53,0.5.-Well Boring.-George W. Spear, New York City:
First, 1 claim the combination of an axially perforated or tubular
reamer wi h a detachade dibble, subscantially as and for the pur reamer wi ha detachadle dibble, substantially as and for the pur-
pose described
Second, the combination ot a drill with an axially perforated or
 ihird, The combination of an axially perforited or tubular reamer
with a detachable tubular shank or shas1, substautially as de
wribed. Fou:th, The combination of a dibble and axially perforat ed or
Fubular reamer and a tubu ar shank with a driving tube. Fifth, 1 he combination of an axially pertiorated or tubular
reamer, a detacliable tubular shank, aid a drill with a driving tube. 3,055.-Dish Drainer and Dryer.-Royal U. Stone and H. $\Lambda$. Kendrick, Rowe, Mass.:

We claim the arrangement and combiation of the braces, A.
atatches, $\mathbf{I}$, slats, $\mathbf{D}$, and rods, $H$, as herein described and for the
purpuees set torth
3,056.-Forming Artificial Stones for Grinding and Polishing.-Warren Tanner, Chicago, Ill., Isaiah
S. Hyatt, Rockford, Ill., and John W. Hyatt, A1-
S. Hyatt, R.:

Wr clain the combination of coarse grit with flour grit and a
binding material substantially as and for the purpos-s herein set 53,0.57.-Harvester,-Clark Tompkins, Troy, N. Y.
 53,058.-Device for Securing the Tail Stocks of Lathes. - Alfred Thomas, Worcester, Mass :

53,059. Grate and Grate Bars.-W. B. Treadwell, Albany, N. Y.:
 er are suscoprible ot receiving a vibrating motiou a autut their
xes, substantially as de cribed.

 a th. ting frame. A, substantially as descrijed.
$53,060$. Hair-crimping Pin.-Emma A. Tyler, Buffalo, I claim a hair pin adapted for crimping, substantially as de-53,061.-Hand Garden Plow.-Joseph Von Achen, Bloomfield, Iowa:
I claim the combina ion, in a parden plow, of otherwise ordinary
suitable construction of a station ury clevis on th iorvar 1 en 1 of he blow beam wit ha guide wheei hung in a swinging frame verti-
adily adjusable in relation to the said clevis, substantially as de-
Second, The combination in a gardon plinw with a plow stock fixe
ithe beam under the arrangenen oo the beam under the arrangensen des rib.d of a rever sivle shivel
constructed and adjusted in themanner and ior the purposes hercin

phe be.tm, substantially as set for $h$.

 the rubber disk, at and ubitantial $y$ in
des. ribed and for the : urpoee set forth.
53,087. - Steam Blower. Joseph Simmonds (assigno to himself and Samuel (G. Law), Brooklyn, N. Y.

