## THE MANUFACTURE OF TIN AT ST. LOUIS.

 A recent census bulletin gives us various interesting particulars showing the rapid growth of St. Louis as an industrial center. She already stands in the front ranks as a manufacturing district, and a few more years of progress will give her a positive pre-eminence. Among the more recent industries commenced at St. Louis is the manufacture of tin, and, according to the Iron Age, to which we are indebted for the following particulars, the enterprise presents every prospect of permanent success. The works here illustrated are those of the St. Louis Stamping Company.Tompany.
The works have been completed at a cos The works have been completed at a cost of $\$ 250,000$ for the tin plate mill alone, but, including forge, bar mills, warehouses, etc. the investment is over $\$ 400,000$, and we take pleasure in laying before our readers views of the different departments taken from photographs.
The St. Louis tin plate plant comprises a sheet mill 150 ft . long by 100 ft . wide, an annealing department 150 by 65 ft ., and a tinning department 250 by 60 ft . The steel plate bars are made in the other departments plate bars are made in the other departments
of the works. In the forge mill the billets of the works. In the forge mill the billets
and bars are prepared and rolled to suitable and bars are prepared and rolled to suitable they are taken to the tin plate works, where they are reheated and rolled to about No. 16 gauge. They are then doubled, rerolled three times, and sheared to the different sizes. The doubler and shearer used by the company is of their own design, and is in use nowhere else. An upright bar, jointed at its base, has two arms, one forming the doubler and the other the shearer, which doubler and the other the shearer, which
work alternately with the motion of a cam work alternately with the motion of a cam
at the top. There are four mills in the sheet mill department, a mill consisting of a roughing and a finishing roll. The sheets are then cut to the size required, after which they are taken to the pickling machine or agitator, to remove the scale and other impurities from the surface of the sheet, and allowed to remain there from twenty to twenty-five minutes. The agitator is capable of pickling sheets for 500 boxes of tin ble of pick
plate a day.

MANUFACTURE OF TIN-THE SHEET MILL

THE ST, LOUIS STAMPING COMPANY-VIEW IN THE TINNING HOUSE.
half-bright plates, which are largely used in the company's own works, save what are sold to the retail trade. The balance of the production is roofing or terne plates. The roofing plates are all sold to dealers, and the company say that consumers report the plates are much better than English plates of the same grade. It may be of interest to note that the Government Building at the World's Fair at Chicago is covered with World's Fair at Chicago is covered with
these plates. There are 11 furnaces in the these plates. There are 11 furnaces in the
annealing department running on sheets for annealing department running on sheets for
the tinning department, to which will soon be added four more, when sufficient quantities of sheets can be annealed to run the tinning department full. Arrangements have also been completed for the erection of a cold-rolling house, with 12 sets of rolls, for finishing the sheets before they are sent to the tinning house. This will give the company two more mills in the mill proper now being used for cold-rolling, which will increase their capacity about one-third. In addition to the improvements noted, the company is soon to erect a new steel plant, which will be located at Granite City, a new town now being built by the Neidringhaus Bros., opposite the city of St. Louis. The steel plant will produce steel both by the open hearth and Bessemer process, and will contain boiler, stack and nail plate mills. The nail plate mills will be run to prepare plate for the tin plate mills, where they will plate for the tin plate mills, where they will
be rolled to the thin sheets as above described. The company intend to be able to control the entire process of the manufacturing operations step by step, from the production of the steel ingot to the finished tin (Continued on page 343.)

For the Week Ending May 28, 1892. Price 10 cents. For sale by all newsdealers. I. ASTRONOMY--The Peruvian Mountain Station of the Haryar

minutes $581 / 2$ seconds, 2 minutes $571 / 2$ seconds, or a speed of over 20 miles per hour. On Saturday, May 7, the New Hampshire made an excursion trip to the lower bay with a company of about 400 guests, who did good duty to an excellent luncheon. Through the politeness of Mr. Samuel J. Clarke, superintending engineer and superintendent of construction of both the Maine and New Hampshire, we have obtained the following details of the boat and engines :
Length over all, 310 ft .; length on water line, 302 ft . 7 in .; beam moulded on load water line, 44 ft .; width over guards, 60 ft .; draught, $121 / 2 \mathrm{ft}$.; gross tonnage, 2,400; net tonnage, 1,500 ; hull of steel, with seven steel bulkheads, dividing the vessel into water-tight com partments; propeller screw left-handed, four blades $131 / 2 \mathrm{ft}$. diameter, $181 / 2 \mathrm{ft}$. pitch; 13 in . shaft, 130 ft . long, in sections of about 25 ft ., with eight thrust bearings of Magnolia metal; maximuin revolutions, 100 per minute.
The engine is of the inverted direct-acting triple ex pansion type, with four cylinders: One high pressure cylinder, 28 in . in diameter; one intermediate, 45 in . in diameter; and two terminal cylinders, each 51 in . diam hall type, with a centrifugal circulating pump, and a steam reversing gear. The high pressure cylinder has a single piston valve; the other cylinders each have double piston valves; cranks quartering. The high pressure cylinder takes steam at 160 lb ; 1st receiver 40 lb . pressure; 2 d receiver, 12 lb . pressure; terminal pressure in 3 d and 4th cylinders, 0-thus utilizing
steam to its utmost expansion. The engine, at 100
revolutions, develops 2,947 indicated horse power, or 1•227 I. H. P. per gross ton.
The action of the quadruple engine tends to a freedom from jar or vibration, usual with our large propellers of this class, making the after part of the vessel an exceptionally quiet part. The roughness and impact of water at the bow make the usual vibration so that if you want a quiet berth, take an after one.
The boilers, two in number, are of the Scotch type with Purves corrugated furnaces, each $46 \times 78$ in. aggregating 270 sq. ft. of grate surface. Boilers $131 / 2$ ft . diameter, 11 ft . long. A blower service for the fire room and boilers when necessary. The engine room is arranged with all the modern facilities for utility and convenience for every needed service. A powerful fire pump and fire apparatus throughout the vessel. Five bilge pumps constantly working on the crosshead of the air pump. A supply pump for salt water for sanitary purposes. A fresh water supply pump for pres sure service. A steam jack for turning over the shaft An incandescent lighting system, consisting of two Thomson-Houston dynamos of 350 light power each, driven by separate engines of 20 horse power each Steam is reduced to 80 lb . pressure for these engines by a reducing valve. An annunciator service throughou the boat. A steam heating service in connection with both main and donkey boilers.
The fitting up of saloons and staterooms is in the most elegant style, and there seems nothing wanting to make the new boats favorites with the traveling public.

## THE LARGEST MASONRY DAM IN THE WORLD.

The largest masonry dam in the world has lately been completed in India, in connection with the new water works for the city of Bombay. It is situated 65 miles north from Bombay, and stretches across the Tansa Valley. The dam is about two miles in length ; 118 feet high; 100 feet thick at its greatest depth; $151 / 2$ feet at the top. The lake which will be formed when the valley is full covers an area of eight square miles, and it is expected will furnish a supply of $100,000,000$ gal lons per day throughout the year. The dam has been $51 / 2$ years in process of construction and from 9,000 to $12,000 \mathrm{men}$ and 800 carts and animals have been employed upon it during each working season from October to May. The difficulties of construction were tober to May. The difficulties of construction were
very great. The sand and cement of which it is comvery great. The sand and cement of which it is com-
posed had to be carted for many miles. Over $14,700,000$ cubic feet of rubble stone were used, over $2,200,000$ cubic feet of lime, and over $3,300,000$ cubic feet o washed sand. The excavations of rock amounted to over $6,700,000$ cubic feet. The masonry work in all was over $11,000,000$ cubic feet. The contractors were Glover \& Co., of Edinburgh. The executive engineer was J. B. Clarke. The water is conducted from the dam to Bombay in iron pipes 48 inches diameeter, laid above ground. Each length weighs about four tons. The aggregate weight of the pipes is 50,000 tons, supplied by Macfarlane, Strang \& Co., of Glasgow.

## Kalsomining.

Kalsomining, or wall coloring in distemper, is best done about this time of the year, when the walls are not too cold or too hot. It may be done, says the Paint and Varnish Journal, any time during the Paint and Varnish Journal, any time during the
winter, so that the walls do not freeze. There are a winter, so that the walls do not freeze. There are a
good many preparations put up for this purpose and called by various names. However, if you are where you cannot procure this, it may be prepared in follow ng manner: White-To 10 pounds best whiting use $1 / 2$ pounds white glue, $1 / 2$ pound alum and a little ultramarine blue. Put the glue in cold water, set it on the fire and stir until dissolved. Put about half a callon of hot water over the whiting, and when dis solved add the glue, the blue and the alum, which must also be dissolved in hot water. Stir this mixture well and run through a sieve. For first coating this well and run through a sieve. For first coating this
may be used while hot, but the other coats must be cold. If your color works too stiff, a little soap will help. All colors and shades are made by adding the dry colors. Before kalsomining, the crack and nai holes should be filled with plaster of Paris. Mix this with paste, and it will not dry so quickly. If you have a good brush and work as quickly as possible to avoid laps, you will have a good job of kalsomining. A nice stencil border run around the top of wall makes a nice finish.

## Natural Gas at Salt Lake.

Natural gas has been discovered on the shore of the Great Salt Lake, within ten miles of Salt Lake City and a large company has been organized to utilize and develop the fuel. Several wells have already been put down to the depth of 650 feet, and it is said that $50,000,000$ cubic feet of gas are now flowing daily. A new town, to be named Woodman, has been laid out on the site of the wells, and a new railway is to be ex tended to Salt Lake City. A smelting establishment to cost from between $\$ 1,000,000$ and $\$ 2,000,000$, is shortly to be erected, and a large glass factory is also projected.

Remarkable Water Powers.
Altogether the most extraordinary water power in-tallation-so far as head is concerned-ever known has recently been made by the Pelton Water Wheel Company, in one of the famous Comstock mines, at Virginia City, Nevada. The wheel is 36 inches diameter, made of a solid steel disk with the buckets riveted on to the periphery in a way to afford absolute curity, weighing complete 180 pounds.
curity, weighing complete 180 pounds.
It is running under a vertical head of 2,100 feet, It is running under a vertical head of 2,100 feet,
equal to 911 pounds pressure, 460 feet of this head is obtained from the pipe line of the Gold Hill Water Company and the remaining 1,640 feet from the California and Con. Virginia shaft, down which the pipe line is run to the Sutro tunnel level, where the power station is located, and through which the water discharges after passing over the wheel. The wheel runs at 1,150 revolutions, with a peripheral speed of 10,804 feet per minute, or about 120 miles per hour.
The construction of the wheel amply provides for the centrifugal strain the velocity of the water gives it, running without load, when it would attain the enormous speed of 21,608 feet per minute, equal to about 240 miles per hour. A nozzle tip one-half inch diameter gives under above conditions 100 h . p. Every miner's inch of water, equal to a flow of 1.6 cubic feet per minute, gives 5 h . p., while 1 h . p. is given for every 2 lb . of metal in the wheel. It is only by comparison that an idea can be obtained of the height of
a column of water due to such pressure. It is more a column of water due to such pressure. It is more
than four times as high as the Washington monument than four times as high as the Washington monument and considerably more than twice the height of the
Eiffel tower. It is safe to say that no water wheel Eiffel tower. It is safe to say that no water wheel
has ever before been operated under any such head, nor any such demonstration afforded of the velocity and power of water under such an extreme pressure. The installation made by the Pelton Company some two years ago in the Chollar shaft on the Comstock lode is in some respects no less extraordinary. This consisted of six 40 in . Pelton wheels, which run under a vertical head of 1,680 feet, driving that number of electrical generators, the power from which is conveyed up the shaft to the Nevada mill, some 2,000 feet distant. These wheels only weigh 220 lb . each, and with nozzle tips $5 / 8$ of an inch diameter develop 125 h . p. each.
The water is first run over a Pelton wheel on the surface under 460 feet head, and is then carried down the shaft by a pipe to the Sutro tunnel level, where the underground station is located, the power from the electrical generators being conveyed to the countershaft of the mill with which the surface wheel is connected, the two distinct forces working together in perfect harmony.
A most interesting illustration of the double use of water is here given, some 400 h . p. being produced in this way from what may be termed waste water. This station has now been running more than three years without interruption and practically without expense in the way of repairs, as well as without any appreciable loss of efficiency, affording a most striking example of the advantages of water power, both by direct application and electric transmission, as well as the reliability of such a plant under such extraordinary conditions.

## New Antiseptics.

Among new antiseptics from coal tar derivatives, says S. A. Walton, may be mentioned pyoktanin, methylviolet, the most antiseptic of the aniline colors. A solution of 1 in 1,000 is used in various eye diseases, phthisis, ulcers, etc. There is a yellow variety com monly known as auramine, also used antiseptically.
Lysol is a saponified phenol derived from cresols, and contains the higher homologues of carbolic acid. It is said to possess higher antimycotic power than carbolic acid, and to be less poisonous. This preparation is much used in Germany at the present time.
Retinol, a distillation product of pine resin, is a viscid fluid hydrocarbon. It is a non-irritating and stable antiseptic.

