To convert time into longitude divide by 4. Thus $8 \cdot 28 \mathrm{~s} . \div 4=2^{\prime} \cdot 07$ long.

SHOWING THE ERROR PRODUCED IN THE TIME OR LONGITUDE BY AN ERROR OF $1^{\prime}$ IN THE ALTITUDE.

When the Latitude Variation is + name the Azimuth the same name as Latitude. opposite name to the Latitude.
On the Equator the"Azimuth will have the same name as the Declination.

When the Latitude Variation is + name the Azimuth the same name as Latitude
opposite name to the Latitude.
On the Equator the Azimuth will have the same name as the Declination.

When the Latitude Variation is＋name the Azimuth the same name as Latitude． opposite name to the Latitude．
On the Equator the Azimuth will have the same name as the Declination．

It must be borne in mind that Table VJ. does not give the true geographical lines of position, but lines of position which will give the same result as to latitude and longitude on a plane chart as the true lines of position would give on a Mercator chart.

This table has been published on account of the difficulty often experienced in getting a suitable scale Mercator chart for plotting Sumner positions, as the ocean charts are usually on too small a scale, and, moreover, it saves the trouble of getting out an ordinary chart.

Plane Sumner charts can naturally be published at a much cheaper price, as one chart does for all latitudes; or the position may be plotted on paper with squared lines ruled on it. If neither of these are at hand, the Sumner position may be plotted in the work book by drawing a horizontal line representing the D. R. latitude at time of second observation, and a line at right angles to this as a meridian of longitude, which may be used for laying off the position-lines by a protractor.

On the horizontal line set off the points of two longitudes at a distance from one another of say 1 min . to $10^{\prime}$ of longitude. From these two points lay off the Sumner lines, and from the point where they intersect draw a perpendicular to the parallel of D.R. latitude ; the longitude at the point struck by the perpendicular is the longitude required, and can be measured from either of the points of longitude.

With ex-meridian latitudes the position-lines would of course be set off from the meridian, from the starting-points of the latitudes by the observations.

Special Caution.-When double altitudes are taken with a run interval between the sights the traverse table should be employed to bring both observations up to the same instant of time, as the true course plotted on the plane chart would not give a correct result. If the course is plotted it must be altered in the same way as shown below for the position-lines. A small 6 -inch boxwood protractor rule with a diagonal scale of inches for measuring to $\frac{1}{100}$ part of an inch may be bought for about is., and is the only instrument which will be required.

The examples on accompanying chartlet below will show how a plane chart may be used, and illustrates clearly how both the Mercator and plane charts may be made to give the same final position from position. line plottings.

The upper longitude scale with the meridian scale represents a Mercator chart in latitude $60^{\circ} \mathrm{N}$., where $I^{\prime}$ of latitude would equal $2^{\prime}$ of longitude, and the lower longitude scale represents with the same meridian scale of latitude a plane Sumner chart, where the scales of latitude and longitude are equal, as on the Equator.

Two positions are plotted, one from a parallel of latitude starting from latitude $59^{\circ} 55^{\prime} \mathrm{N}$. and longitudes $10^{\circ} 0^{\prime} \mathrm{W}$. and $10^{\circ} 20^{\prime} \mathrm{W}$. with true position-lines $\mathrm{N} .26^{\circ} \mathrm{W}$. and N . $26^{\circ} \mathrm{E}$., and the other from a meridian starting from longitude $10^{\circ} 0^{\prime} \mathrm{W}$. and latitudes $59^{\circ} 55^{\prime} \mathrm{N}$. and $60^{\circ} 5^{\prime} \mathrm{N}$. with true position-lines $\mathrm{N} .45^{\circ} \mathrm{E}$. and $\mathrm{S} .45^{\circ} \mathrm{E}$.

First observation star's bearing N. $64^{\circ}$ E., position-line N. $26^{\circ}$ W., in latitude $60^{\circ}$ gives (p. 264, Table IV.) lat. var. $3^{3.90}$, which gives (p. 270, Table VI.), position-line for plane chart N. $44 \frac{1}{}^{\circ} \mathrm{W}$., and for the second position-line in same way $\mathrm{N}_{.} 444^{1^{\circ}} \mathrm{E}$.