 This inntructed as and for the purpeses set forth,
truis intention re ates to the arrangement of a steam blower con $l_{\text {et }}$ in through the hollow shaft and it discharges through a seri of curved arms which are connected by perforated fifures running parallel with the shait, and aleo by plates of sheet metal which fil up the square between said curved arms, in such a manner that by the ac.on of the steam a rapid revolving motion is imparted to said wheel and a wixed current of steam and air is crcated which can be employed with good advantage under a pressure or as a ventilator.
53,088.-Device for Canal Propulsion.-Greenleaf
Stackpole, New York City, assignor to himself,
D. Cobb, Boston, Mass. Antedated Feb. 28, 1866:
 stantialy in int manner and for the surpose se for th.
Se ond, I chaim in combination with the sle sub
 stance permanenty pating cylinder, E, of lear or other flexible substance, as described, rererlin upon the expansion ring, D and bencath
the tibing to be operated by the driver, H. substantiall vas set ior $h$.
 catcles, $\boldsymbol{f} G$ a arranged in reia in to the
53,074.-Combined Tunnel and Cocks.-Arthur G. Wilson, Chicago, Ill.:
I, and the cock, $\mathbf{B}$, all substantially as described. 53,075.-Landan Carriage Doors.-Frederick Wood, Bridgeport, Conn.:
I claim tate
53,076. - Jug Top.-Hugh Wright, Pittsburgh, Pa.:
I claim torming ihe nect, part oi tue cover, hanit, i, hinge, and
the riuc of a sheet metal jug op from a seamless sheet metal cap as specined.
53,077. - Stovepipe, Drum, and Oven.-James Beebe, Bloody Kun, Pa.:
Frrst, I claim the conbination of cylinder, $A$, with the two series
of tues or tubular opent gs. $D$ thertin, as and for the purpose silown and represented, and
Second, I claim the closing of one end of any umber of t.he
tubes or tubular openings, $\mathrm{D}^{\prime} \mathrm{D}^{\prime \prime}$. etc., and the atiachment of
 53,078 .-Process for Making Beer.-John S. Bressler 3,078.-Process for Making Beer.-John S. Bress
(assignor to Anthony Ihms), Milwaukee, Wis.:
clam tuae urocess herenberfore described of preparing inash for brewaim tue process herenberore
beve may beer b the use of corn or maize and mant, in quantitien
and mane as set forth, with application of water in quanties and under degrees ot hear, s described, and iu the manner substantiaily
as set ,orth, by unitiny the mait and the maize by one manulation
and washing the two together betore any chemical clange lias taken
53,079.-Gage Cock for Steam Boilers.-James Hold craft (assignor to himself and William Holdcratt) Philadelphia, Pa.:
I claium the employment of a washer, G, in connection with flexi-
ble joints, in the nanner and for tue purpose substantially as de-
53,080.- Eyelet Machine. - William R. Landfear, Hart ford, Conn., assignor to himself and David Whitte-
more, North Bridgewater, Mass. Antedated uct. 9, 1865 :
First, I clarm the combination and arrangement of the die, $A$, the
male orner. Sc cond, 1 also claiul the combination of the die, d. and the expell
 tialy as descrived.
Tuiru, I also claim the combination of the uie, d, the expelling
passage, t, the temale furmer, $\mathbf{c}$, the puach, C , the male former, B ,

 53,081. - Paper for l'ostage Stamps. - Henry Lowenberg
(assignor to himself ind Emile Granier), New york
City
I clatim the use of prussiate of potash and oxalic acid or such or printing. or both, so that when ane paper to be used tor writing or printing. or both, so that when any attempt is made by the use
or any chemical agents to remove fuch writing or printing, or hoth,
the paper will perceptibly change its color, but the writing will be more aftixed to the paper.
53,082.-Apparatus for Cooling Liquids.-B. G. Martin. Philadelphia, Pa،, assignor to himself, w. Sand Pa., and L. H. Walton, Philadelphia, Pa. Ante Pa., and L. Harch 2, 1866 :
First, I claim the two vertical casinge, A and A', with their boxes as and for the purpose speciffed.
second. So constructing the es vertical casings with their boxes
and $p$ ates that they may be adjustable to and trom each other, as and $p$ ates that
and for the purpose described.
Thir, The reeservir, $D$, with its holes, $n$, in comblnation with the

53,089.-Lamp.-Oscar D. Woodbury (assignor to I Claim the B. Le Forest), Derby, Conn.: I claim the arrangement of the pawl a, reating to the wick
and adjustins wheel so as to arre.t the descent or the wick efore it has pass d delow the control ot
as and ior the purpose specitled
53,090.-Method of Fastening Corks in Bottles.-Gustave Bonsigues, called bley, Rheims, France: I claim the metnoi herein described of fastening stoppering corks
for liquid, wheieby the twine and wire fase nings cant be renoved
by the by the hard wichout the aid or iatervention of any instrument, as
set forth.
53,091.-Cleaning Tubes of Boilers.-Daniel McDowell, Kingston, West Indies.
Iclaim the arrangement of the iointed pipes, $F$. with the nozzle
pipe, E and the auxiliary ope. ing. D , whereby to clean the flues or ujes of steam generators, as herein set forth.
53,092.-Composition to be Used as a Cement.-
Stanislas sorel, Paris. France:
I claim as a vew product the magne.sia cement or cement having he purpose of iorming various sub tancees ased in the ar s, Vy agglo-
meration or moldine, as terexin set forth. 53,093. - Manutacture of White Lead.-Peter Spence, Newton Heath, Eng.
I clamm the production or white lead by dissolving substances
containing oxiue or carbona eof lead in caustic alkaline solutions containing oxide or carbona e of lead in caustic
aud then preciptating tue requred carbonate.