Europhen, iso-butyl-ortho-cresyl-iodide, contains 23 per cent of iodine, and is non-poisonous.
Dermatol, a basic gallate of bismuth, forms a power ful antiseptic and dessicant.
Sulphaminol, thio-oxydiphenylamine, the antiseptic action of which is due to its decomposition in contact with the fluids of the body into sulphur and phenol.
Monochlorphenol is prepared by the action of chlorine on cooled phenol. It is a powerful antiseptic and less irritating than trichlorophenol.
Camphoid, though only a mild antiseptic in itself, is a valuable adjunct to this class of bodies, as it form a ready method of applying antiseptics to the surface of the skin, and owing to its composition (of spirit, camphor and pyroxylin) it forms a valuable solvent for substances such as salicylic acid, resorcin, hydronaph thol and many others.

## A Great Weed.

The wild potato vine (I. pandurata) sometimes has a root that attains the size and occasionally the form of a boy's body, and weighs thirty-five pounds.

A notice under the above heading, published in the Scientific American for November 14, 1891, induces me to write down a theory which I adopted some
thirty years ago, and have been teaching since then, because it fully explains several facts which formerly have been a stumbling block to the right understanding of many phenomena presented by atmospheric electricity.
Among them is the fact that a kite held by a conductive string (made so by one of the strands being a fine copper or brass wire), when it is made to ascend in a clear, dry, and cloudless atmosphere, with apparently not the least tendency to a thunderstorm in it, will always, without exception, show positive electricity, and more of it in proportion as the kite ascends higher. When a hollow metallic ball is attached to one end of a fine wire, of which the other end is connected with a proper electrometer, and the ball is thrown upward in the free open air, the electrometer will show positive electricity, and may be made to retain it for a short time when the wire is attached in such a way as to become separated from the electrometer when the ball has reached its highest point. A lightning rod arranged at its lower end in such a way dhat its ground connection can be interrupted will, floating over it, show alternately positive and negative electricity, but when the sky is clear and dry its electric charge is always positive. Of this I had the rare opportunity to satisfy myself by a multitude of experiments on several occasions. De Saussure re peated many more experiments in the Alps, and found always, even in the highest accessible regions, positive electricity when the sky was clear.
The conclusion arrived at, as published in the works of Biot and other eminent investigators, was that the dry, clear atmosphere was always charged with positive electricity, and this in a greater amount in proportion as we ascend higher.
This explanation was sufficient until Biot, during his famous scientific balloon ascension with GayLussac, lowered a metallic globe suspended by a copper wire from the car of his balloon, and found very strong negative electricity in the higher regions. In his description of this experiment he confesses that this is contrary to what De Saussure found in the higher regions of the Alps. He tries some kind of explanation in the second volume of his "Traite de Physique," but as he, like all the electricians of his time, adhered to the theory that the air itself was charged with the electricity which acted upon the electrometer, there was a quandary left to be solved. The credit of doing this belongs to Peltier, whose theory is that our terrestrial globe is always permanently charged with negative electricity, which, according to the law of its distribution, resides principally in its surface, and which, when the air is dry, and therefore a good insulator, will not be communicated outwardly, but will act by induction upon any conducting body insulated above the surface and cause its lower end or under side to become charged with the opposite (positive) electricity, while its upper end or top side will become charged with the similar (nega tive) electricity, and this by the separation of the two electricities, positive and negative, which are contained in and neutralize one another in all conducting bodies which are not so influenced. Consequently, where a rod or wire extends from the earth's surface upward, its lower end must become positive and it upper end negative by the inductive capacity of the whative earth, and this explains at once the dilemm why Biot, in his balloon, in testing the upper end of the wire, found negative electricity, while the observers on the earth's surface testing the lower end found
positive electricity. The fact is that it was not the electricity absorbed from the air they had to dea with, but with electricity developed in the wire itself by the inductive influence of the earth's constant negative charge.
I ought not to omit here the statement that Sir William Thomson (in proceedings of Royal Institution, May 18, 1860) declares that he does not agree with Peltier in regarding the earth as a negatively charged conductor. Still he admits at the end of the same ex-
planatory paragraph that "the result we obtain every day of fair weather in ordinary observations on atmo spheric electricity is precisely the same as if the earth were electrified negatively and the air had no electri city in it whatever."
Recently some other English investigators have gone step further, and striking from the last suggestion of ir William Thomson, have come to the conclusion mat actually dry air at the normal pressure of one at mosphere does not and cannot contain an electric
charge ; also that it cannot conduct nor convey electricity, but only be perforated by the electric spark, as we do in our laboratory experiments, and which nature does in her gigantic laboratory by a flash of lightning.
This theory, striking as it is, and contrary to the plains fully and satisfactorily two phenomena not
otherwise possible of explanation: The cause of a sudden clap of thunder from a cloudless sky and the gradual formation of a highly charged thundercloud in very high regions of the atmosphere. This will be the subject of a future communication
P. H. Vander Weyde, M.D.

```
Trees.
```

What a. strange underground life is that which is ed by the organisms we call trees! These great flut led by the organisms we call trees! These great flut-
tering masses of leaves, stems, boughs, trunks, are not the real trees. They live underground, and what we see are nothing more nor less than their tails. Yes; a tree is an underground creature, with its tail in the air. All its intelligence is in its roots. All the senses it has are in its roots. Think what sagacity it shows in its search after food and drink. Somehow or other, the rootlets, which are its tentacles, find out that there is a brook at a moderate distance from the trunk of the tree, and they make for it with all their might. They find every crack in the rocks where there are a few grains of the nourishing substance they care for and insinuate themselves into its deepest recesses. When spring and summer come, they let their tails grow, and delight in whisking them about in the wind, or letting them be whisked about by it; for these tails are poor passive things, with very little will of their own, and bend in whatever direction the wind choose to make them. The leaves make a deal of noise whispering. I have sometimes thought I could understand them, as they talk with each other, and that they seem to think they made the wind as they wagged forward and back. Remember what I say. The next time you see a tree waving in the wind, recollect that it is the tai of a great underground, many-armed, polypus-like creature, which is as proud of its caudal appendage, especially in summer time, as a peacock of his gorgeous expanse of plumage.
Do you think there is anything so very odd about this idea? Once get it well into your heads, and you will find that it renders the landscape wonderfully in teresting. There are as many kinds of tree tails as there are of tails to dogs and other quadrupeds. Study them as Daddy Gilpin studied them in his "Forest Scenery," but don't forget that they are only the ap pendage of the underground vegetable polypus, the true organism to which they belong.-Dr. O. W Holmes.

Gener mon
Senator Teller has proposed an amendment to the naval appropriation bill, appropriating $\$ 50,000$ to enable the Secretary of the Navy to have constructed one 8 inch 50 caliber steel rifle, firing a high explosive projectile of great velocity. In order to test the gun, the secretary is authorized to use the $\$ 50,000$ appro priated in March, 1889, for testing guns for secondary batteries. The amendment stipulates, however, that no part of the money shall be expended until the owners of the patent of the gun agree to construct them exclusively for the government. The gun is known as the Hurst high explosive 8 inch rifle, and is the result of five years' experiments begun at the navy yard in Washington by the inventor, and conducted in private by him. In the experiments Senator Hawley, f Connecticut, took a prominent part. He has great faith in the two charges of powder, one of the difficul ties to be overcome being in providing a suitable gas check for the projectiles. This General Hawley suc ceeded in patenting, and at first took the patent out in his own name and afterward on joint invention with General Hurst. The gun provided for by the proposed amendment will fire the Hawley projectile, which will be filled with dynamite, gun cotton or some other high explosive, and have, it is said, a range greater than that of any gun of similar caliber constructed in this or any country.-Army and Navy Register.

## A Queer Case.

Three fifteen-year-old patent applications of Thoma A. Edison for telephone transmitters went to issue last week, after such long delay that the English patents, applied for after the American, had been ex amined, granted, gone to issue, run their term of 14 years, and expired before the American patents were issued. It is a nice legal question whether these patents had not expired by limitation of law before they were issued. The courts will probably so hold. There is not so much ground for suspecting intentional and fraudulent delay in the interference proceedings as there was with the Berliner patent, issued some months ince, but we concur with the Engineering News in their opinion that such decisions are a great reproach to our patent practice and to the state of the law.

From the last annual report of the Bell Telephone Company, it appears that the number of instruments in use at the close of the year 1891 was 512,407-a large increase over the previous year. The total earnings for the year were $\$ 4,375,290$. The expenses were $\$ 1,505,872$, leaving the net earnings at $\$ 2,869,418$. The xtension of the long-distance telephone system is rapidly progressing.

AN IMPROVED STEAM ENGINE GOVERNOR.
A governor which is positive in operation, and designed to admit steam quickly and in proper proportion to overcome the resistance of any load carried, as well as to shut off the steam and prevent undue increase of speed after release of the load, is shown in the accompanying illustration, and has been patented by Mr. Richard J. McIlhenny, of Wilmington, N. C. The ends of the engine cylinder are connected with pipes leading to a valve casing in which is a valve stem, sliding longitudinally on seats in the casing, and the latter is connected with a pipe, A, from which leads

## moilitenny's steam engine governor.

the valved pipe, B , opening into a cylinder containing an equalizing valve, C. The lower end of the latter cylinder is connected by a pipe, through the valve, $D$, controlled from the equalizing valve, with the upper end of a cylinder, E, containing a piston whose upward movement is limited by a screw rod. The piston has on its under side a piston rod extending into a cylinder of less diameter, connected by a pipe with the steam supply pipe, while the stem of the piston rod, extended through a stuffing box, is connected with a crank arm on a shaft, F, carrying arms connected with valves regulating the supply of steam. The equalizing valve is provided with an auxiliary valve, which permits the steam to escape from above the valve at the time the engine cuts off and steam is expanding. By this improvement the initial pressure in the engine cylinder operates a piston which controls the movement of the steam inlet valve. The cylinder of the governor is preferably steam-jacketed, as shown in the sectional view, and the governor is intended to be set on top of the engine cylinder, as shown in the small view in perspective. The device is desig stationary or marine engines.

## THE PENDULINE TITMOUSE.

 Of all the titmice of France, this, with the whiskered panurus, is the rarest and least known; and it is for this reason that we devote the present article to it.The under side of the head, the throat and the neck of the male are white, sometimes grayish. The lower part of the back and the tail coverts are of an ashen russet. The breast is gray, variegated with rose color; the forehead and the cheeks are of a brownish black; the remiges and the retrices are black ish, bordered with reddish white the eye is brown; the bill is of a more or less pronounced black, and the feet are gray.
The female differs from the male in color only in her lighter tints and in the less extended black of the cheeks.
This charming little bird, which is only four inches in length, is remarkable for its vivacity, its agility, and its boldness, but it is at the same time so wary that it inces santly conceals itself from the eye of the hunter and is with difficulty taken in traps.
Temminck, who established three divisions in the genus Parus, placed the bird under consideration in that embracing the inhabitants of river banks. It is, in fact, upon the sides of ponds and amid reeds that it exclusively lives, and it is never met with in any woods except those that are situated in marshy places It lives among reeds, of which it eats
the seeds. It also feeds upon insects and their larvæ.
As active as the other titmice, it suspends itself from As active as the other titmice, it suspends itself from
the reeds and hides itself among them so completely that its cry is often heard without the bird itself being perceived.
In autumn, the birds congregate in small flocks of from three to six individuals, but stop only in humid places. The art that this bird introduces into the construction of its nest has for a long time attracted the attention of naturalists. "I have given it," says Buffon, " the name of penduline, which represents to the mind the construction of its nest." This nest, in
fact, is the most curious of any of those of the rest of the birds of France, and can be compared only to the nest of certain species of weavers of India and Africa for it is shaped like a purse, is fixed by its upper extremity, and is suspended in most cases over water.
Baldamus (Naumannia, I., p. 50) gives a very accurate description of it: "The male and female display great ardor in constructing their nest, and yet it is difficult for one to understand how they finish such a work in less than two weeks. The bird begins by selecting a slender pendant branch having several bifurcations at a short distance from its point of origin. It surrounds this with wool or more rarely with goats' wolf's or dog's hair or filaments of bark. Between the branches of the bifurcation it fixes the sides of the nest, weaves them until they extend sufficiently be neath these branches to be attached below one to the other, and thus form a flat flooring. The nest thus roughly outlined resembles a basket with flat sides. The external walls are afterward solidified. To this effect, the bird makes use of the down of poplars or willows, which it agglutinates by means of its saliva and which it fixes with filaments of bark, wool and hair. The nest then presents the form of a rounded basket. At this moment, the bird begins to construct a small, lateral, circular aperture. This, however, is not the only one, for the nest has two openings. One of them is provided with a passageway from one inch to three inches in length, and the other remains open. One of the apertures is closed later on. However, I have seen a nest in which this aperture had not been stopped up. Finally, our bird places in the bottom of its nest a layer of vegetable down about an inch in thickness, and the construction is finished."
We must remark, however, that we have seen a certain number of these nests that exhibited quite perceptible differences in form from each other, due no doubt to the materials employed and the places where the nests were suspended. They have generally the form of a purse of from six to nine inches in length and from four to six inches in diameter. The entrance, which pretty accurately resembles the neck of a bottle, is sometimes horizontal and sometimes oblique.
It is in this charming cradle that the bird lays from five to seven pure white eggs, of elongated and cylin drical form. This bird is not common in France. It has been killed only accidentally in the north and
east. It takes up its quarters in summer in the neigh borhood of Pezenas. It is found likewise in the de partments of Aude, Eastern Pyrenees and Gard, and especially upon the banks of the Rhone. The true country of this bird, which is known scientifically as Fgithalus pendulinus, is Russia, Lithuania and Galicia. In these countries its curious nest naturally trikes the superstitious with astonishment, and so the rapeutic properties are ascribed to it. The naturalist Radde says that, among the Mongolians, the smoke given off through the burning of a piece of the nest is inhaled for the cure of intermittent fever. A nest