For second position star's bearing N. $45^{\circ} \mathrm{W}$. and S. $45^{\circ} \mathrm{W}$. gives (p.265) lat. var. $8 \mathrm{~s} \cdot \mathrm{oo}$, which gives (p. 270) position-lines for plane chart N. $63^{\circ} \cdot 4 \mathrm{E}$. and S. $63^{\circ} \cdot 4 \mathrm{E}$.

Upper longitudes represent scale on a Mercator Chart. Position-lines on Mercator Chart represented by continuous lines.

Lower longitudes represent scale on a Plane Chart. Position-lines on Plane Chart represented by dotted lines.
Note.-Without the aid of this table the Sumner position from simultaneous observations of two stars, or from two sun observations (if the course and true interval is applied from the traverse table), will always give the same latitude when taken from a plane as from a Mercator chart, and the correct longitude will be found by converting the departure into d. long.

In the example above in latitude $60^{\circ}$, $10^{\prime}$ dep. gives $20^{\prime}$ d. long.

## 272 TABLE VII.-HOUR-ANGLE LIMITS FOR EX-MERIDIAN TABLE VIII.

the table shows the limits within which the reduction at 1 Min., as given IN TABLE VIII., WHEN MULTIPLIED BY THE NUMBER OF MINUTES IN TABLE BELOW, WILL NOT GIVE A GREATER ERROR IN REDUCTION THAN $01_{2}^{\prime}$.

THE MEAN PLACES OF 108 OF THE BRIGHTEST STARS-continued.

Nore.-In this table + means add, and - means subtract.
In the column headed "Mag." the adopted unit of brightness is designated $r \cdot 0$. The magnitudes of stars are determined to tenths of a magnitude with reference to this adopted unit : thus the value $-1 \cdot 4$ for Sirius indicates that that star is 2.4 magnitudes brighter than the unit: the value 0.3 for Arcturus indicates that that star is seven-tenths of a magnitude brighter than the unit.

## APPROXIMATE APPARENT TIMES OF THE MERIDIAN PASSAGES OF THE PRINCIPAL FIXED STARS AT GREENWICH ON THE FIRST DAY OF EACH MONTH, 1910.

$\dagger \mathrm{N}$. or $\dagger \mathrm{S}$. - These times relate to the Meridian Passages of Circumpolar Stars at the Inferior Transit, N. or S. denoting the

[^2]Note.-The bearings $\left\{\begin{array}{l}\text { N.E. } \\ \text { S.E. }\end{array}\right\}$ N.W. S.$\}$ etc., mean that the Star will be in the N.E., N.W., etc., quadrant before and after Meridian Passage. If the declination of Star is South of observer's latitude, the Star will of course bear South when passing the Meridian, and North when declination is North of observer.

# RULE OF THE ROAD FOR SALLING-SHIPS 

H. S. BLACKBURNE (Extra Master),<br>Principal Examiner of Masters and Mates in New Zealand, WITH WHICH ARE EMBODIED THE

## "REQULATIONS FOR PREVENTING COLLISIONS AT SEA."

Published by J. D. Potter, 145 Minories, London, E.C., and by H. S. Blackburne, Wellington, New Zealand.

PRICE, 2s. NEW ZEALAND, 2s. 3d.

## EXTRACTS FROM LETTERS TO THE AUTHOR BY NAUTICAL EXPERTS.

From Captain E. W. Owens, Examiner, Local Marine Board, London.
" I certainly have no objection to make, but much approval ; your work is concise, clear, and, from my point of view, correct."

From Captain R. W. Espinasse, Examiner to the Marine Board of Victoria, Australia Letter to Editor of Nautical Magazine, published March 1904.
" Captain Blackburne is well known for diagrams with explanations ' Illustrating the Rule of the Road for Sailing-ships.' . . This booklet is worthy of praise as the clearest and most original view of the subject yet made public."

## NAUTICAL ASSESSORS AND TEACHERS OF NAVIGATION.

Captain A. Wood, N.A. and Teacher of Navigation.
" I think they will be very useful to candidates getting up the Rule of the Road. I especially like your treatment of two vessels close-hauled on the same tack, Diagram I."

Captain Saml. Brooks, N.A.
"Your diagrams are excellent, and I think every officer in charge of a watch on board ship should have a copy of your book for his own information."

Captain J. T. Castle, N.A.
" It is well thought out, and you are to be congratulated on the simple and efficient manner in which its problems are presented. You may rest assured that its production will be of great service to those who wish to study so important a subject as" that of knowing what means to adopt in order to avoid a collision when meeting or crossing another sailing-vessel."