## REISSUES.

,182.-Machine for Shaving and Nicking Screws.-
American Screw Company, Providence, R. I., as-
signee of Thomas J. Sloan. Patented Uct. 21,1851 :
signee of Thomas Ji Sliean. Patipng jaws on the rotating man-
I clain the combination or the the cutting the nick in the head, substantially as described, to perform I also claim the two same jaws.
blanker is grems
I also claim the two mandrels, with their griping jaws, in combl
nation with the saving mochanism aud the nick ng mech antsm nation with the 8 aving mo chanism and the tink jng mechantsm,
nobstantially as described, so that the operation of naving can be
pertiormed on on blank while the ope ation ot nicking is being I almo claim anting to the mandrel or mandrels end play in their
oxes, in cumb.nation with the permanent rest at the back of the hoxes, in comb.nation with tha permanent rest at the back of the
mandrel and with the cutter, pub tan ially as spectied, $b:$ means
 asdrscribed.
I a sio clain the combination of the griping jiws on the rotat ng
mandrel the shavin, tool on the movable toul post, the rest for andrel the shaviny tool on the movabe toul post. the rest for eearing against the blank to stead, it while being acted upon, and
he cutter fur cuting the nick, subs antia.ly as and tor the purpose I also ciaim the combination of the grping laws on the mandrel
or holding the screw blank, that cutter for cutting the nick. and the
 alank is held in ture waws oo a a mandrt capable of be.ng rotared.
1 aliso claim subjecting the tlank, while 1 alio claim subjectng the Llank, while tield th the same jaws
uccessively to the three operations of shaving, nickirg, and re shaving. by the means substantianly as herein described.
s.183.-Wire Staple. - Byron Boardman, Norwich 2,183.-Wire Staple. - Byron Boardman, Norwich,
Conn. Patented March 30, 1858: As a new manufacture or commodity, $\begin{gathered}\text { claim a wire staple } \\ \text { adapted for use in makng window blinds or screens, and cou- }\end{gathered}$ structed substantially as aoove described.
2,184.-Shingle Machine.-Charles S. Burt, Dunleith,
Patented March 16, 1858:
Patented March 16, 1858:
First, I claim a vertically movable and co'nterbalanced bolt gate
or irame. G, in comtination with a circular saw. D, which is ar-
and
 Second, Providing a vertically moving. connterbalanced bolt
frame or gate. G with a head block, K, and contrivances for ad
justing said block up to and trom the saw, when constructed sub antialy 8 described
Third. So constructing a machine for sawing tapering or straight
slabs from boits. that the table or frame upon which the boltt are
secured shall be autem the secured shall be automatically returned by an upward movement
or a downward movement to a positlon which will admit of the ad.
jutment of the bolt after each out, by the means substantlally as
doseribed.
 2,185. Machine for terrating theet Metal -. '1 homas Brasher, New York City, assignee by mesne as signinents of ward Eaton. Palented May 6. 185 f :

 2,186.-Head Block for Suw Milis. - Dennis Lane, Montpelier, Vt Jatented Sept. 6; 1864:

 2,187.-Steam Capstan.- Jom Shaffer, St. Louis, Mo. First. I clain, a cus stan with the drum divided in two par's. the
shait, R, of which rotates within the drum. $c$ and d which call be

 tallows frame, A, as herein described and firr the purpose set
forth. 2,188. - Manufacture of Tape Trimming.-The Elm Crosby and Henry Kellogrg. Patented Sept. 16 , Crosby and Henry Kellogg. Patented Sept. 16, We caim as an improved artic'e of manufacture, the finished
ape rammug constituted and made substantiallw a 3 herein de. 2,189. - Watch -Merrit Burt, ' Cleveland, Ohio. Patented Sept. 13, 1864:
I cla m so conuecting a pin on of a watch train to the center
shatt or arbor hat said phition will turn with it or in the ordnary running of the movements and at the same time turn independently
of $i$ in case of any suduen recoil or undur strain upon the levers when being weund up or oth 1 wise, second ${ }_{I}$ claim in eccmbination with the center shaft of a watch rain a hollow friction pining thereon so as turn with or inde-
pend not ot ots ratbor withou chick 3 or ratche!s, substantialiy as
and for the purpose de.cribed. and for the purpose de-cribed.
Third, I clam holding or supprting the friction pinion. D, in
place up in it stait or arbor uy means of a screw nut, substanflacly as set forth.
Fourth, $I$ claim the comhination of a spriag washer and nut with Fourth, I claim the combination of a spring washer and nut with
a friction pinion and its stait ot a watch train, substantially as
and for the purpose set forth. DESIGNS
2,273.-Military Cenotaph.-John S. Armstrong, Prai rie du Chien, Wis.
2,274, 2,275, and 2,276.-Architectural Center Flowers. Patents.
2,277.- Trade Mark.-Robert S. Lyon, West Mor-
risania, N. Y.

## Shifting Top for Wagons.

To these who are not able to have several vehicles for use in all kinds of weather, the shifting-top device latels invented must prove very convenient, since a top wagon is converted into a no-top buggy, or the reverse, in a few minutes and with lictle labor. The parts are the same in number and character as in all top wayons; but instead of being permanently fasiened, are capable of being changed, as before mentioned.
We here illustrate one of the shifting tops alluded to. The details consist of a series of brackets, A, lastrned to the seat of the wagon, and dogs, $B$; in cornection with the latter are the springs, C. The top is beld in place by inserting the feet in the brackets, A, and shifting the dogs, B, so that they fall in between the two parts, as shown at Done dng serving to confine both legs. The dogs are jointed to the bracket, E, so that they cannot be lost, and when in place are held there by the springs. To remove them it is only requisite to depress the spring and muve the dog on one side, as shown at F. The top can then be lifted off and laid on one side.

A patent is now pending on this invention through the Scientific American Patent Agency. For further information adjress F. B. Morse, Milwaukee, Wis.

## The Trichina.

The Detroit Tribune saysthat one case of the disease called trichina, which bas recently excited much alarm in Berin, Prussia, has appeared in that city and proved fatal. The victim was a German young lady. Trichina spiralis is a small microscopic worm or animalcule, which is found in the muscles and intestines ot varions animals, especially pigs and rabbits, in such enormous quantities that in a single ounce of pork 100,000 of these animalcule have been found. • By partaking of the meat infected with them they are transferred to the human body, causing intense suffering, followed in many cases by a painful death. These animalcule are not destroyed by smoking or by frying pork, but hard and long boiling is necessary.

We learn byothe London Lancet that at Hedersleben, in Prussian Saxony, upward of ninety deaths have occurred from this disease, while the number of persons attacked has been several hundred. All this havoc has been caused by one trichinous pig! The butcher, having recognized the abnormal appearance of the meat of this pig had carefully disguised it by mixing it with the meat of two healthy pigs or added it it small pieces to larger joints of pork to make up weight. He made this confession snortly betore his death, which was caused by trichiniasis contracted irom his own meat. His wile also died of the disease.