MOODY \& PITCHER'S BLANKET FASTENER.
softened in warm water cures rheumatism, it being only necessary to apply it to the painful spot.
Everrmann says that the "nest of this bird is re garded in Russia as very efficacious against all sorts of maladies, especially fevers and epizooties, which it has the property of warding off. A peasant of Astrakhan came one day to Kasan with a wagon load of these nests."
Finally, in the fens of the environs of Bologna, the simple-minded have a superstitious veneration for these nests, each hovel having one of them hanging near the door. The owners regard them as genuine lightning conductors, and the little architects of them as sacred birds. In that part of France in which the bird builds its nest we happily do not meet with such ingenuous prejudices.
This bird has sometimes been preserved in captivity by feeding it upon a pasty of nightingales' mixed with ants' eggs; but, like all other titmice, the bird is so rest less and so active that it cannot long survive the loss of liberty.-Le Naturaliste

## A SIMPLE HORSE BLANKET FASTENER

The device shown in the engraving is designed to be readily attached to the fabric with out tearing it, and facilitates the quick and easy opening or closing and holding together of the edges of the blanket to which it is attached. It has been patented by Messrs. George A. Moody and Charles H. Pitcher, of Red Bank, N. J. Each of the holders is formed of two plates, or disks, having circular cor rugations on their faces, one of the plates being on the front and the other opposite on the back of the blanket, the two plates being united by means of a central rivet, or by prongs projecting from one plate through apertures in the other, the prongs then being clinched. Engaging a loop on each holder is a fastening member, one of which is in the shape of a flat spring with a part doubled up to form a tongue, from which a finger piece bends outward. The other fastening member has a lip adapted to be engaged by the tongue, as plainly shown in the sectional view. To unlock the members they are moved slightly toward each other, when an inward pres sure upon the finger piece disenga ges the tongue from the lip. In stead of a lip being formed, as shown, upon one of the fastening members, it may be provided with an aperture adapted to receive the tongue of the other member, the operation being substantially the same in both cases. This fastening may be conveniently opened or closed, but is not liable to open accidentally.

Lead pencils were first used in

## TEA KETTLE ANDIRON

The apparatus represented herewith seems destined to replace to advantage the tea kettles that are usually placed before the fire in order that hot water may always be at one's disposal. This andiron is entirely hollow, so that it may be filled with water. A cock placed at the side permits of drawing off the water in measure as it is needed.
If it is desired to convert the apparatus into a hot If it is desired to convert the apparatus into a hot

TEA KETTLE ANDIRON.
and to immerse in the boiling water the vessel containing the liquid to be heated.
It is very easy to give the apparatus an artistic form that will permit of its being utilized in any fireplace. Les Inventions Nouvelles.

## A TRAIN OF COMPOUND LOCOMOTIVES.

The Baldwin Locomotive Works recently shipped by the Lehigh and Wabash. Despatch a novel train, consisting entirely of compound locomotives. The motive power was furnished by the compound tenwheel locomotive No. 82, which has become famous for its remarkable performances on the Pennsylvania, the Norfolk \& Western, the East Tennessee, Virginia \& Georgia and Chicago, Burlington \& Quincy Railroads. This engine is of the Vauclain four-cylinder system, with high pressure cylinders $14 \times 24$ and low pressure cylinders $24 \times 24$, driving wheels 72 inches diameter total weight of engine in working order about 133,000 pounds,weight on driving wheels about 100,000 pounds, total weight of engine and tender in working order 200,000 pounds, total wheel base 24 feet 2 inches, driving wheel base 12 feet 6 inches. This engine will undergo further tests on the C., B. \& Q. and C., R. I. \&
the train was $1,000,000$ pounds, exclusive of the live engine hauling the train above described.
These engines for the Alley road were built in accordance with specifications prepared by Mr. R. I Sloan, chief engineer, and Mr. D. L. Barnes, consult ing engineer, of the South Side Railroad. They combine novel features, which are believed will make them better adapted to elevated service than any locomotives heretofore in use. The compound system practically does away with loud or offensive noise from the exhaust and prevent throwing of sparks or cinders. By the use of anthracite coal, all show of smoke is avoided. The engines weigh in work ing order about 58,000 pounds, and have about 40,000 pounds on drivers. They about 40,000 pounds on drivers.
are intended to haul five-car trains, making an average rate of speed, including stops, of 20 miles per hour; and a maxi mum speed between stations of from 25 to 30 miles per hour. The amount of work required by this performance can be appreciated when it is understood that the stations are at the rate of three per mile
The movement of this train required three sets or relays of engineers and fire men, working eight hours each, to enable the train to run night and day without other stops than necessary for coal and other stops than necessary for coal and
water. Pilot engineers were taken over water. Pilot engineers were taken over
each division of the lines traversed by each division of the lines traversed by
the train. Seven engineers or machinists acted as messengers, to see that the train ran cool, and to avoid possibility of accident. The whole train was in charge of Mr. W. J. $\left\lvert\, \begin{aligned} & \text { lower ends in the interior of a hemispherical capsule, } \\ & \text { McCarroll, assisted by Mr. Jerome J. Parmelee and } \\ & \mathrm{C} \text {, capable of tilting. If a cent be placed in the }\end{aligned}\right.$ McCarroll, assisted by Mr. Jerome J. Parmelee and C, capable of tilting. If a cent be placed in the Mr. H. Burall, traveling engineers employed by the slot, A, it will fall at B upon a lever fixed to the cap Baldwin Locomotive Works. Mr. Burall took charge sule. The latter, in tilting, empties the liquid that it of the tests of the compound engine 82 , and Mr McCarroll and Mr. Parmelee attend to putting the elevated locomotives into working order and conducting tests of their performance on the road.

## TOY AUTOMATIC DISTRIBUTER OF LIQUIDS.

With the object of producing a new scientific toy and also, it must be confessed, of popularizing auto matic distributers and making the use of them general the French Society of Popular Fountains has devised and put on the market for holiday gifts of the presen year an ingenious apparatus that we think it our duty to make known to our readers.
Although the first models, hastily constructed, do not operate with all the regularity desirable, the principle upon which they are based remains none the less curious and capable of giving good results, with better constructed apparatus, for the holiday season of next year.
The toy presents externally the aspect of the appa-
in the keg. It is introduced through the aperture, G, which it is necessary to close hermetically by screwing down tightly the .plug that serves as a stopper. This reservoir is provided beneath with an aperture fitted with a cock, $F$, through which the liquid flows in sensi bly equal proportions. This cock is closed during the operation of filling, and opened immediately after ward. A vertical tube, $\mathbf{E}$, is soldered in the reservoir and its upper extremity debouches therein, while its

TOY AUTOMATIC DISTRIBUTER OF LIQUIDS. contains at D , whence it makes its exit and flows through a tube into a small cup placed alongside of the keg. On tilting, the capsule opens the lower extremity of the tube, E , which dips into the liquid During the tilting there is, therefore, a certain quanti ty of air introduced into the cylindrical reservoir, and this permits a certain quantity of liquid to flow through $F$ and fill the capsule anew just at the mo ment at which the lower extremity of the tube, being closed by the liquid, no more air can enter the re servoir, and this arrests the flow. The capsule then remains filled with liquid until another coin is intro duced into the slot.
The keg rests upon a base, forming a money box nto which the coins fall
It may be conceived that such an apparatus requires to be perfectly immovable in order to work properly and that it is impossible to obtain equal volumes of liquid at each operation, since the conditions of equilibrium and the rapidity of flow are not the same, ac

LOCOMOTIVES FOR THE CHICAGO AND SOUTH SIDE RAPID TRANSIT RAILWAY.
P. and M. P. Railroads after its arrival at Chicago. The train which it hauled consisted of 20 compound locomotives of the Vauclain system, intended for the equipment of the Chicago \& South Side Rapid Transit Railway, otherwise known as the Alley Elevated Road. The aggregate weight of the 20 engines comprising
ratus that we have already described,* but operates through a much simplified mechanism, based upon the principle of the fountain of birds. To this effect, the liquid to be distributed, called "Elixir for Good Children," is contained in a cylindrical reservoir contained

cording as the reservoir is full or nearly empty. It is cording as the reservoir is full or nearly empty. It is
possible, however, by regulating the level of the lower possible, however, by regulating the level of the lower
extremity of the tube, F , dipping into the capsule, C, to modify in a certain measure the quantity of liquid discharged through the introduction of another coin into the slot, A.-La Nature.

## [For the Scientific American.]

## Future Inventions and Improvements

Judging the future from the past sixty years, we may reasonably expect wondrous developments in genius and science. Railroading, telegraphing, ocean navigation, were then engaging a few advancing minds, with predictions of failure, and yet success has attended each of these wondrous enterprises; and probably no one then anticipated crossing the Atlantic inside of six days, or sixty miles an hour by rail, or of telegraphing around the globe, yet these have long since been successfully accomplished. But little was then known of electricity or of its power of transmitting messages, and not until many years after messages were transmitted did any one anticipate the running of cars through our cities by its wondrous power. At our 1876 centennial at Philadelphia, an electric light was exhibited as a curiosity, and now nearly all of our cities are so lighted, and Mr. Edison has given the world the incandescent light for the interior of our dwellings and buildings. The storage battery is now being so perfected that we may reasonably look for its being employed to convey passenger cars over our common railroad tracks, and even to be used in place of the steam engine for freight trains. The public are more credulous now than sixty years ago. Aerial navigation is no doubt an accom plishment of the future, and when some supposed crank says that he is going across the Atlantic in an air ship, don't discourage him nor predict a failure, as they did poor Fulton with his first American steamer.
Electric light and heat is no doubt an accomplishment for not only lighting but warming our homes, and to be produced by a small windmill on our roofs, which may run a dynamo and produce these elements and store them in our attics, to be used at pleasure and at a nominal cost of production. All of the so-called lost arts are to be restored, Damascus steel being among the most useful of them all. Then comes tempered copper; but from what I saw of tempered copper tools in England, in 1869, I think that its usefulness has been greatly overrated, and I have been of opinion that steel tools in place of tempered copper were used in chiseling ancient obelisks and granite, but that rust has destroyed them, while the copper have remained as they were used.

Certain colored glass is very desirable for ornamentation, but not so very useful as steel for choice implements.
And now our sculpturing is approaching the Grecians. We have had our Powers in the Greek Slave, and in sculptured heads are nearing the ancients. In painting, we appear to be behind Raphael and Michael Angelo and many others of the old masters.
In architecture we are as yet mere imitators in struc ture, except in bridge architecture. Ancient architec ture never spanned Niagara nor built a Brooklyn bridge. Our scientific architects and inventors are be coming not only grandimitators but great originators. And this is not only due to natural genius and America's liberal protection to the original inventor and designer, but also to the discovery of the so-called lost arts. And whenever any important principle for usefulness, whether mechanical or ornamental, is discovered or invented, it opens a vast field for thousands to improve, as each one of the improvers is entitled under our protective laws to an exclusive interest in his rights. Our present patent laws should be greatly improved to still encourage inventive genius, and our Congress should look more to the encouragement of inventions than to many of our useless laws. And to-day our Patent Office bureau is more neglected than any other one of our departments, and is the only department that pays, and now I believe has over $\$ 3,000.000$ to it credit in the United States Treasury. We have abun dant skill for examiners, and why keep a poor inven tor often four to six months even to have an examination of his case.
Inventors have combined and held important meet ings and petitioned Congress for reforms in this ter ribly neglected matter, and still nothing is done for relief. But, as we truly live in a great age for ad vancement, we can but still hope and work to win.

## J. E. Emerson

## The Measles Bacillus.

Dr. Canon and Dr. Pielicke, of the Moabit Hospital, the former of whom was one of the first to demonstrate the presence of the influenza bacillus in the blood, have now turned their attention to measles, and it is reported that they have been so far successful that they have been enabled to demonstrate the presence of a specific bacillus in connection with this disease.