## Captain G. Kenneth-Hore, N.A.

" It seems to me that you have taken great pains to make a clear explanation of the 'weather rule ' position, and, what is sometimes a very difficult question to determine, how a vessel is steering when her green light is seen three points on the port bow of your own vessel, which at the same time has the wind on her port beam, and what is to be done under these circumstances."

Captain J. Netherclift Jutsum, Principal of the Nautical Academy, 6r Fitzhamon Embankment, Cardiff.
" Many thanks for your little book re Rule of the Road. I consider it is as near perfection as any graphic method could be brought for illustrating this subject, and, although it is striking in its simplicity, its conciseness bears the impress of very careful and painstaking consideration in its production."

Captain Geo. Shields, Principal of Naval Academy, 40 Clyde Place.
" Allow me to thank you for the copy of your book, which is perfection itself. I wish you every success, and shall be pleased to recommend it to my pupils at all times."

Captain John Owen, Principal of the Nautical School, 48 London Square, Cardiff.
" I thank you for your diagrams of the Rule of the Road for Sailing-ships. I think the illustrations are very good, and better than anything I have seen before on this most important subject."

## REVIEWS FROM THE PRESS.

## Shipping Gazette.

"There is good reason to anticipate that appreciation of these diagrams will not be limited to candidates for Board of Trade certificates, and we have no doubt that many officers at sea will find them of valuable and very practical assistance."

## The Shields Daily Gazette and Shipping Telegraph.

" Captain Blackburne, a well-known name in nautical circles, has just rendered a signal service to his seafaring confrères. His diagrams with explanations illustrating the new Rule of the Road are marked with simplicity and distinctness. His little and unpretentious work ought to be in the hands of every master of a sailing-ship."

# AZIMUTHS, GREAT-GIRCLE SAILING and 

REDUCTION TO THE MERIDIAN
with a

Azimuths through Tables A, B, and C (or separately through Table D), for all the Heavenly Bodies at any Time the Body is above the Horizon; and Great-circle Sailing-courses between any two Places on the Globe.

Also other Useful Navigational Tables, with Numerous Examples of Double Altitudes, Equal Altitudes, Azimuths, etc.
By H. S. BLACKBURNE (Extra Master),
Principal Examiner of Masters and Mates in New Zealand, and Nautical Adviser to the Government. [Fourth Edition, 1916.]

PRICE 6s.

## BOOK OF "SUMNER" CHARTS.

 PRICE 2s. 6d.A book containing examples of positions found by the improved "Sumner" method from ex-meridians, and twenty-four plane blank "Sumner" charts on a convenient scale for facilitating the "Sumner" problem in connection with Captain Blackburne's A, B, and Cazimuth tables mentioned above.

Every single chart is available for any latitude through the aid of the above-mentioned tables, by which greater accuracy of position is found, as well as a wider range for observation, than is given by the usually taught "Sumner" method.

## MODERN UP-TO-DATE NAVIGATION.

POSITION-FINDING BY THE IMPROVED "SUMNER" METHOD

# CONTRASTED WITH <br> THE NEW NAVIGATION (MARCQ SAINT-HILAIRE SYSTEM) AND <br> THE OLD "SUMNER" METHOD <br> TOGETHER WITH 

A FEW SPECIAL STAR REDUCTION AND AZIMUTH TABLES.<br>By H. S. BLACKBURNE.<br>PRICE 1s. 6d.

[The United Service Gazette, London, October 15 th, 1914.j

#### Abstract

"The book contains some nautical tables of great value for ready position-finding from observations of two stars out of the meridian. . . . The book also contains several fully worked-out examples showing the use of the tables, with some well-executed diagrams illustrating the problems; the different methods of determining the ship's position by the ' Old Sumner Method,' the 'Improved Sumner Method,' and the 'New Navigation Method ' are contrasted, and the author clearly exposes some of the fallacious claims which have been made by one or two recent writers for the so-called 'New Navigation' or 'Marcq St. Hilaire 'system of dealing with observations for position-finding."

Captain H. H. Edmonds, Teacher of Navigation, Sydney, writes :-
"I thoroughly endorse all you say on the Marcq St. Hilaire method; it is the truest thing that has been written on the subject."

