Day 7: China Is A Technocracy

Thanks to early members of the Trilateral Commission, China was brought out of its dark ages Communist dictatorship and onto the world stage. Furthermore, the Trilateral Commission orchestrated and then facilitated a massive transfer of technology to China in order to build up its non-existent infrastructure.

Professor Antony C. Sutton and I co-authored *Trilaterals Over Washington, Volumes I and II* between 1978 and 1979, and in those books we thoroughly documented the so-called "China trade":

> *Trilaterals propose to build up Communist China. Trilateralist policy is clear cut. The West must aid the construction of Communist China: this is expressed in An Overview of East-West Relations (Triangle Paper No. 15, 1978, p. 57) as follows:*
>
> *"To grant China favorable conditions in economic relations is definitely in the political interest of the West" adding "...there seems to exist sufficient ways for aiding China in acceptable forms with advanced civilian technology."*

Triangle paper 15 also adds:

"The situation is different... where arms supplies or advanced military technologies are concerned, except for types of equipment that by their nature serve purely defensive purposes." (p. 58)

In fact, as we shall see later, Trilateral firms have exported even advanced military technology to Communist China.

Further, as part of one world, Trilateralists see an ultimate merging of free enterprise Taiwan with the Communist mainland. Even more remarkable, the paper envisages that Communist China will return to an expansionist aggressive policy under two conditions:

1. *as Communist China "gets stronger,"*
2. *if relations with the Soviets are "normalized."*

The paper adds, "already now, the activity of Communist Guerrillas in Thailand and Malaysia, linked to each other and looking to China, persists and even seem to be on the increase." (page 59)

So far as Communist China is concerned, we may conclude that Trilaterals:

- *want to build Communist China into a military superpower,*
- *wish to do this with the full and clear understanding that China will likely resume its expansionist course in the Far East, and*
- *are willing to subsidize guerrilla activities in Thailand and Malaysia (much of the "civilian technology" currently being transferred has usefulness for guerrilla warfare.)*

In hindsight, it's clear that we absolutely nailed the issue. It wasn't that we were so smart but that we were simply reading what they themselves wrote and then we reported on it.

It has been widely noted that China was initially brought into the mainstream of global trade by Trilateral Commission co-founder

Zbigniew Brzezinski. As a failed Communist dictatorship, China was a blank slate with over 1.2 billion citizens under its control. However, Chinese leadership knew nothing about capitalism and free enterprise, and Brzezinski made no effort to teach them about it. Instead, he planted seeds of Technocracy.

Once diplomatic relations were normalized with China, global corporations connected to the Trilateral Commission rushed in to build infrastructure, factories, educational facilities, financial centers, etc. In the 20-year period from 1980 to 2000, a transformation took place that was considered nothing short of an economic miracle; but it was not of China's doing. Rather, it can be fully attributed to the masters of Technocracy within the ranks of the Trilateral Commission.

In 2001, an article appeared in Time Magazine. The editor of Time, Hedley Donovan, was a founding member of the Trilateral Commission, and his publication was one of several media outlets that collaborated with Trilateral initiatives. The article, Made in China: The Revenge of the Nerds accurately and plainly revealed what had taken place during the prior 20 years:

> *The nerds are running the show in today's China. In the twenty years since Deng Xiaoping's reforms kicked in, the composition of the Chinese leadership has shifted markedly in favor of* ***technocrats****. ...It's no exaggeration to describe the current regime as a* ***technocracy****.*

> *After the Maoist madness abated and Deng Xiaoping inaugurated the opening and* ***reforms that began in late 1978, scientific and technical intellectuals were among the first to be rehabilitated.*** *Realizing that they were the key to the Four Modernizations embraced by the reformers, concerted efforts were made to bring the "experts" back into the fold.*

> *During the 1980s, technocracy as a concept was much talked about, especially in the context of so-called "**Neo-Authoritarianism" — the principle at the heart of the "Asian Developmental Model" that South Korea, Singapore, and**

*Taiwan had pursued with apparent success. The basic beliefs and assumptions of the technocrats were laid out quite plainly: **Social and economic problems were akin to engineering problems and could be understood, addressed, and eventually solved as such.***

*The open hostility to religion that Beijing exhibits at times — most notably in its obsessive drive to stamp out the "evil cult" of Falun Gong — has pre-Marxist roots. **Scientism underlies the post-Mao technocracy**, and it is the orthodoxy against which heresies are measured.* [Emphasis added]

I will take momentary leave to request that my skeptics and critics stop insisting that China is a Communist dictatorship and not a Technocracy. Can you just read the article above?

China's Technocracy In Full Bloom

Today's China is a scientific dictatorship nightmare. With 600 million facial recognition cameras to be installed by 2020, China will have one monitoring camera for every seven citizens and facial recognition Artificial Intelligence software to instantly locate, identify and track everyone. In short, China is totally obsessed with surveillance and absolute control over its population using state-of-the-art technology.

Here are some examples of Technocracy at work in China:

China's Social Credit Scoring system registers all citizens, their activities and their behavior in order to deny or award privileges. Citizens cannot purchase a new cell phone without first providing a facial scan and other identification information.

Companies in China, regardless of national origin, are also assigned Social Credit scores in order to control their behavior. All companies are required to install government-accessed cameras within their own offices and factories.

China supports "anything goes" genetic engineering on plants, animals and humans.

China intends to dominate space and space travel, having recently landed an exploration vehicle on the dark side of the moon. It is already testing a Mars lander and pledges to colonize the red planet.

China currently leads the world in 5G, Artificial Intelligence, Internet of Things, Quantum Computing, and it intends to dominate all areas of science and technology.

China is aggressively exporting its surveillance technology to nations around the world, in an effort to establish its Technocracy as widely as possible.

The list goes on, but the evidence supports the analysis: China is a full-blown Technocracy and it is the first of its kind on planet earth, thanks to the clever manipulation and support of Western elites like the Trilateral Commission. Furthermore, its intentional Technocracy is spreading like a cancer to other nations, including India, Asia, Europe, Africa and South America. The combined population of China and India alone represents over 36 percent of world population; by comparison, the number of people living under Marxist-style governments is very small.

In conclusion, the clear and present danger to world domination is not any kind of Marxist derivative, but rather neo-authoritarian Technocracy. Living under such a system will be far more oppressive and painful than Socialism, Communism or Fascism.