This discovery has naturally attracted consider able attention; for although a priori we should expect measles to be the result of the action of such a germ, we have hitherto been unable to associate it directly with any such causal agent. In fourteen patients they have succeeded in finding what they assume to be a specific bacillus in the blood, in the expectorations, and
in other secretions. This bacillus is stained with methylene blue in the same way as the influenza bacillus, the coloration being specially intense at the ends. The different individuals differ considerably in length, be ing from one three-thousandth to one one-thousandth of an inch. Its characteristics are said to be different from those of any other bacillus known, and artificia cultures have already been obtained. If once we are enabled to study the life history of this organism, there seems to be a possibility that we shall be able to take some efficient steps in the protection of children agains this disease. The further observations on this organ ism and on its power of producing the disease will be awaited with additional interest from the fact that it appears to be so like the influenza bacillus in its distri bution, and also to a certain extent in the effect it produces, in spite of the fact that it is very different in structure and appearance from the influenza organism. -Lancet.

## an improved pocket wire gauge.

The little implement shown at full size in the illustration is finely finished in German silver and is de signed to be a great convenience to electricians, line men, and all having occasion to use wire for any elec trical purpose. By placing the wire in the $V$-shaped opening between the movable arm and the edge of the gauge, and moving the arm around until the wire is closely held, the shoulder of the arm and its radial line will indicate: 1. The American or Brown \& Sharpe gauge of the wire, (2) the safe current it will carry in amperes, and (3) the ohms resistance per foot of copper wire. Then, by formula as stamped on the arm, may be readily determined the size of wire required to carry any number of lamps, any distance. The figures on the front of the gauge, near the center, indicate the Brown \& Sharpe wire gauge, and those on the oute edge show
tive power. This fast train is hauled by the class "H" mogul designed at Aurora.-Railroad Gazette.

## Eating Before Sleeping.

It used to be considered prejudicial to good health to partake of food just before going to bed. But many physicians now recommend to their patients a light meal before retiring. On this subject Dr. W. T. Cathell, in Md. Med. Jour., says :
Many persons, though not actually sick, keep below par in strength and general tone, and I am of the opinion that fasting during the long interval between supper and breakfast, and especially the complete emptiness of the stomach during sleep, adds greatly to the amount of emaciation, sleeplessness, and general weakness we so often meet
Physiology teaches that in the body there is a per petual disintegration of tissue, sleeping or waking; it is therefore logical to believe that the supply of nourishment should be somewhat continuous, especially in those who are below par, if we would counteract thei emaciation and lowered degree of vitality; and as bodily exercise is suspended during sleep, with wear and tear correspondingly diminished, while digestion, assimila tion, and nutritive activity continue as usual, the food furnished during this period adds more than is destroyed, and increased weight and improved general vigo is the result.
All beings except man are governed by natural in tinct, and every being with a stomach, except man eats before sleep; and even the human infant, guided by the same instinct, sucks frequently day and night, and if its stomach is empty for any prolonged period, it ries long and loud.
Digestion requires no interval of rest, and if the mount of food during the twenty-four hours is, in quantity and quality, not beyond the physiological limit, it makes no hurtful difference to the stomach how limit, it
few or how short are the intervals between eating; but it does make a vast difference in the weak and emaciated one's welfare to have a modicum of food in the stomach during the time of sleep, that, instead of being consumed by bodily action, it may during the interval improve the lowered system. I am fully satisfied that were the weakly, the emaciated, and the sleepless to nightly take a light lunch or meal of simple, nutritious food before going to bed for a prolonged period, nine in ten of them would be thereby lifted into a better standard of health.
In my specialty (nose and throat) I en counter cases that, in addition to local and constitutional treatment, need an increas of nutritious food; and I find that by direct ing a bowl of bread and milk, or a mug o

the "novelty" electric wire gavge.

raising its temperature thirty degrees. On the back of the gauge is given the ohms resistance of a foot of copper wire of any size, as shown by the gauge. This resistance is multiplied by seven to find that of a foo f iron wire, or by thirteen to find the resistance of a oot of German silver wire. This very useful imple ment is manufactured and sold by the Novelty Elecric Company, whose factory and warerooms are at 50 52 , and 54 North Fourth Street, Philadelphia, Pa For price see advertisement on page 349, this issue.

## Long Distance Fast Trains.

The fastest train from Denver to Chicago is now the A. M. on the Burlington, reaching Chicago at 2:15 P M. the next day. It is also the fastest long run in the est. The distance is 1,028 miles, and the time, allowng for the difference in longitude, is $281 / 4$ hours. Hence the speed from terminal to terminal is 36.4 miles an hour. This is not far behind the speed of the limited trains between New York and Chicago, and is a pretty fast schedule for a run of over 1,000 miles. The fastes New York-Chicago trains are as follows
New York to Chicago-North Shore Limited via New York Central and Michigan Central, 976 miles in 25 hours. Average speed between terminals, 39 miles an hour.
Buffalo to Chicago-North Shore Limited via Michi gan Central, $5361 / 2$ miles in $14 \frac{1}{6}$ hours. Average speed between terminals, 37.8 miles an hour
New York to Chicago-South Shore Limited via New York Central and Lake Shore \& Michigan Southern 964 miles in $243 / 4$ hours. Average speed between termi nals, 39 miles an hour.
New York to Chicago-Pennsylvania Limited via Pennsylvania Railroad, 911 miles in $241 / 2$ hours (allow ing for the ferry). Average speed between terminals, $37 \cdot 2$ miles an hour
New York to Chicago-Columbian Express via Penn sylvania Railroad, 912 miles in $261 / 4$ hours. Average speed between terminals, 34.7 miles an hour.
The Southwestern Limited from New York to St Louis by the New York Central, etc., runs 1,168 miles in $303 / 4$ hours, or 38 miles an hour between terminals.
Very much the greater part of the Burlington line is single track, and on much of it the freight business is heavy. A schedule of 36.4 miles an hour for 1,028 miles therefore requires skillful operating besides robust mo-
reer a few biscuits, or a saucer of oatmeal and eam before going to bed, for a few months, a surpris increase in weight, strength, and general tone esults. On the contrary, persons who are too stou or plethoric should follow an opposite course.

## team Launches.

The steam launches or cutters for the United State naval vessels are built strong enough to be raised and lowered with bunkers and tanks full and steam up They are 30 feet long, 7 feet 9 inches beam, 4 feet deep, 2 feet 5 inches and 2 feet 10 inches draught forward and aft. They have a speed of $71 / 2$ to 8 knots. They are fitted with compound vertical inverted engines, intend ed to run at 300 revolutions per minute with a boiler pressure of 160 pounds. The cylinders are $31 / 2$ inches by 5 inches and 7 inches by 5 inches. The valves are f the three-port slide valve type, with $15 / 8$ inches travel and driven by the ordinary link motion. The crank hafts are of wrought steel, with two thrust rings forged n. The screws are true helices, 27 inches diamete and 48 inches pitch, or 36 inches pitch for 28 feet cut ters; the helicoidal area is 3.19 square feet, and the projected area $2 \cdot 23$ square feet. The boilers are of the Towne pattern, having a rectangular grate, surrounded by a water box with water tubes running diagonally from side to side above the grate, with a top steam drum connected to the water box by tubes. These boilers have been in service for some years, and are found to steam freely with natural draught, to be economical in coal consumption, and to have a low center of gravity Their working pressure is 160 pounds per square inch The condenser consists of a copper pipe along the kee The boats carry 35 gallons of water on each side of the engine space, and 300 pounds of coal on each side of the boiler, or 70 gallons- 640 pounds-of water and 600 pounds of coal. The weight of machinery is 850 pounds; boiler, with water and attachments, 2,295 pounds; bunkers, tanks, etc., 570 pounds; total weight, fully equipped for service, 4,955 pounds.

The rate of progression of a storm is often 50 miles an hour, and a series has been traced in a direct line from north to south, a distance of 400 miles. Mr. Marriott thinks that the average altitude of a thundertorm does not extend beyond about 5,000 feet above the earth's surface.

## The Largest Load of Logs.

To the Editor of the Scientific American:
Anent "The Largest Load of Logs," etc., with figure in a recent number of the Scientific Ameri can, you may be interested to know that in the report of the Michigan Forestry Commission, 1888, pages 32, 33 , Prof. Beal gives an account and illustration of the largest load of pine logs ever drawn by one team (two horses)- 30,068 feet board measure
W. A. Buckhout

State College, Center County, Pa., May 13, 1892.

## The Joint Snake.

To the Editor of the Scientific American :
I send herewith, for your snake department, a por tion of the tail of the common "joint snake" of this region, in process of transformation into the "hoop snake," that wonderful creation of the negro imagination, a serpent that, taking his tail in his mouth, rolls over like a hoop and drives the horn or spike into a tree, which immediately wilts and dies.
In every neighborhood of the South and Southwest some venerable old darkey can be found who has "seed it myself, sah!" and has told the story so often that he religiously believes it.
When a joint snake loses a portion of its tail by accident or otherwise, the stump in a few weeks becomes sharpened to a point and covered with a hard shell of a reddish or brown color, as in this specimen. In this case the injury must have been rather recent, as the spike is still soft and flexible.
I have in the course of years met with several just such specimens as this, but so sharp and hard that it might truly be designated a spike or horn.
G. O. Hardeman.

Gray's Summit, Mo., May 16, 1892.

## Facts About Artesian Wells.

To the Editor of the Scientific American
Permit me to correct the claims made in your paper of May 7, wherein it is stated that the "Samson" artesian well at Waco, Texas, is the largest well in the United States, and throws the hottest water. None of the claims made are supported by the facts. Wells at Columbus, St. Louis, and other points are deeper than the Waco wells; being over 2,000 feet deep. The Ponce de Leon well at Jacksonville, Florida, is larger, being 12 inches, and many other wells are 10 or 12 inches or more in size. The Florida well has a volume of from 7 to $10,000,000$ gallons per day, so is four or five times as large in point of volume as the "Samson;" and several of the wells in Kern Co., California, are twice as large, while here in Dakota we have a number of wells two and three times as large. Again, as to being the hottest-having a temperature of $103^{\circ}$-the claimant has probably not heard of the hot water artesian wells at Boise City, Idaho, the temperature of which ranges from $160^{\circ}$ to $170^{\circ}$-the water being used for heating purposes. Finally, as to the matter of pressure the Dakota wells with pressures ranging from 50 to 22 pounds per inch stand, in this respect, at the head of the list, supplying the most perfect water powers to be found in the world. The "Samson" is indeed a giant and a marvel, but is overshadowed in all respects by many other wells in this country, as well as by others in France, Australia and other countries.
W. P. Butler.

Huron, Dakota, May 16, 1892.

## Yankee Fish Catching.

To the Editor of the Scientific American
The inventive genius of the New England backwoods man is most noticeable in his methods of catching fish Usually he is too poor to indulge in bamboo poles, plated reels, glittering spoons, and artificial flies. This circumstance, however, does not prevent him from se curing his share of the denizens of the streams and ponds in the various seasons.
In April, snaring pickerel is the leading sport with these men. They cut a long birch pole, the weight of which would make the average city sportsman groan before he had carried it a mile, and at the end they fasten a piece of wire about eighteen inches long. To this wire they attach a noose made of carefully plaited hairs taken from the tail of a horse. Enough of these hairs are taken to render the noose stiff, so that it will pass through the water without closing.
With this tackle the fisherman seeks out the quiet shallows in the streams and ponds, and when he espies a pickerel he carefully drops the noose into the water at a point some distance to the rear of the fish, and gradually advances it toward him. When the noose has passed the middle of the fish's body a sudden jerk tightens the noose about him, and in a twinkling it is landed. These men are very dextrous at this style of fishing and seldom miss landing the game; but in the hands of a novice the noose is absolutely useless.
After the spring freshets are passed and the streams have resumed their usual size, bobbing for eels begins. This is a sport that any man who is fond of piscatoria
$\left\lvert\, \begin{aligned} & \text { diversion will enjoy. It is carried on in the night, and } \\ & \text { if the fisherman wishes to be successful, he must choose }\end{aligned}\right.$ if the fisherman wishes to be successful, he must ch
In bobbing for eels no hook or seine or net is used. The tackle consists of a line, a broom corn, and a few angle worms. The broom corn must be a strong one. One end of it is sharpened. Through the other end a hole is made, into which is threaded the line. The broom corn now acts as a needle. It is thrust length wise through the worms, which are pushed back upon the line until they cover four or five feet of it. The broom corn is then removed, and that portion of the line covered with worms is gathered up and tied in a half a dozan bunches or double loops. When the fishing ground is reached, these bobs as they are called are dropped into the water. When the fisherman feels a bite he hauls the line rapidly in and throws the eel into the boat, where it loosens its hold on the worms and the bob is dropped into the water again. The eel will not loosen its hold on the worms until its body comes in contact with a hard substance or unless it catches sight of the boat. It is useless to fish with bobs on a moonlight night, for the moment that the eel comes to the surface and sees the boat it lets go the bait. I have known two experienced men with bobs to catch 200 pounds of eels in this manner in three hours time.
Early in the spring, when the water is cold and brook suckers have a market value, large numbers of them are caught in gunny sacks. The fisherman fastens to a barrel hoop the mouth of a gunny sack. He seeks out a narrow spot in the stream and in the middle of it he sets the hoop, building a wall of loose stones on each side of it to the banks. He then goes up the stream a quarter of a mile and wades down toward the bag, all the time prodding the bottom with a pole. This drives the fish down the stream, and when they reach the dam they follow it along until they find the opening into the sack. They rush into it, and when the fisher manarrives he lifts up the hoop, and dragging the sack on to the bank empties his catch on the ground. Wagon loads of suckers are often caught in a single night in this manner.