[^3][^4]
# TABLES FOR AZIMUTHS, GREAT-CIRCLE SAILING 

AND

# REDUCTION TO THE MERIDIAN. 

#### Abstract

[From the Lyttelton Times, 24th June 1905.] "The author's new method of dealing with the 'Sumner' problem is fully discussed, and his method compared and contrasted on pages 49, 75, 80, and 81 with the method prescribed by the Board of Trade for candidates seeking a certificate. The simplicity, availability, and greater accuracy of this new method should shortly lead to the Board of Trade prescribing it in their syllabus, instead of the older, more cumbrous, and less accurate method, which has done service for so many years. In the second example of the contrasted methods the older method shows an error of no less than $4 \frac{1}{2}^{\prime}$ in latitude and $5^{\prime}$ in longitude. "Only a very few of the points of excellence contained in this work are noticed. It should be in the hands of all having to do with the sea. Every phase of practical, up-todate navigational method is here clearly explained with a master touch, and the work forms an invaluable addition to the literature of the sea."

## [From the Auckland Star, 8th July 1905.]

" A very valuable work for mariners has just been published by Captain Blackburne entitled 'A, B, and C Azimuth Tables.' The azimuth tables are brief, yet compendious enough for sun, moon, and stars under all ordinary circumstances, while the improved Sumner's method is a valuable acquisition, and will certainly supersede the older and longer method now in vogue. The examples of the various subjects dealt with are beautifully worked out with a clearness, briefness, and accuracy that creates admiration; indeed, the book is replete with all that is required in working out those vital problems so necessary in this present age of steam and speed for reliable and correct navigation-i.e., the position of the vessel and the correct course to steer-and confers a boon on the rising generation of navigators that their predecessors never dreamt of."

## [From the New Zealand Times, 8th July 1905.]

" Another feature of the work is Captain Blackburne's method of dealing with the popular 'Sumner' problem. This has been favourably commented upon in all reviews of the 'New Zealand Nautical Almanac,' in which the method first appeared. Captain Blackburne summarises the advantages of it over the method at present encouraged in Board of Trade examinations, as follows (page vi): (1) Greater accuracy; (2) fewer figures, and consequently less time required for the work; (3) one chart does for any navigable latitude; and (4) many observations which would be considered useless for the ordinary "Sumner" give excellent results with even fewer figures by combining ex-meridian and chronometer observations together, as illustrated in this book by various examples. The book abounds with notes of great practical value to mariners."

## [From the Syren and Shipping, 23rd August 1905.]

"Captain Blackburne's labour-saving aids for navigators are known all over the world by his brethren who keep themselves posted in up-to-date methods; and this collection of tables now published leaves nothing to desire by the navigator wishful of finding his ship's geographical position, or the error of her compass, with the least possible chance of error, and in the shortest possible interval of time, anywhere within the usual limits of navigation. There is one point in connection with these tables which is deserving of the close consideration of the Board of Trade. Although the practical seaman will almost invariably use such data at sea, yet the Board compels the candidates for certificates to plod along in a way which gives admittedly erroneous results under certain conditions. . . . That the Board of Trade should examine along one line-that of antiquity-and that practical navigators should work along quite another line-that of labour-saving tablesis surely ludicrous. The New Zealand Government requested the Board of Trade to allow the use in the examination-room of tables like those of Captain Blackburne's, together with improved methods of working, but the request has not been granted. We sincerely trust that the Board of Trade will see fit to adopt modern methods by allowing the candidates permission to use the A, B, C Azimuth Tables of Blackburne, or any similar laboursaving work."

## EXTRACTS FROM PAPER REVIEWS-Continued.

## [From the Nautical Magazine, September 1908.]

"In the new edition of his well-known A, B, C, and D Tables, Captain Blackburne must surely have cut all existing records."

## [From the Nautical Magazine, December 1908, on the latest edition.]

"Captain Blackburne is as indefatigable as ever in his efforts to lighten the labours of those who go down to the sea in ships. Early in the present year he published an edition of the A, B, and C Tables. They are now republished, with an appendix entitled 'Exmeridian and Azimuth Inspection Tables.' . . . The author seems here to have hit upon a happy idea, for we have a maximum of information in a minimum of space; and, as he points out, once calculated, the reduction and azimuths will hold good for a long series of years."