## A \$25,000 Tree.

In the month of January, 1866, a remarkable tree was brought to New York from a Western State,which is considered by the best judges to be worth $\$ 25,000$. No foreign tree was ever brought here of so great value. This was a black walnut tree 70 feet long, measuring board or inch measure 4,500 feet; but when cut into veneers it would be 30 times that, making 135,000 leet, which at 20 cents would be $\$ 27,000$. The cost of cutting, carting and placing in store for sale, would be about $\$ 700$.

There are other kinds of trees also in this country which are valuable for manulacturing purposes, as well as for fruit and shade, of which black walnut has for the last six years been gradually taking the lead of mahogany, and is worth now as much as mahogany was formerly. The figure most sought for at present, is a stripe which seems to be formed by the saps, casting dark and light shades alternately through the tree, which, when worked, makes the most beautiful furniture that is manufactured. A tree worth
head, in bolts for bridge making and similar work. The machine appears so plainly that little is needed by way of letters ol reference. It consists of a solid cast-iron block, fitted with a die on top for holding the iron, and a block underneath for supporting the end of the iron while the head is being made. This block can be moved up aud down, set at any point, and then keyerl up-the several parts, in connection with the key, holding it firmly together. The dies are opened tor the insertion of the iron by a treadle at the side, and closed again, to hold it tast, hy another in front, and swages both half round and hexagonal are cast at the top, for obvious purposes. This is a most convenient machine and is in use in many of the largest and bestappointed machine shops in the country.

For furiber information address L. L. Davis, manufacturer, Springfield, Mass., by whom it was patented Feb. 6, 1866.

## The New Cable.

The new Atlantic cable, now in course of construction by the Telegraph Construction and Maintenance Co., has the ten sheathing wires galvanized instead of plain. With this exception it is of the same make in every respect as that laid last year. Individual wires are weakened slightly by galvanizing, but in the case of the cable it is said that additional strength is given-that the wires instead of snapping, yifld till the strain bears also upon the surrounding hemp, so that, in fact, the breaking strain of the cable is increased to nine tuns.

MORSE'S SHIFTING ITOP FOR WAGONS
$\$ 10,000$ is not often found; bnt one worth $\$ 25,000$ is harder to strike than oil. Our forests abound in trees of great value, and the wealth that is in them is scarcely yet begun to be deroloped.

## DAVIS'S BOLT HEADER.

The method of making machine bolts, now practiced, is to cut the iron long enough to form a head,

heat it white hot, and then upset the iron on the end by repeated hammering untilit fills the die it has been placed in. This make a solid, firm head, far better than the old way of welding on a collar and subsequently swaging it to shape.
The machine shown in this engraving is one well adapted for the purpose; it is strong, solid, and conveniently arranged, and bolts of great length can be headed up as well as short ones. This saves the weld, which is generally made five or six inches from the

## INVENTORS, MANUFACTURERS

The SCIENTIFIC aMERICAN is the largest and most widelgg circulated lournal or its class in this country. Each number contains sixteen pages, with numerous illustrations. The numbers for a year make two volumes of 416 pages each. It also contains a full account of all the principal inventions and discoveries ot the day. Also, valuable illustrated articles upon Tools and Machinerv used in Workshops, Manufactories, Steam and Mechanical Eng ineering, Woolen, Cotton, Chemical, Petroleum, and al other manufacturing and producing inturests. Also. Fere-arms, War Implements, Ordnance, W, ir Vessels, Railway Machinery. Electric, Chemical, and Mathematical Apparatus, Wood and Lumber Mashinery. Hydraulics, Oll and Water Pumps, Water Wheels, Etc.; Household, Horticultural. and Farm Implements-this latter department heing verv full and of great value to Farmers and Gardeners. Articles emiracing every department of Popular sciencゃ, whic
Also, Reports of Scientific Societies, at home and abroad, Patentlaw Decisions and Discussions, Practical Recipes, Etc. It also contains an Official List of all the $I$ atent Claims, a special feature of great value to Inve: tors and owners of Patents.