Thomas Holmes.

## The Ives colored Pictures.

Mr. Frederick E. Ives thus describes his process fo obtaining and projecting pictures in the colors of nature by aid of photography:

By means of a very ingenious compound camera ront, three photographic negatives of the object are made by simultaneous and equal exposure, from the same point of view, and upon the same sensitive plate The photographic plate is sensitive to all colors of light, but by introducing light filters one of the negative is made by such light rays only as excite the funda mental red sensation, and in due proportion; another by such light rays as excite the fundamental green sen sation, and another by such light rays as excite the fundamental blue-violet sensation.
"From this triple negative a triple lantern slide is made, which, although it shows no color, contains such a graphic record of the natural colors that in order to reproduce them to the eye it is sufficient to superpose the three images, one with red light, one with green, nd one with blue-violet. This is accomplished either in Mr. Ives' new heliochromoscope, a device about the size of a hand stereoscope, and used in much the same
way, or by projection with a special optical lantern, way, or by projection with a special optical lantern,
having three optical systems, with red, green, and blue having three optical systems, with red, green, and blue "Th
The process is as scientifically accurate for repro duction in color as ordinary photography is for reproductions in monochrome, but at present can be carried out successfully only by a scientific expert employing the photospectrograph for testing the sensitive plates and adjusting the selective color screens. When such preliminary adjustments have been correctly made, the process is almost as simple and reliable as the ordinary negative process. By a modification of the process, in troducing further complication, color prints are made on glass or paper; but the comparative simplicity of the plan of superposing images commends it to scien tists, and is more convincing to the general public."

## Sensitive water Jets.

Prof. W. B. Croft, in a note to Nature, says: A form of this effect lately presented itself which seemed in some ways new. A thin jet, 5 feet high and arched so as to be 3 feet at the base, was falling in a feathery spray. At 13 feet distance a small Wimshurst machine was set going; not instantly, but after two minutes, the spray gathered itself up almost into one clear line; although the jet was turned up and down and the ma chine was discharged, the falling water would not re olve itself again into spray for fifteen or twenty minutes. It is difficult to imagine the medium for this ac ion; it is too indefinite, perhaps, to suppose that an in dicator is found for the trembling of a disturbed ethe while it is dying down.
The well known experiment is not known enough, for it is not often described in books. Take a glass rod electrified ever so little, to a certain point; at once the jet collects itself ; a slight move a way brings back the
worse. It is a striking illustration to help one to imagine what the electrical forces of the air may do. We can perhaps understand those thick thundery rain ares, that almost allow us to pass between the whil they are giving friendly warning of what will come.

Preservation of Mineralogical and Geological
Minerals and fossils are exposed to two causes of destruction-deliquescence and efflorescence. Deliquescence is the property that certain bodies possess of absorbing moisture from the atmosphere and of gradaally dissolving in the water that results therefrom There is no other means of preventing such accidents than to preserve the specimens in hermetically sealed jars.
Efflorescence is the property found in other bodies of resolving themselves into dust. There are several processes for preserving specimens from such destruc tion. Certain fossils converted into white pyrites, or whose substance is impregnated with salts and cannot be washed, should be thoroughly dried and coated with a varnish that does not scale off, or else be immersed in oil. Impressions that have a tendency to disappear may be preserved by impregnating them with a thin solution of gum arabic to which a little sugar has been added in order to prevent it from racking in drying.
Mr. Chalande recommends the following process for the preservation of rocks, fossils, bones, etc., that are apt to crack or effloresce: Immerse them for from one hour to twenty-four hours, according to the size of the specimens and their brittleness, in a mixture of equa parts of silicate of soda and water or of potassa and water. After being dried the specimen will in a short ime acquire considerable hardness.
Mr. André Fouville gives the following process for preserving pyritous fossils: "Pyritous fossils are of all paleontological specimens the most difficult to pre serve. Contact with moist air alters them, and converts the sulphuret into sulphate to such a point that they become unrecognizable. The surest and most advantageous means is to preserve the fossil in paraf fine, a solid substance melting at $44^{\circ}$ and containing no oxygen. But only specimens of small size can be pre served in this manner. Ferns, trunks of sigillarius and bulky fossils should be coated with a solution of silicate of soda in boiling water."
For consolidating fossil bones, Mr. Lambert gives the following process: Melt some spermaceti over an alcohol lamp and while it is still hot coat the bone with it. The spermaceti will enter the bone through the pores, and, on cooling, will consolidate it and give it the hardness of stone. If, as sometimes happens, a thin layer of the fatty substance remains upon the surface, it may be made to disappear by submitting the bone to the heat of a piece of burning paper. Some persons employ gelatine or glue. This method may be good, but it is not as effective as the one above given.-La Nature.

Treatment of Rheumatism.
It seems as if everybody is complaining of rheuma tism nowadays, young and old, rich and poor. Science ever ready with something new to alleviate the suffer ngs of mankind, has not failed in this direction, and alol is now the remedy extensively used for rheuma tism. The Medical Times and Register says: "Thera peutically the anodyne property of salol is exhibited in the cases that are rheumatic in source." The first triumphs of salol were won in the treatment of acute heumatism, excelling, as it apparently does, all other emedies in its power to abate and lessen fever If all the conditions be propitious, by the end of the second and third day fever and joint pain and swelling will have disappeared. Salol has a further use, in tha it is antiseptic, and excellent results have been ob tained from it when used as a disinfectant for the bow els in cases of cholera, typhoid fever, etc. In connec tion with the cure of rheumatism, it may be stated that of late years massage treatment has found great avor with rheumatic patients. In practicing massage the fingers are usually moistened with some sort of oily preparation, and for this purpose nothing bette can be used than lanoline. Many physicians conside this vastly preferable to vaseline, or any other prepa ation, and its use has invariably been attended with the greatest success.

Bare Underground Conductors.
It is pointed out in L'Electricien that not only does serious deterioration go on when the bare wires are in the presence of moisture, owing to the formation of hydrocarbonate of copper, a formation which is accel rated when the wires become reduced in section and consequently heat to a greater extent, but it has ap parently been proved that an explosion which took place in Paris was due to the generation of gas from he electric decomposition of moisture, which gas was fired by the presence of sodium, also due to a decom position taking place, and not to any electric spark Thorough ventilation would seem to be the best remedy against such accidents.

Curious Things About Clocks in India. Clocks are regarded as curiosities by the Hindoos, and for this reason half a dozen or more timepieces are often found in the apartments of the wealthy Hindostanees. They are not used as timepieces, but simply for ornament, since the old-fashioned way of telling the hour of the day in India, by calculating the number of bamboo lengths the sun has traveled above the horizon, is entirely satisfactory to the natives. It is said that in the country police stations in India, where the European division of the hours is observed, time is measured by placing in a tub of water a copper pot in which a small hole has been bored. It is supposed that it will take one hour for the water to leak into the pot so as to fill it and sink it. When the policeman sees that the pot has disappeared, he strikes the hour on a bell-like gong. If he is smoking or dozing, the copper pot may have disappeared several minutes before he discovers the fact; but the hour is when he strikes the gong.

Intoxicating Rye.
In some of the communes of the department of Dordogne, France, the rye of the last harvest exhibited some singular toxic properties. In several villages, persons who had eaten bread made from this rye were attacked with a general torpor and found it impossible to do any work for twenty-four hours. The effects produced did not resemble those caused by ergot, but rather those of darnel, with an intenser and quicker action.
According to the Revue Internationale des Falsifications, the same phenomena have been observed in Russia. Mr. Woronine, who has examined specimens of the rye said to have stupefying and intoxicating properties, finds that the grains have been overrun by a cryptogamic vegetation, and mentions several forms of fungi that may be suspected of having caused the accidents.
Mr. Prillieux has made a similar examination of the rye harvested in Dordogne, and has found that the small, light grains of mediocre appearance exhibit on their surface no trace of the presence of the fungi observed by Mr. Woronine. It is in the interior of the grains that he has detected, by means of the micro scope, the presence of a fungus, always the same whose mycelium has overrun the external layer of albumen. He has distinguished numerous interlaced filaments forming a sort of stroma surrounding the albumen and even penetrating the teguments of the grain. He has found that at certain points the starch grains present a very evident corrosion, due doubtless to the action of a diastase secreted by the fungus.
The organization of the filaments permits of the supposition that the fungus belongs to the genus Dendodrochium; but the arrangement of the spores more closely resembles that observed in Sporochisma paradoxum. As there exists no resem blance with any known genus, Mr. Prillieux thinks that a new genus will probably have to be created for this fungus.-Revue Scientifique.

The Fastest Long Distance Train in the World The Empire State Express Line on the New York Central and Hudson River Railroad has now been running since November 1, 1891, and has been oper ated with the greatest regularity. It leaves New York daily at 9 A. M., and goes through to Buffalo, $4399_{\frac{6}{10}}^{\frac{6}{0}}$

COLUMBUS MONUMENT FOR NEW YORK.
Probably there will be no more beautiful and completely representative monument erected to the great discoverer on the four hundredth anniversary of his landing in the new world than the splendid gift of the Italians of New York to that city, a representation of

COLUMBUS MONUMENT GIVEN BY ITALIANS TO NEW york.
which is here given, and which is to be unveiled with imposing ceremonies on the 12 th of October next. The monument will have a place at the Eighth Avenue and Fifty-ninth Street entrance to the Central Park. Sufficient contributions for the purpose were obtained without difficulty when the idea first took shape among the Italian residents here, and, through Signo Barsotti, of the Progresso Italo-Americano, an Italian newspaper of New York, the order for a design for the monument was, in January, 1889, forwarded to the Minister of Public Instruction of the Kingdom of
award was made to Signor Gaetano Russo, born in Messina, Sicily, and examples of whose work are now to be found in many of the public buildings of Rome and other Italian cities.
The entire monument, with its terraced pedestal, will be 77 feet high. The figure of Columbus is 12 feet 9 inches high, its feet being 36 inches long, and it is cut from a block of Carrara marble which weighed twenty-five tons. The column and pedestal are of red granite, a short terrace of Carrara marble separating them, the capital of the column being also of marble. The red granite terraced pedestal has octagonal corner columns, a noble figure of Genius crowning the second terrace on one side, and on the other side, at the back of the Genius, is depicted a magnificent Alpine eagle, both in marble. Below the figures, on each side, are splendid basso-relievos, ten feet by two feet in size, these being in bronze, as are also the six prows, three on each side of the column, facsimiles of those of the vessels of Columbus, with representations of anchors above and below the central inscription, "A Cristofero Colombo." The Genius is 10 feet 4 inches high, and cut from a block of marble originally weighing twenty tons, it represents a youth upheld by the wings of Faith, and holding in its grasp the whole globe, which it is apparently studying with an intent ness which may well be likened to that with which Columbus pored over the maps in existence at his time. The Eagle, on the reverse side of the monument, and of similar size, is in the attitude of guarding the arms of the United States and those which were distinctive of the Republic of Genoa during many centuries.
The illustration given of one of the basso-relievos represents Columbus starting in a little boat from his vessel to first set foot upon the land of the New World. The vessels, boats, banners, and costumes are designed to be accurate representations of the originals, and the artist has endeavored to faithfully portray the interest and excitement undoubtedly felt by all on board the little fleet. The basso-relievo on the opposite side shows Columbus reverently returning thank upon the land, his companions pressing all around and kneeling about him, and the frightened Indians peeping through the foliage. The spaces between the basso-relievos and at the sides of the Genius and the Eagle will be filled with bronze tablets bearing Eng lish inscriptions by Ugo Fleres, an Italian poet

## Exhibition Notes.

In front of the Administration Building at the Expo sition the largest fountain in the world will toss grace ful streams and excite the admiration of millions of spectators. It is now being constructed in Paris by Sculptor MacMonnies, who is acknowledged to be one of the very best of living artists. The idea of the fountain is that of an apotheosis of modern liberty-Columbia-and will take the shape of a triumphal barge, guided by time, heralded by fame, and rowed by eight standing figures, representing on one side the arts and on the other science, industry, agriculture and commerce. The barge is preceded by eight sea horses, forming a semicircle in front and mounted by eight young men as outriders, who represent modern commerce. The smallest figure is some twelve feet in height and the largest twenty feet. The design of the base is circular- 150 feet in diameter-and is flanked on each side by columns 50 feet high, surmounted by eagles. The water is furnished by a great half circle

COLUMBUS MONUMENT-BASS-RELIEF-FIRST BOAT LEAVING THE SHIP.
miles, in $8 \frac{2}{3}$ hours, being at the rate of $50 \frac{7}{10}$ miles an hour, including stops. The train consists of an engine and four cars, weighing about 230 tons. Weight of the engine 60 tons and driving wheels 40 tons. This is probably the fastest railway train in the world, distance considered.