## [From Syren and Shipping Illustrated, London, 4 th November 1908.]

"We have only praise for the one-hundred-and-sixty-page volume of 'Tables for Azimuth, Great-circle Sailing, and Reduction to the Meridian,' by Captain H. S. Blackburne. The tables are comprehensive, yet concise, and practical navigators will find that the 7 s .6 d spent on acquiring them is certain to save a lot of mistake-inviting figure-manipulation at a critical moment. ... More convenient in form or more utilitarian in application these tables could not be."

## [From Shipping Illustrated, New York, 5th December 1908.]

" These tables, as set forth in the present edition, are the most complete and comprehensive Azimuth and Ex-meridian Tables for practical work yet published."

## [From the Shipping World, 9th December 1908.]

"The new issue of his $\mathrm{A}, \mathrm{B}$, and C Tables for Azimuth, etc., which has reached us from the New Zealand Government's Marine Department, through the High Commissioner, in London, is undoubtedly the most complete and comprehensive volume on this subject yet published."
[From the United Service Magazine, December 1908.]
"These tables now make it possible to determine the position of the ship more readily at any time, and with less trouble than ever before."

## [From the Mariner, 15 th December 1908.]

"Sufficient is it to say that the various navigation tables, rules and examples, including a new and improved 'Sumner' method, make the volume on all counts one of the most complete and authoritative that we know in nautical literature."

## [The Press, Christchurch, 24th January 1912.] <br> VALUABLE NAUTICAL PUBLICATION.-CAPTAIN BLACKBURNE'S TABLES.

"The 'Tables for Azimuths, Great-circle Sailing, and Reduction to the Meridian," compiled by Captain H. S. Blackburne, Nautical Adviser to the New Zealand Government, have been published in a third and much improved edition by the Marine Department. This work, which is comprised in a compact and neatly bound volume, is published at 6 s ., and is highly spoken of by navigators. . . .
"The most valuable addition to this new edition of Blackburne's tables is Table M, on pages 150 and 15 I . The error of latitude to 4 seconds of error in the time is seen at a glance from the table for any ex-meridian observation, and the same table is used for facilitating the work of finding the latitude and longitude from a Sumner or double-altitude observation, either from the ex-meridians or from one ex-meridian combined with a chronometer observation.
"The great beauty of these tables and the methods presented by Captain Blackburne for position-finding from two observations is that the navigator need never concern himself about either of the bodies being too near the meridian or the prime vertical, or too high in altitude for a Sumner or double-altitude position, as even such well-known writers as the late Captain Lecky would consider a bar to reliable results; but he impresses on the navigator that the only necessary condition of importance to ensure good results is that the two observations should be sufficiently far apart in bearing to give a good cut."

# EXTRACTS FROM LETTERS re THE A, B, and C "AZIMUTH AND REDUCTION TABLES." 

[From Captain Squire T. S. Lecky, R.N.R.]

"I intend shortly to tackle a new edition of 'Wrinkles,' and will try to make it as perfect as possible. Now, I have so much admiration for your A and B tables that I consider my book incomplete without them, etc.-Neyland House, Neyland, R.S.O., Wales, 3rd November 1890."

## [From Admiral William R. Lang, R.N.]

"Your very simple and most useful azimuth tables will be a great boon to many navigators. What labour you will save them by your splendid work. . . . ! What a very useful book for navigators you have compiled !-Harrogate, 27th April I903."