Italy. The latter called for a competition of designs for the monument, in which none but artists of Italian nationality might compete. Nine judges were ap-pointed-three architects, three painters, and three -and the competition was large and spirited. The
of dolphins in the rear and by a system of jets which entirely surround the barge and figures. At night the fountain will be illuminated by electricity after the principle employed in fountains in the Champ de Mars. Moulders and other artisans are working day and night in getting this immense fountain ready in time.

York Journal of Commerce says, is 1,500 feet a minute, a rate of one mile in three min utes and a fraction. Before the fire in the Western Union building in New York City occurred that company had a machine which could run 1,500 feet a minute. It was the only one of its kind in the East.
These machines are of the water balance type-that of the orignal hydraulic eleva tor, the invention of Cyrus Baldwin. Owing to its expensiveness, and the fact that it could not be controlled automatically, it went out of use. The speed was regulated by the engineer, and it went fast or slow as he pleased.
With the modern elevator almost any speed desired can be obtained; it all de pends on the power used and the distance traveled. In a building which has a shaft of 250 feet, a speed of from 850 to 1,000 feet a minute can be attained. On a rise of 150 feet it is easy to get a speed of 750 feet per minute with a weight of 1,000 pounds aboard the elevator. In New York the fastest ele vators are in the Union Trust Company's building on Broadway, near Wall Street They shoot up or down, carrying 3,000 pounds, at a speed of 600 feet a minute pounds, at a speed of 600 feet a minute.
When tested with lighter weights, they have traveled from 800 to 900 feet in a minute. But the average speed of elevators in office buildings in and around New York is 300 feet a minute.
The largest elevator cars in the world are now at Weehawken. These elevators, of which there are three, are designed to carry 135 persons on each trip, and are equivalent to ten tons. They are owned by the North Hudson County Railway Company. A viaduct, 875 feet in length, has been built

## THE MANUFACTURE OF TIN AT ST. LOUIS.

(Continued from first page.)
prate. The location for a steel plant at Granite City, as well as for other manufactures, is unsurpassed. Coal will cost about one-third the price in Wales. The leading railroad systems of the country connect at this point, and labor is plentiful and of a high grade. The total production of this concern is but a drop in the bucket compared with the aggregate conthe bucket compared with the aggregate con-
sumption of the article. To indicate to what sumption of the article. To indicate to what proportions the manufacture of tin plate can
Gevelop, it is only necessary to add that it will require fifty establishments similar to the one we have just described to supply the demand in this country.

Speed of Elevators.
The maximum speed of the fastest passenger elevators which have ever been built, the New

## THE ANNEALING OVENS FOR TIN PLATES

out from the Palisades to a point above the ferry depot. From the rails on the viaduct to the river level the distance is about 150 feet. The railroad company's contract calls for a speed of 200 feet a minute. The common elevators of small business buildings are worth at least $\$ 3,000$. From that they range up to $\$ 13,000$ in the same class of buildings.
From an elevator point of view, the new Masonic Temple building in Chicago will be the most important in the world. It will have 24 cars built in a circular shaft having a 250 footrise. There will be express elevators, way and freight trains. The frst will go to the top floor without stopping, while the others will stop either at every floor, or at the 5 th, 10 th, 15 th, and so on. They will not run at full speed, probably, because passengers do not like the sensation of flying. With the present safety devices it is just as safe to run fast as slow.

## Zinc Chloride for Preserving Wood.

A new method of impregnating logs with zinc chloride, in order to preserve them, is now in use in Austria, being known as the Pfister process. The timber is impregnated in the forest as soon as possible after it is felled. The zinc chloride solution has a specific gravity of 1.01 and is forced into the thick end of the log by a force pump. To this end, an iron disk of suitable diameter and furnished with a cutting rim is forced into the end of the log and secured by clamps. The time required for this preliminary into the end of the log and secured by clamps. The the only three or four minutes for each log. After a pressure of two or three atmo-
work spheres has been maintained at the thick end of the log for a few minutes, the sap begins to exude at the opposite end, and finally a weak solution of zinc chloride comes through, showing that the operation has been completed. About 214 gallons of the solution are required per cubic foot of timber treated. Though rapid, the process does not appear to distribute the solution so uniformly as other methods.

Electric Light in Medicine.
the light is directly introduced into the cavities There recently died at Vienna the mechanician Josef Leiter, a man who, in concert with eminent physicians, spent many years of his life in zealous study and experiment in order to realize one of the most and experiment in order to realize one of the most anx, which is thus brilliantly illuminated and reflected was engaged with the solution of the question how the eye of the observer. Much more complicated is far the interior of the human body can be made accessible to the eye of the physician. Before his death he had the satisfaction of knowing that his merits ing that his merits were fully acknowledged in a recent
work by the distinwork by the distin-
guished neurologist guished neurologist
Prof. Lewandowski. The medical world is already able to illuminate the interior of the mouth, the pharynx, the stomach, eye and tor with the electric ear, This is light. This is effect-
ed either by the died either by the di-
rect introduction of rect introduction of
the source of light into the organs concerned or by the reflection of the light. At first the light of incandesced platinum wire was used, but latterly the wellknown carbon filaments of the glow light have been universally employed. The " mignon" glow lamps, scarcely larger than an ordinary pea, were first shown at the Vienna Electric al Exhibi-
tion, and were successfully were sucthis use by Leiter. this use liter A number of apparatus for both first evacuated by means of the stomach pump and back it snaps itself into the air with a clicking sound. (direct and by afterward expanded with air after the apparatus has The secret of the light this firefly gives is as yet un reflection) have been devised. The instruments for the been introduced. This apparatus is a long tube which discovered. Apparently it is connected in some wa use of reflected light do not differ in principle from has at its closed lower end a glass window, behind those used for solar light. The electric light has, how- which is placed a mignon lamp connected with the ever, the advantage that the medical expert is ren- battery by wires. When the current is turned on the dered independent of the freaks of the weather. This filament becomes ignited, and illuminates through the principle can of course be combined in all possible window the interior of the body, while a small mirmanners with concentrating lenses, reflectors, etc. The first such apparatus of this kind emanated from Vienna, where they were executed in 1883 by the optician Jirasko, at the instigation of Prof. Mosetti von tigations have already been furnished by Profs. Oser Moorhof. In the direct introduction of light we dis- and Mikulicz. tinguish two modifications, illumination properly so called and diaphonoscopy. This latter method depends on the fact that human flesh is, in thin layers, translucent. If we hold up the open hand with the fingers close together before a brilliant light (not otherwise visible to the observer), the fingers appear at their margins translucent, and transmit a reddish light. This method is used in dentistry. The patient bites a small gag of vulcanite, the lateral process of which, projecting into the mouth, supports a mignon lamp. The interior of the mouth is brilliantly illuminated, and the dentist can look into the inside of the tooth and detect any morbid changes in the enamel, the dent ine, the roots, the gums, etc.

The most interest ing method at pre sent is that by which

INTERIOR VIEW OF THE TIN PLATE MILL, ST. LOUIS STAMPING COMPANY.-(See first page.)

It will be perceived that the electric light plays already a not unimportant part in the art of healing, although we see only the beginning of its career.Electrical Review.
[Many of our readers will call to mind the gastroscope, which was illustrated and described in these picture illustrating the application of the instrument with in the stomach of a person, and the bulb lighting it up, which appeared in the Scientific Ameri CAN, April 14, 1883.Ed.]

Insect Illumination.
The secretary of the Smithsonian In stitution, Professor Langley, has been recently experimenting with Cuban fireflies with a view to discovering the man ner in which the illu ner in which the illumination they emit is generated. He says that the light they give is the " cheap est" in the worldproduced, that is to say, with the least heat and the small est expenditure of energy-and he believes that a success ful imitation of it would prove a most profitable substitute for gas or electricity. The insects are bee tles two inches long, and belong to the family of "snapping bugs," so called because when one of them is laid on its The secret of the light this firefly gives is as yet uniscovered. Apparently it is connected in some way with the mysterious phenomena of life, and chemists
and physicists have sought in vain to explain its and physicists have sought in vain to explain its
origin. On each side of the animal's thorax is a luminous membraneous spot, and these flash at intervals, so that the Cubans put a dozen of the insects in a cage together and so obtain a continuous illumination bright enough to read by. This light is accompanied by no perceptible heat, and is seemingly produced with almost no expenditure of energy. How great an improvement it represents upon all known artificia lights can be imagined when it is stated that in candle light lamp light, or gas light, the waste is more than 99 per cent. In other words, if they could be so obtained as not to throw anything away, they would give nearly one hundred times the illumination which they afford at the present time. Even the electric light is mostly waste.-Ame rican Analyst.

## Credit to Whom <br> Credit is Due.

In a recent number of our paper we quoted from La Nature, of Paris, an article on the electric girl. We now learn that the quoted article was translated into French frome our American nei,yhbor Electricity. Wetake pleasure in making this statement and in giving due credit to our enterprising contemporary.

New Process of Purifying Cane Juice.
William Valentine Fry, of Lambayeque, Peru, describes his process as follows :
I place a quantity-say for example thirty poundsof the leaves, twigs, or points of small boughs of the eucalyptus tree in a kettle or boiler with a proportionate quantity of cold water, the quantity of water for thirty pounds of leaves, twigs, etc., being 55 gallons, more or less. The contents of the kettle are then boiled for three hours, more or less, or until the decoc tion has a density of $15^{\circ}$ Cartier standard when the liquid is hot. When cold, the density of the decoc tion will be from $9^{\circ}$ to $10^{\circ}$ Cartier standard. The decoction will lose from eight to ten gallons during the process of boiling, the evaporation of course depending to a certain extent on the intensity of the fire. The decoction is then properly strained to separate it from the leaves and twigs, and is ready for use in the process of purification.
I use the decoction in the proportion of from one and one-half to two gallons of the decoction to 500 gallons of cane juice, as follows: I place in the defecator from twenty to forty gallons of cane juice, to which I add the eucalyptus decoction in about the proportion specified, taking care that the contents of the defecator be well stirred. Heat is then applied in the usual or any preferred manner until an active ebullition takes place. Before the ebullition takes place the impuri ties will have risen to the top of the liquid in the defecator. As soon as the ebullition takes place the steam or heat is cut off from the defecator, and a short timesay from ten to twelve minutes-is allowed for settling. The juice can then be passed to the evaporator or
vacuum pans for the making of the sugar, and the vacuum pans for the making of the sugar, and the
impurities can then be removed in the usual manner employed in cooking houses. If white sugar is re quired, charcoal filters should be used. To make the ordinary grained sugar of commerce, no charcoal fil ters are required, but bag filters can be used to advantage.

## American Ramie

The first experiment in the manufacture of cloth from ramie in the United States was made lately at the San Jose woolen mill. The fiber was put through the same presses at the mills as any other material used for making cloth. It went through the machines, was twisted into thread, and then a thread of wool and a thread of ramie were twisted together. Being put on the loom the machine was started, and in a few minutes the cloth began slowly to unroll.

The fabric resultant from the process was a strong closely woven piece of cloth. Holding it up to the light, one could not see through it. The color of the cloth was a bluish-gray, the wool supplying the dark and the ramie fiber the light portion. Ramie is much stronger than wool, is forty-one times stronger than cotton, and more nearly approaches silk in this respect than any other material used in the manufacture of cloth. Thus it is evident that a fabric made of a mixture of woo The fiber, when ready for the mills, is in bunches about five feet long, of a creamy white color, and has a luster like silk. It can be dyed any color and still retain its luster, and hence can be used in the manufacture of silk-mixed weaves, making a fabric just as good in every way, but far cheaper than if silk were used
It will have the effect when it comes into general use of cheapening all textiles of this character, while giving a fabric better in looks and wearing qualities. One of the big points claimed for ramie is the ease with which it can be produced, and the consequent big profit to the producer. Ramie is nothing more or less than a weed, and grows and increases with the prolificness for
which weeds are noted. The plant does not need a which weeds are noted. The plant does not need a
rich soil; in fact, seems to thrive best in a soil in which nothing else will grow, and is especially valuable on this account. It is claimed that three crops a year can be secured, and that at the least calculation a profit of $\$ 200$ an acre will pour into the pockets of the ramiecultivator. The field will not have to be replanted for twenty years, for the plants will grow and produce good fiber for that length of time.-Pacific Lumber man.

## The Utilization of Tin Clippings.

The owners of a sardine factory have found a way to get rid of the piles of tin clippings which have encum bered their docks. These clippings are now carefully collected; those made by the dies which stamp the bottoms and covers of the cans are pounded into suitable shape for handling, while the strips made by the shears in cutting the tin for the sides are carefully bundled and boxed. The clippings find their way to the smelting furnace, where the tin with which they are coated is melted and drawn off separately, while the molten mass of steel which composed the plate is run into moulds and formed into window weights and other useful articles. The bright tin strips of various widths and lengths are made to serve manifold purposes, being made into tin tags which ornament plug tobacco, button moulds, ornamentalbaskets, and hundreds of other articles.

The agricultural building, an imposing and beauti ful structure, situated across the main lagoon, south ward from the great manufactures building, is rapidly approaching completion, and will be flnished, even to all details of ornamentation, before October 1. It measures 500 by 800 ft . and has an annex 300 by 550 ft . and a connected assembly hall, which has a seating capacity of 1,500 . Close by, on the south, is the dairy building, measuring 100 by 200 ft .
The northern portion of the main floor of the build ing will be occupied by the agricultural and other food exhibits of foreign nations, which, it is already assured, will be extensive. Great Britain, Germany France, Mexico, Austria, Denmark, Sweden, Japan, Paraguay, Canada, and a number of other countries have already been assigned space, ranging from 1,00 to $15,000 \mathrm{sq}$. ft. each. It is expected that the agricul tural exhibits by these countries will be as compre hensive as those of our own country, and will show some features which will be exceedingly instructive to Americans.
Occupying nearly all of the remainder of the main floor will be the exhibit of cereals and other farm pro ducts from the States of the Union. Every State and Territory, it is expected, will be represented by its pro ducts. Thus, upon this one vast floor, covering nearly ten acres, will be displayed in all their variety and per fection the pick of the farm products of the world. It is believed that the exhibit made by this country, naturally exceeding that of any other in extent, will attract great attention, also, by reason of its excep tional merit and the comprehensive information that will accompany it.
On the six acres of flooring in the annex, which is virtually an extension of that of the main building, will be shown every description of agricultural ma chinery, including not only the best and most improved now in use, but also such as will illustrate the progres of the industry from primitive times to the present. In the great galleries of the building, which are most novel in construction and perfect in point of avail ability, will be located on the north front the woo exhibit; on the west end the apiary display, which will include working colonies of bees; on the south front the dairy implements, and on the great centra sections the exhibit of the brewing and tobacco in dustries, and the wealth of magnificent exhibits o flours, meals, bread, pastry, sugars, confectionery, canned foods, oils, soaps, chocolates, etc.
One of the most novel, instructive and elaborate ex hibits, and one that will undoubtedly attract the at tention of every scientific person and scholar interested in any phase of agricultural life, will be that made by the Association of American Agricultural Colleges and Experiment Stations. This exhibit will occupy nearly 8,000 square feet of space, and will be located in the southwest corner of the building, on the first floor. It will represent the entire work of a model agricultura experiment station, covering entirely the field of ex periment and research in crops, botany, horticulture, entomology, feeding stuffs, animal nutrition, dairy solids, milk testing and veterinary science, and wil include an elaborate and complete botanical, biologi cal and chemical laboratory.
In addition to this, the agricultural colleges of the United States will have, in this space, a combined ex hibit graphically illustrating the work and special
field covered by each college. This entire exhibit is not only unique but is something that has never been accomplished or attempted at any previous exposition. The exhibit will be put up and conducted by the di rectors of the different experiment stations and repre sentatives of the different agricultural colleges of the United States, each contributing some part of the ex hibit, the whole to be installed in a magnificent man ner, at the expense of the United States government
This will give to every visitor an opportunity to wit ness the methods by which the great advances in al phases of agricultural life and research are carried on in the colleges and experiment stations of the United States.
Outside the building will be shown several magnificent exhibits, put up at a great cost, of the irrigation systems of the great West. On the lagoon just south of the annex to the agricultural building will be in stalled traction and portable engines and a wonder fully interesting exhibit of windmill machinery.
Helena, Montana, will send to the Exposition a meteor, discovered near that city. It is composed of nickel and magnetic iron, and is in two pieces of ninety and seventy pounds respectively. It is reported that when found these pieces were in a hole in the ground large enough to contain a house, from which fact it is inferred that the meteor exploded when it struck the earth.
rom Holland an offer has been made to the Hol land Society, of New York, and the St. Nicholas Society, of Brooklyn, to construct and present them an exact reproduction of the Half Moon, the ship in which Henry Hudson discovered and explored the river which bears his name. The societies named have accepted the offer and are planning to fit up the ship
as a club house and to take it to Chicago, both to be exhibited and to be occupied by their members during the Exposition.
The prospect is that the Engineering Congress, which is to be held in Chicago in 1893, under the auspices of the World's Congress Auxiliary, will be a gathering of very great scientific importance. Of the $\$ 15,000$ estimated to be necessary for its expenses $\$ 10,000$ have been raised. Many of the most prominent engineers of the world have accepted memberships on the advisory council, among whom may be mentioned William H. Maw and James Dredge, of the London Engineering; Don Fernandez Leal, president of the Mexican Society of Engineers and Architects; Sir C. S. Gowzki, of Canada, and others.
Chairman Corthell, of the general committee, who went to Europe last fall in the interest of the congress, invited thirty-six engineering societies to participate by sending delegates. About twenty-seven of these ocieties have accepted, and not a single declination has been received. He received on all sides expres sions of great interest in the coming congress, not onl from the engineers composing these societies, but from the engineers of the governments of Europe-France, Germany, Holland and Belgium. The interest in the ongress among the engineers of Great Britain and the officers of the great engineering societies of that country was not less than that shown on the continent In fact, the promise of support and expression of a de sire to attend were universal. Among the large so ieties which accepted the invitation were the Me chanical Engineering Society and Society of Civil Engineers and Architects of Germany. Each of these societies has a membership of about 6,000 .
The allotment of wall space in the fine arts building o various nations for the hanging of pictures, to be exhibited at the World's Fair, has been made as fol ows:

The only clarifying agents permitted to be used in Bavaria, the country which is renowned for the best nd purest malted liquors, are mechanical ones, that is. uch as will not enter into solution or remain in the liquid under any circumstances. The principal ones are isinglass and fine wood shavings. Clarifying by means of isinglass is so well known that it need not be described here. The second method, howover, is not so well known, and, as it is quite effective, a brief de scription of it will be of use to many of our readers.
Any kind of moderately close-fibered wood which is free from strongly tasting resinous matter may be used for this purpose, but the most suitable has been found to be beech wood and hazel wood. Either of these is ut into lengths of six to twelve inches, the bark care ully removed, and the wood reduced by a machine to shavings, which ought to be as thin as possible. These must be deprived of tannin by being soaked for severa daysincold water, and afterward repeatedly boiled with water until the latter no longer acquires any color Only a comparatively small portion of these purified shavings need be used for a cask of the liquid to be clarified-about one-half pound for 15 gallons. The nodus operandi by which the clarifying is accomplished is, of course, a purely mechanical one, mostly due to currents established by capillary attraction into the fibers of the wood floating on top of the liquid, and the mechanical adherence of suspended impurities to the surface of the shavings, as a new portion of the turbic iquid is brought toward the surface.
When the casks are emptied, the shavings may be taken out, washed, and used over again. The wood shavings are a regular article of trade, and may be obtained through dealers in brewers' supplies.

## Trade Mark-Infringement.

In the case of White et al. vs. Miller et el., recently decided by Judge Colt, in the United States Circuit Court, at Boston, a suit was brought to restrain the infringement of a trade mark. The complainants were the owners of a trade mark used on a brand of whisky, which consisted of a chicken cock standing upright in a circle surrounded by certain words. The defendants sold a brand of whisky upon which they used as a trade mark a chicken cock standing uprigh in a circle. The words surrounding the circle were not the same in both cases, but the court held that there was a clear case of infringement.

RECENTLY PATENTED INVENTIONS. Railway Appliances.
Car Coupling.-Simon J. Freeman, Bradford, Pa. This is a simple, durable and inexpenive coupling, adapted for application to elther a freight
or a passenger car, coupling automatically and holding securely until purposely uncoupled, the uncoupling being effected from either side or the top of the car. A spring-pressed knuckle is pivoted in the drawhead,
the spring normally holding the knuckle in coupling the spring normally holding the knuckle in coupling
position, and a finger is projected from the opposite ront of the drawhead to extend beneath the knuckle, shifting lever being provided whereby the knuck may be carried to uncoupled position.
Dumping Freight Car.-Robert M. Johnson, Flemington, N. J. Beneath the bottom of this car is a winding shaft to which is attached a chain extending trausversely across the dumping doors, the
opposite end of the chain being secured beneath the car. The construction and location of the mechanism is such that the dumping doors may be opened as
readily in inclement weather as in good weather the readily in inclement weather as in good weather, the
condition of the conteuts of the car having no effect condition of the conteuts of the car having no effect area of the discharge opening in the car bottom may b exposed as required.

## Mechanical Appliances.

Fiber Machine.-Luis B. y Sanchez, Matanzas, Cuba. Combined with carrying wheels or drums, one in advance of the other, over which pass cables, is a reversing mechanism between the drums
adapted to turn a leaf end for end, cables acting in onjunction whereby the leaves are held in engagement with the reversing mechanism and with the
drums. The leaves from which the fiber is to be exacted are fed at one end of the machine, which is posite end, the leaf in its transit being so held that the skin and pulp of one half will be first cruised and oosened, the other half being held fixed, an automatic the other half is subjected to the cleaning process, hen the fibers are thoroughly cleaned and delivered in egular order to an apron. The cleaning rolls or the fiber.
Machine to Cut Tan Bark. - Albert F. Jones, Salem, Mass. This machine has a casing in being arranged on the front end of the casing, ard a heel turning between the hopper and the we. The wheel is provided at its front end with knives for cuting the bark into strips, while wings held on the wheel form a feed for the fixed knives on the web. This machine is of simple construction, an
Wrench.-Lewis C. Hurd, Durango, ol. This improvement consists of a bar forked a surface of one of the arms of the fork, the bar being beveled and serrated at the opposite end and furnished with a pivoted serrated unction with the serrated end of the bar as an ad justable wrench. A screw driver blade is formed on he outer end of the pivoted jaw, the implement forming a simple and inexpensive tool for turning and holding round or polygonal rods, nuts, gas burners, etc., wheels.

## gricultural.

Hand Corn Planter.-Jeremiah W hampion, Rocheport, Mo. The seed receptacle of has a delivery chute at its lower end normally closed pout is pressed into the ground up to an adjustable gauge plate, when a slide is operated permitting the seed to escape into the ground and bringing more seed
into a pocket ready for planting. A positve rotary feed is obtained by the device, and one that is very simple in construction and applicable to any form of hand

Planter and Fertilizer Distribu-Er.-Joseph Laude, Monticello, Ark. This is a ma being an adjustable auxiliary bottom fitted in the hopper whereby a fine or coarse fertilizer may be distri-
buted, the feed wheel, as the machine is drawn over the ground, drawing the fertilizer from the hopper and ropping it, while agitators stir up and loosen the fer d by a forwarl plow and is covered by rear plows. The machine is of simple
and inexpensive construction and designed to do its work very efficiently

## iscenaneou

Labeling Machine.-Frank Mueller, Albany, N. Y. This is an improved machine for quickly, accurately, and securely attaching labels to
bottles, cans, and other receptacles, one operator, by ts use, conveniently handling a large number of bottles and firmly attaching the labels. A bottle receiver con-
tains a pad adapted to be dipped in a paste box next to which is a label table, revolving brushes being arranged botlle between and through the brushes and means or imparting simultaneously a vertical sliding motion to the receiver and to the plunger.
Belaying Pin. - John W. Collins, ing to this invention, in connection with belaying pins of novel construction upon a hinged plate upon the rail, the connection between the levers and the pins being so made that when a vessel lists dangerously the belaying pins will be acted upon on the weather
side of the vessel to cause the sheets and halyards to side of the ressel to cause the sheets and halyards to pins, thus permitting the hull of the vessel to right it-
sheets, and other ropes may be shifted in a conven ient and exp
the vessel.
Cash Recorder. - Wooster B. Metcalfe and Frank A. Ziegler, Hanover, Penn. This invention provides an improvement in cash drawers and chase, the making of change, or paying credit pur amount, will be duly entered upon a record slip, carried under a glass to prevent erasure or alteration, a bell being sounded as the drawer is opened. The box or casing in which the mechanism is arranged is
designed to be locked and the key carried by the prodesigned to be locked and the key carried by the pro-
prietor to prevent tampering with the record elip or prietor to pr
mechanism.
Calendar and Key Ring.-Andrew B. Dwigans, Chicago, Ill. A perpetual pocket calendar which may also be used as a key ring is provided by his invention, the device having means for the easy at nicely adjusted to indicate the day of the week, month nd year, and may be changed to adapt it for any year It is preferably made of disk shape, so there will be no corners to wear on the pocket, and consists of a face
and back plate centrally pivoted by a rivet, the face plate carrying near its rim the names of the months, nd a square with figures up to 31, above which ie lot where the initials of the days of the week appear
showing through from the back plate as it is turned to he proper position. A split ring inserted in a marginal hole holds the two plates in correct position.
Self-closing Gas Burner. - Willam M. Roberts, Joliet, Ill. This is a burner arranged bown out or the ip passes through an opening in a plate made of two metal strips of different material, preferably brass and steel, so that when the plate is heated by the flame it bends upward. On the under side of the plate is a downpressing on a wheel on the cock, the wheel containing spring to close the cock when the other spring is disconnected, such disconnection being effected by the novement of the rod on the cooling of the plate to which it is attached.
Bicycle Mechanism. - David J. Hoopes, Philadelphia, Pa. This invention consists of bicycle frame, and carrying on its periphery a pinion in mesh with an internal gear wheel on a shaft passing
through the hub, and also journaled in the bicycle rame. The improvement forms a driving melting easily simple and durable constrach rate of speed rendering its construction very compact and strong.
Vehicle Pole. - John W. Jeffery, vehicles of different widths. The pole has a cro piece at its rear end, secured to the pole in the usual way, braces attached to the ends of the cross piece
being secured to the pole by bolts, and the rear ends of the braces are provided with eyes, while between the yes and the pole in each brace is a longitudinal slot. he pole iron passes through the eye on the brace, ex be moved in or out and securely clamped to the brace any desired position.
Axle Bearing.-David Wigger, New York City. A simple, cheap, and easy running bearing o all sorts of vehicles, and the outer end of the hab is so rounded off that when struck by the hub of another vehicle it is not likely to be injured. The outer end of the axle box is closed and its inner end recessed and crew-threaded, while the axle has enlarged bearings in entering the threaded portion of the box and a aiding crew being held partly in the nut and partly in the