## [From Lieutenant Alexander G. Wright, R.N.]

" I think it is a most excellent book indeed, and quite the best of its kind that I ever came across. Your A and B tables are old friends of mine. I had the good fortune to meet with them when I was on the China Station in 1897.-H.M.S. Brilliant, Cruiser Squadron, 2 rst June 1903."
[From Captain T. S. Angus, Nautical Inspector, P. \& O. S. N. Company.]
"Your latest A and B tables are certainly the most concise for practical work I have seen.-London, 14th September 1903."
[From Captain Thomas Liddle, s.s. Kurrachee.]
"I consider them the most complete and comprehensive azimuth tables published. Having used them for over twenty years I can speak with confidence as to their utility and accuracy, and have no hesitation in recommending them to navigators. The plane charts for the use of the 'Sumner' problem are available for any latitude, and are in themselves a boon to navigators.-Hamburg, Germany, 25th September 1905."
[From Captain Robert W. Ferguson, Brisbane, Queensland, rst July r906.]
"You indeed deserve the gratitude of seamen for the publication of these valuable tables. I have long held that every other method should give place to this. Personally, I have used Lecky's tables and the skeleton tables 27 A and B and 28 C of Norie for many years, but I shall discard them in future for your excellent tables. I do not understand why the Board of Trade continue the old cumbersome Sumner method in the examinations in preference to the graphic methods of Pagel, Johnson, and yourself."
[From Captain Thomas Mincham, Teacher of Navigation, Auckland, New Zealand, 7 th December 1908.]
"The A, B, C Azimuth Tables I have used from the start of their publication. I prefer them to all others as more simple, and much easier to learn."
[From Mr W. H. Sweny, Chief Officer, P. \& O. s.s. Moolton, Adelaide, 23rd January rgog.]
"I have now had your new edition of Azimuth and Reduction to the Meridian Tables in use for one Australian voyage, using them almost daily for stellar observation. The results obtained have been surprising, and so satisfactory that I have discarded all other books on these problems."
[From Captain John Owen, Teacher of Navigation, Cardiff, 25th January 1909.]
"Your method of solving the Time Azimuth problem by the A, B, C Tables is concise, and easy of solution. If these tables were more generally known, I think seafarers would use them in preference to Burdwood's or any other special tables employed at present."
[From Mr John Blencowe, late Second Officer, B.I. s.s. Shivala, Auckland, New Zealand, 9th February 1909.]
" In Lyttelton I obtained a copy of your new Azimuth and Ex-meridian Tables, and on showing them to my brother officers they were so taken with them that they all bought a copy themselves. I think the tables are splendid, and for the sake of the profession will do all I can to make them more widely known."
[From Mr S. C. Warner, Chief Officer, P. \& O. s.s. Socotra, off Minikoi Island, 13th September 1910.]
" I should like to add my humble testimonial to the new A, B, C Book you have brought out, and to tell you how much it is appreciated here on board. I certainly think it is the very best book of navigation ever printed."

## EXTRACTS FROM LETTERS-Continued.

[Firom Captain George Burton, Instructor of Cadets, Ocean Training-Ship Port Jackson, off Australia, 26th November 19ro.]
"I have shown your book to all our senior cadets, and advised them to procure copies. The book is certainly altogether the most complete education in modern navigation yet published."
[From Captain J. King Davis, commanding the Australasian Antarctic Expedition, s.y. Aurora, Macquarie Island, I6th December I9II.]
" We have already several copies of the previous edition, as I use nothing else, and have insisted on my officers learning to use them, as they are the only suitable tables for our work, and are much handier, in my opinion, for any latitude. I hope that they will become very widely known, as I am sure you make matters much simpler than many of the bulky and expensive tables which seem to be of much less value."
[From Mr H. Rochford Hughes, Navigating Officer, H.M. Cable Steamer Iris, Auckland, 8th February 1912.]
" I have tried ' new navigation ' methods, and all the principal tables of the day, during my search for the shortest and most accurate methods, and have come to the conclusion that for our work your tables and system generally are the best."
[From Commander Irving B. Miles, R.N., Officer in charge of Survey on Atlantic Coast of the Dominion of Canada, Department of the Naval Service Hydrographic Survey, Ottawa, 18th January 1912.]
"You may be interested to know that on my recommendation the Department here is providing all ships with your latest edition of tables. I have still your 'third edition,' 1886, which has been everywhere with me from New Zealand to Hudson Bay and Strait."
[From Commander Richard Hyde, R.N., Navigation School, Portsmouth, 12th April I9I2.]
"I have just returned from a cruise with our gunboats the Dryad and Harrier, when I used your tables exclusively for finding azimuths, and personally I prefer them to Burdwood or Weir's diagram."
[From Lieutenant Edward R. G. R. Evans, R.N., who Commanded the British Antarctic Expedition R.Y.S. Terra Nova from England to Antarctic in 19ıo. Christchurch, 17th April 1912.]
" I shall endeavour to bring your tables into more general use in the Navy, as I consider them facile princeps of their kind. Burdwood and Davis are so cumbersome. I think you will be pleased to hear that on the southern journey I used your tables exclusively, and worked out all magnetic variations and true bearings by means of them up to latitude $85^{\circ}$ and hence to $88^{\circ}$ almost by exterpolation."