Harness Saddle.-Louis A. Mancini Montclair, N. J. This is a saddle for single harness, fitted to the back of any horee. The construction provides for holding the tree of the sadale at an elevatio bove the back of the animal to which the sadde applied, and the pads are so made that they will not
chafe or injure the skin, the pads being also amply entilated.
Rein Support. - David Hand, Netherwood, N. J. This is an improvement on a viding a tail guard and line rest capable of attachment oo any harness. The body of the device is formed of a od or strap bent to form two forwardly converging members having their ends connected, in connection
with inwardly and outwardly extending link-like rest arms and a rearwardly extending bow forming tail guard. The device is very simple, durable and in
expensive, and in using it the lines cannot possibl expensive, and in using it the lines ca
become entangled with the animal's tail.
Trace Support.-Russel W. Minard, Larned, Kansas. This is a simple and inexpensive
metallic loop device adapted to be readuly raised lowered on the skirt to assume the proper position to carry the trace according to the size of the animal, the device being connected at its lower end with a strap to which the belly band may be buckled.
Pier. - Ommund Haerem, Houston, Texas. This invention relates to piers for bridges and other substructures, the pier consisting of a shell having
inside sets of ears through which are passed rods, each having at its lower end an auger adapted to screw into apper threaded ends of the rods to abut against the apper set of ears. The shell is made of two vertical sections being joined together and their joints extendng in line with the current of water of the river. The
construction possesses great strength and stability, and readily sunk in the water and fastened in place.
Barrel. - James P. Cowden, Cedar
porting fruits, etc., designed to be light and of great strength, and retaining its original shape when the
upper hoops are removed to take out the head. It is upper hoops are removed to take out the head. It is
formed of a series of staves held spaced apart, each stave formed of an outer and an inner member, the ands of which abut and are secured together, while one
or more hoops are interposed between the inner and or more hoops are interposed between the inner and trussed and strengthened, the barrel thus affording an Transom Lifter.-Henry A. Brennan, 14 Warren Street, Jersey City, N. J. This is a window worker adapted for use in connection with tilting windows, etc., affording a safeguard against burglaries and facilitating ventiation, being also wend all kind of buildings, and on steamboats, railroad cars etc., the device being made to operate one or all the windows as desired. When the windows are one above the other a vertically movable hollow shaft connects with a portion of the windows, the shaft having a slot in one side, a rod held to slide in the shaft being also connected with portion of the windows. The device may be conwindows so they cannom the inside, but holds the
Head and Shoulder Rest. - Levi Pletcher, Mcconnellsvile, ohio. This is a devic or use in a coln, coning the two oppositely sup adapted to be rotated and locked at any point, in co nection with flexible bands, wherehy the position of
the head and shoulders may be altered as desired without touehing the corpse
Clamp. - Wilhelm H. E. Brande, Hamburg, Germany. This is a device in which two jaws are pivotally connected intermediate of their ends
and a hanger having a pin projects into inclined slots in the upper ends of the jaws, the clamp being designed o hold small articles, such as documents, garments, etc., the weight of the clamped articles increasing the

Bed Fan.-William H. Wrigley, New Orleans, La. This is a device adapted to be set up by a isting of a light standard from which projects a shaft carrying a fan wheel, the height of which can be readily adjusted, while the fan may be turned to throw the reeze in any direction. The device is ope
Underwaist. - George D. McKay be a highly elastic and comfortable garment, with central opening down the back, the portions of the garment on the sides of the opening being connected at by elastic bands, while a vertical band attached to of the cross bands connects with the lower portion of he body, etc.
Design for a Pedestal.-Alexander J. Windmayer, Fort Madison, Iowa. This design includes a base in the form of a column, surmounted by a statuaving clouds at its base, while on the globe is and an uplifted sword and the left hand grasping the staff of an unfurled flag. The globe is presented so an North Amer
Design for a Bottle. - Joseph P. Cherry, Nashville, Tenn. This is a design for an ink bottle in which the ink is used from the bottom and the surface for evaporation is limited to the cork hole, only ink will not creep up the holder, while the bottle, if accidentally tipped over, will always stop with the

## ole up.

Note.-Copies of any of the above patents will be furnished by Munn \& Co., for 25 cents each. Please
send name of the patentee, title of invention and date of this paper.

NEW BOOKS AND PUBLICATIONS. The Mediterranean Shores of AMERICA-SOUTHERN CALIFORNIA.
Its climatic, physical and meteoromogical conditions. By P. C. Re-
mondino, D. London : The F. A. Davis Co., publishers. 1892 . Pp. Xiv, 160.
cloth, $\$ 1.25$. Paper 75 cents.
This work is an energetic eulogy on the beauties, It presents numerous illustrations of difern California, with statements of the meteorology and healthfulness of the country. Among the illustrations we note one of an Indian 140 years old and another of a white man 110 years old, given as tributes to California's air
The Hygienic Treatment of Con SUMPTION. By M. L. Holbrook, M.
D. New York : M. L. Co. No date. Copyright, 1891. Pp.
219 . No index. Price ${ }_{\$ 2}^{2}$.
The nature and causes of the disease, its prevention and treatment in its earlier stages, and its treatment work, including 25 chapters. Many of the chapters re very practical in therr titles, and the whole work eems composed from the general standpoint of common sense treatment of this complaint. A considerable portionof the work is devoted to physical culture, from Indian club exercises, through vocal, gy
Manual of Assafing Gold, Silver, COPPER AND LEAD ORES. By Wal
ter Lee Brown, B.Sc. Chicago: E.
H. Sargent \& Co. 1892. Pp. 533 . Price, \$2.50.
The fire assay of the ores of the metals named is the real subject of this work. The author distinguishes his work to scorification and crucible assays for the most part. We notice, however, that the volume
in the appendix. A bibliography of the subject, with
the list of the principal ores of the United States, is
The Drainage of Habitable BuildINGs. By W. Lee Beardmore. New
York: Macmillan \& Co. London: Whittaker \& Co. ${ }^{\&}$ 1892. Co. London
Pp. x, 89 .
Price $\$ 1.50$. Price $\$ 1.50$
The general subject of house plumbing is treated by this author. The work is of special valuelas indicating an English author's view on a subject which has re ber of illustrations are given as required and a ful in dex closes the work.
A Text Book on Retaining Walls AND Masonry Dams. By Mansfield
Merriman. New York : John Wiley
$\&$ Sons. 1892 . Pp. iv, 122. No index. Price $\$ 2$.
The author's belief that example is better than precep has not prevented him from producing a very useful work treating of the subject of the resistance of walls to pressure, both with regard to overturning and sliding. Throughout the work analytical methods are used for investigating the problems, without, however, hav-
ing recourse to the very highest mathematics. The ing recourse to the very highest mathematics. The
work, as far as it goes, will be within the scope of all Igebraists.
Electricity up to Date for Light, PowEr AND Traction. By John
B. Verity. London and New York.
Frederick Warne \& Co. Pp. 178. Frederick Wa
Price 75 cents.
Although no date is stated on the title page, the name meaning by at least the dating of the preface-November, 1891. The work is treated largely from a trade and English standpoint. The particulars of the capital and operations of a number of English companies are given, and throughout the subject of practical and business electricity from the English standpoint is the mo-
tive of the work. It is to be remarked trat an undated copy of a book entitled "Electricity up to Date" is rather confusing.

(4362) R. S. H. asks: 1. How can I test imestone to find if it contains phosphorus? A simple Dissolve in nitric acid and add a large excess of test. monium molybdate dissolved in nitric acid. A very bright yellow precipitate indicates phosphoric acid, provided no silica or arsenic acid is present. 2. What the necessary analysis of sand used, for furnace bot-
oms in open hearth steel making, and why common ilica sand does not answer the purpose? A. Such sand would incline to run into slag with the oxide of iron. analysis of the sand is not necessary. For the ordinary acid process a siliceous sand is used which should have cementing qualities, so as to make a solid bed. 3. It an electro-magnet or an iron core surrounded with a coil of wire was held near the armature and between the duced in the coil? A. Under the conditions a current be inrent might be generated if the coil made a closed circuit 4. There was an electric candle used for alternating current arc lamp, consisting of two carbons placed ogether and insulated from one another. I have forgoten the name of the inventor, but it is a foreign inention. What is the failing of this lamp, and why is it not now used? A. You
dle. It was not economical.
(4363) G. K. asks : 1. When FeSO is oiled with $\mathrm{HNO}_{3}, \mathrm{Fe}_{2}\left(\mathrm{SO}_{4}\right)_{s}$ is produ $\mathrm{HeSO}_{4}$ is the equation or reaction. A. An excess of sulphuric The following is the reaction: $12 \mathrm{FeSO}_{4}+2 \mathrm{HNO}_{3}+6 \mathrm{H}_{2}$ $\mathrm{SO}_{4}=6 \mathrm{Fe}_{2}\left(\mathrm{SO}_{4}\right)_{3}+2 \mathrm{NO}+4 \mathrm{H}_{2} \mathrm{O} . \quad 2 . \mathrm{Is}$ the lightning rod still considered a protection against lightning? A. Yes. See our Supplement, Nos. 746, 650, 249, 348, 525, 288.
$(4364)$ N. P. writes : I wish to know of
(4364) N. P. writes : I wish to know of a simple and sure test that I can employ to find if
there is an adulteration of white arsenic in powdered borax. Have used a little of it bottled in soft water for the complexion. A. Dissolve in water, add a little hydrochloric acid and place a drop on a bright surface of
copper. A lead-colored stann indicates arsenic. Borax will answer your purpose, we think.
(4365) J. F. writes: The photographs of bullets taken by Professor C. V. Boys cannot be corde down to steady flight, but were varionsly tilted across he path. H is well known that the stability of an fight, and with the modern magazine nif I find vo iation of angle up to twenty feet from the muzzle (4366) W. W. N. asks: How many cells of simple plunge battery described on page 400 , " Exerimental Science," will be required to operate a two me, and how long would they operate the lamp if used ontinuously? A. It will require 3 cells. Such a battery will run a lamp for about two or three hours continuusly.
(4367) H. P. asks for formula for printing on
ing:

Boiling water.. .......... .... ... ... 20 oz .
Chloride of ammonium ................ 100 grs. Iceland moss.............................. 60 ""
minutes. o the ounce, silver for 15 minutes in an acia, $2 c$ grain cardboard. Print deeper than usual and tone in a so lation of -
Water.

20 oz. Acetate of sodium

2 drs.
3 grs.
Add a few grains of common whiting. Fix in hypo (4368) A. H. asks (1) the method used or transferring photographs on to gold and silve watch domes to be durable. A. Yon can by using Eastman's transfer photo paper transfer a picture on to a watch dial without dificulty. Address Eastman Co. Rochester, N. Y. 2 . If diamond steel can be bough or engraving on gold and silver, and is it better for
holding an edge than the ordinary Stubs steel? The diamond brand of steel is not made in suitable sizes for gravures. The $\mathrm{Swis8}$ steel gravers are a favorwith
(4369)
(4369) W. T. N. asks : What causes the peculiar acid smell when any steel instrument is being
harpened on a whetstone where water is used? A. The peculiar smell of a stone when rubbed is due to he odor of the stone, it will be the same whentwo buted to ozone.