## [From Captain L. B. Bennett Gillman, s.s. Matatua, London, 30th April 1912.]

" Before leaving Wellington on our last homeward voyage I procured a 1911 edition of your tables for azimuth and reduction to the meridian. I think it is the cheapest and best book on practical navigation ever offered to the seafaring community. Had the price been two guineas instead of six shillings it would have been nearer the intrinsic value of the book. The tables are absolutely the last word in modern and up-to-date navigation."
[From Lieutenant Harry Pennell, R.N., commanding the British Antarctic Expedition R.Y.S. Terra Nova, Lyttelton, 3rd June 1912.]
"I have used your A, B, C and Ex-meridian Tables whenever the Terra Nova has made a voyage south, and have found them invaluable. In parts of Ross Sea the variation changes $I^{\circ}$ for every four miles run at right angles to the lines of equal variation, and the large number of azimuths that it is necessary to take during the twenty-four hours would mean a prohibitive amount of work if your all-embracing tables were not at hand."
[From Captain Thomas Liddre, 3I Argyle Square, Sunderland, 3oth December i9i2.]
"Your last I9II edition is undoubtedly the best book published for navigation, and the cheapest."

From Lieut.-Col. W. A. Tilney, commanding 17 th Lancers, Sialkot, India, 29th July 19 I3, to Captain Blackburne.]
"Your tables have practically enabled us to revolutionise night marching, as you see by the enclosed report."

# TABLES OF CALCULATED HOUR-ANGLES 

AND

# ALTITUDE AZIMUTH TABLE, ETC. 

[Extract from Shipping Illustrated, New York, U.S.A., April 3rd, 1915.]
" The main purpose of these tables is to make as easy as possible the problem of finding the ship's position from combined altitudes of the sun, moon, or stars, and especially to facilitate the much-neglected practice of determining the ship's position from two or three stars at twilight, a few minutes before sunrise, and a few minutes after sunset. By the aid of the calculated star reduction and azimuth tables in this book a latitude and position line can be obtained at any time when the stars are visible almost as easily as by meridian altitude of a star. This method is the simplest yet brought forth for quickly and accurately solving the problem of determining position from stellar observations out of the meridian, or for determining latitude and position line from a single observation, which may be used in connection with a sounding, or the bearing of some mountain peak or light."

## [Extract from Shipping and Commerce, Wellington, N.Z., March IIth, 1915.]

" This publication again shows the author's extraordinary faculty and grasp of the art of condensation in applied navigation. The tables comprise over a quarter of a million tabulations of calculated hour-angles, azimuths, reductions, and variations for the hour angles to I degree of latitude, altitude, and declination. The calculated reductions and azimuths of 27 bright stars from one hour to three hours from the meridian, some of them for hour-angles from the meridian below the Pole as well as above, have been made for the actual declination of the stars for the year 1920. This does away with the need for any interpolation for the declination, and these tables will be in this respect perfectly accurate for many years. The tables have been computed to an extreme degree of accuracy, and are especially helpful for determining the ship's position from combined altitude of the sun or stars. By these tables the problem of finding the ship's position from two or three stellar observations out of the meridian or for the numerous adaptations in conjunction with fixed shore objects and soundings in obtaining ' a fix' is copiously explained. The great advantage of these tables for daylight or twilight observations is that the ready determination of the altitude and azimuth from the table prevents the possibility of a wrong star being taken, and an observation may be obtained by setting the approximate altitude to the sextant before the star is visible to the naked eye."
[Extract from Evening Post, Wellington, N.Z., March 29th, 1915.]
" Nothing, it is understood, has ever before been published for so readily and accurately finding the latitude by stellar observations, as the reduction to the meridian is taken out at sight, for 27 of the brightest stars, for one hour on each side of the meridian, and up to 2 and 3 hours from the meridian below the Pole for all the brightest circumpolar stars. The true bearings of these stars are also taken out more simply and accurately than by any other tables, as the calculation has been made for the actual declination of the star, thus saving the interpolation required with other azimuth tables. The bearings given of the circumpolar stars supplement the omissions of Davis's Star Azimuth Tables, as no bearings are given in these tables within 3 hours of the meridian below the Pole, when the altitude is low and in the most suitable position for compass bearings.
"By combining observations from two stars within the limits of the Reduction and Azimuth Tables, when about $30^{\circ}$ from the meridian, the latitude and longitude may be obtained in a very simple way. In this work Captain Blackburne has once again drawn attention to the value of double altitude observations for a 'Sumner' position in low latitudes, as well as in high, and in his effort to remove the wrong impression which exists among many officers in the merchant service in this direction he has given two or three convincing examples with altitudes not more than $2^{\circ}$ from the zenith.
"The completeness and conciseness of the calculations, which greatly facilitate the task of navigation, make the book very valuable to all mariners in responsible positions."

# EXTRACTS FROM LETTERS RECEIVED re "TABLES OF CALCULATED HOUR-ANGLES," Etc. 

The late Commander Harry Pennell, R.N., H.M.S. Duke of Edinburgh, wrote :" These hour-angle and azimuth tables reduce sights now to the minimum of work conceivable when they fall within its limits."

Captain Herbert H. Edmonds, Teacher of Navigation, Sydney, writes :-_" Received my copy of your book, with which I am greatly pleased. I have tested a few critical cases and find results all that can be desired, both with hour-angle and azimuths. What a boon to have all you want with a position-line in one act!"

Commander Edward R. G. R. Evans, R.N., H.M.S. Viking, writes :-" Very many thanks for 'Tables of Calculated Hour-Angles, Star Reductions, and Azimuth Tables.' Like all your works this is excellent, and simple enough for any navigator who will read the explanation and work a few examples until he is familiar with their use-then they are a pleasure."

Lieut. E. B. Dalby, R.N.R., H.M.S. Carmania, writes :-" I have purchased a copy of your new book, and hasten to say how much I like it. The printing is good, the arrangement could not be bettered, the explanations are copious, and the whole book a marvel of cheapness. I have checked the hour-angles in Table I by working out quite a number of sights in the usual way, and then working the same sights by this table. In no case did I get a difference of over a second, and in most cases the error was under half a second. The facility and accuracy with which the azimuth is obtained through the latitude variation (with a little mental interpolation in some cases) is certainly remarkable. For your star reduction and azimuth tables I have nothing but admiration. For stellar navigation I know of nothing to equal these incomparable tables."

Captain Robert W. Ferguson, of Brisbane, Queensland, writes:-"The tables are magnificent, and the most singular part of them is the truly graphic Altitude Azimuth Table No. IV, it being the best and most ingenious I have ever seen. . . . These tables are of inestimable value to the science of navigation, and your methods supersede all others in accuracy and brevity."

Captain Walter Lumsden, C.V.O., R.N., Director Royal Indian Marine, writes, saying :-" I am obtaining copies of this publication for supply to Royal Indian Marine seagoing vessels."

Captain John J. K. Konghan, commanding R.M.S. Sierra, writes :-" I use your books in preference to all other books on navigation. They give me entire satisfaction. . . . Your books are very popular with the Japanese. They know a good thing when they see it. .. Have read and used nearly all the new books on navigation. Your books are the best I have seen up to this date. I intend to introduce it into the United States."

Later, Captain Konghan writes :-" Five copies of 'Calculated Hour-Angles' and eight of the small books, 'Azimuths,' have been purchased by the officers of this steamer for themselves and friends. I believe every voyage they purchase some."

Sub-Lieut. T. Konishi, of H.I.J.MS. Azuma, Japanese Navy, writes:-" I tried your new book, and found it very good-very simple and very accurate. I tried (I) by logarithms; (2) Ball's Altitude Table ... most used; (3) The Newest Navigation, Altitude and Azimuth Tables, by Lieut. Radler de Aquino, Brazilian Navy; and your table I think the best."

Sub-Lieut. Konishi took very high honours at the Naval College in Japan. His opinion, therefore, is much valued.

Naval Instructor S. F. Card, B.A., R.N., Head of the Navigation Department, and Lecturer in Navigation at the Royal Naval College, Greenwich, writes :-" Personally, I am a great admirer of your latest tables, and have brought it to the notice of the sixty new Naval Instructors that I have been training here at the R.N. College. The Azimuth Table I prefer to Burdwood's," etc.

Sir E. Lionel Fletcher, Manager Oceanic Steam Navigation Co., Ltd. (White Star Line), writes:-" We think it well to advise you that we have ordered 40 copies of your new Navigation Table, for use by the commanders in this Company's service."

The P. \& O.S.N. Company, the N.Z.S.S. Company, the White Star Line, and the U.S.S. Company of New Zealand supply copies of the work to their steamers. The New Zealand Government are also supplying each of H.M.N.Z. transport steamers with a copy of the book.
